# General Ledger Overview

The G/L module is used for creating and maintaining a number of essential facilities in Maconomy, including the twelve dimensional chart of accounts and multiple companies in the same system.

## Registration Section

This section includes the fields and descriptions for the Registration section workspaces.

## General Journal Workspace

Use this workspace to make manual entries to a general journal.

These entries are G/L transactions; customer transactions, such as payments; and vendor transactions, such as expenses and payments to vendors. You can change a journal until it is posted.

### Posting Journals

A general journal cannot be posted until:

- Its balance is zero.
- The balance for each transaction end entry date combination in the journal is zero. Maconomy validates the balance in base currency, and the balance in registration currency, if all transactions have the same registration currency, and the **Do not check currency amount when posting a journal** system parameter is not marked.
- The balance matches the batch control (if a batch control sum is entered).

You also might need to submit the journal before you post it, depending on how the **Submission of General Journal required** system parameter is set.

### Reusing Journals

You can reuse posted journals for transactions that occur on a regular basis (rent, monthly salaries, and so on) or for correcting erroneous entries in previous journals.

For journals that you reuse on a regular basis, you can create a template journal. Select the **Save Template** field and specify a template name. In the General Journal Templates and Journal Copying workspaces, create journals using your template. When you create a journal, enter a new entry date and new transaction number and specify whether to reverse entries (create the original debit entries as credits and vice versa).

You can also re-create any posted journal that was not saved as a template—for instance, to correct erroneous entries. For a description of this functionality, see the Journal Copying workspace.

Maconomy provides the same functionality when you create a journal from a previously posted journal as it does when you create a journal from a template. Because a limited number of templates is easier to manage than a large number, you should only create templates for journals that you expect to reuse on a regular basis.

### Creating Reversing Journals

You can create a reversing journal for the current journal directly in this workspace, without using a template. In the Journal Reversion island, specify whether the reversing journal is to be posted manually, or it should be posted automatically when the original journal is posted.

### Multiple Currencies

A general journal line can contain amounts in different currencies. Maconomy converts these amounts automatically, using the exchange rate that is valid on the posting date.

If the entry is a customer entry, Maconomy uses the exchange rate table for sales.

If the entry is a vendor entry, Maconomy uses the exchange rate table for purchases.

If the entry is a G/L entry, Maconomy uses:

- The exchange rate table for purchases if the balance on the specified account is zero or in debit.
- The exchange rate table for sales if the balance on the specified account is in credit.

If the entry is a job entry—the **Job No.** field in the Entries sub-tab has a value—and the **Account No.** field does not have a value, Maconomy checks whether fixed exchange rate information has been specified for the job in the Job Price Information workspace in the Job Cost module.

If this is the case, and you did not select the **Fixed exchange rates in budgets only** system parameter, Maconomy converts the currency according to the fixed exchange rate information specified in the Job Price Information workspace.

### Multiple Companies

If a journal contains entries for two different companies, Maconomy automatically creates intercompany balances, unless you do not select the **Create intercompany entries for companies with same parent company** system parameter, and the companies in question are both assigned to the same parent company. For more information, see description of the Intercompany Accounts workspace.

### General Journal Tab

This section includes the fields and descriptions for the General Journal tab.

### Journal Island

Field	Description
<b>Journal No.</b>	This is the journal number. Maconomy automatically allocates the next available journal number from the window System Numbers in the Set-Up module.
<b>Created by</b>	This is the name of the user who created the general journal. The name cannot be changed.
<b>Date</b>	This is the date the journal was created. It cannot be changed.
<b>Period No.</b>	This field shows the journal's period number in the current fiscal year. If your company uses periods that follow the months of the year, the field will, for example, show 1 for January, 2 for February, 3 for March, and so on. However,

Field	Description
	<p>the periods do not necessarily follow the months of the year. The duration of the period is shown in the fields "Period Start" and "Period End" below.</p> <p>When you have completed the first entry line, Maconomy checks the current fiscal year defined in the window Fiscal Year and finds the period covering this entry's date. This period is assigned to this field, and in this way, the first entry line determines the journal's posting period. All entries in a journal must be within the same period. This ensures that each period balances. The date in this field cannot be changed manually.</p>
<b>Period Start</b>	<p>This field shows the first date in the period covered by the journal. The period of the journal goes from the period starting date to the date shown in the field "Period End" below. It is only possible to specify entry dates within this period to ensure that each period balances. The date in this field cannot be changed manually.</p> <p>When you have completed the first entry line, Maconomy checks the current fiscal year defined in the window Fiscal Year and finds the period covering this entry's date. This period is assigned to the journal, and this field shows the first day of that period. In this way, the first entry line determines the journal's posting period.</p>
<b>Period End</b>	This field shows the last date in the period covered by the journal. For a further description, please see the field "Period Start" above.
<b>Fiscal Year</b>	This field shows the fiscal year to which the journal is assigned.
<b>Balance, Base</b>	This is the journal's balance in the base currency of the company responsible for the current journal. The currency is displayed in the field "Base Currency" in the island Company. Maconomy updates the balance every time you complete an entry line. A general journal can only be posted when the balance is zero both in base currency for the current company and in the enterprise currency. This guarantees that debit and credit amounts are always the same.
<b>Balance, Enterprise</b>	This is the journal's balance in enterprise currency. Maconomy updates the balance every time you complete an entry line. The balance must be zero in both the base currency of the current company and the enterprise currency before the journal can be posted, this ensures that debit and credit amounts are always the same.
<b>Prior-Period</b>	<p>Here you can specify if the general journal is a prior-period journal and if so, which prior periods the G/L entries are to be posted to. If a period is selected, the journal is a prior-period journal. The periods are created in the popup field "Prior Periods" in the window Popup Fields in the Set-Up module. That window is also used for specifying whether the prior-period is open and in which G/L period the current prior-period can be used. A user can only select a prior-period if he or she has been granted access to using prior-periods in the window Actions in the SetUp module.</p> <p>The window Journal Listing shows the marked journals and also gives you the choice of having and overview of prior-period journals only. In the window Print</p>

Field	Description
	<p>Posting Journal it is possible to specify that the posting or the reprinting of journals should include prior-period journals only.</p> <p>In the window G/L Report Columns you can create a report which only contains G/L entries from a given prior period.</p> <p>Prior-period journals are used when posting in closed periods, including closed financial years.</p>
<b>Auto. Trans. No.</b>	<p>You can check this box if you want Maconomy to suggest your transaction numbers. Maconomy raises the transaction number automatically every time the journal balance is zero, otherwise it suggests the same number as the transaction before it. You must enter a transaction number for the first transaction in a journal.</p> <p>If you remove the mark in the “Reuse Entry Information” box, the transaction number will always be 0, that is, blank, regardless of the journal’s balance, and you must enter a number manually.</p>
<b>Post</b>	<p>Here you can mark the journal as ready to be posted. If the field is marked, you can either post the journal directly in this window, or you can include the journal in posting done from the Posting and Print Posting Journal windows. If the field is not marked, you must mark the journal in the “Post” field in the window Posting.</p> <p>In the window G/L Report Columns, it is possible to generate a report which contains G/L entries with a specific prior-period only.</p> <p>Prior-period journals are used for postings to closed periods, including postings to closed fiscal years.</p>
<b>Reuse Entry Info.</b>	<p>If you check this box, Maconomy will reuse entry information from one line on the next. Maconomy reuses the “Entry Date,” “Transaction Type,” “Trans. No.,” “Description,” “Std. Description,” “Offset Entry,” and “Currency” information as long as the journal balance is different from zero. If you remove the mark, Maconomy suggests today’s date in the field “Entry Date” and the base currency in the field “Currency” and leaves the fields “Transaction Type,” “Trans. No.,” “Description,” “Std. Description,” and “Offset Entry” empty, regardless of the journal’s balance.</p>

### Template Island

Field	Description
<b>Save Template</b>	<p>If you check this box, Maconomy will keep the journal as a template when you post it. You can create new journals from your templates in the General Journal Templates and Journal Copying windows.</p> <p>If you check the box, you can use the remaining fields in this island and the field “Num. Series” to specify what the template will be used for. All the values entered below can be changed in the window General Journal Templates after posting.</p> <p>It is also possible to create journals based on posted journals that were not saved as templates, for instance, to correct erroneous entries. For a description</p>

Field	Description
	of this functionality, please see the window Journal Copying. The functionality offered when creating a journal from a previously posted journal is identical to the one offered when creating journals from templates. As a limited number of templates provide a better overview, templates should therefore only be created for journals that you expect to reuse on a regular basis.
<b>Name</b>	Here you can enter the name of your new template journal.
<b>New Entry Date</b>	Here you must enter the new entry date for the template, that is, the entry date which is to be used the first time that the template is copied.
<b>Range (Months)</b>	Here you can enter the range for the template, if you are going to use it repeatedly.
<b>New Trans. No.</b>	Here you can enter the transaction number which is to be used for template copies. If you do not enter a value, any transaction number series specified in the field "Num. Series" will be used. If neither of the two fields is completed, the fields will also be blank in the template created.
<b>New Trans. Type</b>	Here you can enter the transaction type which is to be used for template copies. If you do not enter a value, the transaction specified in the Transaction Type field in the Transaction Numbering island will be used. A value must be entered in at least one of these fields. The value entered in either field must be a transaction type that is valid for the company and for the General Journal journal type.
<b>Reverse Entries</b>	If you mark this field, Maconomy will reverse the entries when journals are created from the current journal (or from the template created upon posting, if the field "Save Template" is marked). This field does not cause the creation of reversing entries when posting the current journal. If you want Maconomy to create reversing entries when the current journal is posted, use the fields in the "Journal Reversion" island.

### Transaction Numbering Island

Field	Description
<b>Transaction Type</b>	In this field you can enter a default transaction type to be used when creating the lines. The default transaction type that is set up for the General Journal in the given company will be shown initially.
<b>Number Series</b>	In this field you can select a transaction number series created in the popup field "Transaction No. Series" in the window Popup Fields in the Set-Up module. If you select a number series, Maconomy will automatically number your journal lines. The field is optional.  The default number series defined for the transaction type will be suggested initially.

Field	Description
	<p>The selected transaction number series will be suggested when creating new journals from the current journal in the windows Journal Copying and General Journal Templates. This will not take place, however, if the field "New Trans. No." in the Template island is completed, as this transaction number will then be suggested instead.</p> <p>If the field "Create Reversing Journal" in the Journal Reversion island is marked, it also applies that a number series in this field will be used on the entries in the reversion journal, unless a transaction number is specified in the field "New Trans. No." in the island Journal Reversion.</p>

### Posting Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use when the journal is posted. The layout "Standard" includes detailed information on each entry. The layout "Journal Overview" shows summary information with totals for the journal, including any resulting intercompany journals.

### Offsetting Entries Island

Here you can select up to five offset codes, for which Maconomy updates the entry sum in the journal's "Total" column and the resulting balance in the "Balance" column. The following types of entries are included in the entry total and resulting balance of a given offset code specified in this island:

Entries for which you have entered the offset code in question in the "Offset" field.

Entries on which the dimension values comply with the dimension values assigned to the offset code. The dimension values assigned to the offset code are specified in the window Popup Fields by means of a dimension combination. If this dimension combination contains company specific dimension values, an entry is only included in the entry total and resulting balance if the dimension values on the entry comply with those dimension values in the dimension combination that apply to the company responsible for the current journal.

Examples of offset codes are cash, bank, and giro. The totals are shown in the base currency of the company that created the journal and updated after each journal line is completed. Offset codes are maintained in the popup field "Offset Accounts" in the window Popup Fields in the Set-Up module.

When a journal is created, Maconomy automatically retrieves the offset codes specified on the last general journal created by the same user and concerning the same settling company, unless the user has selected one or several offset codes before pressing Enter, in which case no offset codes are transferred.

### Batch Total Island

Field	Description
<b>Control</b>	Here you can enter a control sum that is the expected total of all the entries in the journal. The amount must be specified in the base currency of the company that created the journal. The batch total is the total of all the values in the fields "Debit" and

Field	Description
	<p>"Credit" in the journal lines. Both debit and credit entries are calculated as positive figures.</p> <p>If you enter a control sum, the general journal can only be posted if the total is the same as the batch total calculated by Maconomy, shown in the field "Current", that is, the value in the field "Balance" must be 0. If the control sum is 0, the batch total is ignored. A journal can only be posted as long as it balances, that is, that the total of debit entries is equal to the total of credit entries.</p> <p>The control sum is used as an extra check that you have entered the correct amounts in the entry lines. Before you enter any amounts, Maconomy counts up all the entries, regardless of whether they are being credited or debited. If you forget a transaction, or if you enter a wrong amount, the batch total will not balance with the total Maconomy calculates in the field "Current."</p>
<b>Current</b>	This is the batch total calculated by Maconomy. It is the total of the values entered in the fields "Debit" and "Credit" in the journal. The batch total is shown in the base currency of the company that created the journal.
<b>Balance</b>	This is the difference between the amounts in the fields "Control" and "Current". The amount is shown in the base currency of the company that created the journal. If you have entered an amount in the field "Control", the journal cannot be posted before the values in this field and in the field "Balance" in the island Journal are both 0.

### Company Island

Field	Description
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.
<b>Number</b>	<p>In this field, you can enter the number of the company responsible for the general journal. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>If you create lines in the general journal in which you specify a company different from the value in this field, Maconomy will automatically create intercompany balances between the companies at the posting of the general journal. In the intercompany balance, the company in this field will be the responsible company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>See the section about dimension derivation in the chapter "Introduction to the G/L Module" and the window Dimension Derivations for a description of dimension derivation. Intercompany balances are described in the window Intercompany Accounts.</p>
<b>Balance</b>	This is the journal's balance in the currency of the company responsible for the current journal. A general journal can only be posted when the balance is zero both in

Field	Description
	base currency for the current company and the enterprise currency. This guarantees that debit and credit amounts are always the same.

### Dimensions Island

Field	Description
<b>Location</b>	Here you can enter a value for the Location dimension. When dimension values are derived to the Entries sub-tab, the value in this field will be used as a context value for the dimension Location, and thus in some cases be transferred to table lines. For a description of the term “context values” and the cases where context values are derived, see the section “Deriving Dimensions.”
<b>Entity</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Project</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Purpose</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.

### Journal Reversion Island

Field	Description
<b>Create Rev. Journal</b>	If you mark this field, Maconomy will create a reversion copy of the general journal when posting. This means that Maconomy creates a new journal containing the same lines as the current journal. However, amounts in debit in the original journal will be in credit in the reversing journal and vice versa. The reversing journal is posted automatically if you mark the field “Post Rev. Journal.”
<b>Post Rev. Journal</b>	If the field “Create Reversing Journal” is marked, you can use this field to specify if Maconomy should automatically post the reversing journal when the current journal is posted. If you mark the field, Maconomy will post the reversing copy together with the current journal. If you do not mark the field, the reversing journal is just created in this window when the current journal is posted, giving you the possibility to edit the reversing journal.
<b>New Entry Date</b>	In this field, you must enter the entry date to be used on the entries in the reversing journal.

Field	Description
<b>New Trans. No.</b>	In this field, you can enter a transaction number to be used on the entries in the reversing journal. If you do not specify a value, Maconomy will instead use any transaction number series specified in the field "Num. Series." If the field "Create Reversing Journal" is marked, you must either specify a transaction number in this field or a number series in the island Transaction Numbering.
<b>New Trans. Type</b>	In this field, you can enter a transaction type to be used on the entries in the reversing journal. If the field "Create Reversing Journal" is marked, you must either specify a transaction type in this field, or in the Transaction Type field in the island Transaction Numbering (if a value is specified in this field, this value is used; if not, the value specified in the other field mentioned will be used.) Either transaction type must be valid for the company and the General Journal type.

### Document Archive Island

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

### Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Entry Date</b>	<p>Here you enter the entry date. The first entry you enter in a journal determines which period the journal will be posted to. The "Period" field is completed automatically based on the date you enter here. Maconomy suggests today's date. If you have marked the field "Reuse Entry Information," Maconomy will suggest the previous transaction's entry date for the next transactions. Otherwise Maconomy suggests today's date for all transactions.</p> <p>If you have not selected a prior period in the card part of this window, Maconomy checks that their dates are within the open posting range and within the journal's period. The open posting range can be changed for the individual company in the window Company Information or generally in the window System Information in the Set-Up module. The field is mandatory.</p> <p>If a prior-period has been chosen in the card part of this window, Maconomy checks that the entry date corresponds with the prior-period.</p> <p>Please note that all lines regarding the same transaction number must be assigned the same entry date.</p>

Field	Description
<b>Trans. No.</b>	<p>Here you enter the entry's transaction number. The way this works depends on whether a value is specified in the Number Series field in the General Journal tab.</p> <p>If Number Series has been specified, the following applies:</p> <p>In this case, the "Reuse Entry Information" and "Auto. Trans. No." have no effect on the "Trans. No." field. It does not matter if they have a value, or are left blank.</p> <p>The value in the "Trans. No." field will be set like this:</p> <ul style="list-style-type: none"> <li>■ The value specified by the user.</li> <li>■ If the user did not specify a value, and "Balance, Base" in the General Journal tab is not 0 (zero), Maconomy will suggest the same number as in the previous entry.</li> <li>■ If the user did not specify a value, and "Balance, Base" in the General Journal tab is 0 (zero), and if the user does not specify a "Trans. Type," Maconomy will suggest the next number from the number series specified in the card part.</li> <li>■ If the user did not specify a value, and "Balance, Base" in the General Journal tab is 0 (zero), and if the user specifies the same "Trans. Type" on the line as the "Transaction Type" in the General Journal tab, Maconomy will suggest the next number from the number series specified in the card part.</li> <li>■ If the user did not specify a value, and "Balance, Base" in the General Journal tab is 0 (zero), and if the user specifies a "Trans. Type" on the line that is different from the "Transaction Type" in the General Journal tab, Maconomy will suggest the next number from the number series corresponding to the "Trans. Type" on the line.</li> </ul> <p>Note that changing the "Trans. Type" on a line that has already been created will not change the "Trans. No."</p> <p>If Number Series has not been specified, the following applies:</p> <p>You must complete the field for the first entry. On the next lines, Maconomy will suggest one of the following transaction numbers:</p> <ul style="list-style-type: none"> <li>■ You have marked the field "Reuse Entry Information": If the journal balance in the field "Balance, Base" in the General Journal tab is not 0, Maconomy suggests the same transaction number as for the previous entry. If the balance is zero, and you have marked the field "Auto. Trans. No.," Maconomy gives it the next transaction number. If the balance is 0 and the field "Auto. Trans. No." is not marked, you must enter a number manually.</li> <li>■ There is no mark in the field "Reuse Entry Information": The number must be entered manually, regardless of the journal balance.</li> </ul>

Field	Description
	<p>If you have not checked the box “Reuse Trans. No.” in the window System Information in the Set-Up module, Maconomy checks that the transaction number has not already been used for a journal entry in an unposted general or vendor invoice journal belonging to the company applying to the current line or for an already posted G/L entry belonging to the company applying to the current line.</p> <p>If the system parameter “Company specific transaction number check” has been marked, Maconomy checks that the transaction number has not already been used for a journal entry in an unposted general, asset, customer payment or vendor invoice journal belonging to the company applying to the current line or for an already posted G/L entry belonging to the company applying to the current line. If the parameter has not been marked, Maconomy checks that the number has not been used on any other manual transaction in the system, regardless of company number.</p> <p>Please note that all lines regarding the same transaction number must be assigned the same entry date. Furthermore, the journal can only be posted if the amounts in base and enterprise currencies balance on lines with identical transaction numbers.</p>
<b>Trans. Type</b>	<p>Here you can enter the transaction type. The field will show the transaction type specified in the General Journal tab as a default. It is mandatory to enter a transaction type. You can select from the transaction types available for the general journal and the company of the general journal line.</p>
<b>Description</b>	<p>Here you enter the entry text. If you use a number of standard texts, it will be quicker for you to select a text from the field “Std. Description” pop-up. If you have entered both a manual and a standard text, Maconomy uses the manually entered text. If the journal’s balance in the field “Balance, Base” in the General Journal tab is not 0, and you have marked the field “Reuse Entry Information”, Maconomy suggests the text from the previous line.</p> <p>If the current entry is an entry from the Job Cost module, and no account text is entered, the text from the activity will be transferred to this and the “Name” fields.</p>
<b>Std. Description</b>	<p>Here you can select a standard text. Descriptions like “Payment,” “Purchase,” “Purchase Order,” and so on are typical frequently used entry texts. Standard texts are entered and changed in the pop-up field “Standard Descriptions” in the window Popup Fields in the Set-Up module. See also the description of the field “Description.”</p>
<b>GRP</b>	<p>Here you can select “G,” “R,” or “P,”= which is shorthand for General Ledger, Accounts Receivable, and Accounts Payable respectively.</p> <ul style="list-style-type: none"> <li>■ G — The entry is a G/L entry without relevance to a customer or vendor.</li> <li>■ R — The entry is a customer entry, which means it is entered to the customer’s control account in the G/L module and to the customer’s</li> </ul>

Field	Description
	<p>account in the Accounts Receivable module. The reference to the control account is retrieved from the field "Control Account" in the window Payment Information in the Accounts Receivable module.</p> <ul style="list-style-type: none"> <li>▪ If you choose "R" and enter an invoice number in the field "Invoice No.," Maconomy automatically enters the customer number of the relevant customer in the field "Account No."</li> <li>▪ P — The entry is an vendor entry, which means it is entered to the vendor's control account in the G/L module and to the vendor's account in the Accounts Payable module. The reference to the control account is retrieved from the field "Control Account" in the window Payment Control in the Accounts Payable module.</li> </ul> <p>This field is ignored if you leave the field "Account No." blank and specify a job in the field "Job No."</p>
<b>Account No.</b>	<p>Here you can enter the account number to which the entry will be posted. If you wish to create a job entry, leave this field blank and enter a job number in the field "Job No." If you specify both an account number and a job number, the dimension derivation process will include derivation of dimensions from the specified job, but the entry will be considered a G/L, customer, or vendor entry, meaning that although the entries created will be stamped with the job number, no entries will be created in the Job Cost module. Even if both a job and an account have been specified, the tax code is derived from the account.</p> <p>If the field "GRP" shows:</p> <ul style="list-style-type: none"> <li>▪ G — Enter a G/L account number.</li> <li>▪ R — You must enter an A/R (Customer) account number. If the field shows "R" and you enter an invoice number in the field "Invoice No.," Maconomy automatically enters the customer number in this field. However, when creating lines regarding invoice reconciliation, you can also specify a customer number here. If you do so, the Find Invoice window in the field "Reconc. Invoice No." will only show invoices relating to the customer in question.</li> <li>▪ P — Enter an A/P (Vendor) account number.</li> </ul> <p>Maconomy checks that the specified account exists in the module in question. Maconomy checks that the combination of dimensions indicated on the general journal line is a valid allocation combination. Valid allocation combinations are defined in the windows G/L Allocation Combinations and Company Allocation Combinations.</p> <p>If the current account is a G/L account, and if an allocation code has been entered on the account information card of the current account, this code will automatically be used on the general journal line unless an allocation code has already been specified.</p> <p>If the current account is a customer, and if the system parameter "Aut. company specific customer creation" is not selected, Maconomy will check if the customer in question has been created as a company specific customer for</p>

Field	Description
	the company specified on the line. If this is not the case, the customer must be created as a company specific customer in the window Company Specific Customer Information Card before any posting on the current combination of customer and company number can be performed.
<b>Account Name</b>	<p>This field shows the account text of the account shown in the field "Account No." It cannot be changed here.</p> <p>If the entry is from the Job Cost module, and no account text is entered, the text from the activity will be transferred to this and the "Description" fields.</p>
<b>Debit</b>	<p>In this field, you enter an amount if the entry is a debit entry.</p> <p>Enter the amount in the base currency of the company responsible for the current journal, that is, the currency displayed in the field "Base Currency" in the island Company in the card part. You must complete this field if you leave the fields "Credit," "Currency Amount," "Amount, Enterprise," "Quantity," and "Quantity 2" blank. However, if the balance in the field "Balance, Base" in the card part is less than zero in the current journal (that is, a credit balance), and you enter an amount neither in the field "Currency Amount" nor in the field "Amount, Enterprise," you can leave this field blank to let Maconomy automatically enter the corresponding debit amount in this field when you press Return.</p> <p>You can enter amounts in more than one of these fields on the same line. If you specify amounts in more than one field, Maconomy uses a fixed order of priority to decide which amount should be copied to the other amount fields. The following description is based on the presumption that all amounts in the fields "Currency Amount" and "Amount, Enterprise" are positive (or zero), as negative amounts in these fields represent credit amounts. It is also presumed that the field "Exchange Rate Variance" has not been marked, as Maconomy will otherwise not calculate currency conversion amounts.</p> <p>When entering amounts, Maconomy uses the following order of priority:</p> <ol style="list-style-type: none"> <li>1. The field "Debit" or "Credit."</li> <li>2. The field "Currency Amount."</li> <li>3. The field "Amount, Enterprise."</li> </ol> <p>If amounts in more than one field on the line are in the same currency (for example, if the base currency corresponds to the enterprise currency), Maconomy automatically equalizes the amounts to the same size. If you specify non-matching amounts in two fields that represent the same currency, the amount entered in the field which is located highest in the priority list and contains an amount greater than zero is therefore the one that is copied to the other fields representing the same currency. When amounts are copied, manually entered amounts in the relevant fields are overwritten.</p> <p>If the amounts specified in the fields on one line represent more than one currency, Maconomy first points out the currency whose amount should form the basis for the calculation of amounts in other currencies. This currency is called the primary currency. The primary currency is pointed out as the first</p>

Field	Description
	<p>field in the priority list that contains an amount that is greater than zero. Based on the amount in this field, Maconomy calculates the amounts in the other currencies represented on the current line. If, however, an amount has been entered manually in a field not representing the primary currency, Maconomy keeps the manually entered amount.</p> <p>Furthermore, if the amount specified in the field "Debit" is changed to zero on an existing line, the amount in this field will always be calculated on the basis of the value in the field "Currency Amount."</p> <p>When performing currency conversion on general journal lines, Maconomy uses the exchange rate valid on the posting date. Depending on whether the journal line entry is a customer or vendor entry, Maconomy uses either the exchange rate table for sales or the exchange rate table for purchase. If the entry is a G/L entry, Maconomy uses the exchange rate table for purchase if the balance on the specified account is zero or in debit, whereas the exchange rate table for sales is used if the balance on the account is in credit. If the current entry is a job entry, and the job specified in the field "Job No." uses fixed exchange rate information on all transactions, the currency is converted according to the information specified in the window Job Price Information for the job in question. For more information about currency conversion in the Job Cost module, please see "Appendix A: Price Calculation in the Job Cost Module."</p> <p>When converting between currencies on the individual lines it sometimes happens that when amounts are rounded off, the balance in, for example, enterprise currency does not amount to zero, even though the debit and credit amounts on the lines are the same. When you press Return in the table part, Maconomy will check if the journal contains other lines with the same transaction number as the current line, and if the current line brings the balance of the fields "Debit" and "Credit" to zero for all lines with the same transaction number. If this is the case, Maconomy will make sure that the balance in enterprise currency for the transaction in question will total zero as well. This is done by setting the amount in enterprise currency to the difference between zero and the balance in enterprise currency for all other lines with the same transaction number. If you have specified the same currency in the field "Currency" for all lines with the same transaction number, a similar adjustment of the currency amount of the new line takes place. This also applies to job entries where the job in question uses fixed exchange rate information on all transactions. If different currencies are specified on the lines in question, this automatic rounding of the currency amount does not take place.</p>
<b>Credit</b>	<p>Here you enter an amount if the entry is a credit entry. Enter the amount in the base currency of the company responsible for the current journal, that is, the currency displayed in the field "Base Currency" in the island Company in the card part. You must complete this field if you leave the fields "Debit," "Currency Amount," "Amount, Enterprise," "Quantity," and "Quantity 2" blank. However, if the balance in the field "Balance, Base" in the card part has a positive amount in the current journal (that is, a debit balance), and you enter an amount neither in the field "Currency Amount" nor in the field "Amount, Enterprise," you</p>

Field	Description
	<p>can leave this field blank to let Maconomy automatically enter the corresponding credit amount in this field when you press Return.</p> <p>You can enter amounts in more than one of these fields on the same line. If you specify amounts in more than one field, Maconomy uses a fixed order of priority to decide which amount should be copied to the other amount fields. This order of priority is described in further detail in the description of the field "Debit."</p>
<b>Offset</b>	<p>Here you select the offsetting entry. If none of the pre-defined offset codes apply, leave the field blank. You can then enter the offsetting code on the next line. Offset codes are maintained in the popup field "Offset Accounts" in the window Popup Fields in the Set-Up module. Dimensions specified on the line are also registered to the offsetting entry.</p> <p>In the General Journal tab you can select one of the five possible offset codes for which Maconomy shows a continuous update of entry total and resulting balance.</p>
<b>Tax Code</b>	<p>In this field, you can specify a tax code for the entry on the current line if the line represents a G/L entry. If a value has been entered in the field "Account No." on the same line, Maconomy suggests the G/L tax code of the account in question, provided that the tax code is for ingoing tax. If a G/L tax table has been specified on the information card of the compveany, the G/L tax code is retrieved from this G/L tax table using the information on the line to determine which tax table line to use. If no G/L tax table has been specified, or if the G/L tax table does not contain any lines matching the information on the current journal line, Maconomy suggests the G/L tax code specified for the account in the window Account Information Card.</p> <p>If a value has been entered in the field "Activity No." on the same line, and this activity is assigned to a P&amp;L account, Maconomy suggests the tax code of the P&amp;L account in question.</p> <p>Maconomy calculates tax automatically using the tax code. The tax is entered to the account for ingoing/outgoing tax. The references to these accounts can be changed by specifying dimension combinations in the window G/L Tax Codes.</p> <p>When tax is calculated automatically, the tax amount and account are registered to the individual entries when these are posted.</p> <p>You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters window. When multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2," and, if enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p> <p>The field only applies to G/L and job entries.</p>
<b>Registration Code</b>	<p>In this field you can enter a registration code if you want to use a shortcut to manual entry of dimensions. You can only enter a registration code if it has been created in the window Registration Codes. Please note that if you use a</p>

Field	Description
	<p>registration code with a company number when creating a new line, the company number suggested by Maconomy or entered by the user is overwritten by the one in the registration code while the suggested or manually entered values in other dimensions are not overwritten by values from the registration code.</p>
<b>Company No.</b>	<p>In this field you can enter the number of the company responsible for the general journal. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the Dimension Derivations workspace in the G/L module. If no value can be derived, the standard value is transferred from the System Information workspace in the Set-Up module.</p> <p>If you create lines in the general journal in which you specify a company different from the value in this field, Maconomy will automatically create intercompany balances between the companies at the posting of the general journal. In the intercompany balance, the company in this field will be the responsible company. However, if the system parameter "Crate intercompany entries for companies with the same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>See the section about dimension derivation in "Introduction to the G/L Module" and the Dimension Derivations workspace for a description of dimension derivation. Intercompany balances are described in the Intercompany Accounts workspace.</p>
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not enter a value manually or through a registration code, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations. Any manually entered value will however be overwritten, if a value is derived for which "Overwrite" is selected. If no value can be derived, the standard value is transferred from the window System Parameters in the Set-Up module. See the chapter "Introduction to the G/L Module" and the window Dimension Derivations for a further description of dimension derivation.</p> <p>If an offset code is entered on the line, the location will also be stored in the automatically created offset entry. The location is furthermore stored in any automatically created tax entry.</p> <ul style="list-style-type: none"> <li>For a G/L entry, the location will be registered to the entry itself. You can only complete this field if the "Location" box in the "Allowed" column in the account information card is marked. It must be completed if the "Required" column is marked.</li> <li>For a Customer entry, the location will be registered to the customer's control account in the G/L module. It will not be registered to the customer entry in the Accounts Receivable module.</li> <li>For a Vendor entry, the location will be registered to the vendor's control account in the G/L module. It will not be registered to the vendor entry in the Accounts Payable module.</li> </ul>

Field	Description
	If you are entering a new customer payment and you have set up the table part of the window Dimension Derivations in the G/L module to derive dimensions from invoices when creating a customer payment, specifying an invoice in the field "Reconc. Invoice No." will cause the location on the specified invoice to be copied to this field on the current line. However, if you have manually specified a location before pressing Enter, this value is not overwritten by the dimension value from the invoice. For further information, see the field "Action" in the table part of the window Dimension Derivations.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Currency</b>	<p>Here you select the original currency of the entry, if it involves a currency transaction (such as payments from foreign customers). The transaction normally shows the amount in both the foreign currency and the base currency of the company responsible for the current journal.</p> <p>The entry is then registered in both the company base currency, in the foreign currency, and in the enterprise currency. If the entry is a customer or vendor entry, the base amount is converted to the customer or vendor's standard currency when it is posted to the accounts receivable or accounts payable modules.</p> <p>If the balance is not zero in the field "Balance, Base" in the General Journal tab, Maconomy suggests the same currency as for the previous entry if you have marked the field "Reuse Entry Information."</p> <p>If you have entered a G/L account in the field "Account No." and the field "Currency Account" is marked for this account, you can only specify the currency assigned to the account in question.</p>
<b>Currency Amount</b>	<p>Here you enter the entry amount in the currency, if the entry is a currency entry. A credit amount is entered as a negative figure.</p> <p>You can enter amounts in more than one of these fields on the same line. If you specify amounts in more than one field, Maconomy uses a fixed order of priority to decide which amount should be copied to the other amount fields. This order of priority is described in more detail in the description of the field "Debit." The description of the field "Debit" also accounts for how the amounts in all currencies within the same transaction number are balanced.</p>

Field	Description
	Please note that the value in this field cannot be changed to zero on an existing line unless the field "Exchange Rate Variance" has been marked. For further information, see the field "Exchange Rate Variance."
<b>Currency Direction</b>	If another currency than the base currency has been entered, a currency direction must be chosen here. The currency direction specifies which currency table applies to the entry. The currency table, sales, applies to sales and the table, purchase, to purchases.
<b>Exchange Rate Variance</b>	<p>By marking this field, you can specify that the current line concerns an exchange rate variance. If the field is marked, the amount in the field "Currency Amount" must therefore be zero, and the currency on the line must be different from the base currency of the company responsible for the journal. If you mark the field, Maconomy will not perform any currency conversions of the amounts entered on the line. This means that if you, for example, enter an amount in the field "Debit," Maconomy will not calculate amounts for the fields "Currency Amount" and "Amount, Enterprise Currency." However, if amounts in more than one field on the line are in the same currency (for example, if the base currency corresponds to the enterprise currency), Maconomy automatically equalizes the amounts to the same size, using the order of priorities specified in the description of the field "Debit." If the base currency of the company responsible for the journal is different from the Enterprise currency, it is possible to enter both a debit/credit amount and an enterprise currency, and none of the amounts will result in currency recalculations.</p> <p>If you do not mark this field, the amount in the field "Amount, Currency" must be different from zero.</p>
<b>Amount, Enterprise</b>	<p>In this field, you can enter the entry amount in enterprise currency. A credit amount should be entered as a negative figure.</p> <p>You can enter amounts in more than one of these fields on the same line. If you specify amounts in more than one field, Maconomy uses a fixed order of priority to decide which amount should be copied to the other amount fields. This order of priority is described in further detail in the description of the field "Debit." The description of the field "Debit" also accounts for how the amounts in all currencies within the same transaction number are balanced.</p> <p>Please note that you cannot change the enterprise amount to zero if a job has been specified on the line.</p>
<b>Quantity</b>	<p>Here you can enter a quantity.</p> <p>If the chart of accounts, for example, has an account for "Oil Purchases," you can enter oil quantities here when entering the oil bill. This enables you partly to read total oil usage, partly to compare prices of different oil deliveries.</p>
<b>Quantity 2</b>	The functionality of this field is similar to that of "Quantity" above.
<b>Allocation Code</b>	Here you enter an allocation code. You can enter one of the codes created in the window Allocation Codes. Note that the field cannot be changed later.

Field	Description
	When you enter an allocation code, Maconomy will automatically replace the original entry with the entries specified by the allocation code. Allocation codes are used for relieving manual work with standardized entries. If an allocation code has been entered on the account information card of the current account, this code will automatically be used on the general journal line unless an allocation code has already been specified.
<b>Summary Posting</b>	You can mark this field if you want gather entries to the same account number during posting. In the window System Information, you can choose between two ways of joining entries.
<b>Job No.</b>	<p>In this field, you can enter the number of a job from the Job Cost module. If the job is a job entry, enter a number in this field and leave the field "Account No." blank. If you specify both a value in the field "Account No." and a job number, the dimension derivation process will include derivation of dimensions from the specified job, but the entry will be considered a G/L, customer or vendor entry, meaning that although the entries created will be stamped with the job number, no entries will be created in the Job Cost module. Even if both a job and an account have been specified, the tax code is derived from the account.</p> <p>If you receive an invoice from a vendor in connection with a job, and if you wish to assign the invoice to a job, you can enter the job entry in this window or in the window Vendor Invoices in the Accounts Payable module (after which the invoice is allocated in the window Invoice Allocation or Reallocate Invoices in the Accounts Payable module).</p> <p>If you enter a job here, and leave the field "Account No." blank, you must enter an amount activity (from the window Activities in the Job Cost module) in the field "Activity" on the same line.</p> <p>Amounts for non-capitalized jobs are posted on the activity's P &amp; L account. The capitalization principle determines how capitalized jobs are posted. "At Cost" means the entry is posted to the job's posting reference for work in progress (WIP) for amount activities. "At Billing Price" means the calculated billing price is posted to the job's WIP account and set off against the open billing price account. The amount is posted to the open billing price account. The posting references for these accounts are specified by means of dimension combinations in the window Job Groups and in the window Activities in the Job Cost module if "Post by Activity" is marked in the window System Information in the SetUp module, or the window Posting References if "Post by Activity" is not marked.</p>
<b>Job Name</b>	This field displays the name of the current job.
<b>Activity</b>	Here you can enter a number of an activity from the Job Cost module, if the entry pertains to a job. Maconomy checks that the number is that of an existing amount activity. Activities are created in the window Activities in the Job Cost module.

Field	Description
<b>Activity Name</b>	This field shows the name of the activity if you have entered an activity on the current line. The name is retrieved from the window Activities in the Job Cost module.
<b>Employee No.</b>	If the current entry concerns a certain employee, you can enter the employee number in question in this field. Employees are created in the window Employees in the Set-Up module.
<b>Task</b>	Here you can enter the job dimension "Task." If a task is entered, Maconomy checks that the selected task has been assigned to the task list for the job in question. If a task list has been selected for a job, it is necessary to enter a task in connection with job entries to the job (that is, entries where the field "Account No." is left blank and a job is specified in the field "Job No." Task lists are created in the window Task Lists in the Job Cost module.
<b>Task Description</b>	This field shows the description of the task if you have entered a task on the current line. The description is retrieved from the window Task Lists in the Job Cost module.
<b>Customer No., Ref.</b>	In this field, you can enter a reference to a customer. You can only specify a customer number here if the current line pertains to a finance entry (for example, the field "GRP" contains the value "G"). If the line also contains a value in the field "Job No.," you can only specify the customer of the job in question. When deriving dimension values for the current line, dimension values may be derived from the specified customer. For further information on this process, see the description of the field "Location No."
<b>Customer Name, Ref.</b>	If a customer has been specified in the field "Customer No., Ref." above, this field shows the name of the customer in question.
<b>Vendor No., Ref.</b>	In this field, you can enter a reference to a vendor. You can only specify a vendor number here if the current line pertains to a finance entry (for example, the field "GRP" contains the value "G"). When deriving dimension values for the current line, dimension values may be derived from the specified vendor. For further information on this process, see the description of the field "Location No."
<b>Vendor Name, Ref.</b>	If a customer has been specified in the field "Vendor No., Ref." above, this field shows the name of the vendor in question.
<b>Asset No., Reference</b>	Use this field to enter a reference to an asset. You can only specify an asset number here if the current line pertains to a finance entry and GRP=G.
<b>Asset Description</b>	This field displays a description of the referenced asset.
<b>Tax Direction</b>	Here you can specify whether the entry is for a purchase or a sale. It only needs to be completed if you have selected "Extended Tax Reporting" in the window System Information.

Field	Description
	<p>If you enter a customer entry, Maconomy will choose "Sale" for the subsequent G/L entry lines if they have the same transaction number as the customer entry and if you have chosen a "Company Tax Code."</p> <p>If you enter a vendor entry, Maconomy will choose "Purchase" for the subsequent G/L entry lines if they have the same transaction number as the vendor entry and if you have chosen a "Company Tax Code."</p>
<b>Company Tax Code</b>	<p>Here you can select a company tax code. It is only necessary to complete the field if you complete the field "Tax Direction."</p> <p>If you enter a customer entry, Maconomy will choose the customer's reporting code for the subsequent G/L entry lines if they have the same transaction number as the customer entry and if you have chosen an Item Tax Code."</p> <p>If you enter a vendor entry, Maconomy will choose the vendor's reporting code for the subsequent G/L entry lines if they have the same transaction number as the vendor entry and if you have chosen an "Item Tax Code."</p>
<b>Item Tax Code</b>	<p>Here you can choose an item tax code. It is only necessary to complete the field if you complete the field "Tax Direction."</p> <p>If you enter an account in the field "Account No." on the same entry line, Maconomy suggests the reporting code assigned to the account.</p>
<b>Vendor Invoice No.</b>	<p>This field can only be used when you post entries related to a vendor in the general journal. You can specify a vendor invoice number in the field. The field "Settle non-appr. Cred. Entries" in the system information must be marked if you wish to settle a non-approved vendor entry in this window.</p>
<b>Reconc. Invoice No.</b>	<p>Here you enter an invoice number, if you have entered "R" in the field "GRP." You can only specify invoices that have been posted.</p> <p>If the field "GRP" is marked "R," and you enter the number of an invoice or credit memo here, Maconomy automatically enters the customer number in the field "Account No." However, if you have manually entered a customer number in the field "Account No.," the Find Invoice window activated from this will only show invoices relating to the customer in question.</p> <p>If the entry is a customer payment that is supposed to automatically reconcile an invoice, enter the invoice number. If the amount paid is not the same as the invoice amount, the invoice will be partly reconciled. Note that if you do not enter an invoice number, and the customer is marked in the field "Automatic Reconciliation" in the window Payment Information in the A/R module, Maconomy will reconcile the oldest due invoice.</p> <p>If the entry is a payment that is supposed to automatically reconcile a credit memo, enter the credit memo number. If the amount on the payment (which is entered in debit) is not the same as the credit memo amount, the credit memo will be partly reconciled.</p> <p>If you have set up the table part of the window Dimension Derivations in the G/L module to derive dimensions from invoices when creating a customer payment, specifying an invoice or credit memo in this field while creating a new customer payment will cause the dimension values on the specified invoice or credit memo to be copied to the dimension fields on the current line. However,</p>

Field	Description
	<p>fields in which a value has manually been specified are not overwritten by the dimension values from the invoice. For further information, see the field "Action" in the table part of the window Dimension Derivations.</p> <p>If an invoice is reconciled in a foreign currency, any exchange rate difference will be posted at the same time as the journal.</p>
<b>Due Date</b>	<p>Here you enter the due date of the customer or vendor entry.</p> <p>You can use the date when entering cost vendor entries, in which case the entry is registered in the Accounts Payable module with the date. This makes it possible to include cost transactions in your regular payment control.</p> <p>You can also manually enter debit entries to a customer account—for example, invoices—and also enter a due date in this field.</p> <p>If you do not enter a date here, Maconomy will calculate the due date from the entry date and the terms of payment. This only applies to a customer entry to a customer or a vendor entry to a vendor, that is, a sales or purchase invoice.</p>
<b>Reference Date</b>	<p>In this field you can enter a reference date for the current entry. This might, for example, be the date of a telephone call which gave rise to the current entry. If you do not enter a date, Maconomy suggests the entry date of the line. The date is transferred to the G/L entries resulting from the current journal line.</p> <p>If you enter a job number on the current line, Maconomy checks that the date specified in this field is within the open posting period of the job in question. Furthermore, if a job is specified, the date in this field is used as the job cost posting date on the job entries resulting from the current journal line.</p>
<b>Check No.</b>	<p>If the current line is a debit entry for a vendor, the line represents payment to the vendor. If you pay the vendor by check, you can enter the number of the handwritten check in this field. A payment mode must also be specified in the field "Payment Mode" described below. The payment mode must be assigned to a check book, and the number will be checked against the number series created for the check book that is assigned to the payment mode. If the system parameter "Consecutive Check Numbers Required" has been marked, you can only specify enter a check number corresponding to the next check number according to the check book setup in the window Popup Fields.</p>
<b>Payment Mode</b>	<p>This field can only be completed on lines concerning payment of vendors by check or registration of vendor invoices or credit memos. The field is used for specifying the payment mode to be used when paying the vendor, either immediately by handwritten check or later if the registration concerns the registration of a vendor invoice. The functionality of the field depends on whether a check number has been specified in the field "Check No." above.</p> <ul style="list-style-type: none"> <li>▪ If a check number has been specified (manual payment to vendor by check): If you have specified a check number, the line represents payment to the vendor by check. In this field, you must therefore specify the payment mode assigned to the relevant check book covering the specified check number.</li> </ul>

Field	Description
	<p>If the field "Omit Payment Reporting" has not been marked on the payment mode, the G/L entry resulting from the current line is posted to the account "Being Paid" specified on the vendor control account in the window Popup Fields, while the offset entry is posted to the account specified for the payment mode in the field "Posting Ref., Being Paid" in the table part of the window External Accounts. If the payment mode specifies to omit payment reporting, the G/L entry is posted to the account "Control Account" specified on the vendor control account in the window Popup Fields, while offset entry is posted to the account specified in the field "Account No." in the card part of the window External Accounts.</p> <ul style="list-style-type: none"> <li>■ If no check number has been specified (registration of vendor invoice or credit memo): If no check number has been specified, the line represents the registration of a vendor invoice or credit memo, depending on whether the amount is in credit or debit. In this field, you can therefore specify the payment mode to be used when the vendor entry is paid. This payment mode will be suggested when the entry is selected for payment, rather than the standard payment mode of the vendor, specified in the window Payment Control. If you do not enter a payment mode, Maconomy will suggest the vendor's standard payment mode when the vendor invoice is selected for payment.</li> </ul> <p>If you have specified a payment mode, it is not possible to enter an offset code on the line.</p>
<b>Prior-Period</b>	<p>If the journal is a prior-period journal, the prior period is displayed in this field. If the journal is not a prior-period journal, you can specify a prior period from another fiscal period in this field. If this is the case when you post the entry, postings will be made on a sub-total account for the selected prior period. The posting date will be the last day in the period, if the prior period is before the current period, and on the first day in the period if the prior period is after the current period.</p> <p>Prior-periods are created in the popup field "Prior Periods" in the window Popup Fields in the Set-Up module and can contain information about which sub-total account the prior period should be posted on, which period and fiscal year is to be used and whether the prior period is open for registration or import.</p>
<b>Accrual Type</b>	<p>If you select a value in this field, the entry will be accrued. You can only accrue an entry if a G/L account or job has been selected. If you select accrual, Maconomy will create a G/L entry on the specified G/L account or job for each G/L period specified in the fields "Period From, Accrual" and "Period To, Accrual." If the current entry is a G/L entry, the accrual entries are posted to the account specified in the field "Account No." If the current entry is a job entry, the accrual entries are posted to the relevant, accrual related posting references on the activity in question or in the window Posting References, depending on whether the field "Post by Activity" is marked in the window System Information.</p>

Field	Description
	The offset entries are posted to the accounts referenced for the selected accrual type in the window Popup Fields. The amount is distributed evenly on the selected periods. For accruals made on job entries, both cost and billing prices are accrued.
<b>Period From, Accrual</b>	<p>In this field and the field "Period To" you can enter a range of dates. If you select an accrual type in the field "Accrual Type" above, Maconomy will create a G/L entry on the specified G/L account for each G/L period specified in the fields "Period From, Accrual" and "Period To, Accrual." The amount is distributed evenly on the selected periods.</p> <p>Please note that the last period must be no later than the accrual ending period set up in the field "Accrual Period, Ending" in the information card of the company specified on the entry. If no ending period has been specified there, the ending period set up in the corresponding field in the window System Information applies instead. If an ending period has been set up neither in the company information card nor in the system information window, you can specify any period in the field "Period To".</p>
<b>Period To, Accrual</b>	See the field "Period From, Accrual" above.
<b>External Trans. No.</b>	In this field you can enter the number of an external transaction, for example, a transaction which originates in a legacy financial system. After posting, this number can be viewed in the window Show G/L Entries.
<b>Payer ID</b>	In this field you can specify a payer ID on vendor entries, corresponding to the payer ID entered on vendor invoices in the window Vendor Invoices. For further information on the functionality of the payer ID, see the field "Payer Identification" in the A/P module's description of the window Vendor Invoices.

## Actions

This section shows the actions available in the General Journal workspace.

### General Journal Tab

Field	Description
<b>Attach Document</b>	<p>Use this action to attach a document to the General Journal. For example, this could be a scanned voucher or invoice which serves as documentation for the General Journal.</p> <div> <p><b>Note:</b> You can only attach one document per journal, so if you try and add a new document when one is already attached, a dialog displays to give you an option to replace the current document with the new document. The current document is permanently deleted when the new document is attached. Documents are attached at a journal level, and not a table line level. All the lines refer to the same attached document.</p> </div>

Field	Description
<b>View Document</b>	Use this action to display the document attached to the General Journal.

## General Journal Templates Workspace

Use this workspace to reuse general journals, for instance for transactions that occur on a regular basis (rent, monthly salaries, and so on) or for correcting erroneous entries in previous journals.

This workspace displays any templates that you created from posted journals. You can use these templates to create journals that have the same entry lines as the originals. You can enter a new entry date and transaction number, and you can reverse the entries, meaning that the original debit entries are created as credit entries, and vice-versa.

You can copy templates in batches in the Journal Copying workspace.

### General Journal Templates Tab

This section includes the fields and descriptions for the General Journal Templates tab.

#### Template Island

Field	Description
<b>Journal No.</b>	This is the number of the general journal from which you created the template. You can use the search functions in the Find menu to find the correct template.
<b>Name</b>	Here you can enter the name of the template.
<b>Created by</b>	This is the name of the user who created the template. It cannot be changed.
<b>Date</b>	This is the date the template was created. It cannot be changed.
<b>Period</b>	This is the first day in the period the original journal was posted in. it cannot be changed.
<b>Prior-Period</b>	<p>Here you can specify that the journal is a prior-period journal, as well as which prior period the journal is for. If you choose a period, the journal is registered as a prior-period journal. The mark is shown in the window Journal Listing, where you can choose to see a list of prior-period journals. In the window Print Posting Journal, you can choose to make a printout or to post just prior-period journals. In the window G/L Report Set-Up you can extract a financial report based on a prior period.</p> <p>Prior-period journals are used for entries to periods which have been closed, including entries to previous fiscal years. The prior periods are created in the popup field "Prior Periods" in the window Popup Fields in the Set-Up module.</p>

**Company Island**

Field	Description
<b>Company</b>	This field displays the name of the company responsible for the journal used as a basis for the current template. The company name cannot be changed.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company" above. See the field "Base Currency" in the window Company Information for a detailed description of the concepts of company base currency and enterprise currency.

**Transaction Numbering Island**

Field	Description
<b>Transaction Type</b>	In this field you can specify the default transaction type of the template journal. You can later change the transaction type of individual entries in the General Journal workspace.
<b>Number Series</b>	In this field you can select a transaction number series. When you create the general journal, Maconomy will use the next available transaction number in the selected number series for all entry lines in the new general journal. This means that even if the template lines have different transaction numbers, the transaction number will be the same on every line in the new general journal. You can, however, change the transaction number on individual entry lines in the General Journal workspace. You can also enter a specific transaction number on the entry lines by leaving this field blank and instead specifying a fixed transaction number in the field "New Trans. No."

## Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Entry Date</b>	This is the entry date of the entry line.
<b>Trans. No.</b>	This is the transaction number of the entry line.
<b>Trans. Type</b>	This field is the transaction type of the entry line.
<b>Description</b>	This is the entry text of the entry line.
<b>Std. Desc.</b>	This is the text code, if the entry text is based on a standard text code.
<b>GRP</b>	This field contains "G," "R," or "P," depending on whether the entry is a general ledger, customer (receivable) or vendor (payable) entry. It has a

Field	Description
	“G” if the entry is from the Job Cost module, that is, there is a job number in the field “Job No.”
<b>Account No.</b>	<p>This field shows the account number, if the entry is not a job entry from the Job Cost module, that is, if there is a job number in the field “Job No.” on the line. If the field “GRP” contains:</p> <ul style="list-style-type: none"> <li>■ G — The number is a general ledger account number.</li> <li>■ R — It is a customer number.</li> <li>■ P — It is a vendor number.</li> </ul> <p>If the entry is a job entry from the Job Cost module, this field is blank.</p>
<b>Account Name</b>	This is the account text. It is retrieved from the Account Information Card for the general ledger, customer or vendor account given in the field “Account No.”
<b>Tax</b>	<p>This field shows the G/L tax code, if applicable.</p> <p>If multiple tax codes are enabled, the field will display the aggregate G/L tax. For further information on multiple tax codes, please see the description in “Tax Codes.”</p>
<b>Debit</b>	This field is the amount in Base Currency, if the entry is a debit entry. The amount is displayed in the base currency of the company specified in the island Company in the General Journal Templates tab.
<b>Credit</b>	This field is the amount in Base Currency, if the entry is a credit entry. The amount is displayed in the base currency of the company specified in the island Company in the General Journal Templates tab.
<b>Registration Code</b>	This field displays a registration code, if you used one when entering the dimensions.
<b>Company No.</b>	This field displays the number of the company to which the current posting line pertains.
<b>Location</b>	This is the Location to which the entry is assigned.
<b>Entity</b>	This is the Entity to which the entry is assigned.
<b>Project</b>	This is the Project to which the entry is assigned.
<b>Purpose</b>	This is the Purpose to which the entry is assigned.
<b>Spec. 1-3</b>	These fields display the Specifications to which the entry is assigned.
<b>Local Spec. 1-3</b>	These fields display the Local Specifications to which the entry is assigned.

Field	Description
<b>Offset</b>	This is the entry's offset code.
<b>Summary Posting</b>	This field is marked if the entry line is going to be posted with other entries to the same account number.
<b>Job No.</b>	This is the entry's job number, if the entry pertains to a job in the Job Cost module.
<b>Activity</b>	This is the job activity, if the entry pertains to a job in the Job Cost module.
<b>Task</b>	This is the task number of the entry line, if the entry pertains to a job in the Job Cost module.
<b>Vendor Invoice No.</b>	This field shows the vendor invoice number, if any.
<b>Reconc. Vendor Invoice No.</b>	If you are paying a vendor invoice, that is, an A/P entry in debit, this field shows a vendor invoice number.
<b>Reconc. Invoice No.</b>	This is the invoice number if the field "GRP" contains an "R." If the entry is a customer payment, the invoice number indicates the invoice that the payment reconciles.
<b>Due Date</b>	This is the due date, if applicable, of the customer or vendor entry.
<b>Currency</b>	This is the original currency, if the entry is from a currency transaction.
<b>Currency Amount</b>	This is the entry amount in the foreign currency. Credit amounts are negative.
<b>Amount, Enterprise</b>	This field displays the entry amount in enterprise currency. A credit amount is shown as a negative figure.
<b>Quantity</b>	This is the entry quantity.
<b>Quantity 2</b>	This is the entry quantity 2.
<b>Payment Mode</b>	This field shows the payment mode and is only used in connection with registering checks. The check number will not be transferred to the template. When a new general journal is created based on the journal template, a new check number must be specified in the general journal.
<b>Accrual Type</b>	This field shows the accrual type. You can only accrue an entry if this is a G/L account or job.
<b>Period From, Accrual</b>	This field shows the beginning date of the accrual period, if the Accrual Type field contains a value.

Field	Description
<b>Period To, Accrual</b>	This field shows the ending date of the accrual period, if the Accrual Type field contains a value.

## Journal Copying Workspace

Use this workspace to copy journals in batches.

You can also use this workspace to give an overview of the templates that are to be used within a given period. You enter the date range in the **New Entry Date** target group fields in the Selection Criteria island.

By default, this workspace displays any templates that you created from posted journals that meet the selection criteria that you specify. You can use these templates to create journals that have the same entry lines as the originals. You can enter a new entry date and transaction number, and you can reverse the entries, meaning that the original debit entries are created as credit entries, and vice-versa.

You can also create journals from posted journals that were not saved as templates—for instance to correct erroneous entries. Deselect the **Show Templates Only** field in this workspace to see a list of posted journals that match the specified criteria.

This approach provides the same functionality as that for creating journals from templates.

To create a journal from another journal or a template, select the **Copy** field on the journal or template line and enter information about the entry date, transaction numbers, reversion, and so on. You can select any number of lines for copying.

If you change any information about templates in this workspace, the General Journal Templates workspace also displays those changes.

### Journal Copying Tab

This section includes the fields and descriptions for the Journal Copying tab.

#### Selection Criteria Island

Field	Description
<b>Journal No.</b>	Here you can enter a range of journal numbers to specify which journals and templates are to be shown in the table part of the window.
<b>New Entry Date</b>	Here you can enter a range of dates. The Journals sub-tab will display templates for the journals to be posted within the specified date range. This range only pertains to journals marked as templates. If the field “Show Templates Only” is unmarked, this period does not limit the number of non-template journals shown in the Journals sub-tab.
<b>Show Journals to Repeat</b>	If you mark this box, the Journals sub-tab will show journals that are not marked in the field “Reverse Entries”.

Field	Description
<b>Show Journals to Reverse</b>	If you mark this box, the Journals sub-tab will show journals that are marked in the field "Reverse Entries".
<b>Show Templates Only</b>	If this box is marked, the Journals sub-tab will only show journal templates. If the mark is removed, the Journals sub-tab also shows journals that are not marked as templates. Journals are marked as templates either before they are posted in the General Journal or by assigning a name to them later in the field "Name" in the Journals sub-tab of this workspace.

### Journals Sub-Tab

This section includes the fields and descriptions for the Journals sub-tab.

Field	Description
<b>Journal No.</b>	This is the number of the current general journal. If the line shows a template, this is the number of the journal from which the template was created.
<b>Name</b>	This field shows the name of the current template. You can change the name here. If the field is blank, the current line shows a journal which has not been marked as a template. However, you can enter a name on such lines, thus marking the journal in question as a template. Similarly, if you remove the name from a template, the template is changed to a "normal" journal.
<b>New Entry Date</b>	Here you can enter an entry date. When you create a new journal, Maconomy will use this entry date for all entry lines in the new journal. The entry dates can be changed in the window General Journal.
<b>Range (Months)</b>	If you enter a range here, Maconomy will set the date in the "New Entry Date" to the applied entry date plus the value in this field. The new date will be used next time the template or journal is copied.
<b>New Trans. No.</b>	Here you can specify a transaction number. When you create the new journal, Maconomy will use the number for all entry lines. You can later change transaction number of individual entries in the window General Journal. You can also let Maconomy enter the next available number in a transaction number series on the journal lines by leaving this field blank and instead specifying a transaction number series in the field "Transaction Number Series."
<b>New Trans. Type</b>	Here you can specify a transaction type. When you create the general journal, Maconomy will use this transaction type for all entry lines. You can later change the transaction type of individual entries in the General Journal workspace.
<b>Transaction Number Series</b>	In this field you can select a transaction number series. When you create the general journal, Maconomy will use the next available transaction number in the selected number series for all entry lines in the new general journal. This means that even if the lines in the original journal had different transaction

Field	Description
	numbers, the transaction number will be the same on every line in the new general journal. You can, however, change the transaction number on individual entry lines in the General Journal workspace. You can also enter a specific transaction number on the entry lines by leaving this field blank and instead specifying a fixed transaction number in the field "New Trans. No."
<b>Transaction Type</b>	In this field you can select the default transaction type of the current general journal.
<b>Rev. Entries</b>	If you mark this field, Maconomy will reverse entry lines when creating a new journal. This means the original debit entries are created as credit entries and vice versa. However, a reversing journal is only created if the field "Copy" is also marked.
<b>Copy</b>	If you mark this field, Maconomy will create a journal as a copy of the journal or template on the line when you select the "Copy" action. However, if the field "Rev. Entries" has also been marked, the journal created when the action "Copy" is selected will be a reversing journal, as described in the field "Rev. Entries" above.
<b>Created by</b>	This field shows the name of the user who created the original journal. The name cannot be changed.
<b>Created on</b>	This is the date when the template was created. It cannot be changed.

## Actions

This section shows the actions available in the Journal Copying workspace.

### Top Pane

Field	Description
<b>Copy</b>	When you select this action, Maconomy copies the templates and journals which have a mark in the field "Copy". Each individual template or journal is copied in the same way as with the action "Copy General Journal" in the window General Journal Templates. At this time it is validated that the new entry date is within the open posting periods for the company and transaction type combination.

## Posting Workspace

Use this workspace to view a list of unposted journals—which you can limit by specifying selection criteria—and to post all of these journals directly.

In the Journals sub-tab of this workspace you can select each journal as released for posting. A journal can only be released for posting when its balance is 0, and the control sum balances with the batch total that Maconomy calculates. Maconomy only performs this last check for general

and A/P journals. You cannot post A/P journals if they contain allocated vendor invoices that have not been approved.

You can also post journals in the Print Posting Journal workspace. You can post only journals that have been released for posting, both in this workspace and in the Print Posting Journal workspace.

You cannot post general journals, vendor invoice journals, and payment journals if they are being processed in the General Journal, Vendor Invoices, or Payment Journal workspaces.

The posting procedure requires that you have created a number of posting references, such as references for customer cash discounts, cost of sales, inventory value, and so on. You create these references in a number of different workspaces, such as Posting References and Popup Fields in the Set-Up module, Warehouse Information Card and Item Group Information Card in the Inventory module, Job Groups and Activities in the Job Cost module, and so on.

The posting procedure also requires that you have created a number of standard posting texts in the Posting Descriptions workspace.

### Multiple Journals of the Same Type

Multiple general journals, vendor invoice journals, job journals, and customer payment journals can exist at the same time; these are created manually by the user. All the other journal types are automatically created by Maconomy as needed; only one of each journal type is created. These automatic journals are cumulative for each user-company combination if a user-specific journal system parameter is selected (for example, **User Specific Vendor Journal**, **User Specific Payment Journal**, **User Specific Customer Reconciliation Journal**), and are cumulative for a company if a user-specific system parameter is not selected.

For example, when you create an invoice for the first time, Maconomy automatically creates an invoice journal. This invoice journal contains all of the entries from invoicing and crediting until it is posted. This means that you can have invoice entries that go back several days. When you post the invoice journal, Maconomy marks the journal as posted, and you can no longer see the journal in this workspace. Maconomy creates a new journal the next time that you create an invoice or a credit note.

When you settle accounts periodically, be sure not to omit posting journals that contain invoices or other entries for the period that you are closing.

### Interrupted Posting

If a journal posting is interrupted—for example, by server problems—entries whose posting was complete when the interruption occurred remain posted. When the posting resumes, only the entries that were not posted are processed. After an interruption, you must resume the posting from this workspace.

### Multiple Companies

If a journal contains entries for two different companies, Maconomy automatically creates intercompany balances, unless you do not select the **Create intercompany entries for companies with same parent company** system parameter, and the two companies involved are both assigned to the same parent company.

When you post intercompany entries, Maconomy copies all of the dimension values to the account that you defined as the intercompany account by means of a posting reference in the Intercompany Accounts workspace. To avoid copying local specifications that might not exist for

the intercompany company, Maconomy resets the values of local specifications to standard values before copying them.

### Multiple Currencies

If a journal contains job entries, Maconomy checks whether fixed exchange rate information has been provided for the job in the Job Price Information workspace in the Job Cost module. If this is the case, and you did not select the **Fixed exchange rates in budgets only** system parameter, Maconomy converts the currency according to the fixed exchange rate information specified in the Job Price Information workspace.

### Posting Tab

This section includes the fields and descriptions for the Posting tab.

#### Statistics Island

Field	Description
<b>No. Journals to Post</b>	This field shows how many of the journals shown in the table part you have released for posting. A journal is released for posting when its balance is 0 and it is marked in the "Post" field.

#### Selection Criteria Island

Field	Description
<b>Company No.</b>	In these fields you can enter a range of company numbers. Only companies within the range will be included in the Journals sub-tab. If you do not specify a range, no regard is made to the companies to which the Journals sub-tab entries belong.
<b>Journal No.</b>	In this field, you can specify a range of journal numbers. Only journals with numbers within the specified range will be included in the Journals sub-tab.
<b>Journal Type</b>	In this field, you can select a journal type. Only journals of the specified type will be included in the Journals sub-tab. A description of the individual journal types is given in the introduction to this workspace.
<b>Created on</b>	In this field, you can specify a range of creation dates. Only journals created on dates within the specified range will be included in the Journals sub-tab.
<b>Created by</b>	In this field, you can specify a range of user names. Only journals created by users whose user name is within the specified range will be included in the Journals sub-tab.
<b>Post</b>	This field shows whether the journal is ready to be posted.

## Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. The layout "Standard" includes detailed information on each entry. The layout "Journal Overview" shows summary information with totals for each posted journal, including intercompany journals.
<b>Include Totals</b>	You can check this box if you wish to print a total for every account to which there are entries in the posting journals you are printing. If you check the box, Maconomy will total up debit, credit and tax amounts for every account in every journal during posting.

## Journals Sub-Tab

This section includes the fields and descriptions for the Journals sub-tab.

Field	Description
<b>Journal No.</b>	This is the journal number. Maconomy allocates it automatically from the "Journal" system number series. It cannot be changed.
<b>Company No.</b>	This field displays the number of the company to which the journal pertains.
<b>Name</b>	This field displays the name of the company specified in the field "Company No."
<b>Journal Type</b>	This is the journal type. The different types are general, payment, A/R, A/P, invoice, vendor invoice, reallocation, job, client adjustment, and item journal. See also the introductory description of this workspace. The type cannot be changed.
<b>Created on</b>	This is the date when the journal was created. It cannot be changed.
<b>Created by</b>	This is the name of the user who created the journal. It cannot be changed.
<b>Balance</b>	This is the journal's balance. It is automatically updated by Maconomy. A/R and vendor invoice journal balances are calculated as the total of customer and vendor entries respectively. The total of offsetting entries are not included in the calculation. This means that these two types of journal can be posted without their balances having to be 0. All other journals must balance to be posted, that is, the value in this field must be 0.
<b>Post</b>	If you mark this field, the journal will be posted when you select the "Post" action on the Posting tab. All journals with a check mark in this field will be included in the posting. There will only be a mark for general, job, vendor invoice, and payment journals if the mark was set when the journals were entered. Other journals will automatically be marked.

Field	Description
<b>Being Posted</b>	This field shows whether parts of the journal have been posted. When the posting of a journal starts, this field is marked until the posting of the journal is completed. If posting is interrupted due to server problems, the field remains marked, but those entries whose posting was complete when the interruption occurred remain posted. Thus, when the posting is resumed, only the entries remaining to be posted are processed. After an interruption, a posting can only be resumed in this workspace.

## Actions

This section shows the actions available in the Posting workspace.

### Top Pane

Field	Description
<b>Post</b>	<p>When you select this action, Maconomy posts all the journals that are currently shown in the Journals sub-tab and have the field "Post" marked.</p> <p>Before Maconomy carries out the posting in the G/L module, it checks that all of the accounts named in the journals exist in the chart of accounts, and that they are not blocked. The journal cannot be posted if an account, a customer, or a vendor is missing, or if a G/L account is blocked. A vendor invoice journal can only be posted when all allocated vendor invoices are approved.</p> <p>Depending on the setting of the system parameters "Submission of General Journal required," "Submission of Job Journal required," "Submission of Customer Payment Journal required," and "Allow Posting of Own Journals," general journals, job journals, and customer payment journals, respectively, may have to be submitted before they can be posted, and they may have to be posted by a different user than the one who submitted them.</p> <p>Maconomy automatically prints the posting journals. This cannot be prevented, but you can select a layout which summarizes the journal information rather than itemizing all entries.</p> <p>You can reprint posting journals in the window Print Posting Journal.</p> <p>You cannot change information in a journal which has been posted.</p>

## Types of Posting Journals

Maconomy provides many types of posting journals, for different types of entries and calculations.

Type	Description
General	You create this journal in the General Journal workspace. It contains manually entered G/L, customer, and vendor entries. Depending on how you set the <b>Submission of General Journal required</b> and <b>Allow Posting of Own Journals</b> system parameters, you might need to submit a journal before you can post it, and it might need to be posted by a different user from the one who submitted it.

