iAccess for Maconomy

Installation Guide

Online Help This document is also available in an online edition that is easier to navigate and copy-paste from. You can find it here:

<https://help.deltek.com/Product/MaconomyiAccess/2.5.1/Documentation/InstallationGuide/#/>

Introduction

The following document serves as an introduction to the iAccess for Maconomy product. The target audience is technical consultants and partners that need to install, extend, and maintain iAccess. The content is structured in the following parts:

- In the first part, we will describe core concepts of the iAccess architecture.
- The second part describes how it can be installed using MConfig.
- The third part describes how it can be extended using the Maconomy Extender.
- In the fourth part, we will provide an overview of the current extension toolkit.
- The fifth part contains an API reference describing the facilities available in the extension toolkit.
- Finally, the last part contains a migration guide, and a troubleshooting guide. Both of these guides should be particularly useful when upgrading an existing iAccess installation.

Contact & Support

-
- Visit our [Deltek Collaboration space](#) for bug reports, feature requests, or questions.

Architecture

Briefly described, iAccess for Maconomy is an HTML5 web client. It is a lightweight user interface supplement to the existing Workspace Client. The backend is

Maconomy, specifically the new RESTful web services exposed from Maconomy since version 2.2. In this section, we will give a cursory overview of the technical architecture.

Technical Architecture

Figure @architecture shows the high-level architecture of a Maconomy system with iAccess. This setup resembles the traditional Maconomy architecture with a few exceptions. In the following section, we will describe the core components involved and the purpose of each of those.

Maconomy 2.x server and database : iAccess for Maconomy is available from Maconomy 2.2. It does not impose any specific requirements on the database, but it does require a Maconomy 2.2 server and corresponding RESTful API [RestAPI]. See the [following section](#) for more details on the required web services.

Web server (IIS/Apache) : One or more web servers are required to serve both the static and dynamic content of iAccess. Static content such as HTML, JavaScript, CSS files, and so on are placed directly on the web server. Dynamic content such as specifications, files, and data are retrieved from the Maconomy server, but the web server in this case acts as proxy. Using the web server as proxy prevents cross-origin (CORS) issues on the client side. The web server is also required for encryption and compression of client-web server communication.

iAccess Clients : The iAccess clients can be located both on the internal network or on the open Internet depending on the web server configuration and exposure.

Furthermore, clients can run iAccess on different devices such as laptops with the main browsers (IE, Chrome, and Safari), as well as on iOS and Android tablets.

RESTful Web Service API

As mentioned previously, iAccess for Maconomy uses the RESTful Web Service API which was introduced in Maconomy 2.2. This is *not* the same thing as the existing MScript web services. Please see the RESTful Web Services documentation for more information [aRestAPI]. For now, we will just briefly list the web service endpoints that iAccess uses and what they are used for:

/containers : The *containers* endpoint delivers both metadata and data for the containers exposed by the Maconomy 2x server. Metadata include specifications of the names, actions, fields, and foreign keys exposed by different containers. Data include the actual filter-, card-, and table-data stored in the underlying database as well as information on which actions are enabled.

/filedrop : The *filedrop* endpoint is used to upload files such as receipt attachments on expense sheets.

/configurations : The *configurations* endpoint was introduced in Maconomy 2.2.2 and is used by iAccess 1.2 and onwards. This endpoint is used to retrieve JSON specifications from the Maconomy server, specifically the application specification (`application.json`) which configures iAccess. These specifications are the foundation of the iAccess extensibility model.

/auth : The *auth* endpoint was introduced in Maconomy 2.2.4 and 2.3GA, and is used by iAccess 2 and onwards. This endpoint is used to obtain login tokens for 3rd party integrations such as Business Objects.

/environment : The *environment* endpoint was introduced in Maconomy 2.2.5 and 2.3GA and is used by iAccess 2 and onwards. This endpoint is used to retrieve the end-user's environment variable, e.g., employee name and number, company info etc.

Installation

This section describes the installation process for iAccess. Keep in mind that parts of the installation process (in particular, web server configuration) are specific to the individual installation. As such, this section can only offer general guidelines. In case of doubt, we recommend posting a question on our iAccess Deltek Collaboration Space.

The iAccess Manifest

To install iAccess, you need an installation of Maconomy and a suitable version of MConfig. The iAccess product is packaged in an archive file format called an FPU (*Flexible Packaging Unit*). An FPU contains the following components:

1. The Tools part which is a set of JavaScript, HTML and CSS files responsible for executing the iAccess Applications in the browser.
2. The embedded iAccess Applications each consisting of a set of JSON files describing workspaces, layouts, and other settings for iAccess against a particular range of Maconomy backends
3. The FPU manifest (`manifest.json`) which specifies various metadata about the FPU such as version info and compatibility constraints.

The required backend Maconomy version for a given iAccess is documented in the release notes for each iAccess release. You can also inspect the `manifest.json` file mentioned above. In the following `manifest.json` sample, we can see that this iAccess FPU is of version 2.0.5. The applications section lists the core Maconomy versions that this version of iAccess is compatible with. In this case, it is compatible with specific service packs on 2.2 (internally called `17`), 2.3 (internally called `19`), and 20 (internally called `20`). Below, the metadata for the 2.2/17 application is expanded and it can be seen that iAccess 2.0.5 is specifically only compatible with service pack 5 of Maconomy 2.2 (internally called `17.0.105`).

```

{
  "manifest-version": 3,
  "marketingVersion": "iAccess for Maconomy 2.0",
  "fpuVersion": "2.0.5",
  "apiVersion": "8.0.0",
  "applications": {
    "17": {
      "requires": "^1.0.0",
      "src": "...",
      "backends": [
        {
          "tpu": { "versionRange": "17.0.105" },
          "apu": { "versionRange": "17.0.105" }
        }
      ]
    },
    "19": { ... },
    "20": { ... }
  }
}

```

Once the Maconomy system is installed and configured, MConfig can install the iAccess FPU on a web server of choice. MConfig will also install an iAccess Application matching the Maconomy backend on the Maconomy server, specifically in the `Web` folder in `MaconomyDir`. We currently support IIS and Apache (see release notes for the specific version requirements for these web server products). On the web server, you should also set up a web site with the installed iAccess `index.html` in the root. Once the MConfig installation has taken place, and the web site and proxy settings have been completed, iAccess is ready. Please observe that certain manual steps may be required for specific installations.

Security Considerations

While Deltek recommends the following procedures, ultimately each company is liable for its own security. The landscape evolves quickly, and each customer should continuously take internal measures to ensure its own security.

Regarding the use of HTTPS/TLS

Deltek best practice recommends that you configure web servers to use HTTPS (instead of HTTP). Using HTTPS/TLS encrypts your network traffic, making it difficult for anyone to access the credentials as they are passed to the web server. Using simple HTTP is tantamount to sending confidential information over the wire in clear text. The iAccess login page will display a warning message in case HTTP is used instead of HTTPS.

Address Risk of Clickjacking

To reduce the likelihood of clickjacking, Deltek suggests you follow the OWASP guidelines to defend against clickjacking attacks. Based on the OWASP guideline, you can perform additional steps when configuring your webserver. See [Additional Related Procedures](#) for more details.

Prerequisites

The following are prerequisites to installing iAccess:

- Maconomy 2.5.1
- Latest MConfig version
- Latest Extender version
- RESTful Web Services is enabled in the Coupling Service
- iAccess downloaded from DSM, and iAccess FPU placed in the PUs folder (with the APU and TPU)
- If you are using Apache as the webserver, download the Apache binary package

including OpenSSL, and install it from the following link: <http://httpd.apache.org/>

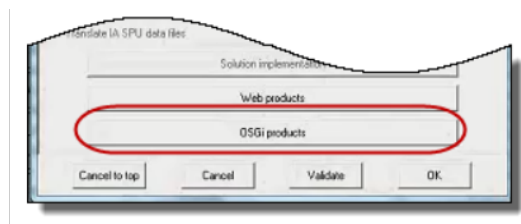

- Standard extensions are already installed

Additionally, this document assumes that you have already set up an application. For detailed instructions on setting up applications, see the Deltek Maconomy Installation Guide for your specific Maconomy version.

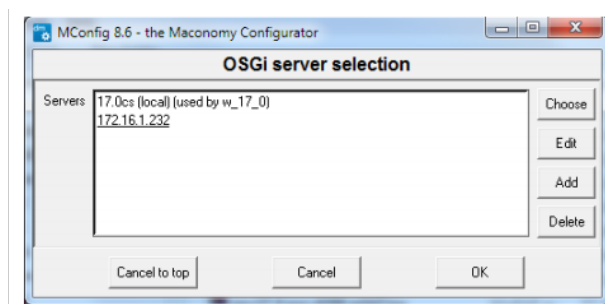

MConfig Installation

To begin installation with MConfig, complete the following steps:

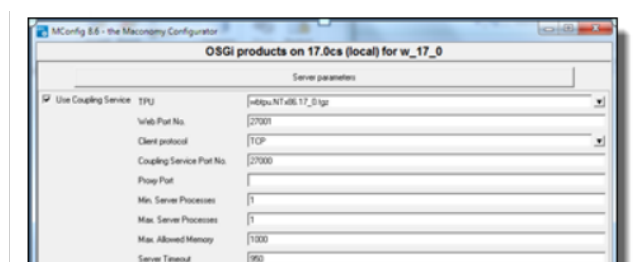

Step 1 : In the MConfig Main Window, double-click the application to open. The Application Instance window displays as shown in Figure @mconfig1.

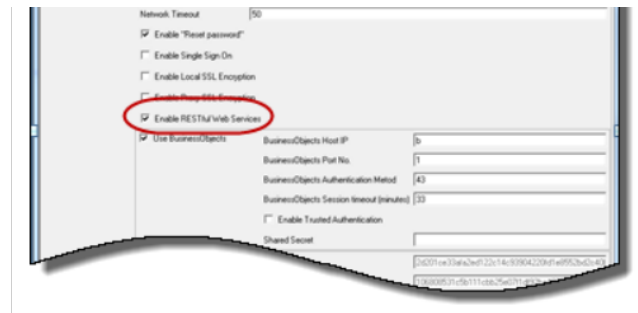

Step 2 : Click OSGi products. The OSGi Server Selection screen appears as shown in Figure @mconfig2.

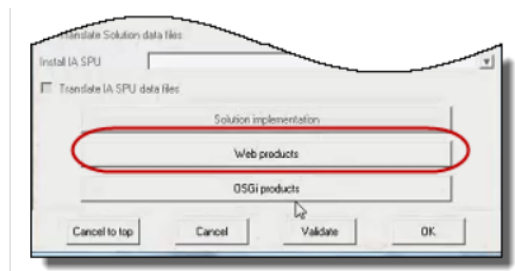

Step 3 : Select the Coupling Service to update as shown in Figure @mconfig3.

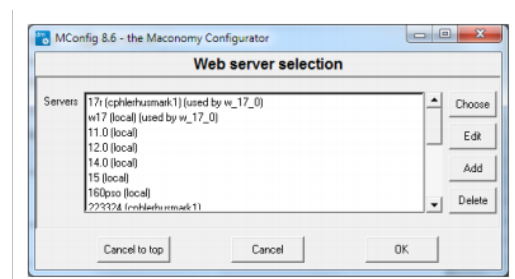

Step 4 : Select the Enable RESTful Web Services check box as shown in Figure @mconfig4.

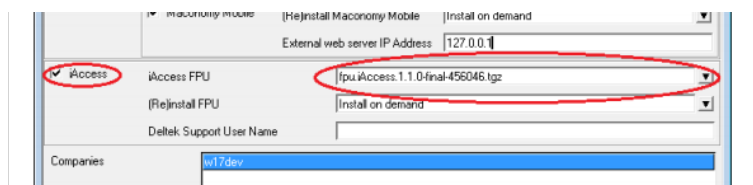

Step 5 : Click OK to save, and click OK at the SSL warning to return to the Application Instance window. In the Application Instance window, click Web products as shown in Figure @mconfig5.

Note: While you can click OK at the SSL warning, Deltek recommends you follow the steps listed in the warning to ensure the security of your system.

Step 6 : On the Web server selection screen, select the application to update. Select the iAccess check box as shown Figure @mconfig6. In the iAccess FPU field, select the relevant FPU from the drop-down list.

Step 7 : Click Ok a couple of times to return to the main window, and click Next a couple of times, and then click Yes to complete the MConfig installation.

Create a Website Using IIS

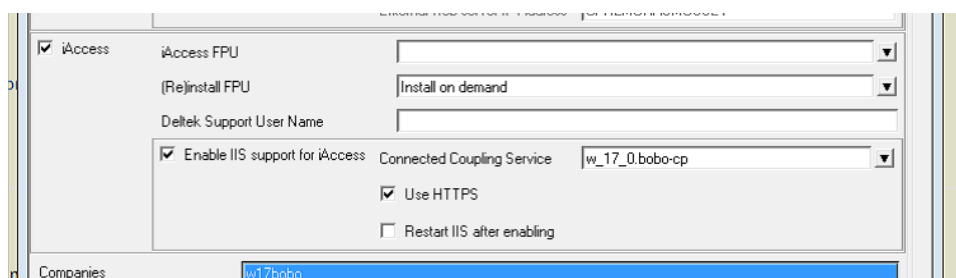

To create a website using IIS, you can enable IIS support automatically using MConfig, or perform the steps manually using IIS Manager.

Enabling IIS support with MConfig automatically completes the steps described under the manual installation. Use MConfig for the initial setup of an iAccess website using IIS. However, modifying the setup later should be done manually using IIS Manager.

Enable IIS Support Automatically Using MConfig

Automatic IIS configuration requires MConfig 8.12.4. Previous version will not perform a correct configuration of IIS due to a shortcoming in MConfig. To enable IIS support using MConfig, follow these steps (See Figure @iis-mconfig):

1. In MConfig, go to the Web Products window.
2. Select the Enable IIS support for iAccess check box and click OK.

Note: After you complete the initial installation with MConfig, you should check the setup in IIS Manager and possibly modify parameters, such as Web Server Port Number.

