

## Connect for Web 4.6.101.1 Release Notes

Release Date: March 25, 2026

Welcome to the **Connect for Web 4.6.101.1 Release Notes**, which describe the new features, enhancements, and fixes introduced in this release.

### New

- A new feature has been implemented to enable per-key control over allowed HTTP methods (GET, POST, PUT, PATCH, DELETE) through appsettings.json. This enhancement allows administrators to restrict the operations an API key can perform, supporting least-privilege practices and reducing the risk of compromised keys. The configuration tool has been updated to present checkboxes for each method per key, along with a simple 'Allow all' quick toggle.
- A secure storage mechanism has been introduced to protect credentials in the appsettings.json file. This new feature replaces plaintext storage with hashing for comparison-only secrets and encryption for secrets that must be retrieved at runtime. The system now enforces redaction of secret material in logs, configuration dumps, diagnostics, and telemetry, significantly improving the overall security posture.

### Enhancements

- Compatibility with ProPricer 9.6.101.1 has been added.