Vendor Invoice	You create this journal in the Vendor Invoices workspace in the Accounts Payable module. It contains manually entered vendor invoices and credit memos. If the journal involves a vendor invoice that is assigned to a purchase order that has unsettled job accruals, posting the journal triggers a number of postings that reconcile the job accrual.
Invoice Reallocation	You create this journal in the Reallocate Invoices workspace in the Accounts Payable module.
Job	You create this journal in the Job Journal workspace in the Job Cost module. When you post the job journal in this workspace, it includes job entries from the Invoice Selection workspace in the Job Cost module, so that customers are invoiced for services sold. Depending on how the <b>Submission of Job Journal required</b> and <b>Allow Posting of Own Journals</b> system parameters are set, you may need to submit a journal before it can be posted, and it may need to be posted by a different user than the one who submitted it. When you make entries to a job in a job group for which there is automatic capitalization, the resulting G/L entries depend on which capitalization principle you selected for the job. When you make entries to a job in a job group that does not have automatic capitalization, or to an unbillable job or activity, Maconomy creates a G/L entry only if you select the <b>Post Hours in Job Journal</b> (for hours entries) or <b>Post Amount in Job Journal</b> (for amount entries) fields in the System Information workspace. If you selected the <b>Dept. from Employee</b> field in the System Information workspace, Maconomy takes the posting reference for the offsetting entry for time activities from the department to which the employee belongs. If you do not select this field, Maconomy uses the department to which the job is assigned.
Time Sheet	You create this journal when you transfer or approve time sheets in the Time Sheets workspace in the Job Cost module. When you post the time sheet journal in this workspace, the entries are included in the Invoice Selection workspace in the Job Cost module so that the relevant customers are invoiced for services. You can post time sheet journals from this workspace and from the Print Posting Journal workspace.
Expense Sheet	You create this journal when you transfer or approve expense sheets that you entered in the Expense Sheets workspace in the Job Cost module. You can post expense sheet journals from this workspace and from the Print Posting Journal workspace.
Customer Reconciliation	You create this journal when you approve customer reconciliations in the A/R module. You also use this journal type if the reconciliation produces a cash discount or exchange rate difference.
Automatic Customer Payment	You create this journal when customer payments are read from a file or entered and approved manually in the Customer Payment Reporting workspace in the Banking module.
Follow-up Selection	You create this journal when you print a petty cash follow-up selection in the Print Follow-Up Selection workspace in the Banking module.

Vendor	You create this journal when you print out checks or create an electronic payment file. When the vendor journal is posted, entries are made to the payment mode account for amounts being paid and to the equivalent account belonging to the A/P control account. The amounts are offset when the payment is approved in the Payment Reporting workspace in the Banking module and subsequently posted.
Payment	You create this journal when you approve payment selections in the Banking module. You can edit the journal in the Payment Journal workspace in the Banking module, where you can change the entry date and the amount in base currency for currency entries.
Invoice	You create this journal by invoicing and crediting in the Sales Orders or Job Cost modules. Invoice journals contain transaction information about the following accounts: customer and customer control accounts, item sales accounts, invoice discounts, the four charge accounts, cost of sales accounts, accounts for non-invoiced cost of sales, accounts for non-inventoried cost of sales, WIP accounts, open billing price accounts, open cost accounts, accounts for outgoing tax, job invoice/contract deviation accounts, and accounts for advance payment of subscriptions. Dimension values on item lines on invoices and credit memos with reference to any of these accounts are posted with the dimension specification. Entries to the customer's account in the Accounts Receivable module are excepted. Entries to customer control accounts, tax accounts, and charge accounts are posted with the dimensions given in the card part of the invoice or credit memo that the invoice journal is related to.
Item	You create this journal when you approve inventory change transactions in the Inventory module, approve item receipts in the Item Purchase module, print delivery notes and credit memos in the Sales Orders module, and when you print invoices and credit memos in the Accounts Receivable module. An inventory journal contains information about transactions involving the posting references in Warehouse Information Cards in the Inventory module and the account for unreconciled vendor entries. When you post an inventory journal line that is attached to a job and activity number, the debit entry is marked with the job's dimension information. If you have the Maconomy Bill of Materials module, you also create an inventory journal when you approve a production transaction in the Inventory module.
Job Item	You create this journal when you use one of the Print Packing Slip or Release to Invoice actions in the Sales Orders workspace, and you select the <b>Invoice in Job Cost</b> field for the sales order. The entries in this journal are then included in a subsequent invoice selection for the job.
Asset	You create this journal when you approve an asset adjustment in the Asset Adjustment workspace. An asset journal shows transactions to posting references in the Asset Groups workspace in the Fixed Assets module.

Asset Depreciation	You create this type of journal when you create a depreciation adjustment for one or more assets in the Depreciation Adjustment workspace in the Fixed Assets module.
Asset Sale	You create this journal when you use the Asset Disposal workspace to sell an asset (you fill out the Sales island in that workspace and use the Approve Sale action).
Asset Transfer	You create this journal when you use the Asset Disposal workspace to transfer an asset (you fill out the Transfers island in that workspace and use the Approve Transfer action).
Asset Relocation	You create this journal when you use the Asset Relocation workspace to change the internal location of an asset.
Asset Internal Sale	You create this journal when you use the Asset Internal Sale workspace to sell an asset internally.
Bank Reconciliation	You create this journal when you approve a set of bank reconciliation lines in the Bank Reconciliations workspace in the Banking module.
Job Reallocation	This journal contains approved job reallocation entries from the Job Reallocation workspace. Posting of job reallocation entries is performed according to the principles for job journals.
Job Accrual	This journal contains entries for job accruals created in the Job Accruals workspace. When job accruals are posted, a number of job and G/L postings are created (for example, to the WIP account) so that you can invoice a customer for a cost before the cost is entered into Maconomy.
G/L Reallocation	You create this journal when you use the Create Journal action in the G/L Reallocation workspace to reallocate G/L entries.
Royalty	You create this journal when you approve royalties in the A/P module.
Import	You create this journal when you run import programs and other programs from the <b>Programs...</b> menu option.
Job Revenue Recognition	This journal contains entries for job revenue recognition adjustments, overrun adjustments, and WIP evaluations. When the journal is posted, a number of job and G/L postings are created (for example, to the account for WIP adjustment and the open sales price account). If the journal is created in connection with overrun adjustments on a job, the entries that are created adjust the open sales price to match the fixed price of the job. If the journal is created as a result of revenue recognition on a job, the entries adjust the capitalized amount to match the completion percentage of the job. If the journal is created as a result of a WIP evaluation, the entries adjust the account for work in progress and the account for open billing price.
Customer Payment	This journal contains error entries from reading customer payment files in the Read Customer Payments workspace or manually marking entries as error entries in the Customer Payment Reporting workspace in the Banking module. Before the journal can be posted, the errors must be

	corrected in the Customer Open Entry Reconciliation workspace in the A/R module. Depending on the setting of the <b>Submission of Customer Payment Journal required</b> and <b>Allow Posting of Own Journals</b> system parameters, a journal of this type may need to be submitted before it can be posted, and may need to be posted by a different user than the one who submitted it.
Unrealized Exchange Rate Variance	You create this journal when you run currency reports where the <b>Create G/L Entries</b> field is selected. The entries in this journal enter unrealized exchange rate variances in your accounts.
Job Transfer	You create this journal when a job is transferred to new dimensions in the Job Transfer workspace in the Job Cost module. The G/L postings that are made as a result of a job transfer depend on the capitalization method selected for the job. If a job is capitalized at cost price, only the accounts for work in progress are affected. If a job is capitalized at billing price, postings are also made to the accounts for open cost and open billing price and to the two accounts for internally transferred cost and sales.
Interest Charge Notice	You create journal when an interest charge selection is approved in the Change Interest Charge Selection or Approve Interest Selection workspaces in the A/R module.
Reminder	You create this journal when a reminder is approved in the Change Reminder Selection or Approve Reminders workspaces in the A/R module.
Collection	You create this journal when a customer collection file is created in the Collection Files workspace in the Banking module.
Tax Settlement	You create this journal when approving a tax settlement in the Tax Settlement workspace.
Intercompany Settlement Vendor Invoice	You create this journal when you run intercompany settlements in the Intercompany Invoicing workspace.
Intercompany Interest Memo	You create this journal when intercompany interest calculations are posted in the Open Entry Intercompany Statement workspace.
Intercompany Grouping	You create journal type when intercompany entries are grouped using the "Group Entries" action in the Open Entry Intercompany Statement workspace.

## Print Posting Journal Workspace

Use this workspace to reprint one or more posted posting journals and to post other journals. When journals are posted, Maconomy automatically prints the posting journal.

When you post a journal, the journal keeps its number and you cannot change it. This serves as documentation of the changes that were made by the posting. You can reprint any posting journal.

Before you can post a journal, you must release it for posting. Select the **Post** field in the Posting workspace or select the **Release for Posting** field on lines in those workspaces that allow you to release entries for posting, such as the Customer Payments workspace.

In the Vendor Invoices and Invoice Allocation workspaces, you cannot select the **Released for Posting** field manually, but Maconomy automatically selects it when an invoice is approved for posting.

In the Posting workspace, you can see which journals are released for posting.

When you post journals in this workspace, you choose which journal type to include in the posting. Maconomy posts all journals of this type that have been released for posting, and prints a copy of the journal.

## Print Posting Journal Tab

This section includes the fields and descriptions for the Print Posting Journal tab.

### Post Journal Island

Field	Description
<b>Cash</b>	If you mark this field, you specify that you wish to post general journals that have been released for posting. In the Posting window, you can mark the "Post" field to specify which journals should be released for posting. General journals should be released for posting. General journals can also be released for posting in the General Journal window. If this field is not marked, general journals will not be posted even though they have been released for posting.
<b>Vendor Invoice</b>	If you mark this field, you specify that you wish to post vendor invoice journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. Vendor invoice journals can also be released for posting in the windows Vendor Invoices and Invoice Allocation in the Accounts Receivable module. If this field is not marked, vendor invoice journals will not be posted even though they have been released for posting.
<b>Reallocate Invoices</b>	If you mark this field, you specify that you wish to post invoice reallocation journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. When Maconomy creates an invoice reallocation journal, it will automatically be released for posting. If this field is not marked, invoice reallocation journals will not be posted even though they have been released for posting.
<b>Job</b>	If you mark this field, you specify that you wish to post job journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. Job journals can also be released for posting in the window Job Journal in the Job Cost module. If this field is not marked, job journals will not be posted even though they have been released for posting.

Field	Description
<b>Time Sheet</b>	If you mark this field, you specify that you wish to post time sheet journals released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, time sheet journals will not be posted even though they have been released for posting.
<b>Expense Sheet</b>	If you mark this field, you specify that you wish to post expense sheet journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, expense sheet journals will not be posted even though they have been released for posting.
<b>Mileage Sheet</b>	If you mark this field, you specify that you wish to post mileage sheet journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, mileage sheet journals will not be posted even though they have been released for posting.
<b>Customer Payment</b>	If you mark this field, you specify that you wish to post customer payment journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, customer payment journals will not be posted even though they have been released for posting. Note that customer payment journals can also be posted in the window Customer Payments in the A/R module.
<b>Customer Reconciliation</b>	If you mark this field, you specify that you wish to post customer reconciliation journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, customer reconciliation journals will not be posted even though they have been released for posting.
<b>Interest Charge Notice</b>	If you mark this field, you specify that you wish to post interest charge notice journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, interest charge notice journals will not be posted even though they have been released for posting.
<b>Reminder Letter</b>	If you mark this field, you specify that you wish to post reminder letter journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, reminder letter journals will not be posted even though they have been released for posting.
<b>Collection</b>	If you mark this field, you specify that you wish to post collection journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, collection journals will not be posted even though they have been released for posting.

Field	Description
<b>Automatic Customer Payment</b>	If you mark this field, you specify that you wish to post customer payment journals which have been automatically created by reading customer payments in the window Read Customer Payments in the Banking module and which have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, automatic customer payment journals will not be posted even though they have been released for posting.
<b>Follow-up Selection</b>	If you mark this field, you specify that you wish to post follow-up selection journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, follow-up selection journals will not be posted even though they have been released for posting.
<b>Vendor</b>	<p>If you mark this field, you specify that you wish to post vendor journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, vendor journals will not be posted even though they have been released for posting.</p> <p>A/P journals are created when you post exchange rate differences or cash discounts in connection with reconciliations in the window A/P Open Entry Reconciliation in the A/P module.</p>
<b>Payment</b>	If you mark this field, you specify that you wish to post payment journals that have been released for posting. Payment journals are created when you print checks in the window Print Check, when you create payment files in the window Payment Files or when you approve payments in the window Payment Reporting in the Banking module. Payment journals can also be released for posting in the window Payment Journal in the Banking module. If this field is not marked, payment journals will not be posted even though they have been released for posting.
<b>Invoice</b>	If you mark this field, you specify that you wish to post invoice journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. When Maconomy creates an invoice journal, it will automatically be released for posting. If this field is not marked, invoice journals will not be posted even though they have been released for posting.
<b>Job Invoice Allocation</b>	If you mark this field, you specify that you wish to post job invoice allocation journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. When Maconomy creates a job invoice allocation journal, it will automatically be released for posting. If this field is not marked, job invoice journals will not be posted even though they have been released for posting.
<b>Item</b>	If you mark this field, you specify that you wish to post item journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. When

Field	Description
	Maconomy creates an inventory journal, it will automatically be released for posting. If this field is not marked, item journals will not be posted even though they have been released for posting.
<b>Job Item</b>	If you mark this field, you specify that you wish to post job item journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. When Maconomy creates a job item journal, it will automatically be released for posting. If this field is not marked, job item journals will not be posted even though they have been released for posting.
<b>Asset</b>	If you mark this field, you specify that you wish to post asset journals which have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, asset journals will not be posted even though they have been released for posting.
<b>Asset Depreciation</b>	If you mark this field, you specify that you wish to post asset depreciation journals which have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, asset depreciation journals will not be posted even though they have been released for posting.
<b>Asset Sale</b>	If you mark this field, you specify that you wish to post asset sale journals which have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, asset sale journals will not be posted even though they have been released for posting.
<b>Asset Internal Sale</b>	If you mark this field, you specify that you wish to post asset internal sale journals which have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, asset internal sale journals will not be posted even though they have been released for posting.
<b>Asset Relocation</b>	If you mark this field, you specify that you wish to post asset relocation journals which have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, asset relocation journals will not be posted even though they have been released for posting.
<b>Asset Transfer</b>	If you mark this field, you specify that you wish to post asset transfer journals which have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, asset transfer journals will not be posted even though they have been released for posting.
<b>Asset Acquisition</b>	If you mark this field, you specify that you wish to post asset acquisition journals which have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, asset acquisition journals will not be posted even though they have been released for posting.

Field	Description
<b>Bank Reconciliation</b>	If you mark this field, you specify that you wish to post bank reconciliation journals which have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, bank reconciliation journals will not be posted even though they have been released for posting.
<b>Job Reallocation</b>	If you mark this field, you specify that you wish to post job reallocation journals released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. When Maconomy creates a job reallocation journal, it will automatically be released for posting. If this field is not marked, job reallocation journals will not be posted even though they have been released for posting.
<b>Fixed Price Inclusion</b>	If you mark this field, you specify that you wish to post fixed price inclusion journals released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. When Maconomy creates a fixed price inclusion journal, it will automatically be released for posting. If this field is not marked, fixed price inclusion journals will not be posted even though they have been released for posting.
<b>Job Transfer</b>	If you mark this field, you specify that you wish to post job transfer journals released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. When Maconomy creates a job transfer journal, it will automatically be released for posting. If this field is not marked, job transfer journals will not be posted even though they have been released for posting.
<b>Job Accrual</b>	If you mark this field, you specify that you wish to post job accrual journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, job accrual journals will not be posted even though they have been released for posting.
<b>Job Revenue Recognition</b>	If you mark this field, you specify that you wish to post job revenue recognition journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, revenue recognition journals will not be posted even though they have been released for posting.
<b>Debtor Provisions</b>	If you mark this field, you specify that you wish to post debtor provisions journals that have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, debtor provision journals will not be posted even though they have been released for posting.
<b>G/L Reallocation</b>	If you mark this field, you specify that you wish to post G/L reallocation journals released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, G/L reallocation journals will not be posted even though they have been released for posting.

Field	Description
<b>Royalty</b>	If you mark this field, you specify that you wish to post royalty journals which have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, royalty journals will not be posted even though they have been released for posting.
<b>Commission</b>	If you mark this field, you specify that you wish to post commission journals which have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, commission journals will not be posted even though they have been released for posting.
<b>Import</b>	If you mark this field, you specify that you wish to post import journals which have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, import journals will not be posted even though they have been released for posting.
<b>Tax Settlement</b>	If you mark this field, you specify that you wish to post tax settlement journals created as a result of approving tax settlements. If this field is not marked, tax settlement journals will not be posted.
<b>Unrealized Exchange Rate Variance</b>	If you mark this field, you specify that you wish to post unrealized exchange rate journals which have been released for posting. In the window Posting, you can mark the field "Post" to specify which journals should be released for posting. If this field is not marked, unrealized exchange rate journals will not be posted even though they have been released for posting.
<b>Intercompany Settlement Vendor Invoice</b>	If you mark this field, you specify that you wish to post intercompany settlement vendor invoice journals created as a result of running intercompany settlements. If this field is not marked, intercompany settlement vendor invoice journals will not be posted.
<b>Intercompany Interest Note</b>	If you mark this field, you specify that you wish to post intercompany interest memo journals created as a result of calculating intercompany interest. If this field is not marked, intercompany interest memo journals will not be posted.
<b>Intercompany Grouping</b>	If you mark this field, you specify that you wish to post intercompany grouping journals created as a result of grouping intercompany entries. If this field is not marked, intercompany grouping journals will not be posted.

### Selection Criteria Island

Field	Description
<b>Company No.</b>	In these fields, you can enter a range of company numbers. The posting or reprint will only include journals which belong to companies within the specified range. If you leave the fields blank, the company number will not affect what is reprinted or posted.

Field	Description
<b>Journal No.</b>	Here you enter a range of journal numbers. The posting or reprint will only include journals inside the given range. If you leave the fields blank, journal number will not affect what is reprinted or posted.
<b>Reprint Posted Journals</b>	If you mark this field, you will print already posted journals within the selected range as well as any intercompany journals resulting from those journals. You must mark either this field or at least one of the fields in the Posting island.
<b>Only Incl. Prior-Period Entries</b>	In this field, you mark whether to only post or reprint prior-period journals. In the window General Journal, you can mark a journal as prior-period journal. This field is thus only applicable for posting and reprinting general journals.

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. The layout "Standard" includes detailed information on each entry. The layout "Journal Overview" displays summary information about each posted journal, including intercompany journals.
<b>Include Totals</b>	If you mark this field, every posting journal will be shown with a total per account to which entries have been posted. Maconomy will total how much has been debited, credited and taxed for each account involved.
<b>Print Posted, Previously Unprinted Journals</b>	If you mark this field, all posted, previously unprinted journals within the specified Selection Criteria will be included on the printout.

## G/L Reallocation Workspace

Use this workspace to automatically reallocate G/L entries, letting Maconomy create the necessary G/L entries.

Using this workspace, you can change the allocation combination on a range of G/L entries.

You specify the range of entries that you want to reallocate and the dimension values to which they should be reallocated. If you leave a dimension field blank, the entries keep their current values in that dimension field.

You can also specify whether the entries that a reallocation creates should keep their current transaction numbers, be assigned a specific transaction number, or be assigned numbers from a transaction number series.

Use the Selection Criteria island to specify the entries that you want to reallocate. Maconomy saves these selection criteria by user, so the next time that you open this workspace, you see the same selection criteria.

Use the Entry Information island to enter the new values and specify whether the entries should be assigned new transaction numbers.

Then use the **Create Journal** action to create one or more reallocation journals, which you can post in the Posting workspace.

### G/L Reallocation Tab

This section includes the fields and descriptions for the G/L Reallocation tab.

#### Show Entries Island

Field	Description
<b>Show Entries</b>	If you mark this field, the Entries sub-tab shows the entries matching the Selection Criteria. Please note that the entries do not have to be shown to be reallocated. When the action "Create Journal" is selected, Maconomy reallocates all of the entries matching the Selection Criteria, regardless of whether this field has been marked.

#### Selection Criteria Island

Field	Description
<b>Reallocated Entries</b>	If this field is selected, the entries previously reallocated are also shown.
<b>Trans. No.</b>	In these fields, you can specify a range of transaction numbers. The reallocation will only affect G/L entries with a transaction number within the specified range. If you leave the fields blank, the transaction number is ignored in the selection of G/L entries to be reallocated or shown in the Entries sub-tab.
<b>Journal No.</b>	The functionality of these fields is similar to that of the field "Trans. No."
<b>Entry Date</b>	The functionality of these fields is similar to that of the field "Trans. No."
<b>Company No.</b>	The functionality of these fields is similar to that of the field "Trans. No."
<b>Account No.</b>	The functionality of these fields is similar to that of the field "Trans. No."

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of these fields is similar to that of the field "Trans. No."
<b>Entity</b>	The functionality of these fields is similar to that of the field "Trans. No."
<b>Project</b>	The functionality of these fields is similar to that of the field "Trans. No."

Field	Description
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Trans. No."
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Trans. No."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Trans. No."

### Entry Information Island

Field	Description
<b>Trans. No.</b>	In this field, you can specify whether the entries created as a result of the reallocation should be assigned a new transaction number. If you specify a number in this field, all new entries will be assigned a new number. If you do not enter a transaction number here, and you leave the field "Number Series" blank, the transaction date of each original entry will be assigned to the reallocation entries reallocating the original entry in question. For further information, please see the description of the field "Number Series" and the action "Create Journal".
<b>Trans. Type</b>	In this field you can specify whether the entries created as result of the reallocation should have a new transaction type. You can select from all transaction types registered in the system. If you do not specify a transaction type, the transaction type of the original entry will be assigned to the new entry created as result of the reallocation.
<b>Number Series</b>	If you specify a transaction number series in this field, all entries created in the reallocation will be assigned new transaction numbers from the specified series. If you neither enter a new transaction number in the field "Trans. No." above nor specify a transaction number series in this field, the number series of each original entry will be assigned to the reallocation entries reallocating the original entry in question.
<b>Entry Date</b>	In this field, enter a new entry date for the reallocation entries. If you do not specify an entry date, the entry date of each original entry will be assigned to the reallocation entries reallocating the original entry in question.
<b>Company No.</b>	In this field, you can specify a company number. The entries matching the Selection Criteria will be reallocated to this value.
<b>Account No.</b>	In this field, you can specify the account number of the entry.

### Entry Information, Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Company No."

Field	Description
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No."
<b>Project</b>	The functionality of this field is similar to that of the field "Company No."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No."
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No."

## Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Entry Date</b>	When the field "Show Entries" is marked in the Show Entries island, this field shows the entry date of the entry in question. The fields in the Entries sub-tab cannot be changed. The entries are sorted by entry date.
<b>Reallocate</b>	If this field is selected, this is the entry chosen for reallocation.
<b>Reallocated</b>	This field is selected for entries that have been reallocated.
<b>Trans. No.</b>	This field shows the transaction number of the entry.
<b>Transaction Type</b>	This field shows the transaction type of the entries created as result of the reallocation. If a valid transaction type has been specified in the Entry Information island, it will be copied to this field.
<b>Entry Description</b>	This field shows the entry description of the entry.
<b>Debit, Base</b>	This field shows the debit amount in base currency if the entry is a debit entry.
<b>Credit, Base</b>	This field shows the credit amount in base currency if the entry is a credit entry.
<b>Account No.</b>	This field shows the account number of the entry.
<b>Company No.</b>	This field shows the company number to which the current entry is assigned.

Field	Description
<b>Location</b>	This field shows the location assigned to the current entry.
<b>Entity</b>	This field shows the entity assigned to the current entry.
<b>Project</b>	This field shows the project assigned to the current entry.
<b>Purpose</b>	This field shows the purpose assigned to the current entry.
<b>Spec. 1-3</b>	These fields show the values in the dimensions Specification 1-3 assigned to the current entry.
<b>Local Spec. 1-3</b>	These fields show the values in the dimensions Local Specification 1-3 assigned to the current entry.
<b>Date Posted</b>	This field shows the date when the entry was posted.
<b>Journal No.</b>	This field shows the number of the journal in which the entry was posted.
<b>Journal Line No.</b>	This field shows the number of the line on which the entry was placed in the journal.
<b>Quantity 1</b>	This field shows the quantity registered in the entry.
<b>Quantity 2</b>	This field shows the quantity 2 value registered in the entry.

## Actions

This section shows the actions available in the G/L Reallocation workspace.

### Top Pane

Field	Description
<b>Mark for Reallocation</b>	When you select this action, all job entries that match the selection criteria are marked. This excludes job entries that belong to closed jobs, job entries marked for reallocation in the Job Reallocation or Batch Job Reallocation workspaces but not yet approved, entries of unknown type of origin, and job entries created on the basis of a job surcharge rule. Job entries of the latter type are automatically reallocated when the entries that caused the job surcharge are reallocated. After this action has been selected, Maconomy will issue information as to the number of entries not marked for reallocation.
<b>Unmark for Reallocation</b>	When you select this action, all job entries that match the selection criteria are unmarked. This means that the mark in the fields "Reallocate" and "Marked is removed for all entries in the Entries sub-tab.

Field	Description
<b>Create Journal</b>	<p>When you select this action, one or several reallocation journals are created. If you have specified a company in the Entry Information island, Maconomy creates one reallocation journal for which this company is responsible. If you have not specified a company, a reallocation journal is created for each of the companies within the Selection Criteria.</p> <p>When you select this action, Maconomy looks through all of the entries matching the Selection Criteria and transfers them to the reallocation journals created. When the journals are posted, two entries are created for each entry in the journal. One entry matches the original entry, but with the opposite amount or quantity, and the entry date and transaction number may be different, according to the entry information entered in the workspace. The other entry also matches the original entry, except for the company number, account number, and dimension values, which are retrieved from the Entry Information island. If one or several dimension fields have been left blank in the Entry Information island, the values for these dimensions are retrieved from the original entry, meaning that no reallocation is made for the dimensions in question. As in the first case, the entry date and transaction number may be different, according to the entry information entered in the workspace.</p> <p>As in the case of, for example, entering information in a general journal, Maconomy performs a dimension derivation of the values entered in the Entry Information island when the journal is posted. This means that the reallocation of any dimension value can cause changes to a number of other dimensions.</p> <p>Furthermore, if you added a transaction type it will be validated, and if it is invalid, a warning will be issued.</p>

## Finance Reconciliation Workspace

Use this workspace to reconcile entries with the general ledger.

This workspace displays an account's unreconciled entries and lets you reconcile these against each other.

You typically use reconciliation for suspense accounts, whose entries need regular reconciliation to maintain a clear picture of outstanding entries.

The following rules govern reconciliations:

- You can only reconcile entries that balance.
- You can only reconcile entries that belong to the same company.
- You can only reconcile entries to accounts for which you selected the **Reconciliation** field in the Account Information Card workspace.

To perform a reconciliation, enter the account number for which you want to reconcile entries and set up selection criteria in the Selection Criteria island to identify the entries to be reconciled. Then use the **Approve Reconciliation** action to perform the reconciliation.

Maconomy ensures that no two users can reconcile the same entries at the same time. You receive a message if another user is trying to reconcile the same account and entries, and you cannot continue.

## Finance Reconciliation Tab

This section includes the fields and descriptions for the Finance Reconciliation tab.

### Account Island

Field	Description
<b>Account</b>	In this field, enter the name or number of the account whose entries you want to reconcile. You can use the Find menu to retrieve an account.
<b>Department</b>	This is the department to which the account is assigned.
<b>Account Type</b>	This is the account type.
<b>P&amp;L/Balance Sheet</b>	This shows whether the account is a Profit & Loss or a Balance Sheet account.
<b>Blocked</b>	This shows whether the account is blocked.

### Selection Criteria Island

Field	Description
<b>Show Entries</b>	When you mark this field, the table part of the window will show those unreconciled entries to the account that match the Selection Criteria in this island.
<b>Show Automatically Reconciled Entries</b>	This field only applies if you use intercompany invoicing. If you mark this field, the table part will also show finance entries which belong to the intercompany accounts and which must therefore be automatically reconciled through intercompany invoicing. If you do not use intercompany invoicing, this field has no effect.
<b>Company No.</b>	In this field, you must specify a company number. The table part will only display entries for the specified company.
<b>Entry Date</b>	In these fields, you can specify a range of entry dates. The table part will only display entries with entry dates within the specified range.
<b>Trans. No.</b>	In these fields, you can specify a range of transaction numbers. The table part will only display entries with transaction numbers within the specified range.
<b>Intercomp. Company</b>	In these fields, you can specify a range of company numbers. The table part will only display entries on which the intercompany company is within the specified range.

Field	Description
<b>Customer No.</b>	In these fields, you can specify a range of customer numbers. The table part will only display entries on which a customer within the specified range has been specified.
<b>Vendor No.</b>	In these fields, you can specify a range of vendor numbers. The table part will only display entries on which a vendor within the specified range has been specified.
<b>Job No.</b>	In these fields, you can specify a range of job numbers. The table part will only display entries on which a job within the specified range has been specified.
<b>Activity No.</b>	In these fields, you can specify a range of activity numbers. The table part will only display entries on which an activity within the specified range has been specified.
<b>Employee No.</b>	In these fields, you can specify a range of employee numbers. The table part will only display entries on which an employee within the specified range has been specified.
<b>Asset No.</b>	In these fields, you can specify a range of asset numbers. The table part will only display entries on which an asset within the specified range has been specified.
<b>Item No.</b>	In these fields, you can specify a range of item numbers. The table part will only display entries on which an item within the specified range has been specified.
<b>Reference Date</b>	In these fields, you can specify a range of dates. The table part will only display entries on which a reference date within the specified range has been specified.

### Reconciliation Island

Field	Description
<b>Debit</b>	This field shows the total of the debit entries which are selected for reconciliation.
<b>Credit</b>	This field shows the total of the credit entries which are selected for reconciliation.
<b>Balance</b>	This field shows the difference between the "Debit" and "Credit" fields. It must be zero before you can reconcile.

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	In these fields, you can specify a range of locations. The table part will only display entries for locations within the specified range.

Field	Description
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location."
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location."
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location."
<b>Spec. 1-3</b>	The functionality of this field is similar to the functionality of the field "Location."
<b>Local Spec. 1-3</b>	The functionality of this field is similar to the functionality of the field "Location."

## Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Entry Date</b>	This is the entry date. The entries are sorted by this date.
<b>Description</b>	This is the entry text.
<b>Trans. No.</b>	This is the entry's transaction number.
<b>Trans. Type</b>	This is the entry's transaction type. Transaction types are set up in the Transaction Types window.
<b>Debit</b>	This is the entry amount in the base currency of the current company, if the entry is a debit entry.
<b>Credit</b>	This is the entry amount in the base currency of the current company, if the entry is a credit entry.
<b>Reminder</b>	Reminder charges from the windows Reminder Selection and Approve Reminders in the Accounts Receivable module. The entries are posted in a reminder letter journal .
<b>Reconcile</b>	The entry will be reconciled when you select "Approve Reconciliation" in the Action menu.
<b>Amount for reconciliation</b>	Here you can enter an amount if you want to do a partial reconciliation. The amount should be negative for credit entries and positive for debit entries, although Maconomy will change the sign if the amount is entered with the wrong sign.
<b>Quantity</b>	This is the entry quantity.

Field	Description
<b>Quantity 2</b>	This is the entry quantity 2.
<b>Location</b>	The functionality of this field is similar to the functionality of the field "Company."
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Company."
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Company."
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Company."
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company."
<b>Date Posted</b>	This is the entry's posting date.
<b>Journal No.</b>	This is the number of the posting journal in which the entry is posted.
<b>Customer No.</b>	This is the number of the customer associated with the entry.
<b>Vendor No.</b>	This is the number of the vendor associated with the entry.
<b>Job No.</b>	This is the number of the job associated with the entry.
<b>Asset No.</b>	This is the number of the asset associated with the entry.
<b>Employee No.</b>	This is the number of the employee associated with the entry.
<b>Activity No.</b>	This is the number of the activity associated with the entry.
<b>Item No.</b>	This is the number of the item associated with the entry.
<b>Reference Date</b>	This field shows the entry reference date.

## Actions

This section shows the actions available in the Finance Reconciliation workspace.

### Top Pane

Field	Description
<b>Approve Reconciliation</b>	When you select this action, you reconcile the entries marked in the "Reconcile" field. Reconciliation is only possible when the entries balance, that is, when the "Balance" field shows zero.
<b>Mark All for Reconciliation</b>	When you select this action, the field "Reconcile" is marked on all entries matching the Selection Criteria. Please note that the entries are marked regardless of whether the field "Show Lines" has been marked.
<b>Unmark All for Reconciliation</b>	When you select this action, the field "Reconcile" is unmarked on all entries matching the Selection Criteria. Please note that the entries are marked regardless of whether the field "Show Lines" has been marked.

## Print Currency Report Workspace

Use this workspace to calculate and print out a list of the company's G/L balance sheet accounts, customers, and vendors whose currency is different from the currency that you select in the Selection Criteria island in this workspace.

For accounts, only accounts for which you select the **Currency Account** field are included in the report.

Use the Selection Criteria island to select accounts, customers, and vendors. For these entities, Maconomy displays the open balance in the base currency of the company and in the currency of the account, vendor, or customer.

Choose between two layouts:

- **Standard**—Reevaluation is based on the standard currency of the account, vendor, or customer.
- **Original**—Reevaluation is based on the original currency of the entry.

The report can include multiple companies, with balances printed for each company.

### Exchange Rates

In the Currency island, you can select specific exchange rates for sales and purchases. If you do not select rates, Maconomy uses the sales currency table for customers and the purchases currency table for vendors.

For G/L accounts, Maconomy uses the sales currency table if the account has a debit balance and the purchases currency table if the account has a credit balance. In all cases, Maconomy uses the exchange rate that is valid on the statement date.

### Exchange Rate Variances

For each account, customer, and vendor, the workspace displays any unrealized exchange rate variances caused by changes in the exchange rates between the statement date and the entry dates of open entries. This workspace displays the variances on an entry-by-entry basis and as a total for each account, customer, or vendor in each company.

Maconomy uses the following process to determine the exchange rate variance of an account, customer, or vendor:

1. For each account, customer, or vendor, Maconomy finds the open entries that exist for the current company.
2. For each of these entries, Maconomy takes the amount in base currency and calculates a new base currency amount. This new amount is based on the exchange rate that is valid on the statement date and the entry amount in the standard currency of the account, customer, or vendor or in the original currency of the entry, depending on whether you use the Standard or Original layout.
3. Maconomy adds up all of the variances found between the original base currency amounts and the recalculated ones. It displays the total of these amounts for the account, customer, or vendor, converted into the reporting currency.

If you select the **Create G/L Entries** field, Maconomy creates entries for unrealized exchange rate variances. These entries cause account balances to look as they would if the exchange rate variances had actually been realized, providing a more up-to-date picture of the accounts. The automatically created entries are set to reverse themselves on a given date.

### Print Currency Report Tab

This section includes the fields and descriptions for the Print Currency Report tab.

#### Selection Criteria Island

Field	Description
<b>Company</b>	In these fields, you can enter a range of companies. If you specify a range, the balance is calculated and printed based on G/L entries, customer entries, and vendor entries assigned to the companies within the specified range. If the companies included in the printout do not have the same fiscal year, no grand totals are printed for the companies.
<b>Currency</b>	Select a currency from the drop-down list to calculate currency positions. The calculation will include all open job entries, unallocated invoices, G/L accounts, customers, and vendors whose currency corresponds to the currency in this field. Only G/L accounts accounts where you have selected the <b>Currency Account</b> field are included in the report.  If you do not specify a currency in this field, the printout includes all jobs, G/L currency accounts, customers and vendors having a base currency different from the current company's base currency.
<b>Account Type General</b>	Select this check box to include G/L accounts when you run the report.

Field	Description
<b>Account Type Receivable</b>	Select this check box to include accounts receivable (customers) when you run the report.
<b>Account Type Payable</b>	Select this check box to include accounts payable (vendors) when you run the report.
<b>Jobs Work In Progress</b>	Select this check box to include open job entries when you run the report.
<b>Jobs Unallocated On Account Amount</b>	Select this check box to include jobs with unallocated on account amounts when you run the report.
<b>Job Group</b>	Select the job groups to include in the report. These fields are applicable only for work-in-progress jobs and unallocated invoices.
<b>Account Group</b>	If you selected "G" in the field "Account Type," you can specify in this field that the report should only include accounts belonging to the account group specified in this field. If you leave the field blank, the report will include accounts in all groups.
<b>A/R Control Account</b>	If you selected "R" in the field "Account Type," you can specify in this field that the report should only include customers belonging to the control account specified in this field. If you leave the field blank, the report will include customers using any control account.
<b>Customer Type</b>	If you selected "R" in the field "Account Type" or if that field is empty, you can specify here that the report should only include customers having the customer type specified in this field. If you leave the field blank, the report will include all customers.
<b>Customer Group</b>	If you selected "R" in the field "Account Type" or if that field is empty, you can specify here that the report should only include customers belonging to the customer group specified in this field. If you leave the field blank, the report will include all customers.
<b>A/P Control Account</b>	If you selected "P" in the field "Account Type," you can specify in this field that the report should only include vendors belonging to the control account specified in this field. If you leave the field blank, the report will include vendors using any control account.
<b>Vendor Group</b>	If you selected "P" in the field "Account Type" or if that field is empty, you can specify here that the report should only include vendors belonging to the vendor group specified in this field. If you leave the field blank, the report will include all vendors.

**Print Control Island**

Field	Description
<b>Statement Date</b>	In this field, you can enter a statement date for the currency report. The report can thus be printed on the basis of, for example, an ending date of a given month or a given year.
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

**Unrealized Exchange Rate Variances Island**

Field	Description
<b>Create G/L Entries</b>	<p>Select this check box to create G/L entries for unrealized exchange rate variances when you print the report. These are exchange rate variances caused by changes in the exchange rates between the statement date and the registration dates of open entries. This illustrates the exchange rate variances that would have to be registered if the open entries were closed on the statement date. The exchange rate variances are shown on the printout. For a further description of the calculation of the exchange rate variances, please see the introduction to this workspace.</p> <p>If you select this check box, Maconomy creates a number of G/L entries, registering these expected exchange rate variances in your accounts. This corresponds to the information shown in the printout. However, no G/L entries are created for control accounts, as all accounts of this type are skipped in the process. The following posting process is carried out for each company included in the printout.</p> <ul style="list-style-type: none"> <li>■ The exchange rate variance is determined for each G/L currency account (accounts where the <b>Currency Account</b> field is selected) in the Selection Criteria. For each account that has a variance, Maconomy then creates a G/L entry, using the number of the account in question as the account number on the entry. The variance amount is transferred to the entry; a variance in the current company's favor results in a credit entry, and a variance in the account's favor results in a debit entry. The amounts in different currencies are as follows on this entry: <ul style="list-style-type: none"> <li>■ The amount in base currency is the exchange rate variance amount (converted into the company's base currency).</li> <li>■ The amount in currency is zero.</li> <li>■ The enterprise currency amount is calculated from the amount in base currency, using the statement date as the exchange rate date. If the enterprise currency and base currency are identical,</li> </ul> </li> </ul>

Field	Description
	<p>the amount is simply transferred. However, if the enterprise currency is the same as the currency of the account, the enterprise currency amount is set to zero.</p> <p>When all accounts have been processed, Maconomy sums up the variances found on the G/L accounts and creates an offset entry for the total variance amount found. This entry is posted to the G/L account referred to in the dimension combination specified for Unrealized G/L Exchange Rate Variances in <b>Setup » Job Cost Setup » Dimensions » Posting References » Job Posting Reference Lines</b>.</p> <p>The same process is carried out for each customer and vendor, respectively. However, the account number used on the G/L entries is different for customers and vendors.</p> <p>If you select the <b>Jobs Work In Progress</b> or <b>Jobs Unallocated On Account Amount</b> check boxes, but do not enter dimension combinations in the job posting references for these entries, an error is displayed when you run the report.</p>
<b>Group Offset Entries by Currency</b>	<p>If this field is marked Maconomy will create one entry per currency on the account for unrealized exchange rate differences. If the field is not marked Maconomy will create one entry per customer/vendor.</p>
<b>Transaction Type</b>	<p>In this field, you can specify a transaction type for the entries created as a result of the current currency report. You can only select transaction types that are valid in the Unrealized Exchange Rate Variance journal. The field is left empty by default.</p> <p>If you leave the field empty, the system will try to derive a transaction type. If this fails, a warning message will be issued.</p> <p>The value will be validated before actually used. The validation will test if the given transaction type is allowed for the Companies involved in the currency reevaluation, User, Unrealized Exchange Rate Variance journal combination.</p>
<b>Transaction Number Series</b>	<p>In this field, you can specify a transaction number series by which the entries created as a result of the current currency report should be numbered. If you mark the field "Create G/L Entries" and select a number series in this field, the next available number in this series is used as the transaction number on all of the entries created as a result of unrealized exchange rate variances including the reversion entries. If this field is empty, the system will try to derive a value from the Transaction Type if "Transaction No." is not specified on the lines.</p>
<b>Transaction No.</b>	<p>In this field, you can specify a transaction number for the entries created as a result of the current currency report. If you mark the field "Create G/L Entries" and specify a number in this field, this number is used as the transaction number on all of the entries created as a result of unrealized exchange rate variances including the reversion entries. If this field is empty, the system will try to derive a "Transaction Number Series."</p>

Field	Description
<b>Reversion Date</b>	If you have marked the field "Create G/L Entries," you must specify in this field the date on which the unrealized exchange rate variance entries should be reversed as described in the field "Create G/L Entries."

### Currency Island

Field	Description
<b>Sales Exchange Rate Table</b>	In this field, you can select an exchange rate to use for the conversion of sales. The default is to use the standard exchange rate table.
<b>Purchase Exchange Rate Table</b>	In this field, you can select an exchange rate to use for the conversion of purchases. The default is to use the standard exchange rate table.
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which figures on the printout should be displayed. All report figures will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date." In the conversion, the currency table for sales is used for customers, while the currency table for purchases is used for vendors. For G/L accounts, the currency table for sales is used if the account has a debit balance, while the currency table for purchases is used if the account has a credit balance. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may cause discrepancies between the registered amounts and the amounts shown in this window.</p>

### Actions

This section shows the actions available in the Print Currency Report single dialog workspace.

### Print Currency Report Tab

Field	Description
<b>Print</b>	If you select the <b>Create G/L Entries</b> check box and the <b>Jobs Work In Progress</b> or <b>Jobs Unallocated On Account Amount</b> check boxes, but do not enter an account in the job posting references for these entries, an error is displayed when you run the report.

## Year-End Closing Workspace

Use this workspace to close your books and calculate annual results for one or multiple companies.

When you close the fiscal year, Maconomy prints a report for each company that shows the year-end closing for each account with posted entries, and the year-end result.

Use the Selection Criteria island to specify a range of companies and a fiscal year. Maconomy performs the year-end closing for those companies that match the selection criteria and have the specified fiscal year. You define each company's fiscal in the Company Information workspace. If a company has a parent company, Maconomy uses the parent company's fiscal year as the company's fiscal year.

It is important that you set the fiscal year template correctly before you close the fiscal year. For example, if your company wants to calculate the year-end result for 2014 in April 2015, you must set the fiscal year template to the one that covers 2014 in the Company Information or System Information workspace before you close the fiscal year.

Before you close the fiscal year, you must post all journals that are relevant to the period.

After you close the fiscal year, you should update the fiscal year in the Company Information workspace in the General Ledger module or the System Information workspace in the Set-Up module.

### Effect of Year-End Closing

When Maconomy closes the fiscal year, the following actions occur:

- The year-end result is transferred to the Retained Earnings Account, which you define by means of a posting reference in the System Information workspace in the Set-Up module.  
To perform this step, Maconomy takes the total of all closing balances for all P&L accounts in the old fiscal year and transfers them to the opening balance of the Retained Earnings Account in the new fiscal year.  
After you perform a year-end closing, Maconomy continues updating the Retained Earnings Account if you make entries to the closed year. This ensures that the Retained Earnings Account amount that appears on G/L reports reflects any entries made to the closed year.
- Opening balances on balance sheet accounts in the new fiscal year are set to the closing balances from the old year. As in the case of the Retained Earnings Account, Maconomy keeps these opening balances updated if you subsequently make entries to the closed year.  
Maconomy updates the current balance on all P/L Accounts if the system parameter **Update balance on account information card** is marked.  
The current balance is shown in the account information card. The current balance is calculated as the sum in enterprise currency of all finance entries that belong to the account in the fiscal year following the closing year.
- If you use a local chart of accounts (you defined a local dimension in the System Information workspace), Maconomy also performs a year-end closing for the local chart of accounts. Maconomy takes the total of all closing balances for all local charts of accounts linked to a P&L account in the old fiscal year, and transfers them to the opening

balance of the local chart of account used for Retained Earnings Account in the new fiscal year.

To determine which local accounts should be considered P&L accounts (and thus which local account balances should be transferred to the Retained Earnings account and reset), Maconomy checks the **Derived Account No.** field on the information card for each local account. The local account is considered to be of the same type as the derived account.

By selecting the appropriate layout, you can have the report show the year-end closing amounts of either the global accounts or the local accounts. However, if a local chart of accounts has been specified in the System Information workspace, Maconomy performs year-end closing for both global and local accounts, regardless of your layout choice.

### Reprocessing Year-End Closing

You can process any number of year-end closings for a given year, and you can process them at any time. Maconomy calculates a new year-end result, ignoring earlier results, including previously calculated opening balances for the Retained Earnings Account and other accounts.

It is important to run a new year-end closing if you make back-dated entries to the closed year, so that your year-end closing report shows current information.

If you reprocess a year-end closing for a fiscal year that lies several years back, you must also reprocess year-end closings for the years in between. Otherwise, the balances for intervening years will be incorrect.

### Year-End Closing Tab

This section includes the fields and descriptions for the Year-End Closing tab.

#### Selection Criteria Island

Field	Description
<b>Fiscal Year</b>	Here you enter the date of the first day in the fiscal year for which you wish to perform the year-end closing.
<b>Company No.</b>	In these fields you specify a range of company numbers. The year-end closing will be processed for all companies within the range, provided that their fiscal year corresponds to the one specified in the field "Fiscal Year."

#### Run Mode Island

Field	Description
<b>Close Year</b>	If this box is checked, the year-end closing is performed for the companies specified in the Selection Criteria island. If the box is not checked, previously performed year-end closings for the companies specified in the Selection Criteria island are reprinted. If this is the case, no year-end closing is performed.

**Print Control Island**

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If you select "Standard," the printout will show year-end closing figures for accounts in the dimension Accounts. The layout "Local Chart of Accounts" is only available if a local chart of account dimension has been specified in the field "Local Chart of Account" in the window System Information, and shows the year-end closing figures for the values in the local chart of account dimension selected in that field. For a further description of the year-end closing procedure for global and local accounts, see the introduction to this workspace.

**Show Year End Closing Workspace**

Use this workspace to view the information from the most recently performed year-end closing.

You can browse through previous year-end closings and reprint these using the Print menu. The year-end closings are displayed in the sequence in which they were processed. You cannot change the fields in this workspace.

You can perform a new year-end closing in the Year-End Closing workspace.

**Show Year End Closing Tab**

This section includes the fields and descriptions for the Show Year End Closing tab.

**Company Island**

Field	Description
<b>Company</b>	This field shows the name of the company for which the currently displayed year-end closing was performed.

**Time Island**

Field	Description
<b>Date</b>	This field shows the date of the year-end closing.
<b>Time</b>	This field shows the time when the year-end closing was processed.
<b>Made by</b>	This field shows which user processed the year-end closing.

## Closing Island

Field	Description
<b>Fiscal Year</b>	This is the fiscal year of the year-end closing. Maconomy always calculates the year-end closing for the fiscal year specified for the current company in the Company Information window.
<b>Total Debits</b>	This is the debit total from accounts with a debit balance. The result is calculated when you close the year.
<b>Total Credits</b>	This is the credit total from accounts with a credit balance. The result is calculated when you close the year.
<b>Account</b>	This is the account to which the year-end closing is transferred. The account number is retrieved from the posting reference specified in the System Information window in the Set-Up module.

## Intercompany Invoicing Workspace

Use this workspace to perform intercompany invoicing.

The functionality of this workspace only applies if you select the **Create Intercompany Invoicing Basis** system parameter.

On the Intercompany Invoicing tab, select a company, then select the **Show Lines** option. On Intercompany Entries sub-tab, Maconomy displays all of the invoiceable intercompany entries for which the selected company is the executing company. These entries represent times when the company performed work, shipped items, and so on, on behalf of another company in the same enterprise.

Use the Selection Criteria to limit the number of lines that Maconomy displays in the Intercompany Entries sub-tab. You can also enter an invoice date and a text to appear on the next intercompany invoice(s) that you create.

Use the **Marked for Invoicing** field to select the intercompany entries that you want to invoice.

When you use the **Print Invoice** action, Maconomy invoices all the intercompany entries selected for invoicing, and reconciles the intercompany balancing entries in the G/L system as described for the Print Invoice action. These take place regardless of whether you selected the **Show Lines** field.

### Intercompany Invoicing Tab

This section includes the fields and descriptions for the Intercompany Invoicing tab.

## Executing Company Island

Field	Description
<b>Company No.</b>	<p>This field shows the number of the currently selected company. The lines shown in the table part are intercompany entries where the selected company is the executing company.</p> <p>The remaining fields in the island display the name, address, and country of the company.</p>

**Invoice Island**

Field	Description
<b>Amount, Base, Executing</b>	This field shows the sum of the amounts in the field "Amount, Base, Executing" on those lines in the Intercompany Entries sub-tab where the field "Marked for Invoicing" has been marked.
<b>Invoice Date</b>	In this field, you can specify the invoice date to be applied to the invoice(s) created when you select the "Print Invoice" action.
<b>Invoice Text</b>	In this field, you can specify a text to be shown on the invoice(s) created when you select the "Print Invoice" action. If you use the "Standard" invoice layout, this text will be displayed below the column names in the table part of the printed invoice.

**Print Control Island**

Field	Description
<b>Layout, Invoice</b>	In this field, you can specify the layout to be used in the printout of the invoice(s) created when you select the "Print Invoice" action. If no other layouts have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.
<b>Layout, Credit Memo</b>	In this field, you can specify the layout to be used in the printout of the credit memo(s) created when you select the "Print Invoice" action. If no other layouts have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

**Selection Criteria Island**

Field	Description
<b>Show Lines</b>	When you check this box, the Intercompany Entries sub-tab will display the intercompany entries that match the Selection Criteria specified in this island and have the current company as responsible company.
<b>Intercompany Type</b>	In this field, you can select an intercompany type. The Intercompany Entries sub-tab will only show intercompany entries of the selected type. The intercompany type is the type of transaction which caused an intercompany entry. See the field "Intercompany Name" in the Intercompany Accounts window for a description of the individual intercompany types.
<b>Entry Date</b>	In these fields, you can specify a range of entry dates. The Intercompany Entries sub-tab will only show intercompany entries whose entry date is within the specified range.
<b>Responsible Company</b>	In these fields, you can specify a range of responsible companies. The Intercompany Entries sub-tab will only show intercompany entries pertaining to a responsible company within the specified range. If the range of company numbers specified here spans several companies, an invoice will be created for each of the companies in question when the

Field	Description
	“Print Invoice” action is selected. However, a given company is only included in the invoicing if the field “Marked for Invoicing” is marked on one or more lines pertaining to the company in question.
<b>Job No.</b>	In these fields, you can specify a range of job numbers. The Intercompany Entries sub-tab will only show intercompany entries pertaining to jobs within the specified range.
<b>Employee No.</b>	In these fields, you can specify a range of employee numbers. The Intercompany Entries sub-tab will only show intercompany entries pertaining to employees within the specified range.
<b>Activity No.</b>	In these fields, you can specify a range of activity numbers. The Intercompany Entries sub-tab will only show intercompany entries pertaining to activities within the specified range.
<b>Task</b>	In these fields, you can specify a range of task names. The table part will only show intercompany entries pertaining to tasks within the specified range.
<b>Customer No.</b>	In these fields, you can specify a range of customer numbers. The Intercompany Entries sub-tab will only show intercompany entries pertaining to customers within the specified range.
<b>Vendor No.</b>	In these fields, you can specify a range of vendor numbers. The Intercompany Entries sub-tab will only show intercompany entries pertaining to vendors within the specified range.
<b>Asset No.</b>	In these fields, you can specify a range of asset numbers. The Intercompany Entries sub-tab will only show intercompany entries pertaining to assets within the specified range.
<b>Item No.</b>	In these fields, you can specify a range of item numbers. The Intercompany Entries sub-tab will only show intercompany entries pertaining to items within the specified range.

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	In these fields, you can specify a range of locations. The Intercompany Entries sub-tab will only show intercompany entries where the value in the field “Location” is within the specified range.
<b>Entity</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Project</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Purpose</b>	The functionality of these fields is similar to that of the field “Location” above.

Field	Description
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.

### Intercompany Entries Sub-Tab

This section includes the fields and descriptions for the Intercompany Entries sub-tab.

Field	Description
<b>Responsible Company</b>	This field shows the number of the company which was the responsible company on the transaction that caused the current intercompany entry. See the description of the Intercompany Accounts window for information about the method for identifying the responsible company on the individual intercompany transaction types.
<b>Resp. Company Name</b>	This field shows the name of the company shown in the field “Responsible Company” on the current line.
<b>Entry Date</b>	This field shows the entry date of the current intercompany entry.
<b>Date Posted</b>	This field shows the date on which the registration that gave rise to the current intercompany entry was posted.
<b>Trans. No.</b>	This field shows the transaction number of the registration that gave rise to the current intercompany entry.
<b>Trans. Type</b>	This is the entry’s transaction type. Transaction types are set up in the Transaction Types window.
<b>Entry Description</b>	This field shows the entry description on the registration that caused the current intercompany entry.
<b>Marked for Invoicing</b>	In this field, you can mark the intercompany entry for invoicing. When you select the “Print Invoice” action, the intercompany invoicing will only include those intercompany entries that pertain to the current executing company and match the Selection Criteria specified in the Intercompany Invoicing tab, regardless of whether the field “Show Lines” is marked.
<b>Amount, Base, Executing</b>	This field shows the amount of the intercompany entry in the base currency of the company selected in the card part.
<b>Amount, Base, Responsible</b>	This field shows the amount of the intercompany entry in the base currency of the company shown in the field “Company No.” on the current line.
<b>Amount, Currency</b>	This field shows the amount of the intercompany entry in the currency of the registration that caused the creation of the intercompany entry. The

Field	Description
	currency in question is shown in the field "Currency." The amount corresponds to the amount in currency on the registration that gave rise to the current intercompany entry.
<b>Amount, Enterprise</b>	This field shows the amount of the intercompany entry in the enterprise currency of the system. The amount corresponds to the amount in enterprise currency on the registration that gave rise to the current intercompany entry.
<b>Currency</b>	This field shows the currency of the transaction that caused the creation of the current intercompany entry.
<b>Item Tax Code</b>	<p>In this field, you can enter an item tax code, which is created in the window Popup Fields. Maconomy suggests the tax code from the basis entry of the current intercompany entry.</p> <p>Maconomy uses the field to determine a tax code for the fields "Tax Code, Invoice" and "Tax Code, Vendor Invoice," as the item tax code is part of the criteria to derive a tax code from the window Tax Tables in the G/L module. For further information, see the description of the fields "Tax Code, Invoice" and "Tax Code, Vendor Invoice."</p>
<b>Tax Code, Invoice (Tax Code 1-3, Invoice)</b>	<p>In this field, you can specify a tax code used for calculating tax for the invoice line of which the current intercompany entry will be part when you select the "Print Invoice" action. Maconomy suggests a tax code using the following method:</p> <p>In the field "Item Tax Code," you can specify an item tax code created in the window Popup Fields. The field is used by Maconomy for determining the tax code to be suggested in this field, as the item tax code is part of the criteria for the selection of a tax code in the window Tax Tables in the G/L module.</p> <p>These Selection Criteria also involve a company tax code which corresponds to the one specified on the executing company's company specific version of the intercompany settling customer assigned to the responsible company. In other words, Maconomy looks up the number of the intercompany settling customer on the information card of the responsible company, and finds the executing company's company specific information card for this customer. The company tax code on this customer will then be used along with the item tax code specified in the field "Item Tax Code" for looking up a tax code in the tax table.</p> <p>At the selection of a tax code from a tax table, Maconomy uses the tax table specified for the company responsible for the current intercompany entry. This tax table is selected in the window Company Information. However, the tax code is only selected from a tax table, if you have specified that tax tables which are specified in the window System Information are to be used, and only if the company responsible for the intercompany entry is assigned to a tax table. If no tax table has been specified for the responsible company or if you use differentiated tax, and you do not use tax tables, the tax code is derived using the following order of priorities:</p>

Field	Description
	<ol style="list-style-type: none"> <li>1. The tax code specified for any activity referenced on the basis entry of the current intercompany entry</li> <li>2. The tax code specified for any item referenced on the basis entry of the current intercompany entry.</li> <li>3. The standard tax code specified in the window System Information in the Set-Up module</li> </ol> <p>When posting invoices, the company and item tax codes are used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if extended tax reporting has been selected in the window System Information.</p> <p>If multiple tax codes are enabled, the "Tax Code, Invoice" field will be replaced by the following fields: "Tax Code 1, Invoice," "Tax Code 2, Invoice," and, if enabled, "Tax Code 3, Invoice." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Tax Code, Vendor Invoice (Tax Code 1-3, Vendor Invoice)</b>	<p>The functionality of this field corresponds to that of the "Tax Code, Invoice" field above. However, this field contains the tax code applied to the invoice allocation line of which the current intercompany entry will be part when you select the "Print Invoice" action.</p> <p>Furthermore, the company tax code used for looking up a tax code for this field is found on the responsible company's company-specific version of the intercompany settling vendor assigned to the executing company. In other words, Maconomy looks up the number of the intercompany settling vendor on the information card of the executing company, and finds the responsible company's company-specific information card for this vendor. The company tax code on this vendor will then be used along with the item tax code specified in the field "Item Tax Code" for looking up a tax code in the G/L tax table.</p> <p>If no G/L tax table has been specified for the responsible company, or if you use differentiated tax, and you do not use G/L tax tables, the tax code specified on the account referenced on the basis entry of the current intercompany entry is used.</p> <p>If multiple tax codes are enabled, the "Tax Code, Vendor Invoice" field will be replaced by the following fields: "Tax Code 1, Vendor Invoice," "Tax Code 2, Vendor Invoice," and, if enabled, "Tax Code 3, Vendor Invoice." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Intercompany Type</b>	<p>This field shows the type of intercompany transaction that gave rise to the current intercompany entry. See the field "Intercompany Name" in the window Intercompany Accounts for a description of the individual intercompany types.</p>

Field	Description
<b>Account No., Executing</b>	When a registration involving two different companies is posted, Maconomy posts an intercompany balancing entry in the executing company and one in the responsible company, using the window Intercompany Accounts to look up the account to which each entry should be posted. Each entry is then assigned to the intercompany entry created as a result of the intercompany transaction. For each intercompany entry in the Intercompany Entries sub-tab, this field shows the account number to which the intercompany balancing entry was posted in the executing company.
<b>Account No., Responsible</b>	When a registration involving two different companies is posted, Maconomy posts an intercompany balancing entry in the executing company and one in the responsible company, using the Intercompany Accounts window to look up the account to which each entry should be posted. Each entry is then assigned to the intercompany entry created as a result of the intercompany transaction. For each intercompany entry in the Intercompany Entries sub-tab, this field shows the account number to which the intercompany balancing entry was posted in the responsible company.
<b>Journal Type</b>	This field shows the type of journal in which the registration that caused the current intercompany entry was entered.
<b>Journal No.</b>	This field shows the number of the journal in which the registration that caused the current intercompany entry was entered.
<b>Journal Line No.</b>	This field shows the number of the line in the above journal on which the registration that caused the current intercompany entry was entered.
<b>Basis Account</b>	This field shows the account that was posted against and which caused the intercompany invoicing.
<b>Account Name</b>	This field shows the name of the basis account.
<b>Location</b>	This field shows the number of the location to which the current intercompany entry pertains.
<b>Location Name</b>	This field shows the name of the location shown in the field "Location" above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Entity Description</b>	This field shows the description of the purpose shown in the field "Entity" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project Description</b>	This field shows the description of the project shown in the field "Project" above.

Field	Description
<b>Purpose</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Purpose Description</b>	This field shows the description of the purpose shown in the field “Purpose” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Spec. 1-3 Description</b>	These fields show the descriptions of the spec. 1-3 values shown in the fields “Local Spec. 1-3” above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Local Spec. 1-3 Description</b>	These fields show the descriptions of the local spec. 1-3 values shown in the fields “Local Spec. 1-3” above.
<b>Job No.</b>	This field shows the number of the job to which the current intercompany entry pertains, that is, the job specified on the registration that gave rise to the current intercompany entry, if any.
<b>Job Name</b>	This field shows the name of the job shown in the field “Job No.” on the current line.
<b>Employee No.</b>	This field shows the number of the employee to which the current intercompany entry pertains, that is, the employee specified on the registration that gave rise to the current intercompany entry, if any.
<b>Employee Name</b>	This field shows the name of the employee shown in the field “Employee No.” on the current line.
<b>Activity No.</b>	This field shows the number of the activity to which the current intercompany entry pertains, that is, the activity specified on the registration that gave rise to the current intercompany entry, if any.
<b>Activity Name</b>	This field shows the name of the activity shown in the field “Activity No.” on the current line.
<b>Task</b>	This field shows the name of the task to which the current intercompany entry pertains, that is, the task specified on the registration that gave rise to the current intercompany entry, if any.
<b>Task Description</b>	This field shows the description of the task shown in the field “Task” on the current line.
<b>Customer No.</b>	This field shows the number of the customer to which the current intercompany entry pertains, that is, the customer specified on the registration that gave rise to the current intercompany entry, if any.
<b>Customer Name</b>	This field shows the name of the customer shown in the field “Customer No.” on the current line.

Field	Description
<b>Vendor No.</b>	This field shows the number of the vendor to which the current intercompany entry pertains, that is, the vendor specified on the registration that gave rise to the current intercompany entry, if any.
<b>Vendor Name</b>	This field shows the name of the vendor shown in the field "Vendor No." on the current line.
<b>Entry No.</b>	If the current intercompany entry was created as a result of a registration which also gave rise to the creation of an A/P or A/R entry (for instance if one company has sent an invoice to a customer belonging to another company), the entry number assigned to the A/P or A/R entry in question is displayed in this field. For further information on the entry number assigned to A/P and A/R entries, please see the description of the field "Entry No." in the window Show G/L Entries.
<b>Asset No.</b>	This field shows the number of the asset to which the current intercompany entry pertains, that is, the asset specified on the registration that gave rise to the current intercompany entry, if any.
<b>Asset Name</b>	This field shows the name of the asset shown in the field "Asset No." on the current line.
<b>Item No.</b>	This field shows the number of the item to which the current intercompany entry pertains, that is, the item specified on the registration that gave rise to the current intercompany entry, if any.
<b>Description</b>	This field shows the description of the item shown in the field "Item No." on the current line.

## Actions

This section shows the actions available in the Intercompany Invoicing workspace.

### Top Pane

Field	Description
<b>Mark All for Invoicing</b>	When you select this action, the field "Mark for Invoicing" is automatically marked on all intercompany entries that pertain to the current executing company and match the criteria specified in the Intercompany Invoicing tab, regardless of whether the field "Show Lines" has been marked.
<b>Remove Mark from All</b>	When you select this action, the field "Mark for Invoicing" is automatically unmarked on all intercompany entries that pertain to the current executing company and match the criteria specified in the Intercompany Invoicing tab, regardless of whether the field "Show Lines" has been marked.
<b>Print Invoice</b>	When you have marked the desired entries in the Intercompany Invoicing tab, select this action to execute the intercompany invoicing. When you select the action, Maconomy creates an invoice or credit memo for each responsible company occurring on the lines marked for invoicing, summarizing on each invoice the entries pertaining to the responsible company in question.

Field	Description
	<p>An invoice or credit memo pertaining to the responsible company in question is created and printed, containing one line for each combination of item tax code, invoice tax code, and vendor invoice tax code occurring on the lines pertaining to the company. The amount on each of these lines corresponds to the sum of the amounts on the lines with the tax combination in question. If the sum of amounts on the selected entries pertaining to the responsible company is 0 or more, an invoice is created. If the sum is negative, a credit memo is created. The invoice or credit memo is stored in a regular invoice journal which is ready for posting (and will be posted automatically if the system parameter "Automatic posting of invoices" has been marked). The customer on the invoice or credit memo is the intercompany settling customer specified in the information card of the responsible company.</p> <p>At the same time, a vendor invoice or credit memo on which the vendor is the intercompany settling vendor specified in the information card of the executing company is created. Maconomy automatically creates and approves an allocation line for each corresponding line on the invoice created earlier in the process. The vendor invoice or credit memo is stored in an intercompany settling vendor invoice journal in the responsible company which is ready for posting (which will be posted automatically if the system parameter "Automatic posting of Intercompany Vendor Invoices" has been marked). It is not possible to change the vendor invoice or credit memo.</p> <p>When the invoices or credit memos are posted, Maconomy creates the regular A/P, A/R, and G/L entries pertaining to normal invoices/credit memos and vendor invoices/credit memos, including entries to, for example, the account for item sales and the A/P and A/R control accounts. Furthermore, when the invoice or credit memo is posted, Maconomy creates (for each intercompany entry being invoiced or credited) an entry to the intercompany account indicated in the field "Account No., Executing" to set off the original intercompany balancing entry in the executing company. Similarly, when the vendor invoice or credit memo is posted, Maconomy creates an entry to the intercompany account indicated in the field "Account No., Responsible."</p> <p>On the entries posted to the intercompany accounts, the amounts in enterprise currency and invoice currency (the currency of the customer on the invoice) are calculated from the amount in base currency on the intercompany entries in question. If the exchange rates have changed since the posting of the original registrations that caused the creation of the intercompany entries being invoiced, this can lead to exchange rate variances in the enterprise and invoice currencies. Maconomy handles this by automatically creating the necessary exchange rate variance entries in the G/L system. When the invoice is posted, any variance between the amount in enterprise currency on the original entries and the entries created as a result of the invoicing, respectively, is posted to the account for Customer Balancing Exchange Rate Gain. The company on this entry will be the executing company. When the vendor invoice or credit memo is posted, any variance between the amounts in base currency is posted to the account for intercompany settling exchange rate variances, while any variance between the amount in enterprise currency on the original registrations and the entry created as a result of the invoicing, respectively, is posted to the account for Vendor</p>

Field	Description
	Balancing Exchange Rate Variance. The company on these entries will be the responsible company. Finally, all of these entries, along with the original intercompany balancing entries assigned to the intercompany entries being invoiced or credited, are reconciled against each other.

## Open Entry Intercompany Account Statement Workspace

Use this workspace to view the open intercompany entries.

In the Open Entry Intercompany Account Statement tab, you specify the companies whose intercompany entries you want to see. In the Intercompany Entries sub-tab, you can see the intercompany entries between the two companies.

The functionality of this workspace only applies if you select the **Create Intercompany Invoicing Basis** system parameter.

You can also calculate interest for open, non-invoiced intercompany entries in this workspace. Maconomy calculates interest in the same way as it does for customers. The intercompany customer specified for each company in the Company Information workspace determines the calculation principle (interest rate and terms) used in the interest calculation.

Use the **Group Entries** action to combine multiple open intercompany entries between two companies into one summarized intercompany entry, to reduce the number of open entries.

### Open Entry Intercompany Account Statement Tab

This section includes the fields and descriptions for the Open Entry Intercompany Account Statement tab.

#### Selection Criteria Island

Field	Description
<b>Show Lines</b>	When you check this box, the Intercompany Entries sub-tab will display the intercompany entries between the companies specified in this island.
<b>Company 1</b>	In this field, specify the number of a company. When the field "Show Lines" is marked, the Intercompany Entries sub-tab will show the intercompany entries between this company and the one specified in the field "Company 2" below.
<b>Company 2</b>	In this field, specify the number of a company. When the field "Show Lines" is marked, the Intercompany Entries sub-tab will show the intercompany entries between this company and the one specified in the field "Company 1" above.

#### Interest Calculation Island

Field	Description
<b>Interest Date</b>	In this field, you can specify a date for interest calculation. When the action "Calculate Interest" is selected, the interest calculation will only include

Field	Description
	intercompany entries with an entry or interest date earlier than or equal to the date specified in this field. For further information about the interest calculation procedure, see the action "Calculate Interest."

**Balance Island**

Field	Description
<b>Net Amount, Currency</b>	<p>This field shows the open balance between the two companies specified in the island Selection Criteria. The amount is expressed in the currency displayed in the field "Currency" below.</p> <p>A positive amount means a balance in favor of the company in the field "Company 1," whereas a negative amount means a balance in favor of the company in the field "Company 2."</p>
<b>Currency</b>	This field shows the base currency of the company specified in the field "Company 1." The amount in the field "Net Amount, Currency" is shown in this currency.

**Grouping Island**

Field	Description
<b>Grouping Date</b>	In this field, you can specify a date for grouping intercompany entries. When you select the "Group Entries" action, the grouping procedure will only include intercompany entries with an entry or interest date earlier than or equal to the date specified in this field. For further information about the grouping procedure, see the "Group Entries" action.

## Intercompany Entries Sub-Tab

This section includes the fields and descriptions for the Intercompany Entries sub-tab.

Field	Description
<b>Executing Company</b>	This field shows the number of the executing company of the current intercompany entry.
<b>Responsible Company</b>	This field shows the number of the executing company of the current intercompany entry.
<b>Entry Date</b>	This field shows the entry date of the current intercompany entry.
<b>Date Posted</b>	This field shows the date when the current intercompany entry was posted.
<b>Entry Description</b>	This field shows a description of the current intercompany entry.