Note: If you enable IIS support automatically, MConfig also updates the IIS web.xml file with a routing rule that ensures login pages and other non-root URLs load

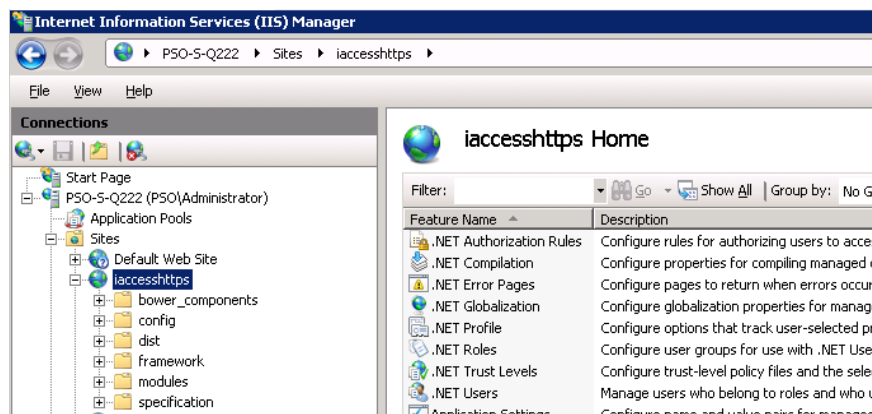

properly.

Enable IIS Support Manually Using IIS Manager

After iAccess has been installed on your IIS web server, you can configure it using IIS Manager.

Add the Site

: Connect to your server in the Internet Information Services (IIS) Manager application and setup the iAccess site. The site should have the files shown in Figure @iis1 as root files.

Add MIME Types

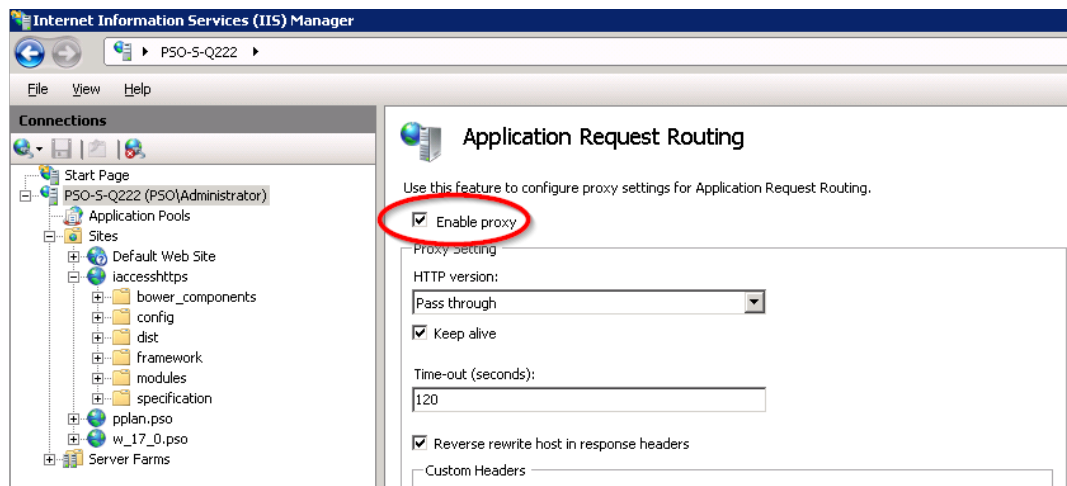

: Click the "MIME Types" and ensure that the MIME Types below are defined

```
.json application/json
.woff application/font-woff
.woff2 application/font-woff
```

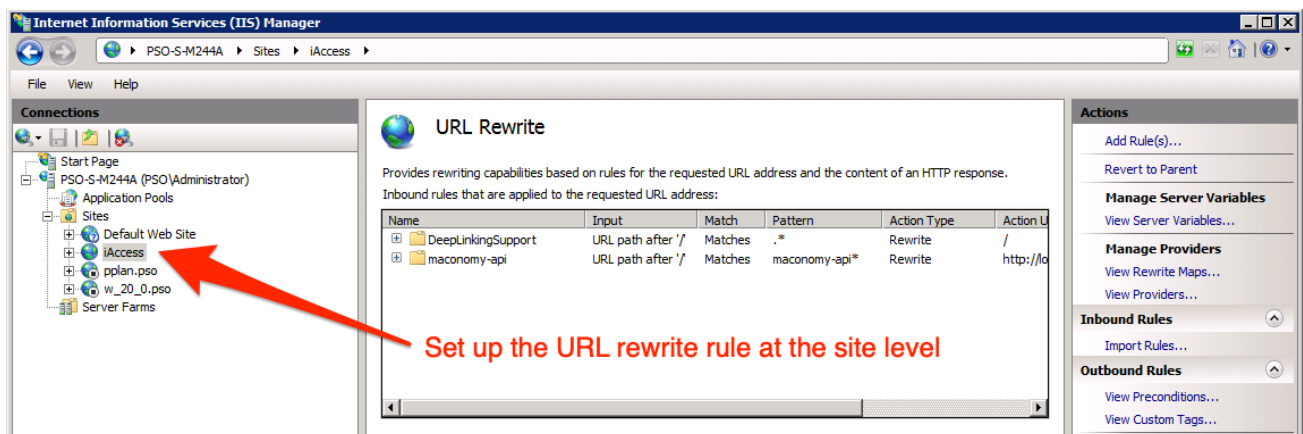

In IIS 8.0 and up, the .woff extension exists by default but with a different type. Change it to *application/font-woff*.

Proxy Setup

Proxy Setup

1. Install Microsoft Application Request Routing for IIS [ARR](#).
2. Restart IIS Manager.
3. In the *Application Request Routing* configuration, click *server proxy settings*.
4. Check *Enable proxy* as shown in Figure @iis2.
5. Open *URL Rewrite* to add proxy rules for the container, configurations and filedrop APIs. Note: This must be done on the local site, not globally as shown in Figure @iis3.

In IIS 8.0 and up, you will need to install the [Web Platform Installer](#) in order to install the ARR plugin.

Edit Routing Rules

To ensure that login pages (and other non-root URLs) load properly, open the IIS web.xml file and add the following rule *before* the other routing rules:

```
<rule name="DeepLinkingSupport" stopProcessing="false">
  <match url=".*" />
  <conditions logicalGrouping="MatchAll" trackAllCaptures="false">
    <add input="{REQUEST_FILENAME}" matchType="IsFile" negate="true" />
    <add input="{REQUEST_FILENAME}" matchType="IsDirectory" negate="true" />
    <add input="{REQUEST_FILENAME}" pattern="maconomy-api*" negate="true" />
  </conditions>
  <action type="Rewrite" url="/" />
</rule>
```

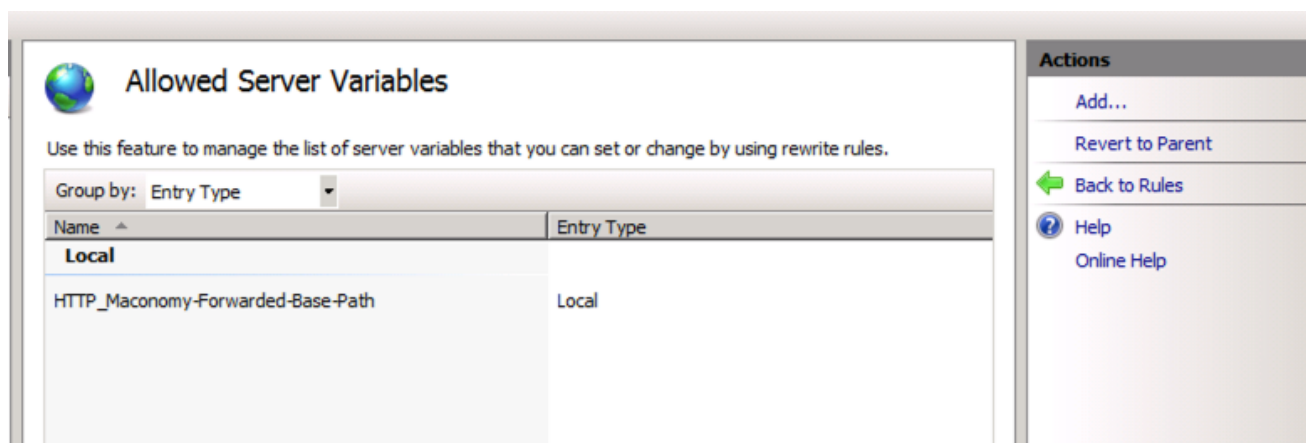

Note: If you want to install iAccess in an *IIS Application folder*, you should update the **rewrite** action accordingly.

For example, if the *IIS Application folder* is called ****iAccess**", then the rewrite action should be:

```
<action type="Rewrite" url="/iAccess/" />
```

Add the server variable for Maconomy API

1. Click View Server Variables
2. Click Add...
3. Set the name: HTTP_Maconomy-Forwarded-Base-Path

Set up proxy for Maconomy API

1. Click Add Rule...
2. Select Blank rule.
3. Fill out the rule as shown in the section on setting up proxy for Maconomy API, specifically with the following parameters:

Match URL

Requested URL: Matches the Pattern

Using: Wildcards

Pattern: maconomy-api*

Ignore case: checked

Server Variables

Click Add...

Server variable name: HTTP_Maconomy-Forwarded-Base-Path

Value: maconomy-api

Action

Action type: Rewrite

Rewrite URL: http://<coupling-service-host>:<coupling-service-port>

Append query string: checked

Edit Inbound Rule

Name:

maconomy-api

Match URL

Requested URL:

Matches the Pattern

Using:

Wildcards

Pattern:

Test pattern...

☒ Ignore case

Conditions

Server Variables

Name	Value	Replace
HTTP_Maconomy-Forwarded-Base-Path	/maconomy-api	True

Add...
Edit...
Remove
Move Up
Move Down

Action

Action type:
Rewrite

Action Properties

Rewrite URL:

☒ Append query string
☐ Log rewritten URL

☐ Stop processing of subsequent rules

Preserve the Host Header

Open a console with Administrative privileges, and navigate to

C:\Windows\System32\inetsrv

Enable preserveHostHeader by running the following command:

http://localhost:3000/#/concat

```
cd C:\Windows\System32\inetsrv
appcmd.exe set config -section:system.webServer/proxy /preserveHo
```

Note: To preserve the spacing, copy the command and paste it in the command prompt.

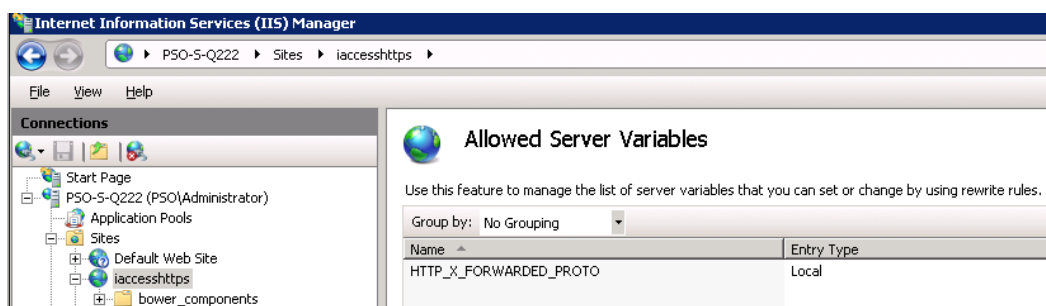

Restart the web server.

See [AppCmd reference](#) for more details.

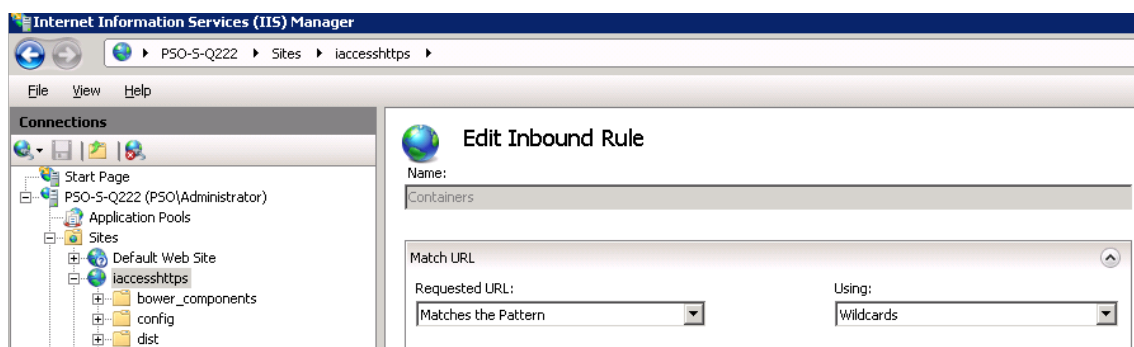

Set Up HTTPS

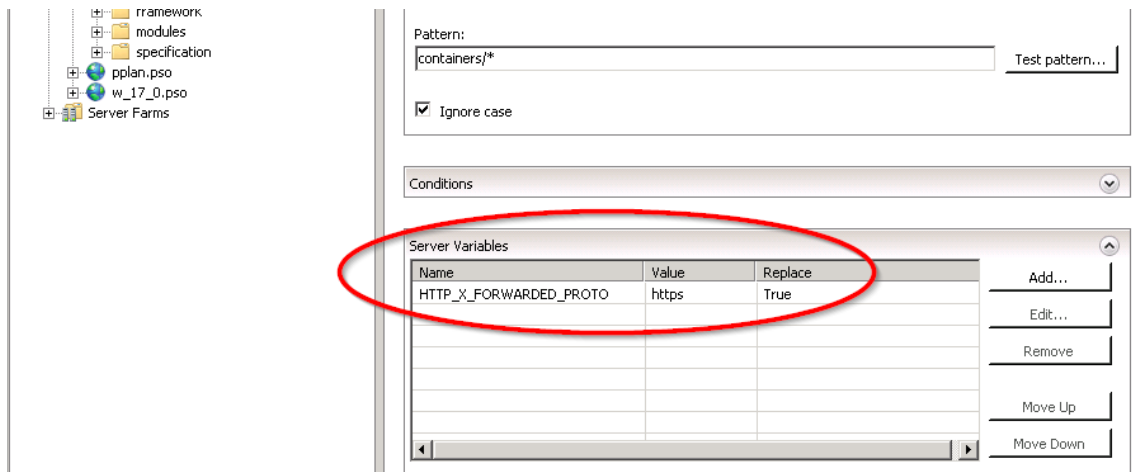

Open the Server Variables screen by clicking *View Server Variables...* in the *URL Rewrite* screen.

