

## Integration Pro 4.6.101.1 Release Notes

Release Date: March 25, 2026

Welcome to the **Integration Pro 4.6.101.1 Release Notes**, which describe the new features, enhancements, and fixes introduced in this release.

### New

- Integration Pro now includes a Field Change Listener feature. This new functionality allows users to define specific fields to monitor for changes and automatically trigger associated import/export processes when changes are detected. The Field Change Listener enhances workflow efficiency by enabling customized event-driven actions across different pricing models and datasets.
- Integration Pro now supports exporting data to external databases via ODBC connections. This new capability provides full parity with existing export features, allowing users to select and validate ODBC connections, map fields, and schedule recurring exports. The ODBC export option maintains consistency with current security, authentication, and storage behaviors while enabling end-to-end automation for cloud and remote database integrations.

### Enhancements

- The Costpoint integration in ProPricer has been upgraded to use a direct ODBC connection instead of web services. This enhancement expands access to all Costpoint database tables, improves throughput and reliability, and reduces latency for large data volumes.
- Compatibility with ProPricer 9.6.101.1 has been added.