Field	Description
<b>Amount, Currency</b>	This field shows the amount of the current intercompany entry, expressed in the currency specified in the field "Currency."
<b>Currency</b>	This field shows the currency of the transaction that caused the creation of the current intercompany entry.
<b>Interest Date</b>	This field shows the interest date of the current intercompany entry, if interest has been calculated for the entry.
<b>Trans. No.</b>	This field shows the transaction number of the intercompany entry.
<b>Trans. Type</b>	This is the entry's transaction type. Transaction types are set up in the Transaction Types window.
<b>Intercompany Type</b>	This field shows the type of intercompany transaction that caused the current intercompany entry. See the field "Intercompany Name" in the Intercompany Accounts window for a description of the individual intercompany types.
<b>Journal Type</b>	This field shows the type of journal in which the registration that gave rise to the current intercompany entry was entered.
<b>Journal No.</b>	This field shows the number of the journal in which the registration that caused the current intercompany entry was entered.
<b>Journal Line No.</b>	This field shows the number of the line in the above journal on which the registration that caused the current intercompany entry was entered.
<b>Location</b>	This field shows the number of the location to which the current intercompany entry pertains.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Job No.</b>	This field shows the number of the job to which the current intercompany entry pertains, that is, the job specified on the registration that caused the current intercompany entry, if any.
<b>Customer No.</b>	This field shows the number of the customer to which the current intercompany entry pertains, that is, the customer specified on the registration that caused the current intercompany entry, if any.

Field	Description
<b>Vendor No.</b>	This field shows the number of the vendor to which the current intercompany entry pertains, that is, the vendor specified on the registration that caused the current intercompany entry, if any.
<b>Entry No.</b>	If the current intercompany entry was created as a result of a registration which also caused the creation of an A/P or A/R entry (for instance, if one company has sent an invoice to a customer belonging to another company), the entry number assigned to the A/P or A/R entry in question is displayed in this field. For further information on the entry number assigned to A/P and A/R entries, please see the description of the field "Entry No." in the Show G/L Entries window.
<b>Employee No.</b>	This field shows the number of the employee to which the current intercompany entry pertains, that is, the employee specified on the registration that caused the current intercompany entry, if any.
<b>Activity No.</b>	This field shows the number of the activity to which the current intercompany entry pertains, that is, the activity specified on the registration that caused the current intercompany entry, if any.
<b>Task</b>	This field shows the name of the task to which the current intercompany entry pertains, that is, the task specified on the registration that caused the current intercompany entry, if any.
<b>Item No.</b>	This field shows the number of the item to which the current intercompany entry pertains, that is, the item specified on the registration that caused the current intercompany entry, if any.
<b>Asset No.</b>	This field shows the number of the asset to which the current intercompany entry pertains, that is, the asset specified on the registration that caused the current intercompany entry, if any.

## Actions

This section shows the actions available in the Open Entry Intercompany Account Statement workspace.

### Top Pane

Field	Description
<b>Calculate Interest</b>	<p>Using this action, you can calculate interest for the non-invoiced, open intercompany entries between two companies.</p> <p>When you select the action, Maconomy will calculate interest for the intercompany entries between the two companies specified in the Open Entry Intercompany Account Statement tab. The interest calculation only takes place for open, non-invoiced intercompany entries whose date for interest calculation is earlier than or equal to the date specified in the field "Interest Date" in the Open Entry Intercompany Account Statement tab. An entry's date for interest calculation depends on whether interest has previously been calculated for the entry in question. If it has, the date for interest calculation is equal to the interest date on</p>

Field	Description
	<p>the entry. If interest has not previously been calculated for the entry, the date for interest calculation is equal to the entry date.</p> <p>Note that the system parameter Use Enterprise Currency in Intercompany Interest Calculation and Grouping determines if the grouping is based on the original or the enterprise currency.</p> <p>For each of the companies, interest is calculated according to the interest charge/reminder principle of the customer specified as intercompany settling customer in the information card of the company in question. This means that for each entry, Maconomy looks up the intercompany settling customer of the company which owes the amount. In the information card of the intercompany settling customer is a reference to an interest charge/reminder principle, which will then be used in the calculation of interest for the company in question.</p> <p>Interest is calculated individually for the intercompany entries meeting the above-described criteria. The method in which interest is calculated for each entry depends on the setup of the interest charge/reminder principle used. For instance, a field on the interest charge/reminder principle determines whether entries created as a result of previous interest calculations should also be included in subsequent interest calculations. Therefore, for a description of the interest calculation method, see the description of the Interest Charge Selection and Interest Charge/Reminder Principles windows in the A/R module.</p> <p>After an interest amount has been calculated for each entry, Maconomy calculates the difference between the total interest amount calculated for each of the companies and creates a single intercompany entry for the difference. This means that if USD 100 has been calculated for company A, and USD 70 has been calculated for company B, an intercompany entry for the amount of -30 is created with company A as executing company and company B as responsible company. The new entry is posted in an intercompany interest note journal.</p> <p>Furthermore, the amount is posted to the relevant interest earnings, interest expense, and intercompany accounts in the general ledger.</p> <p>After the interest charge calculation, Maconomy prints an interest charge notice.</p>
<b>Group Entries</b>	<p>Using this action, you can reduce the number of open, noninvoiced intercompany entries between two companies.</p> <p>When you select the action, Maconomy will group similar entries between the two companies specified in the Open Entry Intercompany Account Statement tab into one entry for the total amount of the grouped entries. The grouping only takes place for open, non-invoiced intercompany entries whose grouping date is earlier than or equal to the date specified in the field "Grouping Date" in the Open Entry Intercompany Account Statement tab. The grouping date of an entry depends on whether interest has been calculated for the entry in question. If it has, the grouping date of the entry is equal to the interest date on the entry. If interest has not been calculated for the entry, the grouping date is equal to the entry date.</p> <p>After the entries matching the above criteria have been identified, Maconomy creates a number of groups. Each group will consist of the entries where the following information is identical:</p>

Field	Description
	<ul style="list-style-type: none"> <li>▪ Intercompany type</li> <li>▪ Date (entry date or interest date as described above)</li> <li>▪ Item Tax Code</li> <li>▪ Tax code on the invoice on which the intercompany entry was based</li> <li>▪ Tax code on the vendor invoice on which the intercompany entry was based</li> </ul> <p>For each group, Maconomy creates an intercompany entry on which the amount corresponds to the net balance of the intercompany entries in the group. An offset intercompany entry is also created, along with corresponding G/L entries. The new intercompany entries are created in an intercompany grouping journal which is posted automatically.</p> <p>Finally, the intercompany entries which were grouped are closed, along with their respective G/L entries. The new intercompany entries and their respective G/L entries remain open and can therefore be invoiced in the Intercompany Invoicing workspace.</p>

## Interest Calculation of Intercompany Entries Workspace

Use this workspace to calculate interest for the intercompany entries that pertain to a given company, or that pertain to all combinations of responsible and settling company for which intercompany entries exist in Maconomy.

The functionality of this workspace only applies if you select the **Create Intercompany Invoicing Basis** system parameter.

To reduce the number of open entries, you can also use the **Group Entries** action to combine multiple open intercompany entries between two companies into one summarized intercompany entry.

The **Use Enterprise Currency** system parameter in Intercompany Interest Calculation and Grouping determines whether the interest calculation and the open intercompany entry grouping are based on the original or the enterprise currency.

### Interest Calculation of Intercompany Entries Tab

This section includes the fields and descriptions for the Interest Calculation of Intercompany Entries tab.

#### Selection Criteria Island

Field	Description
<b>Company No.</b>	In this field, you can specify a company number. If you specify a company number, the actions "Calculate Interest" and "Group Entries" will only take into consideration intercompany entries on which the company in question is involved, either as the responsible or as the settling company. If you do not enter a company

Field	Description
	<p>number, selecting an action will cause the action to be run for all combinations of responsible and executing company for which intercompany entries exist in the system.</p> <p>Please note that access restrictions to companies also apply when using the actions in this workspace. This means that the actions will only include entries with an executing company to which the current user has access. If, for instance, interest is being calculated for two companies, only one of which is accessible to the user, Maconomy only calculates interest for the entries for which that company is the executing company. If the user had access to both companies, Maconomy would also calculate the interest for the entries where the other company is responsible, and set off the interest calculations of the two companies against each other as described for the “Calculate Interest” action.</p>

### Calculate Interest Island

Field	Description
<b>Interest Date</b>	In this field, you can specify a date for interest calculation. When you select the “Calculate Interest” action, the interest calculation will only include intercompany entries with an entry or interest date earlier than or equal to the date specified in this field. For further information about the interest calculation procedure, see the “Calculate Interest” action.

### Grouping Island

Field	Description
<b>Grouping Date</b>	In this field, you can specify a date for grouping intercompany entries. When you select the “Group Entries” action, the grouping procedure will only include intercompany entries with an entry or interest date earlier than or equal to the date specified in this field. For further information about the grouping procedure, see the “Group Entries” action.

### Actions

This section shows the actions available in the Interest Calculation of Intercompany Entries workspace.

### Top Pane

Field	Description
<b>Calculate Interest</b>	<p>Using this action, you can calculate interest for the non-invoiced, open intercompany entries between companies.</p> <p>For each pair of companies between which intercompany entries exist, Maconomy runs a process corresponding to the one described for the “Calculate Interest” action in the Open Entry Intercompany Account Statement workspace. This means that selecting this action corresponds to specifying two companies in</p>

Field	Description
	<p>the Open Entry Intercompany Account Statement tab of the Open Entry Intercompany Account Statement workspace and selecting the “Calculate Interest” action there, then specifying another combination of companies, running the action again, and so on, until the action has been run for all combinations of companies.</p> <p>However, if a company number has been specified in the field “Company No.” in the Interest Calculation of Intercompany Entries workspace, the process is only run for each pair of companies that involves the specified company. In other words, this corresponds to specifying the company in question in the field “Company 1” in the window Open Entry Intercompany Account Statement workspace and then selecting the “Calculate Interest” action there for a number of times, each time specifying a new company in the field “Company 2,” until all companies have been specified in the field “Company 2.”</p>
<b>Group Entries</b>	<p>Using this action, you can reduce the number of open, noninvoiced intercompany entries between companies.</p> <p>For each pair of companies between which intercompany entries exist, Maconomy runs a process corresponding to the one described for the action “Group Entries” in the window Open Entry Intercompany Account Statement workspace. This means that selecting this action corresponds to specifying two companies in the Open Entry Intercompany Account Statement tab of the Open Entry Intercompany Account Statement workspace and selecting the “Group Entries” action there, then specifying another combination of companies, running the action again, and so on, until the action has been run for all combinations of companies.</p> <p>However, if a company number has been specified in the field “Company No.” in the Interest Calculation of Intercompany Entries tab, the process is only run for each pair of companies that involves the specified company. In other words, this corresponds to specifying the company in question in the field “Company 1” in the window Open Entry Intercompany Account Statement workspace and then selecting the “Calculate Interest” action there for a number of times, each time specifying a new company in the field “Company 2,” until all companies have been specified in the field “Company 2.”</p>

## Sequence Numbers Workspace

This workspace allows customers to view sequence numbers added to finance entries, and view opening balance entries with sequence numbers.

Along with the **Sequence Number Criteria** single dialog workspace, the **Sequence Numbers** workspace allows customers to view sequence numbers added to finance entries, and view opening balance entries with sequence numbers. These numbers are unique, chronological (according to entry date), and unbroken within the context of a company and fiscal year (and, optionally, within a fiscal year period and transaction type).

This functionality is also added as an enhancement to the Accounting Entry File (AEF), a French statutory requirement that is generated using BPM. The sequence numbers for finance entries listed in the AEF report can be used to look up those finance entries in Maconomy.

You can also specify if a company is a reporting/non-reporting company. This is significant when you want to use the same sequence of numbers for a reporting company and its subordinate company (which should be a non-reporting one).

To make this functionality usable, you must tag specific local accounts (or companies) to the Local Specification 1 dimension. Only finance entries for these local accounts are assigned sequence numbers and taken into consideration when Maconomy calculates opening balance entries.

## Sequence Numbers Tab

This section includes the fields and descriptions for the Sequence Numbers tab.

### Sequence No. Assignment Island

Field	Description
<b>Reporting Company</b>	Enter the name or number of the reporting company for Maconomy to consider when assigning sequence numbers to finance entries. Maconomy considers the finance entries of the company you specify here, as well as the finance entries of the company's subordinate non-reporting companies.
<b>Fiscal Year</b>	In this field, specify the fiscal year within which finance entries should be considered.
<b>From Period</b>	In these fields, specify a range of fiscal year periods. Maconomy will consider finance entries within these periods.

### Log Selection Criteria Island

Field	Description
<b>Show Logs</b>	If you select this check box, the Logs sub-tab will display all log entries that satisfy the selection criteria. If you leave this blank, the Logs sub-tab will remain empty.
<b>Reporting Company</b>	In these fields, specify the range of companies for which Maconomy should display log entries in the Logs sub-tab.
<b>Fiscal Year</b>	In these fields, specify the range of fiscal years for which Maconomy should display log entries in the Logs sub-tab.
<b>Period</b>	In these fields, specify the fiscal year period interval of the selected fiscal years for which Maconomy should display log entries in the Logs sub-tab. If you are not restarting the sequence for each period, the value for the <b>Period</b> field in the log entries is '0'.
<b>Transaction Type</b>	If you specify a value for this field, only the log entries for the specified transaction type are displayed in the Logs sub-tab.

## SD\_GL\_Sequence\_NumbersWS\_Logs Sub-tab

This section includes the fields and descriptions for the Logs sub-tab.

Field	Description
<b>Reporting Company</b>	This field displays the reporting company of the finance entries assigned a sequence number.
<b>Fiscal Year</b>	This field displays the fiscal year of the finance entries.
<b>Period</b>	This field displays the fiscal year period of the finance entries.
<b>Transaction Type</b>	This field displays the transaction type of the finance entries. If your setup specifies that a new sequence should not be used for each transaction type, this field is left blank.
<b>First Seq. No.</b>	This field displays the first sequence number assigned to finance entries belonging to the company, fiscal year, fiscal year period, and transaction type on the same log entry.
<b>Last Seq. No.</b>	This field displays the last sequence number assigned to finance entries belonging to the company, fiscal year, fiscal year period, and transaction type on the same log entry.
<b>Created by</b>	This field displays the user who performed the assignment of sequence numbers.
<b>Created Date</b>	This field displays the date of the assignment.
<b>Created Time</b>	This field displays the time of the assignment.

## Actions

This section shows the actions available in the Sequence Numbers workspace.

## Sequence Numbers Tab

Field	Description
<b>Assign Sequence Numbers</b>	If you click this action, Maconomy assigns sequence numbers to the finance entries that meet the company and fiscal year criteria as well as the local account and transaction type criteria.

## Journals Workspace

Use this workspace to view all the journals created in Maconomy to which you have access.

### Journal Tab

This section includes the fields and descriptions for the Journal tab.

#### Journal Island

Field	Description
<b>Journal No.</b>	This is the number of the journal. Maconomy numbers journals in consecutive order. All journals use the same system number series, regardless of which module a journal is created in. The journal number series is defined in the System Numbers window in the Set-Up module.
<b>Type</b>	In this field, you can enter the type of the journal.
<b>Company No.</b>	In this field, you can enter the number of the company to which the current journal pertains.
<b>Company of Origin</b>	This field shows the original company number of the journal. This is relevant for intercompany transactions.
<b>Orig. Company Journal No.</b>	If the current journal is an intercompany journal, that is, the field "Intercompany Posting" is marked, this field shows the number of the company responsible for the journal which caused the intercompany posting and thus the creation of the current journal.
<b>Main Journal No.</b>	A journal can be created when you post another journal. A customer reconciliation journal can be created when you post a credit memo if the credit memo is reconciled automatically against the invoice. The customer reconciliation journal will then have the invoice journal as the main journal.
<b>Period, Start</b>	This field shows the first date in the period covered by the journal. The period of the journal goes from the period starting date to the date shown in the "Period, End" field below.
<b>Period, End</b>	This field shows the last date in the period covered by the journal. For a further description, please see the "Period, Start" field above.
<b>Period No.</b>	This field shows the journal's period number in the current fiscal year. If your company uses periods that follow the months of the year, the field will, for example, show 1 for January, 2 for February, 3 for March, and so on. However, the periods do not necessarily follow the months of the year. The duration of the period is shown in the fields "Period, Start" and "Period, End."
<b>Fiscal Year</b>	This field shows the fiscal year used by the journal's company.

Field	Description
<b>Prior-Period</b>	This field shows the prior period, if posting outside the open posting period is allowed.
<b>Last Entry Date</b>	This field shows date on which the most recent entry was created.
<b>Last Line Number</b>	This field shows the number of the last line in the journal.
<b>Lines Deleted</b>	You can delete general journal lines after the general journal has been posted. This field is marked if the lines have been deleted.

### Balance Island

Field	Description
<b>Balance, Base</b>	This field shows the journal's balance in base currency. Note that A/R and vendor invoice journals are the total of customer and vendor entries, respectively, since the total of offsetting entries are not included in the balance. These two journals can therefore be posted even though they do not balance. All other journals must balance before they can be posted.
<b>Base Currency</b>	This field shows the company currency.
<b>Balance, Enterprise</b>	This field shows the journal balance in enterprise currency.
<b>Intercompany Posting</b>	This check box is selected if the journal is a result of intercompany operations.
<b>Control Entry Total</b>	This is the expected total of the all the entries in the journal. The batch total is the total of all the values in the fields "Debit" and "Credit" in the journal lines. Both debit and credit entries are calculated as positive figures. The control entry total is in the base currency of the company that created the journal.
<b>Current Entry Total</b>	This is the batch total calculated by Maconomy. It is the total of the values entered in the fields "Debit" and "Credit" in the journal. The current entry total is shown in the base currency of the company that created the journal.

### Status Island

Field	Description
<b>Created by</b>	This field shows the user name of the person who created the journal.
<b>Created on</b>	This field shows the date on which the journal was created.

Field	Description
<b>Submitted by</b>	This field shows the user name of the person who submitted the journal.
<b>Date Submitted</b>	This field shows the date on which the journal was submitted.
<b>Marked for Posting</b>	If this check box is selected, the journal is marked for posting.
<b>Being Posted</b>	This field shows whether parts of the journal have been posted. When the posting of a journal starts, this field is marked until the posting of the journal is completed.
<b>Posted</b>	If this check box is selected, the journal has been posted.
<b>Date Posted</b>	This field shows the date on which the journal was posted.
<b>Posted by</b>	This field shows the user name of the person who posted the journal.
<b>Printed</b>	If this check box is selected, the journal has been printed.

### Transaction Island

Field	Description
<b>First Trans. No.</b>	This field shows the transaction number used on the first entry, usually the smallest number.
<b>Last Trans. No.</b>	This field shows the transaction number used on the last entry, usually the largest number.
<b>Previous Transaction Number</b>	This field shows the transaction number used on the previous entered entry.
<b>Number Series</b>	This field shows the default transaction number series.
<b>Transaction Type, Default</b>	This field shows the default transaction type.

### Offsets Island

Field	Description
<b>Offset Code 1-5</b>	This field shows up to five offset codes, for which Maconomy updates the entry sum in the journal's "Total" column and the balance in the "Balance" column.

## Opening Balances Workspace

This workspace allows you to set up and view fields and logs related to opening balances.

The **Opening Balances** single dialog workspace allows you to view the reporting company, fiscal year, and other log-related information for sequence numbering purposes.

### Opening Balances Tab

This section includes the fields and descriptions for the Opening Balances tab.

#### Opening Balance Creation Island

Field	Description
<b>Reporting Company</b>	Enter the name or number of the reporting company for Maconomy to consider when calculating opening balance entries. Maconomy considers the finance entries of the company you specify here, as well as the finance entries of the company's subordinate non-reporting companies.
<b>Fiscal Year</b>	In this field, specify the fiscal year for which Maconomy should create opening balance entries.

#### Log Selection Criteria Island

Field	Description
<b>Show Logs</b>	If you select this check box, the Logs sub-tab will display all log entries that satisfy the selection criteria.
<b>Reporting Company</b>	In these fields, specify the range of companies for which Maconomy should display log entries in the Logs sub-tab.
<b>Fiscal Year</b>	In these fields, specify the range of fiscal years for which Maconomy should display log entries in the Logs sub-tab.

### Logs Sub-tab

This section includes the fields and descriptions for the Logs sub-tab.

Field	Description
<b>Reporting Company</b>	This field displays the reporting company of the created opening balance entries for the specific log entry.
<b>Fiscal Year</b>	This field displays the the fiscal year for which the opening balance entries were created.
<b>Entries Created</b>	This field displays the number of opening balance entries created for the specific log entry.
<b>Created by</b>	This field displays the user who created the opening balance entries.

Field	Description
<b>Created Date</b>	This field displays the date of creation.
<b>Created Time</b>	This field displays the time of creation.

## Actions

This section shows the actions available in the Opening Balances workspace.

Field	Description
<b>Create Opening Balances</b>	If you click this action, Maconomy creates opening balance entries with sequence numbers for the company and fiscal year specified in the Opening Balances tab, and for the local account and transaction type specified in the Sequence Number Criteria single dialog workspace.

## Lookup Section

This section includes the fields and descriptions for the Lookup section workspaces.

### Account Ledger Workspace

Use this workspace to view an account's opening and closing balances for an accounting period, and see the entries that affected the account balance.

You cannot change any information that you see in this workspace.

You enter an account number and a period range. The Entries sub-tab displays the entries, sorted by entry date, then transaction number. Another way to view finance entries from this sub-tab is by using the Show G/L Entries workspace.

You can also display balances and entries for specific dimensions, meaning that you can review a periodic statement for any account and dimension.

When you open this workspace, Maconomy displays information for the account that you most recently viewed. Use the Find menu to retrieve other accounts. The **Company** field in the Entry Selection island defaults to your own company.

### Account Ledger Tab

This section includes the fields and descriptions for the Account Ledger tab.

### Entry Selection Island

Field	Description
<b>Account No.</b>	This is the account number of the account shown in the window. Use the search functions in the Find menu to retrieve other accounts.

Field	Description
<b>Name</b>	This is the text entered for the account.
<b>Type</b>	This is the account type.
<b>P&amp;L/Balance Sheet</b>	This field shows whether the account is a Profit & Loss or Balance Sheet account.
<b>Account Currency</b>	This is the standard currency of the account.
<b>Blocked</b>	This field is marked if the account is blocked.
<b>Company No.</b>	In these fields you can specify a range of company numbers. The Entries sub-tab only shows entries which belong to the specified range of companies. If the Maconomy system contains companies whose fiscal year templates do not include the current period, Maconomy shows an error message. To avoid this problem every time you open this window, Maconomy automatically suggests the company of the user as the criterion in this field.

### Entry Selection, Dimensions Island

Field	Description
<b>Location</b>	Here you can enter a range of location values. The Entries sub-tab will only show entries assigned to dimension values within the given range. If you leave the fields blank, "Location" has no influence on the entry selection. The values shown in the Period Balances: Opening/Closing island and in the field "Balance" in the Entries sub-tab are calculated from the entries selected in the Account Ledger tab.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

**Period Island**

Field	Description
<b>Month/Yr</b>	<p>Here you enter the starting month and year and the ending month and year to define the period for which you wish to see a balance. Enter the month as a figure, for instance, "1" for January, "2" for February, and so on. The period must be created as a fiscal year in the fiscal year template for all companies within the range of companies specified in the Entry Selection island. If you wish to see entries for a period which does not follow your company's G/L periods, you must enter the period in the "Date" field instead. This field will then show the period to which the starting and ending dates belong.</p> <p>If you use flexible periods that do not follow the calendar year, the month that you enter refers to the period defined in the window Fiscal Year for the combination of month and year.</p>
<b>Date</b>	<p>This is the date range which defines the period for which you want to see account statements. If the period corresponds to one of the fiscal periods of the company, you could supply the dates in the fields "Month/Yr." instead. If a period is entered in the fields "Month/Yr.," a date range corresponding to the selected period is automatically displayed in these fields. Using the account number and period, Maconomy retrieves the period balance and movements.</p>

**Period Balances: Opening/Closing Island**

Field	Description
<b>Currency</b>	This is the account's opening and closing balances in the reporting currency.
<b>Enterprise</b>	This is the account's opening and closing balances for the specified period and within the specified dimensions. The amounts are shown in enterprise currency. The balances are updated upon posting and cannot be changed.
<b>Account</b>	This is the account's opening and closing balances for the specified period and within the specified dimensions. The amounts are shown in the currency of the account. The balances are updated upon posting and cannot be changed.
<b>Quantity</b>	This is the account's opening and closing quantity balances for the specified period and dimension specification. The balances are updated during posting and cannot be changed here.
<b>Quantity 2</b>	This is the account's opening and closing quantity 2 balances for the specified period and dimension specification. The balances are updated during posting and cannot be changed here.

**Currency Island**

Field	Description
<b>Reporting Currency</b>	In this field, you can specify the currency in which totals in this workspace are to be displayed. The totals in the Period Balances: Opening/Closing island will be converted into and displayed in this currency. If the current user has been

Field	Description
	<p>assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates that are valid on the date entered in the field "Exchange Rate Date," and the exchange rate table used is the exchange rate table selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may cause discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	<p>In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates that are valid on this date according to the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."</p>

### Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Entry Date</b>	This is the entry date. The entries are sorted by entry date. Entries with the same date are sorted by transaction number.
<b>Description</b>	This is the entry text.
<b>Trans. No.</b>	<p>This is the entry's transaction number. Depending on where the entry occurs, the transaction number was entered manually or allocated by Maconomy.</p> <p>If the number originates in a general or vendor invoice journal, it is manually entered.</p> <p>If the number originates in an A/R, A/P, invoice, reallocation, inventory, job, or client account regulation journal, it is entered automatically.</p>
<b>Trans. Type</b>	This is the entry's transaction type. Transaction types are set up in the Transaction Types window.
<b>Debit, Base</b>	This is the entry amount in the base currency of the company specified on the entry if the entry is a debit entry.
<b>Credit, Base</b>	This is the entry amount in the base currency of the company specified on the entry if the entry is a credit entry.
<b>Base Currency</b>	This is the currency used as base currency in the company specified on the current entry.

Field	Description
<b>Balance, Rep. Currency</b>	This is the balance on the current account after the posting of the current entry. The amount is calculated from the amount in base currency of the company specified on the entry, but is displayed in the reporting currency selected in the Account Ledger tab. The balance on the first transaction in the Entries sub-tab thus corresponds to the opening balance plus the amount on the first entry, whereas the balance on the last transaction in the Entries sub-tab corresponds to the closing balance. Credit balances are displayed as negative figures. The balance is shown for entries within the specified dimension ranges in the Account Ledger tab. Note that the column only displays amounts if the Selection Criteria cover companies that use the same base currency, and if this base currency corresponds to the reporting currency.
<b>Debit, Account</b>	This is the entry amount in the standard currency of the account, if the entry is a debit entry.
<b>Credit, Account</b>	This is the entry amount in the standard currency of the account, if the entry is a credit entry.
<b>Balance, Account</b>	In this field, Maconomy displays the balance of the current account after the posting of the current entry. The amount is displayed in the base currency of the account. The balance on the first transaction in the Entries sub-tab corresponds to the opening balance plus the amount on the first entry, while the balance on the last transaction in the Entries sub-tab corresponds to the closing balance. Credit balances are displayed as negative figures. The balance is shown for entries within the specified dimension ranges in the Account Ledger tab.
<b>Debit, Enterprise</b>	This is the entry amount in enterprise base currency if the entry is a debit entry.
<b>Credit, Enterprise</b>	This is the entry amount in enterprise base currency if the entry is a credit entry.
<b>Balance, Enterprise</b>	In this field, Maconomy displays the balance of the current account after the posting of the current entry. The amount is displayed in the base currency of the account. The balance on the first transaction in the Entry sub-tab corresponds to the opening balance plus the amount on the first entry, while the balance on the last transaction in the Entry sub-tab corresponds to the closing balance. Credit balances are displayed as negative figures. The balance is shown for entries within the specified dimension ranges in the Account Ledger tab.
<b>Amount, Original</b>	This is the amount that was specified in the field "Currency Amount" when the current entry was created.
<b>Original Currency</b>	This is the original currency for the entry.
<b>Quantity</b>	This is the quantity registered to the entry.

Field	Description
<b>Quantity Balance</b>	This is the account's quantity balance after posting. The balance for the first transaction is thus the opening balance plus the first entry quantity, while the balance for the last transaction is the closing balance. Note that the quantity balance is only for the entries selected in the Account Ledger tab.
<b>Quantity 2</b>	This is the quantity 2 registered to the entry.
<b>Quantity 2 Balance</b>	This is the account's quantity 2 balance after posting. The balance for the first transaction is thus the opening balance plus the first entry, while the balance for the last transaction is the closing balance. Note that the quantity 2 balance is only for the entries selected in the Account Ledger tab.
<b>Company No.</b>	This is the number of the company to which the current entry is assigned.
<b>Location</b>	This is the Location to which the current entry is assigned.
<b>Entity</b>	This is the Entity to which the current entry is assigned.
<b>Project</b>	This is the Project to which the current entry is assigned.
<b>Purpose</b>	This is the Purpose to which the current entry is assigned.
<b>Spec. 1-3</b>	These are the Specification values to which the current entry is assigned.
<b>Local Spec. 1-3</b>	These are the Local Specification values to which the current entry is assigned.
<b>Date Posted</b>	This is the date when the entry was posted in the general ledger.
<b>Journal No.</b>	This is the number of the posting journal in which the entry is posted.
<b>EU Tax Code</b>	This is the EU tax code of the entry.
<b>Prior-periods</b>	This field displays the prior period assigned to the current entry.

## Actions

This section shows the actions available in the Account Ledger workspace.

### Entries Sub-Tab

Field	Description
<b>View Document</b>	Select a line in the table, then use this action to display the document attached to the General Journal or Vendor Invoice, if any.

## Dimension Card Workspace

Use this workspace to view all G/L entries for a specific period, for a range of dimension combinations or based on other criteria for selecting accounts.

You can select the accounts to include based on selection criteria or dimensions. Maconomy remembers the last selections that you made and displays them the next time that you open this workspace.

The Entries sub-tab displays the entries, sorted by account number, then entry date, then transaction number.

### Dimension Card Tab

This section includes the fields and descriptions for the Dimension Card tab.

### Selection Criteria Island

Field	Description
<b>Show Entries</b>	When this box is checked, the Entries sub-tab will display the entries that fall within the specified ranges.
<b>Account No.</b>	In these fields, you can specify a range of account numbers. The Entries sub-tab will only show entries to accounts within the range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The Entries sub-tab will only show entries to companies within the range.
<b>Intercomp. Company</b>	In these fields, you can enter a range of company numbers. The Entries sub-tab will only show entries where a company within the range is the intercompany company. Consequently, if these fields are completed, only intercompany entries will be displayed in the Entries sub-tab.
<b>Customer No.</b>	In these fields, you can enter a range of customer numbers. The Entries sub-tab will only show entries associated with a customer within the specified range. Please note that it must be specified for each account in the window Account Information Card whether customer numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the Entries sub-tab will only show entries to accounts for which it has been specified that customer numbers should be transferred to G/L entries.

Field	Description
<b>Vendor No.</b>	In these fields, you can enter a range of vendor numbers. The Entries sub-tab will only show entries associated with a vendor within the specified range. Please note that it must be specified for each account in the window Account Information Card whether vendor numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the Entries sub-tab will only show entries to accounts for which it has been specified that vendor numbers should be transferred to G/L entries.
<b>Job No.</b>	In these fields, you can enter a range of job numbers. The Entries sub-tab will only show entries associated with a job within the specified range. Please note that it must be specified for each account in the window Account Information Card whether job numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the Entries sub-tab will only show entries to accounts for which it has been specified that job numbers should be transferred to G/L entries.
<b>Activity No.</b>	In these fields, you can enter a range of activity numbers. The Entries sub-tab will only show entries associated with an activity within the specified range. Please note that it must be specified for each account in the window Account Information Card whether activity numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the Entries sub-tab will only show entries for accounts for which it has been specified that activity numbers should be transferred to G/L entries.
<b>Task</b>	In these fields, you can enter a range of tasks. The Entries sub-tab will only show entries associated with a task within the specified range. Please note that it must be specified for each account in the window Account Information Card whether tasks should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the Entries sub-tab will only show entries to accounts for which it has been specified that tasks should be transferred to G/L entries.
<b>Employee No.</b>	In these fields, you can enter a range of customer numbers. The Entries sub-tab will only show entries associated with an employee within the specified range.
<b>Asset No.</b>	In these fields, you can enter a range of asset numbers. The Entries sub-tab will only show entries associated with a fixed asset within the specified range. Please note that it must be specified for each account in the window Account Information Card whether asset numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the Entries sub-tab will only show entries to accounts for which it has been specified that asset numbers should be transferred to G/L entries.
<b>Item No.</b>	In these fields, you can enter a range of item numbers. The Entries sub-tab will only show entries associated with an item within the specified range. Please note that it must be specified for each account in the window Account Information Card whether item numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the Entries sub-tab will only show entries to accounts for which it has been specified that item numbers should be transferred to G/L entries.

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	In these fields, you can enter a range of values for the dimension Location. The Entries sub-tab will only show entries with a location value within the specified range. If no range is specified, the dimension Location has no influence on the selection of entries displayed in the Entries sub-tab.
<b>Entity</b>	The functionality of these fields is similar to that of the field "Location."
<b>Project</b>	The functionality of these fields is similar to that of the field "Location."
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Location."
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."

### Period Island

Field	Description
<b>Month/Yr</b>	Here you enter the starting month and starting year of the period for which you wish to see entries. Enter the month as a number, for instance "1" for January, "2" for February, and so on. If you wish to see entries for a period which does not follow your company's fiscal periods, you must enter the period in the "Date" field instead. This field will then show the period to which the starting and ending dates belong.  If your company uses flexible periods that do not follow the calendar year, the month you enter here refers to the period defined in the window Fiscal Year.
<b>Date</b>	This is the date range of the period for which you want to see a dimension card. If the desired period corresponds to one of the fiscal periods of the company, you can enter this period in the "Month/Yr." fields instead. If a period is entered in the "Month/Yr." fields, a date range which corresponds to the selected period is displayed in these fields. Maconomy will use the account number and the period to retrieve period balance and movements.

### Period Balances Island

Field	Description
<b>Calculate Opening Balances</b>	Maconomy will calculate the opening balance for the period and dimension specification if this field is marked. The opening balance will not be calculated if the field is not marked, and Maconomy will in that case show the movement for the period and dimension specification in the closing column.

Field	Description
<b>Currency</b>	This is the opening and closing quantity balances in reporting currency for the specified period and dimension specification.
<b>Enterprise</b>	This is the opening and closing quantity balances in enterprise currency for the specified period and dimension specification.
<b>Quantity</b>	This is the quantity registered to the entry, if applicable.
<b>Quantity 2</b>	This is the quantity 2 registered to the entry, if applicable.

### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which amounts in the Entries sub-tab should be displayed. The amounts will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date," and the exchange rate table used is the exchange rate table selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may cause discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."
<b>Exchange Rate Table</b>	In this field, you can specify the exchange rate table to use in accordance with the exchange rate date.

### Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Account No.</b>	This is the account to which the entry is entered.
<b>Account Name</b>	This is the text entered for the above account.

Field	Description
<b>Entry Date</b>	This is the entry date.
<b>Description</b>	This is the entry text.
<b>Trans. No.</b>	<p>This is the entry's transaction number. It is entered manually or automatically depending on where the entry originates.</p> <p>If the number is of a general or vendor invoice journal, it is entered manually.</p> <p>If the number is of an A/R, A/P, invoice, reallocation, inventory, job, or client account adjustment journal, it is given automatically.</p>
<b>Trans. Type</b>	This is the entry's transaction type. Transaction types are set up in the Transaction Types window.
<b>Debit, Company</b>	This is the entry amount in the base currency of the company specified on the entry if the entry is a debit entry.
<b>Credit, company</b>	This is the entry amount in the base currency of the company specified on the entry if the entry is a credit entry.
<b>Company Currency</b>	This is the currency used as base currency in the company specified on the current entry.
<b>Balance, Currency</b>	This is the customer's current balance in the customer's standard currency. The balance is updated at posting.
<b>Debit, Account</b>	This is the entry amount in the standard currency of the account, if the entry is a debit entry.
<b>Credit, Account</b>	This is the entry amount in the standard currency of the account, if the entry is a credit entry.
<b>Account Currency</b>	This is the base currency of the currency account.
<b>Debit, Enterprise</b>	This is the entry amount is enterprise base currency if the entry is a debit entry.
<b>Credit, Enterprise</b>	This is the entry amount is enterprise base currency if the entry is a credit entry.
<b>Balance, Enterprise</b>	In this field, Maconomy displays the balance of the current account after the posting of the current entry. The amount is displayed in the base currency of the account. The balance on the first transaction in the Entries sub-tab corresponds to the opening balance plus the amount on the first entry, while the balance on the last transaction in the table part corresponds to the closing balance. Credit balances are displayed as negative figures. The

Field	Description
	balance is shown for entries within the specified dimension ranges in the card part of the window.
<b>Amount, Original</b>	This is the entry amount in the currency that the entry was registered in, for example, the field "Currency Amount" if the entry originates from a general journal entry, the currency specified on the vendor invoice if the entry originates from a vendor invoice, or the currency on the invoice if the entry was created upon posting of an invoice.
<b>Original Currency</b>	This is the currency in which the entry was registered, for example, the field "Currency" if the entry originates from a general journal entry, the currency of the vendor invoice if the entry originates from a vendor invoice, or the currency of the invoice if the entry was created upon the posting of an invoice.
<b>Quantity</b>	This is the quantity registered to the entry, if applicable.
<b>Quantity Balance</b>	This is the total of the quantity of the current entry and those above it. The quantity balance of the first entry is thus its own quantity, and the quantity balance of the last entry is the total of all the entry quantities, that is, the accumulated sum of the Quantity entry.
<b>Quantity 2</b>	This is the quantity 2 registered to the entry, if applicable.
<b>Quantity 2 Balance</b>	The functionality of this field is similar to that of the field "Quantity Balance" above.
<b>Company No.</b>	This field displays the number of the company to which the current entry is assigned.
<b>Location</b>	This is the name of the Location to which the entry is assigned.
<b>Entity</b>	This is the name of the Entity to which the entry is assigned.
<b>Project</b>	This is the name of the Project to which the entry is assigned.
<b>Purpose</b>	This is the name of the Purpose to which the entry is assigned.
<b>Spec. 1-3</b>	These are the names of the Specifications to which the entry is assigned.
<b>Local Spec. 1-3</b>	These are the names of the Local Specifications to which the entry is assigned.
<b>Date Posted</b>	This is the date the entry was posted to the general ledger.

Field	Description
<b>Journal No.</b>	This is the number of the journal to which the entry was entered.
<b>EU Tax Code</b>	This is the EU tax code of the entry.
<b>Prior Periods</b>	This is the prior period of the entry, if applicable.
<b>Intercomp. Company</b>	This is the a range of company numbers of intercompany companies, if the entry is an intercompany entry. The printout will only include entries where a company with a number within the range is the intercompany company. Consequently, if these fields are completed, only intercompany entries will be included in the printout.
<b>Customer No.</b>	This is a range of customer numbers. The printout will only include entries associated with a customer within the specified range. Please note that it must be specified for each account in the Account Information Card workspace whether customer numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the printout will only include entries to accounts for which it has been specified that customer numbers should be transferred to G/L entries.
<b>Vendor No.</b>	This is a range of vendor numbers. The printout will only include entries associated with a vendor within the specified range. Please note that it must be specified for each account in the Account Information Card workspace whether vendor numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the printout will only include entries to accounts for which it has been specified that vendor numbers should be transferred to G/L entries.
<b>Job No.</b>	This is a range of job numbers. The printout will only include entries associated with a job within the specified range. Please note that it must be specified for each account in the Account Information Card workspace whether job numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the printout will only include entries to accounts for which it has been specified that job numbers should be transferred to G/L entries.
<b>Asset No.</b>	This is a range of asset numbers. The printout will only include entries associated with a fixed asset within the specified range. Please note that it must be specified for each account in the Account Information Card workspace whether asset numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the printout will only include entries to accounts for which it has been specified that asset numbers should be transferred to G/L entries.
<b>Task</b>	This is a range of tasks. The printout will only include entries associated with a task within the specified range. Please note that it must be specified for each account in the Account information Card workspace whether tasks should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the printout will only include

Field	Description
	entries to accounts for which it has been specified that tasks should be transferred to G/L entries.
<b>Employee No.</b>	This is a range of employee numbers. The printout will only include entries associated with employees within the specified range.
<b>Activity No.</b>	This is a range of activity numbers. The printout will only include entries associated with an activity within the specified range. Please note that it must be specified for each account in the Account Information Card workspace whether activity numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the printout will only include entries for accounts for which it has been specified that activity numbers should be transferred to G/L entries.
<b>Item No.</b>	This is a range of item numbers. The printout will only include entries associated with an item within the specified range. Please note that it must be specified for each account in the Account Information Card workspace whether item numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the printout will only include entries to accounts for which it has been specified that item numbers should be transferred to G/L entries.

## Company Overview Workspace

Use this workspace to see a high-level overview of a company's financial status, including predefined metrics that correspond to financial highlights.

It includes basic company information, key employee information, finance, and other company metrics.

Many metrics are included by default, but you can also add almost any figure that appears on a G/L report.

As a start, Maconomy supports a total of 20 finance metrics.

The Company Overview workspace includes:

- Basic company information, such as company number, name, address, phone, and bank account.
- Information about key employees in the company.
- Finance metrics, such as income statement and balance sheet highlights. These metrics are figures that Maconomy extracts from G/L reports. Before you can include these metrics in this workspace, you must define the proper G/L reports and metrics. Define the reports using the G/L Report Columns and G/L Report Set-Up workspaces, and define the metrics using the G/L Report Metrics workspace. To get up-to-date metrics, you must generate the source G/L reports for the given company and fiscal year before you review the Company Overview.
- Other company metrics, such as details about customers, vendors, and employees are provided as a standard set of key metrics, which you cannot customize.

## Company Tab

This section includes the fields and descriptions for the Company tab.

### Company Island

Field	Description
<b>Company No.</b>	This field shows the company's number, name, and address.
<b>Country</b>	This field shows the company's country code.
<b>Phone</b>	This field shows the company's telephone number.
<b>Fax</b>	This field shows the company's fax number.
<b>Telex</b>	This field shows the company's telex number.
<b>Giro</b>	This field shows the company's giro account number.
<b>Bank</b>	This field shows the company's bank.
<b>Company Reg. No.</b>	This field shows the company's registration number.
<b>Credit Card No.</b>	This field shows the company's credit card number.
<b>Tax No.</b>	This field shows the company's tax registration number.

### Currency Island

Field	Description
<b>Base Currency</b>	This field shows the company's base currency. Maconomy calculates all metrics in base currency.

### Accounts Receivable Island

Field	Description
<b>Total Outstanding</b>	This field shows the open balance of all of the company's customers, in base currency. This includes the amount that has been invoiced to customers, but has not yet been paid.

Field	Description
<b>Total Overdue</b>	This field shows the due open balance of all of the company's customers, in base currency. This includes the amount that has been invoiced to customers, is due for payment, but has not yet been paid.

### Accounts Payable Island

Field	Description
<b>Total Outstanding</b>	This field shows the open balance of all of the company's vendors, in base currency. This includes the amount that vendors have invoiced, but the company has not yet paid.
<b>Total Overdue</b>	This field shows the open balance of all of the company's vendors, in base currency. This includes the amount that vendors have invoiced, is due for payment, but the company has not yet paid.

### Contact Management Island

Field	Description
<b>Opportunities</b>	This field shows the current number of opportunities in the company.
<b>Campaigns</b>	This field shows the current number of campaigns running in the company.

### Human Resources Island

Field	Description
<b>Employees</b>	This field shows the current number of employees in the company.
<b>Vacancies</b>	This field shows the current number of vacancies in the company.

### Fiscal Year Island

This field shows the company's fiscal year.

### Finance Island

Copy to come

## Actions

This section shows the actions available in the Company Overview workspace.

### Top Pane

Field	Description
<b>Recalculate Finance Metrics</b>	Use this action to recalculate the metrics. This process effectively runs the G/L reports related to those metrics; as a result, this process can be time consuming.

## Finance Entry Analysis Workspace

Use this workspace to view G/L entries that include information about dimensions, and any information about the import of G/L data. You cannot change the data in this workspace.

### Finance Entry Tab

This section includes the fields and descriptions for the Finance Entry tab.

#### Company Island

Field	Description
<b>Company No.</b>	This field shows the company number.
<b>Base Currency</b>	This field shows the company's base currency.

#### Account Island

Field	Description
<b>Account No.</b>	This field shows the account number.

#### Control Account Island

Field	Description
<b>Job No.</b>	If the entry was created as a result of entry on a job, the job number in question is shown in this field, if the Account Information Card for the G/L account in question specifies that job numbers should be transferred to G/L entries.
<b>Activity No.</b>	If the entry was created with an activity specified, the activity number in question is shown in this field, if the Account Information Card for the G/L account in question specifies that activity numbers should be transferred to G/L entries.

Field	Description
<b>Task Name</b>	If the entry was created with a task specified, the task in question is shown in this field, if the Account Information Card for the G/L account in question specifies that tasks should be transferred to G/L entries.
<b>Employee</b>	If the entry was created with a task specified, the employee in question is shown in this field.
<b>Customer No.</b>	If the entry was created with a customer number, the customer number in question is shown in this field, if the Account Information Card for the G/L account in question specifies that customer numbers should be transferred to G/L entries.
<b>Vendor No.</b>	If the entry was created with a vendor number specified, the vendor number in question is shown in this field, if the Account Information Card for the G/L account in question specifies that vendor numbers should be transferred to G/L entries.
<b>Asset No.</b>	If the entry was created from an entry with an asset number specified, the asset number in question is shown in this field, if the Account Information Card for the G/L account in question specifies that asset numbers should be transferred to G/L entries.
<b>Item No.</b>	If the entry was created from an entry with an item number specified, the item number in question is shown in this field, if the Account Information Card for the G/L account in question specifies that item numbers should be transferred to G/L entries.
<b>Entry No.</b>	G/L entries which are assigned to a specific customer or vendor through a customer or vendor entry are automatically given an entry number. If the current entry was created as a result of a customer or a vendor entry, the entry number of the current entry is shown in this field. The number will be 0 if the entry consists of several customer or vendor entries which are joined into a single G/L entry.

### Tax Island

Field	Description
<b>Entry Type</b>	<p>If the current entry is related to tax calculation, this field shows the nature of the relation.</p> <p>If the entry type is "Tax Receivable" or "Tax Payable," the entry is a tax entry created in connection with tax calculation for sales or purchases. If the entry type is "Tax Basis," the entry is a G/L entry on the basis of which tax entries have been created, for instance the G/L entry representing an invoice for taxable items. If the field contains a different value, the entry is a tax entry for one of the tax types set up in the Tax Codes and G/L Tax Codes windows.</p>
<b>Tax Date</b>	In some countries, legal requirements demand that the entry date of each registration is what determines the tax settlement period in which the entry belongs, while in other countries, the period is determined by the invoice date of

Field	Description
	<p>the registration. In this field, you can specify for the current tax reporting unit which of the two methods should apply to companies belonging to the reporting unit.</p> <p>Each G/L entry contains a field called "Tax Date" to which either the entry date or the invoice date of the registration depending on the value in this field on the tax reporting unit assigned to the company which the entry concerns is automatically transferred when the entry is posted. When you create tax settlements in the Tax Settlement window, Maconomy uses the tax date registered on each individual G/L entry to determine whether the entry is covered by the period for which settlement is carried out.</p>
<b>EU Tax</b>	If the entry type is Tax Basic, EU Tax gets a value if the related tax code is an EU tax code.
<b>Nature of Tax</b>	This is the nature of tax with which the G/L entries must be posted to be included in the printout. See the G/L Tax Codes workspace for a description of nature of tax.
<b>Tax Type</b>	This field shows the tax type assigned to the G/L tax code. See the description of the G/L Tax Codes workspace for more information about tax types.
<b>Debit Tax</b>	<p>This shows the tax on the entry, if the entry is a debit entry subject to tax.</p> <p>Note that tax amount and tax account can only be registered to the account if the tax is calculated from a tax code in the general journal.</p>
<b>Credit Tax</b>	This shows the tax on the entry, if the entry is a credit entry subject to tax.
<b>Debit Ratio Tax</b>	<p>If ratio tax has been calculated for the current entry, the debit entry ratio tax amount is displayed in this field.</p> <p>Ratio tax is set up in the G/L Tax Codes workspace.</p>
<b>Credit Ratio Tax</b>	If ratio tax has been calculated for the current entry, the credit entry ratio tax amount is displayed in this field.

### Import Information Island

Field	Description
<b>Run No.</b>	This field shows the run number of a previous import.
<b>Line No.</b>	This field displays the line of the above mentioned run from which the current G/L entry has been imported.
<b>External Trans. No.</b>	If a transaction number is registered on the current G/L entry in the import file, this field displays a transaction number. An external transaction number can, for example, be the number of the transaction in a legacy financial system.

### Export Information Island

Field	Description
<b>Run No.</b>	This field shows the run number of a previous export.
<b>Group No.</b>	This field displays the number of the group in the above mentioned run of which the current G/L entry was a part.
<b>Line No.</b>	This field displays the line number of the above mentioned run of which the current G/L entry was a part.

### Entry Information Island

Field	Description
<b>Trans. No.</b>	This is the entry's transaction number.
<b>Trans. Type</b>	This is the entry's transaction type.
<b>Entry Date</b>	This is the entry's entry date.
<b>Entry Description</b>	This is the entry text.
<b>Prior-Period</b>	This is the current entry's prior period.
<b>Open/Closed</b>	This field displays whether the current G/L entry is open or closed. In the Account Information Card workspace, you can specify whether an account is to be reconciled. When entries on the account are subsequently reconciled in the Finance Reconciliation workspace, their status is changed from "Open" to "Closed."
<b>Reference Date</b>	This field shows the reference date for the current entry. The reference date can manually be specified on G/L journals and vendor invoices. The reference date is automatically set to the job/cost entry date for job-related entries in the cases where the job/cost entry date can be different from the G/L entry date.

### Entry Island

Field	Description
<b>Debit, Base</b>	This is the entry amount in the base currency of the company displayed in the Company island, if the entry is a debit entry.
<b>Credit, Base</b>	This is the entry amount in the base currency of the company displayed in the Company island, if the entry is a credit entry.
<b>Debit, Enterprise</b>	This is the entry amount in enterprise currency, if the entry is a debit entry.

Field	Description
<b>Credit, Enterprise</b>	This is the entry amount in enterprise currency, if the entry is a credit entry.
<b>Debit, Currency</b>	This is the entry amount in the standard currency of the account, if the entry is a debit entry.
<b>Credit, Currency</b>	This is the entry amount in the standard currency of the account, if the entry is a credit entry.
<b>Currency</b>	This is the account's currency.
<b>Amount, Original</b>	This is the entry amount in the currency that the entry was registered in, for example, the field "Currency Amount" if the entry originates from a general journal entry; the currency specified on the vendor invoice if the entry originates from a vendor invoice; or the currency on the invoice if the entry was created upon the posting of an invoice.
<b>Original Currency</b>	This is the currency that the entry was registered in, for example, the field "Currency" if the entry originates from a general journal entry; the currency of the vendor invoice if the originates from a vendor invoice; or the currency of the invoice if the entry was created upon the posting of an invoice.
<b>Quantity</b>	This shows the quantity registered to the entry, if applicable.
<b>Quantity 2</b>	This shows the quantity 2 registered to the entry, if applicable.

### Posting Island

Field	Description
<b>Date Posted</b>	This is the date when the entry was posted.
<b>Time Posted</b>	This is the time when the entry was posted.
<b>Journal No.</b>	This is the journal number of the posting journal to which the entry is posted.
<b>Journal Line No.</b>	This is the number of the journal line in the posting journal to which the entry is posted. If there is more than one entry to a transaction, Maconomy numbers the lines with the same number within the transaction. If, for example, you tax an entry in the window General Journal, you will get two entries with the same line number.
<b>Journal Type</b>	This field shows the journal type.
<b>Aut. Entry</b>	If this box is checked, the account number has been supplied by means of a posting reference. If the value is Yes, the user specified an account number manually in the General Journal, Invoice Allocation, or Reallocate Invoices

Field	Description
	window. In this way it is, for example, possible to check whether manual postings have been made on control accounts.

**Intercompany Posting Island**

Field	Description
<b>Intercompany Company No.</b>	If the entry was created as a result of an intercompany posting, this field shows the number of the intercompany company.
<b>Journal No.</b>	This is the number of the posting journal to which the entry is posted.
<b>Journal Line No.</b>	This is the number of the journal line in the posting journal to which the entry is posted. If there is more than one entry to a transaction, Maconomy numbers the lines with the same number within the transaction. If, for example, you tax an entry in the window General Journal, you will get two entries with the same line number.

**Origin Object Island**

Field	Description
<b>Origin Object</b>	The relation name of the origin object, for example, Time Sheet Header.
<b>Origin Object Instance Key</b>	The instance key of the origin object
<b>Object Key 1, String</b>	If any of the key fields of the origin object is of type String, then this field contains the value of the first String key field.
<b>Object Key 2, String</b>	If two or more of the key fields of the origin object are of type String, then this field contains the value of the second String key field.
<b>Object Key 1, Integer</b>	If any of the key fields of the origin object is of type Integer, then this field contains the value of the first Integer key field.
<b>Object Key 2, Integer</b>	If two or more of the key fields of the origin object are of type Integer, then this field contains the value of the second Integer key field.
<b>Object Key 3, Integer</b>	If three or more of the key fields of the origin object are of type Integer, then this field contains the value of the third Integer key field.
<b>Object Key 1, Date</b>	If any of the key fields of the origin object is of type Date, then this field contains the value of the first Date key field.
<b>Object Payment Agent</b>	If any of the key fields of the origin object is a reference to a Payment Agent, then this field contains the name of that Payment Agent.

**Origin Line Island**

Field	Description
<b>Origin Line</b>	The relation name of the origin line, for example, Time Sheet Line.
<b>Origin Line Instance Key</b>	The instance key of the origin line.
<b>Line Key 1, String</b>	If any of the key fields of the origin line is of type String, then this field contains the value of the first String key field.
<b>Line Key 2, String</b>	If two or more of the key fields of the origin line are of type String, then this field contains the value of the second String key field.
<b>Line Key 1, Integer</b>	If any of the key fields of the origin line is of type Integer, then this field contains the value of the first Integer key field.
<b>Line Key 2, Integer</b>	If two or more of the key fields of the origin line are of type Integer, then this field contains the value of the second Integer key field.
<b>Line Key 3, Integer</b>	If three or more of the key fields of the origin line are of type Integer, then this field contains the value of the third Integer key field.
<b>Line Payment Agent</b>	If any of the key fields of the origin line is a reference to a Payment Agent, then this field contains the name of that Payment Agent.

**Transaction Entries Island**

Finance This field shows the number of finance entries in the same transaction.

Field	Description
<b>Customer</b>	This field shows the number of customer entries in the same transaction.
<b>Vendor</b>	This field shows the number of vendor entries in the same transaction.
<b>Job</b>	This field shows the Number of job entries in the same transaction.
<b>Asset</b>	This field shows number of asset entries in the same transaction.
<b>Intercompany</b>	Number of intercompany entries in the same transaction.

**Show G/L Entries Workspace**

Use this workspace to view G/L entries that include information on tax and dimensions, and any information about the import of G/L data.

With the exception of the **Reference Date** field, you cannot change the data in this workspace.

## Show G/L Entries Tab

This section includes the fields and descriptions for the Show G/L Entries tab.

**Entry Information Island**

Field	Description
<b>Trans. No.</b>	This is the entry's transaction number.
<b>Trans. Type</b>	This is the entry's transaction type. Transaction types are set up in the Transaction Types workspace.
<b>Entry Date</b>	This is the date when the entry was entered to the general ledger. It indicates which period the entry is in.
<b>Entry Description</b>	This is the entry text.
<b>Prior-Period</b>	This is the current entry's prior period.
<b>Open/Closed</b>	This field displays whether the current G/L entry is open or closed. In the Account Information Card workspace, you can specify whether an account is to be reconciled. When entries on the account are subsequently reconciled in the Finance Reconciliation workspace, their status is changed from "Open" to "Closed."
<b>Reference Date</b>	This field shows the reference date for the current entry. The reference date can manually be specified on G/L journals and vendor invoices. The reference date is automatically set to the job/cost entry date for job-related entries in the cases where the job/cost entry date can be different from the G/L entry date.

**Company Island**

Field	Description
<b>Company</b>	This field displays the company's name and number.
<b>Base Currency</b>	This field displays the company's base currency.

**Account Island**

Field	Description
<b>Account</b>	This field displays the account name and number.

### Dimensions Island

Field	Description
<b>Location</b>	This is the name of the location attached to the current entry.
<b>Entity</b>	This is the name of the entity attached to the current entry.
<b>Project</b>	This is the name of the project attached to the current entry.
<b>Purpose</b>	This is the name of the purpose attached to the current entry.
<b>Spec. 1-3</b>	These are the names of the specifications attached to the current entry.
<b>Local Spec. 1-3</b>	These are the names of the local specifications attached to the current entry.

### Control Account Island

Field	Description
<b>Job</b>	If the entry was created as a result of entry on a job, the job number in question is shown in this field, if the Account Information Card for the G/L account in question specifies that job numbers should be transferred to G/L entries.
<b>Activity</b>	If the entry was created as a result of entry on an activity, the activity number in question is shown in this field, if the Account Information Card for the G/L account in question specifies that activity numbers should be transferred to G/L entries.
<b>Task</b>	If the entry was created as a result of entry on a task, the task in question is shown in this field, if the Account Information Card for the G/L account in question specifies that tasks should be transferred to G/L entries.
<b>Employee</b>	If the entry was created as a result of entry on an employee, the employee number in question is shown in this field.
<b>Customer</b>	If the entry was created as a result of entry on a customer, the customer number in question is shown in this field, if the Account Information Card for the G/L account in question specifies that customer numbers should be transferred to G/L entries.
<b>Vendor</b>	If the entry was created as a result of entry on a vendor, the vendor number in question is shown in this field, if the Account Information Card for the G/L account in question specifies that vendor numbers should be transferred to G/L entries.
<b>Item</b>	If the entry was created as a result of entry on an item, the item number in question is shown in this field, if the Account Information Card for the G/L account in question specifies that item numbers should be transferred to G/L entries.
<b>Asset</b>	If the entry was created as a result of entry on an asset, the asset number in question is shown in this field, if the Account Information Card for the G/L account in question specifies that asset numbers should be transferred to G/L entries.

Field	Description
<b>Entry No.</b>	G/L entries which are assigned to a specific customer or vendor through a customer or vendor entry are automatically given an entry number. If the current entry was created as a result of a customer or a vendor entry, the entry number of the current entry is shown in this field. The number will be 0 if the entry consists of several customer or vendor entries which are joined into a single G/L entry.

### Posting Island

Field	Description
<b>Date Posted</b>	This is the date when the entry was posted to the general ledger.
<b>Time Posted</b>	This field shows the time at which the journal/entry was posted. Maconomy uses the posting time internally only, for drilling in financial statements.
<b>Journal No.</b>	This is the number of the posting journal to which the entry is posted.
<b>Journal Line No.</b>	This is the number of the journal line in the posting journal to which the entry is posted. If there is more than one entry to a transaction, Maconomy numbers the lines with the same number within the transaction. If, for example, you tax an entry in the window General Journal, you will get two entries with the same line number.
<b>Journal Type</b>	This field shows the journal type.
<b>Aut. Entry</b>	If this box is checked, the account number has been supplied by means of a posting reference. If the box is not checked, the user specified an account number manually in the General Journal, Invoice Allocation, or Reallocate Invoices window. In this way it is, for example, possible to check whether manual postings have been made on control accounts.

### Intercompany Posting Island

Field	Description
<b>Intercompany Company</b>	If the entry was created as a result of an intercompany posting, this field shows the number of the intercompany company.
<b>Journal No.</b>	If the entry was created as a result of an intercompany posting, this field shows the number of the journal in the intercompany company in which the entry was posted.
<b>Journal Line No.</b>	If the entry was created as a result of an intercompany posting, this field shows the line number of the posting journal in the intercompany company in which the entry was posted.

**Entry Island**

Field	Description
<b>Debit, Base</b>	This is the entry amount in the base currency of the company displayed in the Company island, if the entry is a debit entry.
<b>Credit, Base</b>	This is the entry amount in the base currency of the company displayed in the Company island, if the entry is a credit entry.
<b>Debit, Enterprise</b>	This is the entry amount in enterprise currency, if the entry is a debit entry.
<b>Credit, Enterprise</b>	This is the entry amount in enterprise currency, if the entry is a credit entry.
<b>Debit, Currency</b>	This is the entry amount in the standard currency of the account, if the entry is a debit entry.
<b>Credit, Currency</b>	This is the entry amount in the standard currency of the account, if the entry is a credit entry.
<b>Currency</b>	This is the account's currency.
<b>Amount, Original</b>	This is the entry amount in the currency that the entry was registered in, for example, the field "Currency Amount" if the entry originates from a general journal entry; the currency specified on the vendor invoice if the entry originates from a vendor invoice; or the currency on the invoice if the entry was created upon the posting of an invoice.
<b>Original Currency</b>	This is the currency that the entry was registered in, for example, the field "Currency" if the entry originates from a general journal entry; the currency of the vendor invoice if the originates from a vendor invoice; or the currency of the invoice if the entry was created upon the posting of an invoice.
<b>Quantity</b>	This shows the quantity registered to the entry, if applicable.
<b>Quantity 2</b>	This shows the quantity 2 registered to the entry, if applicable.

**Tax Island**

Field	Description
<b>Entry Type</b>	<p>If the current entry is related to tax calculation, this field shows the nature of the relation.</p> <p>If the entry type is "Tax Receivable" or "Tax Payable," the entry is a tax entry created in connection with tax calculation for sales or purchases. If the entry type is "Tax Basis," the entry is a G/L entry on the basis of which tax entries have been created, for instance the G/L entry representing an invoice for taxable items. If the field contains a different value, the entry is a tax entry for one of the tax types set up in the windows Tax Codes and G/L Tax Codes.</p>

Field	Description
<b>Tax Date</b>	This field shows the tax date applying to the current entry. The tax date of a given entry can be either the entry date or the invoice date of the registration on which the entry is based, depending on the setup of the tax reporting unit used by the company that the entry concerns.
<b>EU Tax</b>	In this field, you can specify the tax type under which EU acquisition tax should be reported in tax settlement printouts for the current tax reporting unit.
<b>Nature of Tax</b>	This field displays whether the current entry (which is typically an expense account entry) regards sales of items or services which are taxable, tax exempt, or for export. The field is used when you need to calculate the value of taxable, tax-exempt, or export sales in connection with a tax settlement.
<b>Tax Type</b>	This field shows the tax type assigned to the G/L tax code. See the description of the G/L Tax Codes window for more information about tax types.
<b>Debit Tax</b>	This shows the tax on the entry, if the entry is a debit entry subject to tax. Note that tax amount and tax account can only be registered to the account if the tax is calculated from a tax code in the general journal.
<b>Credit Tax</b>	This shows the tax on the entry, if the entry is a credit entry subject to tax.
<b>Debit Ratio Tax</b>	If ratio tax has been calculated for the current entry, the debit entry ratio tax amount is displayed in this field. Ratio tax is set up in the G/L Tax Codes workspace.
<b>Credit Ratio Tax</b>	If ratio tax has been calculated for the current entry, the credit entry ratio tax amount is displayed in this field.

### Import Information Island

If the current G/L entry is imported using the Import Data window, import information is shown in this island.

Field	Description
<b>Run No.</b>	This field displays the run number of the currently imported G/L entry.
<b>Line No.</b>	This field displays the line of the above-mentioned run from which the current G/L entry has been imported.
<b>Delivery No.</b>	This field displays the delivery number of the import file from which the current G/L entry has been imported.
<b>Data Sender</b>	This field displays the name of the data sender shown by the import file from which the current G/L entry has been imported.
<b>External Trans. No.</b>	If a transaction number is registered on the current G/L entry in the import file, this field displays a transaction number. An external transaction number can, for example, be the number of the transaction in a legacy financial system.

### Export Information Island

If the current G/L entry was exported using the Export Data window, export information is shown in this island.

Field	Description
<b>Run No.</b>	This field displays the run number of the currently exported G/L entry.
<b>Group No.</b>	This field displays the number of the group in the above-mentioned run of which the current G/L entry was a part.
<b>Line No.</b>	This field displays the line number of the above mentioned run of which the current G/L entry was a part.

### VAT Settlement Entries Sub-Tab

This section includes the fields and descriptions for the VAT Settlement Entries sub-tab.

Field	Description
<b>Tax Reporting Unit</b>	If the current entry is currently included in a tax settlement (approved or non-approved), this field shows the number of the tax reporting unit to which the settlement in question pertains. The field "Tax Settlement No." below shows whether the entry is included in a settlement.
<b>Tax Settlement No.</b>	If the current entry is currently included in a tax settlement (approved or non-approved), this field shows the number of the settlement in question. If the entry ceases to be included in this settlement as a result of a recalculation of the settlement, this field is updated accordingly.
<b>Tax Settlement Type</b>	<p>This shows the type of account used. This field displays one of the types listed below. For a detailed description of each tax settlement type, please refer to the descriptions of the G/L Tax Codes, Tax Codes, and Tax Reporting Unit Selection workspaces.</p> <ul style="list-style-type: none"> <li>■ Tax Receivable — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for tax receivable in the G/L Tax Codes, Tax Codes, and Tax reporting Units workspaces.</li> <li>■ Tax Payable — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for tax payable in the G/L Tax Codes and Tax Codes workspaces.</li> <li>■ EU Acquisition Tax — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for acquisition tax in the G/L Tax Codes workspace.</li> <li>■ Investment Tax — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for acquisition tax in the G/L Tax Codes workspace.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Basis high investment Tax</b> — The line shows amounts that form the basis for calculation of high investment tax. The line there for shows amounts registered on accounts used for investment tax basis in B/L tax codes in which the investment tax is zero. These accounts are referred to by the dimension combination specified for each C/L tax code.</li> <li>▪ <b>Sales Tax</b> — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for sales tax in the Tax Codes workspace.</li> <li>▪ <b>Tax</b> — The line shows amounts registered on the account of a given tax type. The field "Tax Type" on the current line shows the relevant tax type. You can assign an account to a specific tax type in the Tax Reporting Units workspace by specifying a dimensions combination.</li> <li>▪ <b>Ratio Tax</b> — The line shows amounts registered on the accounts referred to by the dimension combination specified for the ratio tax in the G/L Tax Codes workspace.</li> </ul>
<b>Tax Code</b>	This field shows a tax code for the entry on the current line if the line represents a G/L entry.
<b>Tax Rate</b>	This field shows the tax rate for the current tax code.
<b>Tax Account</b>	This is the account to which tax has been entered, if applicable. If ratio tax applies to the current entry, the account number for the ratio tax account is shown. If both regular tax and ratio tax apply, both account numbers are shown, separated by a comma. Ratio tax is mainly used by governmental units.
<b>Tax Settlement Company</b>	This field shows the company number of the tax settlement company, if the current entry is currently included in a tax settlement (approved or non-approved).
<b>Original Currency</b>	This field shows the original currency of the entry, typically the currency of the invoice or vendor invoice.
<b>Debit Tax, Currency</b>	This shows the tax on the entry, if the entry is a debit entry subject to tax, in the company's currency. Note that tax amount and tax account can only be registered to the account if the tax is calculated from a tax code in the general journal.
<b>Credit Tax, Currency</b>	This shows the tax on the entry, if the entry is a credit entry subject to tax, in the company's currency.
<b>Base Currency</b>	This field shows the company currency.

Field	Description
<b>Debit Tax, Base</b>	This shows the tax on the entry, if the entry is a debit entry subject to tax, in the company's base currency.
<b>Credit Tax, Base</b>	This shows the tax on the entry, if the entry is a credit entry subject to tax, in the company's base currency. Debit Tax, Enterprise This field shows the tax on the entry in the enterprise currency of the entry.
<b>Credit Tax, Enterprise</b>	This field shows the tax on the entry in the enterprise currency of the entry.

## Show Journals Workspace

Use this workspace to view all of the journals created in Maconomy to which you have access.

This is necessary in the Financial Analysis and Journals workspaces.

### Journal Tab

This section includes the fields and descriptions for the Journal tab.

### Journal Island

Field	Description
<b>Journal No.</b>	This is the number of the journal shown. Maconomy numbers journals in consecutive order. All journals use the same system number series, regardless of which module a journal is created in. The journal number series is defined in the System Numbers window in the Set-Up module.
<b>Type</b>	This field shows the type of the journal.
<b>Company No.</b>	This is the number of the company to which the current journal pertains.
<b>Company of Origin</b>	This field shows the original company number of the journal. This is relevant for intercompany transactions.
<b>Original Company Journal No.</b>	If the current journal is an intercompany journal, that is, the field "Intercompany Posting" is marked, this field shows the number of the company responsible for the journal which caused the intercompany posting and thus the creation of the current journal.
<b>Main Journal No.</b>	A journal can be created when you post another journal. A customer reconciliation journal can be created when you post a credit memo if the credit memo is reconciled automatically against the invoice. The customer reconciliation journal will then have the invoice journal as the main journal.

Field	Description
<b>Period, Start</b>	This field shows the first date in the period covered by the journal. The period of the journal goes from the period starting date to the date shown in the "Period, End" field below.
<b>Period, End</b>	This field shows the last date in the period covered by the journal. For a further description, please see the "Period, Start" field above.
<b>Period No.</b>	This field shows the journal's period number in the current fiscal year. If your company uses periods that follow the months of the year, the field will, for example, show 1 for January, 2 for February, 3 for March, and so on. However, the periods do not necessarily follow the months of the year. The duration of the period is shown in the fields "Period, Start" and "Period, End."
<b>Fiscal Year</b>	This field shows the fiscal year used by the journal's company.
<b>Prior-Period</b>	This field shows the prior period, if posting outside the open posting period is allowed.
<b>Last Entry Date</b>	This field shows date on which the most recent entry was created.
<b>Last Line Number</b>	This field shows the number of the last line in the journal.
<b>Lines Deleted</b>	You can delete general journal lines after the general journal has been posted. This field is marked if the lines have been deleted.