In the Server Variables screen, click *Add...* and add the variable `HTTP_X_FORWARDED_PROTO` as shown in Figure @iis6.

In the URL rewrite rules (both containers, configurations, filedrop, auth, and environment) that proxies the web service, set the server variable `HTTP_X_FORWARDED_PROTO` to `https` as shown in Figure @iis7.

Restart the webserver.

Note: It is not possible to run both HTTP and HTTPS on the same IIS site.

Create a Website Using Apache

Here is a short guide to setting up iAccess on Apache (2.2 and 2.4)

Download Apache

Download the Apache 2.2 binary package including OpenSSL. Install it.

In `httpd.conf` , comment in the following modules:

```
LoadModule headers_module modules/mod_headers.so
LoadModule proxy_module modules/mod_proxy.so
LoadModule proxy_http_module modules/mod_proxy_http.so
LoadModule ssl_module modules/mod_ssl.so
LoadModule rewrite_module modules/mod_rewrite.so
```

Comment in the inclusion: `Include conf/extra/httpd-vhosts.conf`

Comment out `#Listen 80` (we will use the `httpd-vhosts.conf` file instead)

Enable compression

If using Apache 2.2, comment in the following module:

```
LoadModule deflate_module modules/mod_deflate.so
```

If using Apache 2.4, use this module:

```
LoadModule filter_module modules/mod_filter.so
```

Configure the compression:

```
<IfModule deflate_module>
    AddOutputFilterByType DEFLATE text/html text/plain text/xml tex
    SetOutputFilter DEFLATE
    DeflateCompressionLevel 5
</IfModule>
```

See [Apache Deflation Module](#) for more information.

Setup with SSL

Here is a template for setting up a virtual host that serves iAccess *with* SSL. Copy contents into the `httpd-vhosts.conf` file, and replace the variables with the desired values. Please observe that the line `Require all granted` below is only required for Apache 2.4.

```
Listen <port>
<VirtualHost *:<port>>
    ServerName <server-name>

    # Server iAccess files from installation directory
    DocumentRoot "<iAccess-installation-directory>"

    <Directory <iAccess-installation-directory>>
```

```

    Order deny,allow
    Allow from all
    AllowOverride All
    Require all granted
</Directory>

<Proxy *>
    Order deny,allow
    Allow from all
</Proxy>

ProxyRequests      Off
ProxyPreserveHost  On

RequestHeader set Maconomy-Forwarded-Base-Path maconomy-api
# Signal to the coupling service that the originating protocol is https
RequestHeader set X-Forwarded-Proto "https"

# Proxy the web services from the coupling service
ProxyPass /maconomy-api http://<coupling-service-host>:<coupling-service-port>

# Set up this virtual host to use SSL
SSLEngine          On
SSLProxyEngine      On
SSLCertificateFile  <cert-file-location>
SSLCertificateKeyFile <key-file-location>
</VirtualHost>

```

Edit Routing Rules

For more information, refer to [Edit Routing Rules](#) under the [Enable IIS Support Manually Using IIS Manager](#) section.

Verifying the setup

To quickly verify the setup, open a browser (such as Chrome) and navigate to the following URL:

```
https://<external-url-and-port>/containers/v1/<shortname>
```

For example:

```
https://acme.com/containers/v1/w20sp100
```

If the proxy configuration is correct, the browser should either download, or show an XML or JSON document that looks like the following:

```
<Endpoint xmlns="http://www.deltek.com/ns/webservices" shortname=
  <Versions>
    <TPU major="20" minor="0" sp="100" fix="0" beta=""/>
    <APU major="20" minor="0" patch="100" hotfix=""/>
  </Versions>
  <Languages> ... </Languages>
  ...
  <Links>
    <Link href="https://acme.com/containers/v1/w20sp100" rel="sel
  </Links>
</Endpoint>
```

Domain Login and Single Sign On

The domain login functionality in iAccess is based on Kerberos service tickets obtained through the SPNEGO authentication protocol. This protocol allows direct Single Sign On (SSO) when the user is running iAccess while already authenticated

against the domain (that is, logged in to their computer via a domain account).

If the user is not authenticated against the domain, the browser typically prompts for domain credentials. Click **Cancel** in the browser login window and use the iAccess domain login page.

Browser Setup for Single Sign On

Refer to the instructions in this section to set up Single Sign On (SSO) for various browsers.

SSO Setup for Internet Explorer

For Internet Explorer (IE), you may need to add the iAccess server address to the Local intranet zone if it is not already in this zone, as IE does not permit Kerberos-based SSO for websites in the Internet zone.

More details are available in the "Client Side-Internet Explorer" section of the following Microsoft article about security zones in Internet Explorer:

<https://msdn.microsoft.com/en-us/library/ms995329.aspx>

SSO Setup for Chrome

You can choose one of two options:

- If using Windows, you can perform the setup required for Internet Explorer. Chrome can replicate the setup for IE.
- To configure Chrome to work with SSO using Kerberos authentication, follow the steps in the "Set Chrome policies for devices" guide (<https://support.google.com/chrome/a/answer/187202?hl=en>).

The configurations should be done by IT administrators who want to set Chrome policies on their corporate-managed devices. The templates contain hundreds of

available policies that can be set, but you should only focus on two of these, namely:

AuthNegotiateDelegateWhitelist (<http://www.chromium.org/administrators/policy-list-3#AuthNegotiateDelegateWhitelist>)

and

AuthServerWhitelist (<http://www.chromium.org/administrators/policy-list-3#AuthServerWhitelist>).

The properties should be set to the domain you want to authenticate against, such as:

`"*. example.com "`.

SSO Setup for Chrome on Windows

After following the preceding guide from Google, you can set

AuthNegotiateDelegateWhitelist and **AuthServerWhitelist** as follows:

1. Navigate to Administrative Templates >> Classic Administration Templates (ADM) >> Google >> Google Chrome >> Policies for HTTP Authentication.
2. Click "Kerberos delegation server whitelist".
3. Click Enabled.
4. In the Input field, enter the domain you want to authenticate against, such as `"*. example.com "`.
5. Click Apply.
6. Click on "Authentication server whitelist".
7. Click Enabled.

6. In the Input field, enter the domain you want to authenticate against, such as `"*. example.com "`.

8. In the input field, enter the domain you want to authenticate against, such as "example.com".
9. Click Apply.
10. Open Chrome.
11. Check the values by navigating to the URL:

`chrome://policy`

SSO Setup for Chrome on Mac

After following the preceding guide from Google, you should also read the Mac Quick Start guide from Google at:

<http://www.chromium.org/administrators/mac-quick-start>

If the "Workgroup Manager from Apple" is not available for your version of OS X, then you can set **AuthNegotiateDelegateWhitelist** and **AuthServerWhitelist** using one of two recipes.

By creating a `com.google.Chrome.plist` file:

1. Create `com.google.Chrome.plist` file with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple//DTD PLIST 1.0//EN" "http://www.apple.com/DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
  <dict>
    <key>AuthNegotiateDelegateWhitelist</key>
    <string>*.example.com</string>
    <key>AuthNegotiateDelegateWhitelist</key>
    <string>*.example.com</string>
```

```

        <string>*.example.com</string>
    </dict>
</plist>

```

2. Set the two string attributes to the domain you want to authenticate against.
3. Convert the com.google.Chrome.plist to the binary format by running the following command from the Terminal:

```
plutil -convert binary1 com.google.Chrome.plist
```

4. Copy the file to "/Library/Managed Preferences/" by running the following command from the Terminal:

```

sudo -s
cp com.google.Chrome.plist /Library/Managed Preferences/<useri

```

5. Open Chrome.
6. Check the values by navigating to the following URL:

```
chrome://policy
```

By using the "defaults" command:

1. Run the following commands:

```

defaults write com.google.Chrome AuthServerWhitelist "*.example.com"
defaults write com.google.Chrome AuthNegotiateDelegateWhitelist "*"

```

2. Open Chrome.

3. Check the values by navigating to the following URL:

```
chrome://policy
```

Or by using the following command:

```
defaults read com.google.Chrome
```

Note that using the "defaults" command only sets the "AuthServerWhitelist" and "AuthNegotiateDelegateWhitelist" Chrome properties for the current user.

SSO Setup for Safari

No setup is needed.

SSO Setup for iOS

Follow the steps in the following guide:

```
https://samuelyates.wordpress.com/2013/10/11/kerberos-single-sign
```

Remember to put your own servername on the URLPrefixMatches field. As the name implies, this has to contain a URL prefix. This could be "<https://myserver.example.com:8080>", so basically this will be set to the base server URL including an optional port number.

You can use Apple Configurator 2 to install the profile on a number of iPads:

```
https://itunes.apple.com/us/app/apple-configurator-2/id1037126344
```

SSO Setup for Firefox

Complete the following steps:

1. In the location bar, type: about:config.

This brings up the configuration page.

2. In the Filter:box, type: negotiate.

This restricts the listing to the configuration options you need.

3. Edit network.negotiate-auth.trusted-uris to the domain against which you want to authenticate. For instance: `""example.com`

Domain Controller Setup

The SPNEGO authentication protocol works by assuming the presence of a specific Service Principal Name (SPN) on the domain controller:

`HTTP/name.domain` or `HTTP/name`

where name and domain are the web server DSN name and domain respectively, as seen from the user's computer.

For example, if the user is opening iAccess using the internet address <https://some-server.some-domain.com>, then the browser expects one of the following SPNs to be present on the domain controller:

`HTTP/some-server` or `HTTP/some-server.some-domain.com.`

SPN Setup

It is a task for the domain administrator to ensure that these SPNs are created and associated with the existing domain account used for Maconomy SSO.

SSO with Active Directory

For Active Directory, associating SPNs with the existing domain account is done with the 'setspn' command.

To associate SPN with an existing domain account, complete the following step:

On a command line enter the following:

```
setspn -A HTTP/name account  
setspn -A HTTP/name.domain account
```

where account is the name of the domain account used for Maconomy SSO.

Special Instructions for SPN Conflicts

If iAccess is installed on a web server that already hosts other web applications with SNEGO authentication, this causes a conflict on the SPN, as an SPN can only be associated with one domain account.

To resolve the issue, either install only one web application on each web server, or create multiple local DNS names for the web server, so that each web application can be accessed through different addresses and will map to different SPNs.

Maconomy Server Setup

Please refer to the Single Sign On with Kerberos section in the Deltek Maconomy

System Administrator Guide.

Additional Related Procedures

Displaying System Information on the iAccess Interface

You can display the system name along the top margin of your iAccess installation. For details on how to configure this, refer to the Displaying System Information on Clients section in the Deltek Maconomy System Administrator Guide.

Configure Web Server to Reduce Risk of Clickjacking

You can reduce the risk of clickjacking by performing an additional step when configuring your web server. This step applies to both Apache and IIS.

To configure your web server and reduce the risk of clickjacking, complete the following step:

Configure your web server to always reply with the following response headers:

```
Content-Security-Policy: frame-ancestors 'self'  
X-Frame-Options: SAMEORIGIN
```

These headers are then added to all responses.

Downloading Deltek Products using the Deltek Software Manager

You can use the Deltek Software Manager (DSM) to download complete Deltek products, hot fixes, and sub-releases. You can access DSM directly or through the Deltek Customer Care Connect site.

When you access DSM directly, you will be prompted to log on before you can access the application. If you access DSM from within the Deltek Customer Care site, you do not have to log on since you are already logged in to the Customer Care site.

Accessing DSM Directly

To access Deltek Software Manager directly, complete the following steps:

1. Launch Deltek Software Manager by taking one of the following actions:

Click here: <http://www.deltek.com/>. On your desktop, click Start >> Programs >> Deltek >> Maconomy iAccess >> Deltek Software Manager.

2. In the Deltek Software Manager logon dialog box, enter your Deltek Customer Care User ID and Password, and click Logon.
3. To select the folder where you want to download Deltek products, click Settings above the right pane of Deltek Software Manager.

Note: When you log on for the first time, Deltek Software Manager asks you to select a default folder where Deltek products are to be downloaded.

4. Use the Settings dialog box to specify the folder where you want to download Deltek products, and click OK.

Note: You can change this folder anytime in the Settings dialog box.

5. In the left pane of Deltek Software Manager, expand the Deltek product that you want to download, if it is not already expanded.

Note: If you clicked the link in step 1 to access DSM, the application automatically selects Maconomy iAccess for you.

6. Select the product type that you want to download. Your options are Complete, HotFix, and Sub-Release.

7. In the table, select the check box that corresponds to the Deltek product that

you want to download. The right pane displays a message stating that the product has been added to the download queue. To view the items in the download queue, click View Download Queue at the bottom of the left pane.

8. Click Download at the bottom of the left pane. Deltek Software Manager downloads the product to the folder that you selected.

Accessing DSM from within the Customer Care Connect Site

To access Deltek Software Manager from within the Customer Care Connect site, complete the following steps:

1. In your Web browser, go to <http://support.deltek.com>.
2. Enter your Customer Care Connect Username and Password, and click Log In.
3. When the Customer Care Connect site displays, click the Product Downloads tab. You are automatically logged into Deltek Software Manager.
4. To select the folder where you want to download Deltek products, click Settings above the right pane of Deltek Software Manager.

Note: When you log on for the first time, Deltek Software Manager asks you to select a default folder where Deltek products are to be downloaded.

5. Use the Settings dialog box to specify the folder where you want to download Deltek products, and click OK.

Note: You can change this folder anytime in the Settings dialog box.

6. In the left pane of Deltek Software Manager, expand the Deltek product that you want to download, if it is not already expanded.
7. Select the product type that you want to download. Your options are Complete, HotFix, and Sub-Release.
8. In the table, select the check box that corresponds to the Deltek product that you want to download. The right pane displays a message stating that the product has been added to the download queue.

Note: To view the items in the download queue, click View Download Queue at the bottom of the left pane.

9. Click Download at the bottom of the left pane. Deltek Software Manager downloads the product to the folder that you selected.

DSM Documentation and Troubleshooting

To view the online help for Deltek Software Manager, navigate to:

<https://dsm.deltek.com/DeltekSoftwareManager/Help/>

To view a tutorial on how to use Deltek Software Manager, navigate to:

<https://dsm.deltek.com/DeltekSoftwareManager/Tutorial/PubData/Eng>

To view more information on troubleshooting Deltek Software Manager, navigate to:

https://deltek.custhelp.com/app/answers/detail/a_id/52469

Note: The preceding troubleshooting link only works if you are logged in to Deltek Customer Care Connect.

Extension

Note to the Reader The Extension model has changed significantly from iAccess version 1 to version 2. This section describes key parts of the iAccess 2 extension facilities. However, it is not complete and should be

considered *Work in Progress*. If you are unable to find what you are looking for here, we recommend posting a question to the Engineering team through our “iAccess for Maconomy” Deltek Collaboration space (<https://collaborate.deltekfirst.com/#!/projects/129727>). We will reply there and take note of your questions, feedback, and comments for future iterations of this section.

This section describes how to make client-side iAccess extensions using built-in extension facilities as well as tooling provided by the Maconomy Extender. Client-side extensions cover authentication methods, preferred settings, menu customization, and updates to existing workspaces/addition of new workspaces. The primary goal of iAccess extensions is to customize the appearance of Maconomy functionality when leveraged over a Web user interface. If you need to make fundamental changes such as extending core business logic and adding new fields and actions, use the Java extension framework to create server-side extensions. While the two extension approaches can be used together, it is important to note that the purpose of client-side extensions is to change how Maconomy functionality is rendered, not how it works.

The iAccess runtime is essentially version-independent. It runs on different Maconomy backends and service pack ranges. On the other hand, the iAccess applications are tied to specific Maconomy backends or applications (that is, Application Packaging Units or *APUs*). If you install a specific iAccess FPU, it will look and act differently depending on which Maconomy version you are running in the backend. This approach is necessary since different Maconomy versions expose different containers, fields, actions, system parameters, and backend extension capabilities.

When developing new iAccess extensions or upgrading existing ones, you must take note of what the target Maconomy backend is because this restricts what containers, actions, fields, and so on, are available. The iAccess FPU contains different applications, each compatible with a specific range of service packs on a given major Maconomy version. You must also look at the iAccess API version that the given iAccess FPU exposes. The API version determines the kinds of extension

possibilities available and their properties.

Both the iAccess application version and the API version are specified in the root of the iAccess configuration files, specifically in the `application.json` file. In the following example, the iAccess application is called `17` and the current version is `1.0.2`. The FPU manifest describes the backend Maconomy versions compatible with this application. This sample configuration complies with version `8.0.0` of the iAccess runtime API.

```
{
  "api": "8.0.0",
  "application": {
    "name": "17",
    "version": "1.0.2"
  },
  "authentication": {
    "$ref": "Authentication:Authentication"
  },
  "platform": {
    "$ref": "Platform:Platform"
  },
  "shell": {
    "$ref": "Shell:Shell"
  },
  "workspace": {
    "$ref": "Workspace:Workspace"
  }
}
```

The remainder of this file consists of JSON references to the four main iAccess areas:

- Authentication - Configuration of available and preferred login methods.
- Platform - Configuration and tweaking of low-level iAccess runtime mechanics.
- Shell - Configuration of the sidebar menu, notifications, and preferences.

- Workspace - Configuration of workspaces and their layouts.

The following subsections describe these areas in greater detail.

A Note about iAccess Configuration Files

iAccess configurations use the JSON format, a standard notation similar to XML. During runtime, iAccess requests a single configuration file describing all extensions (standard or custom). This file is called `application.json` and is retrieved through the `configurations` end point in the REST API. In the iAccess source configuration files, the notation (see the following example)

```
{
  "$ref": "Authentication:Authentication"
}
```

is a heavily used modularization technique. The JSON object is replaced (or macro expanded) by the `Authentication.json` configuration file located in the `Authentication` folder.

When the iAccess configuration files are processed by the REST API, all JSON properties with the prefix `T$` are translated to the language utilized by the end-user. For example, if an iAccess source configuration file has the following contents:

```
{
  "T$title": "Hello World"
}
```

then a Spanish user receives the following content in his/her browser:

```
{
  "title": "Hola mundo"
}
```

The translation relies on standard Maconomy dictionaries. It only works if a dictionary containing the required terms exists in the chosen language.

Authentication

The *authentication* part is the first main area of iAccess extension. It specifies the authentication methods available to end-users when they log in to iAccess. How you configure authentication determines the screen end-users see when they first visit the iAccess web page. For a sample configuration, refer to the following text:

```
{
  "preferred": "maconomy",
  "methods": {
    "maconomy": {
      "enabled": true
    },
    "domain": {
      "enabled": true
    },
    "sso": {
      "enabled": true
    },
    "azure": {
      "enabled": true
    }
  }
}
```

Although this is probably the simplest area in terms of iAccess configuration, authentication is often hard to get right in actual installations. As an installation consultant, you must focus on setting up the right infrastructure and specifying a

corresponding *preferred* authentication method. The preferred method determines how iAccess will redirect the browser for the user accessing the root URL (for example: /) If you specify *maconomy* as preferred, iAccess will redirect the browser to the /maconomy URL so the user can enter login credentials there.

iAccess currently supports four different authentication methods:

Maconomy : A standard Maconomy login page where the user can enter his/her username and password.

Domain : A domain login page where the user can enter domain, username, and password.

SSO : Single Sign-On using Kerberos authentication and the SPNEGO protocol [@rfc4178; @rfc4559] which takes the user past the login screen and directly into the application. If the login fails, the user is redirected to the domain login page as a fallback.

Azure : Single Sign-On using Azure which takes the user through the Azure login flow. This flow varies depending on the customer's setup. To force account selection during the Azure login flow, the user can opt to append `prompt=select_account` to the iAccess URL as an extra query parameter.

If you disable an authentication method, you also disable the iAccess URL associated with that login method. Deltek recommends that only required authentication methods are left enabled on production installations.

Subcontractor Login

It makes sense for a company with different types of users sharing an iAccess installation to employ more than one authentication method. For example, a company with domain login configured for its employees will need a different method for subcontractors who are not allowed on the domain. In this case, the company can provide Maconomy credentials for its subcontractors. The company can then choose domain login as its preferred authentication method on the system, but instruct its subcontractors to log in to iAccess using the /maconomy URL which leads directly to the Maconomy login page. The suggested configuration

URL which leads directly to the maconomy login page. The suggested configuration for this is as follows:

```
{
  "preferred": "domain",
  "methods": {
    "maconomy": {
      "enabled": true
    },
    "domain": {
      "enabled": true
    },
    "sso": {
      "enabled": false
    },
    "azure": {
      "enabled": false
    }
  }
}
```

Platform

The second main area of iAccess extension is the *platform* part which specifies various low-level iAccess behaviors. You can find the default configuration of the platform part in the `Platform.json` file:

```
{
  "usageTracking": {
    "$ref": "Usagetracking"
  },
  "containers": {
    "$ref": "Containers"
  }
}
```

```

    "$ref": "#Containers"
  },
  "typeAhead": {
    "$ref": "Typeahead"
  }
}

```

Usage Tracking

The *usage tracking* part concerns the integration between iAccess and Google Analytics. This feature was also present in iAccess version 1 and is used to track page views, events, errors, and other usage data about end-users. You can acquire your own tracking ID directly from Google, and add it to the configuration so you can collect usage data about an iAccess installation. In the following excerpt, the Google Analytics tracking ID `UA-123456789-1` is added to the standard configuration:

```

{
  "enabled": true,
  "endUserOptIn": true,
  "trackingId": "UA-123456789-1"
}

```

The two mandatory properties, `enabled` and `enduserOptIn`, are used to (1) enable/disable tracking completely and (2) show/hide the cookie consent banner. If tracking is disabled, then iAccess still creates cookies in the browser but performs no actual tracking. If the end-user opt-in is disabled, then users are not presented with a banner informing them of tracking.

Containers

The *containers* part is active and is a new feature introduced in iAccess version 2. The containers configuration allows consultants to supply additional metadata

about REST API containers. This is necessary because the specification of containers that we get through the `containers` endpoint only describes a subset of the semantics of the backend. The configuration format follows a very simple convention: it is an object with properties matching the container names from the REST API. You can add information about each container's various aspects, and the iAccess runtime will then adapt to this new data.

Singleton Containers

Maconomy makes a special distinction between normal and *singleton* containers. Whereas normal containers represent collections of resources, singleton containers always represent a single resource. This leads to a slightly different navigation interface in the REST API. Only very few containers are singletons, and these are not specifically identified by the REST API. However, since some of these are very prominent for most users, iAccess allows the consultant to add information about singletons in the containers configuration.

```
{
  "TimeRegistration": {
    "card": {
      "singleton": {
        "DateVar": "card.datevar",
        "EmployeeNumberVar": "card.employeenumbervar"
      }
    }
  }
}
```

The preceding excerpt specifies *TimeRegistration* as a singleton container. *DateVar* and *EmployeeNumberVar* are used when navigating with this container. Singleton properties on the right side refer to internal names used by the REST API when navigating this container.

File Actions

Another feature of the containers configuration is the ability to add information about file actions. The REST API supports actions for uploading files. However, it does not specify which ones are actually file actions. This information is important since the protocols for dealing with file actions are different from those for normal actions, both in the iAccess runtime and in terms of messages exchanged between the browser and the REST API.

```
{
  "ExpenseSheets": {
    "card": {
      "actions": {
        "AttachDocument": {
          "attachments": {
            "required": true,
            "allowMultipleAttachments": true
          }
        }
      }
    },
    "table": {
      "actions": {
        "AttachDocumentToLine": {
          "attachments": {
            "required": true,
            "allowMultipleAttachments": false
          }
        }
      }
    }
  }
}
```

The preceding configuration specifies that the *AttachDocument* action on the *ExpenseSheets* card pane and the *AttachDocumentToLine* action on the

corresponding table pane are file actions. Both require an attached file, but they differ in the number of files they allow as attachments.

Action Parameters

Some Maconomy actions require certain variables to have a particular value when executed. The REST API does not specify these variables, so iAccess can add this information as so-called *parameters* in the container configuration. In the following example, the *ApproveAbsenceEntry* action on the card pane of the *AbsenceEntryOverview* container is configured to require four variables as parameters, namely: *EntryDateVar*, *ValidTillVar*, *NumberOfDaysVar*, and *ReasonVar*.

```
"AbsenceEntryOverview": {
  "card": {
    "actions": {
      "ApproveAbsenceEntry": {
        "parameters": {
          "EntryDateVar": "card.entrydatevar",
          "ValidTillVar": "card.validtillvar",
          "NumberOfDaysVar": "card.numberofdaysvar",
          "ReasonVar": "card.reasonvar"
        }
      }
    }
  }
}
```

Filter-As-Table Panes

Standard Maconomy containers have at least one of the following pane types: card, table, and filter. iAccess 2 includes a new special type called *Filter as Table* which is handled purely on the client-side. This pane type allows consultants to render a standard filter pane as a table pane. In general, filters are read-only whereas tables are editable. When using a filter as a table, the currently selected record is actually

the corresponding card pane record. This makes the filter appear as an editable table, although it takes a bit longer to respond since iAccess has to load the corresponding card record whenever the user selects a filter row.

```
"AbsenceEntryOverview": {
  "filterAsTable": {
    "fields": {
      "RelatedEntryValidTill": {
        "immutable": true
      },
      "EmployeeName1": {
        "mapsTo": "EmployeeNameVar"
      }
    }
  }
}
```

To make a filter pane available as a table, you may need to add additional field specifications in the containers configuration file. In the preceding example, two changes are added. First, the *RelatedEntryValidTill* field is specified as immutable. This is a performance optimization which states that this field will not change its value when its card record is edited. This means that iAccess does not need to reread the field when a user edits the card record. Second, the *EmployeeName1* field is mapped to the *EmployeeNameVar* field. This is necessary in cases where an underlying database column has different field names depending on whether it is shown in the filter or in the card. The `mapsTo` attribute allows iAccess to link these two fields.

Configuration Attributes for Controlling Caching of New Record Data

When a new card or table record is created, iAccess sends a request to the server to obtain default values for the new record. By default, these values are cached for all containers. iAccess 2.4.1 introduces a configuration setting that you can use to disable caching for a specific container.

For example, to disable caching of new record data for both the card and the table panes of the ExpenseSheets container, add the following attributes to the Containers.json file:

```
{
  "ExpenseSheets": {
    "card": {
      "cacheInitResponse": false,
      ...
    },
    "table": {
      "cacheInitResponse": false,
      ...
    }
  },
  ...
}
```

Type Ahead

Type Ahead is a feature available in table panes which lets the user perform changes, such as adding, editing and deleting lines, or running line actions, without having to wait for a server response after each action. The requested changes are queued and executed in the background.

In some cases, it might be desirable to disable this functionality, or to control how many uncommitted changes a user is able to make. This can be configured using the attributes available in the Typeahead.json file.

Shell

The *shell* part is the third main area of iAccess extension and this refers to the part

The `error` part is the third main area of iAccess extension, and this refers to the part of the application that surrounds the workspace area after the user logs in. The core configuration covers the sidebar menu as well as the documentation URL, settings, and notifications in the top-right corner.