### Balance Island

Field	Description
<b>Balance, Base</b>	This field shows the journal's balance in base currency. Note that A/R and vendor invoice journals are the total of customer and vendor entries, respectively, since the total of offsetting entries are not included in the balance. These two journals can therefore be posted even though they do not balance. All other journals must balance before they can be posted.
<b>Base Currency</b>	This field shows the company currency.
<b>Balance, Enterprise</b>	This field shows the journal balance in enterprise currency.
<b>Intercompany Posting</b>	This check box is selected if the journal is a result of intercompany operations.
<b>Control Entry Total</b>	This is the expected total of the all the entries in the journal. The batch total is the total of all the values in the fields "Debit" and "Credit" in the journal lines. Both debit and credit entries are calculated as positive

Field	Description
	figures. The control entry total is in the base currency of the company that created the journal.
<b>Current Entry Total</b>	This is the batch total calculated by Maconomy. It is the total of the values entered in the fields "Debit" and "Credit" in the journal. The current entry total is shown in the base currency of the company that created the journal.

**Status Island**

Field	Description
<b>Created</b>	This field shows date on which the journal was created and the user name of the person who created the journal.
<b>Submitted</b>	This field shows the date on which the journal was submitted and the user name of the person who submitted the journal.
<b>Being Posted</b>	This field shows whether parts of the journal have been posted. When the posting of a journal starts, this field is marked until the posting of the journal is completed.
<b>Posted</b>	This field shows the date and time when the journal was posted and the user name of the person who posted the journal. Maconomy uses the posting time internally only, for drilling in financial statements.
<b>Printed</b>	This field shows whether the journal has been printed.

**Transaction Island**

Field	Description
<b>First Transaction No.</b>	This field shows the transaction number used on the first entry, usually the smallest number.
<b>Last Transaction No.</b>	This field shows the transaction number used on the last entry, usually the largest number.
<b>Previous Transaction No.</b>	This field shows the transaction number used on the previous entered entry.
<b>Number Series</b>	This field shows the default transaction number series.
<b>Transaction Type</b>	This field shows the default transaction type.

## Offsets Island

Field	Description
<b>Offset Code 1-5</b>	This field shows up to five offset codes, for which Maconomy updates the entry sum in the journal's "Total" column and the balance in the "Balance" column.

## Show General Journals Workspace

Use this workspace to view posted general journals.

The tab shows the journal, and the sub-tab shows the general journal lines.

### General Journal Tab

This section includes the fields and descriptions for the General Journal tab.

## Journal Island

Field	Description
<b>Journal No.</b>	This field shows the journal number. This window shows all the general journals to which you have access that were posted or are in the process of being posted.
<b>Type</b>	This field shows the journal type.
<b>Main Journal No.</b>	This field shows the main journal number if the journal was created when another journal was posted.
<b>Original Company Journal No.</b>	This field shows the number of the company responsible for the journal that resulted in the intercompany posting, and thus the creation of the current journal, if the current journal is an intercompany journal.

## Period Island

Field	Description
<b>Fiscal Year</b>	This field shows the fiscal year used in the current journal.
<b>Period, Start</b>	This field shows the first date in the period that the journal covers.
<b>Period, End</b>	This field shows the last date in the period that the journal covers.
<b>Last Entry Date</b>	This field shows the date on which the most recent entry was created.
<b>Period No.</b>	This field shows the journal's period number in the current fiscal year.

Field	Description
<b>Prior-Period</b>	This field indicates whether the general journal is a prior-period journal, and if so, to which prior periods the G/L entries were posted.

**Balance Island**

Field	Description
<b>Balance, Base</b>	This field shows the journals' balance in the base currency of the company that is responsible for the journal. Maconomy updates the balance each time that you complete an entry line. You can only post a general journal when the balance is zero in both the base currency for the current company and in the enterprise currency. This guarantees that debit and credit amounts are always the same.
<b>Balance, Enterprise</b>	This field shows the journal's balance in enterprise currency. Maconomy updates the balance each time that you complete an entry line. You can only post the journal if the balance is zero in both the base currency of the current company and the enterprise currency. This ensures that debit and credit amounts are always the same.

**Transaction Numbering Island**

Field	Description
<b>Transaction Type</b>	This field shows the transaction type.
<b>Number Series</b>	This field shows the transaction number series.

**Company Island**

Field	Description
<b>Company</b>	This field shows the name and number of the company that is responsible for the general journal.
<b>Base Currency</b>	This field shows the currency used as base currency for the company specified in the Company field.

**Dimensions Island**

Field	Description
<b>Location</b>	This field shows the location dimension value of the company specified in the Company field.
<b>Entity</b>	This field shows the entity dimension value of the company specified in the Company field.

Field	Description
<b>Project</b>	This field shows the project dimension value of the company specified in the Company field.
<b>Purpose</b>	This field shows the purpose dimension value of the company specified in the Company field.
<b>Spec. 1 – Spec. 3</b>	This field shows the specification 1 – specification 3 dimension value of the company specified in the Company field.
<b>Local Spec. 1 – Local Spec. 3</b>	This field shows the local specification 1 through local specification 3 dimension value of the company specified in the Company field.

**Status Island**

Field	Description
<b>Created</b>	This field shows date when the general journal was created and the user name of the person who created it.
<b>Submitted</b>	This field shows the date when the general journal was submitted and the user name of the person who submitted it.
<b>Being Posted</b>	This field shows whether parts of the journal have been posted. When the posting of a journal starts, this field is marked until the posting of the journal is completed. If the posting is interrupted due to server problems, the field remains marked, but those entries whose posting was complete when the interruption occurred remain posted. Thus, when the posting is resumed, only the entries remaining to be posted are processed. After an interruption, a posting can only be resumed in this window.
<b>Posted</b>	This field shows the date and time on which the general journal was posted and the user name of the person who posted it.
<b>Printed</b>	This field shows whether the general journal has been printed.
<b>Lines Deleted</b>	You can delete general journal lines after the general journal has been posted. This field is marked if the lines have been deleted.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

## Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Entry Date</b>	This field shows the date on which the journal was entered.
<b>Trans. No.</b>	This field shows the entry's transaction number.
<b>Trans. Type</b>	This field shows the transaction type.
<b>Description</b>	This field shows the entry text.
<b>Std. Description</b>	This field shows the standard text.
<b>GRP</b>	<p>This field shows one of the following values:</p> <ul style="list-style-type: none"> <li>■ G – The entry is a G/L entry without relevance to a customer or vendor.</li> <li>■ R – The entry is a customer entry, which means that it was entered to the customer's control account in the G/L module and the customer's account in the Accounts Receivable module. Maconomy retrieves the reference to the control account from the Control Account field in the Payment Information window in the Accounts Receivable module.</li> <li>■ P – The entry is a vendor entry, which means that it was entered to the vendor's control account in the G/L module and to the vendor's account in the Accounts Payable module. Maconomy retrieves the reference to the control account from the Control Account field in the Payment Control window in the Accounts Payable module.</li> </ul>
<b>Account No.</b>	This field shows the account number to which the entry was posted.
<b>Account Name</b>	This field shows the account text for the account that is associated with the account number.
<b>Debit</b>	This field shows an amount in the base currency of the company that is responsible for the journal, if the entry is a debit entry.
<b>Credit</b>	This field shows an amount in the base currency of the company that is responsible for the journal, if the entry is a credit entry.
<b>Offset</b>	This field shows the entry's offset code.

Field	Description
<b>Tax Code</b>	This field shows a tax code for the entry on the current line if the line represents a G/L entry.
<b>Registration Code</b>	This field shows a registration code for a shortcut to manual entry of dimensions.
<b>Company No.</b>	This field shows the number of the company that is responsible for the general journal.
<b>Location</b>	This field shows the location dimension value of the company specified in the Company No. field.
<b>Entity</b>	This field shows the entity dimension value of the company specified in the Company No. field.
<b>Project</b>	This field shows the project dimension value of the company specified in the Company No. field.
<b>Purpose</b>	This field shows the purpose dimension value of the company specified in the Company No. field.
<b>Spec. 1 – 3</b>	This field shows the specification 1 – specification 3 dimension value of the company specified in the Company No. field.
<b>Local Spec. 1 – 3</b>	This field shows the local specification 1 through local specification 3 dimension value of the company specified in the Company No. field.
<b>Currency</b>	This field shows the original currency of the entry, if it involves a currency transaction such as payments from foreign customers.
<b>Currency Amount</b>	This field shows the entry amount in the currency, if the entry is a currency entry. A credit amount is displayed as a negative figure.
<b>Currency Direction</b>	This field shows which currency table applies to the entry, if a currency other than the base currency was entered for the entry.
<b>Exchange Rate Variance</b>	If this check box is selected, the entry is for exchange rate variance.
<b>Amount, Enterprise</b>	This field shows the entry amount in enterprise currency. A credit amount is displayed as a negative figure.
<b>Quantity</b>	This field shows the quantity of the entry.
<b>Quantity 2</b>	This field shows another quantity of the entry.
<b>Allocation Code</b>	This field shows the allocation code.
<b>Summary Posting</b>	This check box is selected if Maconomy has gathered entries to the same account number during posting.

Field	Description
<b>Job No.</b>	This field shows the number of the job from the Job Cost module if the entry pertains to a job.
<b>Job Name</b>	This field shows the name of the current job.
<b>Activity</b>	This field shows the number of the activity from the Job Cost module if the entry pertains to a job.
<b>Activity Name</b>	This field shows the name that is associated with the activity number.
<b>Employee No.</b>	This field shows the number of an employee if the entry pertains to a specific employee.
<b>Task</b>	This field shows the Task job dimension.
<b>Task Description</b>	This field shows the description for the task identified by the Task field.
<b>Customer No., Ref.</b>	This field shows a reference to a customer if the current line pertains to a finance entry – that is, the GRP field contains the value G.
<b>Customer Name, Ref.</b>	If a customer has been specified in the Customer No., Ref. field, this field shows the name of the customer in question.
<b>Vendor No., Ref.</b>	This field shows a reference to a vendor if the current line pertains to a finance entry – that is, the GRP field contains the value G.
<b>Vendor Name, Ref.</b>	This field shows the name that is associated with the vendor number.
<b>Asset No., Reference</b>	This field shows a reference to an asset.
<b>Asset Description</b>	This field displays a description of the referenced asset.
<b>Tax Direction</b>	This field indicates whether the entry is for a purchase or a sale.
<b>Company Tax Code</b>	This field shows the company tax code. This field must contain a value if the Tax Direction field contains a value.
<b>Item Tax Code</b>	This field shows the item tax code. This field must contain a value if the Tax Direction field contains a value.
<b>Vendor Invoice No.</b>	This field shows the vendor invoice number. You can only use this field when you post entries that are related to a vendor in the general journals.
<b>Reconc. Vendor Invoice No.</b>	This field shows an invoice number if you entered R in the GRP field.

Field	Description
<b>Reconc. Invoice No.</b>	This field shows the invoice number for a posted invoice.
<b>Due Date</b>	This field shows the due date of the customer or vendor entry.
<b>Reference Date</b>	This field shows the reference date for the current entry. The reference date can manually be specified on G/L journals and vendor invoices. The reference date is automatically set to the job/cost entry date for job-related entries in the cases where the job/cost entry date can be different from the G/L entry date.
<b>Check No.</b>	This field shows the payment to the vendor if the current line is a debit entry for a vendor. This can be the number of a handwritten check if you pay the vendor by check.
<b>Payment Mode</b>	This field shows the payment mode that you use to pay the vendor, either immediately by handwritten check or later if the registration concerns the registration of a vendor invoice. The functionality of this field depends on whether a check number is displayed in the Check No. field.
<b>Prior-Period</b>	This field shows the prior period if the journal is a prior-period journal. If the journal is not a prior-period journal, this field can show a prior period from another fiscal period.
<b>Accrual Type</b>	This field shows the accrual type. You can only accrue an entry if this is a G/L account or job.
<b>Period From, Accrual</b>	This field shows the beginning date of the accrual period, if the Accrual Type field contains a value.
<b>Period To, Accrual</b>	This field shows the ending date of the accrual period, if the Accrual Type field contains a value.
<b>External Trans. No.</b>	This field shows the number of an external transaction – that is, a transaction that originates in a legacy financial system.
<b>Payer Id</b>	This field shows the payer ID on vendor entries, which corresponds to the payer ID entered on vendor invoices in the Vendor Invoices window.

## Show General Journal Lines Workspace

Use this workspace to view general journal lines. It is possible to see both posted and unposted general journal lines..

You cannot change data in this workspace.

## General Journal Entry Tab

This section includes the fields and descriptions for the General Journal Entry tab.

### General Island

Field	Description
<b>Entry Date</b>	This field shows the date when the entry was created.
<b>Trans. No.</b>	This field shows the transaction number.
<b>Transaction Type</b>	This field shows the transaction type.
<b>Description</b>	This field shows the entry text.
<b>Std. Description</b>	This field shows the standard text.
<b>GRP</b>	<p>This field shows one of the following values:</p> <ul style="list-style-type: none"> <li>■ G — The entry is a G/L entry without relevance to a customer or vendor.</li> <li>■ R — The entry is a customer entry, which means that it was entered to the customer's control account in the G/L module and the customer's account in the Accounts Receivable module. Maconomy retrieves the reference to the control account from the Control Account field in the Payment Information workspace in the Accounts Receivable module.</li> <li>■ P — The entry is a vendor entry, which means that it was entered to the vendor's control account in the G/L module and to the vendor's account in the Accounts Payable module. Maconomy retrieves the reference to the control account from the Control Account field in the Payment Control workspace in the Accounts Payable module.</li> </ul>
<b>Account No.</b>	This field shows the account number to which the entry was posted.
<b>Account Name</b>	This field shows the account text for the account that is associated with the account number.
<b>Debit</b>	This field shows an amount in the base currency of the company that is responsible for the journal, if the entry is a debit entry.
<b>Credit</b>	This field shows an amount in the base currency of the company that is responsible for the journal, if the entry is a credit entry.
<b>Offset</b>	This field shows the entry's offset code.

Field	Description
<b>Company No.</b>	This field shows the number of that company that is responsible for the general journal.
<b>Exchange Rate Variance</b>	This field shows whether the entry is for exchange rate variance.
<b>Allocation Code</b>	This field shows the allocation code.
<b>Summary Posting</b>	This field shows whether Maconomy has gathered entries to the same account number during posting.
<b>Registration Code</b>	This field shows a registration code for a shortcut to manual entry of dimensions.

**Tax Island**

Field	Description
<b>Tax Code</b>	This field shows a tax code for the entry on the current line if the line represents a G/L entry.
<b>Tax Direction</b>	This field indicates whether the entry is for a purchase or a sale.
<b>Company Tax Code</b>	This field shows the company tax code. This field must contain a value if the Tax Direction field contains a value.
<b>Item Tax Code</b>	This field shows the item tax code. This field must contain a value if the Tax Direction field contains a value.

**Amounts Island**

Field	Description
<b>Currency</b>	This field shows the original currency of the entry, if it involves a currency transaction such as payments from foreign customers.
<b>Currency Amount</b>	This field shows the entry amount in the currency, if the entry is a currency entry. A credit amount is displayed as a negative figure.
<b>Currency Direction</b>	This field shows which currency table applies to the entry, if a currency other than the base currency was entered for the entry.
<b>Amount, Enterprise</b>	This field shows the entry amount in enterprise currency. A credit amount is displayed as a negative figure.
<b>Quantity</b>	This field shows the quantity of the entry.
<b>Quantity 2</b>	This field shows another quantity of the entry.

### Job Island

Field	Description
<b>Job No.</b>	This field shows the number of the job from the Job Cost module if the entry pertains to a job.
<b>Activity</b>	This field shows the number of the activity from the Job Cost module if the entry pertains to a job.
<b>Employee No.</b>	This field shows the number of an employee if the entry pertains to a specific employee.
<b>Task</b>	This field shows the Task job dimension.

### Vendor Island

Field	Description
<b>Vendor No., Reference</b>	This field shows a reference to a vendor if the current line pertains to a finance entry that is, the GRP field contains the value G.
<b>Vendor Invoice No.</b>	This field shows the vendor invoice number. You can only use this field when you post entries that are related to a vendor in the general journals.
<b>Reconc. Vendor Invoice No.</b>	This field shows an invoice number if you entered R in the GRP field.

### Customer Island

Field	Description
<b>Customer No., Reference</b>	This field shows a reference to a customer if the current line pertains to a finance entry that is, the GRP field contains the value G.
<b>Reconc. Invoice No.</b>	This field shows the invoice number for a posted invoice.

### Asset Island

Field	Description
<b>Asset</b>	This field shows a reference number to an asset.

**Payment Island**

Field	Description
<b>Due Date</b>	This field shows the due date of the customer or vendor entry.
<b>Reference Date</b>	This field shows the reference date for the current entry. The reference date can manually be specified on G/L journals and vendor invoices. The reference date is automatically set to the job/cost entry date for job-related entries in the cases where the job/cost entry date can be different from the G/L entry date.
<b>Check No.</b>	This field shows the payment to the vendor if the current line is a debit entry for a vendor. This can be the number of a handwritten check if you pay the vendor by check.
<b>Payment Mode</b>	This field shows the payment mode that you use to pay the vendor, either immediately by handwritten check or later if the registration concerns the registration of a vendor invoice. The functionality of this field depends on whether a number is displayed in the Check. No. field.
<b>Prior-Period</b>	This field shows the prior period if the journal is a prior-period journal. If the journal is not a prior-period journal, this field can show a prior period from another fiscal period.
<b>External Trans. No.</b>	This field shows the number of an external transaction that is, a transaction that originates in a legacy financial system.
<b>Payer Id.</b>	This field shows the payer ID on vendor entries, which corresponds to the payer ID entered on vendor invoices in the Vendor Invoices workspace.

**Accrual Island**

Field	Description
<b>Accrual Type</b>	This field shows the accrual type. You can only accrue an entry if this is a G/L account or job.
<b>Period From, Accrual</b>	This field shows the beginning date of the accrual period, if the Accrual Type field contains a value.
<b>Period To, Accrual</b>	This field shows the ending date of the accrual period, if the Accrual Type field contains a value.

## Show Journal Foundation Workspace

Use this workspace to view journals of several types.

The journals that are displayed are:

- Commission
- G/L Reallocation

- Unrealized Exchange Rate Variances
- Follow up Selection
- Import
- Tax Settlement
- Bank Reconciliation

This workspace does not show intercompany journals.

## Journals Tab

This section includes the fields and descriptions for the Journals tab.

### Journal Island

Field	Description
<b>Journal No.</b>	This field shows the number of the journal to which the entry was posted.
<b>Type</b>	This field shows the journal type (for example, general, customer payment, bank reconciliation, vendor and so on).
<b>Main Journal No.</b>	This field shows the main journal number if the journal was created when another journal was posted.

### Period Island

Field	Description
<b>Fiscal Year</b>	This field shows the fiscal year used in the current journal.
<b>Period, Start</b>	This field shows the first date in the period covered by the journal.
<b>Period, End</b>	This field shows the last date in the period covered by the journal.
<b>Last Entry Date</b>	This field shows the date on which the most recent entry was created.
<b>Period No.</b>	This field shows the journal's period number in the current fiscal year.
<b>Prior-Period</b>	This field specifies whether the general journal is a prior-period journal.

**Balance Island**

Field	Description
<b>Balance, Base</b>	This field shows the journal's balance in the base currency of the company responsible for the current journal.
<b>Balance, Enterprise</b>	This field shows the journal's balance in enterprise currency.

**Company Island**

Field	Description
<b>Company</b>	This field shows the name and number of the company responsible for the general journal.
<b>Base Currency</b>	This field shows the currency used as base currency for the company specified in the Company field.

**Dimensions Island**

Field	Description
<b>Location</b>	This field shows the location dimension value of the company specified in the Company field.
<b>Entity</b>	This field shows the entity dimension value of the company specified in the Company field.
<b>Project</b>	This field shows the project dimension value of the company specified in the Company field.
<b>Purpose</b>	This field shows the purpose dimension value of the company specified in the Company field.
<b>Spec. 1 – 3</b>	These fields show the values in the dimensions Specification 1-3 assigned to the current entry.
<b>Local Spec. 1 – 3</b>	These fields show the values in the dimensions Local Specification 1-3 assigned to the current entry.

**Status Island**

Field	Description
<b>Created</b>	This field shows the date when the journal was created and the name of the user who created it.
<b>Submitted</b>	This field shows date when the journal was submitted and the name of the user who it.
<b>Being Posted</b>	This field shows whether parts of the journal have been posted. When the posting of a journal starts, this field is marked until the posting of the journal is completed. If the posting is interrupted due to server problems, the field remains marked, but those entries whose posting was complete when the interruption

Field	Description
	occurred remain posted. Thus, when the posting is resumed, only the entries remaining to be posted are processed. After an interruption, a posting can only be resumed in this window.
<b>Posted</b>	This field shows the date and time when the entry was posted and the name of the user who posted it.
<b>Printed</b>	This field shows whether the current journal has been printed.

## General Journals Sub-Tab

This section includes the fields and descriptions for the General Journals sub-tab.

Field	Description
<b>Entry Date</b>	This field shows the date on which the journal was entered.
<b>Trans. No.</b>	This field shows the transaction number.
<b>Trans. Type</b>	This field shows the transaction type.
<b>Description</b>	This field shows the entry text.
<b>Std. Description</b>	This field shows the standard text.
<b>GRP</b>	This field specifies whether the entry was made to the General Ledger (G), Accounts Receivable (R), or Accounts Payable (P).
<b>Account No.</b>	This field shows the account number to which the entry will be posted.
<b>Account Name</b>	This field shows the account text for the account shown in the Account No. field.
<b>Debit</b>	This field shows an amount if the entry is a debit entry.
<b>Credit</b>	This field shows an amount if the entry is a credit entry.
<b>Offset</b>	This field shows the entry's offset code.
<b>Tax Code</b>	This field shows a tax code for the entry on the current line if the line represents a G/L entry.
<b>Registration Code</b>	This field shows a registration code for a shortcut to manual entry of dimensions.

Field	Description
<b>Company No.</b>	This field shows the number of the currently selected company.
<b>Location</b>	This field shows the location dimension value of the company specified in the Company No. field.
<b>Entity</b>	This field shows the entity dimension value of the company specified in the Company No. field.
<b>Project</b>	This field shows the project dimension value of the company specified in the Company No. field.
<b>Purpose</b>	This field shows the purpose dimension value of the company specified in the Company No. field.
<b>Spec. 1 – 3</b>	These fields show the values in the dimensions Specification 1-3 assigned to the current entry.
<b>Local Spec. 1 – 3</b>	These fields show the values in the dimensions Local Specification 1-3 assigned to the current entry.
<b>Currency</b>	This field shows the currency of the account.
<b>Currency Amount</b>	This field shows the entry amount in the currency, if the entry is a currency entry.
<b>Currency Direction</b>	This field shows a currency direction if another currency other than the base currency has been entered.
<b>Exchange Rate Variance</b>	If this field is marked, it specifies that the current line concerns an exchange rate variance.
<b>Amount, Enterprise</b>	This field shows the entry amount in enterprise currency.
<b>Quantity</b>	This field shows the quantity registered to the entry.
<b>Quantity 2</b>	This field shows the quantity 2 registered to the entry.
<b>Allocation Code</b>	This field shows the allocation code.
<b>Summary Posting</b>	This field specifies whether the entries will be gathered to the same account number during posting.
<b>Job No.</b>	This field shows the job number.
<b>Job Name</b>	This field shows the name of the current job.
<b>Activity</b>	This field shows the activity number.

Field	Description
<b>Activity Name</b>	This field shows the name of the activity.
<b>Employee No.</b>	This field shows the employee number for the current entry.
<b>Task</b>	This field shows the job dimension task.
<b>Task Description</b>	This field shows the description of the task entered in the Task field on the current line.
<b>Customer No., Ref.</b>	This field shows a reference to the customer.
<b>Customer Name, Ref.</b>	If a customer has been specified in the Customer No., Ref. field, this field shows the name of the customer in question.
<b>Vendor No., Ref.</b>	This field shows a reference to a vendor.
<b>Vendor Name, Ref.</b>	If a customer has been specified in the Vendor No., Ref. field, this field shows the name of the vendor in question.
<b>Asset No., Reference</b>	This field shows a reference to an asset.
<b>Asset Description</b>	This field displays a description of the referenced asset.
<b>Tax Direction</b>	This field specifies whether the tax direction is for a purchase or a sale.
<b>Company Tax Code</b>	This field shows the company tax code.
<b>Item Tax Code</b>	This field shows the item tax code.
<b>Vendor Invoice No.</b>	This field shows the vendor invoice number.
<b>Reconc. Vendor Invoice No.</b>	This field shows a vendor invoice number if the current payment should be reconciled fully or partly against an invoice. If the reconciliation can be made, the payment is automatically reconciled against the invoice when the journal is posted.
<b>Reconc. Invoice No.</b>	This field shows the invoice number for a posted invoice.
<b>Due Date</b>	This field shows the due date of the customer or vendor entry.
<b>Reference Date</b>	This field shows the reference date for the current entry. The reference date can manually be specified on G/L journals and vendor invoices. The reference date is automatically set to the job/

Field	Description
	cost entry date for job-related entries in the cases where the job/cost entry date can be different from the G/L entry date.
<b>Check No.</b>	This field shows the number of the check used for payment of the current vendor entry.
<b>Payment Mode</b>	This field shows the payment mode, for example, check.
<b>Prior-Period</b>	If the journal is a prior-period journal, the prior period is displayed in this field. If the journal is not a prior-period journal, a prior period from another fiscal period may be shown in this field.
<b>Accrual Type</b>	If there is a value in this field, the entry will be accrued.
<b>Period From, Accrual</b>	This field, together with the Period To, Accrual field shows a range of dates.
<b>Period To, Accrual</b>	This field, together with the Period From, Accrual field shows a range of dates.
<b>External Trans. No.</b>	This field shows the number of an external transaction, for example, a transaction which originates in a legacy financial system.
<b>Payer Id.</b>	This field shows a payer ID on vendor entries, corresponding to the payer ID entered on vendor invoices in the Vendor Invoices window.

## Show Intercompany Invoice Details Workspace

Use this workspace to review intercompany invoices created in the Intercompany Invoicing workspace.

The Show Intercompany Invoice Details tab displays information about the currently selected invoice, including information about the customer who is associated with the invoice. Select the **Show Lines** option to populate the Intercompany Entries sub-tab with all intercompany entries that are covered by the current invoice. You can enter a number of criteria in the Selection Criteria island to limit the number of lines that are shown.

### Show Intercompany Invoice Details Tab

This section includes the fields and descriptions for the Show Intercompany Invoice Details tab.

#### Executing Company Island

Field	Description
<b>Company</b>	<p>This field shows the number of the executing company of the currently selected invoice. The executing company is the company who ran the intercompany invoicing which resulted in the current invoice.</p> <p>This field also displays the name, address, and country of the company.</p>

**Billing Address Island**

Field	Description
<b>Bill to Customer</b>	<p>This field shows the number of the customer billed on the current invoice, as well as the name, address, and country of the bill-to customer. In the Company Information window, each company can be assigned to a customer for use in intercompany invoicing, and when a company is being invoiced in an intercompany invoicing, this customer is automatically assigned to the invoice created for the company in question.</p> <p>In other words, the customer in this field is the customer representing the company being billed in the intercompany invoicing.</p>

**Ship to Address Island**

Field	Description
<b>Customer</b>	<p>This field shows the number of the ship-to customer on the current invoice, as well as the name, address, and country of the ship-to customer. The ship-to customer is automatically derived from the information card of the customer shown in the "Bill to Customer" field above.</p>

**Invoice Island**

Field	Description
<b>Invoice No.</b>	This field shows the number of the current invoice.
<b>Invoice Date</b>	This field shows the invoice date of the current invoice. This invoice date corresponds to the one specified in the Intercompany Invoicing window when the current invoice was created.
<b>Due Date</b>	This field shows the date on which the invoice is due for payment. The due date is calculated automatically from the invoice date and payment terms.
<b>Department</b>	This field shows the department to which the current invoice is assigned. The department is automatically derived from the information card of the customer shown in the field "Bill to Customer" above.
<b>Reference</b>	This field is not used in the current version of Maconomy.
<b>Printed by</b>	This field shows the name of the user who ran the intercompany invoicing which resulted in the current invoice.
<b>Printing Date</b>	This field shows the date on which the current invoice was originally printed.

**Price Island**

Field	Description
<b>Billing Price Total, Currency</b>	This field shows the total invoice amount.
<b>Sales Price Total, Base</b>	This field shows the total invoice amount in the base currency.
<b>Hereof within Search Criteria</b>	This field shows the total billing price on the lines currently shown in the Intercompany Entries sub-tab. The amount is shown in the currency displayed in the base currency.

**Selection Criteria Island**

Field	Description
<b>Show Lines</b>	When you check this box, the Intercompany Entries sub-tab will display the intercompany entries that are covered by the current invoice and match the Selection Criteria specified in this island.
<b>Intercompany Type</b>	In this field, you can select an intercompany type. The Intercompany Entries sub-tab will only show intercompany entries of the selected type. The intercompany type is the type of transaction which caused an intercompany entry. See the field "Intercompany Name" in the Intercompany Accounts window for a description of the individual intercompany types.
<b>Entry Date</b>	In these fields, you can specify a range of entry dates. The Intercompany Entries sub-tab will only show intercompany entries where the entry date is within the specified range.
<b>Responsible Company</b>	In these fields, you can specify a range of responsible companies. The Intercompany Entries sub-tab will only show intercompany entries pertaining to a responsible company within the specified range.
<b>Job No.</b>	In these fields, you can specify a range of job numbers. The Intercompany Entries sub-tab will only show intercompany entries pertaining to jobs within the specified range.
<b>Employee No.</b>	In these fields, you can specify a range of employee numbers. The Intercompany Entries sub-tab will only show intercompany entries pertaining to employees within the specified range.
<b>Activity No.</b>	In these fields, you can specify a range of activity numbers. The Intercompany Entries sub-tab will only show intercompany entries pertaining to activities within the specified range.
<b>Task</b>	In these fields, you can specify a range of task names. The Intercompany Entries sub-tab will only show intercompany entries pertaining to tasks within the specified range.

Field	Description
<b>Customer No.</b>	In these fields, you can specify a range of customer numbers. The Intercompany Entries sub-tab will only show intercompany entries pertaining to customers within the specified range.
<b>Vendor No.</b>	In these fields, you can specify a range of vendor numbers. The table part will only show intercompany entries pertaining to vendors within the specified range.
<b>Asset No.</b>	In these fields, you can specify a range of asset numbers. The Intercompany Entries sub-tab will only show intercompany entries pertaining to assets within the specified range.
<b>Item No.</b>	In these fields, you can specify a range of item numbers. The Intercompany Entries sub-tab will only show intercompany entries pertaining to items within the specified range.

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	In these fields, you can specify a range of locations. The Intercompany Entries sub-tab will only show intercompany entries where the value in the field "Location" is within the specified range.
<b>Entity</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Project</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

#### Intercompany Entries Sub-Tab

This section includes the fields and descriptions for the Intercompany Entries sub-tab.

Field	Description
<b>Exclude Reversed and Reversal Entries</b>	Select to display the original intercompany entries only. When selected, all reversed and reversal entries created in the background when reversing an intercompany entry are hidden.
<b>All Entries</b>	Select to display all entries, including reversed and reversal entries.

Field	Description
<b>Responsible Company</b>	This field shows the number of the company which was the responsible company on the transaction that caused the current intercompany entry.
<b>Resp. Company Name</b>	This field shows the name of the company shown in the field "Responsible Company" on the current line.
<b>Entry Date</b>	This field shows the entry date of the current intercompany entry.
<b>Date Posted</b>	This field shows the date on which the registration that caused the current intercompany entry was posted.
<b>Trans. No.</b>	This field shows the transaction number of the registration that caused the current intercompany entry.
<b>Trans. Type</b>	This is the entry's transaction type. Transaction types are set up in the Transaction Types window.
<b>Entry Description</b>	This field shows the entry description on the registration that caused the current intercompany entry.
<b>Amount, Base, Executing</b>	This field shows the amount of the intercompany entry in the base currency of the company selected in the card part.
<b>Amount, Base, Responsible</b>	This field shows the amount of the intercompany entry in the base currency of the company shown in the field "Company No." on the current line.
<b>Amount, Currency</b>	This field shows the amount of the intercompany entry in the currency of the registration that caused the creation of the current intercompany entry. The currency in question is shown in the field "Currency." The amount corresponds to the amount in currency on the registration that caused the current intercompany entry.
<b>Amount, Enterprise</b>	This field shows the amount of the intercompany entry in the enterprise currency of the system. The amount corresponds to the amount in enterprise currency on the registration that caused the current intercompany entry.
<b>Currency</b>	This field shows the currency of the transaction that caused the creation of the current intercompany entry.
<b>Intercompany Type</b>	This field shows the type of intercompany transaction that caused the current intercompany entry. See the field "Intercompany Name" in the Intercompany Accounts window for a description of the individual intercompany types.
<b>Account No. Executing</b>	When a registration involving two different companies is posted, Maconomy posts an intercompany balancing entry in the executing company and one in the responsible company, using the Intercompany Accounts window to look up the account to which each entry should be

Field	Description
	posted. Each entry is then assigned to the intercompany entry that is created as a result of the intercompany transaction. For each intercompany entry in the Intercompany Entries sub-tab, this field shows the account number to which the intercompany balancing entry was posted in the executing company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.
<b>Account No. Responsible</b>	<p>When a registration involving two different companies is posted, Maconomy posts an intercompany balancing entry in the executing company and one in the responsible company, using the Intercompany Accounts window to look up the account to which each entry should be posted. Each entry is then assigned to the intercompany entry that is created as a result of the intercompany transaction. For each intercompany entry in the Intercompany Entries sub-tab, this field shows the account number to which the intercompany balancing entry was posted in the responsible company.</p> <p>However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p>
<b>Journal Type</b>	This field shows the type of journal in which the registration that caused the current intercompany entry was entered.
<b>Journal No.</b>	This field shows the number of the journal in which the registration that caused the current intercompany entry was entered.
<b>Journal Line No.</b>	This field shows the number of the line in the above journal on which the registration that caused the current intercompany entry was entered.
<b>Location</b>	This field shows the location of the current intercompany entry.
<b>Location Description</b>	This field shows the name of the location shown in the field "Location" above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Entity Description</b>	This field shows the name of the entity shown in the field "Entity" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project Description</b>	This field shows the name of the project shown in the field "Project" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.

Field	Description
<b>Purpose Description</b>	This field shows the name of the purpose shown in the field "Purpose" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Spec. 1-3 Description</b>	These fields show the names of the Spec. 1-3 values shown in the fields "Local Spec. 1-3" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3 Description</b>	These fields show the names of the Local Spec. 1-3 values shown in the fields "Local Spec. 1-3" above.
<b>Job No.</b>	This field shows the number of the job to which the current intercompany entry pertains, that is, the job specified on the registration that caused the current intercompany entry, if any.
<b>Job Name</b>	This field shows the name of the job shown in the field "Job No." on the current line.
<b>Employee No.</b>	This field shows the number of the employee to whom the current intercompany entry pertains, that is, the employee specified on the registration that caused the current intercompany entry, if any.
<b>Employee Name</b>	This field shows the name of the employee shown in the field "Employee No." on the current line.
<b>Activity No.</b>	This field shows the number of the activity to which the current intercompany entry pertains, that is, the activity specified on the registration that caused the current intercompany entry, if any.
<b>Activity Name</b>	This field shows the name of the activity shown in the field "Activity No." on the current line.
<b>Task</b>	This field shows the name of the task to which the current intercompany entry pertains, that is, the task specified on the registration that caused the current intercompany entry, if any.
<b>Task Description</b>	This field shows the description of the task shown in the field "Task" on the current line.
<b>Customer No.</b>	This field shows the number of the customer to whom the current intercompany entry pertains, that is, the customer specified on the registration that caused the current intercompany entry, if any.
<b>Customer Name</b>	This field shows the name of the customer shown in the field "Customer No." on the current line.
<b>Vendor No.</b>	This field shows the number of the vendor to which the current intercompany entry pertains, that is, the vendor specified on the registration that caused the current intercompany entry, if any.

Field	Description
<b>Vendor Name</b>	This field shows the name of the vendor shown in the field "Vendor No." on the current line.
<b>Entry No.</b>	If the current intercompany entry was created as a result of a registration which also caused the creation of an A/P or A/R entry (for instance, if one company has sent an invoice to a customer belonging to another company), the entry number assigned to the A/P or A/R entry in question is displayed in this field. For further information on the entry number assigned to A/P and A/R entries, please see the description of the field "Entry No." in the Show G/L Entries window.
<b>Asset No.</b>	This field shows the number of the asset to which the current intercompany entry pertains, that is, the asset specified on the registration that caused the current intercompany entry, if any.
<b>Asset Name</b>	This field shows the name of the asset shown in the field "Asset No." on the current line.
<b>Item No.</b>	This field shows the number of the item to which the current intercompany entry pertains, that is, the item specified on the registration that caused the current intercompany entry, if any.
<b>Description</b>	This field shows the description of the item shown in the field "Item No." on the current line.

### Reverse Intercompany Invoice Wizard

Field	Description
<b>Reopen Intercompany Entries</b>	Select the check box to reopen the corresponding intercompany entries when reversing the invoice. Deselect to reverse the invoice without reopening.
<b>Invoice Text</b>	Enter the text to use on the invoice and corresponding finance entries.
<b>Layout</b>	Select the layout to use for printing the invoice.

### Reopen Intercompany Entries Action

Field	Description
<b>Reopen Intercompany Entries</b>	Run this action to reopen intercompany entries. This action is visible only if the intercompany invoice was reversed without selecting the <b>Reopen Intercompany Entries</b> field.

## Show Intercompany Entries Workspace

Use this workspace to view all of the intercompany entries created in Maconomy.

The Show Intercompany Entries single dialog workspace is primarily used in the Financial Analysis workspace to show the intercompany entries that are included in a specific transaction.

### Intercompany Entry Tab

This section includes the fields and descriptions for the Intercompany Entry tab.

#### Entry Information Island

Field	Description
<b>Trans. No.</b>	This field shows the number of the transaction that generated the intercompany entry.
<b>Transaction Type</b>	This field shows the transaction type of the intercompany entry line.
<b>Entry Date</b>	This field shows the date on which the intercompany entry was created.
<b>Entry Description</b>	This field shows additional information about the intercompany entry.

#### Amounts Island

Field	Description
<b>Base, Executing</b>	This field shows the amount on the intercompany entry, in the executing company's currency.
<b>Base, Responsible</b>	This field shows the amount of the intercompany entry in the base currency of the company shown in the field "Company No." on the current intercompany entry line.
<b>Currency</b>	This field shows the amount of the intercompany entry in the currency of the registration that caused the creation of the intercompany entry. The amount corresponds to the amount in currency on the registration that caused the current intercompany entry.
<b>Enterprise</b>	This field shows the amount of the intercompany entry in the enterprise currency of the system. The amount corresponds to the amount in enterprise currency on the registration that caused the current intercompany entry.

#### Tax Island

Field	Description
<b>Item Tax Code</b>	This field shows an item tax code, which is created in the Popup Fields window.

Field	Description
<b>Tax Code, Invoice</b>	This field shows a tax code used for calculating tax for the invoice line of which the current intercompany entry will be part when the "Print Invoice" action is selected.
<b>Tax Code, Vendor Invoice</b>	This field shows the tax code applied to the invoice allocation line of which the current intercompany entry will be part when the "Print Invoice" action is selected for this vendor.

### Intercompany Island

Field	Description
<b>Intercompany Type</b>	This field shows the type of transaction that generated the intercompany entry (for example, job registration, general journal, asset journal, or budget journal).
<b>Intercompany Entry Type</b>	This field shows the type of the intercompany entry, indicating the kind of intercompany calculation: intercompany invoicing, intercompany interest calculation, or grouping.
<b>Settlement Invoice No.</b>	This field shows the settlement invoice number.
<b>Settlement Invoice Line No.</b>	This field shows the settlement invoice line number.
<b>Status</b>	This field shows the intercompany entry status type: not selected, selected for invoicing, invoiced, settlement posted, or closed via grouping.
<b>Marked for Invoicing</b>	This check box is selected if the intercompany entry is marked for invoicing.
<b>Invoice Posted</b>	This check box is selected if the invoice was posted.
<b>Vendor Invoice Posted</b>	This check box is selected if the vendor invoice was posted.

### Interest Island

Field	Description
<b>Interest Date</b>	This field shows the date on which intercompany interest was calculated.
<b>Selected for Interest Calculation</b>	This check box is selected if the intercompany entry is currently involved in interest calculation.

### Executing Company Island

Field	Description
<b>Company</b>	This field shows the name and number of the executing company on the intercompany entry.
<b>Account</b>	When a registration involving two different companies is posted, Maconomy posts an intercompany balancing entry in the executing company and one in the responsible company, using the Intercompany Accounts window to look up the account to which each entry should be posted. Each entry is then assigned to the intercompany entry that is created as a result of the intercompany transaction.

### Responsible Company Island

Field	Description
<b>Company</b>	This field shows the name and number of the responsible company on the intercompany entry.
<b>Account</b>	When a registration involving two different companies is posted, Maconomy posts an intercompany balancing entry in the executing company and one in the responsible company, using the Intercompany Accounts window to look up the account to which each entry should be posted. Each entry is then assigned to the intercompany entry that is created as a result of the intercompany transaction.

### Dimensions Island

Field	Description
<b>Location</b>	This field shows the location dimension value which is assigned to the current intercompany entry.
<b>Entity</b>	This field shows the entity dimension value which is assigned to the current intercompany entry.
<b>Project</b>	This field shows the project dimension value which is assigned to the current intercompany entry.
<b>Purpose</b>	This field shows the purpose dimension value which is assigned to the current intercompany entry.
<b>Spec. 1 – 3</b>	These fields show the values in the dimensions Specification 1-3 assigned to the current intercompany entry.
<b>Local Spec. 1 – 3</b>	These fields show the values in the dimensions Local Specification 1-3 assigned to the current intercompany entry.

### Control Account Island

Field	Description
<b>Job</b>	This field shows the job number and name, if the intercompany entry is related to a job.

Field	Description
<b>Activity</b>	This field shows the activity number and name, if the intercompany entry is related to a job.
<b>Task</b>	This field shows the task identifier and name, if the intercompany entry is related to a job.
<b>Employee</b>	This field shows the employee number and name, if the intercompany entry is related to an employee.
<b>Customer</b>	This field shows the customer number and name, if the intercompany entry is related to a customer.
<b>Vendor</b>	This field shows the vendor number and name, if the intercompany entry is related to a vendor.
<b>Item</b>	This field shows the item number and name, if the intercompany entry is related to an item.
<b>Asset</b>	This field shows the asset number and name, if the intercompany entry is related to an asset.

### Origin Object Island

Field	Description
<b>Origin Object</b>	The relation name of the origin object, for example, Time Sheet Header.
<b>Origin Object Instance Key</b>	The instance key of the origin object
<b>Object Key 1, String</b>	If any of the key fields of the origin object is of type String, then this field contains the value of the first String key field.
<b>Object Key 2, String</b>	If two or more of the key fields of the origin object are of type String, then this field contains the value of the second String key field.
<b>Object Key 1, Integer</b>	If any of the key fields of the origin object is of type Integer, then this field contains the value of the first Integer key field.
<b>Object Key 2, Integer</b>	If two or more of the key fields of the origin object are of type Integer, then this field contains the value of the second Integer key field.
<b>Object Key 3, Integer</b>	If three or more of the key fields of the origin object are of type Integer, then this field contains the value of the third Integer key field.
<b>Object Key 1, Date</b>	If any of the key fields of the origin object is of type Date, then this field contains the value of the first Date key field.
<b>Object Payment Agent</b>	If any of the key fields of the origin object is a reference to a Payment Agent, then this field contains the name of that Payment Agent.

### Origin Line Island

Field	Description
<b>Origin Line</b>	The relation name of the origin line, for example, Time Sheet Line.
<b>Origin Line Instance Key</b>	The instance key of the origin line.
<b>Line Key 1, String</b>	If any of the key fields of the origin line is of type String, then this field contains the value of the first String key field.
<b>Line Key 2, String</b>	If two or more of the key fields of the origin line are of type String, then this field contains the value of the second String key field.
<b>Line Key 1, Integer</b>	If any of the key fields of the origin line is of type Integer, then this field contains the value of the first Integer key field.
<b>Line Key 2, Integer</b>	If two or more of the key fields of the origin line are of type Integer, then this field contains the value of the second Integer key field.
<b>Line Key 3, Integer</b>	If three or more of the key fields of the origin line are of type Integer, then this field contains the value of the third Integer key field.
<b>Line Payment Agent</b>	If any of the key fields of the origin line is a reference to a Payment Agent, then this field contains the name of that Payment Agent.

### Transaction Entries Island

Field	Description
<b>Finance</b>	Number of finance entries in the same transaction.
<b>Customer</b>	Number of customer entries in the same transaction.
<b>Vendor</b>	Number of vendor entries in the same transaction.
<b>Job</b>	Number of job entries in the same transaction.
<b>Asset</b>	Number of asset entries in the same transaction.
<b>Intercompany</b>	Number of intercompany entries in the same transaction.

## Show Finance Reconciliation Workspace

Use this workspace to review approved reconciliations.

## Show Finance Reconciliation Tab

This section includes the fields and descriptions for the Show Finance Reconciliation tab.

### Account Island

Field	Description
<b>Account No.</b>	Enter the number of the account whose entries you want to review in this field. You can use the Show menu to retrieve an account.
<b>Account Name</b>	This is the name of the account.

### Company Island

Field	Description
<b>Company No.</b>	This field shows the number of the company the reconciliation was made for.
<b>Name</b>	This field shows the name of the company the reconciliation was made for.

### Reconciliation Island

Field	Description
<b>Approved by</b>	This field shows who has approved the reconciliation.
<b>Approval Date</b>	This field shows the date when the reconciliation was approved.
<b>Reopened</b>	This field will be marked if the reconciliation has been reopened.
<b>Reopened by</b>	If the reconciliation has been reopened, this field shows who reopened it.
<b>Date reopened</b>	If the reconciliation has been reopened, this field shows the date when it was reopened.

## Finance Reconciliation Lines Sub-Tab

This section includes the fields and descriptions for the Finance Reconciliation Lines sub-tab.

Field	Description
<b>Entry Date</b>	This is the entry date. The entries are sorted by this date.
<b>Description</b>	This is the entry text.

Field	Description
<b>Trans. No.</b>	This is the entry's transaction number.
<b>Trans. Type</b>	This is the entry's transaction type.
<b>Debit</b>	This is the entry amount in the base currency of the current company, if the entry is a debit entry.
<b>Amount Reconciled, Base</b>	This is the entry amount in the base currency of the current company, if the entry is a credit entry.
<b>Quantity</b>	This is the entry quantity.
<b>Quantity 2</b>	This is the entry quantity 2.
<b>Location</b>	The functionality of this field is similar to the functionality of the field "Company."
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Company."
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Company."
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Company."
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company."
<b>Date Posted</b>	This is the entry's posting date.
<b>Journal No.</b>	This is the number of the posting journal in which the entry is posted.
<b>Intercomp. Company</b>	This is the intercompany number if the entry is an intercompany entry.
<b>Customer No.</b>	This field shows the number of the customer to whom the current entry pertains, that is, the customer specified on the registration that caused the current entry, if any.
<b>Vendor No.</b>	This field shows the number of the vendor to which the current entry pertains, that is, the vendor specified on the registration that caused the current entry, if any.

Field	Description
<b>Job No.</b>	This field shows the number of the job to which the current entry pertains, that is, the job specified on the registration that caused the current entry, if any.
<b>Asset No.</b>	This field shows the number of the asset to which the current entry pertains, that is, the asset specified on the registration that caused the current entry, if any.
<b>Employee No.</b>	This field shows the number of the employee to whom the current entry pertains, that is, the employee specified on the registration that caused the current entry, if any.
<b>Activity No.</b>	This field shows the number of the activity to which the current entry pertains, that is, the activity specified on the registration that caused the current entry, if any.
<b>Item No.</b>	This field shows the number of the item to which the current entry pertains, that is, the item specified on the registration that caused the current entry, if any.
<b>Reference Date</b>	This field shows the reference date for the current entry. The reference date can manually be specified on G/L journals and vendor invoices. The reference date is automatically set to the job/cost entry date for job-related entries in the cases where the job/cost entry date can be different from the G/L entry date.

## Show VAT Calculations Workspace

Use this workspace to view the calculated tax amount for a given tax reporting unit (depending on the specific combination of tax types).

### Show Tax Calculations Tab

This section includes the fields and descriptions for the Show Tax Calculations tab.

#### Tax Calculation Island

Field	Description
<b>Tax Reporting Unit</b>	If the current entry is currently included in a tax settlement (approved or non-approved), this field shows the number of the tax reporting unit to which the settlement in question pertains.
<b>Tax Settlement Type</b>	This shows the type of account used. This field displays one of the types listed below. For a detailed description of each tax settlement type, please refer to the descriptions of the G/L Tax Codes, Tax Codes, and Tax Reporting Unit Selection workspaces.

Field	Description
	<ul style="list-style-type: none"> <li>■ Tax Receivable — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for tax receivable in the G/L Tax Codes, Tax Codes, and Tax reporting Units workspaces.</li> <li>■ Tax Payable — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for tax payable in the G/L Tax Codes and Tax Codes workspaces.</li> <li>■ EU Acquisition Tax — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for acquisition tax in the G/L Tax Codes workspace.</li> <li>■ Investment Tax — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for acquisition tax in the G/L Tax Codes workspace.</li> <li>■ Basis high investment Tax — The line shows amounts that form the basis for calculation of high investment tax. The line there for shows amounts registered on accounts used for investment tax basis in B/L tax codes in which the investment tax is zero. These accounts are referred to by the dimension combination specified for each C/L tax code.</li> <li>■ Sales Tax — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for sales tax in the Tax Codes workspace.</li> <li>■ Tax — The line shows amounts registered on the account of a given tax type. The field "Tax Type" on the current line shows the relevant tax type. You can assign an account to a specific tax type in the Tax Reporting Units workspace by specifying a dimensions combination.</li> <li>■ Ratio Tax — The line shows amounts registered on the accounts referred to by the dimension combination specified for the ratio tax in the G/L Tax Codes workspace.</li> </ul>
<b>Nature of Tax</b>	This field shows the nature of tax as Taxable, Tax Exempt, or Export. The tax reporting unit(s) on the line will only be used if this tax nature matches the tax nature code from the tax code or the G/L tax code applied in a registration window when registration values are entered.
<b>Tax Type</b>	This field shows the tax type for the current entry. The tax reporting unit(s) on the line will only be used if this tax nature matches the tax nature code from the tax code or the G/L tax code applied in a registration window when registration values are entered.
<b>Manual Tax Type</b>	This field shows the manual tax type. Manual tax types are created in the pop-up field "Tax Account References" in the popup fields workspace in the Set-Up module.

Field	Description
<b>Debit basis, Reporting Currency</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Credit basis, Reporting Currency</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Debit Tax, Reporting Currency</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Credit Tax, Reporting Currency</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Debit Tax, Base</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in base currency.
<b>Credit Tax, Base</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in base currency.
<b>Debit basis, Base</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in base currency.
<b>Credit basis, Base</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in base currency.

## Show VAT Reporting Unit Selection Lines Workspace

Use this workspace to view information about tax reporting unit selection lines.

Create and maintain these lines in the sub-tab of the Tax Reporting Unit Selection single dialog workspace.

### Show Tax Reporting Unit Lines Tab

This section includes the fields and descriptions for the Show Tax Reporting Unit Lines tab.

#### Tax Reporting Unit Selection Table Island

Field	Description
<b>Name</b>	This field shows the name of the tax reporting unit selection table for the current tax reporting unit.

**Selection Criteria, Dimensions Island**

Field	Description
<b>Location</b>	This is the name of the location attached to the current entry.
<b>Entity</b>	This is the name of the entity attached to the current entry.
<b>Project</b>	This is the name of the project attached to the current entry.
<b>Purpose</b>	This is the name of the purpose attached to the current entry.
<b>Spec. 1-3</b>	These are the names of the specifications attached to the current entry.
<b>Local Spec. 1-3</b>	These are the names of the local specifications attached to the current entry.

**Selection Criteria Island**

Field	Description
<b>Period</b>	This field shows the period to which the tax code on the tax table line should apply.
<b>Zip Code</b>	This field shows the company zip code.
<b>Tax Direction</b>	This field specifies whether the tax direction is for a purchase or a sale.
<b>Company Tax Code</b>	This field shows the company tax code.
<b>Area</b>	This field shows the area to which the tax code on the tax table line should apply.
<b>Enterprise</b>	This field shows the enterprise to which the tax code on the tax table line should apply.
<b>Segment</b>	This field shows the segment to which the tax code on the tax table line should apply.
<b>Country</b>	This field shows the country to which the tax code on the tax table line should apply.

**Show Closing Entry Workspace**

Use this workspace to view an entry that Maconomy creates for each account that has a balance each time that you perform a year-end closing.

## Closing Entry Tab

This section includes the fields and descriptions for the Closing Entry tab.

### Entry Island

Field	Description
<b>Line No.</b>	This field shows the number of the G/L report line where the metric value resides.
<b>Account No.</b>	This field shows the account number for the current entry.
<b>Debit</b>	This field shows the ultimo balance in debit in the base currency for the current company, account and fiscal year.
<b>Credit</b>	This field shows the ultimo balance in credit in the base currency for the current company, account and fiscal year.
<b>Quantity A</b>	This field shows the ultimo balance for Quantity A for the current company, account and fiscal year.
<b>Quantity B</b>	This field shows the ultimo balance for Quantity A for the current company, account and fiscal year.

## Show Dimension Combination Lines Workspace

Use this workspace to view information about dimension combination lines.

Create and maintain these lines in the sub-tab of the Dimension Combinations single dialog workspace.

## Dimension Combination Lines Tab

This section includes the fields and descriptions for the Dimension Combination Lines tab.

### Dimension Combination Line Island

Field	Description
<b>Dimension Comb. No.</b>	This field shows the number of the dimension combination for the current entry.
<b>Description</b>	In this field, you can enter a description of the current dimension combination line.
<b>Account No.</b>	In this field, you can specify a dimension value for the Account dimension, if you want this value to be derived whenever the current dimension combination is used. If you also want the specified value to overwrite existing dimension values when it is derived, mark the field "Overwrite Account." If you do not select "Overwrite Account," the dimension value will only be derived if the dimension field into which the value is derived is neither completed

Field	Description
	<p>manually nor through a registration code. If the dimension combination type is "Posting Reference," you must always mark the field "Overwrite Account" when you specify an account number.</p> <p>When an entry is made, on which the current dimension combination is to be applied, the value in this field will only be used if the current line is the top line of those lines that match the number of the company to which the entry pertains. The company number range is specified in the fields "Company No. From" and "Company No. To." If the dimension combination type is "Dimension Derivation," the value will only be used when deriving from information cards which refer to the dimension combination, and where no derivation value for the Account dimension has been entered.</p> <p>A value in this field will not be used if the dimension combination has been assigned to an account information card in the Account Information Card workspace. This means that if the dimension combination, for example, has been selected for the account no. 1110 in the Account Information Card workspace, a value in this field will not be applied when dimensions are derived from account number 1110.</p> <p>Please note that a mark in the field "Overwrite Account" will only have effect if an account is also specified. If you only mark the field "Overwrite Account," but do not specify an account, the overwrite mark is ignored, as the account and the overwrite mark are always retrieved together from the same dimension derivation island, dimension combination, or dimension combination line.</p> <p>For more information about derived dimensions, please see "Introduction to the G/L Module" and the description of the Dimension Derivations workspace. You can find more information about the priority of the values in the Dimension Combinations tab in relation to company-specific values and values on the individual information cards in the introduction to this workspace.</p>
<b>From Company No.</b>	<p>Together with the field "To Company No.," this field constitutes a range of company numbers. When the current dimension combination is used as a result of an entry being made, Maconomy will check if the dimension combination contains a line with a company number range which matches the company to which the entry pertains. If this is the case, Maconomy will apply the dimension specifications entered on the dimension combination line instead of the specifications from the card part of the window. This way, it is possible to create lines with company-specific exceptions to the values in the card part. If more than one line match the company to which the entry pertains, the topmost of those table lines is applied. If no lines match the company to which the entry pertains, or if no lines have been created at all, Maconomy will only use the information in the card part.</p> <p>For more information about how Maconomy assigns priorities to the use of values from dimension derivation islands, dimension combinations, and dimension combination lines, please see the introduction to this workspace and the description of the field "Account No." in the Dimension Combinations tab and the Dimension Combination Lines sub-tab.</p>

Field	Description
<b>To Company No.</b>	The functionality of this field is described in the field “From Company No.” above.

### Derived Dimensions Island

Each of the following fields in this island has two columns: Value and Overwrite.

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field “Account No.”
<b>Entity</b>	The functionality of this field is similar to that of the field “Account No.”
<b>Project</b>	The functionality of this field is similar to that of the field “Account No.”
<b>Purpose</b>	The functionality of this field is similar to that of the field “Account No.”
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Account No.” Furthermore, when you enter a value in this field, Maconomy checks whether the current dimension combination is in use on any information cards (customers, vendors, employees, and so on.) assigned to a specific company. If it is, Maconomy checks whether the local spec. value entered in this field is also available in the local spec. list assigned to the companies in question.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Account No.”

## Show Finance Reconciliation Line Workspace

Use this workspace to view information about how and when a reconciliation was performed, and only as a link between the reconciliation and the finance entry.

Use the Finance Reconciliation single dialog workspace to reconcile finance entries.

### Finance Reconciliation Line Tab

This section includes the fields and descriptions for the Finance Reconciliation Line tab.

### Reconciliation Island

Field	Description
<b>Instance Key, Reconciliation</b>	A link to overall information about the reconciliation. The information is shown in the “Show Finance Reconciliation” dialog.

Field	Description
<b>Instance Key, Finance Entry</b>	A link to the finance entry. The finance entry is shown in the "Show G/L entries" dialog.
<b>Instance Key</b>	This field shows the instance key for the finance reconciliation line.
<b>Amount Reconciled, Base</b>	This is the reconciled amount in the base currency of the finance entry.

## Show Finance Tax Table Lines Workspace

Use this workspace to view information about G/L tax table lines.

Create and maintain these lines in the sub-tab of the G/L Tax Tables single dialog workspace.

### Show G L Tax Table Lines Tab

This section includes the fields and descriptions for the Show G/L Tax Table Lines tab.

#### G/L Tax Table Island

Field	Description
<b>Name</b>	This field shows the name of the G/L tax table.

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	In these fields, you can enter a range of values for the Location dimension. If no range is specified, the dimension Location has no influence on the selection of entries displayed in the table part of the window.
<b>Entity</b>	The functionality of these fields is similar to that of the field "Location."
<b>Project</b>	The functionality of these fields is similar to that of the field "Location."
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Location."
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."

**Selection Criteria Island**

Field	Description
<b>Period</b>	This field shows the period to which the tax code on the tax table line should apply.
<b>Account</b>	This field shows the range of accounts to which the tax code on the tax table line should apply.
<b>Task</b>	This field shows the Task job dimension.
<b>Activity</b>	This field shows the name and number of the activity from the Job Cost module if the entry pertains to a job.
<b>Company Tax Code</b>	This field shows the company tax code. This field must contain a value if the Tax Direction field contains a value.
<b>Item Tax Code</b>	This field shows the item tax code. This field must contain a value if the Tax Direction field contains a value.
<b>Area</b>	In this field, you can specify an area. All tax table lines matching the selected area and the other specified selection criteria are shown in the table part.
<b>Enterprise</b>	In this field, you can specify an enterprise. All tax table lines matching the selected enterprise and the other specified selection criteria are shown in the table part.
<b>Segment</b>	In this field, you can specify a segment. All tax table lines matching the selected segment and the other specified selection criteria are shown in the table part.

**Show Tax Settlement Entries Workspace**

Use this workspace to view information about Tax Settlement Entries.

You can also view these entries in the sub-tab of the Show G/L Entries single dialog workspace.

**Tax Settlement Entries Tab**

This section includes the fields and descriptions for the Tax Settlement Entries tab.

**Tax Settlement Type Island**

Field	Description
<b>Tax Settlement Type</b>	This shows the type of account used. This field displays one of the types listed below. For a detailed description of each tax settlement type, please refer to the descriptions of the G/L Tax Codes, Tax Codes, and Tax Reporting Unit Selection workspaces.

Field	Description
	<ul style="list-style-type: none"> <li>■ Tax Receivable — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for tax receivable in the G/L Tax Codes, Tax Codes, and Tax reporting Units workspaces.</li> <li>■ Tax Payable — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for tax payable in the G/L Tax Codes and Tax Codes workspaces.</li> <li>■ EU Acquisition Tax — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for acquisition tax in the G/L Tax Codes workspace.</li> <li>■ Investment Tax — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for acquisition tax in the G/L Tax Codes workspace.</li> <li>■ Basis high investment Tax — The line shows amounts that form the basis for calculation of high investment tax. The line there for shows amounts registered on accounts used for investment tax basis in B/L tax codes in which the investment tax is zero. These accounts are referred to by the dimension combination specified for each C/L tax code.</li> <li>■ Sales Tax — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for sales tax in the Tax Codes workspace.</li> <li>■ Tax — The line shows amounts registered on the account of a given tax type. The field "Tax Type" on the current line shows the relevant tax type. You can assign an account to a specific tax type in the Tax Reporting Units workspace by specifying a dimensions combination.</li> <li>■ Ratio Tax — The line shows amounts registered on the accounts referred to by the dimension combination specified for the ratio tax in the G/L Tax Codes workspace.</li> </ul>
<b>Tax Type</b>	In this pop-up field, you can select a tax pop-up value. The tax reporting unit(s) on the line will only be used if this tax nature matches the tax nature code from the tax code or the G/L tax code applied in a registration window when registration values are entered.
<b>Nature of Tax</b>	In this pop-up field, you can select a nature of tax as Taxable, Tax Exempt, or Export. The tax reporting unit(s) on the line will only be used if this tax nature matches the tax nature code from the tax code or the G/L tax code applied in a registration window when registration values are entered.
<b>EU Tax</b>	In this field, you can specify the tax type under which EU acquisition tax should be reported in tax settlement printouts for the current tax reporting unit.
<b>Tax Level</b>	This field shows the tax level to which the tax code you are creating should belong. The available options are Tax Level 1, Tax Level 2, and Tax Level 3.

Field	Description
<b>Tax Date</b>	<p>In some countries, legal requirements demand that the entry date of each registration is what determines the tax settlement period in which the entry belongs, while in other countries, the period is determined by the invoice date of the registration. In this field, you can specify for the current tax reporting unit which of the two methods should apply to companies belonging to the reporting unit.</p> <p>Each G/L entry contains a field called "Tax Date" to which either the entry date or the invoice date of the registration depending on the value in this field on the tax reporting unit assigned to the company which the entry concerns is automatically transferred when the entry is posted. When you create tax settlements in the Tax Settlement workspace, Maconomy uses the tax date registered on each individual G/L entry to determine whether the entry is covered by the period for which settlement is carried out.</p>
<b>Tax Code</b>	This field shows a tax code for the entry on the current line if the line represents a G/L entry.
<b>Tax Rate</b>	In this field, you can specify the tax rate for the current tax code.
<b>EU Tax</b>	In this field, you can specify the tax type under which EU acquisition tax should be reported in tax settlement printouts for the current tax reporting unit.
<b>Calculate Tax of Tax</b>	<p>If this field is set to "Yes," cumulative tax will be calculated on the different tax levels. Consider the following example which shows the difference between basic and cumulative tax calculation: If three tax levels of 5% national tax, 7% regional tax, and 8% local tax are calculated on a base amount of \$100, the total amount after applicable taxes will be \$120 (<math>100+5+7+8 = 120</math>).</p> <p>Conversely, if the three tax levels are added using the cumulative method, the total amount after applicable taxes will be \$121.34 (<math>100 \times 1.05 = 105</math>; <math>105 \times 1.07 = 112.35</math>, <math>112.35 \times 1.08 = 121.34</math>).</p>
<b>Popup 1-4</b>	In these four fields, you can select various information about the tax rates. These are pop-up fields, which means that you can choose from the options created for each field. They are created as Tax Popup 1 - Tax Popup 4 in the Popup Fields workspace. This information is transferred to tax settlement entries so that the tax reports can be group by the new tax type fields.

### Tax Amount Island

Field	Description
<b>Debit basis, Currency</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in the company's currency.
<b>Credit basis, Currency</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in the company's currency.

Field	Description
<b>Debit Tax, Currency</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in the company's currency.
<b>Credit Tax, Currency</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in the company's currency.
<b>Debit basis, Base</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in base currency.
<b>Credit basis, Base</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in base currency.
<b>Debit Tax, Base</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in base currency.
<b>Credit Tax, Base</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in base currency.
<b>Debit basis, Reporting Currency</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Credit basis, Reporting Currency</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Debit Tax, Reporting Currency</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Credit Tax, Reporting Currency</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.

## Show Tax Specification Lines Workspace

Use this workspace to view the calculated tax amount for a given tax reporting unit for a given combination of tax types and finance account.

## Show Tax Specification Lines Tab

This section includes the fields and descriptions for the Show Tax Specification Lines tab.

### Tax Specification Line Island

Field	Description
<b>Tax Settlement Type</b>	<p>This shows the type of account used. This field displays one of the types listed below. For a detailed description of each tax settlement type, please refer to the descriptions of the G/L Tax Codes, Tax Codes, and Tax Reporting Unit Selection workspaces.</p> <ul style="list-style-type: none"> <li>■ <b>Tax Receivable</b> — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for tax receivable in the G/L Tax Codes, Tax Codes, and Tax reporting Units workspaces.</li> <li>■ <b>Tax Payable</b> — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for tax payable in the G/L Tax Codes and Tax Codes workspaces.</li> <li>■ <b>EU Acquisition Tax</b> — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for acquisition tax in the G/L Tax Codes workspace.</li> <li>■ <b>Investment Tax</b> — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for acquisition tax in the G/L Tax Codes workspace.</li> <li>■ <b>Basis high investment Tax</b> — The line shows amounts that form the basis for calculation of high investment tax. The line there for shows amounts registered on accounts used for investment tax basis in B/L tax codes in which the investment tax is zero. These accounts are referred to by the dimension combination specified for each C/L tax code.</li> <li>■ <b>Sales Tax</b> — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for sales tax in the Tax Codes workspace.</li> <li>■ <b>Tax</b> — The line shows amounts registered on the account of a given tax type. The field "Tax Type" on the current line shows the relevant tax type. You can assign an account to a specific tax type in the Tax Reporting Units workspace by specifying a dimensions combination.</li> <li>■ <b>Ratio Tax</b> — The line shows amounts registered on the accounts referred to by the dimension combination specified for the ratio tax in the G/L Tax Codes workspace.</li> </ul>
<b>Manual Tax Type</b>	<p>If the value specified in the field "Tax Settlement Type" is "Tax," this field shows which tax type has been selected. Tax types are created in the pop-</p>

Field	Description
	up field "Tax Type" in the Popup Fields workspace in the Set-Up module and are assigned to G/L accounts in the Tax Reporting Units workspace.
<b>Nature of Tax</b>	In this pop-up field, you can select a nature of tax as Taxable, Tax Exempt, or Export. The tax reporting unit(s) on the line will only be used if this tax nature matches the tax nature code from the tax code or the G/L tax code applied in a registration window when registration values are entered.
<b>Tax Type</b>	In this pop-up field, you can select a tax pop-up value. The tax reporting unit(s) on the line will only be used if this tax nature matches the tax nature code from the tax code or the G/L tax code applied in a registration window when registration values are entered.
<b>Company No.</b>	This is the company to which the tax was posted.
<b>Posting Ref.</b>	This is the posting reference to which the tax was posted.
<b>Description</b>	This is the description of the posting reference to which the tax was posted.
<b>Debit basis, Reporting Currency</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Credit basis, Reporting Currency</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Debit Tax, Reporting Currency</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Credit Tax, Reporting Currency</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Debit Tax, Base</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in base currency.
<b>Credit Tax, Base</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in base currency.
<b>Debit basis, Base</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in base currency.
<b>Credit basis, Base</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in base currency.

## Show Tax Table Lines Workspace

Use this workspace to view information about tax tables lines.

Create and maintain these lines in the sub-tab of the Tax Tables single dialog workspace.

### Show Tax Table Lines Tab

This section includes the fields and descriptions for the Show Tax Table Lines tab.

#### Tax Table Island

Field	Description
<b>Name</b>	This field shows the name of the G/L tax table.

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	In these fields, you can enter a range of values for the Location dimension. If no range is specified, the dimension Location has no influence on the selection of entries displayed in the table part of the window.
<b>Entity</b>	The functionality of these fields is similar to that of the field "Location."
<b>Project</b>	The functionality of these fields is similar to that of the field "Location."
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Location."
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."

#### Selection Criteria Island

Field	Description
<b>Period</b>	This field shows the period to which the tax code on the tax table line should apply.
<b>Account</b>	This field shows the range of accounts to which the tax code on the tax table line should apply.
<b>Task</b>	This field shows the Task job dimension.
<b>Activity</b>	This field shows the name and number of the activity from the Job Cost module if the entry pertains to a job.