```
{
  "menu": {
    "$ref": "Menu"
  },
  "documentationUrl": "https://help.deltek.com/Product/MaconomyiA
  "settings": {
    "$ref": "Settings"
  },
  "notifications": {
    "$ref": "Notifications"
  }
}
```

Menu

The sidebar menu is configured in the `Menu.json` file. The *workspace* part of the iAccess configuration contains the total list of available workspaces. The menu is a subset of these workspaces, ordered in groups. There is no limit to the number of groups nor the number of workspaces within a group. iAccess does not allow the use of nested groups, so avoid adding too many groups and workspaces to the menu. Doing so clutters the user interface and makes navigation difficult for the user.

```
{
  "groups": [
    {
      "Title": "Self Service",
      "items": [
        {
```

```

        {
            "workspace": "WeeklyTimeSheets"
        },
        ...
    ]
},
...
]
}

```

Groups have a `title` property and a list of items. Each item represents either a concrete workspace or a hyperlink. You can assign a title to a specific workspace. The `workspace` property refers to the internal name of the workspace as declared in [the *workspace* part of the iAccess configuration](#). On the other hand, hyperlinks are composed of a title and a URL. Placing hyperlinks in the menu is convenient if access to third-party systems is required.

Groups, workspaces, and hyperlinks have an optional `visible` property which determines their visibility. To specify this property, you must use an expression. The following example shows an excerpt of a menu where the *Employee Information* workspace is only visible to users with either the Project Manager or HR Manager role. When specifying a role name.

```

{
    "T$title": "Employee Information",
    "workspace": "EmployeeInformation"
    "visible": "hasRole('ProjectManager', 'HRManager')"
}

```

Documentation URL

The documentation URL is a simple hyperlink to external documentation. It is rendered as a question mark in the top-right corner of the screen. By default, it points to the standard hosted help from Deltek. It is version-specific because the

`<version>` placeholder is substituted with the iAccess version at runtime.

Customers who prefer to use their own external documentation (such as a page on an internal Sharepoint site) can simply replace the URL here.

Settings

Settings concern iAccess language and formatting. Select the language used in iAccess from the dictionaries installed on the Maconomy server. To further filter the server list of languages, you can use the `couplingconfiguration.mcs1.xml` file found in the 'Definitions' folder on the server.

Aside from specifying the preferred language, you need to configure the `fixed` flag which states whether the user can change the language used. If you set the `fixed` flag to 'false', the user can change the language on the login screen and in the settings dialog inside iAccess. If you set the `fixed` flag to 'true', make sure the preferred language is actually available from the server. In other words, the iAccess language configuration must be aligned with the set of dictionaries installed on the server and with any filters defined in the *MCSL* specification.

Default data formatting is location-specific. This format controls rendering of dates, as well as the decimal separator and digit grouping used. You can edit the preferred location and the settings for that location. You also have the option to assign formatting to a specific location by using the `fixed` property. The following example shows the `preferred` and `fixed` properties in use, as well as a single location configured with a date format, a decimal separator, and a digit grouping system.

```
{
  "preferred": "da_DK",
  "fixed": false,
  "available": {
    "da_DK": {
      "date": {
        "short": "dd/MM/y"
```

```

    },
    "symbol": {
      "decimal": ",",
      "group": "."
    }
  },
  ...
}

```

You can also configure the optional `minutesThreshold` property, which determines whether a time entry is interpreted as minutes or hours. The default value is '10', which means that an entry of '10' is interpreted as 10 minutes, and an entry of '11' is interpreted as 11 hours.

Notifications

Use the `recalculation` object to configure how often iAccess retrieves the notifications computed on the server. Specifically, you can use the `interval` property to configure how often iAccess should request the recalculation of a specific user's notifications. You can also set the `initialDelay` property to configure when iAccess should start the recalculation after the user logs in. Both of these properties are specified in minutes. If you make the recalculation interval too short, you risk causing a serious system-wide performance degradation.

```

{
  "recalculation": {
    "initialDelay": 30,
    "interval": 30
  }
}

```

Customization Procedures

Create a Menu Group

You can create a menu group, and move specific menu items into this group.

To create a menu group:

1. In the **Standard and Solution Files Filter Search** field, type the Menu.json filename. You can also specify the file path (that is: Web >> iaccess >> [iAccess version] >> shell >> menu.json).
2. In the search results, double-click the Menu.json file for the iAccess version you want to customize. The Extender opens the Menu.json file.
3. Click the **Copy selected file as extension to active project** icon.
4. In the Menu.json file, look for the "groups" property. You create menu groups under this property. For example, if you want to create a menu group for workspaces used by Time and Expense users, edit the code as follows:

From

```
{
  "groups": [
    {
      "T$title": "Self Service",
      "items": [
        {
          "T$title": "Weekly Time Sheet",
          "workspace": "WeeklyTimeSheets"
        },
        ...
      ]
    },
  ],
}
```

To

```
{
  "groups": [
    {
      "T$title": "Time & Expense",
      "items": [

      ]
    }
    {
      "T$title": "Self Service",
      "items": [
        {
          "T$title": "Weekly Time Sheet",
          "workspace": "WeeklyTimeSheets"
        },
        ...
      ]
    },
  ],
}
```

5. Select the code for all the workspaces you want to move into the new group. Make sure you include the braces for each workspace object.

```
{
  "T$title": "Weekly Time Sheet",
  "workspace": "WeeklyTimeSheets"
},
```

For this example, select the code for the following workspaces: Weekly Time Sheets, Daily Time Sheets, Expenses, Mileage, Favorites, Absence, and Purchase Orders.

6. Cut and paste the selected code inside the brackets of the "items" property in the new menu group you created.

For this example, the code for the new menu group should now read:

```
{
  "groups": [
    {
      "T$title": "Time & Expense",
      "items": [
        {
          "T$title": "Weekly Time Sheet",
          "workspace": "WeeklyTimeSheets"
        },
        {
          "T$title": "Daily Time Sheet",
          "workspace": "DailyTimeSheets"
        },
        {
          "T$title": "Expenses",
          "workspace": "ExpenseSheets"
        },
        {
          "T$title": "Mileage",
          "workspace": "MileageSheets"
        },
        {
          "T$title": "Favorites",
          "workspace": "Favorites"
        },
        {
          "T$title": "Absence",
          "workspace": "Absence"
        },
        {
          "T$title": "Purchase Orders",
          "workspace": "PurchaseOrders"
        }
      ]
    }
  ]
}
```

```

    }
  ]
}

```

7. Click the **Save** icon.
8. To deploy your changes, click the **Commit and Push changes to Server Repository** icon.
9. In the window that displays:
 - a. Fill out the **Commit message** field with the details of your customization.
 - b. You can select the **Deploy immediately** check box.
 - c. Click **OK**.

The Extender pushes your changes to the server repository, and displays a progress bar.

10. In the Deployment success message that displays, click **OK**.
11. To view your changes:
 - a. Pull up the browser window with your open iAccess system.
 - b. Hold down the CTRL key, and click **Refresh**.

Restrict Access to a Menu Group

You can restrict access to a menu group such that it is only visible to users with specific roles.

To restrict access to a menu group:

1. In the **Standard and Solution Files Filter Search** field, type the Menu.json filename. You can also specify the file path (that is: Web >> iaccess >> [iAccess version] >> shell >> menu.json).
2. In the search results, double-click the Menu.json file for the iAccess version you want to customize. The Extender opens the Menu.json file.

3. Click the **Copy selected file as extension to active project** icon.
4. In the Menu.json file, scroll down to the menu group to which you want to restrict access.
5. Add a visible property to this menu group. For example, if you want to restrict access to a newly created Time and Expense menu group such that only users assigned to specific roles can view the workspaces under the group, edit the code as follows:

From

```
"groups": [  
  {  
    "T$title": "Time & Expense",  
    "items": [  
      {  
        "T$title": "Weekly Time Sheet",  
        "workspace": "WeeklyTimeSheets"  
      },  
    ],  
  },  
]
```

To

```
"groups": [  
  {  
    "T$title": "Time & Expense",  
    "visible": "hasRole('iAccess T&E', 'iAccess Manager')",  
    "items": [  
      {  
        "T$title": "Weekly Time Sheet",  
        "workspace": "WeeklyTimeSheets"  
      },  
    ],  
  },  
]
```

Note: Roles refer to window groups you set up in the Workspace Client.

6. Click the **Save** icon.
7. To deploy your changes, click the **Commit and Push changes to Server Repository** icon.
8. In the window that displays:
 - a. Fill out the **Commit message** field with the details of your customization.
 - b. You can select the **Deploy immediately** check box.
 - c. Click **OK**.

The Extender pushes your changes to the server repository, and displays a progress bar.
9. In the Deployment success message that displays, click **OK**.
10. To view your changes:
 - a. Pull up the browser window with your open iAccess system.
 - b. Log out, then log in again.

Remove a Menu Item

To remove a menu item:

1. In the **Standard and Solution Files Filter Search** field, type the Menu.json filename. You can also specify the file path (that is: Web >> iaccess >> [iAccess version] >> shell >> menu.json).
2. In the search results, double-click the Menu.json file for the iAccess version you want to customize. The Extender opens the Menu.json file.
3. Click the **Copy selected file as extension to active project** icon.
4. In the Menu.json file, delete the workspace from the list. Make sure you also delete the braces before and after the workspace object.

For example, if you want to remove the Weekly Time Sheets menu item, edit the code as follows:

From

```
"T$title": "Self Service",
"items": [
  {
    "workspace": "WeeklyTimeSheets"
  },
  {
    "workspace": "DailyTimeSheets"
  },

```

To

```
"T$title": "Self Service",
"items": [
  {
    "workspace": "DailyTimeSheets"
  },

```

5. Click the **Save** icon.
6. To deploy your changes, click the **Commit and Push changes to Server Repository** icon.
7. In the window that displays:
 - a. Fill out the **Commit message** field with the details of your customization.
 - b. You can select the **Deploy immediately** check box.
 - c. Click **OK**.

The Extender pushes your changes to the server repository, and displays a progress bar.

8. In the Deployment success message that displays, click **OK**.
9. To view your changes:

- a. Pull up the browser window with your open iAccess system.
- b. Hold down the CTRL key, and click **Refresh**.

Rename a Menu Item

To rename a menu item:

1. In the **Standard and Solution Files Filter Search** field, type the Menu.json filename. You can also specify the file path (that is: Web >> iaccess >> [iAccess version] >> shell >> menu.json).
2. In the search results, double-click the Menu.json file for the iAccess version you want to customize. The Extender opens the Menu.json file.
3. Click the **Copy selected file as extension to active project** icon.
4. In the Menu.json file, add a "T\$title" property to the workspace object you want to rename. For example, if you want to change the name of the Employee Information workspace to "Employee Info", edit the code as follows:

From

```
{
  "workspace": "EmployeeSelfService"
},
{
  "workspace": "EmployeeInformation"
},
```

To

```
{
  "workspace": "EmployeeSelfService"
},
{
```

```
"T$title": "Employee Info",
"workspace": "EmployeeInformation"
},
```

5. Click the **Save** icon.
6. To deploy your changes, click the **Commit and Push changes to Server Repository** icon.
7. In the window that displays:
 - a. Fill out the **Commit message** field with the details of your customization.
 - b. You can select the **Deploy immediately** check box.
 - c. Click **OK**.

The Extender pushes your changes to the server repository, and displays a progress bar.
8. In the Deployment success message that displays, click **OK**.
9. To view your changes:
 - a. Pull up the browser window with your open iAccess system.
 - b. Hold down the CTRL key, and click **Refresh**.

Customize a Search Filter Name

You can rename the search filters found in some workspaces.

To customize a search filter name:

1. In the **Standard and Solution Files Filter Search** field, type the name of the heading.json file for the workspace that you want to customize. You can also specify the file path. For example, if you want to rename the **My Open** search filter found in the Expenses workspace, search for the ExpenseSheets_Heading.json file, or specify the following file path: Web >> iaccess >> [iAccess version] >> workspace >> EmployeeSelfService >> ExpenseSheets >> ExpenseSheets_Heading.json.

2. In the search results, double-click the heading.json file for the iAccess version you want to customize. The Extender opens the heading.json file.
3. Click the **Copy selected file as extension to active project** icon.
4. In the heading.json file, scroll to the "selection" property. Under this, the "options" property lists the available search filters for a workspace.
5. Edit the "T\$title" property for the search filter you want to rename. For example, if you want to rename the **My Open** search filter, edit the code as follows:

From

```
"options": {  
  "MyOpenExpenseSheets": {  
    "T$title": "My Open",  
    "restriction": "not FullyApproved and EmployeeNumber = employ  
  }
```

To

```
"options": {  
  "MyOpenExpenseSheets": {  
    "T$title": "My Open Expenses",  
    "restriction": "not FullyApproved and EmployeeNumber = employ  
  }
```

6. Click the **Save** icon.
7. To deploy your changes, click the **Commit and Push changes to Server Repository** icon.
8. In the window that displays:
 - a. Fill out the **Commit message** field with the details of your customization. b.

You can select the **Deploy immediately** check box. c. Click **OK**.

The Extender pushes your changes to the server repository, and displays a progress bar.

9. In the Deployment success message that displays, click **OK**.

10. To view your changes:

a. Pull up the browser window with your open iAccess system. b. Hold down the CTRL key, and click **Refresh**.

Workspace

The *workspace* part is the fourth main area of iAccess extension. It specifies the structure and layout for all workspaces available in iAccess. This part represents the majority of iAccess extension capabilities, since end-users spend most of their time in the workspaces. It has two components: a set of workspaces, and a set of global definitions.

```
{
  "workspaces": {
    "Absence": {
      "$ref": "EmployeeSelfService:AbsenceMgmt"
    },
    ...
  },
  "definitions": {
    "$ref": "GlobalDefinitions"
  }
}
```

In the `Workspace.json` file (as shown in the preceding example), the `workspaces` property is a map of all embedded workspaces, and includes the

entire collection of workspaces. The sidebar menu is a subset of this collection.

The `definitions` property specifies a set of named styles that can be used across workspaces.

Each workspace has a unique name that serves as its internal identifier and an external, localizable title. The contents of a workspace has two main parts: the data bindings and the layout (as shown in the following example). The data bindings is a configuration of the Maconomy containers that provide data for the workspace. These containers are bound together in a tree, similar to how workspace definitions (*MWSL* specifications) are done for the Workspace Client. On the other hand, the layout is a configuration of how this tree of Maconomy containers is rendered to the end-user. This corresponds roughly to dialog layouts (*MDML* specifications) for the Workspace Client. The following subsections discuss data bindings and layouts in greater detail.

```
{
  "name": "ExpenseSheets",
  "T$title": "Expenses",
  "dataBindings": {
    ...
  },
  "layout": {
    ...
  }
}
```

Data Bindings

Customization Procedures

Rename a Card Action

iAccess has several actions available in the card part of each workspace. You can customize the names of most of these actions.

To rename a card action:

1. In the **Standard and Solution Files Filter Search** field, type the name of the **ActionBar.json** file that corresponds to the workspace you want to customize. You can also specify the file path. For example, if you want to rename the **Submit** action in the card part of the Expenses workspace, search for the **ExpenseSheets_ActionBar.json** file, or specify the following file path: Web >> iaccess >> [iAccess version] >> workspace >> EmployeeSelfService >> ExpenseSheets >> ExpenseSheets_ActionBar.json.
2. In the search results, double-click the **ActionBar.json** file for the iAccess version you want to customize. The Extender opens the **ActionBar.json** file.
3. Click the **Copy selected file as extension to active project** icon.
4. In the **ActionBar.json** file, scroll to the instance of the "actions" property that contains the action you want to rename. This property lists the actions that you are allowed to customize.
5. Edit the "T\$title" property for the action you want to rename. For example, if you want to rename the **Submit** action, edit the code as follows:

From

```
"actions": [
```

```
{
  "T$title": "Submit",
  "source": "SubmitExpenseSheet"
},
```

To

```
"actions": [
  {
    "T$title": "Submit My Expense",
    "source": "SubmitExpenseSheet"
  },
```

6. Click the **Save** icon.
7. To deploy your changes, click the **Commit and Push changes to Server Repository** icon.
8. In the window that displays:
 - a. Fill out the **Commit message** field with the details of your customization. b. You can select the **Deploy immediately** check box. c. Click **OK**.

The Extender pushes your changes to the server repository, and displays a progress bar.

9. In the Deployment success message that displays, click **OK**.
10. To view your changes:
 - a. Pull up the browser window with your open iAccess system. b. Hold down the CTRL key, and click **Refresh**.

Rename a Field

To rename a field:

1. In the **Standard and Solution Files Filter Search** field, type the name of .json file for the part of the workspace that contains the field you want to rename. You can also specify the file path. For example, if you want to rename the **Total Amount** field found in the card part of the Expenses workspace, search for the ExpenseSheets_Card_Row.json file, or specify the following file path: Web >> iaccess >> [iAccess version] >> workspace >> EmployeeSelfService >> ExpenseSheets >> ExpenseSheets_Card_Row.json.
2. In the search results, double-click the .json file for the iAccess version you want to customize. The Extender opens the .json file.
3. Click the **Copy selected file as extension to active project** icon.
4. In the .json file, scroll down to the "column" property for the column that contains the field you want to rename.
5. Edit the "T\$title" property for the field you want to rename. For example, to change the name of the **Total Amount** field to **Full Amount**, edit the code as follows:

From

```
"unitField": {
  "T$title": "Total Amount",
  "source": "AmountBase",
```

To

```
"unitField": {
  "T$title": "Full Amount",
  "source": "AmountBase",
```

6. Click the **Save** icon.

7. To deploy your changes, click the **Commit and Push changes to Server Repository** icon.
8. In the window that displays:
 - a. Fill out the **Commit message** field with the details of your customization.
 - b. You can select the **Deploy immediately** check box.
 - c. Click **OK**.

The Extender pushes your changes to the server repository, and displays a progress bar.
9. In the Deployment success message that displays, click **OK**.
10. To view your changes:
 - a. Pull up the browser window with your open iAccess system.
 - b. Hold down the CTRL key, and click **Refresh**.

API Reference

The following section gives an overview of all parts of the configuration API. Each configuration part consists of a JSON object with a set of properties.

Application

The application name and version.

Properties: [version](#)

version

The version of this particular application. This version number is NOT related to core Maconomy versions.

Type	Required	Default Value
string	true	<i>n/a</i>

AuthenticationType

Representation of available methods of logging in to iAccess.

Azure

No description available

Properties: enabled

enabled

No description available

Type	Required	Default Value
boolean	true	<i>n/a</i>

Configuration API

The core application configuration is split into four main areas: authentication,

platform, shell, and workspace. The entire configuration has an API version used to guarantee compatibility and enforce upgrades. Finally, the configuration includes a dictionary of the static terms embedded in iAccess. These terms are localized before the client receives the configuration from the REST API.

Properties: api, application, authentication, platform, shell, workspace

api

The version of the configuration format that this representation conforms to. Versions follow the SemVer standard.

Type	Required	Default Value
string	true	<i>n/a</i>

application

The application name and version.

Type	Required	Default Value
<u>Application</u>	true	<i>n/a</i>

authentication

Authentication determines preferred login mechanism as well as general configuration of the login flow.

Type	Required	Default Value
------	----------	---------------

Type	Required	Default Value
<u>IAuthenticationConfiguration</u>	true	n/a

platform

General configuration that spans the entire application

Type	Required	Default Value
<u>IPlatformConfiguration</u>	true	n/a

shell

The application shell covers the menu, documentation, notifications and auxiliary features such as settings, change password and about information.

Type	Required	Default Value
<u>IShellConfiguration</u>	true	n/a

workspace

Configuration of general properties that span all workspaces as well as configuration of individual workspaces in terms of data bindings and layouts.

Type	Required	Default Value
<u>IWorkspaceConfiguration</u>	true	n/a

EmployeeConfiguration

true

n/a

Domain

No description available

Properties: enabled

enabled

No description available

Type	Required	Default Value
boolean	true	n/a

EmployeeLookup

Configuration properties related to looking up employees for mentioning in messages.

Properties: restriction

restriction

An optional restriction to be applied when searching for employees. For example:
"not Blocked" .

Type	Required	Default Value
string	false	<i>n/a</i>

Formatting

Configure formatting rules for data types.

Properties: amount, autotimestamp, boolean, date, enum, integer, real, string, time, timeduration, pp:color, pp:datetime, pp:double, pp:float, pp:guid, pp:integer, pp:string

amount

IAuthenticationConfiguration

Set up authentication schemes.

Properties: [preferred](#), [methods](#)

preferred

The preferred method of performing login. This method determines the entry route when arriving from the bare, default '/' URL.

Type	Required	Default Value
AuthenticationType	true	<i>n/a</i>

methods

Used to disable/enable individual login methods.

Type	Required	Default Value
------	----------	---------------

Methods

IBooleanFormatting

No description available

IConversationConfiguration

Configuration of the conversation functionality.

Properties: enabled, refreshInterval, employeeLookup, conversationTypes

enabled

Determines if the conversation functionality is enabled in iAccess. For example:

"true" .

Type**Required****Default Value**

Type	Required	Default Value
string	true	n/a

refreshInterval

The refresh interval in seconds. The list of unread messages in the message center component is automatically refreshed once per this time interval. For example: 60 indicates that the refresh happens every minute.

Type	Required	Default Value
number	true	n/a

employeeLookup

Configuration properties related to looking up employees for mentioning in messages.

Type	Required	Default Value
<u>EmployeeLookup</u>	false	n/a

conversationTypes

A mapping between conversation types and workspaces supporting these conversations. This mapping is used by the message center to open a workspace associated with a conversation, and to navigate to a record to which the conversation is attached.

Type	Required	Default Value
string -> IConversationType	true	<i>n/a</i>

IConversationType

No description available

Properties: [workspace](#), [parameters](#)

workspace

The name of the target workspace for the conversation type.

Type	Required	Default Value
string	true	<i>n/a</i>

parameters

A map of url parameters for the workspace linking to primary keys of the object attached to the conversation.

Type	Required	Default Value
string -> string	false	<i>n/a</i>

IDateFormatting

No description available

IEnumFormatting

No description available

IFormats

No description available

Properties: preferred, fixed, available

preferred

No description available

Type	Required	Default Value
string	false	<i>n/a</i>

fixed

No description available

Type	Required	Default Value
boolean	false	<i>n/a</i>

available

No description available

Type	Required	Default Value
<u>IAvailableFormats</u>	true	<i>n/a</i>

IGlobalDefinitions

Definitions are used to share common referable concepts and items across different workspaces and areas of iAccess.

Properties: css, infoBubbles, sizes, styles, colors, tables, searchLayouts

CSS

Predefined CSS that can be referred and used across all workspaces.

Type	Required	Default Value
string -> <i>unknown</i>	true	<i>n/a</i>

infoBubbles

Info-bubbles that can be used across all workspaces.

Type	Required	Default Value
string -> <u>IReusableInfoBubbleDefinition</u>	true	<i>n/a</i>

sizes

Mapping between symbolic names to pixel width.

Type	Required	Default Value
<u>Sizes</u>	true	<i>n/a</i>

styles

Reusable style definitions that can be applied across all workspaces.

Type	Required	Default Value
string -> <i>unknown</i>	true	<i>n/a</i>

colors

Reusable colors used across different workspaces

Type	Required	Default Value
string -> string	true	<i>n/a</i>

tables

Global configuration for tables *

Type	Required	Default Value
<u>ITableProperties</u>	true	<i>n/a</i>

searchLayouts

Layouts used for performing different kinds of searches across all workspaces.

Type	Required	Default Value
<u>IGlobalSearchLayouts</u>	true	<i>n/a</i>

IGlobalSearchLayouts

Represents a hierarchy of search layout configurations. Search layouts are defined per search container where a search will be performed. For example, the field `JobNumber` on a time sheet line is associated with the search container `Find_JobHeader` from the `maconomy` family. Therefore, for searches started

from this field, the search layouts for the `Find_JobHeader` container will be used.

Properties: [containers](#)

containers

No description available

Type	Required	Default Value
array [<i>unknown</i>]	true	<i>n/a</i>

IntegerFormatting

No description available

Properties: [zeroSuppression](#), [short](#), [decimalPlaces](#)

zeroSuppression

True if zero values should be suppressed.

Type	Required	Default Value
boolean	false	<i>n/a</i>

short

No description available

Type	Required	Default Value
<i>unknown</i>	false	<i>n/a</i>

decimalPlaces

No description available

Type	Required	Default Value
number	false	<i>n/a</i>

ILanguageConfiguration

No description available

Properties: preferred, fixed

preferred

The preferred locale, e.g., 'da_DK'

Type	Required	Default Value
string	true	<i>n/a</i>

fixed

True if the language is fixed and cannot be changed by the end-user. This removes the language selector from the both login screen and settings dialog.

Type	Required	Default Value
boolean	true	<i>n/a</i>

IMenu

The menu provides access to the workspaces that are available to the logged-in user. A menu consists of workspaces ordered in groups. Different users may see different sets of menu groups and items depending on the user's privileges and context.

Properties: [restoreLastWorkspace](#), [defaultWorkspace](#), [groups](#)

restoreLastWorkspace

Restore the last used workspace on login.

Type	Required	Default Value
boolean	false	<i>n/a</i>

defaultWorkspace

A prioritized list of candidate default or startup workspaces. On startup, this list is evaluated and the first candidate where the condition is satisfied is chosen as default for the logged-in user.

Type	Required	Default Value
array [<i>unknown</i>]	false	<i>n/a</i>

groups

The set of menu groups available in the menu.

Type	Required	Default Value
array [<u>IMenuGroup</u>]	true	<i>n/a</i>

IMenuGroup

A group of workspaces arranged under a common title

Properties: items, visible, title

items

The workspaces or links contained in this menu group.

Type	Required	Default Value
array [<i>unknown</i>]	false	<i>n/a</i>

`array [UNKNOWN]``false``n/a`

visible

A visibility predicate determining whether this layout part is shown.

Type	Required	Default Value
string	false	<i>n/a</i>

title

An mandatory, localizable title.

Type	Required	Default Value
string	true	<i>n/a</i>

INotificationConfiguration

Represents the configuration of notification reload and recalculation intervals.

Properties: [recalculation](#), [types](#)

recalculation

The recalculation settings determine when the first recalculation of the end-user's notifications occur and what the interval between subsequent recalculations is. All

values are specified in minutes.

Type	Required	Default Value
<u>Recalculation</u>	true	<i>n/a</i>

types

Supported notification types as specified in the MNSL files.

Type	Required	Default Value
string -> <u>INotificationType</u>	true	<i>n/a</i>

INotificationType

No description available

Properties: workspace, parameters

workspace

The name of the workspace

Type	Required	Default Value
string	true	<i>n/a</i>

parameters

A map of url parameters for the workspace linking to the Focus key in question.

Type	Required	Default Value
string -> string	false	<i>n/a</i>

IReusableInfoBubbleDefinition

A definition of a reusable info bubble.

Properties: parameters, width, position, title, subTitle, rows, pane, label

parameters

No description available

Type	Required	Default Value
<u>IReusableInfoBubbleParameters</u>	true	<i>n/a</i>

width

You can optionally specify the width of the Info-bubble: xs: 200 px sm: 300 px md:

400 px lg: 400 px xl: 400 px The default behavior is: 1 column is rendered xs 2 columns is rendered sm >2 columns is rendered md

Type	Required	Default Value
string	false	<i>n/a</i>

position

An optional position of the info bubble. Right is default.

Type	Required	Default Value
string	false	<i>n/a</i>

title

The title or heading of the info bubble

Type	Required	Default Value
<i>unknown</i>	false	<i>n/a</i>

subTitle

The sub heading of the info bubble

Type	Required	Default Value
------	----------	---------------

Type	Required	Default Value
<i>unknown</i>	false	<i>n/a</i>

rows

The rows or content of the info bubble

Type	Required	Default Value
array [<i>unknown</i>]	true	<i>n/a</i>

pane

The pane used to resolve unqualified references in this scope. If unspecified, the parent scope is inherited.

Type	Required	Default Value
string	false	<i>n/a</i>

label

A Name or Identifier to give this component. This may be used when the HTML is generated, when hyperlinks are generated as well as other processes such as automated testing. Please use a value that is completely unique and one which will not require changing at a later date. Doing so may break existing older functionality which relies on the original value you use. Values must not begin with 'dm-' since this is reserved for internal use.

Type	Required	Default Value
string	false	<i>n/a</i>

IReusableInfoBubbleParameters

Defines the parameters for the reusable info bubble.

Properties: [fields](#), [foreignKeys](#)

fields

No description available

Type	Required	Default Value
array [string]	true	<i>n/a</i>

foreignKeys

No description available

Type	Required	Default Value
array [string]	false	<i>n/a</i>

ISettings

Settings represents formats, language, and other end-user configurable properties.

Properties: formats, minutesThreshold, menuSearch, formatting, userInactivityInterval

formats

The formats configuration determines the data formatting as well as whether this can be changed by the end-user.

Type	Required	Default Value
<u>IFormats</u>	true	<i>n/a</i>

minutesThreshold

The minute threshold determines when a time entry is interpreted as minutes or as hours. Default is '10' which means that an entry of '10' will be interpreted as 10 minutes, and an entry of '11' will be interpreted as 11 hours.

Type	Required	Default Value
number	false	<i>n/a</i>

menuSearch

The menuSearch configuration determines if the search component is enabled in

The menuSearch configuration determines if the search component is enabled in the menu

Type	Required	Default Value
boolean	true	<i>n/a</i>

formatting

Configure formatting rules for data types.

Type	Required	Default Value
<u>Formatting</u>	true	<i>n/a</i>

userInactivityInterval

The user inactivity interval in minutes. iAccess will perform certain automatic operations, such as periodically refreshing conversations or notifications, only when the user is active. If the inactivity timeout exceeds the number of minutes specified in this property, then such automatic refresh will be paused.

Type	Required	Default Value
number	false	<i>n/a</i>

IShellConfiguration

The application shell covers the menu, documentation, notifications and auxiliary features such as settings, change password and about information.

Properties: menu, documentationUrl, settings, notifications, conversations

menu

No description available

Type	Required	Default Value
<u>IMenu</u>	true	<i>n/a</i>

documentationUrl

The URL used for hosted help. Can be a simple string with variables such as .

Type	Required	Default Value
string	true	<i>n/a</i>

settings

No description available

Type	Required	Default Value
<u>ISettings</u>	true	<i>n/a</i>

notifications

No description available

<u>INotificationConfiguration</u>	true	<i>n/a</i>

conversations

No description available

Type	Required	Default Value
<u>IConversationConfiguration</u>	true	<i>n/a</i>

IStringFormatting

No description available

ITableProperties

Common table properties.

Properties: columnChooser

columnChooser

Based on the expression you define if a column chooser should be visible on all tables.

Type	Required	Default Value
string	true	<i>n/a</i>

ITimeDurationFormatting

No description available

Properties: type, zeroSuppression

type

No description available

Type	Required	Default Value
string	false	<i>n/a</i>

zeroSuppression

True if zero values should be suppressed.

Type	Required	Default Value
boolean	false	<i>n/a</i>

ITimeFormatting

No description available

Properties: [useDropDownList](#), [step](#)

useDropDownList

Indicates if the time-picker should use a dropdown list or the time-selector wheel. You specify `true` to use the dropdown-list or `false` to use the time-selector wheel. You can also specify a number to indicate at which number of steps the time-picker should change behavior. Default is 96, calculate as $(24 / 1) * (60 / 15)$.

Type	Required	Default Value
<i>unknown</i>	true	<i>n/a</i>

step

Defines the steps to use for the dropdown list or the time-selector wheel.

Type	Required	Default Value
ITimeStep	true	<i>n/a</i>

ITimeStep

Defines the steps to use for the dropdown list or the time-selector wheel.

Properties: hour, minute

hour

No description available

Type	Required	Default Value
number	true	<i>n/a</i>

minute

No description available

Type	Required	Default Value
number	true	<i>n/a</i>

ITypeAheadConfiguration

No description available

Properties: enabled, maximumQueueLength

enabled

This flag enables type-ahead for all workspaces. Default: `true`

Type	Required	Default Value
boolean	false	<i>n/a</i>

maximumQueueLength

The maximum number of operations that can be scheduled for execution. Default: 5

Type	Required	Default Value
number	false	<i>n/a</i>

IUsageTrackingConfiguration

No description available

Properties: enabled, endUserOptIn, trackingId

enabled

This flag enables usage tracking for the entire iAccess installation. Default: `True`

Type	Required	Default Value
boolean	true	<i>n/a</i>

endUserOptIn

This flag enables end-user opt-in notification about usage tracking. When the end-user opts-in, the notification is not shown for a year unless cookies are cleared.

Default: True

Type	Required	Default Value
boolean	true	<i>n/a</i>

trackingId

Google Analytics tracker ID can be provided here for custom tracking of iAccess usage.

Type	Required	Default Value
string	false	<i>n/a</i>

IWorkspaceConfiguration

Representation of both general configuration spanning all workspaces as well as the

setup of data bindings and layout for individual workspaces. A workspace will, however, not appear in iAccess until it is referred from the menu.

Properties: [definitions](#), [workspaces](#)

definitions

Global definitions contain pre-defined colors and other referrable items that span all workspaces. These definitions are used both for convenience and as a way of ensuring a uniform look and feel across all workspaces.

Type	Required	Default Value
IGlobalDefinitions	true	<i>n/a</i>

workspaces

The collection of all workspaces available to iAccess.

Type	Required	Default Value
array [<i>unknown</i>]	true	<i>n/a</i>

Maconomy

No description available

Properties: [enabled](#)

enabled

No description available

Type	Required	Default Value
boolean	true	<i>n/a</i>

Methods

Used to disable/enable individual login methods.

Properties: enabled

enabled

No description available

Type	Required	Default Value
boolean	true	<i>n/a</i>

Recalculation

The recalculation settings determine when the first recalculation of the end-user's notifications occur and what the interval between subsequent recalculations is. All values are specified in minutes.

Properties: initialDelay, interval, quarantinePeriod

initialDelay

The initial delay in minutes between the time the user logs in and when the first recalculation of notifications is requested. The reason for not requesting recalculation immediately is that the server should be set up to recalculate every night such that the notifications are already up to date on login.

Type	Required	Default Value
number	true	<i>n/a</i>

interval

The interval in minutes between each request for recalculation of the user's notifications. Care should be taken when setting this interval as recalculation of notifications can be a very performance intensive process. If the interval is set to a low value then overall system performance may degrade significantly.

Type	Required	Default Value
number	true	<i>n/a</i>

quarantinePeriod

The quarantine period property defines the minimum quarantine period between repeated client requests for recalculation of notifications.

Type	Required	Default Value
number	true	<i>n/a</i>

Sizes

Mapping between symbolic names to pixel width.

Properties: xs, sm, md, lg, xl, custom

Miscellaneous

The following section contains a migration guide which describes how to migrate a customized iAccess installation. We also include a troubleshooting guide with a few tips about how to overcome typical installation issues.

Migration Guide

The following sections describes the steps needed for migrating from one specific version of iAccess to another. If the version that you are currently using is not mentioned here, or if you have received a special release or hotfix, please get in touch with the iAccess development team for further instructions.

Our long term goal in iAccess 2 is to make all migrations automated through tool support in the Maconomy Extender. However, this functionality is not yet available. Hence, manual steps are always required. When migrating iAccess 2 extensions, it is important to notice that such migrations have two dimensions:

1. If the Maconomy backend has changed version then the standard iAccess configuration files will most likely be extracted from a different iAccess

application. In that case, it is important to inspect the differences between the source iAccess application and the target one since fields, layout, workspaces, and available configurations may have changed. The easiest way to do this is to use a Diff tool to compare the old standard files with the new ones. These standard files are always placed in the `Web` folder in `MaconomyDir` on the Maconomy server.

2. Since iAccess uses Agile methodology (with frequent smaller releases), the configuration API often changes. The API version is specified in the manifest of the iAccess FPU. This version should match the one given in the `application.json` root configuration file. When the API changes, it is important to validate one's existing extensions in the context of the target iAccess FPU. This can be done through the validation facility in the Maconomy Extender.

From 2.2 to 2.2.3

Changes To Menu Configuration

Two non-backward compatible changes have been introduced to the subsection of the configuration that deals with the menu.

The `defaultWorkspace` property was used to specify the workspace iAccess should load on login. This property has been de-supported and must be removed from all menus.

The `condition` property on groups and items in the menu has been replaced by the `visible` property as part of the introduction of a more general-purpose expression language. Previously, the visibility of groups and items could be guarded by either simple true/false expressions or lists of role names. The new `visible` property is a string containing an expression. If the expression evaluates to true, the group or item is made visible. Otherwise, it will be hidden. This expression can rely on system parameters and similar environment information, and has greater expressiveness than those used in previous versions.

Here is an example of how a conditional menu group must be rewritten to comply with the new syntax.

From