Field	Description
<b>Item</b>	This field shows the item number and name, if the intercompany entry is related to an item.
<b>Zip Code</b>	This field shows the company zip code.
<b>Tax Direction</b>	This field indicates whether the entry is for a purchase or a sale.
<b>Company Tax Code</b>	If this field displays a company tax code, the tax code on the current line will only be used if the company tax code specified in the Tax Table tab in which the actual registration takes place matches this code. Company tax codes are created in the pop-up field "Company Tax Codes" in the Popup Fields workspace.
<b>Item Tax Code</b>	<p>If this field displays item tax code, the tax code on the current line will only be used if the item tax code specified in the Tax Table Lines sub-tab in which the actual registration takes place matches this code. When invoicing and crediting on account, the tax code on the current line will only be used if the on-account tax code specified in the System Information workspace corresponds to the code specified in this field.</p> <p>Please note that it is only possible to point out the tax code on an invoice on account or a credit memo on account using a tax table if the system parameter "Get on account tax code from tax table" is marked. Item tax reporting codes are created in the pop-up field "Item Tax Codes" in the Popup Fields workspace.</p>
<b>Area</b>	This field shows an area to which the tax code on the tax table line should apply.
<b>Enterprise</b>	This field shows an enterprise. All tax table lines matching the selected enterprise and the other specified selection criteria are shown in the table part.
<b>Segment</b>	This field shows a segment. All tax table lines matching the selected segment and the other specified selection criteria are shown in the table part.
<b>Country</b>	This field shows the country in which the tax code should be made applicable.
<b>Item Group</b>	This field shows the item group to which the item must belong for the tax code to be used.
<b>Item Type</b>	This field shows the item type to which the item must belong for the tax code to be used.
<b>Statistics 1-4</b>	If these fields are used, the tax code will only be used for items with the same code in the fields "Statistics 1," "Statistics 2," "Statistics 3," and "Statistics 4" in the field "Print Control" in the Item Information Card workspace.

## Show Finance Report Output Line Workspace

Use this workspace to view information about previously executed and saved finance reports.

This workspace shows one entry for each line in the saved report.

Use the G/L Report Set-Up single dialog workspace to perform the following tasks:

- Define the G/L report format.
- Execute the finance report.
- Specify if Maconomy should save the result when you execute a finance report.

### Show G L Report Output Data Line Tab

This section includes the fields and descriptions for the Show G/L Report Output Data Line tab.

Field	Description
<b>Line No.</b>	This field shows the current line's number in the sequence of lines. The lines are numbered consecutively in the order of their creation.
<b>Print</b>	This field shows whether the current line is shown on printouts and in text and RTF files created from the current report. The value is derived from the field "Print" on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. On Maconomy's internal calculation lines, however, this field is always unmarked.
<b>Description</b>	This field shows the description of the current line. The value is derived from the field "Description" on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based.
<b>Column 1-40</b>	These fields show the actual data generated in the report, that is, the report contents.
<b>Month From/Month To</b>	<p>These fields show the values from the corresponding fields on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. If either of these fields is blank, the value from the corresponding field in the Show G/L Report Output Data tab applies instead.</p> <p>Please note that the column description used on the line may cause this range to be overruled in some of the data fields ("Field 1-40"). This field therefore only represents the default range used in those columns for which the column description does not specify another range.</p>
<b>Year From/Year To</b>	The functionality of these fields is similar to that of the fields "Month From" and "Month To."
<b>Company No. From/ Company No. To</b>	These fields show the values from the corresponding fields on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. If either of these fields is blank, the value from the corresponding field in the Show G/L Report Output Data tab applies instead.

Field	Description
	<p>However, if the current line was the result of a G/L report setup line that itemizes company numbers, these fields show the actual range of company numbers whose data is shown in this field.</p> <p>Please note that the column description used on the line may cause this range to be overruled in some of the data fields ("Field 1-40"). This field therefore only represents the default range used in those columns for which the column description does not specify another range.</p>
<b>Account No. From/ Account No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From" and "Company No. To."
<b>Intercompany Company From/ Intercompany Company To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Customer No. From/Customer No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Vendor No. From/ Vendor No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Job No. From/Job No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Activity No. From/ Activity No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Task From/Task To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Employee No. From/Employee No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Asset No. From/ Asset No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Item No. From/Item No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."

Field	Description
<b>Statistics 1-4 From/ Statistics 1-4 To</b>	These fields show the values from the corresponding fields on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. If either of these fields is blank, the value from the corresponding field in the Show G/L Report Output Data tab applies instead.
<b>Include subcompanies</b>	This field shows whether figures from subcompanies to the companies covered by the range in the fields "Company No. From" and "Company No. To" are included in the figures on the line. Subcompanies are included if the corresponding field is marked on the report containing the G/L report definition line on which the current output line is based. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Include subcompanies."
<b>Account Group</b>	This field shows that the current report line should display information about accounts in a specific account group. If the report line is assigned to a report that has been called by from another report, the value is inherited from the corresponding field on the report line that has called the current report.
<b>Currency</b>	This field shows the currency in which the figures on the current line are shown. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Currency." Please note that the column description used on the line may cause this currency to be overruled in some of the data fields ("Field 1-40"). This field therefore only represents the default currency used in those columns for which the column description does not specify another currency.
<b>Exchange Rate Date</b>	<p>This field shows the date whose exchange rates were used for converting amounts from one currency to another on the current line when the report was generated. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Exchange Rate Date."</p> <p>Please note that the column description used on the line may cause this currency to be overruled in some of the data fields ("Field 1-40"). This field therefore only represents the default exchange rate date used in those columns for which the column description does not specify another date.</p>
<b>Format</b>	This field shows the format applied to the current line on printouts. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Format."

Field	Description
<b>Indent</b>	This field shows by how many spaces the line description is indented on printouts. The indent does not apply when creating tab-separated files. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Indent."
<b>Invert Sign</b>	This field shows whether the figures on the current line have inverted signs (+/-). The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Invert Sign."
<b>Show 0</b>	This field shows whether a zero or a blank value should be shown in the fields "Field 1-40" in those when a field has the value 0. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Show 0."
<b>Department</b>	This field shows the name of the department to which the current G/L report output line pertains.
<b>Report No.</b>	This field shows the number of the report containing the G/L report definition line on which the current output line is based. The field "Original Line No." shows the G/L report definition line's table part position in the G/L Report Set-Up workspace. Using the information in this field and the field "Original Line No.," you can thus in the G/L Report Set-Up workspace find the G/L report definition line on which the current G/L report output line is based.
<b>Original Line No.</b>	This field shows the table part position of the G/L report definition line in the G/L Report Set-Up workspace on which the current G/L report output line is based. The current output line may be the result of a sub-report, meaning that the G/L report definition line on which the output line is based does not necessarily belong to the main report. Therefore, the report in question is shown in the field "Report No." Using the information in this field and the field "Report No.," you can thus in the G/L Report Set-Up workspace find the G/L report definition line on which the current G/L report output line is based.
<b>Line Type</b>	This field shows what type of information is represented on the line. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Type."
<b>Calculation</b>	This field shows the formula used for calculating the information on the current line (if any). The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L

Field	Description
	report output line is based. For information on the functionality of the field, you should therefore refer to the field "Calculation."
<b>Expansion No.</b>	This field is used for Maconomy support purposes only.
<b>Itemization Level</b>	This field shows the sub-report level at which the current output line was created. The main report represents level number one. If the main report calls a sub-report, the sub-report represents level two. The sub-report, in turn, can call another sub-report which represents level 3, and so on, and when a report at a given level results in an output line, the level in question is shown in this field.
<b>Column Description</b>	Here you enter the name of the G/L report column you have created in the G/L Report Columns workspace.
<b>Last Printout Column</b>	This field shows which column is the rightmost one to be printed.
<b>Line Style</b>	This field shows the name of the line style applied to the current output line. The line style determines the styles to be used on the different elements of the line when an RTF file is created for the report. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Line Style."
<b>Note No.</b>	This field does not apply to the current version of Maconomy.
<b>Note Text</b>	This field does not apply to the current version of Maconomy.
<b>Note Name</b>	This field does not apply to the current version of Maconomy.
<b>File Name</b>	This field does not apply to the current version of Maconomy.
<b>Note 2-3 Assigned</b>	This field does not apply to the current version of Maconomy.
<b>Note 2-3, Name</b>	This field does not apply to the current version of Maconomy.

### Dimensions Island

Field	Description
<b>Location</b>	In these fields, you can enter a range of values for the Location dimension. If no range is specified, the dimension Location has no influence on the selection of entries displayed in the table part of the window.

Field	Description
<b>Entity</b>	The functionality of these fields is similar to that of the field "Location."
<b>Project</b>	The functionality of these fields is similar to that of the field "Location."
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Location."
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."

## Show Finance Report Output Cell Workspace

Use this workspace to view information about previously executed and saved finance reports.

This workspace shows one entry for each line-column combination in the saved report.

Use the G/L Report Set-Up single dialog workspace to perform the following tasks:

- Define the G/L report format.
- Execute the finance report.
- Specify if Maconomy should save the result when you execute a finance report.

### Finance Temp Report Cell Tab

This section includes the fields and descriptions for the Finance Temp Report Cell tab.

#### Period Island

Field	Description
<b>Period</b>	This field shows the date range which defines the period used in the current calculation.

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	This is the local dimension interval used in the current calculation.
<b>Entity</b>	This is the entity dimension interval used in the current calculation.
<b>Project</b>	This is the project dimension interval used in the current calculation.

Field	Description
<b>Purpose</b>	This is the purpose dimension interval used in the current calculation.
<b>Spec. 1-10</b>	These are the Spec. 1-10 dimension intervals used in the current calculation.
<b>Local Spec. 1-10</b>	These are the Local Spec. 1-10 dimension intervals used in the current calculation.

#### Column Island

Field	Description
<b>Column Line No.</b>	This is the column line number. This number determines where on the printout the column is placed. This number is also used for referring to a given column in column calculations.
<b>Column Heading</b>	This field shows the column header. It is printed in the report using a report line of the type "Column Heading."
<b>Column Base</b>	This field shows whether actual or budgeted figures will be displayed.
<b>Column Description Name</b>	This field shows the name of the G/L report column description.
<b>Column Prior Periods</b>	This field shows the prior periods used in the current calculation.

#### Column Criteria Island

Field	Description
<b>Company No.</b>	This field shows the company no. interval used in the current calculation.
<b>Account No.</b>	This field shows the account no. interval used in the current calculation.
<b>Intercompany Company</b>	This field shows the inter-company no. interval used in the current calculation.
<b>Customer No.</b>	This field shows the customer no. interval used in the current calculation.
<b>Vendor No.</b>	This field shows the vendor no. interval used in the current calculation.
<b>Job No.</b>	This field shows the job no. interval used in the current calculation.
<b>Activity No.</b>	This field shows the activity no. interval used in the current calculation.

Field	Description
<b>Task</b>	This field shows the task name interval used in the current calculation.
<b>Employee No.</b>	This field shows the employee no. interval used in the current calculation.
<b>Asset No.</b>	This field shows the asset no. interval used in the current calculation.
<b>Item No.</b>	This field shows the item no. interval used in the current calculation.

## Show Dimension Periods Workspace

Use this workspace to view and search the content of dimension periods that you can access.

### Show Dimension Periods Tab

This section includes the fields and descriptions for the Show Dimension Periods tab.

#### Period Information Island

Field	Description
<b>Fiscal Year</b>	This field shows the fiscal year when the dimension period aggregates over the finance entries.
<b>Company No.</b>	This field shows the company number the dimension period aggregates over the finance entries.
<b>Account No.</b>	This field shows the account number the dimension period aggregates over finance entries.
<b>Local Account No.</b>	This field shows the local account number the dimension period aggregates over finance entries.
<b>Base Currency</b>	This field shows the currency of the company of the dimension period.
<b>Account Currency</b>	This field shows the currency of the account where you posted the finance entries of the dimension period.

#### Debit Balance Island

Field	Description
<b>Debit 1-12, Base</b>	These fields show the aggregated base debit amount of the finance entries posted in the 1 <sup>st</sup> -12 <sup>th</sup> period of the fiscal year.

### Credit Balance Island

Field	Description
<b>Credit 1-12, Base</b>	These fields show the aggregated base credit amount of the finance entries posted in the 1 <sup>st</sup> -12 <sup>th</sup> period of the fiscal year.

### Tax Island

Field	Description
<b>Tax Opening</b>	This field shows the opening tax balance of the dimension period.
<b>Tax 1-12</b>	These fields show the aggregated tax amount of the finance entries posted in the 1 <sup>st</sup> -12 <sup>th</sup> period of the fiscal year.

### Dimensions Island

Field	Description
<b>Location</b>	This field shows the location where the dimension period aggregates over the finance entries.
<b>Entity</b>	This field shows the entity by which the dimension period aggregates over the finance entries.
<b>Project</b>	This field shows the project by which the dimension period aggregates over the finance entries.
<b>Purpose</b>	This field shows the purpose by which the dimension period aggregates over the finance entries.
<b>Spec. 1-10</b>	These fields show the specifications of the dimension period that aggregates over the finance entries.
<b>Local Spec. 1-10</b>	These fields show the local specifications of the dimension period that aggregates over the finance entries.

### Opening Balance Island

Field	Description
<b>Debit Opening, Base</b>	This field shows the opening debit balance of the dimension period in base currency.
<b>Credit Opening, Base</b>	This field shows the opening credit balance of the dimension period in base currency.
<b>Debit Opening, Currency</b>	This field shows the opening debit balance of the dimension period in account currency.
<b>Credit Opening, Currency</b>	This field shows the opening credit balance of the dimension period in account currency.

Field	Description
<b>Debit Opening, Enterprise</b>	This field shows the opening debit balance of the dimension period in enterprise currency.
<b>Credit Opening, Enterprise</b>	This field shows the opening credit balance of the dimension period in enterprise currency.

**Year End Result Island**

Field	Description
<b>Debit Year End Result, Base</b>	This field shows the year-end debit balance of the dimension period in base currency.
<b>Credit Year End Result, Base</b>	This field shows the year-end credit balance of the dimension period in base currency.
<b>Debit Year End Result, Currency</b>	This field shows the year-end debit balance of the dimension period in account currency.
<b>Credit Year End Result, Currency</b>	This field shows the year-end credit balance of the dimension period in account currency.
<b>Debit Year End Result, Enterprise</b>	This field shows the year-end debit balance of the dimension period in enterprise currency.
<b>Credit Year End Result, Enterprise</b>	This field shows the year-end credit balance of the dimension period in enterprise currency.

**Quantity A Island**

Field	Description
<b>Quantity A Opening</b>	This field shows the opening quantity A of the dimension period.
<b>Quantity A Year End Result</b>	This field shows the year-end quantity A of the dimension period.
<b>Quantity A 1-12</b>	These fields show the aggregated quantity A of the finance entries posted in the 1 <sup>st</sup> -12 <sup>th</sup> period of the fiscal year.

**Quantity B Island**

Field	Description
<b>Quantity B Opening</b>	This field shows the opening quantity B of the dimension period.

Field	Description
<b>Quantity B Year End Result</b>	This field shows the year-end quantity B of the dimension period.
<b>Quantity B 1-12</b>	These fields show the aggregated quantity B of the finance entries posted in the 1 <sup>st</sup> -12 <sup>th</sup> period of the fiscal year.

**Committed Island**

Field	Description
<b>Committed Opening, Base</b>	This field shows the committed opening of the dimension period in base currency.
<b>Committed 1-12, Base</b>	These fields show the aggregated committed amounts of the finance entries posted in the 1 <sup>st</sup> -12 <sup>th</sup> period of the fiscal year.

## Show Dimension Task Periods Workspace

Use this workspace to view and search the content of dimension task periods that you can access.

### Show Dimension Task Periods Tab

This section includes the fields and descriptions for the Show Dimension Task Periods tab.

**Period Information Island**

Field	Description
<b>Fiscal Year</b>	This field shows the fiscal year when the dimension task period aggregates over the finance entries.
<b>Company No.</b>	This field shows the company number the dimension task period aggregates over the finance entries.
<b>Account No.</b>	This field shows the account number the dimension task period aggregates over finance entries.
<b>Local Account No.</b>	This field shows the local account number the dimension task period aggregates over finance entries.
<b>Task Name</b>	This field shows the task name the dimension task period aggregates over finance entries.
<b>Base Currency</b>	This field shows the currency of the company of the dimension task period.
<b>Account Currency</b>	This field shows the currency of the account where the finance entries of the dimension task period are posted.

### Debit Balance Island

Field	Description
<b>Debit 1-12, Base</b>	These fields show the aggregated base debit amount of the finance entries posted in the 1 <sup>st</sup> -12 <sup>th</sup> period of the fiscal year.

### Credit Balance Island

Field	Description
<b>Credit 1-12, Base</b>	These fields show the aggregated base credit amount of the finance entries posted in the 1 <sup>st</sup> -12 <sup>th</sup> period of the fiscal year.

### Tax Island

Field	Description
<b>Tax Opening</b>	This field shows the opening tax balance of the dimension task period.
<b>Tax 1-12</b>	These fields show the aggregated tax amount of the finance entries posted in the 1 <sup>st</sup> -12 <sup>th</sup> period of the fiscal year.

### Dimensions Island

Field	Description
<b>Location</b>	This field shows the location where the dimension task period aggregates over the finance entries.
<b>Entity</b>	This field shows the entity by which the dimension task period aggregates over the finance entries.
<b>Project</b>	This field shows the project by which the dimension task period aggregates over the finance entries.
<b>Purpose</b>	This field shows the purpose by which the dimension task period aggregates over the finance entries.
<b>Spec. 1-10</b>	These fields show the specifications of the dimension task period that aggregates over the finance entries.
<b>Local Spec. 1-10</b>	These fields show the local specifications of the dimension task period that aggregates over the finance entries.

### Opening Balance Island

Field	Description
<b>Debit Opening, Base</b>	This field shows the opening debit balance of the dimension task period in base currency.
<b>Credit Opening, Base</b>	This field shows the opening credit balance of the dimension task period in base currency.

Field	Description
<b>Debit Opening, Currency</b>	This field shows the opening debit balance of the dimension task period in account currency.
<b>Credit Opening, Currency</b>	This field shows the opening credit balance of the dimension task period in account currency.
<b>Debit Opening, Enterprise</b>	This field shows the opening debit balance of the dimension task period in enterprise currency.
<b>Credit Opening, Enterprise</b>	This field shows the opening credit balance of the dimension task period in enterprise currency.

### Year End Result Island

Field	Description
<b>Debit Year End Result, Base</b>	This field shows the year-end debit balance of the dimension task period in base currency.
<b>Credit Year End Result, Base</b>	This field shows the year-end credit balance of the dimension task period in base currency.
<b>Debit Year End Result, Currency</b>	This field shows the year-end debit balance of the dimension task period in account currency.
<b>Credit Year End Result, Currency</b>	This field shows the year-end credit balance of the dimension task period in account currency.
<b>Debit Year End Result, Enterprise</b>	This field shows the year-end debit balance of the dimension task period in enterprise currency.
<b>Credit Year End Result, Enterprise</b>	This field shows the year-end credit balance of the dimension task period in enterprise currency.

### Quantity A Island

Field	Description
<b>Quantity A Opening</b>	This field shows the opening quantity A of the dimension task period.
<b>Quantity A Year End Result</b>	This field shows the year-end quantity A of the dimension task period.
<b>Quantity A 1-12</b>	These fields show the aggregated quantity A of the finance entries posted in the 1 <sup>st</sup> -12 <sup>th</sup> period of the fiscal year.

**Quantity B Island**

Field	Description
<b>Quantity B Opening</b>	This field shows the opening quantity B of the dimension task period.
<b>Quantity B Year End Result</b>	This field shows the year-end quantity B of the dimension task period.
<b>Quantity B 1-12</b>	These fields show the aggregated quantity B of the finance entries posted in the 1 <sup>st</sup> -12 <sup>th</sup> period of the fiscal year.

**Committed Island**

Field	Description
<b>Committed Opening, Base</b>	This field shows the committed opening of the dimension task period in base currency.
<b>Committed 1-12, Base</b>	These fields show the aggregated committed amount of the finance entries posted in the 1 <sup>st</sup> -12 <sup>th</sup> period of the fiscal year.

**Reporting Section**

This section includes the fields and descriptions for the Reporting Section workspaces.

**G/L Reports Introduction**

Use the Maconomy G/L report generator as a tool for extracting and presenting financial data.

It enables you to define and store an unlimited number of reports. Maconomy produces the reports from data that is stored in the general ledger, so after you define a report, you can use it again and again. The G/L report generator consists of the following workspaces: G/L Report Columns, G/L Report Set-Up, and Print G/L Report.

You define G/L reports in Maconomy in two stages:

- Define the columns in the G/L Report Columns workspace.
- Define the report lines in the G/L Report Set-Up workspace.

The basic composition of a report is similar to a spreadsheet and consists of columns and lines (or rows).

The tasks of defining columns and lines are divided among two workspaces so that you can easily combine various column and line calculations. This adds flexibility in creating a wide range of reports, in that you can reuse elements that you have defined once, in numerous reports.

You use the G/L Report Columns workspace to define report columns. You assign the report columns to various report lines. Each line in a column produces figures that are consistent with other lines in the same column. For example, a column can consist of actual figures, budgeted amounts, quantity counts, a calculation from other columns, and so forth. You can define up to 40 columns for each report.

You use the G/L Report Set-Up workspace to define the output of the report lines. Each line expresses a dimension of the general ledger, subject to various target group criteria. Maconomy's general ledger dimensions are Company, Account, Location, Entity, Project, Purpose, Spec. 1-3, and Local Spec. 1-3. The target group enables you to clearly define a range of options for the dimension or dimensions that you include in the report or report line. For example, you might limit a section of the report (report line definition) to a range of expense account numbers.

You can print reports from several places, including the G/L Report Set-Up and Print G/L Report workspaces.

## G/L Report Columns Workspace

Use this workspace to enter and change column specifications that Maconomy uses in financial (G/L) reports.

A G/L report has columns and lines (or rows). The columns control the type of information to be shown, such as actual or budgeted figures, while the lines control the range of information-the accounts and dimensions that are included in the lines.

You define a set of columns in this workspace. For each set of columns, you supply a name, a description, and a report layout (for example, 16ColumnsHorizontal).

The lines in the Column Description Lines sub-tab represent columns in the report. For each column, you enter a header, identify which figures to show, enter a calculation formula, specify whether the report is to include period changes or opening/closing numbers, select a number format, and so on.

For each column, you can also select the period for which the data should be calculated. The period you specify can be relative to the period you entered when you executed the report. For example, you can specify that a column show data for the current period, and another column show data for that same period but from a different year. If you select August 2014 when you execute the report, Maconomy shows one column with data for August 2014, and another column with data for August 2013.

The layout that you choose might limit the number of columns you can include in the report. The absolute maximum is 40 columns, but some layouts allow for fewer columns.

Each report has:

- A text column, which is defined for every report line in the G/L Report Set-Up workspace.
- Additional columns that display text, actual figures, budgeted figures, or calculations (for example, a percentage variance between actual and budget figures).

Each line in a column shows information that is consistent with other lines in the same column. For example, if the first column displays actual figures for a given period, all lines in that column display actual figures for the specified period. Budget figures and figures for other periods must be shown in another column. However, you can change the period for an individual line in a G/L report, such that all of the figures for this line relate to the specified period.

For actual or budgeted figures, you can choose to include only figures for a given location, entity, project, or period. You can enter a limitation using a range of dimension values for each line and for each column in the report. If you do so, the limitation on the column level has higher priority than the limitation on the line level.

If you delete a line from the Column Description Lines sub-tab, Maconomy does not check to see whether the deleted line was referenced by one or more calculation formulas on other lines. For this reason, you should carefully consider the effect of deleting lines.

If you do not define a column, it is blank on the report.

You can print G/L reports using the **Print Report** action in the G/L Report Set-Up or Print G/L Report workspace. You can also export the report to a tab-separated file using the **Create Tab-separated File** action in the G/L Report Set-Up workspace.

## G/L Report Columns Tab

This section includes the fields and descriptions for the G/L Report Columns tab.

### Column Definition Island

Field	Description
<b>Name</b>	Enter a name for the column specification here. You cannot change the name of an existing column definition.
<b>Description</b>	You can optionally enter a description of the column definition here.
<b>Layout</b>	<p>Here you choose which G/L report layout will be used with the current column specification.</p> <p>The number of columns printed depends on the layout chosen. You can choose a layout for which there are more columns than you intend to print and use the remaining columns for subtotals.</p> <p>A layout consists of a number of line layouts (or blocks). When defining the report lines, you designate which of these is to be used for the specified line. You can use the Layout Designer to edit these layouts according to your own specifications. For example, you can choose to always display totals in bold type. If you change the format of the line layout, you can also save it under a new name in the Popup Fields window, to match its new format.</p>

### Access Level Island

Field	Description
<b>Access Level</b>	In this field, you can specify the description and name of an access level for the current G/L report column. In this workspace, you can only see and use the current G/L report column if you have been assigned to this or a higher access level in the User Access Levels workspace in the Set-Up module. In other workspaces, you can only reference the column description if you have been assigned to this or a higher access level in the User Access Levels workspace in the Set-Up module. Please note that this access control only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to G/L report columns may depend on other factors. For further information about the standard access control configuration, please see the "Introduction to the Access Control System" in the Set-Up module.

Field	Description
	If you do not specify an access level, all users will have access to see information about the current G/L report columns.

### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

### Column Width Island

Field	Description
<b>Left Edge Position</b>	This field does not apply in the current version of Maconomy.
<b>Description</b>	This field does not apply in the current version of Maconomy.
<b>Note</b>	This field does not apply in the current version of Maconomy.

### Heading Island

Field	Description
<b>Description</b>	In this field you can enter a heading text to be inserted above the text columns in the printed G/L Report.
<b>Note</b>	This field does not apply in the current version of Maconomy.

### Column Description Lines Sub-Tab

This section includes the fields and descriptions for the Column Description Lines sub-tab.

Field	Description
<b>No.</b>	<p>This is the column number. This number determines where on the printout the column is placed. This number is also used for referring to a given column in column calculations.</p> <p>You can define up to 40 columns, but the number of columns printed depends on the layout that you choose.</p>
<b>Heading</b>	<p>Enter the column header here. It is printed in the report using a report line of the type “Column Heading.”</p> <p>It is possible to use fixed texts as well as texts which refer to the period the column is for. When the report is printed, the text is replaced by the value it represents. If the column covers more than one month, the printout shows the first and the last month in the period.</p> <p>These are the references you can use:</p>

Field	Description
	<ul style="list-style-type: none"> <li>▪ #MonthNumber</li> <li>▪ #MonthName</li> <li>▪ #MonthNumber/Year</li> <li>▪ #MonthName/Year</li> </ul>
<b>Type</b>	<p>In this field, you can specify the figures on which the amounts in the column should be based. You can choose between the following figures:</p> <ul style="list-style-type: none"> <li>▪ Amount in Base Currency — The column will display amounts posted in the base currency of each company. Unless you specify a currency in the field “Currency,” the column figures will be displayed in the base currency assigned to each entry. Note that if a report concerns companies that use nonmatching base currencies, Maconomy does not consider that the currencies do not match when calculating totals. This means that, for example, the amount DEM 250.00 and GBP 750.00 will result in a calculated total of 1,000.00. If totals are to be calculated, you are therefore urged to create a column where each line amount is converted in a specific currency.</li> <li>▪ Amount in Currency — The column will display amounts posted in the currency of the account. Unless you specify a currency in the field “Currency,” the column figures will be displayed in the base currency assigned to the account on each entry. Note that if a report concerns accounts that use non-matching base currencies, Maconomy does not consider that the currencies do not match when calculating totals. This means that, for example, the amount DEM 250.00 and GBP 750.00 will result in a calculated total of 1,000.00. If totals are to be calculated, you are therefore urged to create a column where each line amount is converted in a specific currency.</li> <li>▪ Quantity — The column will display actual or budgeted quantities.</li> <li>▪ Quantity 2 — The column will display actual quantity 2 figures. It is not possible to extract budgeted quantity 2 figures, as budgets cannot be made on quantity 2.</li> <li>▪ Calculation — The column will display the result of a calculation using one or more other columns. Enter the calculation formula in the “Calculation” field.</li> <li>▪ Text — In each report line, the column will display the text entered in the “Calculation” field. If “Text” is chosen, the report line will display the line text and not the column text.</li> <li>▪ Amount in Enterprise — The column will display amounts posted in the enterprise currency. Unless you specify a currency in the field “Currency,” the column figures will be displayed in enterprise currency.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Tax — The column is based on the tax amounts derived from the entries in the Selection Criteria. If the Selection Criteria, for example, includes an entry of USD 80, which caused a tax entry of USD 8, the USD 8 will appear in this column.</li> </ul>
<b>Basis</b>	Here you choose whether to display actual or budgeted figures, provided you have chosen “Amount in Base Currency,” “Amount in Currency,” “Amount in Enterprise,” or “Quantity” in the “Type” field. You can choose between “Actual” or “Budget.” Note that if you select “Budget,” you must select the option “Amount in Base Currency” in the field “Type,” as Maconomy only maintains budget figures in the base currency of the company assigned to each budget entry. If you have specified “Tax” in the field “Type,” you must select “Actual” in this field.
<b>Balance</b>	Here you choose whether to display the period’s opening balance, closing balance, or period changes, provided you have selected “Amount,” “Quantity,” or “Tax” in the field “Type.” The options here are “Closing,” “Opening,” and “Change.”
<b>Direction</b>	Here you choose whether to display the period’s debit entries, credit entries or all entries, provided you have chosen “Amount” in the “Text” field. The options are “Debit,” “Credit,” and blank, the last of which includes all entries.
<b>Calculation</b>	<p>Here you enter a calculation formula, provided you have chosen “Calculation” in the “Type” field.</p> <p>A calculation formula can consist of references to other columns, numeric constants, and math operators. You refer to a column by entering its column number. A whole number preceded by a 0 is interpreted as a numeric constant. The math operators +, -, *, and / can be used for calculations involving columns or whole numbers. Parentheses may also be used to separate calculation expressions. Finally, you can use the % sign to find the percentage ratio between two columns.</p> <p>Here are some examples of calculation expressions:</p> <ul style="list-style-type: none"> <li>■ “1 2” in column three indicates that, for every line, column 3 calculates the difference between columns 1 and 2.</li> <li>■ “(1 + 2) / 4 * 012” in column 3 indicates that column 3 calculates the sum of columns 1 and 2, divided by column 4, multiplied by 12. If column 4 is 0, column 3 will also be 0.</li> <li>■ “1* 01.50” in column 2 means that column 2 is calculated as column 1 multiplied by the constant 1.5.</li> <li>■ “1 % 2” in column 3 indicates that column 3 calculates column 1, less column 2, divided by column 2, multiplied by 100. If column 2 is 0, column 3 will also result in 0. If a text is entered in the system parameter “Text on division by 0 in G/L rep.,” a division by 0 will result in the column displaying the text entered in the system parameter.</li> </ul>

Field	Description
	<p>Please note that if a line in the Column Description Lines sub-tab is deleted, Maconomy will not check whether the deleted line was referenced by one or more calculation formulas on other lines. For this reason it is recommended that you check the calculation formulas for references to the deleted lines and any subsequent lines which have changed number because of the deletion.</p> <p>If you choose "Text" in the "Type" field, you can enter a text or a text reference in the Calculation field. If the line is a "Text" line, and you enter a text in the column, the printed report line will display the line text and not the column text.</p> <p>You can enter fixed texts as well as texts to be retrieved by references to account, location, entity, or project. When the report is printed, the reference will be replaced with the value that it represents. Note that to get correct information in your reports, you should enter kernel strings for the relevant texts. It is, however, possible to enter template strings, but as these might not be configurable when using localized versions of Maconomy, using template strings might result in incomplete reports.</p> <p>You can use the following account references:</p> <ul style="list-style-type: none"> <li>■ #Account.AccountNumber</li> <li>■ #Account.AccountText</li> <li>■ #Account.Statistics1</li> <li>■ #Account.Statistics2</li> <li>■ #Account.Statistics3</li> <li>■ #Account.Statistics4</li> <li>■ #Account.AccountType</li> <li>■ #Account.AccountGroup</li> <li>■ #Account.Department</li> <li>■ #Account.ItemVATCode</li> <li>■ #Account.Blocked</li> <li>■ #Account.ProfitAndLossStatus</li> <li>■ #Account.VATCode</li> <li>■ #Account.Currency</li> <li>■ #Account.Note1...Note5</li> </ul> <p>You can use the following references for dimensions. Replace "&lt;dimension&gt;" with the name of the dimension in the list below. The dimensions are written as follows:</p> <ul style="list-style-type: none"> <li>■ Location</li> <li>■ Entity</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Project</li> <li>Purpose</li> <li>Specification1</li> <li>Specification2</li> <li>Specification3</li> <li>LocalSpecification1</li> <li>LocalSpecification2</li> <li>LocalSpecification3</li> </ul> <p>You can use the following references for the dimensions above:</p> <ul style="list-style-type: none"> <li>#&lt;dimension&gt;.Name</li> <li>#&lt;dimension&gt;.Description</li> <li>#&lt;dimension&gt;.Statistics1</li> <li>#&lt;dimension&gt;.Statistics2</li> <li>#&lt;dimension&gt;.Statistics3</li> <li>#&lt;dimension&gt;.Statistics4</li> <li>#&lt;dimension&gt;.Blocked</li> <li>#&lt;dimension&gt;.Note1</li> <li>#&lt;dimension&gt;.Note2</li> <li>#&lt;dimension&gt;.Note3</li> <li>#&lt;dimension&gt;.Note4</li> <li>#&lt;dimension&gt;.Note5</li> </ul> <p>You can use the following column reference:</p> <ul style="list-style-type: none"> <li>#Column.1...#Column.40</li> </ul> <p>You can use the following extra texts of the report:</p> <ul style="list-style-type: none"> <li>#Extratext.1... Extratext.6</li> </ul> <p>(These texts will always refer to the main report, that is, the user-generated report).</p> <p>You can use the following reference to the main company, that is, the company which appears on all printouts not related to a specific company:</p> <ul style="list-style-type: none"> <li>#MainCompany</li> </ul> <p>You can use the following references to the Company Information workspace:</p> <ul style="list-style-type: none"> <li>#CompanyInformation.CompanyNumber</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>#CompanyInformation.Name1...5</li> <li>#CompanyInformation.ZipCode</li> <li>#CompanyInformation.City</li> <li>#CompanyInformation.Country</li> <li>#CompanyInformation.Phone</li> <li>#CompanyInformation.Fax</li> <li>#CompanyInformation.Telex</li> <li>#CompanyInformation.Giro</li> <li>#CompanyInformation.Bank</li> <li>#CompanyInformation.CompRegNumber</li> <li>#CompanyInformation.BACSTNumber</li> <li>#CompanyInformation.VATNumber</li> <li>#CompanyInformation.Statistics1... Statistics4</li> <li>#CompanyInformation.Blocked</li> <li>#CompanyInformation.Currency</li> <li>#CompanyInformation.Note1...Note5</li> <li>#CompanyInformation.Address1... Address8</li> <li>#CompanyInformation.Text1...Text20</li> <li>#CompanyInformation.Date1...Date5</li> <li>#CompanyInformation.Popup1...Popup5</li> <li>#CompanyInformation.Real1...Real5</li> <li>#CompanyInformation.Integer1...Integer5</li> </ul> <p>Name 1-5, ZipCode, City, and Country refer to the Address fields in the Company Information workspace for the current company. Address 1-8, however, refer to formatted address information. This means that the address consists of Name 1-3, followed by ZipCode and City (in one field), followed by Name 4-5, and finally Country. Blank fields are omitted. This is best illustrated by an example:</p> <ul style="list-style-type: none"> <li>The company information  Name1 = "Maconomy NE Inc."  Name 2 = "33 Boston Post Road West, Suite 310" ZipCode = "MA 01752"  City = "Marlborough" Country = "USA"</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>corresponds to the following: Address1 = "Maconomy NE Inc." Address2 = "33 Boston Post Road West, Suite 310" Address3 = "Marlborough, MA 01752" Address4 = "USA"</li> </ul> <p>The other address fields are blank.</p> <p>You can use the following references to the current year and month:</p> <ul style="list-style-type: none"> <li>#Year</li> <li>#MonthNumber</li> <li>#MonthNumber/Year</li> <li>#MonthName</li> <li>#MonthNumber/Year</li> </ul>
<b>Period Change</b>	<p>In this field you can enter a whole number that determines the column period relative to the period in the G/L report Selection Criteria. For example, if you enter "-12" the column will display figures for the same period range in the previous year.</p>
<b>Period Reference</b>	<p>In this field you can enter a time frame for which the figures in the column are to be shown, relative to the period in the G/L report Selection Criteria. You can choose between the following options:</p> <ul style="list-style-type: none"> <li>Period — The column shows figures for the period specified in the G/L report Selection Criteria.</li> <li>Month — The column shows figures for the last month specified in the G/L report Selection Criteria.</li> <li>Quarter — The column shows figures for the quarter in which the last month specified in the G/L report Selection Criteria is included. If the G/L report is run for months 1-7 in a given year, the column will show the figures for months 7, 8, and 9. Note that the figures for the whole quarter will be included in the report, even though the Selection Criteria only include the 7th month.</li> <li>Half Year — The column shows figures for the half year in which the last month specified in the G/L report Selection Criteria is included. If the G/L report is run for months 1-9 in a given year, the column will show the figures for months 7-12. Note that the figures for the entire half-year will be included in the report, even though the Selection Criteria only include the ninth month.</li> <li>Year — The column shows figures for the last year included by the G/L report Selection Criteria. Note that the figures for the entire year will be included in the report, even though the Selection Criteria only include a given month of that year.</li> </ul>

Field	Description
	It applies to each of these period references that any relative period specified in the field "Period" above will affect the period reference specified in this field. To find the relevant period, Maconomy adds the number of months specified in the field "Period" (or deducts it if it is a negative figure) to the last month covered by the report and determines the period covering the resulting month. If, for instance, a report is to print figures from months 1-7 in a given year, and this field specifies "Quarter," the column will show figures for the third quarter of the year, that is, the months 7, 8, and 9, as mentioned above. If a relative period of "-2" is specified in the field "Period," Maconomy will deduct two months from the last month to be printed (month 7), thus determining that the last month to actually be covered by the report is month 5, which is in the second quarter of the year. Therefore, the column will, instead, show figures for the second quarter, that is, the months 4, 5, and 6.
<b>Show As</b>	Choose the number format here. You can choose between "Decimals," "In Whole Numbers," "In Thousands," "Millions with one decimal," or "Millions."
<b>Print</b>	If you check this field, the current column will be printed out.
<b>Company From</b>	The values in this field and in the field "Company To" constitute a range of company numbers to be included in the column figures. This range is only used if the column should display realized or budgeted figures. The range applying to a given report field can, however, also derive from the card or table part of the report definitions in which the column appears. For a description of the priority used for determining the company range to apply to each report field in a given report, you should therefore see the field "Company No. From" in the table part of the G/L Report Set-Up workspace.
<b>Company To</b>	The functionality of this field is similar to that of the field "Company From" above.
<b>Account No. From</b>	The functionality of this field is similar to that of the field "Company From" above.
<b>Account No. To</b>	The functionality of this field is similar to that of the field "Company From" above.
<b>Location From</b>	The functionality of this field is similar to that of the field "Company From" above.
<b>Location To</b>	The functionality of this field is similar to that of the field "Company From" above.
<b>Entity From</b>	The functionality of this field is similar to that of the field "Company From" above.
<b>Entity To</b>	The functionality of this field is similar to that of the field "Company From" above.

Field	Description
<b>Project From</b>	The functionality of this field is similar to that of the field "Company From" above.
<b>Project To</b>	The functionality of this field is similar to that of the field "Company From" above.
<b>Purpose From</b>	The functionality of this field is similar to that of the field "Company From" above.
<b>Purpose To</b>	The functionality of this field is similar to that of the field "Company From" above.
<b>Spec. 1-3 From</b>	The functionality of these fields is similar to that of the field "Company From" above.
<b>Spec. 1-3 To</b>	The functionality of this field is similar to that of the field "Company From" above.
<b>Local Spec. 1-3 From</b>	The functionality of these fields is similar to that of the field "Company From" above.
<b>Local Spec. 1-3 To</b>	The functionality of this field is similar to that of the field "Company From" above.
<b>Budget Model</b>	If you have selected "Budget" in the field "Basis," you can select the specific budget model from which to retrieve the figures in this field. If you select both a specific budget model and a budget type in the field "Budget Type," a budget model of the specified name and type must exist. Otherwise, no figures will be displayed.
<b>Budget Type</b>	If you have selected "Budget" in the field "Basis," you can in this field select the budget type from which to retrieve the figures. Budget types are created in the Popup Fields workspace in the Set-Up module and assigned to budget models in the Budget Models workspace. For example, you have created a budget type called "Anchor." In one fiscal year, the name of a budget model of the type "Anchor" could be "Anchor 1998," and in another year it could be called "Anchor 1999." To avoid adjusting the G/L report column specifications every fiscal year, it is advisable to select a budget by budget type, instead of selecting a specific budget model.
<b>Budget Version No.</b>	If you have selected "Budget" in the field "Basis," you can in this field select which version of budget specified in the fields "Budget Model" or "Budget Type" you wish to use.
<b>Budget Version Type</b>	If you have selected "Budget" in the field "Basis," you can in this field select the budget version type from which to retrieve the figures. Budget version types are created in the Popup Fields workspace in the Set-Up module and assigned to budget models in the Budget Models workspace. Instead of selecting a specific budget version in the field "Budget Version No.," you can in this field specify a budget version type. For example, you have created the budget

Field	Description
	version type "Revision 1." In one fiscal year a budget model of the version type "Revision 1" has budget version number 2; in another year the version number might be 3. To avoid adjusting the G/L report column specifications every fiscal year, it is advisable to select a budget by budget version type instead of selecting a specific budget version.
<b>Currency</b>	In this field, you can specify the currency in which to display amounts in the current report field. The reporting currency used in any given report field can, however, also derive from the card or table part of the report definitions in which the column appears. For a description of the priority used for determining the reporting currency to apply to each report field in a given report, you should therefore see the field "Currency" in the table part of the G/L Report Set-Up workspace.
<b>Exchange Rate Table</b>	In this field, you can specify the exchange rate table to be used when converting currency amounts in the current report field. The exchange rate date used in a given report field can, however, also derive from the card or table part of the report definitions in which the column is used. For a description of the priority used for determining the exchange rate table to apply to each report field in a given report, you should therefore see the field "Exchange Rate Table" in the table part of the G/L Report Set-Up workspace.
<b>Exchange Rate Date</b>	In this field, you can specify the exchange rate date to be used when converting currency amounts in the current report field. The exchange rate date used in a given report field can, however, also derive from the card or table part of the report definitions in which the column appears. For a description of the priority used for determining the exchange rate date to apply to each report field in a given report, you should therefore see the field "Exchange Rate Date" in the table part of the G/L Report Set-Up workspace.
<b>Price Year</b>	<p>If you have selected "Budget" in the field "Basis," you can in this field select the price year to use when displaying figures from the budget selected in the budget specification fields above.</p> <p>If you select a price year, and the budget model selected was not created using that price year, Maconomy will convert the budget figures to the prices of the price year selected according to rules specified in the Price Areas and Price Registers workspaces in the Budget module. For a further description, please see the description of those workspaces in the documentation about the Budget module.</p> <p>If you do not specify a price year, the figures in the selected budget model will be used without conversion.</p>
<b>Price Register</b>	In this field you select which price register to use if the budget figures need to be converted to a price year specified in the field "Price Year." See the description of the field "Price Year" above.
<b>Prior-Period</b>	For actual figures, you can choose only to show entries from a given prior period.

Field	Description
	Prior-period journals are used when posting in closed fiscal years. Periods are created in the pop-up field "Prior Periods" in the Popup Fields workspace in the Set-Up module.
<b>Column Width</b>	In this field, you can specify the desired width of the current column. The field only applies when the column specification is used on a report which is printed to an RTF file, in which case the width of the table cell corresponding to the current column will be applied the specified width.

## G/L Report Selection Criteria Workspace

Use this workspace to enter selection criteria for G/L reports.

This workspace is an alternative to the G/L Report Set-Up workspace, for users who do not have access to the G/L Report Set-Up workspace. It contains only the Selection Criteria parts of the G/L Report Set-Up workspace.

### G/L Report Selection Criteria Tab

This section includes the fields and descriptions for the G/L Report Selection Criteria tab.

#### G/L Report Selection Criteria Island

Field	Description
<b>Name</b>	In this field, you enter a name for the G/L report Selection Criteria.
<b>Description</b>	In this field, you can enter a description of the current G/L report Selection Criteria.

#### Selection Criteria Island

Field	Description
<b>Period</b>	Here you enter the starting month/year and ending month/year of the period for which the report is to be printed. You can also enter a different period range for each report line definition in the table. Enter the period as a number, for example, "1" for January, "2" for February, and so on.  If your company uses flexible periods that do not follow the calendar year, the month and year that you enter here refer to the period defined in the Fiscal Year workspace.
<b>Company No.</b>	Here you can enter a range of company numbers. Only companies within the specified range are included in the report.
<b>Acct. No.</b>	Here you can enter a range of account numbers to be included in the report. Only accounts within the specified range are included in the report.

Field	Description
<b>Statistics 1-4</b>	Here you can limit the report to a range of statistics codes. For more information about the effect of statistic codes in connection with the individual report lines and dimensions, see the description of the Selection Criteria island in the G/L Report Set-Up workspace.

### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	You can limit the report to a range of locations here. If these fields are left blank, all “Location” dimensions will be included in the report.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field “Location” above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field “Location” above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field “Location” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field “Location” above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field “Location” above.

### Company Island

Field	Description
<b>Include Subordinates</b>	<p>In this field, you can specify whether or not the report should include figures concerning possible subordinate companies for each company in the specified Selection Criteria, that is, companies that have been assigned to the current company as subordinate companies in the Company Information workspace. The structure functions on several levels, meaning that one company can be subordinate to a company that itself is a subordinate company to another company.</p> <p>If this field is marked, the report will include figures for all subordinate companies for each company in the selection criteria. Information from all subordinate companies is included, even if one or more subordinate companies is not within the range of companies in the dimension control. Note, however, that if a subordinate company is within the selection criteria, the figures for this company will be represented more than once on the printout, as the company will be represented both as a subordinate company and as an individual company with possible subordinate companies of its own.</p>

Field	Description
	It is therefore recommended only to mark this field if the selection criteria only concerns one company.

## G/L Report Set-Up Workspace

Use this workspace to create reports that are based on general ledger data.

Name the report, select the period on which you want to report, and select the accounts and dimensions that you want to include.

A G/L report has columns and lines (or rows). The columns control the type of information to be shown, such as actual or budgeted figures, while the lines control the range of information-the accounts and dimensions that are included in the lines.

You define the columns in the G/L Report Columns workspace and define the lines in this workspace. Each line in the Report Lines sub-tab defines one or more lines in the report. A report line definition can determine if a line displays fixed text, actual or budget figures or quantities, calculations based on other lines, and so on.

### Selection Criteria

Use the Selection Criteria in this workspace to specify the period, account number range, dimension option range, and statistics code range.

You typically update the selection criteria before you generate a report, typically to update the period range.

You can also define G/L report selection criteria in the G/L Report Selection Criteria workspace, and override any selection criteria that you defined in the G/L Report Set-Up tab in this workspace.

When you print a G/L report from the Print G/L Report workspace, you can specify a G/L report selection criteria name.

Entries in the **From** and **To** fields in the sub-tab specify the target group or selection criteria. There is a target group for every report line definition in the G/L report, corresponding to the selection criteria in the G/L Report Set-Up tab or the specified G/L Report selection criteria. This defaults to the target group value in the G/L Report Set-Up tab or the specified G/L Report selection criteria, unless you enter a value in a Selection Criteria field for the line definition. If you do enter selection criteria information in the line, it overrides any information that you entered in the G/L Report Set-Up tab or the specified G/L report selection criteria, regardless of whether it narrows or expands the selection criteria.

### Embedded Reports

You can embed a report within another report, generating two different reports simultaneously, one as an extension of the other. The name and layout of the primary report also apply to the embedded report. The selection criteria that are used to generate the embedded report come from the line in the primary report that calls the embedded report, rather than from the selection criteria in the G/L Report Set-Up tab or the G/L report selection criteria of the embedded report.

## Printing Reports

To print a report, use the **Print Report** action in this workspace or the Print G/L Report workspace.

You can also export the report to a tab-separated file or an RTF file by choosing the relevant action in the G/L Report Set-Up tab. When you export a report, you cannot specify a G/L report selection criteria name.

## G/L Report Set-Up Tab

This section includes the fields and descriptions for the G/L Report Set-Up tab.

### Report Island

Field	Description
<b>Report No.</b>	This is a unique number assigned to the report. It can be used to call the report from another report. The number is taken from the "G/L Report" system number series.
<b>Name</b>	Enter the name of the report here. This name is printed on the report and can be used for searches.
<b>Description</b>	You can enter a detailed description of the report in these three text fields. The description can optionally be inserted in the printed report using Maconomy's layout editing tools.
<b>Column Description</b>	Here you enter the name of the G/L report column you have created in the G/L Report Columns workspace.
<b>Standard Column Description</b>	By marking this field, you can choose to have the column description specified above override any column descriptions for reports called from this one.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can specify the description and name of an access level for the current G/L report. In this workspace, you can only see and use the current G/L report if you have been assigned to this or a higher access level in the User Access Levels workspace in the Set-Up module. In other workspaces, you can only reference the current report if you have been assigned to this or a higher access level in the User Access Levels workspace in the Set-Up module. Please note that this access control only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to G/L reports may depend on other factors. For further information about the standard access control configuration, please see "Introduction to the Access Control System" in the Set-Up module.</p> <p>If you do not specify an access level, all users will have access to see information about the current G/L report.</p>

### Extra Remarks Island

Field	Description
<b>Text 1-6</b>	Here you can enter additional descriptive information about the report. You can use Maconomy's layout editing tools to insert this information in the printed report and use it in searches.

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

### Print Control Island

Field	Description
<b>Number of Days until Expiry</b>	<p>If the report is to be saved, that is, the field "Save Output Data" has been marked, you can specify in this field the length of the report's validity period. The validity period is used for warning other users about to run identical reports within a given period that such a report already exists. Please note, however, that you can only save reports if you have installed the add-on "Reprint G/L Reports."</p> <p>Whenever a report is run, Maconomy checks whether an identical report with a validity date that has not yet expired has already been saved and issues a warning if this is the case, allowing you to cancel the process. This way, by specifying how long the new, saved report should be valid, you ensure that users who are about to run an identical report will be informed that such a report already exists. An existing report is considered identical to the one you are about to run if the information in the Selection Criteria, Dimensions, Selection Criteria, Currency Conversion, Company, Access Level, and Report (with the exception of the description fields) islands for the current report in this workspace is the same as the existing report's information in the corresponding islands in the Show G/L Report Output workspace. After the report has been saved, you can edit the validity period in the Reprint G/L Reports or Show G/L Report Output Data workspaces.</p>
<b>Save Output Data</b>	<p>In this field, you can specify whether Maconomy should save the output data created when the report is run. When a report is saved, you can reprint it any number of times in the Reprint G/L Reports workspace. However, you can only save reports if you have installed the add-on "Reprint G/L Reports."</p> <p>When saving a report, Maconomy runs the report as usual and saves the aggregated data—that is, the information that appears on the printout—and not the individual Maconomy entries that are processed in the report. This way you ensure that all reprints are identical to the original report, and the reprint can be made instantly, as no data queries or processing are needed.</p> <p>You can also use this functionality to, for example, run a report and inspect the results before creating an RTF or text file from either the Show G/L Reports or the Show G/L Report Output Data workspaces.</p> <p>If you mark this field, you can specify a validity period for the saved report if you want Maconomy to show a warning if other users are about to run an identical report within a given period. For further information on this, see the description of the field "Number of Days until Expiry" in this island.</p>

Field	Description
<b>Print Report</b>	<p>In this field, you can specify whether the report should be printed when it is run. This can be useful if a report contains sensitive information, and your reports are usually run at night. In those cases, you might prefer that the output is not printed right away, thereby lying in the printer all morning for anyone to see.</p> <p>If you do not want the report to be printed when it is run, unmark this field and mark the field "Save Output Data." This way, the report is saved and can be printed from the Reprint G/L Reports workspace when you see fit. However, you can only save reports if you have installed the add-on "Reprint G/L Reports."</p>
<b>Notify Users</b>	In this field, you can specify whether people to whom this report is relevant should be notified when the report is run. The field is for information only, as no notification procedures are run when the report is generated.

### Output Data File Island

Field	Description
<b>Enter File Name</b>	In this field, you can specify whether or not the user should specify a file name when the "Create Tab-separated File" action is selected. If the field is not marked, Maconomy names and places the file automatically as described for the "Create Tab-separated File" action.

### Company Island

Field	Description
<b>Include Subcompanies</b>	In this field you can specify whether the figures on the report should be based on the figures from the companies that match the Selection Criteria of the report only, or whether the figures in any subcompanies belonging to the companies in the Selection Criteria should also be included. Please note that if you mark this field, and a company covered by the Selection Criteria is also the subcompany of another company covered by the Selection Criteria, the figures of the company in question are included twice: once as a company matching the Selection Criteria, and once as a subcompany of a company matching the Selection Criteria.

### Selection Criteria Island

Field	Description
<b>Show Lines</b>	The Report Lines sub-tab only displays the report line definitions if you mark this field. This makes it quicker to open the workspace if you are only opening a report to print it, without making changes.
<b>Month From</b>	The values in this field and the fields "Year From," "Month To," and "Year To" define a period range. If you do not enter values in these fields, the value will be inherited from the corresponding field of the selection criteria, specified in the G/L Report Set-Up Tab. If the report line belongs to a report that is called from

Field	Description
	another report, the value in this field will be inherited from the corresponding field in the report line from which this report is called.
<b>Company No.</b>	In these fields, you can specify the range of companies that should apply to the columns on the line. Company number ranges can also be specified in the Report Lines sub-tab and for each individual column on the line (in the G/L Report Columns workspace). Therefore, for a description of the priority used for determining the company range to apply to each report field, see the field "Company No. From" in the Report Lines sub-tab.
<b>Account No.</b>	In these fields, you can specify the range of accounts that should apply to the columns on the line. Account number ranges can also be specified in the Report Lines sub-tab and for each individual column on the line (in the G/L Report Columns workspace). Therefore, for a description of the priority used for determining the account range to apply to each report field, see the field "Account No. From" in the Report Lines sub-tab.
<b>Intercomp. Company No.</b>	In these fields, you can enter a range of company numbers. The report will only show entries where a company within the range is the intercompany company. Consequently, if these fields are completed, only intercompany entries will be displayed in the report.
<b>Customer No.</b>	In these fields, you can enter a range of customer numbers. The report will only show entries associated with a customer within the specified range. Please note that it must be specified for each account in the Account Information Card workspace whether customer numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the report will only show entries for accounts for which it has been specified that customer numbers should be transferred to G/L entries.
<b>Vendor No.</b>	In these fields, you can enter a range of vendor numbers. The report will only show entries associated with a vendor within the specified range. Please note that it must be specified for each account in the Account Information Card workspace whether vendor numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the report will only show entries for accounts for which it has been specified that vendor numbers should be transferred to G/L entries.
<b>Job No.</b>	In these fields, you can enter a range of job numbers. The report will only show entries associated with a job within the specified range. Please note that it must be specified for each account in the Account Information Card workspace whether job numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the report will only show entries for accounts for which it has been specified that job numbers should be transferred to G/L entries.
<b>Activity No.</b>	In these fields, you can enter a range of activity numbers. The report will only show entries associated with an activity within the specified range. Please note that it must be specified for each account in the Account Information Card workspace whether activity numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the

Field	Description
	report will only show entries for accounts for which it has been specified that activity numbers should be transferred to G/L entries.
<b>Task</b>	In these fields, you can enter a range of tasks. The report will only show entries associated with a task within the specified range. Please note that it must be specified for each account in the Account Information Card workspace whether tasks should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the report will only show entries for accounts for which it has been specified that tasks should be transferred to G/L entries.
<b>Employee No.</b>	In these fields, you can enter a range of customer numbers. The report will only show entries associated with an employee within the specified range.
<b>Asset No.</b>	In these fields, you can enter a range of asset numbers. The report will only show entries associated with a fixed asset within the specified range. Please note that it must be specified for each account in the Account Information Card workspace whether asset numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the report will only show entries for accounts for which it has been specified that asset numbers should be transferred to G/L entries.
<b>Item No.</b>	In these fields, you can enter a range of item numbers. The report will only show entries associated with an item within the specified range. Please note that it must be specified for each account in the Account Information Card workspace whether item numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the report will only show entries for accounts for which it has been specified that item numbers should be transferred to G/L entries.
<b>Statistics 1-4</b>	<p>Here you can limit the report to a range of statistic codes. The statistics code range operates differently depending on the value chosen in the field "Dimension" on the individual report line definition. If the "Dimension" field is blank, the report prints figures for each statistics code in the given range. If it shows "Account," the report prints a line for each account with a statistics code included in the range entered here. If the "Dimension" field shows "Location," the report prints a line for all locations whose statistics codes are within this range. This also applies to the other dimensions.</p> <p>You can also vary the statistics code ranges for each report line definition in the Report Lines sub-tab.</p>

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	In these fields, you can specify the range of locations that should apply to the columns on the line. Location ranges can also be specified in the Report Lines sub-tab and for each individual column on the line (in the G/L Report Columns workspace). Therefore, for a description of the priority used for determining

Field	Description
	the location range to apply to each report field, see the field "Location From" in the Report Lines sub-tab.
<b>Entity</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Project</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

### Currency Conversion Island

Field	Description
<b>Currency</b>	In this field, you can specify the currency in which to display amounts in each individual report field (a given column on a given line) in the report. The reporting currency used in any given report field can, however, also derive from the Report Lines sub-tab or from the current report description. For a description of the priority used for determining the reporting currency to apply to each report field, see the field "Currency" in the Report Lines sub-tab.
<b>Exchange Rate Table</b>	In this field, you can specify the exchange rate table to be used when converting currency amounts in each individual report field (a given column on a given line) in the report. The exchange rate date used in a given report field can, however, also derive from the Report Lines sub-tab or from the current report description. For a description of the priority used for determining the exchange rate table to apply to each report field, see the field "Exchange Rate Table" in the Report Lines sub-tab.
<b>Exchange Rate Date</b>	In this field, you can specify the exchange rate date to be used when converting currency amounts in each individual report field (a given column on a given line) in the report. The exchange rate date used in a given report field can, however, also derive from the Report Lines sub-tab or from the current report description. For a description of the priority used for determining the exchange rate date to apply to each report field, see the field "Exchange Rate Date" in the Report Lines sub-tab.

## Report Lines Sub-Tab

This section includes the fields and descriptions for the Report Lines sub-tab.

Field	Description
<b>Line No.</b>	Here you enter a range of line numbers to be used in conjunction with the action "Copy Report Lines" described above.
<b>Description</b>	<p>Here you enter a text or text reference. This text will be printed in a text column to the left of the number columns.</p> <p>You can enter fixed text as well as texts that are retrieved by references to accounts, locations, entities, projects, and so on. When the report is printed, the reference will be replaced by the text it represents.</p> <p>You can use the following account references:</p> <ul style="list-style-type: none"> <li>■ #Account.AccountNumber</li> <li>■ #Account.AccountText</li> <li>■ #Account.Statistics1</li> <li>■ #Account.Statistics2</li> <li>■ #Account.Statistics3</li> <li>■ #Account.Statistic4</li> <li>■ #Account.AccountType</li> <li>■ #Account.AccountGroup</li> <li>■ #Account.Department</li> <li>■ #Account.ItemTaxCode</li> <li>■ #Account.Blocked</li> <li>■ #Account.ProfitAndLoss</li> <li>■ #Account.TaxCode</li> <li>■ #Account.Currency</li> <li>■ #Account.Note1...Note5</li> </ul> <p>You can use the following references for dimensions. Replace "&lt;dimension&gt;" with the name of the dimension in the list below. The dimensions are written as follows:</p> <ul style="list-style-type: none"> <li>■ Location</li> <li>■ Entity</li> <li>■ Project</li> <li>■ Purpose</li> <li>■ Specification1</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Specification2</li> <li>Specification3</li> <li>LocalSpecification1</li> <li>LocalSpecification2</li> <li>LocalSpecification3</li> </ul> <p>(These texts will always refer to the main report, that is, the user-generated report.)</p> <p>You can use the following references for the dimensions above:</p> <ul style="list-style-type: none"> <li>#&lt;dimension&gt;.Name</li> <li>#&lt;dimension&gt;.Description</li> <li>#&lt;dimension&gt;.Statistics1</li> <li>#&lt;dimension&gt;.Statistics2</li> <li>#&lt;dimension&gt;.Statistics3</li> <li>#&lt;dimension&gt;.Statistics4</li> <li>#&lt;dimension&gt;.Blocked</li> <li>#&lt;dimension&gt;.Note1</li> <li>#&lt;dimension&gt;.Note2</li> <li>#&lt;dimension&gt;.Note3</li> <li>#&lt;dimension&gt;.Note4</li> <li>#&lt;dimension&gt;.Note5</li> </ul> <p>You can use the following column reference:</p> <ul style="list-style-type: none"> <li>#Column.1...#Column.40</li> </ul> <p>You can use the following extra texts of the report:</p> <ul style="list-style-type: none"> <li>#Extratext.1... Extratext.6</li> </ul> <p>Moreover you can use report texts and note numbers.</p> <p>Moreover, you can use the following references for a number of other relations:</p> <ul style="list-style-type: none"> <li>#Asset</li> <li>#Employee</li> <li>#Activity</li> <li>#Customer</li> <li>#Vendor</li> <li>#Item</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>#Job</li> <li>#Task</li> </ul> <p>An example could be “#Asset.Name1.” However, as you can refer to almost all fields in the above-mentioned relations, these are not stated in this manual. The fields available in each relation can, for example, be seen in the relevant windows by selecting “Find” in the Find menu.</p> <p>You can use the following reference to the main company, that is, the company which appears on all printouts that are not related to a specific company:</p> <ul style="list-style-type: none"> <li>#MainCompany</li> </ul> <p>You can use the following references to the Company Information workspace applying to both main companies and intercompany companies:</p> <ul style="list-style-type: none"> <li>#CompanyInformation.CompanyNumber</li> <li>#CompanyInformation.Name1...5</li> <li>#CompanyInformation.ZipCode</li> <li>#CompanyInformation.City</li> <li>#CompanyInformation.Country</li> <li>#CompanyInformation.Phone</li> <li>#CompanyInformation.Fax</li> <li>#CompanyInformation.Telex</li> <li>#CompanyInformation.Giro</li> <li>#CompanyInformation.Bank</li> <li>#CompanyInformation.CompRegNumber</li> <li>#CompanyInformation.BACSTNumber</li> <li>#CompanyInformation.TaxNumber</li> <li>#CompanyInformation.Statistics1... Statistics4</li> <li>#CompanyInformation.Blocked</li> <li>#CompanyInformation.Currency</li> <li>#CompanyInformation.Note1... Note5</li> <li>#CompanyInformation.Address1... Address8</li> <li>#CompanyInformation.Text1...Text20</li> <li>#CompanyInformation.Date1...Date5</li> <li>#CompanyInformation.Popup1...Popup5</li> <li>#CompanyInformation.Real1...Real5</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>#CompanyInformation.Integer1...Integer5</li> </ul> <p>Name 1-5, ZipCode, City, and Country refer to the Address fields in the Company Information workspace for the current company. Address 1-8, however, refer to formatted address information. This means that the address consists of Name 1-3, followed by ZipCode and City (in one field), followed by Name 4-5, and finally Country. Blank fields are omitted. This is best illustrated by an example:</p> <ul style="list-style-type: none"> <li>The company information Name1 = "Maconomy NE Inc." Name 2 = "33 Boston Post Road West, Suite 310" ZipCode = "MA 01752" City = "Marlborough" Country = "USA"</li> <li>Corresponds to the following: Address1 = "Maconomy NE Inc." Address2 = "33 Boston Post Road West, Suite 310" Address3 = "Marlborough, MA 01752" Address4 = "USA"</li> </ul> <p>The other address fields are blank.</p> <p>You can use the following references to the current year and month:</p> <ul style="list-style-type: none"> <li>#Year</li> <li>#MonthNumber</li> <li>#MonthNumber/Year</li> <li>#MonthName</li> <li>#MonthName/Year</li> </ul>
<b>Type</b>	<p>For each report line definition you must specify a type. These types are:</p> <ul style="list-style-type: none"> <li>Balance — The line will display the figures (actual, budgeted, or column calculation) that relate to each column. If, instead of a total, you wish to itemize individual lines for each account or dimension in the given range, complete the "Dimension" field (described below).</li> <li>Text — The line will display text or manually entered numbers in the individual columns. Text in the text column is entered as described above for the "Description" field. Text or numbers for columns other than the initial "Description" column are entered in the "Calculation" field. Use a semicolon (;) to designate to which column they belong. For columns defined as "Text" in the column specification, Maconomy prints the line text and not the column text on the report line.</li> <li>Page Break — This will insert a page break in the report.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Column Heading — The line will display the column headers defined in the “Heading” fields in the G/L Report Columns workspace.</li> <li>Calculation — The line will show a calculation of other report line definitions. This calculation is entered in the “Calculation” field, and the calculation is made by column. Therefore, if the result in a column is calculated from other columns, the calculation of the report line will take into account the same formula used in that calculation (that is, calculate across). To illustrate, if column 3 is the percentage variance between columns 1 and 2, and if the line calculation is the total of the report lines above it, the result in the line’s third column will be the percentage difference between the totals in columns 2 and 3. The ability to total the percentages on the above report lines (calculate down) is provided by the “Line Calculation” described below. If, instead of a total, you wish to print a line for every account or dimension in a given range, complete the “Dimension” field.</li> <li>Line Calculation — This is also a calculation of other line definitions written in the “Calculation” field. The calculation is made from the result shown in other lines; that is, the column formulas are ignored, and only the results are used. See also “Calculation” above. If, instead of a total, you want to print a line for every account or dimension in a given range, complete the “Dimension” field.</li> <li>Report — This indicates that you are embedding or “calling” another report to be printed at this place in the current report. Enter the number of the report that you are calling in the “Calculation” field. If you wish to print a report for each account or dimension in a given range, complete the “Dimension” field. When you call a report, the dimension ranges, period ranges, and so on, applying to the current line are also applied to the lines in the report called. However, in those columns in the called report where the column description assigned to the report in question specifies other ranges, those ranges are applied in the called report instead.</li> </ul>
<b>Indent</b>	Here you can enter a whole number of spaces by which to indent the text on this line. The text in the “Description” field is indented by the number of spaces specified here.
<b>Format</b>	Here you can choose the print format of the report line as “Normal,” “Bold,” “Underline,” “Italic,” or “Small” (smaller point size). The G/L report layout is accessible with Maconomy’s layout editing tools and contains a number of different line layouts (or blocks) and you choose one of these for each line. With Maconomy’s layout editing tools, you can edit the formats, changing point sizes, type styles, and so on. After changing the line layout format, you can change the name of the format in the pop-up field “Report Formats” in the Popup Fields workspace in the SetUp module.
<b>Header</b>	By marking this field, you can indicate that the content of the report line definition is to be printed as a header on each page of the report printout.

Field	Description
	<p>Headers are always printed first on a page, regardless of where they are listed in the report. If the line is a Report line, that is, you have chosen "Report" in the "Type" field, you can use this field to indicate whether to print the current report header lines or the header lines of the called report, where that report occurs in the printout. If you mark this field, you print the called report's header lines at the beginning of the called report. If a page break occurs while printing the lines of the called report, these header lines are also printed at the top of the new page(s). If you leave the field blank, the header from the called report is not printed.</p>
<b>Print</b>	<p>Here you can indicate whether the result of a report line definition is to be printed on the report. By choosing "No," you can use the line for sub-total calculations or to insert comments in the report definition. If you choose "If Amount," the line will print only if there is a non-zero value in one of the columns. For lines where the line type is "Report," the value "If Amount" means that the line is only printed if the last line in the sub-report called by the line contains one or several amounts different from zero. The last line in the sub-report is the last line in the table part of the report definition of the sub report, and not necessarily the last line to be printed in that report (the field "Print" can be set to "No" on the sub-report line in question). Therefore, using the value "If Amount" in connection with sub-reports requires that the reports called always end with a line printed or non-printed containing figures (typically a grand total), otherwise the line calling the sub-report will never be shown.</p> <p>If the line calls a sub-report, the value in this field is used on those lines in the sub-report that do not have a value in the corresponding field. The value is transferred to any number of subreport levels, that is, sub-reports called by a sub-report.</p> <p>If you want to insert a blank line in the table part without influencing the appearance of the report, that is, by just inserting a space between certain lines in the table part you can specify the value "No" in this field while also specifying the value "Text" in the field "Type." If you do not select "Text" in the field "Type," the performance of the report may be influenced.</p>
<b>Calculation</b>	<p>In this field you can enter a calculation formula, if the report line definition is of the type "Calculation" or "Line Calculation," or an alphanumeric string if the type is "Text."</p> <p>A calculation formula entered here can consist of numeric constants, references to other lines, and math operators. You refer to a line by entering its line number. A whole number preceded by a 0 is interpreted as a numeric constant. The math operators +, -, *, and / can be used for line and whole number calculations. The % operation can also be used for calculating the percentage ratio between two lines. By inserting a colon (:) between two line numbers, you can find the sum of a range of lines. Finally, you can use parentheses to separate various calculation expressions.</p> <p>If a report line involves calculation of lines for which the "Dimension" field is completed, you can select a matching value in the "Dimension" field on the calculation line. This will result in a separate line being printed for each</p>

Field	Description
	<p>account, location, entity, project, and so on, depending on which you have chosen.</p> <p>It is possible to make calculations involving report lines whose types are "Balance" and "Report," even where you have entered a value in the "Dimension" field. If the calculation involves a line that calls another report, Maconomy uses the last line in the called report for the calculation in the current report.</p> <p>Here are some examples of calculation expressions:</p> <ul style="list-style-type: none"> <li>▪ "1 2" in line 3 indicates that line 3 in every column calculates the difference between lines 1 and 2.</li> <li>▪ "(2 : 8) / 9 * 012" in line 1 indicates that the first line in every amount column is calculated as the sum of the corresponding fields in line 2 through line 8, divided by the corresponding field in line 9, multiplied by 12. If line 9 is 0, line 1 will also be 0.</li> <li>▪ "1 % 2" in column 3 indicates that column 3 calculates column 1 less column 2, divided by column 2 multiplied by 100. If column 2 is 0, column 3 will also be 0.</li> <li>▪ "1* 01.50" in column 2 means that column 2 is calculated as column 1 multiplied by the constant 1.5.</li> </ul> <p>In line 1 the "Dimension" field has "Location," while line 2 has the calculation "1." Line 1 will produce a balance line for every location in the Selection Criteria, while line 2 will produce totals for all the lines line 1 has generated. Line 1 through line 7 are lines that display balances for different projects and for whom the "Dimension" field shows "Location."</p> <p>Line 8 is a calculation line where the "Dimension" field shows "Location" and the "Calculation" field shows "1:7." Lines 1 through 7 will display the G/L balance for each location in the Selection Criteria, while line 8 will display the total for each location as generated from lines 1 to 7.</p> <p>In lines 1 and 2 the "Type" field has "Report," while line 3 has the calculation expression "1-2." Line 3 will display the difference between the last line in the report called from line 1 and the last line in the report called from line 2.</p> <p>See also the difference between the types "Calculation" and "Line Calculation."</p> <p>If the line is a "Text" line, you can enter text and manually entered numbers (not balances). Text and numbers in different columns are to be separated by a semicolon (;). For example, if you wish to enter "Not available" in number column 1 (that is, the first column after the initial Description column) and "100" in number column 3, the correct expression is "Not available;;100" (without quotation marks).</p> <p>As in the "Description" field, you can enter fixed texts as well as texts to be retrieved by various references to accounts and dimension values. When the report is printed, the reference is replaced with the value it represents.</p> <p>You can use the following account references:</p>

Field	Description
	<ul style="list-style-type: none"> <li>#Account.AccountNumber</li> <li>#Account.AccountText</li> <li>#Account.Statistics1</li> <li>#Account.Statistics2</li> <li>#Account.Statistics3</li> <li>#Account.Statistics4</li> <li>#Account.AccountType</li> <li>#Account.AccountGroup</li> <li>#Account.Department</li> <li>#Account.ItemTaxCode</li> <li>#Account.Blocked</li> <li>#Account.ProfitAndLoss</li> <li>#Account.TaxCode</li> <li>#Account.Currency</li> <li>#Account.Note1...Note5</li> </ul> <p>You can use the following references for dimensions. Replace "&lt;dimension&gt;" with the name of the dimension in the list below. The dimensions are written as follows:</p> <ul style="list-style-type: none"> <li>Location</li> <li>Entity</li> <li>Project</li> <li>Purpose</li> <li>Specification1</li> <li>Specification2</li> <li>Specification3</li> <li>LocalSpecification1</li> <li>LocalSpecification2</li> <li>LocalSpecification3</li> </ul> <p>You can use the following references for the dimensions above:</p> <ul style="list-style-type: none"> <li>#&lt;dimension&gt;.Name</li> <li>#&lt;dimension&gt;.Description</li> <li>#&lt;dimension&gt;.Statistics1</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ #&lt;dimension&gt;.Statistics2</li> <li>▪ #&lt;dimension&gt;.Statistics3</li> <li>▪ #&lt;dimension&gt;.Statistics4</li> <li>▪ #&lt;dimension&gt;.Blocked</li> <li>▪ #&lt;dimension&gt;.Note1</li> <li>▪ #&lt;dimension&gt;.Note2</li> <li>▪ #&lt;dimension&gt;.Note3</li> <li>▪ #&lt;dimension&gt;.Note4</li> <li>▪ #&lt;dimension&gt;.Note5</li> </ul>
<b>Dimension</b>	<p>In this field, you can choose the type of information for which the line is to get data. If you select "Balance," "Calculation," or "Line Calculation" in the field "Type," and this field is completed, a line is printed for each value in the selected dimension which belongs to the range specified for the dimension in question. If the field "Type" shows "Report," and a value is selected here, the selected report will be called once for each value in the selected dimension included in the range specified for the dimension in question.</p>
<b>Company No. From</b>	<p>In this field, you can specify the lower limit to the range of companies that should apply to the columns on the line. Company number ranges can also be specified in the card part and for each individual column on the line (in the window G/L Report Columns). Therefore, for each column on the line, Maconomy uses the following priority to determine the lower limit to the company range:</p> <ol style="list-style-type: none"> <li>1. If a value has been specified in the corresponding field for the column in the table part of the window G/L Report Columns, that value is used.</li> <li>2. If no value is found there, any value specified in this field on the line in question is used.</li> <li>3. If no value is found here either, the value specified in the corresponding field in the card part of this window is used. However, when running the report from the window Print G/L Report, any value specified in the corresponding field in that window will overwrite the value entered in the card part.</li> </ol> <p>An exception to the procedure described above occurs if the report line belongs to a report that is called from another report. In this case, the value will be inherited from the corresponding field on the report line from which the report is called.</p> <p>How this range is reflected in the final report depends on the values you choose for the report line definition in the "Type" and "Dimension" fields. See the description of the field "Location from."</p>

Field	Description
<b>Company No. To</b>	The functionality of this field corresponds to that of the field "Company No. From" above.
<b>Account No. From</b>	<p>In this field, you can specify the lower limit to the range of accounts that should apply to the columns on the line. Account ranges can also be specified in the card part and for each individual column on the line (in the window G/L Report Columns). Therefore, for each column on the line, Maconomy uses the following priority to determine the lower limit to the account range:</p> <ol style="list-style-type: none"> <li>1. If a value has been specified in the corresponding field for the column in the table part of the window G/L Report Columns, that value is used.</li> <li>2. If no value is found there, any value specified in this field on the line in question is used.</li> <li>3. If no value is found here either, the value specified in the corresponding field in the card part of this window is used. However, when running the report from the window Print G/L Report, any value specified in the corresponding field in that window will overwrite the value entered in the card part.</li> </ol> <p>An exception to the procedure described above occurs if the report line belongs to a report that is called from another report. In this case, the value will be inherited from the corresponding field on the report line from which the report is called.</p> <p>How this range is reflected in the final report depends on the values you choose for the report line definition in the "Type" and "Dimension" fields. Note that you can further limit the range of accounts by specifying a range of statistic codes. This procedure is described in a separate section on statistic codes below.</p> <p>If you choose "Balance" in the "Type" field and leave the "Dimension" field blank, the report will calculate G/L balances for the accounts in the range (subject to any statistic code limitations you enter). If this line is to be printed, the individual accounts and balances will not be shown.</p> <p>If you choose "Balance" in the "Type" field, and "Account" in the "Dimension" field, the report will print a line and the balance for every account in the range (subject to any statistic code limitations you enter).</p> <p>If you choose "Balance" in the "Type" field and "Location," "Entity," "Project," "Purpose," or one of the general or local specifications in the "Dimension" field, the report will calculate G/L balances for the accounts in the range (statistic code limitations will be ignored in this case). If this line is to be printed, the individual accounts and balances will not be shown, only their total.</p> <p>If you choose "Report" in the "Type" field and leave the "Dimension" field blank, the account range (including any statistic code limitations) will be transferred to the lines in the report that is called, where the corresponding account range fields are blank.</p> <p>If you choose "Report" in the "Type" field and "Account" in the "Dimension" field, the report will be called once for each account in the range (subject to</p>

Field	Description
	<p>any statistic code limitations you enter). Every time the report is called, the account number will be transferred to the corresponding field in the called report, if that field is blank. (Note that statistic code limitations will not be transferred to the called report.)</p> <p>If you choose "Report" in the "Type" field and "Location," "Entity," or "Location," "Entity," "Project," "Purpose," or one of the shared or local dimensions in the "Dimension" field, the account range (not including statistic code limitations) will be transferred to those lines in the called report where the corresponding account range fields are blank.</p> <p>If you choose "Calculation" or "Line Calculation" in the "Type" field and select "Location," "Entity," "Project," "Purpose," one of the shared or local dimensions, or blank in the "Dimension" field, the account range will only be used for text references to account fields. See the description of the "Text" option for the "Calculation" field.</p> <p>If you choose "Calculation" or "Line Calculation" in the "Type" field and "Account" in the "Dimension" field, the report makes the calculation specified in the "Calculation" field for every account in the account range (subject to any statistic code limitations you enter).</p> <p>If you choose "Text" in the "Type" field, the account range will only be used for references to account fields. See the description of the "Description" option for the "Calculation" field.</p> <p>See also the description of the "Location From" field below.</p>
<b>Account No. To</b>	<p>The functionality of this field corresponds to that of the field "Account No. From" above.</p>
<b>Location From</b>	<p>In this field, you can specify the lower limit to the range of locations that should apply to the columns on the line. Location ranges can also be specified in the card part and for each individual column on the line (in the window G/L Report Columns). Therefore, for each column on the line, Maconomy uses the following priority to determine the lower limit to the location range:</p> <ol style="list-style-type: none"> <li>1. If a value has been specified in the corresponding field for the column in the table part of the window G/L Report Columns, that value is used.</li> <li>2. If no value is found there, any value specified in this field on the line in question is used.</li> <li>3. If no value is found here either, the value specified in the corresponding field in the card part of this window is used. However, when running the report from the window Print G/L Report, any value specified in the corresponding field in that window will overwrite the value entered in the card part.</li> </ol> <p>An exception to the procedure described above occurs if the report line belongs to a report that is called from another report. In this case, the value will be inherited from the corresponding field on the report line from which the report is called.</p>

Field	Description
	<p>How this range is reflected in the final report depends on the values you choose for the report line definition in the "Type" and "Dimension" fields.</p> <p>If you choose "Balance" in the "Type" field, and complete the "Dimension" field with either blank, "Account," "Entity," "Project," "Purpose," or one of the shared or local dimensions, the report will calculate G/L balances for the locations in the range. If this line is to be printed, the individual locations and balances will not be shown.</p> <p>If you choose "Balance" in the "Type" field, and "Location" in the "Dimension" field, the report will print a line and the balance for every location in the range (subject to any statistic code limitations you enter).</p> <p>If you choose "Report" in the "Type" field and leave the "Dimension" field blank, the location range (including any statistic code limitations) will be transferred to the lines of the report being called, where the corresponding location range fields are blank.</p> <p>If you choose "Report" in the "Type" field and "Location" in the "Dimension" field, the report will be called once for each location in the range (subject to any statistic code limitations you enter). Every time the report is called, the location code will be transferred to the corresponding field in the called report, if that field is blank. (Note that statistic code limitations will not be transferred to the called report.)</p> <p>If you choose "Report" in the "Type" field and "Account," "Entity," "Project," "Purpose," or one of the general or local specifications in the "Dimension" field, the location range (not including statistic code limitations) will be transferred to the lines in the report that is called, where the corresponding location range fields are blank.</p> <p>If you choose "Calculation" or "Line Calculation" in the "Type" field and select either blank, "Account," "Entity," "Project," "Purpose," or one of the general or local specifications in the "Dimension" field, the location range will only be used for text references to location fields. See the description of the "Description" option for the "Calculation" field.</p> <p>If you choose "Calculation" or "Line Calculation" in the "Type" field and "Location" in the "Dimension" field, the report makes the calculation specified in the "Calculation" field for every location in the location range (subject to any statistic code limitations you enter).</p> <p>If you choose "Text" in the "Type" field, the location range will only be used for references to location fields. See the description of the "Description" option for the "Calculation" field.</p> <p>See also the description of the "Account No. From" field.</p>
<b>Location To</b>	The functionality of this field is similar to that of the field "Location From" above.
<b>Entity From / Entity T</b>	The functionality of these fields is similar to that of the field "Location From" above.

Field	Description
<b>Project From / Project To</b>	The functionality of these fields is similar to that of the field "Location From" above.
<b>Purpose From / Purpose To</b>	v
<b>Spec. 1-3 From / Spec. 1-3 To</b>	The functionality of these fields is similar to that of the field "Location From" above.
<b>Local Spec. 1-3 From / Local Spec. 1-3 To</b>	The functionality of these fields is similar to that of the field "Location From" above.
<b>Intercomp. Company From / Intercomp. Company To</b>	The values in these fields define a range of intercompany numbers. If you do not enter values in these fields, the value will be inherited from the corresponding field of the Selection Criteria, specified in the card part of this window.
<b>Customer No. From / Customer No. To</b>	The values in these fields define a range of customer numbers. The report will only show entries associated with a customer within the specified range. If you do not enter values in these fields, the value will be inherited from the corresponding field of the Selection Criteria, specified in the card part of this window. Please note that it must be specified for each account in the window Account Information Card whether customer numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the report will only show entries for accounts for which it has been specified that customer numbers should be transferred to G/L entries.
<b>Vendor No. From / Vendor No.</b>	The functionality of these fields is similar to that of the field "Intercomp. Customer No. From" above.
<b>Job No. From / Job No. To</b>	The functionality of these fields is similar to that of the field "Customer No. From" above.
<b>Activity No. From / Activity No. To</b>	The functionality of these fields is similar to that of the field "Customer No. From" above.

Field	Description
<b>Task From / Task To</b>	The functionality of these fields is similar to that of the field "Customer No. From" above.
<b>Employee No. From / Employee No.</b>	The functionality of these fields is similar to that of the field "Customer No. From" above.
<b>Asset No. From / Asset No. To</b>	The functionality of these fields is similar to that of the field "Customer No. From" above.
<b>Item No. From / Item No. To</b>	The functionality of these fields is similar to that of the field "Customer No. From" above.
<b>Stat. 1-4 From / Stat. 1-4 To</b>	<p>In these fields, you can specify the lower and upper limit to the range of statistic values that should apply to the columns on the line. If you do not enter values in these fields, the value will be inherited from the corresponding field of the Selection Criteria, specified in the card part of this window.</p> <p>An exception to the procedure described above occurs if the report line belongs to a report that is called from another report. In this case, the value will be inherited from the corresponding field on the report line from which the report is called. However, this only occurs if the "Dimension" field is blank in the report line from which this report is called.</p>
<b>Account Group</b>	In this field, you can specify that the current report line should display information about accounts in a specific account group. If the report line is assigned to a report which has been called by from another report, the value is inherited from the corresponding field on the report line that has called the current report.
<b>Month From / Month To</b>	The values in these fields define a period range. If you do not enter values in these fields, the value will be inherited from the corresponding field of the Selection Criteria, specified in the card part of this window. If the report line belongs to a report that is called from another report, the value in this field will be inherited from the corresponding field in the report line from which this report is called.
<b>Year From / Year To</b>	The values in these fields define a period range. If you do not enter values in these fields, the value will be inherited from the corresponding field of the Selection Criteria, specified in the card part of this window. If the report line belongs to a report that is called from another report, the value in this field will be inherited from the corresponding field in the report line from which this report is called.
<b>Invert Sign</b>	Marking this field reverses the signs for printed figures on the report line, that is, credit figures display as positive and debit figures display as negative. The

Field	Description
	<p>net result on the report can be changed to a positive amount if the field is marked.</p> <p>If you mark the field "Carry Forward Inverted Sign" in the window System Information in the Set-Up module, the calculated value on a given G/L report line will be used with inverted sign in further calculations. If you do not mark the field, the original value will be used.</p>
<b>Show 0</b>	Zero balances will print as "0.00." if you mark this field. Otherwise, they will be blank.
<b>Column Description</b>	<p>Here, you can enter a column description, which will be used on the line instead of the description specified in the card part of the window.</p> <p>If the line type is "Report," the column description will be transferred to the report as a standard column description.</p>
<b>Exchange Rate Table</b>	<p>In this field, you can specify the exchange rate table to be used when converting currency amounts in each individual report field (a given column on a given line) in the report. The exchange rate table used in a given report field can, however, derive from the card part of this window or from the current column description. Maconomy uses the following priority to determine which exchange rate table to use in each report field:</p> <ol style="list-style-type: none"> <li>1. If an exchange rate table is specified for the column in the table part of the window G/L Report Columns, that exchange rate table is used.</li> <li>2. If no exchange rate table is found there, any exchange rate table specified for the line in question in this field is used.</li> <li>3. If no exchange rate table is found here either, the exchange rate table specified in the card part of this window is used.</li> </ol>
<b>Exchange Rate Date</b>	<p>In this field, you can specify the exchange rate date to be used when converting currency amounts in each individual report field (a given column on a given line) in the report. The exchange rate date used in a given report field can, however, also derive from the card part of this window or from the current report description. Maconomy uses the following priority to determine which exchange rate date to use in each report field:</p> <ol style="list-style-type: none"> <li>1. If an exchange rate date is specified for the column in question in the table part of the window G/L Report Columns, that exchange rate date is used.</li> <li>2. If no exchange rate date is found there, any exchange rate date specified for the line in question in this field is used.</li> <li>3. If no exchange rate date is found here either, any exchange rate date specified in the card part of this window is used.</li> <li>4. If an exchange rate date still has not been found, the last date of the reporting period for the report field in question is used.</li> </ol>
<b>Currency</b>	In this field, you can specify the currency in which to display amounts in each individual report field (a given column on a given line) in the report. The

Field	Description
	<p>reporting currency used in any given report field can, however, also derive from the card part of this window or from the current report description. Maconomy uses the following priority to determine the reporting currency to be used in each individual report field:</p> <ol style="list-style-type: none"> <li>1. If a currency is specified in the field "Currency" for the column in question in the table part of the window G/L Report Columns, that currency is used.</li> <li>2. If no currency is found there, any currency specified in the field "Currency" for the line in question in this field is used.</li> <li>3. If a currency isn't found here either, any currency specified in the field "Reporting Currency" in the card part of this window is used.</li> <li>4. If a currency still isn't found, the amount of the report field is shown in the currency which applies to the individual entry according to the value in the field "Type" in the column description in question.</li> </ol>
<b>Itemization</b>	<p>This field applies if you choose a value in the "Dimension" field and choose "Report" in the "Type" field. If this field is marked, Maconomy will insert a page break after each call of a report from this line. Also, at the end of the current report, a page will print displaying the last line of each called report. If the current report is itself to be called from another report, then this function will have no effect.</p>
<b>Line Style</b>	<p>In this field, you can specify the line style that should be used for formatting the output resulting from the current line when printing the report to an RTF file using the "Create RTF File" action. If you specify a line style, all lines created in the RTF file as a result of the current report line definition will be formatted according to the RTF styles pointed out in the specified line style definition. Line styles are defined in the window Line Styles in which you specify the names of the RTF styles to use for the line description, positive values, and negative values. The format of the styles should be defined in the template document selected when running the report as an RTF file. For a detailed description of the line style functionality, see the descriptions of the action "Create RTF File" and the window Line Styles.</p>

## Actions

This section shows the actions available in the G/L Report Set-Up workspace.

### Top Pane

Field	Description
<b>Print Report</b>	<p>Select this action to print the report in the window. If you are working on a Macintosh, check the Page Setup to make sure that your setup matches the horizontal/vertical layout of the report.</p>

Field	Description
	<p>When you select this action, Maconomy checks whether an identical report with a validity date that has not yet expired has already been saved and issues a warning if this is the case, allowing you to cancel the process. The conditions for the current report to be identical to an existing, saved report are described in the field "Number of Days until Expiry."</p> <p>If the field "Save Output Data" has been marked, the report is also saved when you select this action and will be available in the Show G/L Reports workspace. For further information on saving reports, see the field "Save Output Data."</p>
<b>Reprint Report</b>	<p>Select this action to reprint a report that has already been saved in the system, rather than generating a new report. If you want to reprint a report, you must specify in this workspace the exact selection criteria of the desired report. You can see the criteria of the individual saved reports in the Reprint G/L Reports workspace. If none of the reports saved in Maconomy has the exact selection criteria that you have specified in this workspace, Maconomy issues an error message. If several saved reports have the exact same selection criteria, Maconomy reprints the one that was generated most recently.</p>
<b>Create Tab-separated File</b>	<p>Select this action to create a tab-separated file consisting of selected data from the current report. You can then edit the file in another program, for example, a spreadsheet editor. If the field "Enter File Name" is marked for the current report, you will be asked to specify a name and a location for the created file. If the field is not marked, Maconomy names the file automatically and places it in the Maconomy program folder.</p> <p>When you select this action, Maconomy checks whether an identical report with a validity date that has not yet expired has already been saved and issues a warning if this is the case, allowing you to cancel the process. The conditions for the current report to be identical to an existing, saved report are described in the field "Number of Days until Expiry."</p>
<b>Create RTF File</b>	<p>When you select this action, Maconomy runs the current report, creating an RTF file with the output data. An RTF file is a formatted file which can be opened in, for example, Microsoft® Word®. The data will be set up in a table in the file created. If the field "Enter File Name" is marked for the current report, you will be asked to specify a name and a location for the created file. If the field is not marked, Maconomy names the file automatically and places it in the Maconomy program folder.</p> <p>When you select this action, Maconomy will ask you to point out an existing RTF file to use as template for new RTF files. The template file must contain definitions of all the styles used in the report, that is, the styles pointed out in the line style definitions selected on the individual lines in the table part of this workspace. For a detailed description of the line style functionality, see the description of the Line Styles window.</p> <p>If the field "Save Output Data" has been marked, the report is also saved in the Maconomy database when you select this action and will be available in the Show G/L Reports workspace. For further information on saving reports, see the field "Save Output Data."</p>

Field	Description
	Maconomy checks if an identical report with a validity date that has not yet expired has already been saved and issues a warning if this is the case, allowing you to cancel the process. The conditions for the current report to be identical to an existing, saved report are described in the field "Number of Days until Expiry."
<b>Copy Report Lines</b>	Select this action to copy lines to the current report, from the report identified in the "Report No." field in the "Copying" island, whose line number is in the range given in the "Line No." field. When the lines are copied, the line references are renumbered.
<b>Delete Report Lines</b>	Select this action to delete a range of line numbers. The range is specified in the "Line No." field in the Deletion island. Line number references are renumbered after deletion.

## G/L Report Notes Workspace

Use this workspace to define the content for a G/L report note.

Notes are automatically assigned consecutive note numbers, and places at the end of the printed report.

You can refer to report notes when you create the G/L report in the G/L Report Set-up single dialog workspace.

### G/L Report Notes Tab

This section includes the fields and descriptions for the G/L Report Notes tab.

#### Report Note Island

Field	Description
<b>Name</b>	In this field, you can enter the name of the current note.
<b>Description</b>	In this field, you can enter a description of the current note.
<b>Template</b>	In this field, you can enter a template name. The template name is in this case just an additional description.
<b>Note Type</b>	In this field, you can specify a note type. The note type can be Free or Balanced. The value of the last line in the note will be shown on the report line where the note is used, if the note type is balanced.
<b>Column Description</b>	Here you enter the name of the G/L report column you have created in the window G/L Report Columns.
<b>Standard Column Description</b>	By marking this field, you can choose to have the column description specified above override any column descriptions for reports called from this one.

## User Island

See the chapter “Getting Started” for a description of the fields in the User island.

### G/L Report Note Lines Sub-Tab

This section includes the fields and descriptions for the G/L Report Note Lines sub-tab.

Field	Description
<b>Line No.</b>	Here you enter a range of line numbers to be used in conjunction with the action “Copy Report Lines” described above.
<b>Description</b>	<p>Here you enter a text or text reference. This text will be printed in a text column to the left of the number columns.</p> <p>You can enter fixed text as well as texts that are retrieved by references to accounts, locations, entities, projects, and so on. When the report is printed, the reference will be replaced by the text it represents.</p> <p>You can use the following account references:</p> <ul style="list-style-type: none"> <li>▪ #Account.AccountNumber</li> <li>▪ #Account.AccountText</li> <li>▪ #Account.Statistics1</li> <li>▪ #Account.Statistics2</li> <li>▪ #Account.Statistics3</li> <li>▪ #Account.Statistic4</li> <li>▪ #Account.AccountType</li> <li>▪ #Account.AccountGroup</li> <li>▪ #Account.Department</li> <li>▪ #Account.ItemTaxCode</li> <li>▪ #Account.Blocked</li> <li>▪ #Account.ProfitAndLoss</li> <li>▪ #Account.TaxCode</li> <li>▪ #Account.Currency</li> <li>▪ #Account.Note1...Note5</li> </ul> <p>You can use the following references for dimensions. Replace “&lt;dimension&gt;” with the name of the dimension in the list below. The dimensions are written as follows:</p> <ul style="list-style-type: none"> <li>▪ Location</li> <li>▪ Entity</li> <li>▪ Project</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Purpose</li> <li>Specification1</li> <li>Specification2</li> <li>Specification3</li> <li>LocalSpecification1</li> <li>LocalSpecification2</li> <li>LocalSpecification3</li> </ul> <p>Note that these texts will always refer to the main report, that is, the user-generated report.</p> <p>You can use the following references for the dimensions above:</p> <ul style="list-style-type: none"> <li>#&lt;dimension&gt;.Name</li> <li>#&lt;dimension&gt;.Description</li> <li>#&lt;dimension&gt;.Statistics1</li> <li>#&lt;dimension&gt;.Statistics2</li> <li>#&lt;dimension&gt;.Statistics3</li> <li>#&lt;dimension&gt;.Statistics4</li> <li>#&lt;dimension&gt;.Blocked</li> <li>#&lt;dimension&gt;.Note1</li> <li>#&lt;dimension&gt;.Note2</li> <li>#&lt;dimension&gt;.Note3</li> <li>#&lt;dimension&gt;.Note4</li> <li>#&lt;dimension&gt;.Note5</li> </ul> <p>You can use the following column reference:</p> <ul style="list-style-type: none"> <li>#Column.1...#Column.40</li> </ul> <p>You can use the following extra texts of the report:</p> <ul style="list-style-type: none"> <li>#Extratext.1... Extratext.6</li> </ul> <p>Moreover you can use report texts and note numbers.</p> <p>Moreover, you can use the following references for a number of other relations:</p> <ul style="list-style-type: none"> <li>#Asset</li> <li>#Employee</li> <li>#Activity</li> <li>#Customer</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>#Vendor</li> <li>#Item</li> <li>#Job</li> <li>#Task</li> </ul> <p>An example could be “#Asset.Name1.” However, as you can refer to almost all fields in the above-mentioned relations, these are not stated in this manual. The fields available in each relation can, for example, be seen in the relevant windows by selecting “Find” in the Find menu.</p> <p>You can use the following reference to the main company, that is, the company which appears on all printouts that are not related to a specific company:</p> <ul style="list-style-type: none"> <li>#MainCompany</li> </ul> <p>You can use the following references to the Company Information workspace applying to both main companies and intercompany companies:</p> <ul style="list-style-type: none"> <li>#CompanyInformation.CompanyNumber</li> <li>#CompanyInformation.Name1...5</li> <li>#CompanyInformation.ZipCode</li> <li>#CompanyInformation.City</li> <li>#CompanyInformation.Country</li> <li>#CompanyInformation.Phone</li> <li>#CompanyInformation.Fax</li> <li>#CompanyInformation.Telex</li> <li>#CompanyInformation.Giro</li> <li>#CompanyInformation.Bank</li> <li>#CompanyInformation.CompRegNumber</li> <li>#CompanyInformation.BACSTNumber</li> <li>#CompanyInformation.TaxNumber</li> <li>#CompanyInformation.Statistics1... Address8</li> <li>#CompanyInformation.Text1...Text20</li> <li>#CompanyInformation.Date1...Date5</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>#CompanyInformation.Popup1...Popup5</li> <li>#CompanyInformation.Real1...Real5</li> <li>#CompanyInformation.Integer1...Integer5</li> </ul> <p>Name 1-5, ZipCode, City, and Country refer to the Address fields in the Company Information workspace for the current company. Address 1-8, however, refer to formatted address information. This means that the address consists of Name 1-3, followed by ZipCode and City (in one field), followed by Name 4-5, and finally Country. Blank fields are omitted. This is best illustrated by an example:</p> <ul style="list-style-type: none"> <li>The company information Name1 = "Maconomy NE Inc." Name 2 = "33 Boston Post Road West, Suite 310" ZipCode = "MA 01752" City = "Marlborough" Country = "USA"</li> <li>Corresponds to the following: Address1 = "Maconomy NE Inc." Address2 = "33 Boston Post Road West, Suite 310" Address3 = "Marlborough, MA 01752" Address4 = "USA"</li> </ul> <p>The other address fields are blank.</p> <p>You can use the following references to the current year and month:</p> <ul style="list-style-type: none"> <li>#Year</li> <li>#MonthNumber</li> <li>#MonthNumber/Year</li> <li>#MonthName</li> <li>#MonthName/Year</li> </ul>
Type	<p>For each report line definition you must specify a type. These types are:</p> <ul style="list-style-type: none"> <li>Balance — The line will display the figures (actual, budgeted, or column calculation) that relate to each column. If, instead of a total, you wish to itemize individual lines for each account or dimension in the given range, complete the "Dimension" field (described below).</li> <li>Text — The line will display text or manually entered numbers in the individual columns. Text in the text column is entered as described above for the "Description" field. Text or numbers for columns other than the initial "Description" column are entered in the "Calculation" field. Use a semicolon (;) to designate to which column they belong. For</li> </ul>

Field	Description
	<p>columns defined as “Text” in the column specification, Maconomy prints the line text and not the column text on the report line.</p> <ul style="list-style-type: none"> <li>Page Break — This will insert a page break in the report.</li> <li>Column Heading — The line will display the column headers defined in the “Heading” fields in the G/L Report Columns workspace.</li> <li>Calculation — The line will show a calculation of other report line definitions. This calculation is entered in the “Calculation” field, and the calculation is made by column. Therefore, if the result in a column is calculated from other columns, the calculation of the report line will take into account the same formula used in that calculation (that is, calculate across). To illustrate, if column 3 is the percentage variance between columns 1 and 2, and if the line calculation is the total of the report lines above it, the result in the line’s third column will be the percentage difference between the totals in columns 2 and 3. The ability to total the percentages on the above report lines (calculate down) is provided by the “Line Calculation” described below. If, instead of a total, you wish to print a line for every account or dimension in a given range, complete the “Dimension” field.</li> <li>Line Calculation — This is also a calculation of other line definitions written in the “Calculation” field. The calculation is made from the result shown in other lines; that is, the column formulas are ignored, and only the results are used. See also “Calculation” above. If, instead of a total, you want to print a line for every account or dimension in a given range, complete the “Dimension” field.</li> <li>Report — This indicates that you are embedding or “calling” another report to be printed at this place in the current report. Enter the number of the report that you are calling in the “Calculation” field. If you wish to print a report for each account or dimension in a given range, complete the “Dimension” field. When you call a report, the dimension ranges, period ranges, and so on, applying to the current line are also applied to the lines in the report called. However, in those columns in the called report where the column description assigned to the report in question specifies other ranges, those ranges are applied in the called report instead.</li> </ul>
<b>Indent</b>	Here you can enter a whole number of spaces by which to indent the text on this line. The text in the “Description” field is indented by the number of spaces specified here.
<b>Format</b>	Here you can choose the print format of the report line as “Normal,” “Bold,” “Underline,” “Italic,” or “Small” (smaller point size). The G/L report layout is accessible with Maconomy’s layout editing tools and contains a number of different line layouts (or blocks) and you choose one of these for each line. With Maconomy’s layout editing tools, you can edit the formats, changing point sizes, type styles, and so on. After changing the line layout format, you can

Field	Description
	change the name of the format in the pop-up field "Report Formats" in the Popup Fields workspace in the SetUp module.
<b>Header</b>	By marking this field, you can indicate that the content of the report line definition is to be printed as a header on each page of the report printout. Headers are always printed first on a page, regardless of where they are listed in the report. If the line is a Report line, that is, you have chosen "Report" in the "Type" field, you can use this field to indicate whether to print the current report header lines or the header lines of the called report, where that report occurs in the printout. If you mark this field, you print the called report's header lines at the beginning of the called report. If a page break occurs while printing the lines of the called report, these header lines are also printed at the top of the new page(s). If you leave the field blank, the header from the called report is not printed.
<b>Print</b>	<p>Here you can indicate whether the result of a report line definition is to be printed on the report. By choosing "No," you can use the line for sub-total calculations or to insert comments in the report definition. If you choose "If Amount," the line will print only if there is a non-zero value in one of the columns. For lines where the line type is "Report," the value "If Amount" means that the line is only printed if the last line in the sub-report called by the line contains one or several amounts different from zero. The last line in the sub-report is the last line in the table part of the report definition of the sub report, and not necessarily the last line to be printed in that report (the field "Print" can be set to "No" on the sub-report line in question). Therefore, using the value "If Amount" in connection with sub-reports requires that the reports called always end with a line printed or non-printed containing figures (typically a grand total), otherwise the line calling the sub-report will never be shown.</p> <p>If the line calls a sub-report, the value in this field is used on those lines in the sub-report that do not have a value in the corresponding field. The value is transferred to any number of subreport levels, that is, sub-reports called by a sub-report.</p> <p>If you want to insert a blank line in the table part without influencing the appearance of the report, that is, by just inserting a space between certain lines in the table part you can specify the value "No" in this field while also specifying the value "Text" in the field "Type." If you do not select "Text" in the field "Type," the performance of the report may be influenced.</p>
<b>Calculation</b>	<p>In this field you can enter a calculation formula, if the report line definition is of the type "Calculation" or "Line Calculation," or an alphanumeric string if the type is "Text."</p> <p>A calculation formula entered here can consist of numeric constants, references to other lines, and math operators. You refer to a line by entering its line number. A whole number preceded by a 0 is interpreted as a numeric constant. The math operators +, -, *, and / can be used for line and whole number calculations. The % operation can also be used for calculating the percentage ratio between two lines. By inserting a colon (:) between two line</p>

Field	Description
	<p>numbers, you can find the sum of a range of lines. Finally, you can use parentheses to separate various calculation expressions.</p> <p>If a report line involves calculation of lines for which the “Dimension” field is completed, you can select a matching value in the “Dimension” field on the calculation line. This will result in a separate line being printed for each account, location, entity, project, and so on, depending on which you have chosen.</p> <p>It is possible to make calculations involving report lines whose types are “Balance” and “Report,” even where you have entered a value in the “Dimension” field. If the calculation involves a line that calls another report, Maconomy uses the last line in the called report for the calculation in the current report.</p> <p>Here are some examples of calculation expressions:</p> <ul style="list-style-type: none"> <li>▪ “1 2” in line 3 indicates that line 3 in every column calculates the difference between lines 1 and 2.</li> <li>▪ “(2 : 8) / 9 * 012” in line 1 indicates that the first line in every amount column is calculated as the sum of the corresponding fields in line 2 through line 8, divided by the corresponding field in line 9, multiplied by 12. If line 9 is 0, line 1 will also be 0.</li> <li>▪ “1 % 2” in column 3 indicates that column 3 calculates column 1 less column 2, divided by column 2 multiplied by 100. If column 2 is 0, column 3 will also be 0.</li> <li>▪ “1* 01.50” in column 2 means that column 2 is calculated as column 1 multiplied by the constant 1.5.</li> </ul> <p>In line 1 the “Dimension” field has “Location,” while line 2 has the calculation “1.” Line 1 will produce a balance line for every location in the Selection Criteria, while line 2 will produce totals for all the lines line 1 has generated. Line 1 through line 7 are lines that display balances for different projects and for whom the “Dimension” field shows “Location.”</p> <p>Line 8 is a calculation line where the “Dimension” field shows “Location” and the “Calculation” field shows “1:7.” Lines 1 through 7 will display the G/L balance for each location in the Selection Criteria, while line 8 will display the total for each location as generated from lines 1 to 7.</p> <p>In lines 1 and 2 the “Type” field has “Report,” while line 3 has the calculation expression “1-2.” Line 3 will display the difference between the last line in the report called from line 1 and the last line in the report called from line 2.</p> <p>See also the difference between the types “Calculation” and “Line Calculation.”</p> <p>If the line is a “Text” line, you can enter text and manually entered numbers (not balances). Text and numbers in different columns are to be separated by a semicolon (;). For example, if you wish to enter “Not available” in number column 1 (that is, the first column after the initial Description column) and “100” in number column 3, the correct expression is “Not available;;100” (without quotation marks).</p>

Field	Description
	<p>As in the “Description” field, you can enter fixed texts as well as texts to be retrieved by various references to accounts and dimension values. When the report is printed, the reference is replaced with the value it represents.</p> <p>You can use the following account references:</p> <ul style="list-style-type: none"> <li>▪ #Account.AccountNumber</li> <li>▪ #Account.AccountText</li> <li>▪ #Account.Statistics1</li> <li>▪ #Account.Statistics2</li> <li>▪ #Account.Statistics3</li> <li>▪ #Account.Statistics4</li> <li>▪ #Account.AccountType</li> <li>▪ #Account.AccountGroup</li> <li>▪ #Account.Department</li> <li>▪ #Account.ItemTaxCode</li> <li>▪ #Account.Blocked</li> <li>▪ #Account.ProfitAndLoss</li> <li>▪ #Account.TaxCode</li> <li>▪ #Account.Currency</li> <li>▪ #Account.Note1...Note5</li> </ul> <p>You can use the following references for dimensions. Replace “&lt;dimension&gt;” with the name of the dimension in the list below. The dimensions are written as follows:</p> <ul style="list-style-type: none"> <li>▪ Location</li> <li>▪ Entity</li> <li>▪ Project</li> <li>▪ Purpose</li> <li>▪ Specification1</li> <li>▪ Specification2</li> <li>▪ Specification3</li> <li>▪ LocalSpecification1</li> <li>▪ LocalSpecification2</li> <li>▪ LocalSpecification3</li> </ul> <p>You can use the following references for the dimensions above:</p>

Field	Description
	<ul style="list-style-type: none"> <li>▪ #&lt;dimension&gt;.Name</li> <li>▪ #&lt;dimension&gt;.Description</li> <li>▪ #&lt;dimension&gt;.Statistics1</li> <li>▪ #&lt;dimension&gt;.Statistics2</li> <li>▪ #&lt;dimension&gt;.Statistics3</li> <li>▪ #&lt;dimension&gt;.Statistics4</li> <li>▪ #&lt;dimension&gt;.Blocked</li> <li>▪ #&lt;dimension&gt;.Note1</li> <li>▪ #&lt;dimension&gt;.Note2</li> <li>▪ #&lt;dimension&gt;.Note3</li> <li>▪ #&lt;dimension&gt;.Note4</li> <li>▪ #&lt;dimension&gt;.Note5</li> </ul>
<b>Dimension</b>	<p>In this field, you can choose the type of information for which the line is to get data. If you select "Balance," "Calculation," or "Line Calculation" in the field "Type," and this field is completed, a line is printed for each value in the selected dimension which belongs to the range specified for the dimension in question. If the field "Type" shows "Report," and a value is selected here, the selected report will be called once for each value in the selected dimension included in the range specified for the dimension in question.</p>
<b>Company No. From</b>	<p>In this field, you can specify the lower limit to the range of companies that should apply to the columns on the line. Company number ranges can also be specified in the card part and for each individual column on the line (in the window G/L Report Columns). Therefore, for each column on the line, Maconomy uses the following priority to determine the lower limit to the company range:</p> <ol style="list-style-type: none"> <li>1. If a value has been specified in the corresponding field for the column in the table part of the window G/L Report Columns, that value is used.</li> <li>2. If no value is found there, any value specified in this field on the line in question is used.</li> <li>3. If no value is found here either, the value specified in the corresponding field in the card part of this window is used. However, when running the report from the window Print G/L Report, any value specified in the corresponding field in that window will overwrite the value entered in the card part.</li> </ol> <p>An exception to the procedure described above occurs if the report line belongs to a report that is called from another report. In this case, the value will be inherited from the corresponding field on the report line from which the report is called.</p>

Field	Description
	How this range is reflected in the final report depends on the values you choose for the report line definition in the "Type" and "Dimension" fields. See the description of the field "Location from."
<b>Company No. To</b>	The functionality of this field corresponds to that of the field "Company No. From" above.
<b>Account No. From</b>	<p>In this field, you can specify the lower limit to the range of accounts that should apply to the columns on the line. Account ranges can also be specified in the card part and for each individual column on the line (in the window G/L Report Columns). Therefore, for each column on the line, Maconomy uses the following priority to determine the lower limit to the account range:</p> <ol style="list-style-type: none"> <li>1. If a value has been specified in the corresponding field for the column in the table part of the window G/L Report Columns, that value is used.</li> <li>2. If no value is found there, any value specified in this field on the line in question is used.</li> <li>3. If no value is found here either, the value specified in the corresponding field in the card part of this window is used. However, when running the report from the window Print G/L Report, any value specified in the corresponding field in that window will overwrite the value entered in the card part.</li> </ol> <p>An exception to the procedure described above occurs if the report line belongs to a report that is called from another report. In this case, the value will be inherited from the corresponding field on the report line from which the report is called.</p> <p>How this range is reflected in the final report depends on the values you choose for the report line definition in the "Type" and "Dimension" fields. Note that you can further limit the range of accounts by specifying a range of statistic codes. This procedure is described in a separate section on statistic codes below.</p> <p>If you choose "Balance" in the "Type" field and leave the "Dimension" field blank, the report will calculate G/L balances for the accounts in the range (subject to any statistic code limitations you enter). If this line is to be printed, the individual accounts and balances will not be shown.</p> <p>If you choose "Balance" in the "Type" field, and "Account" in the "Dimension" field, the report will print a line and the balance for every account in the range (subject to any statistic code limitations you enter).</p> <p>If you choose "Balance" in the "Type" field and "Location," "Entity," "Project," "Purpose," or one of the general or local specifications in the "Dimension" field, the report will calculate G/L balances for the accounts in the range (statistic code limitations will be ignored in this case). If this line is to be printed, the individual accounts and balances will not be shown, only their total.</p> <p>If you choose "Report" in the "Type" field and leave the "Dimension" field blank, the account range (including any statistic code limitations) will be</p>

Field	Description
	<p>transferred to the lines in the report that is called, where the corresponding account range fields are blank.</p> <p>If you choose "Report" in the "Type" field and "Account" in the "Dimension" field, the report will be called once for each account in the range (subject to any statistic code limitations you enter). Every time the report is called, the account number will be transferred to the corresponding field in the called report, if that field is blank. (Note that statistic code limitations will not be transferred to the called report.)</p> <p>If you choose "Report" in the "Type" field and "Location," "Entity," or "Location," "Entity," "Project," "Purpose," or one of the shared or local dimensions in the "Dimension" field, the account range (not including statistic code limitations) will be transferred to those lines in the called report where the corresponding account range fields are blank.</p> <p>If you choose "Calculation" or "Line Calculation" in the "Type" field and select "Location," "Entity," "Project," "Purpose," one of the shared or local dimensions, or blank in the "Dimension" field, the account range will only be used for text references to account fields. See the description of the "Text" option for the "Calculation" field.</p> <p>If you choose "Calculation" or "Line Calculation" in the "Type" field and "Account" in the "Dimension" field, the report makes the calculation specified in the "Calculation" field for every account in the account range (subject to any statistic code limitations you enter).</p> <p>If you choose "Text" in the "Type" field, the account range will only be used for references to account fields. See the description of the "Description" option for the "Calculation" field.</p> <p>See also the description of the "Location From" field below.</p>
<b>Account No. To</b>	The functionality of this field corresponds to that of the field "Account No. From" above.
<b>Location From</b>	<p>In this field, you can specify the lower limit to the range of locations that should apply to the columns on the line. Location ranges can also be specified in the card part and for each individual column on the line (in the window G/L Report Columns). Therefore, for each column on the line, Maconomy uses the following priority to determine the lower limit to the location range:</p> <ol style="list-style-type: none"> <li>1. If a value has been specified in the corresponding field for the column in the table part of the window G/L Report Columns, that value is used.</li> <li>2. If no value is found there, any value specified in this field on the line in question is used.</li> <li>3. If no value is found here either, the value specified in the corresponding field in the card part of this window is used. However, when running the report from the window Print G/L Report, any value specified in the corresponding field in that window will overwrite the value entered in the card part.</li> </ol>

Field	Description
	<p>An exception to the procedure described above occurs if the report line belongs to a report that is called from another report. In this case, the value will be inherited from the corresponding field on the report line from which the report is called.</p> <p>How this range is reflected in the final report depends on the values you choose for the report line definition in the "Type" and "Dimension" fields.</p> <p>If you choose "Balance" in the "Type" field, and complete the "Dimension" field with either blank, "Account," "Entity," "Project," "Purpose," or one of the shared or local dimensions, the report will calculate G/L balances for the locations in the range. If this line is to be printed, the individual locations and balances will not be shown.</p> <p>If you choose "Balance" in the "Type" field, and "Location" in the "Dimension" field, the report will print a line and the balance for every location in the range (subject to any statistic code limitations you enter).</p> <p>If you choose "Report" in the "Type" field and leave the "Dimension" field blank, the location range (including any statistic code limitations) will be transferred to the lines of the report being called, where the corresponding location range fields are blank.</p> <p>If you choose "Report" in the "Type" field and "Location" in the "Dimension" field, the report will be called once for each location in the range (subject to any statistic code limitations you enter). Every time the report is called, the location code will be transferred to the corresponding field in the called report, if that field is blank. (Note that statistic code limitations will not be transferred to the called report.)</p> <p>If you choose "Report" in the "Type" field and "Account," "Entity," "Project," "Purpose," or one of the general or local specifications in the "Dimension" field, the location range (not including statistic code limitations) will be transferred to the lines in the report that is called, where the corresponding location range fields are blank.</p> <p>If you choose "Calculation" or "Line Calculation" in the "Type" field and select either blank, "Account," "Entity," "Project," "Purpose," or one of the general or local specifications in the "Dimension" field, the location range will only be used for text references to location fields. See the description of the "Description" option for the "Calculation" field.</p> <p>If you choose "Calculation" or "Line Calculation" in the "Type" field and "Location" in the "Dimension" field, the report makes the calculation specified in the "Calculation" field for every location in the location range (subject to any statistic code limitations you enter).</p> <p>If you choose "Text" in the "Type" field, the location range will only be used for references to location fields. See the description of the "Description" option for the "Calculation" field.</p> <p>See also the description of the "Account No. From" field.</p>
<b>Location To</b>	The functionality of this field is similar to that of the field "Location From" above.

Field	Description
<b>Entity From / Entity To</b>	The functionality of these fields is similar to that of the field "Location From" above.
<b>Project From / Project To</b>	The functionality of these fields is similar to that of the field "Location From" above.
<b>Purpose From / Purpose To</b>	v
<b>Spec. 1-3 From / Spec. 1-3 To</b>	The functionality of these fields is similar to that of the field "Location From" above.
<b>Local Spec. 1-3 From / Local Spec. 1-3 To</b>	The functionality of these fields is similar to that of the field "Location From" above.
<b>Intercomp. Company From / Intercomp. Company To</b>	The values in these fields define a range of intercompany numbers. If you do not enter values in these fields, the value will be inherited from the corresponding field of the Selection Criteria, specified in the card part of this window.
<b>Customer No. From / Customer No. To</b>	The values in these fields define a range of customer numbers. The report will only show entries associated with a customer within the specified range. If you do not enter values in these fields, the value will be inherited from the corresponding field of the Selection Criteria, specified in the card part of this window. Please note that it must be specified for each account in the window Account Information Card whether customer numbers should be transferred to G/L entries for that particular G/L account. Consequently, if these fields are completed, the report will only show entries for accounts for which it has been specified that customer numbers should be transferred to G/L entries.
<b>Vendor No. From / Vendor No.</b>	The functionality of these fields is similar to that of the field "Intercomp. Customer No. From" above.
<b>Job No. From / Job No. To</b>	The functionality of these fields is similar to that of the field "Customer No. From" above.

Field	Description
<b>Activity No. From / Activity No. To</b>	The functionality of these fields is similar to that of the field "Customer No. From" above.
<b>Task From / Task To</b>	The functionality of these fields is similar to that of the field "Customer No. From" above.
<b>Employee No. From / Employee No.</b>	The functionality of these fields is similar to that of the field "Customer No. From" above.
<b>Asset No. From / Asset No. To</b>	The functionality of these fields is similar to that of the field "Customer No. From" above.
<b>Item No. From / Item No. To</b>	The functionality of these fields is similar to that of the field "Customer No. From" above.
<b>Stat. 1-4 From / Stat. 1-4 To</b>	<p>In these fields, you can specify the lower and upper limit to the range of statistic values that should apply to the columns on the line. If you do not enter values in these fields, the value will be inherited from the corresponding field of the Selection Criteria, specified in the card part of this window.</p> <p>An exception to the procedure described above occurs if the report line belongs to a report that is called from another report. In this case, the value will be inherited from the corresponding field on the report line from which the report is called. However, this only occurs if the "Dimension" field is blank in the report line from which this report is called.</p>
<b>Account Group</b>	In this field, you can specify that the current report line should display information about accounts in a specific account group. If the report line is assigned to a report which has been called by from another report, the value is inherited from the corresponding field on the report line that has called the current report.
<b>Month From / Month To</b>	The values in these fields define a period range. If you do not enter values in these fields, the value will be inherited from the corresponding field of the Selection Criteria, specified in the card part of this window. If the report line belongs to a report that is called from another report, the value in this field will be inherited from the corresponding field in the report line from which this report is called.
<b>Year From / Year To</b>	The values in these fields define a period range. If you do not enter values in these fields, the value will be inherited from the corresponding field of the Selection Criteria, specified in the card part of this window. If the report line belongs to a report that is called from another report, the value in this field will

Field	Description
	be inherited from the corresponding field in the report line from which this report is called.
<b>Invert Sign</b>	<p>Marking this field reverses the signs for printed figures on the report line, that is, credit figures display as positive and debit figures display as negative. The net result on the report can be changed to a positive amount if the field is marked.</p> <p>If you mark the field "Carry Forward Inverted Sign" in the window System Information in the Set-Up module, the calculated value on a given G/L report line will be used with inverted sign in further calculations. If you do not mark the field, the original value will be used.</p>
<b>Show 0</b>	Zero balances will print as "0.00." if you mark this field. Otherwise, they will be blank.
<b>Column Description</b>	<p>Here, you can enter a column description, which will be used on the line instead of the description specified in the card part of the window.</p> <p>If the line type is "Report," the column description will be transferred to the report as a standard column description.</p>
<b>Exchange Rate Table</b>	<p>In this field, you can specify the exchange rate table to be used when converting currency amounts in each individual report field (a given column on a given line) in the report. The exchange rate table used in a given report field can, however, derive from the card part of this window or from the current column description. Maconomy uses the following priority to determine which exchange rate table to use in each report field:</p> <ol style="list-style-type: none"> <li>1. If an exchange rate table is specified for the column in the table part of the window G/L Report Columns, that exchange rate table is used.</li> <li>2. If no exchange rate table is found there, any exchange rate table specified for the line in question in this field is used.</li> <li>3. If no exchange rate table is found here either, the exchange rate table specified in the card part of this window is used.</li> </ol>
<b>Exchange Rate Date</b>	<p>In this field, you can specify the exchange rate date to be used when converting currency amounts in each individual report field (a given column on a given line) in the report. The exchange rate date used in a given report field can, however, also derive from the card part of this window or from the current report description. Maconomy uses the following priority to determine which exchange rate date to use in each report field:</p> <ol style="list-style-type: none"> <li>1. If an exchange rate date is specified for the column in question in the table part of the window G/L Report Columns, that exchange rate date is used.</li> <li>2. If no exchange rate date is found there, any exchange rate date specified for the line in question in this field is used.</li> <li>3. If no exchange rate date is found here either, any exchange rate date specified in the card part of this window is used.</li> </ol>

Field	Description
	<ol style="list-style-type: none"> <li>4. If an exchange rate date still has not been found, the last date of the reporting period for the report field in question is used.</li> </ol>
<b>Currency</b>	<p>In this field, you can specify the currency in which to display amounts in each individual report field (a given column on a given line) in the report. The reporting currency used in any given report field can, however, also derive from the card part of this window or from the current report description. Maconomy uses the following priority to determine the reporting currency to be used in each individual report field:</p> <ol style="list-style-type: none"> <li>1. If a currency is specified in the field "Currency" for the column in question in the table part of the window G/L Report Columns, that currency is used.</li> <li>2. If no currency is found there, any currency specified in the field "Currency" for the line in question in this field is used.</li> <li>3. If a currency isn't found here either, any currency specified in the field "Reporting Currency" in the card part of this window is used.</li> <li>4. If a currency still isn't found, the amount of the report field is shown in the currency which applies to the individual entry according to the value in the field "Type" in the column description in question.</li> </ol>
<b>Itemization</b>	<p>This field applies if you choose a value in the "Dimension" field and choose "Report" in the "Type" field. If this field is marked, Maconomy will insert a page break after each call of a report from this line. Also, at the end of the current report, a page will print displaying the last line of each called report. If the current report is itself to be called from another report, then this function will have no effect.</p>
<b>Line Style</b>	<p>In this field, you can specify the line style that should be used for formatting the output resulting from the current line when printing the report to an RTF file using the "Create RTF File" action. If you specify a line style, all lines created in the RTF file as a result of the current report line definition will be formatted according to the RTF styles pointed out in the specified line style definition. Line styles are defined in the window Line Styles in which you specify the names of the RTF styles to use for the line description, positive values, and negative values. The format of the styles should be defined in the template document selected when running the report as an RTF file. For a detailed description of the line style functionality, see the descriptions of the action "Create RTF File" and the window Line Styles.</p>

## G/L Report Metrics Workspace

Use this workspace to create finance metrics for inclusion in the Company Overview workspace.

These finance metrics are based on G/L reports. You must create the appropriate G/L reports before you can base metrics on them. For the metrics to be up to date, you must generate the reports regularly, at the company level, using the company's fiscal year as the period.

You can extract a total of 20 figures from any report and define them as metrics.

You define a metric by identifying the G/L report that contains the value, and the column and line where the value resides.

In the Company Overview workspace, Maconomy shows the value from the most recently generated report for the current company that has the company's fiscal year as the period.

## Metrics Tab

This section includes the fields and descriptions for the Metrics tab.

### Metric Island

Field	Description
<b>Metric</b>	Enter a name for the metric, such as Gross Profit, and a number that uniquely identifies the metric. You cannot change this number after you create the metric.
<b>Description</b>	Enter a more detailed description for the metric.

### Definition Island

Field	Description
<b>Report</b>	Select or enter the name or number of the G/L report where the metric's value resides.
<b>Line</b>	Select or enter the name or number of the G/L report line where the metric value resides.
<b>Column</b>	Select or enter the name or number of the G/L report column where the metric value resides.

### Access Level Island

Field	Description
<b>Name</b>	Enter the name of the access level to assign to the current metric.
<b>Description</b>	This field shows the description for that access level.

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

## G/L Report Metric List Workspace

Use this workspace to change the order or priorities of all the G/L Report Metrics.

Maconomy shows the first 20 metrics to which you have access in the Company Overview workspace.

### Metric List Tab

This section includes the fields and descriptions for the Metric List tab.

#### Selection Criteria Island

Field	Description
<b>Metric List No.</b>	This field the name of the G/L Report Metric List. The name of the list is always 1, and it is not possible to create additional lists.

### Metrics Sub-Tab

This section includes the fields and descriptions for the Metrics sub-tab.

Field	Description
<b>Metric No.</b>	This field shows the number that uniquely identifies the metric.
<b>Name</b>	This field shows the G/L report's name. You can change this value.
<b>Description</b>	This field shows a description of the current G/L Report. By default, the fields show the values from the corresponding description fields on the report definition on which the current G/L report was based. You can change this description.
<b>Report No.</b>	This field shows the number of the G/L report where the metric's value resides. You can change this value.
<b>Name</b>	This field shows the G/L report's name. You can change this value.
<b>Line No.</b>	This field shows the number of the G/L report line where the metric value resides. You can change this value.
<b>Title</b>	This field shows the title for the selected line, as it appears on the printed report.
<b>Column No.</b>	This field shows the number of the G/L report column where the metric value resides. You can change this value.
<b>Title</b>	This field shows the title for the selected line, as it appears on the printed report.

Field	Description
<b>Column Description</b>	This field shows the name of the column description used in the current G/L report.

## Reprint G/L Reports Workspace

Use this workspace to review and reprint saved G/L reports.

This workspace is available only if you have installed the Reprint G/L Reports add-on.

Use the selection criteria to find the saved reports that you want to see. Select the **Show Lines** field to populate the G/L Report Output Data sub-tab with information about reports that match the criteria and to which you have access.

You can print reports any number of times or create text or RTF files using the information in the reports. You can also delete saved reports.

You can only change the description and remark fields in a saved report.

To save a report, select the **Save Report** field in the G/L Report Set-Up workspace before you run the report.

Maconomy only saves the information that appears in the report, not the underlying data, which ensures that all reprints are identical to the original report. The reprint is created instantly because no queries or processing are performed. You can view this saved report information in the Show G/L Report Output Data workspace.

### Reprint G/L Reports Tab

This section includes the fields and descriptions for the Reprint G/L Reports tab.

#### Selection Criteria Island

Field	Description
<b>Show Lines</b>	When you check this box, the GL Report Output Data sub-tab will display the saved G/L reports that match the Selection Criteria specified in this island.
<b>Show Only with Notify Users</b>	If you mark this field, the GL Report Output Data sub-tab will only show reports where the field "Notify Users" is marked.
<b>Report No.</b>	In this field, you can specify a range of report numbers. The GL Report Output Data sub-tab will only show reports based on G/L report definitions with numbers within the specified range.
<b>Report Name</b>	In this field, you can specify a range of report names. The GL Report Output Data sub-tab will only show reports based on G/L report definitions with names within the specified range.
<b>Access Level</b>	In these fields, you can specify a range of access levels. The GL Report Output Data sub-tab will only show reports with access levels within the specified range.

Field	Description
<b>Expiry Date</b>	In these fields, you can specify a range of expiry dates. The GL Report Output Data sub-tab will only show reports with expiry dates within the specified range.
<b>Generated by</b>	In these fields, you can specify a range of user names. The GL Report Output Data sub-tab will only show reports run by users whose name is within the specified range.
<b>Description 1-3</b>	In these fields, you can specify a range of descriptions. The GL Report Output Data sub-tab will only show reports where first characters in the respective description fields are within the specified range.
<b>Extra Text 1-6</b>	In these fields, you can specify a range of texts. The GL Report Output Data sub-tab will only show reports where the respective extra text fields contain text within the specified range.
<b>Month From / Month To</b>	In these fields, you can specify a range of starting / ending months. The GL Report Output Data sub-tab will only show reports covering a period whose starting / ending month is within the specified range.
<b>Year From / Year To</b>	In these fields, you can specify a range of starting / ending years. The GL Report Output Data sub-tab will only show reports covering a period whose starting / ending year is within the specified range.

### G/L Report Output Data Sub-Tab

This section includes the fields and descriptions for the G/L Report Output Data sub-tab.

Field	Description
<b>Report No.</b>	This field shows the number of the report definition on which the current G/L report was based.
<b>Report Name</b>	This field shows the name of the report definition on which the current G/L report was based.
<b>Month From / Month To</b>	These fields show the starting / ending month of the period covered by the current G/L Report.
<b>Year From / Year To</b>	These fields show the starting / ending year of the period covered by the current G/L Report.
<b>Generated by</b>	This field shows the name of the user who generated the current report, in either the G/L Report Set-Up or the Print G/L Report workspace.
<b>Generated, Date</b>	This field shows the date on which the report was generated, that is, the date on which the user shown in the field "Generated by" either selected an action in this workspace that resulted in the generation of the report, or ordered the report in the Print G/L Report workspace.

Field	Description
<b>Expiry Date</b>	<p>In this field, you can specify the ending date of the report's validity period. The validity period is used for warning other users who are about to run identical reports within a given period that such a report already exists.</p> <p>Whenever a report is run, Maconomy checks if an identical report with a validity date that has not yet expired has already been saved and issues a warning if this is the case, allowing you to cancel the process. This way, by specifying a validity date, you ensure that users who are about to run an identical report will be informed that such a report already exists. Reports are considered identical if they have the same information in the Dimension Control, Selection Criteria, Currency Conversion, Company, Access Level, and Report (with the exception of the description fields) islands in the G/L Report Set-Up workspace.</p>
<b>Notify Users</b>	<p>In this field, you can specify whether people to whom this report is relevant should be notified about the existence of the report. The field is for information only, as no notification procedures are run automatically, but using a Portal interface, you can build a distribution system where this field, for example, determines whether the report should appear in certain report lists.</p> <p>By default, this field shows the value from the corresponding field on the report definition on which the current G/L report was based.</p>
<b>Access Level</b>	<p>In this field, you can specify an access level for the current report. A given user can only see the current G/L report if he or she has been assigned to this or a higher access level in the User Access Levels workspace in the Set-Up module. In other workspaces, a user can only reference the current report if he or she has been assigned to this or a higher access level in the User Access Levels workspace in the Set-Up module. Please note that this access control only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to saved reports may depend on other factors. For further information about the standard access control configuration, please see "Introduction to the Access Control System" in the Set-Up module.</p> <p>If you do not specify an access level, all users will have access to see information about the current report.</p>
<b>Access Level Description</b>	This field shows the description of the access level specified in the field "Access Level."
<b>Output Data Identification</b>	This field shows the identification number of the saved report.
<b>Description 1-3</b>	In these fields, you can enter a description of the current G/L Report. By default, these fields show the values from the corresponding

Field	Description
	description fields on the report definition on which the current G/L report was based.
<b>Enter File Name</b>	In this field, you can specify whether or not the user should specify a file name when the "Create Tab-separated File" or "Create RTF File" action is selected. If this field is not marked, Maconomy names and places the file automatically as described for the "Create Tab-separated File" action. By default, this field shows the value from the corresponding field on the report definition on which the current G/L report was based.
<b>Company No. From / Company No. To</b>	Together, these fields identify the range of companies included in the current report.
<b>Account No. From / Account No. To</b>	Together, these fields identify the range of accounts included in the current report.
<b>Location From / Location To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Entity From / Entity To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Project From / Project To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Purpose From / Purpose To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Spec. 1-3 From / Spec. 1-3 To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Local Spec 1-3 From / Local Spec. 1-3 To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Intercompany Company From / Intercompany Company To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."

Field	Description
<b>Customer No. From / Customer No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Vendor No. From / Vendor No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Job No. From / Job No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Activity No. From / Activity No.</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Task From / Task To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Employee No. From / Employee No.</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Asset No. From / Asset No.</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Item No. From / Item No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Statistic 1-4 From / Statistic 1-4 To</b>	These fields show the values from the corresponding fields on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. If either of these fields is blank, the value from the corresponding field in the Show G/L Report Output Data tab applies instead.
<b>Text 1-6</b>	In these fields, you can enter text regarding the current G/L Report. By default, these fields show the values from the corresponding text fields in the Extra Texts island on the report definition on which the current G/L report was based.
<b>Column Description</b>	This field shows the name of the column description used in the current G/L report.
<b>Standard Column Description</b>	This field shows whether the column description in the field "Column Description" was also applied to all subreports (if any) called by the current report when the report was generated. For further information on the functionality of standard column descriptions, see the description of the field "Standard Column Description."
<b>Currency</b>	This field shows the default currency in which amounts in the individual report fields are shown. However, on the individual lines in

Field	Description
	the report, this currency can in some cases be overruled according to the derivation priorities described in the "Currency" field.
<b>Include subcompanies</b>	This field shows whether the report includes the subcompanies of the individual companies covered by the report. The field reflects the value in the corresponding field in the G/L Report Set-Up workspace when the report was generated.
<b>Exchange Rate Table</b>	This field shows the default exchange rate table used for converting amounts in the individual report fields. However, on the individual lines in the report, this exchange rate table can in some cases be overruled according to the derivation priorities described in the field "Exchange Rate Table."
<b>Exchange Rate Date</b>	This field shows the default exchange rate date used for converting amounts in the individual report fields. However, on the individual lines in the report, this date can in some cases be overruled according to the derivation priorities described in the field "Exchange Rate Date."

## Actions

This section shows the actions available in the Reprint G/L Reports workspace.

### Top Pane

Field	Description
<b>Delete Reports in Selection Criteria</b>	Select this action to delete the reports that are currently selected in the table part of the window.

### Bottom Pane

Field	Description
<b>Print Report</b>	Select this action to print the report currently selected in the G/L Report Output Data sub-tab. If you are working on a Macintosh, check the Page Setup to make sure that your setup matches the horizontal/vertical layout of the report.
<b>Create Tab-separated File</b>	Select this action to create a tab-separated file with the data in the report currently selected in the G/L Report Output Data sub-tab. You can then edit the file in another program, for example, a spreadsheet editor. If the field "Enter File Name" is marked for the current report, you will be asked to specify a name and a location for the created file. If the field is not marked, Maconomy names the file automatically and places it in the Maconomy program folder.
<b>Create RTF File</b>	When you select this action, Maconomy creates an RTF file with the data in the report currently selected in the G/L Report Output Data sub-tab. An RTF file is a formatted file which can be opened in, for example, Microsoft Word. The data will be set up in a table in the file that is created. If the field "Enter File Name" is marked for the current report, you will be asked to specify a name and a

Field	Description
	<p>location for the created file. If the field is not marked, Maconomy names the file automatically and places it in the Maconomy program folder.</p> <p>When you select this action, Maconomy will ask you to point out an existing RTF file to use as template for new RTF files. The template file must contain definitions of all of the styles used in the report, that is, the styles pointed out in the line style definitions selected on the individual lines in the G/L Report Output Data sub-tab. For a detailed description of the line style functionality, see the description of the Line Styles workspace.</p>

## Show G/L Report Output Data Workspace

Use this workspace to view the individual lines that make up each saved G/L report.

This workspace is only available if you have installed the Reprint G/L Reports add-on.

When Maconomy generates a report, it only saves the information that appears in the report, not the underlying data, which ensures that all reprints are identical to the original report. The reprint is created instantly because no queries or processing are performed.

You can print reports any number of times or create text or RTF files using the information in the reports. You can also delete saved reports.

Use this workspace to view the saved report information.

You can change some of the fields in the Show G/L Report output Data tab, but you cannot change any of the information in the G/L Report Output Data Lines sub-tab, which contains the individual report lines.

### Show G/L Report Output Data Tab

This section includes the fields and descriptions for the Show G/L Report Output Data tab.

#### Output Data Island

Field	Description
<b>Show Lines</b>	When you check this box, the G/L Report Output Data Lines sub-tab will display the lines comprised by the report. However, Maconomy's internal calculation lines are only shown if the field "Show Calculation Lines" below is also marked. Please note that Maconomy's internal calculation lines are not the same as regular calculation lines set up in the G/L Report Set-Up workspace (which are shown if this field is marked). For more information on this, see the field "Show Calculation Lines" below.
<b>Show Calculation Lines</b>	If you mark this field, the G/L Report Output Data Lines sub-tab will show Maconomy's internal calculation lines in the current report. However, no lines are shown until the field "Show Lines" above is also marked. Please note that Maconomy's internal calculation lines are not the same as regular calculation lines set up in the G/L Report Set-Up workspace (which are shown if the field "Show Lines" above is marked). Maconomy's internal calculation lines are automatically created lines used for summarizing data.

Field	Description
<b>Output Data Identification</b>	This field shows the identification number of the current report.
<b>Generated by</b>	This field shows the name of the user who generated the current report, in either the G/L Report Set-Up or the Print G/L Report workspace.
<b>Generated on</b>	This field shows the date and time on which the report was generated, that is, the date on which the user shown in the field "Generated by" either selected an action in this window that resulted in the generation of the report, or ordered the report in the Print G/L Report workspace.
<b>Expiry Date</b>	<p>In this field, you can specify the ending date of the report's validity period. The validity period is used for warning other users who are about to run identical reports within a given period that such a report already exists.</p> <p>Whenever a report is run, Maconomy checks if an identical report with a validity date that has not yet expired has already been saved and issues a warning if this is the case, allowing you to cancel the process. This way, by specifying a validity date, you ensure that users who are about to run an identical report will be informed that such a report already exists. Reports are considered identical if they have the same information in the islands Dimension Control, Selection Criteria, Currency Conversion, Company, Access Level, and Report (with the exception of the description fields) in the G/L Report Set-Up workspace.</p>

### Report Island

Field	Description
<b>Report</b>	This field shows the name and number of the report definition on which the current G/L report was based.
<b>Description</b>	In these fields, you can enter a description of the current G/L Report. By default, these fields show the values from the corresponding description fields on the report definition on which the current G/L report was based.
<b>Column Description</b>	This field shows the name of the column description used in the current G/L report.
<b>Standard Column Description</b>	This field shows whether the column description in the field "Column Description" was also applied to all subreports (if any) called by the current report when the report was generated. For further information on the functionality of standard column descriptions, see the description of the field "Standard Column Description."

**Access Level Island**

Field	Description
<b>Description</b>	This field shows the description of the access level specified in the field "Name" below.
<b>Name</b>	<p>In this field, you can specify an access level for the current report. A given user can only see the current G/L report if he or she has been assigned to this or a higher access level in the User Access Levels workspace in the Set-Up module. In other windows, a user can only reference the current report if he or she has been assigned to this or a higher access level in the User Access Levels workspace in the Set-Up module. Please note that this access control only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to saved reports may depend on other factors. For further information about the standard access control configuration, please see "Introduction to the Access Control System" in the Set-Up module.</p> <p>If you do not specify an access level, all users will have access to see information about the current report.</p>

**Extra Remarks Island**

Field	Description
<b>Text 1-6</b>	In these fields, you can enter text regarding the current G/L Report. By default, the values suggested are transferred from the corresponding text fields in the Extra Texts island on the report definition on which the current G/L report was based.