```
"groups": [  
  {  
    "T$title": "Time & Expense",  
    "condition": ["iaccess t&e", "iaccess_manager"],  
    "items": [  
      {  
        "T$title": "Weekly Time Sheet",  
        "workspace": "WeeklyTimeSheets"  
      },  
    ],  
  },  
]
```

To

```
"groups": [  
  {  
    "T$title": "Time & Expense",  
    "visible": "hasRole('iAccess T&E', 'iAccess Manager')",  
    "items": [  
      {  
        "T$title": "Weekly Time Sheet",  
        "workspace": "WeeklyTimeSheets"  
      },  
    ],  
  },  
]
```

Style Property Renamed To Css

With the introduction of traffic lighting and dynamic styles, the existing `style` property has been renamed to `css`. This applies across all layouts. Here is an example of how to migrate part of a layout.

From

```
"columns": [  
  {  
    "ref": "EntryText",  
    "text": {  
      "T$title": "Total"  
    },  
    "style": {  
      "border-right": "1px solid transparent",  
      "font-weight": "bold",  
      "Text-align": "right"  
    }  
  },  
]
```

To

```
"columns": [  
  {  
    "ref": "EntryText",  
    "text": {  
      "T$title": "Total"  
    },  
    "css": {  
      "border-right": "1px solid transparent",  
      "font-weight": "bold",  
      "Text-align": "right"  
    }  
  },  
]
```

From 2.1 to 2.2

Update Foreign Key Definitions

If you created iAccess custom layouts specifically for Maconomy 2.4.0 and are upgrading to iAccess 2.2 (which requires you to run Maconomy 2.4.1 in the backend), you need to update your customizations according to the new naming conventions.

Update your custom usage of named references (that is, foreign key definitions) according to the following list of changed names:

Dialog: Approve Expense Sheets By Employee

Old: "Table_ExpenseSheetHeader"

New: "Table_CopyFromExpenseSheetNumber_ExpenseSheetHeader"

Old: "ApprovalRelationInstanceKey_ExpenseSheetHeader"

New: "Table_ExpenseSheetHeader"

Old: "ExpenseSheetHeaderEmployeeNumberVar_Employee"

New: "Table_Employee"

Old: "SuperiorEmployee_Employee"

New: "Table_SuperiorEmployee_Employee"

Old: "SecretaryEmployee_Employee"

New: "Table_SecretaryEmployee_Employee"

Old: "TutorEmployee_Employee"

New: "Table_TutorEmployee_Employee"

Old: "ApprovalGroupInstanceKey_ApprovalGroup"

New: "Table_ApprovalGroup"

Dialog: Approve Purchase Order Lines By Employee

Old: "ApprovalLine_PurchaseOrderLine"

New: "Table_PurchaseOrderLine"

Introduction of Action Groups

Previous to this release, all actions were shown in a drop-down list called "Other actions". Actions are now shown on a line together with "Save" and "Revert". The following example:

```
{
  ...
  "actions": [
    {
      "title": "Submit",
      "source": "SubmitTimeSheet"
    },
    {
      "title": "Submit",
      "source": "SubmitTimeSheet"
    }
  ]
  ...
}
```

Renders actions as:

Save | Revert | Submit | Reopen

You can also make action groups. This means you can have one or more groups of actions next to the row of action buttons.

```
{
  ...
  "actions": [
```

```

    {
      "title": "Submit",
      "source": "SubmitTimeSheet"
    },
    {
      "title": "Submit",
      "source": "SubmitTimeSheet"
    },
    "actions": [
      {
        "title": "Print",
        "source": "PrintTimeSheet"
      },
      {
        "title": "Copy From",
        "source": "CopyTimeSheet"
      }
    ],
    "title": "Even more actions",
    "actions": [
      {
        "title": "Extra action"
        ...
      },
      {
        "title": "Extra action 2"
        ...
      }
    ]
  ]
  ...
}

```

Renders actions as:

Save | Revert | Submit | Reopen | Other actions | Even more actio

Print

Extra action

Copy From

Extra action 2

If you leave out "title" for an action group, the group is labelled "Other actions" by default.

From 2.1 to 2.1.1

Reusable info-bubbles

You need to manually update all custom reusable info-bubbles.

The format for the **parameters** attribute, found in the info-bubble definition, is updated.

From:

```
{
  "parameters": [
    fieldName1,
    fieldName2,
    ...
  ],
  ...
}
```

To:

```
{
  "parameters": {
    "fields": [
      fieldName1,
      ...
    ]
  }
}
```

```

        fieldName2,
        ...
    ]
},
...
}

```

From 2.0.x to 2.1

iAccess 2.1 includes the parameterized workspace panes feature, a functionality that introduces a breaking change in workspace and container configurations.

Workspace Definition

You need to manually update all custom workspaces.

The format for the **parameters** attribute-found under the **container** definition in the **dataBindings** section of the workspace-is updated

From:

```

{
  urlParameterName: fieldName,
  ...
}

```

To:

```

{
  fieldName: parameterObject,
  ...
}

```

where `parameterObject` can be a URL parameter definition or an expression parameter definition.

1. URL parameter

```
{
  "urlParameter": name
}
```

where `name` is a string with the name of the parameter that will be used in the URL.

2. Expression parameter

```
{
  "expression": expression
}
```

where `expression` is a string with the Expression Language expression providing the value for the parameter. The expression may refer to fields in any pane of the workspace, except for the pane where this parameter is defined as well as this pane's descendants.

For example, the `WeeklyTimeSheets.json` file contained the following lines:

```
{
  "date": "DateVar",
  "EmployeeNumber": "EmployeeNumberVar"
}
```

After the update, this is now converted to:

```
{
  "DateVar": {
    "urlParameter": "date"
  },
  "EmployeeNumberVar": {
    "urlParameter": "EmployeeNumber"
  }
}
```

Layout Definition

Some *breaking changes* are applied to the layout definitions.

1. Label is renamed to text. This means that all instances of `label` elements must be changed to `text` elements.