**Output Data File Island**

Field	Description
<b>Enter File Name</b>	In this field, you can specify whether or not the user should specify a file name when the "Create Tab-separated File" or "Create RTF File" action is selected. If this field is not marked, Maconomy names and places the file automatically as described under the action "Create Tab-separated File." By default, this field shows the value from the corresponding field on the report definition on which the current G/L report was based.

**Company Island**

Field	Description
<b>Include subcompanies</b>	This field shows whether the report includes the subcompanies of the individual companies covered by the report. This field reflects the value in the corresponding field in the G/L Report Set-Up workspace when the report was generated. For further information on the inclusion of subcompanies, you should therefore see the description of the field "Include subcompanies."

### Selection Criteria Island

Field	Description
<b>Period</b>	This field shows the period covered by the current G/L report.
<b>Statistics 1-4</b>	These fields show the statistics values covered by the current G/L report.
<b>Company No. From / Company No.</b>	Together, these fields identify the range of companies included in the current report.
<b>Account No. From / Account No. To</b>	Together, these fields identify the range of accounts included in the report.
<b>Intercompany Company From / Intercompany Company To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Customer No. From / Customer No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Vendor No. From / Vendor No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Job No. From / Job No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Activity No. From / Activity No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Task From / Task To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Employee No. From / Employee No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Asset No. From / Asset No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Item No. From / Item No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Statistics 1-4 From / Statistics 1-4 To</b>	In these fields, you can enter text regarding the current G/L Report. By default, the fields show the values from the corresponding text fields in the Extra Texts island on the report definition on which the current G/L report was based.

**Selection Criteria, Dimensions Island**

Field	Description
<b>Location From / Location To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Entity From / Entity To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Project From / Project To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Purpose From / Purpose To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Spec. 1-3 From / Spec. 1-3 To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Local Spec. 1-3 From / Local Spec. 1-3 To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."

**Currency Conversion Island**

Field	Description
<b>Currency</b>	This field shows the default currency in which amounts in the individual report fields are shown. However, on the individual lines in the report, this currency can in some cases be overruled according to the derivation priorities described in the field "Currency." For further information on how the currency used in the individual fields on individual lines is determined, please see the description of that field.
<b>Exchange Rate Table</b>	This field shows the default exchange rate table used for converting amounts in the individual report fields. However, on the individual lines in the report, this exchange rate table can in some cases be overruled according to the derivation priorities described in the field "Exchange Rate Table." For further information on how the exchange rate table used in the individual fields on individual lines is determined, please see the description of that field.
<b>Exchange Rate Date</b>	This field shows the default exchange rate date used for converting amounts in the individual report fields. However, on the individual lines in the report, this date can in some cases be overruled according to the derivation priorities described in the field "Exchange Rate Date." For further information on how the exchange rate date used in the individual fields on individual lines is determined, please see the description of that field.

## G/L Report Output Data Lines Sub-Tab

This section includes the fields and descriptions for the G/L Report Output Data Lines sub-tab.

Field	Description
<b>Line No.</b>	This field shows the current line's number in the sequence of lines. The lines are numbered consecutively in the order of their creation.
<b>Print</b>	This field shows whether the current line is shown on printouts and in text and RTF files created from the current report. The value is derived from the field "Print" on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. On Maconomy's internal calculation lines, however, this field is always unmarked.
<b>Description</b>	This field shows the description of the current line. The value is derived from the field "Description" on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based.
<b>Column 1-40</b>	These fields show the actual data generated in the report, that is, the report contents.
<b>Month From / Month To</b>	<p>These fields show the values from the corresponding fields on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. If either of these fields is blank, the value from the corresponding field in the Show G/L Report Output Data tab applies instead.</p> <p>Please note that the column description used on the line may cause this range to be overruled in some of the data fields ("Field 1-40"). This field therefore only represents the default range used in those columns for which the column description does not specify another range.</p>
<b>Year From / Year To</b>	The functionality of these fields is similar to that of the fields "Month From" and "Month To."
<b>Company No. From / Company No. To</b>	<p>These fields show the values from the corresponding fields on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. If either of these fields is blank, the value from the corresponding field in the Show G/L Report Output Data tab applies instead.</p> <p>However, if the current line was the result of a G/L report setup line that itemizes company numbers, these fields show the actual range of company numbers whose data is shown in this field.</p> <p>Please note that the column description used on the line may cause this range to be overruled in some of the data fields ("Field 1-40"). This field therefore only represents the default range used in those columns for which the column description does not specify another range.</p>
<b>Account No. From / Account No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From" and "Company No. To."

Field	Description
<b>Location From / Location To</b>	The functionality of these fields is similar to that of the fields "Company No. From" and "Company No. To."
<b>Entity From / Entity To</b>	The functionality of these fields is similar to that of the fields "Company No. From" and "Company No. To."
<b>Project From / Project To</b>	The functionality of these fields is similar to that of the fields "Company No. From" and "Company No. To."
<b>Purpose From / Purpose To</b>	The functionality of these fields is similar to that of the fields "Company No. From" and "Company No. To."
<b>Spec. 1-3 From / Spec. 1-3 To</b>	The functionality of these fields is similar to that of the fields "Company No. From" and "Company No. To."
<b>Local Spec. 1-3 From / Local Spec. 1-3 To</b>	The functionality of these fields is similar to that of the fields "Company No. From" and "Company No. To."
<b>Intercompany Company From / Intercompany Company To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Customer No. From / Customer No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Vendor No. From / Vendor No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Job No. From / Job No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Activity No. From / Activity No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Task From / Task To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."

Field	Description
<b>Employee No. From / Employee No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Asset No. From / Asset No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Item No. From / Item No. To</b>	The functionality of these fields is similar to that of the fields "Company No. From/Company No. To."
<b>Statistics 1-4 From / Statistics 1-4 To</b>	These fields show the values from the corresponding fields on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. If either of these fields is blank, the value from the corresponding field in the Show G/L Report Output Data tab applies instead.
<b>Include subcompanies</b>	This field shows whether figures from subcompanies to the companies covered by the range in the fields "Company No. From" and "Company No. To" are included in the figures on the line. Subcompanies are included if the corresponding field is marked on the report containing the G/L report definition line on which the current output line is based. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Include subcompanies."
<b>Currency</b>	This field shows the currency in which the figures on the current line are shown. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Currency." Please note that the column description used on the line may cause this currency to be overruled in some of the data fields ("Field 1-40"). This field therefore only represents the default currency used in those columns for which the column description does not specify another currency.
<b>Exchange Rate Table</b>	<p>This field shows the exchange rate table whose rates were used for converting amounts from one currency to another on the current line when the report was generated. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Exchange Rate Table."</p> <p>Please note that the column description used on the line may cause this exchange rate table to be overruled in some of the data fields ("Field 1-40"). This field therefore only represents the default exchange rate</p>

Field	Description
	table used in those columns for which the column description does not specify another table.
<b>Exchange Rate Date</b>	<p>This field shows the date whose exchange rates were used for converting amounts from one currency to another on the current line when the report was generated. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Exchange Rate Date."</p> <p>Please note that the column description used on the line may cause this currency to be overruled in some of the data fields ("Field 1-40"). This field therefore only represents the default exchange rate date used in those columns for which the column description does not specify another date.</p>
<b>Format</b>	This field shows the format applied to the current line on printouts. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Format."
<b>Indent</b>	This field shows by how many spaces the line description is indented on printouts. The indent does not apply when creating tab-separated files. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Indent."
<b>Invert Sign</b>	This field shows whether the figures on the current line have inverted signs (+/-). The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Invert Sign."
<b>Show 0</b>	This field shows whether a zero or a blank value should be shown in the fields "Field 1-40" in those when a field has the value 0. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Show 0."
<b>Department</b>	This field shows the name of the department to which the current G/L report output line pertains.
<b>Report No.</b>	This field shows the number of the report containing the G/L report definition line on which the current output line is based. The field "Original Line No." shows the G/L report definition line's table part position in the G/L Report Set-Up workspace. Using the information in this field and the field "Original Line No.," you can thus in the G/L Report

Field	Description
	Set-Up workspace find the G/L report definition line on which the current G/L report output line is based.
<b>Original Line No.</b>	This field shows the table part position of the G/L report definition line in the G/L Report Set-Up workspace on which the current G/L report output line is based. The current output line may be the result of a sub-report, meaning that the G/L report definition line on which the output line is based does not necessarily belong to the main report. Therefore, the report in question is shown in the field "Report No." Using the information in this field and the field "Report No.," you can thus in the G/L Report Set-Up workspace find the G/L report definition line on which the current G/L report output line is based.
<b>Line Type</b>	This field shows what type of information is represented on the line. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Type."
<b>Calculation</b>	This field shows the formula used for calculating the information on the current line (if any). The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Calculation."
<b>Expansion No.</b>	This field is used for Maconomy support purposes only.
<b>Itemization Level</b>	This field shows the sub-report level at which the current output line was created. The main report represents level number one. If the main report calls a sub-report, the sub-report represents level two. The sub-report, in turn, can call another sub-report which represents level 3, and so on, and when a report at a given level results in an output line, the level in question is shown in this field.
<b>Column Description</b>	This field shows the column description used on the current line. The column description contains the definitions on which the data in the field "Field 1-40" is based. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For information on the functionality of the field, you should therefore refer to the field "Column Description."
<b>Last Printout Column</b>	This field shows which column is the rightmost one to be printed.
<b>Line Style</b>	This field shows the name of the line style applied to the current output line. The line style determines the styles to be used on the different elements of the line when an RTF file is created for the report. The value is derived from the corresponding field on the line in the G/L Report Set-Up workspace on which the current G/L report output line is based. For

Field	Description
	information on the functionality of the field, you should therefore refer to the field "Line Style."
<b>Note No.</b>	This field does not apply to the current version of Maconomy.
<b>Note Text</b>	This field does not apply to the current version of Maconomy.
<b>Note Name</b>	This field does not apply to the current version of Maconomy.
<b>File Name</b>	This field does not apply to the current version of Maconomy.
<b>Note 2-3 Assigned</b>	This field does not apply to the current version of Maconomy.
<b>Note 2-3, Name</b>	This field does not apply to the current version of Maconomy.

## Print G/L Report Workspace

Use this workspace to print G/L reports.

You can also use the **Print Report** action in the G/L Report Set-Up workspace to print reports.

Any selection criteria that you enter here override the corresponding criteria entered for the report in the G/L Report Set-Up workspace.

Similarly, information that you enter in the Currency Conversion and Print Control islands overrides the corresponding information in the G/L Report Set-Up workspace.

### Print G/L Report Tab

This section includes the fields and descriptions for the Print G/L Report tab.

#### Selection Criteria Island

Field	Description
<b>Report No.</b>	Enter the number of the report you wish to print here.
<b>Column Description</b>	Here you can optionally choose a column description to be used for the G/L report. Maconomy checks that the column description exists. If you leave this field blank, Maconomy uses the column specification entered for the report that you are printing.
<b>Standard Column Description</b>	If you have completed the "Column Description" field above, you can check this box to indicate that this column description is to be used for all reports called from the report being printed. The default is to use the

Field	Description
	column description specified in the card part of the report in question in the G/L Report Set-Up workspace.
<b>Report Selection Criteria</b>	In this field you select a G/L Report Selection Criteria name. If you select G/L Report Selection Criteria, the selections from the G/L Report Selection Criteria will replace any Selection Criteria specified in the Selection Criteria islands in the G/L Report Set-Up workspace. G/L Report Selection Criteria are created in the workspace by the same name. See the description of the G/L Report Selection Criteria workspace for more information.
<b>Company No.</b>	In these fields, you can specify a range of company numbers for which the report is to be printed. If you enter information in one of the fields, this information will overrule any information entered in the corresponding field in the card part of the G/L Report Set-Up workspace for the report in question.
<b>Account No.</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Intercompany Company</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Customer No.</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Vendor No.</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Job No.</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Activity No.</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Task</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Employee No.</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Asset No.</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Item No.</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Statistics 1-4</b>	In these fields, you can specify ranges of statistics values for which the report is to be printed. If you enter information in one of the fields, this information will overrule any information entered in the corresponding field in the card part of the G/L Report Set-Up workspace for the report in question.

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Entity</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Project</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.

### Period Island

Field	Description
<b>Month/Yr.</b>	<p>In these fields, you can specify the starting month/year and ending month/year of the period for which the report is to be printed. If you enter information in one of the fields, this information will overrule any information entered in the corresponding field in the card part of the window G/L Report Set-Up for the report in question.</p> <p>If your company uses flexible periods that do not follow the calendar year, the month and year you enter here refers to the period defined in the window Fiscal Year.</p>

### Currency Conversion Island

Field	Description
<b>Currency</b>	In this field, you can specify the currency in which the amounts in the report should be shown. If you select a currency, this currency will overrule any currency entered in the corresponding field in the card part of the G/L Report Set-Up workspace for the report in question. However, on the individual lines in the report, this currency can in some cases be overruled according to the derivation priorities described in the field "Currency." For further information on how the currency used in the individual fields on individual lines is determined, please see the description of that field.
<b>Exchange Rate Table</b>	In this field, you can specify an exchange rate table to be used for converting amounts from one currency into another in the report. If you enter information in the field, this information will overrule any information entered in the corresponding field in the card part of the G/L Report Set-Up workspace for the report in question. However, on the individual lines in the report, this exchange rate table can in some cases be overruled according to the derivation priorities described in the field "Exchange Rate Table." For further information on how the

Field	Description
	exchange rate table used in the individual fields on individual lines is determined, please see the description of that field.
<b>Exchange Rate Date</b>	In this field, you can specify the date whose exchange rates should be used for converting amounts from one currency into another in the report. If you enter a date in the field, this information will overrule any date entered in the corresponding field in the card part of the G/L Report Set-Up workspace for the report in question. However, on the individual lines in the report, this exchange rate date can in some cases be overruled according to the derivation priorities described in the field "Exchange Rate Date." For further information on how the exchange rate date used in the individual fields on individual lines is determined, please see the description of that field.

### Print Control Island

Field	Description
<b>Layout</b>	Here you can select the layout of the report. If you do not choose a layout, Maconomy uses the layout of the column specification attached to the report you are printing.
<b>Number of Days until Expiry</b>	If the report is to be saved, that is, the field "Save Output Data" has been marked, you can specify in this field the length of the report's validity period. The validity period is used for ensuring that only one report of a given kind exists at a time, thus making sure everybody can refer to the same report. If you do not specify a number of days, the value in the corresponding field for the report in the G/L Report Set-Up workspace will determine the number of days until expiry. For a description of the functionality of expiry dates on G/L report output data, please see the "Number of Days until Expiry" field in the G/L Report Set-Up workspace.
<b>Reprint</b>	Mark this field if you want to reprint a report that has already been saved in the system, rather than generating a new report. If you want to reprint a report, you must specify in this workspace the exact selection criteria of the desired report. You can see the criteria of the individual saved reports in the Reprint G/L Reports workspace. If none of the reports saved in Maconomy has the exact selection criteria that you have specified in this workspace, Maconomy issues an error message. If several saved reports have the exact same selection criteria, Maconomy reprints the one that was generated most recently.
<b>Save Output Data</b>	In this field, you can specify that Maconomy should save the output data created when the report is run. If you do not mark this field, the value in the corresponding field for the report in the G/L Report Set-Up workspace will determine whether the output should be saved. For a description of the functionality of expiry dates on G/L report output data, please see the "Number of Days until Expiry" field in the G/L Report Set-Up workspace.
<b>Print Report</b>	In this field, you can specify whether the report should be printed on paper when it is run. This can be useful if a report contains sensitive information, and your reports are usually run at night. In those cases, you might prefer that the output is not printed right away, thereby lying in the printer all morning for anyone to see.

Field	Description
	If you do not mark this field, the value in the corresponding field for the report in the G/L Report Set-Up workspace will determine whether the output should be printed.
<b>Notify Users</b>	In this field, you can specify whether people to whom this report is relevant should be notified when the report is run. The field is for information only, as no notification procedures are run when the report is generated. If you do not mark this field, the value in the corresponding field for the report in the G/L Report Set-Up workspace will determine whether users should be notified.

## Report Groups Workspace

This workspace includes information on report groups.

### Report Groups Tab

This section includes the fields and descriptions for the Report Groups tab.

#### Report Group Island

Field	Description
<b>Name</b>	Use this field to enter the name of the report group.
<b>Description</b>	Use this field to enter a description of the report group.
<b>Report Group Type</b>	Use this field to enter the type of report group. Report Group Types are created in the popup field "Report Group Type" in the window Popup Fields in the Set-Up module."

#### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

#### Remarks Island

Here you can enter additional descriptive information about the report. You can use Maconomy's layout editing tools to insert this information in the printed report and use it in searches.

### Report Group Lines Sub-Tab

This section includes the fields and descriptions for the Report Group Lines sub-tab.

Field	Description
<b>Report No.</b>	In this field you can enter the report no. for the report that you want to add to the reporting group.

Field	Description
<b>Selection Criteria</b>	In this field you can enter the selection criteria that should be used when printing the report from the current line.

## Specification of Dimension Reports Workspace

Use this workspace to specify dimension reports so that you can compare G/L and Budget entries for a maximum of three dimensions.

You can then use the specified report to print a balance sheet.

You can use the following dimensions:

- Company
- Account
- Location
- Entity
- Project
- Purpose
- Specification 1
- Specification 2
- Specification 3
- Local Specification 1
- Local Specification 2
- Local Specification 3

The report shows the highest of the selected sum levels furthest to the left, with the subsequent levels indented toward the right.

The lowest sum level of the primary dimension within the selected range is itemized. This means that all entries on the sum level in question are displayed. If sum level 0 is the lowest sum level specified for the report, the report shows account figures at item entry level.

Information and entries are only printed for the three dimensions that you specify. You can further delimit the three dimensions to a certain range of sum levels according to the structure of the dimension in question. Each dimension has a separate workspace in which you define its structure.

You can choose to show a combination of name, description, and sum level of the selected dimensions.

You can further delimit the extent of the report by entering dimension value ranges in the Selection Criteria island in the Specification of Dimension Reports sub-tab.

In the Column Definition 1 island in the Specification of Dimension Reports sub-tab, you specify which information you want to see and how it should be shown. For example, you can choose to see movements in the current dimensions for a certain period, displayed in thousands, or compare budget figures with actuals and committed amounts. In addition, you can use the figures for performing calculations, and you can specify to show the figures with or without tax.

The report runs when you press Enter or click **Start**. Maconomy asks whether you want to save the report as a file for more processing, for example, in a spreadsheet. If you choose to do so, Maconomy first saves the report and then prints it. If you choose **Cancel**, Maconomy just prints the report; it does not save it as a file.

## Specification of Dimension Reports Tab

This section includes the fields and descriptions for the Specification of Dimension Reports tab.

### Report Island

Field	Description
<b>Name</b>	If you want to run a dimension report based on a dimension report template created in the Specification of Dimension Reports workspace, you can enter the name of the desired template here. If you do so and press Return or click "OK," Maconomy will not process and print a report. Instead, Maconomy clears all the fields in the window and transfers the information from the selected dimension report template. You can then make the desired changes to the information transferred from the template before pressing Return or clicking "OK" again to run the report.
<b>Description</b>	In this field, you can enter a short description of the report. If you have specified a dimension report template in the field "Name" above, the description is transferred from the template in question. This ensures that on the printout, you can see the description of the template on which the report was based.

### Dimension Specification Island

Field	Description
<b>Dimension</b>	<p>In this column, you can select the dimensions for which you want a report. The dimensions are compared, using the top dimensions as the primary dimension. If, for instance, you select "Location" as the first dimension and "Account" as the second dimension, "Location" will be displayed in the far-left column in the report, and "Account" will be distributed by locations to the right of the column "Location."</p> <p>In the printed report, the highest sum level is placed to the far-left in a column, and further sum levels are indented toward the right. For each primary dimension value, an additional line is printed that sums the printed entries for the current dimension value.</p>
<b>From Sum Level / To Sum Level</b>	<p>In these fields you can enter a range of sum levels for which you want to print the report. Sum levels are defined in the structure window for the dimension in question.</p> <p>The report will itemize the lowest sum level. The lowest sum level can be either the level selected in this field, if it exists, or the lowest sum level in the entries selected in the Selection Criteria island. If, for instance, you enter "4" in this field, but enter selection criteria that otherwise delimit the selected entries so</p>

Field	Description
	<p>that the lowest sum level among the selected entries is 6, sum level 6 is the lowest and will be fully itemized.</p> <p>The lowest sum level contains the greatest amount of details. Other, higher sum levels are printed as sums but not itemized, as this would only result in a repetition of figures already displayed.</p>
<b>Name</b>	If you check this field, the report will print the name (or number) of the current dimension.
<b>Width</b>	<p>In this field, you can specify the width of the columns used for displaying the dimension names. The width is measured in a unit that relates to the screen's resolution in pixels. It is recommended that you use the landscape paper orientation when printing a report. In Windows, this is done by selecting File » Printer Setup, and then selecting "Landscape" in the field "Paper Orientation" (the Printer Setup window may vary). On a Macintosh, it is done by selecting File » Page Setup, and then clicking the landscape orientation.</p> <p>Please note that if you are using a PostScript® printer, and you reduce the printout size, Maconomy will take this into account and place more information on the same page. Reducing (scaling down) the print size is done in the PostScript printer driver.</p> <p>Space is only allocated to the width if the field "Name" has been marked.</p>
<b>Descr.</b>	If you check this field, the report will print the description (or account text) of the current dimension.
<b>Width</b>	The functionality of this field is similar to that of the "Width" field that applies to columns for dimension names. However, this field is used for specifying the width of the columns that display the dimension descriptions, and space is only allocated for the width if the field "Descr." has been marked.
<b>Sum Level</b>	If you check this field, the report will print the sum level of the current dimension. The sum level is the level specified on the line in the structure window for the dimension in question, that is the Location Structure workspace.
<b>Width</b>	The functionality of this field is similar to that of the field "Width" that applies to columns for dimension names. However, this field is used for specifying the width of the columns that display the sum levels, and space is only allocated to for the width if the field "Sum Level" has been marked.

### Column Definition 1 Island

Field	Description
<b>Number</b>	This is the column number. This number determines where on the printout the column is placed. This number is also used for referring to a given column in column calculations.
<b>Type</b>	<p>Here you choose the type of figures to be shown in the current column.</p> <p>You can choose among the following types of figures:</p>

Field	Description
	<ul style="list-style-type: none"> <li>Actual — The column shows amounts posted in the General Ledger.</li> <li>Committed — The column shows amounts from the commitment accounts. Committed amounts are future expenses registered in approved, non-closed purchase orders. See the section “Commitment Accounts” in the Budget module for further information on the concept of commitment accounts.</li> <li>Budget — The column shows amounts from the budget model and the version specified for the column in the fields “Budget Model” and “Version.”</li> <li>Calculation — The column shows a calculation of amounts in one or more of the other columns. Do not enter a period in the “Period” fields. The calculation formula is entered in the field “Calculation.”</li> </ul>
<b>Balance Sheet</b>	<p>Here you choose the type of balance to be shown in the current column. You can choose among the following balance types:</p> <ul style="list-style-type: none"> <li>Movement — The column shows the period’s movements for the selected group of dimension entries. Enter a period in the “Period” fields below.</li> <li>Opening — The column shows the period’s opening amounts for the selected group of dimension entries. Enter an opening date in the field “From Period.”</li> <li>Closing — The column shows the period’s closing amounts for the selected group of dimension entries. Enter a closing date in the field “To Period.”</li> </ul>
<b>Budget Model</b>	<p>If you have selected “Budget” in the field “Type” for the current column, you must enter in this field the name of the budget model whose figures should be shown in the report.</p>
<b>Version</b>	<p>If you have selected “Budget” in the field “Type” for the current column, you must enter in this field the version number of the budget model whose figures should be shown in the report.</p>
<b>Mth.</b>	<p>Along with the “Year” fields, the “Mth.” fields identify a set of starting G/L period and year and ending G/L period and year whose figures will be displayed in the current column.</p> <p>If you, for example, enter “07” in the leftmost “Mth.” field, the time range will run from the seventh G/L period of the year specified in the field “Year.” Note that the dimension reports only recognize complete G/L periods.</p>
<b>Year</b>	<p>For a description of the functionality of these fields, see the field “Mth.” above.</p>

**Column Definition 2 Island**

Field	Description
<b>Number</b>	This is the column number. This number determines where on the printout the column is placed. This number is also used for referring to a given column in column calculations.
<b>Name</b>	In this field, you can enter a heading for the column. If you do not enter a heading, the current column type will be used as a heading ("Movement," "Opening," "Closing," or "Calculation").
<b>Tax</b>	If you mark this field, the displayed figures will include tax. Usually tax has been lifted from the accounts displayed in the report and entered on special tax accounts. If this field is marked, the tax is added to the original entries again, so that the amounts are shown including tax. This is naturally for reporting only; no actual reallocation is taking place in the system.
<b>Show as</b>	In this field, you can select the format in which to display the column. You can choose between "Decimal," "In Whole Numbers," "Thousands," "Millions with one decimal," and "Millions."
<b>Width</b>	In this field, you can specify the width of the columns used for displaying the figures in the report. The width is measured in a unit which relates to the screen's resolution in pixels. It is recommended that you use landscape paper orientation when printing a report. In Windows, this is done by selecting File » Printer Setup, and then selecting "Landscape" in the field "Paper Orientation" (the Printer Setup window may vary). On a Macintosh, it is done by selecting File » Page Setup, and then clicking the landscape orientation.  Please note that if you are using a PostScript® printer, and you reduce the printout size, Maconomy will take this into account and place more information on the same page. Reducing (scaling down) the print size is done in the PostScript printer driver.
<b>Calculation</b>	In this field, you can enter the formula you want to use for this column if you have selected "Calculation" in the field "Type" above.  A calculation formula can consist of references to other columns and constants. You refer to another column by specifying the column number, preceded with a "#". Whole and decimal numbers are specified as usual. For calculations, you can use the four arithmetical operations: "+", "-", "*", and "/." Furthermore, you can use "%," which indicates the percentage ratio between two columns. Finally, you can use parentheses for grouping arithmetic expressions.  Examples of calculations: <ul style="list-style-type: none"> <li>■ "#1 #2" in column 3 means that column 3 of every line will be calculated as the difference between column 1 and 2.</li> <li>■ "(#1 + #2) / #4 * 12" means that column 3 of every line will be calculated as the sum of columns 1 and 2 divided by column 4, multiplied by the constant "12". If column 4 is 0, column 3 will also be 0. If a text is specified in the system parameter "Text on division by 0 in G/L rep.," a division by 0 will result in the column displaying the text from the system parameter.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ “#1 * 1,50” in column 2 means that column 2 will be calculated as column 1 multiplied by the constant “1,5.”</li> <li>▪ “#1 % #2” in column 3 means that column 3 will be calculated as the difference between columns 1 and 2, divided by column 2, multiplied by 100. If column 2 is 0, column 3 will also be 0. If a text is specified in the system parameter “Text on division by 0 in G/L rep.,” a division by 0 will result in the column displaying the text from the system parameter.</li> </ul>

### Selection Criteria Island

Field	Description
<b>Company No. From/ Company No. To</b>	The functionality of these fields is similar to that of the “Account No.” fields below.
<b>Account No. From/ Account No. To</b>	In these fields, you can enter a range of account numbers. The report will include entries that fulfill the condition specified in the Dimension Specification island and this island. Note that you can use the Find menu to locate account numbers. This feature can be used for all fields in the Selection Criteria island.

### Selection Criteria, Dimension Lists Island

Field	Description
<b>List 1-3</b>	In these fields, you enter the name of the list of local specifications to be used in the selection criteria. Lists of values for local specifications are created in the windows Local Specification 1-3.

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of these fields is similar to that of the field “Account No.” above.
<b>Entity</b>	The functionality of these fields is similar to that of the field “Account No.” above.
<b>Project</b>	The functionality of these fields is similar to that of the field “Account No.” above.
<b>Purpose</b>	The functionality of these fields is similar to that of the field “Account No.” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Account No.” above.

Field	Description
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Account No." above. When selecting criteria for local specifications, you must also enter a list number for the local specification in question.

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

### Print Control Island

Field	Description
<b>Heading</b>	In this field, you can enter a heading for the entire report, which will be printed at the top of each page. If you choose to save the report as a file, the heading will not be included in the file, as it would otherwise be repeated at every page break in the report. The same is true for column headings; these are entered in the file only once.
<b>Print Front Page</b>	If you mark this field, a front page will be printed listing the selections and choices which form the basis of the current report. Also, the current date of printing and user name are included on the front page.
<b>Include 0-Lines</b>	If you check this field, the report will include lines with a zero value.

## Ad Hoc Analysis Workspace

Use this workspace to create G/L queries and reports that are based on the period balances in your chart of accounts.

Use this workspace to:

- Compare account balances.
- Calculate a total for a group or list of accounts. You can create the group independent of the sum levels in the account structure tables.
- Make calculations based on account balances, using the four basic arithmetic operations, constants, and percentages.
- Transfer the report contents to a tab-separated file for use by other programs.

## Ad Hoc Analysis Tab

This section includes the fields and descriptions for the Ad Hoc Analysis tab.

## Report Island

Field	Description
<b>Name</b>	Here you specify the name of the report, the name being the sole identification of the report. You cannot change the name of an existing report. To retrieve existing reports, use the search functions in the Find menu. The name is transferred to the tab-separated file created by the "Create tab-separated file" action.
<b>Updated since Last Calculation</b>	This field shows whether the report has been redefined since the last calculation. If the field is marked, you cannot transfer the report to a tab-separated file before recalculating the values. This is a precaution against inconsistencies.  When you make a new calculation using the "Calculate Ad Hoc Analysis" action, Maconomy removes the mark. You cannot change the value manually.

## Last Calculation Island

Field	Description
<b>Month/Yr.</b>	This is the period of the last calculation for the report displayed. If no information is displayed in this field, the period has no influence on the report figures. The value cannot be changed. It is copied to the tab-separated file created using the "Create tab-separated file" action.
<b>Company</b>	These fields display the range of companies for the last calculation of the current report. If these fields are empty, no company range was entered when the report was created. The value cannot be changed. It is copied to the tab-separated file created using the "Create tab-separated file" action.
<b>Made by</b>	This is the name of the user who last made a calculation for the report.
<b>Date</b>	This is the date of the last calculation. The date cannot be changed here. The date is not transferred to the tab-separated file created using the "Create tab-separated file" action.

## Last Calculation, Dimensions Island

Field	Description
<b>Location</b>	Here you can specify a range of locations. The G/L report in the Lines sub-tab will only include periodic figures for entries with dimension values within the specified range of locations. If no range is specified, the report is not affected by the Location fields.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.

Field	Description
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which periodic figures should be displayed. All amounts in the window be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table selected in the System Information workspace in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may cause discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates that are valid on this date according to the enterprise exchange rate table selected in the System Information workspace in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

### Description Island

Here you enter a description of the report. The two lines of text are copied to the tab-separated file that is created when you select the "Create tab-separated file" action.

### New Calculation Island

Field	Description
<b>Month/Yr.</b>	<p>Here you enter the starting month/year and ending month/year of the period for which the analysis is to be printed. Enter the period as a number, for example, "1" for January, "2" for February, and so on.</p> <p>If your company uses flexible periods that do not follow the calendar year, the month and year that you enter here refers to the period defined in the window Fiscal Year.</p>

Field	Description
<b>Company</b>	In these fields, you can enter a range of companies. The G/L report in the Lines sub-tab will only include periodic figures for entries assigned to the specified range of companies. If no range is specified, the report is not affected by the Company fields.

### New Calculation, Dimensions Island

Field	Description
<b>Location</b>	This is the range of locations used in the last calculation. The G/L report in the Lines sub-tab only includes periodical figures for entries with a location in the "Location" field that is within this range. If the fields are blank, they have no influence on the report. The information is transferred to the tab-separated file created using the action "Create TAB-separated File".
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

### Lines Sub-Tab

This section includes the fields and descriptions for the Lines sub-tab.

Field	Description
<b>Line</b>	This is the line number in the report. All report lines are numbered in consecutive order. When lines are inserted or removed, Maconomy rennumbers the lines and their references. The line number is transferred to the tab-separated file created by the "Create tab-separated file" action.
<b>Account/Line 1</b>	Here you enter either the number of a G/L account in the chart of accounts or the number of an earlier line in the current report. If you cannot remember the number of an existing G/L account, you can use the search functions in the Find menu. You can only use accounts of the type "Control" or "Manual." If you specify a number that is both the number of a G/L account and the number of a report line, Maconomy uses the information on the G/L account.

Field	Description
	The value in the field is transferred to the tab-separated file created by the "Create tab-separated file" action.
<b>Name</b>	This is the text assigned to the G/L account or the line number specified in the "Account/Line 1" field. The text is transferred to the tab -separated file created by the "Create tab-separated file" action.
<b>+, -, *, /, %, :, Constant</b>	<p>Here you enter either an operator or a constant. The operator is used to calculate the values in the "Period" and "YTD" fields. Below is a description of the function of the legal values in this field. The value is transferred to the tab-separated file created by the "Create tab-separated file" action.</p> <ul style="list-style-type: none"> <li>■ "+" — The balance for the account or the value on the report line specified in the "Account/Line 1" field is added to the balance for the account or the value on the report line specified in the "Account/Line 2" field.</li> <li>■ "-" — The balance for the account or the value on the report line specified in the "Account/Line 2" field is subtracted from the balance for the account or the value on the report line specified in the "Account/Line 1" field.</li> <li>■ "*" — The balance for the account or the value on the report line specified in the "Account/Line 1" field is multiplied by the balance for the account or the value on the report line specified in the "Account/Line 2" field.</li> <li>■ "/" — The balance for the account or the value on the report line specified in the "Account/Line 1" field is divided by the balance for the account or the value on the report line specified in the "Account/Line 2" field. If the last balance/value is zero, the result of the calculation is 0.</li> <li>■ "%" — The balance for the account or the value on the report line specified in the "Account/Line 1" field is calculated as a percentage of the balance for the account or the value on the report line specified in the "Account/Line 2" field. If the last balance/value is zero, the result is 0.</li> <li>■ ":" — Maconomy calculates the total of the balances for all positing accounts within the range from the G/L account specified in the field "Account/Line 1," up to and including the G/L account given in the field "Account/Line 2." Note that you cannot specify a range of report line numbers. Maconomy checks that you enter existing account numbers in the fields "Account/Line 1" and "Account/Line 2," when you select the ":" operator.</li> <li>■ Constant — You can enter a constant if you need to use a constant value in later calculations. If so, you merely refer to the line number. The constant must be a whole number. You cannot at the same time enter values in the fields "Account/Line 1" and "Account/Line 2." Maconomy checks this. The field's value is transferred to the fields "Period" and "YTD."</li> </ul>

Field	Description
<b>Account/Line 2</b>	<p>Here you enter either the number of a G/L account in the chart of accounts or the number of an earlier line in the current report. If you cannot remember the number of an existing G/L account, you can use the search functions in the Find menu. You can only use accounts of the type "Control" or "Manual."</p> <p>If you enter a number that is both the number of a G/L account and the number of a report line, Maconomy will use the information on the G/L account. The value in the field is transferred to the tab-separated file created by the "Create tab-separated file" action.</p>
<b>Name</b>	This is the text assigned to the G/L account or the line number specified in the "Account/Line 2" field. The text is transferred to the tab-separated file created by the "Create tab-separated file" action.
<b>Description</b>	Here you specify a text to describe the value calculated on the line. The text is transferred to the "Name" field on another report line, if there is a reference to the line. The text is transferred to the tab-separated file created by the "Create tab-separated file" action.
<b>Period</b>	This field shows the value calculated on the line. The calculation is based on the periodical balances for the period specified in the Last Settlement island in the Ad Hoc Analysis tab. If one of the fields on the line is changed, Maconomy blanks this field. The value is calculated using the "Calculate Ad Hoc Analysis" action. It is then shown here. The value is transferred to the tab-separated file created by the "Create tab-separated file" action.
<b>YTD</b>	This field shows the calculated value on the line, based on the year-to-date balances for the period specified in the Last Settlement island in the Ad Hoc Analysis tab. Note that the year-to-date balances follow the fiscal year and not the calendar year. If one of the fields on the line is changed, Maconomy blanks this field. The value is calculated using the "Calculate Ad Hoc Analysis" action. It is then shown here. The value is transferred to the tab-separated file created by the "Create tab-separated file" action.
<b>Print</b>	Here you specify whether to transfer the line to the tab-separated file created using the "Create tab-separated file" action. Maconomy marks the field automatically.

## Print Trial Balance Workspace

Use this workspace to print a trial balance for a given period.

The Trial Balance lists the following information for each account:

- **Opening Balance**—The opening balance of the account at the beginning of the specified period.
- **Closing Balance**—The closing balance of the account at the end of the specified period.
- **Movements**—The total movement posted to this account during the specified period.

The trial balance can include all G/L accounts, or the included accounts can be limited in a number of ways—for example, to departmental accounts or to a range of dimension values.

Select a value from the drop-down list for the **Layout** field to specify one of three format types: You can choose between three format types:

- **Change**—Select this value to show the period movements (that is, the total debits and total credits made to the account) and fiscal year-to-date figures.
- **Opening**—Select this value to show opening balances for the period.
- **Value**—Select this value to show the period movements. Maconomy will create one report for the dimension specified in the layout name. Each report will be ordered by account.

If you select the **Calculate operating result in reports** system parameter, Maconomy also displays the company's current operating result in the year-end closing account, calculated as the sum of the balances in the company's P&L accounts. In this way, the report simulates a year-end closing without creating the entries made during a year-end closing.

Note that if a trial balance is printed for multiple companies, and these companies use different fiscal years, the year-to-date figures may be misleading.

The report does not include accounts of the Single Line and Double Line type, and also ignores the Invert Sign specification.

## Print Trial Balance Tab

This section includes the fields and descriptions for the Print Trial Balance tab.

### Selection Criteria Island

Field	Description
<b>Company No.</b>	Here you enter a range of company numbers. The trial balance will only include entries to companies within this range. If you leave the fields blank, company numbers have no influence on the selection criteria.
<b>Account No.</b>	Here you enter a range of account numbers. The trial balance will only include accounts with an account number within this range. If you leave the fields blank, they have no influence on the selection criteria.
<b>Statistics 1-4</b>	Here you enter up to four statistics code ranges. The printout will only include accounts with statistics codes within this range. If you leave the codes blank, the statistics fields have no influence on the selection criteria.
<b>Sum Level</b>	Here you can enter a range of sum levels. The printout will only include accounts marked "Balance Sheet" in the Account Structure workspace on a sum level within the given range. If you leave the fields blank, they have no influence on the selection criteria.
<b>Line No.</b>	In these fields, you can specify a range of line numbers from the account structure. The balance will only include lines in the Account Structure workspace and appearing on an account structure line within the specified range.
<b>Department</b>	Here you can select a department. The printout will only include accounts assigned to this department. If you leave the field blank, it has no influence on the selection criteria.

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	Here you enter a range of locations. The trial balance will only include entries to locations within this range. If you leave the fields blank, they have no influence on the selection criteria.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

### Period Island

Field	Description
<b>Month/Yr.</b>	<p>Here you enter the starting month/year and ending month/year of the period for which the balance is to be printed. You can also enter a different period range for each report line definition in the table. Enter the period as a number, for example, "1" for January, "2" for February, and so on.</p> <p>If your company uses flexible periods that do not follow the calendar year, the month and year that you enter here refer to the period defined in the window Fiscal Year.</p>

### Print Control Island

Field	Description
<b>Layout</b>	<p>Here you select whether to print an opening balance or a balance showing monthly movements. You select either "Opening" or "Movement."</p> <p>You can also sort the movement balance, first by options from one of the dimensions, then by account number. To do this, select the option concerning the desired dimension, for example, "Location Account," "Entity Account," or "Project Account" in this field. However, if you do so, you cannot select a dimension in the field "Allocate to Dimension."</p>
<b>Allocate to Dimension</b>	<p>Here you can select whether to split up individual account balances by dimension values. If you leave this field blank, the printout will show a total for every balance. If you select a dimension, the printout will show one line per dimension value, and a balance for every account in the balance sheet.</p> <p>You can only select a dimension in this field if you select "Opening" or "Movement" in the "Layout" field.</p>

Field	Description
<b>Include Zero Balances from Level</b>	Here you specify whether to include zero-balance accounts for a given level. If you enter "1," for example, the printout will only include zero-balance sum accounts, and will not include any zero-balance posting accounts.
<b>Include Zero Balance Dimensions</b>	Here you can specify whether to include a dimension option, also when the balance for an option in an account is zero. The option is included regardless of its balance, if this field is marked. If it is not marked, the option is only included if the account has a balance that is different from zero for this option. The field only applies if the "Allocate to Dimension" field is marked.
<b>Tax Code</b>	If you mark this field, the balance sheet will show the tax codes for every account.  If multiple tax codes are enabled, this field will be replaced by the field "Show Tax Codes." To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters workspace. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Include Page Break</b>	Here you can specify whether to include page breaks, where this is specified by page break accounts in the Account Structure workspace. If the field is marked, the printout includes page breaks. Page breaks only occur in page break accounts found on a line in the account structure that lies within the range specified in the field "Line No."
<b>Include Headings</b>	If you mark this field, the printout will include heading accounts in the Account Structure workspace. The printout will only include heading accounts found on a line in the account structure that lies within the range specified in the field "Line No."
<b>Include Underlinings</b>	If you mark this field, the printout will include underlining accounts—single underlining as well as double in the Account Structure workspace. The printout will only include underlining accounts found on a line in the account structure that lies within the range specified in the field "Line No."  Only Include Accts with Dimension Alloc. Here, you specify whether to include accounts assigned to a dimension. "Manual," "Control," "Heading," and "Page Break" accounts can be assigned to either the "Company," "Location," "Entity," or "Project" dimension in their account information cards. If you mark this field, you must select "Company Account," "Location Account," "Entity Account," or "Project Account" in the "Layout" field in this window. If you do not mark this field, the balance will include all accounts.

### Currency Island

Field	Description
<b>Reporting Currency</b>	In this field, you can specify the currency in which figures on the printout should be displayed. All total figures will be converted into and displayed in this currency. If the current user has been assigned to a company in the Users

Field	Description
	workspace, Maconomy suggests the company base currency of the company in question.  When converting amounts into the selected currency, Maconomy uses the exchange rates that are valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table selected in the field "Exchange Rate Table" below. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may cause discrepancies between the registered amounts and the amounts shown in this window.
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table selected in the field "Exchange Rate Table" below.
<b>Exchange Rate Table</b>	In this field, you can specify the exchange rate table to use when converting between currencies in the printout.
<b>Basis</b>	In this field, you can specify which amounts on each G/L entry should form the basis of the printed figures. Each G/L entry stores the amount in enterprise currency, the base currency of the company in question, and the currency of the account on which the entry is recorded. The printout will for every G/L entry convert the amount in the in the currency of the basis selected into the reporting currency, using the selected exchange rate date and table.

## Print Balance Sheet Workspace

Use this workspace to print a balance sheet for a given period.

The balance sheet shows the opening balance, total debit entries, total credit entries, and closing balance for balance sheet accounts.

The balance sheet can include all balance sheet accounts, or you can limit the included accounts in a number of ways-for example, to departmental accounts or to a range of dimension values.

Maconomy prints the accounts in the order that you specified in the Account Structure workspace.

If you select the **Calculate operating result in reports** system parameter, Maconomy also displays the company's current operating result in the year-end closing account, calculated as the sum of the balances in the company's P&L accounts. In this way, the report simulates a year-end closing without creating the entries made during a year-end closing.

## Print Balance Sheet Tab

This section includes the fields and descriptions for the Print Balance Sheet tab.

### Selection Criteria Island

Field	Description
<b>Company No.</b>	In these fields, you enter a range of companies. If you enter a range, the balance will only include information pertaining to companies within the specified range. If you leave these fields blank, they will not affect the balance.
<b>Account No.</b>	In this field, you enter a range of account numbers. The balance will only include accounts with an account number within this range, and marked "Balance Sheet" in the window Account Structure. If you leave these fields blank, they have no influence on the selection criteria.  If you have marked the "Invert Sign" field in the Print Control island in the Account Information Card workspace, credit amounts will be printed as positive figures and debit amounts as negative figures.
<b>Department</b>	Here you can select a department. The printout will only include balance sheet accounts assigned to this department. If you leave these fields blank, they will not affect the balance.
<b>Statistics 1-4</b>	Here you enter up to four statistics code ranges. The printout will only include balance sheet accounts with statistics codes within this range. If you leave the codes blank, the statistics fields will not affect the selection criteria.
<b>Sum Level</b>	Here you can enter a range of sum levels. The printout will only include accounts marked "Balance Sheet" in the Account Structure workspace on a sum level within the given range. If you leave these fields blank, they will not affect the balance.
<b>Line No.</b>	In these fields, you can specify a range of line numbers from the account structure. The printout will only include accounts marked "Balance Sheet" in the Account Structure workspace, and appearing on an account structure line within the specified range.

### Select Criteria, Dimensions Island

Field	Description
<b>Location</b>	In this field, you enter a range of locations. The balance will only include entries to locations within this range. If you leave the fields blank, they will not affect the balance.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.

Field	Description
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

### Period Island

Field	Description
<b>Month/Yr.</b>	<p>Here you enter the starting month/year and ending month/year of the period for which the balance is to be printed. Enter the period as a number, for example, "1" for January, "2" for February, and so on.</p> <p>If your company uses flexible periods that do not follow the calendar year, the month and year you enter here refer to the period defined in the window Fiscal Year.</p>

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the Print Layout workspace in the Set-Up module, "Standard" is the only option.
<b>Include Zero Balances from Level</b>	Here you specify whether to include balance sheet accounts with both zero opening and zero closing balances from a given level. If, for example, you enter "1," the balance will only show posting accounts (that is, accounts with sum level 0) if either the opening or closing balance for the period is different from 0.
<b>Include Page Break</b>	Here you can specify whether to include page breaks, where this is specified by page break accounts marked "Balance Sheet" in the Account Structure workspace. If the box is checked, the printout includes page breaks.
<b>Include Headings</b>	Here you can specify whether to include headings, where this is specified by heading accounts marked "Balance Sheet" in the Account Structure workspace. If the box is checked, the printout includes headings.

### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which figures on the printout should be displayed. All total figures will be converted into and displayed in this currency. If the current user has been assigned to a company in the Users workspace, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates that are valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table</p>

Field	Description
	selected in the field "Exchange Rate Table" below. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table selected in the field "Exchange Rate Table" below.
<b>Exchange Rate Table</b>	In this field, you can specify the exchange rate table to use when converting between currencies in the printout.
<b>Basis</b>	In this field, you can specify which amounts on each G/L entry should form the basis of the printed figures. Each G/L entry stores the amount in enterprise currency, the base currency of the company in question, and the currency of the account on which the entry is recorded. The printout will for every G/L entry convert the amount in the currency of the basis selected into the reporting currency, using the selected exchange rate date and table.

## Print Income Statement Workspace

Use this workspace to print an income statement (P&L report) for a given period.

The income statement shows the period's total movements compared with its budget or with the corresponding period in the previous fiscal year.

The income statement can include all profit and loss accounts or you can limit the included accounts in a number of ways—for example, to departmental accounts or to a range of dimension values.

### Print Income Statement Tab

This section includes the fields and descriptions for the Print Income Statement tab.

#### Selection Criteria Island

Field	Description
<b>Company No.</b>	In these fields you enter a range of companies. If you enter a range, the report will only include information pertaining to companies within the specified range. If you leave these fields blank, they will not affect the report.
<b>Account No.</b>	Here you enter a range of account numbers. The income statement will only include accounts with an account number within this range, and marked "P & L" in the Account Structure workspace. If you leave these fields blank, these fields have no influence on the report.

Field	Description
	If you have marked the "Invert Sign" field in the Print Control island in the Account Information Card workspace, credit amounts will be printed as positive figures and debit amounts as negative figures.
<b>Department</b>	Here you can select a department. The income statement will only include P & L accounts assigned to this department. If you leave this field blank, it has no influence on the target group.
<b>Statistics 1-4</b>	Here you enter up to four statistics code ranges. The income statement will only include P & L accounts with statistics codes within this range. If you leave these codes blank, the statistics fields have no influence on the target group.
<b>Sum Level</b>	Here you can enter a range of sum levels. The income statement will only include accounts marked "P&L" in the Account Structure workspace on a sum level within the given range. If you leave these fields blank, they have no influence on the target group.
<b>Line No.</b>	In these fields, you can specify a range of line numbers from the account structure. The printout will only include accounts with an account structure line number within the specified range, and marked "P&L" in the Account Structure workspace.

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	Here you enter a range of locations. The income statement will only include entries to locations within this range. If you leave the fields blank, they will not affect the report.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

#### Period Island

Field	Description
<b>Month/Yr.</b>	Here you enter the starting month and year and the closing month and year of the period for the income statement. Enter the month as a number, for example, "1" for January, "2" for February, and so on.

Field	Description
	If your company uses flexible periods that do not follow the calendar year, the month and year you enter here refers to the period defined in the window Fiscal Year.

### Budget Island

Field	Description
<b>Budget Model</b>	If you have selected "Compare with Budget" in the Print Control island, you can enter the budget model with which you want to compare the actual figures in this field.
<b>Version</b>	In this field, you can enter which version of the budget model selected in the field "Budget Model" above with which you want to compare the actual figures.
<b>Budget Type</b>	In this field, you can select the budget type with which to compare the actual period figures, if you have checked the box "Compare with Budget" in the Print Control island. Instead of selecting a budget model in the field "Budget Model" above, you can select a budget type to make Maconomy select the budget model of the specified type for the fiscal year indicated in the field "Month/Yr." Budget types are created in the pop-up field "Budget Type" in the Popup Fields workspace in the Set-Up module.
<b>Version Type</b>	In this field, you can select which budget version type to use when comparing budget figures with actual figures, if you have checked the box "Compare with Budget" in the Print Control island. Instead of selecting a version number in the field "Version" above, you can select a budget version type to make Maconomy select the budget model of the specified version type for the fiscal year indicated in the field "Month/Yr." Budget version types are created in the pop-up field "Budget Version Type" in the Popup Fields workspace in the Set-Up module.

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the Print Layout workspace in the Set-Up module, "Standard" is the only option.
<b>Include Zero Balances from Level</b>	Here you specify whether to include P & L accounts with zero period balances for both this year and last year from a given level. If, for example, you enter "1," the income statement will only show posting accounts (that is, accounts with sum level 0) if either the opening or closing balance for the period is different from 0.
<b>Include Page Break</b>	Here you can specify whether to include page breaks, where this is specified by page break accounts marked "P&L" in the Account Structure workspace. If the box is checked, the printout includes page breaks.
<b>Include Headings</b>	Here you can specify whether to include headings, where this is specified by heading accounts marked "P&L" in the Account Structure workspace. If the box is checked, the printout includes headings.

Field	Description
<b>Compare with Budget</b>	You can check this box if you wish to compare the period result with a budget. If you mark this field, the period movements will be compared with the budget selected in the field "Budget Model." If the box is not checked, the period movements are compared with the movements in the corresponding period in the previous year.

### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which figures on the printout should be displayed. All total figures will be converted into and displayed in this currency. If the current user has been assigned to a company in the Users workspace, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table selected in the field "Exchange Rate Table" below. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates that are valid on this date according to the exchange rate table selected in the field "Exchange Rate Table" below.
<b>Exchange Rate Table</b>	In this field, you can specify the exchange rate table to used when converting between currencies in the printout.
<b>Basis</b>	In this field, you can specify which amounts on each G/L entry should form the basis of the printed figures. Each G/L entry stores the amount in enterprise currency, the base currency of the company in question, and the currency of the account on which the entry is recorded. The printout will for every G/L entry convert the amount in the currency of the basis selected into the reporting currency, using the selected exchange rate date and table.

## Print Balance Overview Workspace

Use this workspace to select a set of accounts and display data about them.

You can show debited and credited amounts or compare budgeted and actual amounts for the accounts that you select.

Use the selection criteria to select accounts. For example, you can select a range of accounts or select all accounts for a single department.

If you print a balance overview for multiple companies, and these companies use different fiscal years, the year-to-date figures may be misleading.

### Print Balance Overview Tab

This section includes the fields and descriptions for the Print Balance Overview tab.

#### Selection Criteria Island

Field	Description
<b>Company No.</b>	In these fields you enter a range of companies. If you enter a range, the report will only include information pertaining to companies within the specified range. If you leave these fields blank, they will not affect the report.
<b>Account No.</b>	Here you enter a range of account numbers. The printout will only include accounts with an account number within this range. If you leave these fields blank, they will not affect the report.
<b>Statistics 1-4</b>	Here you enter up to four statistics code ranges. The printout will only include accounts with statistics codes within this range. If you leave these codes blank, the statistics fields have no influence on the printout.
<b>Sum Level</b>	Here you can enter a range of sum levels. The printout will only include accounts with a sum level within the given range. If you leave these fields blank, they have no influence on the printout.
<b>Line No.</b>	In these fields, you can specify a range of line numbers from the account structure. The printout will only include accounts with an account structure line number within the specified range, and marked "Balance Sheet" in the Account Structure workspace.
<b>Department</b>	Here you can select a department. The printout will only include accounts assigned to this department in the Account Information Card workspace. If you leave these field blank, it has no influence on the printout.

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	Here you enter a range of locations. The printout will only include entries to locations within this range. If you leave these fields blank, they will not affect the report.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.

Field	Description
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

### Period Island

Field	Description
<b>Month/Yr.</b>	<p>Here you enter the starting month and year and the closing month and year of the period for the printout. Enter the month as a number, for example, "1" for January, "2" for February, and so on.</p> <p>If your company uses fiscal periods that do not follow the calendar year, the month and year you enter here refers to the period defined in the window Fiscal Year.</p>

### Budget Island

Field	Description
<b>Budget Model</b>	If you have selected "Result" in the field "Layout," you must enter the budget model with which you want to compare the actual figures in this field. The printout will then show both the budgeted and the actual figures based on the budget and G/L entries within the selection criteria. If the layout "Result" has not been selected, the field has no effect.
<b>Version</b>	In this field, you can enter the version of the budget model selected in the field "Budget Model" above with which you want to compare the actual figures. If the layout "Result" has not been selected, the field has no effect.
<b>Budget Type</b>	In this field, you can select the budget type with which to compare the actual period figures, if you have checked the box "Compare with Budget" in the Print Control island. Instead of selecting a budget model in the field "Budget Model" above, you can select a budget type to make Maconomy select the budget model of the specified type for the fiscal year indicated in the field "Month/Yr." Budget types are created in the pop-up field "Budget Type" in the Popup Fields workspace in the Set-Up module.
<b>Version Type</b>	In this field, you can select the budget version type to use when comparing budget figures with actual figures, if you have checked the box "Compare with Budget" in the Print Control island. Instead of selecting a version number in the field "Version" above, you can select a budget version type to make Maconomy select the budget model of the specified version type for the fiscal year indicated in the field "Month/Yr." Budget types are created in the pop-up field "Budget Version Type" in the Popup Fields workspace in the Set-Up module.

**Currency Island**

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which figures on the printout should be displayed. All total figures will be converted into and displayed in this currency. If the current user has been assigned to a company in the Users workspace, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates that are valid on the date entered in the field “Exchange Rate Date” below, and the exchange rate table used is the exchange rate table selected in the field “Exchange Rate Table” below. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates that are valid on this date according to the exchange rate table selected in the field “Exchange Rate Table” below.
<b>Exchange Rate Table</b>	In this field, you can specify the exchange rate table to use when converting between currencies in the printout.
<b>Basis</b>	In this field, you can specify which amounts on each G/L entry should form the basis of the printed figures. Each G/L entry stores the amount in enterprise currency, the base currency of the company in question, and the currency of the account on which the entry is recorded. The printout will for every G/L entry convert the amount in the in the currency of the basis selected into the reporting currency, using the selected exchange rate date and table.

**Print Control Island**

Field	Description
<b>Layout</b>	In this field you choose the layout of the printout. The layout “Balance Sheet” shows opening and closing balances and the total movements within the period for each of the balance sheet accounts identified by the selection criteria. The layout “Trial Balance” shows debited and credited amounts and total movements within the period for each of the P&L and balance sheet accounts comprised by the selection criteria. The layout “Result” compares actual amounts with the budget figures for the individual accounts. For all the layouts, only the entries identified by the selection criteria are included in the printout.
<b>Include Zero Balances from Level</b>	Here you specify whether to include accounts with zero balances in the printout for a given level. If, for example, you enter “1,” the printout will only show sum accounts with a balance of zero, whereas no posting accounts with a balance of zero will be shown.

Field	Description
<b>Settings</b>	<p>Here you specify additional settings:</p> <ul style="list-style-type: none"> <li>■ <b>Include Page Break</b>— Here you can specify whether to include page breaks in the printout, where this is specified by page break accounts in the Account Structure workspace. If the box is checked, the printout includes page breaks. Page breaks only occur where the page break accounts in the account structure are included in the range specified in the field “Line No.”</li> <li>■ <b>Include Headings</b>— Here you can specify whether to include headings in the printout, where this is specified by heading accounts in the Account Structure workspace. If the box is checked, the printout includes headings. Headings only occur where the heading accounts in the account structure are included in the range specified in the field “Line No.”</li> <li>■ <b>Compare with Budget</b> — You can mark this field if you wish to compare the period figures with a budget. If you mark the field, the period movements will be compared with the budget selected in the field “Budget Type.” If this field is not marked, the period movements are compared with the movements in the corresponding fiscal period in the previous year.</li> </ul>

## Print General Ledger Workspace

Use this workspace to review account activity for a set of accounts.

For each account, you see the opening and closing balances and all of the entries that debited or credited the account.

Use selection criteria to specify the accounts and entries that are included in the report.

Depending on the layout that you select, the report shows all entries that meet the selection criteria or only summary information about the journals to which the entries are assigned.

### Print General Ledger Tab

This section includes the fields and descriptions for the Print General Ledger tab.

#### Selection Criteria Island

Field	Description
<b>Company No.</b>	In these fields you enter a range of companies. If you enter a range, the report will only include entries pertaining to companies within the specified range.
<b>Account No.</b>	Here you enter a range of account numbers. The printout will only include accounts with an account number within this range. If you leave these fields blank, these fields have no influence on the report.
<b>Statistics 1-4</b>	Here you enter up to four statistics code ranges. The income statement will only include accounts with statistics codes within this range. If you leave these codes blank, the statistics fields have no influence on the printout.

Field	Description
<b>Department</b>	Here you can select a department. The printout will only include accounts assigned to this department in the Account Information Card workspace. If you leave these field blank, it has no influence on the printout.

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	Here you enter a range of locations. The printout will only include entries with reference to locations within this range. If you leave the fields blank, they will not affect the report.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

### Period Island

Field	Description
<b>Month/Yr.</b>	<p>Here you enter the starting month and year and the closing month and year of the period for the printout. Enter the month as a number, for example, "1" for January, "2" for February, and so on.</p> <p>If your company uses fiscal periods that do not follow the calendar year, the month and year you enter here refers to the period defined in the window Fiscal Year.</p>

### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which figures on the printout should be displayed. All report figures will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates that are valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the enterprise exchange rate table selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original</p>

Field	Description
	amount has been registered in the same currency as the one specified in this field, which may cause discrepancies between the registered amounts and the amounts shown in this window.
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates that are valid on this date according to the enterprise exchange rate table selected in the System Information workspace in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

### Print Control Island

Field	Description
<b>Layout</b>	Here you choose the layout of the printout. The layout "Standard" shows opening and closing balances for each account in the selection criteria, and information about the entries in the selection criteria which have caused movements on the accounts in question. The layout "Journal Listing" shows summary information for each account about the journals which contain entries within the selection criteria and which have therefore caused movements on the account in question.
<b>Include</b>	Here you specify additional settings: <ul style="list-style-type: none"> <li>Zero Balance Accts — Here you specify whether to include accounts with a zero balance. If this field is selected, the account is always included, regardless of its balance. If the field is not selected, an account is only included if its balance is different from zero.</li> <li>Page Break at New Account — Here you can specify whether to include page breaks in the printout, wherever this is specified by page break accounts in the chart of accounts. If this field is selected, page breaks are included.</li> <li>Dimensions — Here you can specify whether to include the dimension values for the printed entries. If this field is selected, the dimension values are included in the printout. The field is only considered if the layout "Standard" is selected, as the layout "Journal Listing" only shows summary journal information.</li> </ul>

## Print Currency Positions Workspace

Use this workspace to review currency positions, useful for estimating the company's available funds.

The report shows positions for vendors and customers. The positions are displayed in blocks, each of which represents a base currency. Each block displays the amounts originally entered in the vendors' and customers' currencies (that is, the amounts due to vendors and due from customers), the amounts posted in the current base currency, and the converted amounts in the base currency, using the exchange rate that was valid on the exchange rate date. The report also includes a block that shows totals for each position in the reporting currency.

Based on a specified start date, a currency position report shows due amounts on the start date and two months from the start date; it also shows a total for the period after two months. If you specify January 1 as the start date, the list shows the due balance on January 1, February 1, March 1, and the period after that. Note that an entry that is due in January and after the start date (which, in this case, is January 1) is included in the total for the following month (in this case, February).

## Print Currency Positions Tab

This section includes the fields and descriptions for the Print Currency Positions tab.

### Selection Criteria Island

Field	Description
<b>Company No.</b>	In this field, you can specify a range of company numbers. Only the figures relating to company specific customers whose settling company is within the specified range are included in the printout.
<b>Currency</b>	Here you can choose for which currency to calculate currency positions. If you leave this field blank, the list will contain currency positions for all currencies in Maconomy.
<b>Start Date</b>	<p>In this field, you specify the start date from which Maconomy will calculate the currency positions. The field is mandatory.</p> <p>Maconomy calculates the due balance on four dates:</p> <ol style="list-style-type: none"><li>1. The specified start date</li><li>2. One month as of the start date</li><li>3. Two months as of the start date</li><li>4. The due balance for the months following the two month period</li></ol>

### Currency Island

Field	Description
<b>Reporting Currency</b>	Here you can choose for which currency to calculate currency positions. If you leave this field blank, the list will contain currency positions for all currencies in Maconomy.
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected in the System Information workspace in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

**Print Control Island**

Field	Description
Layout	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the Print Layout workspace in the Set-Up module, "Standard" is the only option.

**Tax Section**

This section includes the fields and descriptions for the Tax section workspaces.

**Tax Codes Workspace**

Use this workspace to set up tax codes.

If you sell or purchase an activity or an item, Maconomy applies a tax rate from a tax table if a tax table is available and the tax table criteria are met. If not, Maconomy applies the tax code that is associated with the item or activity.

Tax reporting systems can vary substantially from country to country. Different tax rates may be applied based on the purchaser's location, the type of buyer (retail/wholesale), or the type of product/service provided (tax-free, tax-exempt, or rate). Additionally, multiple regional tax reporting units exist in some countries, including the United States, India, and Brazil.

**Postings**

Maconomy automatically posts the tax amounts to the correct accounts, depending on whether the transaction is a purchase or sale.

Another option is to use G/L tax codes, which you set up in the G/L Tax Codes workspace. These codes let you explicitly determine whether a tax amount should be posted to receivable or payable accounts.

**Three Levels of Taxes**

Maconomy lets you use up to three different tax levels, labeled Tax Code 1, Tax Code 2, and Tax Code 3. For example, you could use the three levels for national tax, regional tax, and local tax. To use this functionality, select the **Show Three Tax Levels** or **Show Two Tax Levels** system parameter in the System Parameters workspace.

Maconomy can calculate all three levels from the base amount, or they can be cumulative.

For example, assume that you are creating an invoice for an item that costs \$100 before taxes. \$100 is the base amount. You have three tax levels: 5% national tax, 7% regional tax, and 8% local tax.

If Maconomy calculates the tax from the base amount, the total invoiceable amount after applicable taxes is \$120 ( $100 + 5 + 7 + 8 = 120$ ).

If the tax is cumulative, the total invoiceable amount is \$121.34 ( $100 \times 1.05 = 105$ ;  $105 \times 1.07 = 112.35$ ;  $112.35 \times 1.08 = 121.34$ ).

## Tax Code Tab

This section includes the fields and descriptions for the Tax Code tab.

### Tax Code Island

Field	Description
<b>Name</b>	In this field, you can enter the name of the tax code.

### Tax Payable Island

Field	Description
<b>Tax Rate</b>	In this field, you can specify the tax rate for the current tax code.
<b>Tax Type, Taxable</b>	In this field, you can specify the tax type of the chosen sublevel to be transferred to tax basis entries created when posting taxable invoices and credit memos.
<b>Tax Type, Export</b>	In this field, you can specify the tax type of the chosen sublevel to be transferred to export related entries created when posting taxable invoices and credit memos.
<b>Posting Reference</b>	In these fields, you can specify the number of a dimension combination which contains the account number and any other dimension values needed when posting payable tax for the sublevel in question. If no value is specified for a dimension in the dimension combination, the value specified on the entry line which gives rise to the tax posting is used.

### Invoices Excl. Tax Island

Field	Description
<b>Nature of Tax</b>	When posting invoices and credit memos, the nature of tax from the tax code of each invoice or credit memo line is transferred to the tax basis entries created. The nature of tax is used in the tax settlement for distinguishing between taxable, tax exempt, and export related entries. In this field you can specify if invoice and credit memo lines using the current tax code should be a part of the company's tax accounts as taxable sales, tax exempt sales, or export sales when the field "Tax" is marked for the invoice or credit memo in question.
<b>Tax Type</b>	<p>In this field, you can specify the tax type to be transferred to tax basis entries created when posting taxable invoices and credit memos. A tax basis entry is an entry from which tax must be lifted. An invoice or credit memo is taxable if the field "Tax" is selected on the invoice or credit memo. When such an invoice or credit memo is posted, the information in these fields will be transferred to the G/L entries which pertain to invoice lines with the current tax code.</p> <p>When posting invoices and credit memos, the tax type from the tax code of each invoice or credit memo line is transferred to the tax basis entries created. If tax is to</p>

Field	Description
	be lifted from the invoice or credit memo in question, the tax type in this field is used. Tax types are created in the popup field "Tax Type" in the window Popup Fields in the Set-Up module.

### Extra Fields Island

Field	Description
<b>Popup 1-4</b>	In these four fields, you can select various information about the tax rates. These are pop-up fields, which means that you can choose from the options created for each field. They are created as Tax Popup 1 - Tax Popup 4 in the window Popup Fields. This information is transferred to tax settlement entries so that the tax reports can be group by the new tax type fields.

### Tax Receivable Island

Field	Description
<b>Posting Reference</b>	In this field, you can specify the number of a dimension combination which contains the account number and any other dimension values needed when posting receivable tax. If no value is specified for a dimension in the dimension combination, the value specified on the entry line which gives rise to the tax posting is used.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can specify a description and name for an access level for the current tax code. If an access level is specified, only users who have been granted access to this access level or higher can use the tax code when registering information in Maconomy windows. In this window, a user can only see a given tax code if he has been granted access to the access level specified for the tax code in question, or a higher level. Please note that this access control only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to tax codes may depend on other factors. For further information about the standard access control configuration, please see the section "Introduction to the Access Control System" in the SetUp module.</p> <p>If you do not specify an access level, all users will have access to see information about the current tax code.</p>

### Special Tax Island

Field	Description
<b>Special Tax Rate</b>	In this field, you can specify a tax rate which often represents public charges. The tax is charged to the invoicing party and not the customer being invoiced. Therefore it is not added to the invoice or credit memo amounts.

Field	Description
	The charge will only be used in connection with invoice and credit memo postings. If you specify a tax rate here, the calculated charge amount will be posted on the account specified in the dimension combination in the field "Tax" in this window with an offset entry posted on the account specified in the dimension combination in the field "Offset Account" in the island Posting References.
<b>Special Tax Type</b>	In this field, you can specify the tax type of the chosen sublevel to be transferred to tax basis entries created when posting taxable invoices and credit memos.
<b>Posting Reference</b>	In these fields, you can specify the number of a dimension combination which contains the account number and any other dimension values needed when posting payable tax for the special tax sublevel in question. If no value is specified for a dimension in the dimension combination, the value specified on the entry line which gives rise to the tax posting is used.
<b>Offset Posting Reference</b>	In this field, you can specify the number of a dimension combination which contains the account number and any other dimension values needed when offsetting the tax calculated from the value in the field "Tax Rate" for Special Tax. If no value is specified for a dimension in the dimension combination, the value specified on the entry line which gives rise to the tax posting is used.
<b>Create Job Entry</b>	When this is selected, Maconomy creates a closed job entry with the special tax rate for the special tax sublevel chosen.
<b>Activity No., Special Tax</b>	These fields allow you to select an Activity which will be transferred to the entries created when selecting the 'Create Job Entry' field.