```
{
  "label: {
    "template": "Some string"
    ...
  }
  ...
}
```

must be changed to

```
{
  "text: {
    "template": "Some string"
    ...
  }
  ...
}
```

2. Action rows have been removed. Previously, you could add a row of actions anywhere in the layout. Now, you can only add actions to the top of the layout or in a tab.

A `record` element can now be added to the top of the layout. This can be thought of as the heading defining the shown entity. In the following example, the `title` defines week information for the time sheet, and the `subTitle` defines employee information. The `status` shows the status of the time sheet, and the `actionBar` contains the actions.

```
"layout": {
  ...
  "record": {
    "pane": "TimeRegistrationCard",
    "T$title" : "Week ^{WeekNumberVar}^{PartVar}: ^{PeriodStartVa
    "subTitle": {
      "reference": {
        "description": "EmployeeNameVar",
        "key": "EmployeeNumberVar"
      }
    },
    "status": {
      "source": "SelectedTimeSheetStatusVar",
      ...
    },
    "actionBar": {
      ...
      "actions": [
        {
          "source": "SubmitTimeSheet",
          ...
        }
      ]
    }
  }
}
```

```

    }
    ...
}

```

Actions can be added to the tabs as shown in the following example:

```

{
  ...
  "tabs": [
    {
      "T$title": "Expense Sheets",
      ...
      "actions": [
        {
          "source": "ApproveExpenseSheetsByEmployeeCard.ApproveAl
        }
      ]
    }
    ...
  ]
  ...
}

```

Container Definition

This functionality also introduces a breaking change in the container configuration (`Containers.json`).

The `singleton` attribute under the `card` pane configuration is now replaced by three attributes:

- `singletonIdentifiers` - This maps field names in the card pane to REST API identifiers, such as *card.datevar*.
- `stateParameters` - This lists the fields in the card pane of this container that

do not persist on the server side, and thus need to be maintained on the client side.

- `navigationParameters` - This lists the fields in the card pane of this container that control the internal navigation in the card and the table. These fields cannot be changed at the same time as other fields in the card or table panes.

From 1.x to 2.0

You need to redo all extensions from scratch. We are not delivering a migration tool at this point. Deltek recommends that you inspect the standard extensions delivered with iAccess 2.0, and then ask concrete questions in our "iAccess for Maconomy" Deltek Collaboration space (<https://collaborate.deltekfirst.com/#!/projects/129727>). Engineering is actively monitoring this forum to ease the transition.

Please observe that for 2.0, two new rewrite rules are added for the two new REST endpoints that we rely on, specifically "auth" and "environment". On IIS, an additional rewrite rule is required as described in the "Edit Routing Rules" section. Also, you need to configure "woff2" as a supported MIME type.

From 1.2.x and 1.3.0-3 to 1.3.4

For upgrades from the 1.2.x series, perform the steps outlined in the following sections, and then proceed to the step given here. When migrating from 1.3.0-3 versions to 1.3.4, make sure you update all JSON references. You no longer need to include an iAccess namespace in the names of specification files. This means you should remove the `iaccess:` -prefix from JSON references. For example, change:

```
"screens": {
  "dm.dailytimesheets": {
    "$ref": "iaccess:dailytimesheets"
  }
}
```

to

```
"screens": {  
  "dm.dailytimesheets": {  
    "$ref": "dailytimesheets"  
  }  
}
```

From 1.2.0 and 1.2.1 to 1.2.2 and 1.3.0

Some of our core terminology has changed, as outlined in the following table. This means that you need to update the following keys in your configuration:

User Interface Concept	1.2.0 and 1.2.1 API	1.2.2 and 1.3 API
Default View	defaultScreen	defaultView
Views	screens	views
Leftnav	sidebar	leftnav

Since this is a *breaking change*, the API version has also changed. Configurations should state that they now rely on version `2.0.0` rather than `1.2.0`.

In 1.3, we added support for the Additional Table Fields extension point in expense and mileage sheets. This means you must merge the specifications from these views with the new defaults from the iAccess 1.3 FPU. You can use the Maconomy Extender to assist in this process.

We also added some new parts to the configuration. Integrate these changes by importing the latest specifications from a new FPU and merging these with existing customizations. Specifically, we introduced a `documentationUrl` under the

`configuration` section in `application.json` . In this section, we also introduced references to two new specification files: `authentication.json` and `usagetracking.json` . Use the Maconomy Extender to add these files.

When migrating to `1.2.2` or to `1.3.0` , remove the preferences in the following listing from the `preferences.json` file. The defaults have changed and are not valid anymore. Customize the preferences as described in the configuration section.

```
"dateFormat": {  
  "short": "M/d/yyyy"  
},  
"decimalSymbol": ",",  
"digitGroupingSystem": ".",  
"minutesThreshold": 10
```

From 1.1.x to 1.2.x

The major difference between the 1.x versions and 1.2.x is the introduction of the extensibility model. The table in the next section describes which configuration options from 1.2.x replace deprecated configuration options from 1.1.x.

Configuration of Leftnav

In version 1.1.x, you could configure which views were accessible via the leftnav by changing the `this.sidebarItems` array in `config.js` . This was done after installation on each individual web server.

In version 1.2.x, this kind of configuration is now a part of the central view configuration, and managed via the Maconomy Extender. You can access the configuration of each view by following the links from `application.json` file. To show/hide a particular view, set the `enabled` attribute to either `true` or `false` .

```
{
  "name": "dm.dailytimesheets",
  "enabled": "true",
  ...
}
```

The mapping of view names between version 1.1.x and 1.2.x can be found in the following table:

1.1.x View Name	1.2.x View Name
inside.timesheets	dm.weeklytimesheets
inside.dailytimesheets	dm.dailytimesheets
inside.expensesheets.edit	dm.expensesheets
inside.mileagesheets.edit	dm.mileagesheets
inside.jobfavorites	dm.favoritegmt
inside.absence.tabs	dm.absencemgmt

In version 1.1.x, you could specify the default leftnav tab in `config.js` with the `defaultSidebarItem` property. In version 1.2.x, you specify the default leftnav in the beginning of the `application.json` configuration as shown in the following example:

```
{
  "api": "1.2.0",
  "defaultScreen": "dm.weeklytimesheets",
  "screens": ...
}
```

Configuration of the Weekly Time Sheets View

In version 1.1.x, you could configure two properties of the time sheets' views: daily descriptions, and overtime specification.

In weekly timesheets, you could enable or disable daily descriptions in `config.js` by setting the `isDailyDescriptionsEnabled` property to either true or false. In version 1.2.x, you achieve this configuration by using the extension point `dm.additionalTableFields` described in a previous section.

Finally, in version 1.1.x, you could show or hide the overtime specification in weekly time sheets. In version 1.2.x, you achieve this by adding the `overtimeType` field to the table using the extension point `dm.additionalTableFields` described in a previous section.

Localization

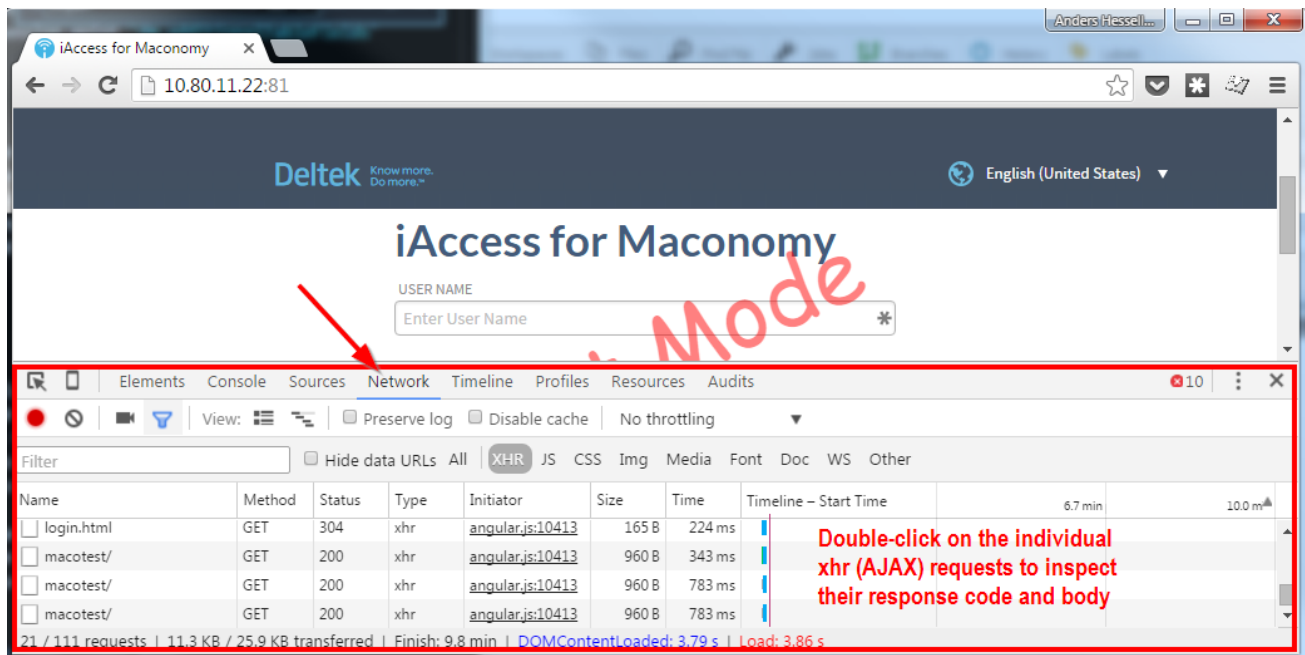

In version 1.1.x, you localized a subset of the terms (for example, error messages) by placing a custom iAccess dictionary in the `i18n` folder on each web server. The 1.1.x version was only released with dictionaries for English and Danish. In version 1.2.x, all localization takes place on the Maconomy server through the existing localization engine. You customize translations by editing the traditional Maconomy dictionaries on the Maconomy server.

Troubleshooting Guide

Solutions to common installation issues are found in the [Installing iAccess](#) section. If your issue/problem is not listed there, the following section provides some additional clues to solve common issues. If you still cannot find a solution to your specific problem, please post a conversation in the *iAccess for Maconomy* Deltek Collaboration space or raise a support case through Customer Care to get your

concrete issue resolved.

A piece of general advice for technical consultants: Always take a look at the requests that the browser issues when you are getting installation and/or network problems. In particular, the AJAX requests and error responses are often useful for uncovering installation and configuration errors. Figure @chrome shows Developer Tools in Chrome where the Network Tab can be a very powerful tool to uncover installation and network problems.

"Incompatible API versions..."-Error

The iAccess specification format deployed on the Maconomy server is not compatible with the installed version of iAccess. This error usually occurs because either the `application.json` specification or the iAccess installed on a given web server have not been updated as part of a system upgrade. If the lowest number in the error message is the *required API version*, then you need to upgrade the iAccess version installed on the given web server. This requires the use of MConfig.

If the lowest number is the *loaded specification API version*, then update the specification deployed to the Maconomy server. This requires the Maconomy Extender.

"Bad Request: Unable to connect to 'configurations' endpoint..."-Error

When moving from version 1.1.x to 1.2.x, iAccess becomes dependent on a new webservice called *configurations*. This web service has to be available through the proxy configuration on the web server. This is similar to how the *containers* and *filedrop* web services are setup. See the [Installing iAccess](#) section for details.

Even if you have properly configured the *configurations* endpoint, you may still get the error on certain IIS installations. The problem can then be that some IIS installations do not allow the colon `:` character in URLs. To solve this, allow the colon `:` in the `web.config` file in the root of your web server [[@IISColons](#)]. Use its unicode encoded format `%u003a` in the configuration.

```
<configuration>
  <system.web>
    <!-- Default <,>*,%,&,:\,<br>
    or %u003c,%u003e,%u002a,%u0025,%u0026,%u003a,%u005c,%<br>
    <httpRuntime
      requestPathInvalidCharacters="%u003c,%u003e,%u002a,%u0025,<br>
    </system.web>
  <system.webServer>
    ...
  </system.webServer>
</configuration>
```

"A%20Network%20Error%20Occurred"-Window Opens

This error occurs when HTTPS has been partially or incorrectly configured on the web server. Double-check that the web server is configured according to the steps in the [Installing iAccess](#) section. This includes checking that the OSGi products in MConfig are configured correctly, and that HTTPS forwarding rules are set up on the web server.

Error 500 in the Browser on Apache 2.2 Installations

If you get a 500 error code in the browser and the following message in the Apache error log:

```
configuration error: couldn't perform authentication. AuthType not set!:
the cause is an incorrect vhosts.conf file. Specifically, make sure that the line
    Require all granted
is not present. This problem occurs for Apache 2.2 only.
Apache 2.4 requires this line.
```