### Invoices Incl. Tax Island

Field	Description
<b>Nature of Tax</b>	When posting invoices and credit memos, the nature of tax from the tax code of each invoice or credit memo line is transferred to the tax basis entries created. The nature of tax is used in the tax settlement for distinguishing between taxable, tax exempt, and export related entries. In this field you can specify if invoice and credit memo lines using the current tax code should be a part of the company's tax accounts as taxable sales, tax exempt sales, or export sales when the field "Tax" is marked for the invoice or credit memo in question.
<b>Tax Type</b>	<p>In this field, you can specify the tax type to be transferred to tax basis entries created when posting taxable invoices and credit memos. A tax basis entry is an entry from which tax must be lifted. An invoice or credit memo is taxable if the field "Tax" is selected on the invoice or credit memo. When such an invoice or credit memo is posted, the information in these fields will be transferred to the G/L entries which pertain to invoice lines with the current tax code.</p> <p>When posting invoices and credit memos, the tax type from the tax code of each invoice or credit memo line is transferred to the tax basis entries created. If tax is to</p>

Field	Description
	be lifted from the invoice or credit memo in question, the tax type in this field is used. Tax types are created in the popup field "Tax Type" in the window Popup Fields in the Set-Up module.

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

## Tax Tables Workspace

Use this workspace to set up tax tables.

Maconomy uses the information from the tax tables in this workspace when you process transactions in the Sales Orders, Item Purchase, and Job Cost modules. If Maconomy cannot identify the correct tax code, it uses the specific item's tax code in the Item Information Card workspace or the Activities workspace.

You can use tax tables if your company sells items to tax locales that have different tax rates, or if you have more than one company in your enterprise, and the companies are subject to different taxes.

### Assigning Tax Tables to Companies and Countries

You can assign a tax table to one or more companies, so that each company uses just one tax table for sales and purchases.

You can also use the **Country** field in this workspace to assign a country code to a tax table, then assign lines in the Tax Table Lines sub-tab to the country.

To determine which tax to apply, Maconomy uses the tax code from the tax table that is assigned to the company that entered the sale or purchase, combined with the country code that is specified for the sales order, invoice, job, and so on. If Maconomy cannot identify the correct tax code, it uses the tax code from the item's information card or from the activity.

On each line in the Tax Table Lines sub-tab, you assign a tax code to a target group that is made up of a combination of item groups, item types, item numbers, and so on. This is how you determine how taxes are applied to specific items and activities.

For auditing purposes, Deltek recommends that you print and file the Tax Tables workspace every time that you change it.

### Tax Table Tab

This section includes the fields and descriptions for the Tax Table tab.

### Tax Table Island

Field	Description
<b>Name</b>	In this field, you can specify a name for the current tax table. The name of the tax table can be assigned to one or more companies limiting a company to the use of one specific tax table in connection with sales and purchases.

Field	Description
	In the following four fields, you can specify a tax table description or outline.

### Selection Criteria Island

Field	Description
<b>Country</b>	In this pop-up field, you select the country code to which you want to assign tax table lines. The Tax Table Lines sub-tab only displays lines assigned to the selected country, and if you create lines, these will be assigned to this country. You can choose between the state/country codes created in the Countries workspace in the Set-Up module. When the current tax table is used, Maconomy only uses those lines in the tax table that are assigned to the country specified on the current sales order, job, and so on.
<b>Company Tax Code</b>	In this field, you can specify a company tax code. All tax table lines matching the selected company tax code and the other specified selection criteria are shown in the Tax Table Lines sub-tab.
<b>Item Tax Code</b>	In this field, you can specify an item tax code. All tax table lines matching the selected item tax code and the other specified selection criteria are shown in the Tax Table Lines sub-tab.
<b>Enterprise</b>	In this field, you can specify an enterprise. All tax table lines matching the selected enterprise and the other specified selection criteria are shown in the Tax Table Lines sub-tab.
<b>Segment</b>	In this field, you can specify a segment. All tax table lines matching the selected segment and the other specified selection criteria are shown in the Tax Table Lines sub-tab.
<b>Area</b>	In this field, you can specify an area. All tax table lines matching the selected area and the other specified selection criteria are shown in the Tax Table Lines sub-tab.
<b>Tax Direction</b>	In this field, you can specify whether the tax direction should be receivable or payable. All tax table lines matching the selected tax direction and the other specified selection criteria are shown in the Tax Table Lines sub-tab.
<b>Date</b>	In this field, you can specify a date. All periodic tax table lines that are in effect on the selected date and the other specified selection criteria will be shown in the Tax Table Lines sub-tab. If no time period has been specified for a tax table line, the tax table line will be shown in the Tax Table Lines sub-tab regardless of the date entry in this field.
<b>Show All Lines</b>	This check box allows you to toggle between showing only the tax table lines that match the specified selection criteria and showing all tax table lines in the Tax Table Lines sub-tab. This means you do not need to reset all selection criteria to view a certain tax table line or all available tax table lines.

### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

**Rederivation Island**

Field	Description
<b>Rederive at &lt;registration value&gt; Change</b>	<p>The check boxes in this island allow you to specify whether the tax code(s) should be rederived from the relevant tax table line. This lets you select individual registration values for which tax codes will be rederived. Rederivation will occur when the relevant tax-related registration value is changed in an amount registration window.</p> <p>If you mark a check box, for instance “Rederive at Location Change,” the tax code(s) belonging to the relevant tax table line will be rederived when a location is changed in any amount registration window.</p> <p>In the example above, if the location on an invoice line is changed, the tax code(s) will be rederived from the relevant tax table line. Deriving the tax code(s) for location value changes could be useful in cases where the tax rate differs from location to location.</p>

**Rederivation, Dimensions Island**

Field	Description
<b>Rederive at &lt;registration value&gt; Change</b>	<p>The check boxes in this island allow you to specify whether the tax code(s) should be rederived from the relevant tax table line. This lets you select individual registration values for which tax codes will be rederived. Rederivation will occur when the relevant tax-related registration value is changed in an amount registration window.</p> <p>If you mark a checkbox, for instance “Rederive at Location Change,” the tax code(s) belonging to the relevant tax table line will be rederived when a location is changed in any amount registration window.</p> <p>In the example above, if the location on an invoice line is changed, the tax code(s) will be rederived from the relevant tax table line. Deriving the tax code(s) for location value changes could be useful in cases where the tax rate differs from location to location.</p>

**Tax Table Lines Sub-Tab**

This section includes the fields and descriptions for the Tax Table lines sub-tab.

Field	Description
<b>Tax Code</b>	<p>Here you specify the tax code for the line. You can choose between the tax codes created in the Tax Codes workspace, or you can leave this field blank to specify that the line is not taxable. In connection with order processing in the Sales Orders and Item Purchase modules, and invoicing in the Job Cost module, Maconomy will use the tax code specified in this field if the item line or job entry lies within the selection criteria specified in the following fields on the current line. Maconomy uses the first tax code line that matches the current registration. It is therefore very important to have the correct order of lines.</p>

Field	Description
	<p>You can easily change the order of lines using the “Move Tax Table Line Up / Down” arrows on the table toolbar. If you leave any field blank, it will not influence the target group. If you leave all of the fields blank, the tax code will be used for all item lines and job entries for which the current tax table is used. You can add up to three different tax codes if necessary.</p> <p>To enable multiple tax codes, the system parameters “Show Three Tax Levels,” “Show Two Tax Levels,” and/or “Show Tax Sublevels” must be marked in the System Parameters workspace. When multiple tax codes are enabled, the “Tax Code” field will be replaced by the following fields: “Tax Code 1,” “Tax Code 2,” and, if enabled, “Tax Code 3.”</p>
<b>Period From / Period To</b>	If you define a period in these fields, the selected tax code will only be applied to items within this range.
<b>Country</b>	This field allows you to select the country in which the tax code should be made applicable.
<b>Company Tax Code</b>	<p>If you enter a company tax code in this field, the tax code on the current line will only be used if the company tax code specified in the Tax Table tab in which the actual registration takes place matches this code.</p> <p>Company tax codes are created in the pop-up field “Company Tax Codes” in the Popup Fields workspace.</p>
<b>Item Tax Code</b>	<p>If you enter an item tax code in this field, the tax code on the current line will only be used if the item tax code specified in the Tax Table Lines sub-tab in which the actual registration takes place matches this code. When invoicing and crediting on account, the tax code on the current line will only be used if the on-account tax code specified in the System Information workspace corresponds to the code specified in this field.</p> <p>Please note that it is only possible to point out the tax code on an invoice on account or a credit memo on account using a tax table if the system parameter “Get on account tax code from tax table” is marked. Item tax reporting codes are created in the pop-up field “Item Tax Codes” in the Popup Fields workspace.</p>
<b>Enterprise</b>	This field allows you to select an enterprise to which the tax code on the tax table line should apply.
<b>Segment</b>	This field allows you to select a segment to which the tax code on the tax table line should apply.
<b>Area</b>	This field allows you to select an area to which the tax code on the tax table line should apply.
<b>Tax Direction</b>	This field allows you to select a tax direction for the tax code on the tax table line. You can choose between receivable, indicating that the tax code pertains to sales, and payable, which indicates that the tax code pertains to purchases.

Field	Description
<b>Account No. From / Account No. To</b>	If you define a range of account numbers in these fields, the selected tax code will only be applied to items within this range.
<b>Location From / Location To</b>	If you define a range of locations in these fields, the selected tax code will only be applied to items within this range.
<b>Entity From / Entity To</b>	If you define a range of entities in these fields, the selected tax code will only be applied to items within this range.
<b>Project From / Project To</b>	If you define a range of projects in these fields, the selected tax code will only be applied to items within this range.
<b>Purpose From / Purpose To</b>	If you define a range of purposes in these fields, the selected tax code will only be applied to items within this range.
<b>Spec. 1-3 From / Spec. 1-3 To</b>	If you define a range of specification values in these fields, the selected tax code will only be applied to items within this range.
<b>Local Spec. 1-3 From / Local Spec. 1-3 To</b>	If you define a range of local specification values in these fields, the selected tax code will only be applied to items within this range.
<b>Zip Code From / Zip Code To</b>	If you define a range of zip codes in these fields, the tax code will only be applied to items with a business address within this range.
<b>Activity No. From / Activity No. To</b>	If you define a range of activity numbers in these fields, the tax code will only be applied to sales orders with activity numbers within the defined range.
<b>Task Name From / Task Name To</b>	If you define a range of task names in these fields, the tax code will only be applied to items within this range.
<b>Item No. From / Item No.</b>	To If you define a range of item numbers in these fields, the tax code will only be used for items within this range. If you forget an item number, use the search function in the Find menu.
<b>Item Group</b>	Here you select the item group to which the item must belong for the tax code to be used.
<b>Item Type</b>	Here you select the item type to which the item must belong for the tax code to be used.
<b>Statistics 1-4</b>	If you complete these fields, the tax code will only be used for items with the same code in the fields "Statistics 1," "Statistics 2," "Statistics 3," and

Field	Description
	"Statistics 4" in the field "Print Control" in the Item Information Card workspace.

## G/L Tax Codes Workspace

Use this workspace to set up G/L tax codes.

These codes are different from standard tax codes because they let you explicitly determine whether a tax amount should be posted to receivable or payable accounts.

Standard tax codes, which you set up in the Tax Codes workspace, implicitly determine whether a tax amount should be posted to receivable or payable accounts.

Maconomy uses G/L tax codes to calculate tax on entries that are posted in the General Journal workspace in the G/L module and in the Purchase Orders, Vendor Invoices, Invoice Allocation, and Reallocate Invoices workspaces in the A/P module.

You can also maintain EU acquisition tax codes in this workspace.

### G/L Tax Code Tab

This section includes the fields and descriptions for the G/L Tax Code tab.

#### G/L Tax Code Island

Field	Description
<b>Name</b>	In this field, you can specify the name of the current tax code.
<b>Tax Rate</b>	In this field, you can specify the percentage rate of the current tax code.
<b>Ratio</b>	In this field, you can specify the deductible ratio of the receivable tax or charge. Companies with both taxable and tax-exempt sales are not entitled to deduct the full tax amount on expenses. If, for instance, only 70% of the receivable tax can be deducted, you must specify 70 in this field. If you have specified a dimension combination which refers to the account for ratio tax, the remaining 30% will be posted on the account specified by means of the dimension combination. If no account for ratio tax is specified, the remaining 30% will be posted on the same account as the expense from which the tax amount has been calculated. Note that this allocation only applies to manual postings. It is only possible to specify a ratio for receivable G/L tax codes as the ratio for payable tax codes is automatically set at 100.
<b>Tax Direction</b>	In this field, you can select the tax direction of the current tax code. You can choose between "Receivable," "Payable," "Withholding Tax Receivable," (used on customer payments) and Withholding Tax Payable (used on vendor payments).
<b>Nature of Tax</b>	In this field, you can specify whether registrations in the window General Journal are to be linked to either taxable, tax exempt or export item sales when

Field	Description
	<p>you calculate tax in the Tax Settlement workspace. The field only applies to payable tax codes.</p> <p>It is only necessary to specify tax codes if you wish to register outgoing invoices directly in the window General Journal. If you register tax-exempt or export item sales in this way, you must create a G/L tax code with a tax rate of 0%. The tax rate is used in connection with tax calculation. The tax basis of entries for which you have selected either "Taxable," "Tax Exempt," or "Export" in this field will be added to item sales originating from invoices or credit memos.</p>
<b>Default Tax Type</b>	<p>In this pop-up field, you can choose a tax type. Tax types are created in the pop-up field "Tax Type" in the Popup Fields workspace in the Set-Up module. In connection with posting, the tax type will be transferred to the entry that causes the tax settlement, and it is hereby possible to distinguish between different types of tax.</p>
<b>EU Acquisition Tax Code</b>	<p>By completing this field, you can specify that the G/L tax code is used for EU acquisition tax.</p> <p>For receivable EU acquisition tax codes, the tax amount is not calculated on the basis of the original amount as in the case of ordinary G/L tax codes. The full amount of the originally specified amount will be posted, and the tax which is calculated from the field "EU Acquisition Tax Rate" will be posted on the account referred to by the dimension combination specified in the field "Tax" in the Posting References island, and offset against the account referred to by the dimension combination specified in the field "EU Acquisition Tax." If you have specified a ratio, the EU acquisition tax will be calculated fully, whereas the non-deductible part of the tax amount will be posted on the account for tax reconciliation. If the latter has not been specified, the amount will be added to the expense itself.</p> <p>It is not possible to specify an EU acquisition tax rate or tax code for payable EU acquisition tax codes. Payable EU acquisition tax codes are used exclusively for manual postings of EU item sales as the G/L entries will be marked EU Sale and thereby appear in the field "EU Sale" on the tax settlement.</p>
<b>EU Acquisition Tax Rate</b>	<p>In this field, you can specify an EU acquisition tax rate to be used for the calculation of EU acquisition tax. For receivable EU acquisition tax codes, the tax amount is not calculated on the basis of the original amount as in the case of ordinary G/L tax codes. The full amount of the originally specified amount will be posted, and the tax which is calculated from the field "EU Acquisition Tax Rate" will be posted on the account referred to by the dimension combination specified in the field "Tax" in the Posting References island, and offset against the account referred to by the dimension combination specified in the field "EU Acquisition Tax." If you have specified a ratio, the EU acquisition tax will be calculated fully, whereas the non-deductible part of the tax amount will be posted on the account for tax reconciliation. If the latter has not been specified, the amount will be added to the expense itself.</p>

Field	Description
	For payable EU acquisition tax codes it is not possible to specify an EU acquisition tax rate or an EU tax account in the field "EU Acquisition Tax." Payable EU acquisition tax codes are used exclusively for manual postings of EU item sales as the G/L entries will be marked EU Sale and thus appear in the field "EU Sale" on the tax settlement.

### Investment Tax Island

Field	Description
<b>Investment Tax Rate</b>	In this field, you can specify the tax rate for the current tax code sublevel for investment tax.
<b>Entry Description</b>	This field shows the text for the entry.
<b>Create Separate Job Entry</b>	<p>In this field, you specify whether Maconomy is to create a separate job entry for the investment tax entry when posting new job-related vendor invoices on which the current G/L tax code has been specified. No markup is calculated for the investment tax entry, even if a markup percentage is specified for the activity.</p> <p>If you mark this field, Maconomy will create separate job entries for the vendor invoice amount excluding tax and the investment tax amount to which the vendor invoice gives rise. The amounts are thus shown separately on job invoices created in the Job Cost module.</p> <p>If you do not mark this field, Maconomy will include both the vendor invoice amount excluding tax and the investment tax amount in the same job entry when posting a job-related vendor invoice.</p>

### Posting References Island

Field	Description
<b>Tax</b>	In this field, you can specify the number of a dimension combination which contains the account number and any other dimensions that you wish to apply to the posting of receivable or payable tax, depending on your selection in the field "Tax Direction."
<b>Ratio Tax</b>	In this field, you can specify the number of a dimension combination which contains the account number and any other dimensions that you wish to apply to the posting of ratio tax. The information will be transferred to entries that are related to nondeductible tax amounts in relation to the specified ratio in the field "Ratio." If you do not enter a dimension combination in this field, the amount will be added to the expense itself. It is only possible to specify a ratio for receivable tax codes.
<b>EU Acquisition Tax</b>	In this field, you can specify the number of a dimension combination which contains the account number and any other dimensions that you wish to apply to the posting of EU acquisition tax. For payable EU acquisition tax codes, it is

Field	Description
	not possible to specify a dimension combination. Payable EU acquisition tax codes are used exclusively for manual postings of EU item sales as the G/L entries will be marked EU Sale and thus appear in the field "EU Sale" on the tax settlement.
<b>Investment Tax</b>	In this field, you can specify the number of a dimension combination which contains the account number and any other dimensions that you wish to apply to investment tax. Investment tax is only used in Norway.
<b>Investment Tax, Offset</b>	In this field, you can specify the number of a dimension combination which contains the account number and any other dimensions on which Maconomy should set off investment tax entries. When investment tax is posted, Maconomy needs to set off the investment tax amount. If you enter a dimension combination in this field, the amount is set off on the account and other dimensions in this dimension combination. If you do not enter a dimension combination, the amounts are set off on the P&L account and the other dimension values used on the entry which gave rise to the investment tax entry.
<b>Investment Tax, Basis</b>	In this field, you can specify the number of a dimension combination which contains the account number and any other dimensions that you wish to apply to basis entries for investment tax. This type of entry is only used in Norway.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can specify a description and name for an access level for the current G/L tax code. If an access level is specified, only users who have been granted access to this access level or higher can use the G/L tax code when registering information in Maconomy windows. In this workspace, a user can only see a given G/L tax code if he or she has been granted access to the access level specified for the G/L tax code in question, or a higher level. Please note that this access control only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to G/L tax codes may depend on other factors. For further information about the standard access control configuration, please see "Introduction to the Access Control System" in the Set-Up module.</p> <p>If you do not specify an access level, all users will have access to see information about the current G/L tax code.</p>

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

## G/L Tax Tables Workspace

Use this workspace to set up G/L tax tables.

Use G/L tax tables if your company purchases items from tax locales that have different tax rates, or if you have more than one company in your enterprise, and the companies are subject to different taxes.

You use tax tables to maintain standard G/L tax codes for specified allocation combinations. If you specify a tax code for the allocation combination in use, Maconomy automatically generates the entry of a tax code whenever that combination is used in, for example, the general ledger.

Use the G/L Tax Table Lines sub-tab to specify the G/L tax code to be used in different cases. For each line in this sub-tab, specify how taxes are applied to certain items and activities by assigning a G/L tax code to a target group composed of a combination of dimensions, activities, and a period.

You can assign one G/L tax table to each company. If you do not assign a G/L tax table to a company, Maconomy uses the G/L tax code for the G/L account that is associated with an entry.

Use the Selection Criteria island to select the G/L tax tables to display in the G/L Tax Table Lines sub-tab. You can edit the field values of any G/L tax table that is displayed.

### G/L Tax Table Tab

This section includes the fields and descriptions for the G/L Tax Table tab.

#### G/L Tax Table Island

Field	Description
<b>Name</b>	In this field, you enter the name of the G/L tax table. The first line is used for the name of the table, and the rest of the lines can be used for a description of the table.

#### Selection Criteria Island

Field	Description
<b>Company Tax Code</b>	In this field, you can specify a company tax code. All G/L tax table lines matching the selected company tax code and the other specified Selection Criteria are shown in the G/L Tax Table Lines sub-tab.
<b>Item Tax Code</b>	In this field, you can specify an item tax code. All G/L tax table lines matching the selected item tax code and the other specified selection criteria are shown in the G/L Tax Table Lines sub-tab.
<b>Enterprise</b>	In this field, you can specify an enterprise. All G/L tax table lines matching the selected enterprise and the other specified selection criteria are shown in the G/L Tax Table Lines sub-tab.
<b>Segment</b>	In this field, you can specify a segment. All G/L tax table lines matching the selected segment and the other specified selection criteria are shown in the G/L Tax Table Lines sub-tab.

Field	Description
<b>Area</b>	In this field, you can specify an area. All G/L tax table lines matching the selected area and the other specified Selection Criteria are shown in the table part.
<b>Date</b>	In this field, you can specify a date. All periodic G/L tax table lines that are in effect on the selected date and the other specified selection criteria will be shown in the G/L Tax Table Lines sub-tab. If no time period has been specified for a G/L tax table line, the G/L tax table line will be shown in the G/L Tax Table Lines sub-tab regardless of the date entry in this field.
<b>Show All Lines</b>	This checkbox allows you to toggle between showing only the G/L tax table lines that match the specified selection criteria and showing all G/L tax table lines in the G/L Tax Table Lines sub-tab. This means you do not need to reset all selection criteria to view a certain G/L tax table line or all available G/L tax table lines.

### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

### Rederivation Island

Field	Description
<b>Rederive at &lt;registration value&gt; Change</b>	<p>The check boxes in this island allow you to specify whether the tax code(s) should be rederived from the relevant G/L tax table line. This lets you select individual registration values for which tax codes will be rederived. Rederivation will occur when the relevant tax-related registration value is changed in an amount registration window.</p> <p>If you mark a checkbox, for instance “Rederive at Location Change,” the tax code(s) belonging to the relevant G/L tax table line will be rederived when a location is changed in any amount registration window.</p> <p>In the example above, if the location on an invoice line is changed, the tax code(s) will be rederived from the relevant G/L tax table line. Deriving the tax code(s) for location value changes could be useful in cases where the tax rate differs from location to location.</p>

### Rederivation, Dimensions Island

Field	Description
<b>Rederive at &lt;registration value&gt; Change</b>	<p>The check boxes in this island allow you to specify whether the tax code(s) should be rederived from the relevant G/L tax table line. This lets you select individual registration values for which tax codes will be rederived. Rederivation will occur when the relevant tax-related registration value is changed in an amount registration window.</p> <p>If you mark a checkbox, for instance “Rederive at Location Change,” the tax code(s) belonging to the relevant G/L tax table line will be rederived when a location is changed in any amount registration window.</p>

Field	Description
	In the example above, if the location on an invoice line is changed, the tax code(s) will be rederived from the relevant G/L tax table line. Deriving the tax code(s) for location value changes could be useful in cases where the tax rate differs from location to location.

## G/L Tax Table Lines Sub-Tab

This section includes the fields and descriptions for the G/L Tax Table Lines sub-tab.

Field	Description
<b>Tax Code</b>	<p>In this field, you enter a G/L tax code for the line in question. You can choose between the G/L tax codes that have been created in the G/L Tax Codes workspace, or you can leave this field blank to specify that the line is not taxable. When registering G/L entries, Maconomy will use this G/L tax code provided that the allocation combination used for the G/L entry fulfilled the combination defined by the fields in the allocation line in question. Maconomy uses the first G/L tax code line that matches the current registration. It is therefore very important to have the correct order of lines.</p> <p>You can easily change the order of lines using the "Move Tax Table Line Up / Down" arrows on the table toolbar. If you do not enter a value in some of the fields, the values entered in the other fields will define the allocation combination. If you do not enter any values in the other fields for a specific allocation combination line, the G/L tax code entered in this field will be used for all G/L entries of relevance to the assigned company.</p> <p>If multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2," and, if enabled, "Tax Code 3."</p>
<b>Period From / Period To</b>	In these fields you enter a date range. When registering a date elsewhere in Maconomy, the G/L tax code which is assigned to this combination will only be used if the date entered is within the range of dates defined in this table.
<b>Company Tax Code</b>	In this pop-up field, you can enter a company tax reporting code. You can select between company tax codes created in the Popup Fields workspace in the Set-Up module. When registering G/L entries, Maconomy will use this company tax code if the allocation combination for the G/L entry is within the Selection Criteria which has been specified by the range fields.
<b>Item Tax Code</b>	The functionality of this field is similar to the functionality of the field "Company Tax Code."
<b>Enterprise</b>	This pop-up field allows you to select an enterprise for the G/L tax table line.

Field	Description
<b>Segment</b>	This pop-up field allows you to select a segment for the G/L tax table line.
<b>Area</b>	This pop-up field allows you to select an area for the G/L tax table line.
<b>Tax Direction</b>	This pop-up field allows you to select a tax direction for the G/L tax table line. The G/L tax code on the line will only be used if the direction on the registration match the selected value in this field.
<b>Account No. From / Account No. To</b>	In these fields you enter a range of account numbers. When registering an account number elsewhere in Maconomy, the G/L tax code assigned to this combination of accounts will only be used if the account number entered is within the range of account numbers defined in this table.
<b>Location From / Location To</b>	The functionality of these fields is similar to the functionality in the field "Account No. From."
<b>Entity From / Entity To</b>	The functionality of these fields is similar to the functionality in the field "Account No. From."
<b>Project From / Project To</b>	The functionality of these fields is similar to the functionality in the field "Account No. From."
<b>Purpose From / Purpose To</b>	The functionality of these fields is similar to the functionality in the field "Account No. From."
<b>Spec. 1-3 From / Spec. 1-3 To</b>	The functionality of these fields is similar to the functionality in the field "Account No. From."
<b>Local Spec. 1-3 From / Local Spec. 1-3 To</b>	The functionality of these fields is similar to the functionality in the field "Account No. From."
<b>Activity No. From / Activity No. To</b>	The functionality of these fields is similar to the functionality in the field "Account No. From."
<b>Task Name From / Task Name To</b>	The functionality of these fields is similar to the functionality in the field "Account No. From."
<b>Transaction Type Group No.</b>	This pop-up field allows you to select a transaction type group for the G/L tax table line. The G/L tax code on the line will only be used if the direction on the registration matches the selected value in this field.

## Tax Reporting Units Workspace

Use this workspace to set up a tax reporting unit.

A tax reporting unit is a set of companies that report tax collectively to the same agency, such as the IRS in the USA.

In the Tax Reporting Units tab, enter information about the tax reporting unit. In the Account References sub-tab, enter information about the dimension values of entries for which tax must be reported. You create **Tax Account References** pop-up entries in the Popup Fields workspace in the Set-Up module.

In the Company Information workspace, identify which tax reporting unit each company should use for reporting tax.

### Tax Reporting Units Tab

This section includes the fields and descriptions for the Tax Reporting Units tab.

#### Reporting Unit Island

Field	Description
<b>Name</b>	In this field, you enter the name of the current tax reporting unit.
<b>Reg. No.</b>	In this field, you enter the registration number of the current tax reporting unit.
<b>Tax Date</b>	<p>In some countries, legal requirements demand that the entry date of each registration is what determines the tax settlement period in which the entry belongs, while in other countries, the period is determined by the invoice date of the registration. In this field, you can specify for the current tax reporting unit which of the two methods should apply to companies belonging to the reporting unit.</p> <p>Each G/L entry contains a field called "Tax Date" to which either the entry date or the invoice date of the registration depending on the value in this field on the tax reporting unit assigned to the company which the entry concerns is automatically transferred when the entry is posted. When you create tax settlements in the window Tax Settlement, Maconomy uses the tax date registered on each individual G/L entry to determine whether the entry is covered by the period for which settlement is carried out.</p>
<b>Currency</b>	A company (in the EU) should paid taxes in a foreign country (also in the EU) if the company has a lot of sales in that company. The tax settlement should in this case be made in the foreign currency instead of the currency of the selling company. This field can be sued to set the currency that the VAT settlement will be made in. If not set, the currency of the company will be used.
<b>Tax Type, EU Acquisition Tax</b>	In this field, you can specify the tax type under which EU acquisition tax should be reported in tax settlement printouts for the current tax reporting unit.

Field	Description
<b>Tax Settlement by Tax Type</b>	<p>In this field, you can specify whether tax reporting for the current tax reporting unit should be made by tax type rather than a combination of tax settlement type, tax type, nature of tax, and tax type.</p> <p>If you do not mark this field, tax settlement printouts will show a line for each combination of tax settlement type, tax type, nature of tax, and tax type. If you mark the field, a line is shown for each tax type, however only including tax types for which the field "Include on Printout" is marked in the Popup Fields workspace.</p> <p>If you mark the field, the Tax Reporting workspace will not show lines for which no tax type has been specified.</p>

### Posting References Island

Field	Description
<b>Settlement</b>	<p>In this field, you can specify the number of a dimension combination which contains the account number and any other dimensions that you wish to apply to the posting of amounts pertaining to tax settlement. If no value is specified for a dimension in the dimension combination, the value specified on the entry line which causes the posting is used.</p>
<b>Investment Tax, Basis, Offset</b>	<p>In this field, you can specify the number of a dimension combination which contains the account number and any other dimensions that you wish to apply to the posting of amounts pertaining to the basis of Norwegian investment tax. The field is only used in Norway. If no value is specified for a dimension in the dimension combination, the value specified on the entry line which causes the posting is used.</p>

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can specify a description and name for an access level for the current tax reporting unit. In this window, you can only see and edit a tax reporting unit if you have been assigned to this or a higher access level in the User Access Levels workspace in the Set-Up module. Please note that this access control only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to tax reporting units may depend on other factors. For further information about the standard access control configuration, please see "Introduction to the Access Control System" in the SetUp module.</p> <p>If you do not specify an access level, all users will have access to see information about the current tax reporting unit.</p>

**Period Island**

Field	Description
<b>Mth/Yr</b>	In these fields you enter the starting month/starting year and the ending month/ending year of the period for which you want to print tax reporting units. Enter the month as a number.  If your company uses flexible periods that do not follow the calendar year, the month and year you enter here refers to the period defined in the Fiscal Year workspace.

**Address Island**

Field	Description
<b>Address</b>	In these fields, you enter the address of the tax authority to which tax settlements from the current tax reporting unit are to be sent. The address appears on tax settlements printed on the basis of the current tax reporting unit in the window Tax Settlement.

**User Island**

See the chapter “Getting Started” for a description of the fields in the User island.

## Account References Sub-Tab

This section includes the fields and descriptions for the Account References sub-tab.

Field	Description
<b>Name</b>	This field displays the name of the posting reference specified on the current table line.
<b>Posting Reference</b>	In this field, you can specify the number of a dimension combination which contains the account number and any other dimensions that you wish to apply to the posting of amounts pertaining to the current tax type. If no value is specified for a dimension in the dimension combination, the value specified on the entry line which causes the posting is used.
<b>Description</b>	This field displays the description of the dimension combination selected in the field “Posting Reference” above.

**Tax Reporting Unit Selection Workspace**

Use this workspace to assign tax settlement units (also known as tax reporting units) to a tax reporting unit table.

This table usually consists of tax settlement units for countries or other geographical areas.

If you need to report tax to multiple tax reporting units, this workspace lets you define relevant entry value ranges for each tax settlement unit in the table. For instance, you can select whether a tax settlement unit table should be used for collecting payable or receivable tax. You can also apply a different geographical area to each tax settlement unit.

In the Tax Reporting Unit Selection tab, you can view or create a tax reporting unit table. You can also view logging information about the current tax reporting unit table. The Tax Reporting Unit Selection Lines sub-tab lets you assign tax settlement units to the table and specify particular entry value ranges for each combination of tax settlement units.

Note that the lines in the Tax Reporting Unit Selection Lines sub-tab are listed in order of priority. Accordingly, if the selection criteria on the top line do not match the entry values that you entered in an entry workspace, Maconomy searches the subsequent lines until it finds matching selection criteria on a lower line. Typically, you define narrow selection criteria on the top lines, while you define broader criteria on lower lines.

## Tax Reporting Unit Selection Tab

This section includes the fields and descriptions for the Tax Reporting Unit Selection tab.

### Tax Reporting Unit Table Island

Field	Description
<b>Name</b>	In this field, you can enter the name of the tax reporting unit table you want to create. The text lines beneath the name allow you to enter a description of the tax reporting unit table.

### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

## Tax Reporting Unit Selection Lines Sub-Tab

This section includes the fields and descriptions for the Tax Reporting Unit Selection Lines sub-tab.

Field	Description
<b>Priority</b>	This field shows the priority of the tax settlement unit. The lines in the table part are listed in order of priority.
<b>Tax Settlement 1 Unit</b>	This field allows you to select a tax settlement unit to be used if the registration values entered in a registration window match the criteria on the current line. Please note that only tax settlement units already created in the “Tax Reporting Units” workspace can be assigned to a table line. You can add up to three different tax settlement units if necessary. To enable multiple tax codes, the system parameters “Show Three Tax Levels” and/or “Show Two Tax Levels” must be marked in the System Parameters workspace. When multiple tax codes are enabled, the “Tax Settlement 1 Unit” field will be replaced by the following fields: “Tax Settlement 1 Unit,” “Tax Settlement 2 Unit,” and, if enabled, “Tax Settlement 3 Unit.” For further information on multiple tax codes, please see the description in “Tax Codes.”
<b>Period From/To</b>	These fields allow you to enter a range of dates during which the relevant tax settlement unit(s) should be effective.

Field	Description
<b>Country</b>	In this pop-up field, select the country in which the selected tax settlement unit(s) should be effective.
<b>Company Tax Code</b>	In this pop-up field, you can select a company tax code. The tax reporting unit(s) on the line will only be used if this company tax code matches the company tax code applied in a registration window when registration values are entered.
<b>Enterprise</b>	In this pop-up field, select the enterprise to which the selected tax settlement unit(s) should belong.
<b>Segment</b>	In this pop-up field, select the segment to which the selected tax settlement unit(s) should belong.
<b>Area</b>	In this pop-up field, select the area to which the selected tax settlement unit(s) should belong.
<b>Tax Direction</b>	This pop-up field allows you to specify whether or not the tax settlement unit(s) on the line should be used for reporting receivable or payable tax.
<b>Location From / Location To</b>	These fields allow you to specify a range of locations for which the selected tax settlement unit(s) should be effective.
<b>Entity From / Entity To</b>	These fields allow you to specify a range of entities for which the selected tax settlement unit(s) should be effective.
<b>Project From / Project To</b>	These fields allow you to specify a range of projects for which the selected tax settlement unit(s) should be effective.
<b>Purpose From / Purpose To</b>	These fields allow you to specify a range of purposes for which the selected tax settlement unit(s) should be effective.
<b>Spec. 1-10 From / Spec. 1-10 To</b>	These fields allow you to specify a range of Spec. 1 values for which the selected tax settlement unit(s) should be effective.
<b>Local Spec. 1-10 From / Local Spec. 1-10 To</b>	These fields allow you to specify a range of Local Spec. 1 values for which the selected tax settlement unit(s) should be effective.
<b>Zip Code From / Zip Code To</b>	These fields allow you to specify a range of zip codes for which the selected tax settlement unit(s) should be effective.
<b>Nature of Tax</b>	In this pop-up field, you can select a nature of tax as Taxable, Tax Exempt, or Export. The tax reporting unit(s) on the line will only be used if this tax nature matches the tax nature code from the tax code or the G/L tax code applied in a registration window when registration values are entered.

Field	Description
<b>Tax Type</b>	In this pop-up field, you can select tax type. The tax reporting unit(s) on the line will only be used if this tax type matches the tax type from the tax code or the G/L tax code applied in a registration window when registration values are entered.
<b>Popup 1 – 4</b>	In this pop-up field, you can select a tax pop-up value. The tax reporting unit(s) on the line will only be used if this tax nature matches the tax nature code from the tax code or the G/L tax code applied in a registration window when registration values are entered.

## Tax Settlement Workspace

Use this workspace to calculate and settle tax.

Tax settlements can involve taxes receivable and payable, EU acquisition tax, and various energy and environmental taxes. Maconomy also calculates EU purchases and sales, dutiable and non-dutiable.

The Accounts sub-tab groups the tax entries, creating a line for each combination of tax settlement type, tax type, and nature of tax. Maconomy also creates export and tax-exempt lines, ensuring that the tax basis amounts in the Tax Settlement tab are fully documented. However, if you select the **Tax Reporting by Tax Type** field for the current tax reporting unit, lines for which you have not specified any tax type are not shown.

The lines that are shown on tax reports also depend on the setting of the **Tax Reporting by Tax Type** field. For more information, see the **Print Settlement** action.

You cannot change the figures in this workspace, but you can view them before they are approved.

When the settlement is approved (using this workspace or the Print Tax Settlement single dialog workspace), Maconomy creates a tax settlement journal that has a line for every account affected (for example, a line each for tax payable, tax receivable, and tax settlement).

### Tax Settlement Tab

This section includes the fields and descriptions for the Tax Settlement tab.

#### Tax Reporting Unit Island

Field	Description
<b>Name</b>	This field displays the name of the current tax reporting unit.
<b>Currency</b>	This field displays the reporting currency of the current tax reporting unit.

**Taxes Island**

Field	Description
<b>Tax Payable</b>	This field shows the sum of debited and credited amounts for entries in the table part marked as being of the tax settlement type "Tax Payable."
<b>Acquisition Tax</b>	This field shows the sum of debited and credited amounts for entries in the table part marked as being of the tax settlement type "EU Acquisition Tax."
<b>Investment Tax</b>	This field shows the sum of debited and credited amounts for entries in the table part marked as being of the tax settlement type "Investment Tax."
<b>Total Taxes</b>	This field shows the sum of the amounts in this island.

**Deduction Island**

Field	Description
<b>Tax Receivable</b>	This field shows the sum of debited and credited amounts for entries in the table part marked as being of the tax settlement type "Tax Receivable."
<b>Taxes</b>	This field shows other taxes.
<b>Total Allowance</b>	This field shows the sum of the two previous fields, Tax Receivable and Taxes.

**Reconciliation Tax Island**

Field	Description
<b>Ratio Tax</b>	Copy to come
<b>Sales Tax</b>	Copy to come

**Tax Settlement Island**

Field	Description
<b>Tax Settlement</b>	This field shows the gross amount for which tax settlement is made.

**Period Island**

Field	Description
<b>Mth/Yr</b>	These fields show the starting month/starting year and the ending month/ending year of the period which is valid for the current tax reporting unit. The month is specified as a number, for example, "1" for January, "2" for February, and so on.

Field	Description
	<p>Only entries with a tax date within the specified range are included in the settlement. The tax date of a given entry can be either the entry date or the invoice date of the registration on which the entry is based, depending on the set-up of the tax reporting unit used by the company that the entry concerns.</p> <p>You can also update the current settlement period of the tax reporting unit using these fields. The current period on the tax reporting unit is updated with the changed dates.</p>

### Sales Island

Field	Description
<b>Taxable</b>	This field shows the taxable amount of the total sales in the specified period. For sales posted through an invoice created by Maconomy, the nature of tax is transferred from the tax code of each individual invoice line. The nature of tax for manual entries which are posted in a general journal will be transferred if you specify a G/L tax code to which a nature of tax has been assigned. For more information on the selection of the nature of tax, please see the description of the fields in the Posting island in the Tax Codes workspace.
<b>Export</b>	This field shows the total amount of export-related sales in the specified period. For sales posted through an invoice created by Maconomy, the nature of tax is transferred from the tax code of each individual invoice line. The nature of tax for manual entries which are posted in a general journal will be transferred if you specify a G/L tax code to which a nature of tax has been assigned. For more information on the selection of the nature of tax, please see the description of the fields in the Posting island in the Tax Codes workspace.
<b>Taxable + Export</b>	This field shows the sum of the amounts in the fields "Taxable" and "Export."
<b>Tax Exempt</b>	This field shows the tax-exempt part of the total sales in the specified period. For sales posted through an invoice created by Maconomy, the nature of tax is transferred from the tax code of the individual invoice line. The nature of tax for manual entries which are posted in a general journal will be transferred if you specify a G/L tax code to which a nature of tax has been assigned. For more information on the selection of the nature of tax, please see the description of the fields in the Posting island in the Tax Codes workspace.
<b>Total Turnover</b>	This field shows the total turnover for the specified period, that is, the sum of the amounts in the fields "Taxable + Export" and "Tax Exempt."

### EU Revenue Island

Field	Description
<b>EU Purchase</b>	This field shows total EU purchases for the period. It is the total of all credit entries less all debit entries made in the General Journal workspace or in the Vendor Invoices, Invoice Allocation, or Reallocate Invoices workspaces in the

Field	Description
	Accounts Payable module that has an incoming G/L tax code for EU Acquisition Tax. A G/L tax code is an EU Acquisition Tax code if there is a mark in the field "EU Acquisition Tax Code" in the window G/L Tax Codes.
<b>EU Sale</b>	<p>This field shows total EU sales for the period. EU sales can be registered in two ways in Maconomy:</p> <ul style="list-style-type: none"> <li>■ The General Journal workspace can be used to register manual EU sales by giving entries an outgoing G/L tax code that is an EU Acquisition Tax code. A G/L tax code is an EU Acquisition Tax code if there is a mark in the field "EU Acquisition Tax Code" in the G/L Tax Codes workspace.</li> </ul> <p>The manual EU sale is the total of all such credit entries less the total of all such debit entries for the specified period.</p> <ul style="list-style-type: none"> <li>■ In the Accounts Receivable and Sales Orders modules, the sale of dutiable goods in non-taxed invoices or credit memos will be registered as automatic EU sales, if there is a mark in the field "EU Sales" in the Statistics to Tax Authorities island on the sales orders, credit orders, invoices, or credit memos. An invoice or a credit memo will not be taxed if the "Tax" field is unmarked. A dutiable item is an item without a mark in the field "Service" on the item information card and with a non-blank tax code in the field "Tax Code." Sales of services and non-dutiable items are not included in EU sales.</li> </ul> <p>The automatic EU sale is the total of non-taxed invoice lines less credit memo lines for dutiable items, for which the field "EU Sales" in the Statistics to Tax Authorities island on the sales orders, credit orders, invoices, or credit memos.</p>
<b>Tax Exempt Sales</b>	Your non-dutiable sales are calculated as the total sales of both goods and services and charges which are not taxed. Tax is not taken from items and services for which there is a tax code in the field "Tax Code" on the item information, or if the field "Tax" on the invoice or credit memo is not marked. If the invoice or credit memo carries discount, the sales figure on individual invoice and credit memo lines will be adjusted accordingly. Maconomy will not calculate tax for charges if the field "Tax" on the invoice or credit memo is unmarked.

### Basis Island

Field	Description
<b>Incl. Investment Tax</b>	This field shows the sum of debited and credited amounts for entries in the table part marked as being of the tax settlement type "Basis high investment tax."
<b>Without Investment Tax</b>	This field shows the sum of debited and credited amounts for entries in the table part marked as being of the tax settlement type "Basis low investment tax."

### Status Island

Field	Description
<b>Made by</b>	This field shows the user who made the settlement.
<b>Date</b>	This field shows the date the settlement was made.
<b>Approved by</b>	This field shows which user approved the settlement.
<b>Date</b>	This field shows the date the settlement was approved.
<b>Changed</b>	A mark in this field shows that you have changed information in the window, for example, the period range or the posting references since selecting the "Create Settlement" action. If there have been changes, you cannot select the "Approve Settlement" action. If the field is not marked, the information in the window is consistent, and you can approve the settlement by selecting the "Approve Settlement" action.

### Accounts Sub-Tab

This section includes the fields and descriptions for the Accounts sub-tab.

Field	Description
<b>Tax Settlement Type</b>	<p>This field shows the type of account used. This field displays one of the types listed below, where they are described briefly. For a detailed description of each tax settlement type, please refer to the descriptions of the G/L Tax Codes, Tax Codes, and Tax Reporting Unit Selection workspaces.</p> <ul style="list-style-type: none"> <li>■ Tax Receivable — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for tax receivable in the G/L Tax Codes, Tax Codes, and Tax Reporting Units workspaces.</li> <li>■ Tax Payable — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for tax payable in the G/L Tax Codes and Tax Codes workspaces.</li> <li>■ EU Acquisition Tax — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for acquisition tax in the G/L Tax Codes workspace.</li> <li>■ Investment Tax — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for acquisition tax in the G/L Tax Codes workspace.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Basis high investment tax — The line shows amounts that form the basis for calculation of high investment tax. The line therefore shows amounts registered on accounts used for investment tax basis in G/L tax codes in which the investment tax is greater than zero. These accounts are referred to by the dimension combination specified for each G/L tax code.</li> <li>■ Basis low investment tax — The line shows amounts that form the basis for calculation of low investment tax. The line therefore shows amounts registered on accounts used for investment tax basis in G/L tax codes in which the investment tax is zero. These accounts are referred to by the dimension combination specified for each G/L tax code.</li> <li>■ Sales Tax — The line shows tax amounts registered on the accounts referred to by the dimension combination specified for sales tax in the Tax Codes workspace.</li> <li>■ Tax — The line shows amounts registered on the account of a given tax type. The field “Tax Type” on the current line shows the relevant tax type. You can assign an account to a specific tax type in the Tax Reporting Units workspace by specifying a dimensions combination.</li> <li>■ Ratio Tax — The line shows amounts registered on the accounts referred to by the dimension combination specified for ratio tax in the G/L Tax Codes workspace.</li> </ul>
<b>Manual Tax Type</b>	If the value specified in the field “Tax Settlement Type” is “Tax,” this field shows which tax type has been selected. Tax types are created in the pop-up field “Tax Type” in the Popup Fields workspace in the Set-Up module and are assigned to G/L accounts in the Tax Reporting Units workspace.
<b>Nature of Tax</b>	This field shows the nature of tax to which the current line pertains.
<b>Tax Type</b>	This field shows the tax type to which the current line pertains. The tax type is specified for each tax code and G/L tax code in the Tax Codes and G/L Tax Codes workspaces, respectively.
<b>Debit basis, Reporting Currency</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Credit basis, Reporting Currency</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.

Field	Description
<b>Change Basis, Reporting Currency</b>	This field shows the difference between the two fields above, thus indicating the net balance movement on the basis entries in the specified period.
<b>Debit Tax, Reporting Currency</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Credit Tax, Reporting Currency</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Change Tax, Reporting Currency</b>	This field shows the difference between the two fields above, thus indicating the net balance movement on the basis entries in the specified period in reporting currency.

## Actions

This section shows the actions available in the Tax Settlement workspace.

### Top Pane

Field	Description
<b>Create Settlement</b>	<p>When you select this action, Maconomy creates a tax settlement. You can make the settlement several times. It will not be final before you select "Approve Settlement."</p> <p>Only entries with a tax date within the specified range are included in the settlement. The tax date of a given entry can be either the entry date or the invoice date of the registration on which the entry is based, depending on the setup of the tax reporting unit used by the company that the entry concerns. For further information on how the tax date is determined and posted, see the field "Tax Date."</p>
<b>Approve Settlement</b>	<p>When you select this action, you approve the settlement. Maconomy creates a tax settlement journal with an entry for each account for tax payable, tax receivable, various charges and the actual tax settlement. This journal is ready to be posted. Once a settlement has been approved, it cannot be changed.</p> <p>If you make new entries for a period that has ended, you must make a new settlement after posting the first journal. The new settlement will include tax settlement for the newly entered entries in the settled period. Maconomy creates a new general journal that you then post. You cannot make a new settlement until the journal has been posted.</p>

Field	Description
<b>Print Settlement</b>	When this action is selected, the currently displayed tax settlement is printed. Depending on whether the field "Company Structure" is marked for the current tax reporting unit in the Tax Reporting Units workspace, the printout will either show a line for each combination of tax settlement type, tax type, nature of tax, and tax type or a line for each tax type (including only tax types for which the field "Include on Printout" is marked in the Popup Fields workspace).

## Tax Specification Workspace

Use this workspace to view a detailed specification of each tax settlement.

The Tax Specification tab displays information about the current tax reporting unit and period. The Tax Specification Lines sub-tab displays information about the tax entries that are part of the tax settlement. You cannot change the information in this workspace.

### Tax Specification Tab

This section includes the fields and descriptions for the Tax Specification tab.

#### Tax Reporting Unit Island

Field	Description
<b>Name</b>	This field displays the name of the tax reporting unit for which the tax settlement was created.
<b>Currency</b>	This field displays the currency of the tax reporting unit.

#### Period Island

Field	Description
<b>From Mth/Yr</b>	This field displays the starting month and starting year of the period covered by the tax settlement.
<b>To Mth/Yr</b>	See the description of the field "From Mth/Yr" above.

#### Status Island

Field	Description
<b>Made by</b>	This field shows the user who created the current settlement.
<b>Date</b>	This field shows the date when the settlement was made.

Field	Description
<b>Approved by</b>	This field shows which user approved the settlement.
<b>Date</b>	This field shows the date when the settlement was approved.
<b>Changed</b>	If this box is checked, information has been changed since the last settlement was made.

### Tax Specification Lines Sub-Tab

This section includes the fields and descriptions for the Tax Specification Lines sub-tab.

Field	Description
<b>Tax Settlement Type</b>	The tax settlement type can be "Tax Payable," "Tax Receivable," "EU Acquisition Tax," "Investment Tax," "Ratio Tax," "Sales Tax," or "Tax." Sales tax occurs when you use a tax code to which a tax rate is assigned in the Tax Codes workspace.
<b>Manual Tax Type</b>	If the tax settlement type is "Tax," this field displays the tax type of the tax. Tax types are created in the pop-up field "Tax Type" in the PopUp Fields workspace in the Set-Up module.
<b>Nature of Tax</b>	This field displays the nature of tax with which the G/L entries must be posted in order to be included in the printout. See the G/L Tax Codes workspace for a description of nature of tax. If you do not select a specific nature of tax, all natures of tax will be shown on the printout.
<b>Tax Type</b>	This field shows the tax type to which the current line pertains. The tax type is specified for each tax code and G/L tax code in the Tax Codes and G/L Tax Codes workspaces, respectively.
<b>Company No.</b>	This is the company to which the tax was posted.
<b>Posting Ref.</b>	This is the posting reference to which the tax was posted.
<b>Description</b>	This is the description of the posting reference to which the tax was posted.
<b>Debit basis, Reporting Currency</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Credit basis, Reporting Currency</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Debit Tax, Reporting Currency</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.

Field	Description
<b>Credit Tax, Reporting Currency</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in reporting currency.
<b>Debit Tax, Base</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in base currency.
<b>Credit Tax, Base</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in base currency.
<b>Debit basis, Base</b>	This field shows the amount debited on the basis entries of the tax entries covered by the current line in the specified period in base currency.
<b>Credit basis, Base</b>	This field shows the amount credited on the basis entries of the tax entries covered by the current line in the specified period in base currency.

## Print Tax Settlement Workspace

Use this workspace to create, approve, and print tax settlements for one or more tax reporting units.

Follow these steps:

1. Create and print a tax settlement.
2. Review the calculated figures in the tax settlement.
3. If the calculated figures are correct, approve the tax settlement and print it.
  - When you approve the settlement, Maconomy creates a general journal that has a line for every account that is included in the settlement.
  - When you print the tax settlement, all entries within the selected period are included. Note that unreported tax postings from prior periods are not included.

### Print Tax Settlement Tab

This section includes the fields and descriptions for the Print Tax Settlement tab.

#### Selection Criteria Island

Field	Description
<b>Reporting Unit</b>	In these fields, you can specify a range of reporting units. If a range is specified, only tax settlements for reporting units within the specified range will be printed; otherwise tax settlements will be printed for all tax reporting units.
<b>Period</b>	In these fields, you can enter a starting month / starting year and an ending month / ending year for the period for which you want to print tax settlements.

### Processing Information Island

Field	Description
<b>Create Settlements</b>	If you mark this field, a tax settlement will be created for the specified range of tax reporting units and periods.
<b>Approve Settlements</b>	If you mark this field, tax settlements for the specified range will be approved.
<b>Entry Date</b>	In this field you can enter an entry date to be used when you approve the tax settlement.

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the Print Layout workspace in the Set-Up module, you can choose between the following layouts: The "Standard" layout shows a line for each combination of tax settlement type, tax type, nature of tax, and tax type. The "Tax Type" layout shows a line for each tax type. This layout only includes tax types for which the field "Include on Printout" is marked in the Popup Fields workspace.
<b>Display Tax Specification</b>	If you mark this field, the tax settlements will contain a specification of each tax entry attached to the settlements in question.

## Print Tax Reconciliation Workspace

Use this workspace to print a tax reconciliation based on the nature of the tax and tax type.

### Print Tax Reconciliation Tab

This section includes the fields and descriptions for the Print Tax Reconciliation tab.

### Selection Criteria Island

Field	Description
<b>Company No.</b>	Here you can enter a range of company numbers. The printout will only show entries posted with a specification of nature of tax or tax type to companies within this range.
<b>Account No.</b>	Here you can enter a range of account numbers. The printout will only show entries posted with a specification of nature of tax or tax type to an account within this range.
<b>Tax Date</b>	Here you enter a range of dates. The printout will only include entries entered within this date range.

Field	Description
<b>Nature of Tax</b>	In this field, you can select the nature of tax with which the G/L entries must be posted in order to be included in the printout. See the G/L Tax Codes workspace for a description of nature of tax. If you do not select a specific nature of tax, all natures of tax will be shown on the printout.
<b>Tax Type</b>	In this field, you can select the tax type with which the G/L entries must be posted in order to be included in the printout. See the G/L Tax Codes workspace for a description of tax type. If you do not select a specific tax type, all tax types will be shown on the printout.
<b>Incl. Manual Entries Only</b>	If you check this box, the printout will only show G/L entries where the account number was entered manually, that is, automatic control account entries are omitted. See the Show G/L Entries workspace for a description of automatic G/L entries.
<b>Include only Entries with Deviant Tax Code</b>	If you check this box, the printout will only show G/L entries on which a nature of tax or tax type was posted which does not correspond to the information specified in the corresponding G/L tax code. That is, G/L entries where the nature of tax or the tax type has been changed from the value suggested by Maconomy when a general journal line is created in the General Journal workspace.

#### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the Print Layout workspace in the Set-Up module, "Standard" is the only option.

## Print EU Tax Reconciliation Workspace

Use this workspace to print details about EU-related purchases and sales.

### Print EU Tax Reconciliation Tab

This section includes the fields and descriptions for the Print EU Tax Reconciliation tab.

#### Selection Criteria Island

Field	Description
<b>EU Tax Code</b>	Here you can select which amount you want specified, that is, which type of G/L entries that are to be printed for the given selection criteria. You can choose between the following types:

Field	Description
	<ul style="list-style-type: none"> <li>EU Sale G/L entries for EU sales can be registered by two methods — The General Journal workspace can be used to register manual EU sales by giving entries an outgoing G/L tax code which is an EU Acquisition Tax code. A G/L tax code is an EU Acquisition Tax code if the field “EU Acquisition Tax Code” field in the G/L Tax Codes workspace has been completed. When you post invoices and credit memos, the sale of dutiable goods in non-taxed invoices or credit memos will be registered as automatic EU sales, if there is a mark in the “EU Sales” field in the Statistics to Tax Authorities island on the sales orders, credit orders, invoices, or credit memos. An invoice or a credit memo will not be taxed if the “Tax” field is unmarked. A dutiable item is an item without a mark in the “Service” field on the item information card and with a nonblank tax code in the “Tax Code” field. Sales of services and non-dutiable items are not included in EU sales.</li> <li>EU Purchase — G/L entries for EU purchases are made in the General Journal workspace or in the Vendor Invoices, Invoice Allocation or Reallocate Invoices workspaces in the Accounts Payable module that has an ingoing G/L tax code for EU Acquisition Tax. A G/L tax code is an EU Acquisition Tax code if there is a mark in the “EU Acquisition Tax Code” field in the G/L Tax Codes workspace.</li> <li>Tax-free Sales — G/L entries for tax-exempt sales are created when you post invoices and credit memos with items or services or charges which are not dutiable. Tax is not taken from items and services for which there is a tax code in the “Tax Code” field on the item information, or if the “Tax” field on the invoice or credit memo is not marked. If the invoice or credit memo carries discount, the sales figure on individual invoice and credit memo lines will be adjusted accordingly. Maconomy will not calculate tax for charges for which the “Add Tax” field in the Charge Codes pop-up field is not marked, or if the “Tax” field on the invoice or credit memo is unmarked.</li> </ul>
<b>Company No.</b>	Here you can enter a range of company numbers. The printout will only show entries posted to companies within this range.
<b>Account No.</b>	Here you can enter a range of account numbers. The printout will only show entries posted to an account within this range.
<b>Entry Date</b>	Here you enter a range of dates. The printout will only include entries entered within this date range.
<b>Only Incl. Manual Tax Entries</b>	If you check this box, the printout will only show G/L entries where tax was not entered automatically. See the Show G/L Entries workspace for a description of automatic tax on G/L entries.

Field	Description
<b>Incl. Manual Entries Only</b>	If you check this box, the printout will only show G/L entries where the account number was entered manually, that is, automatic control account entries are omitted. See the Show G/L Entries workspace for a description of automatic G/L entries.

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the Print Layout workspace in the Set-Up module, "Standard" is the only option.

## Tax Report Fields Workspace

Use this workspace to create the tax report fields that you want to enter in the Tax Report Specification workspace.

Use this workspace to build the fields that you want to include in your printed tax report. You enter the tax report specification in the Tax Report Specification workspace.

### Tax Report Fields Tab

This section includes the fields and descriptions for the Tax Report Fields tab.

### Field Description Island

Field	Description
<b>Field No.</b>	Here you enter the number of the new tax report field. Maconomy checks that the number is not being used already. The number is unique and is used in the Tax Report Specification to point to the field. You can use the search functions in the Find menu to find existing fields.  You cannot change the number of an existing field, but you can delete the information on it if it has not been used in the current or previous fiscal years.
<b>Name</b>	Here you enter the name of the field. The name is printed with the field number in the tax report.

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

## Tax Report Specification Workspace

Use this workspace to create and edit tax report specifications.

You must have the Extended Tax Reporting add-on to use this workspace.

Maconomy uses the information in this workspace only if you selected the **Extended Tax Reporting** field in the System Information workspace.

A tax report specification determines which tax report fields are reported on when you post invoice journals, vendor invoice journals, reallocation journals, and general journals. You create tax report fields in the Tax Report Fields workspace. You print the tax report in the Print Tax Report workspace.

In the **Tax Direction** field, choose whether to work on a tax report specification for sales or purchases. Then create and edit individual tax report specification lines.

Each line determines which tax report fields are being reported on for a combination of item tax code, company tax code, tax rate, tax type, and nature of tax. When posting, Maconomy updates values and applies all of the tax report specification lines that apply to an entry. These updated values are used when you print the report.

For auditing purposes, Deltek recommends that you print and file your tax report specifications every time that you change them. Use the **Print This** function.

### Sources of Information

When posting, Maconomy retrieves information from the following sources.

Posting invoices and credit memos:

- Tax Direction—Sale
- Company Tax Code—From the ship-to customer
- Item Tax Code—From the item or charge
- Tax Rate—From the item or charge
- Invoice/credit memo— Invoice fields for posting invoices, credit memo fields to post credit memos

Posting job invoices and job credit memos:

- Tax Direction—Sale
- Company Tax Code—From the ship-to customer
- Item Tax Code—From the activity
- Tax Rate—From the activity
- Invoice/credit memo— Invoice fields for posting job invoices, credit memo fields to post job credit memos

Posting invoices on account:

- Tax Direction—Sale
- Company Tax Code—From the ship-to customer
- Item Tax Code—From the System Information workspace
- Tax Rate—From the System Information workspace
- Invoice/credit memo— Invoice fields for posting invoices on account

**Note:** Maconomy updates the values for the tax fields when you post an invoice. The amount is reverted if you offset the invoice on account on a final invoice.

Posting allocated vendor invoices, vendor credit memos, and reallocation journals:

- Tax Direction—Purchase
- Company Tax Code—From the vendor
- Item Tax Code—From the allocation/reallocation line
- Tax Rate—From the allocation/reallocation line
- Invoice/credit memo— Invoice fields for posting vendor invoices, credit memo fields for posting vendor credit memos

Posting non-allocated vendor invoices, vendor credit memos:

- Tax Direction—Purchase
- Company Tax Code—From the vendor
- Item Tax Code—From the System Information workspace
- Tax Rate—From the System Information workspace
- Invoice/credit memo— Invoice fields for posting vendor invoices, credit memo fields for posting vendor credit memos

**Note:** Maconomy updates the values in the tax report when it posts the reallocation journal.

Posting general journals:

- Tax Direction—From the general journal line
- Company Tax Code—From the general journal line
- Item Tax Code—From the general journal line
- Tax Rate—From the general journal line
- Invoice/credit memo— Invoice fields when posting debit entries to vendors and credit entries to customers, and credit memo fields when posting debit entries to customers and credit entries to vendors

## Tax Report Specification Tab

This section includes the fields and descriptions for the Tax Report Specification tab.

### Selection Criteria Island

Field	Description
<b>Tax Direction</b>	Here you select the tax direction for the table. You can choose either "Sale" or "Purchase."

## Tax Report Specifications Sub-Tab

This section includes the fields and descriptions for the Tax Report Specifications sub-tab.

## Tax Reporting Unit

Field	Description
<b>Tax Reporting Unit</b>	Copy to come
<b>Company Tax Code</b>	<p>Here you select a company tax code for the line. You can choose between the codes created in the pop-up field "Company Tax Codes" in the Popup Fields workspace in the Set-Up module.</p> <p>If you leave this field blank, only the other fields in the target group will determine whether the line will be used to post a G/L entry.</p>
<b>Item Tax Code</b>	<p>Here you select the item tax code for the line. You can choose between the codes created in the pop-up field "Item Tax Codes" in the Popup Fields workspace in the Set-Up module.</p> <p>If you leave this field blank, only the other fields in the target group will determine whether the line will be used to post a G/L entry.</p>
<b>Verify Tax Rate</b>	If you mark this field, the G/L entry tax rate will be checked against the tax rate in the "Tax Rate" field. This means that if this field is marked, and the field "Tax Rate" is set to zero, the line is only used for entries with a tax rate of zero, whereas the tax rate is disregarded if you leave this field blank and enter zero (or any other value) in the field "Tax Rate."
<b>Tax Rate</b>	Here you can enter a tax rate. If you have marked the "Check Tax Rate" field, the line will only be used if the G/L entry's tax rate in the base currency of the company that the entry concerns is the same as the value entered here.
<b>Check Tax type</b>	If you mark this field, the tax type on G/L entries will be checked against the tax type in the field "Tax Type" on the current line. This means that if this field is marked, and the field "Tax Type" is blank, the line is only used for entries with a blank tax type, whereas the tax type is disregarded if you leave both this field and the field "Tax Type" blank.
<b>Tax Type</b>	<p>Here you can enter a tax type. If you have marked the "Check Tax Type" field, the line will only be used if the G/L entry's tax type is the same as the value entered here.</p> <p>Check nature of tax If you mark this field, the nature of tax on G/L entries will be checked against the nature of tax in the "Nature of Tax" field on the current line. This means that if this field is marked, and the field "Nature of Tax" is blank, the line is only used for entries with a blank nature of tax, whereas the nature of tax is disregarded if you leave both this field and the field "Nature of Tax" blank.</p>
<b>Nature of Tax</b>	Here you can enter a nature of tax. If you have marked the "Check Nature of Tax" field, the line will only be used if the G/L entry's nature of tax is the same as the value entered here.

Field	Description
<b>Invoice Tax Basis</b>	Here you can enter which tax report fields to report to when posting the invoice tax basis. A tax report specification can be entered as an empty list of tax report fields prefixed by either + or -, and separated by blanks.
<b>Invoice Tax Amount</b>	Here you can enter which tax report fields to report to when posting the invoice tax amount. A tax report specification can be entered as an empty list of tax report fields prefixed by either + or -, and separated by blanks.
<b>Credit Memo Tax Basis</b>	Here you can enter which tax report fields to report to when posting the credit memo tax basis. A tax report specification can be entered as an empty list of tax report fields prefixed by either + or -, and separated by blanks.
<b>Credit Memo Tax Amount</b>	Here you can enter which tax report fields to report to when posting the credit memo tax amount. A tax report specification can be entered as an empty list of tax report fields prefixed by either + or -, and separated by blanks.

## Print Tax Report Workspace

Use this workspace to print a tax report for a given period.

Maconomy prints a tax report for each tax reporting unit that matches the selection criteria.

Each tax report includes all of the tax report fields whose values have changed in the specified period. You create tax report fields in the Tax Report Fields workspace, and you define the tax report in the Tax Report Specification workspace.

### Print Tax Report Tab

This section includes the fields and descriptions for the Print Tax Report tab.

#### Selection Criteria Island

Field	Description
<b>Tax Reporting Unit</b>	In these fields, you can specify a range of reporting units. The report will only include tax reporting units within the specified range.
<b>Month/Yr.</b>	Here you enter the month and year for the tax report.

#### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the Print Layout workspace in the Set-Up module, "Standard" is the only option.

## Data Exchange Section

The workspaces described in this section are all part of the add-on module “Import of G/L Data.” The functionality only applies if you have purchased and installed that add-on.

### SD\_GL\_Introduction to Data Exchange

Data Exchange lets you import and export financial data so that you can integrate Maconomy with third-party products, such as payroll systems.

Data Exchange workspaces are all part of the Import of G/L Data add-on module, and are relevant only if you are using that module.

Data Exchange has two parts: Import and Export. The Data Agents workspace is used in both parts; the other workspaces are used by either the Import or Export part.

Data Exchange Module	
Import Workspaces	Export Workspaces
Data Agents	
Import Modes	Conversion Groups
Conversion Tables	Conversion Rules
Import Data	Export Data
Show Imported Files	Show Exported Files
Show Imported Data	Show Exported Data

### Overview of Process

Before you can perform an import or an export using this module, follow these steps:

1. Identify the source or recipient of your data.
2. Get the data specification from the source or recipient, usually a third-party vendor.
3. Use the Format Specification module to build the formats and forms according to the specifications, or  
Import the formats created in another system into Maconomy, using an import program supplied by Maconomy.
4. Create one or more data agents and associate the import and export formats with the data agents.
5. Create import modes and conversion rules and associate them with the data agents.
6. Perform the actual import and export in the Import Data and Export Data workspaces.
7. View the imported or exported data in the Show Imported Files, Show Imported Data, Show Exported Files, and Show Exported Data workspaces.

You only need to perform steps 1 through 5 once.

### Using SQL and RGL Reports

You can also use SQL and RGL reports for importing and exporting data in Maconomy. There are, however, some advantages to using the Data Exchange module:

- Entries that you exported using the Data Exchange module are marked as exported, so that you cannot export the same entry twice by mistake. You can review exported entries in the Show G/L Entries workspace.
- Entries that you imported using the Data Exchange module cannot be imported twice by mistake, provided that the person who imports the data uses unique file numbers.
- The Show Imported Data workspace provides error-checking and error-correcting functionality.

## Import Data Workspace

Use this workspace to import G/L data.

Before you start the import, choose the data agent that you want to use. The import is performed according to the conditions that you defined for the data agent. Depending on the type of the data that you are importing, Maconomy also uses the import modes that are assigned to the data agent.

If the import file does not contain information about the type of data, you can select an import mode in this workspace. This import mode is used on all entries in the import file. Maconomy checks whether the delivery number of the import file has been used before to prevent an import of the same file from occurring more than once.

When you click **OK**, Maconomy prompts you to identify the file that contains the data that you want to import. You perform the import in three steps:

1. Maconomy reads the lines in the import file and stores them.
2. When Maconomy has read all of the lines, it converts the dimensions of the imported lines using the conversion table that you assigned to the data agent that you are using.
3. Maconomy creates the relevant entries in a number of journals, depending on the number of companies that are involved in the import.

When you have performed the import, Maconomy automatically prints out a report that contains the imported data. You can reprint the report from this workspace.

### Import Data Tab

This section includes the fields and descriptions for the Import Data tab.

#### Import Island

Field	Description
<b>Data Agent</b>	In this field, you select the data agent for the import of data. The choice of data agent will determine which conversion table Maconomy will use for the conversion of the imported data to entries in line with Maconomy's dimension structure. When the import is started, Maconomy will ensure that the identification number in the

Field	Description
	import file corresponds to the identification number assigned to the current data agent in the Data Agents workspace.
<b>Import Mode</b>	In this field, you enter the import mode you wish to use in connection with the import. The import mode will determine how different types of data, for example, G/L data and vendor data, are to be treated during the import. The import mode in this field will, however, only be used if no import mode assigned to the data agent fits the type of the imported data.

### Journal Information Island

Field	Description
<b>Trans. No.</b>	In this field, you enter the transaction number you wish to use for the entries created as a result of the data import. This transaction number is only used if no transaction number series is assigned to respectively the data agent or on each individual line in the imported file.
<b>Trans. Type</b>	In this field you enter the transaction type you wish to use for the entries created as result of the data import. This transaction type is only used if there is no default transaction type defined on the data agent or on each individual line in the imported file.
<b>Entry Description</b>	<p>In this field, you enter a posting text. The text is used for all entries created during an import of data. Maconomy will use the following order of priority to determine which posting text to transfer:</p> <ol style="list-style-type: none"> <li>1. If a posting text has been entered on the import line, this text will be used.</li> <li>2. If no posting text has been entered on the import line, Maconomy will use the standard text entered in the window Import Modes.</li> <li>3. If no text has been entered for the import mode, Maconomy will use the standard text which has been assigned to the relevant data agent.</li> <li>4. If no text has been assigned to the data agent, Maconomy will use the posting text entered in this field. If no text was entered here, the text "Import" will be used instead.</li> </ol>

### Reprint Island

Field	Description
<b>Run No.</b>	<p>In this field, you can enter the run number of a previous import.</p> <p>The effect of this field is dependent upon whether the specified import has been processed or whether the import was interrupted at some stage. If the import phase was completed, the field "Processed" in the Show Imported Files workspace is checked for that particular import. In such cases, Maconomy will reprint the log report which was generated when the import was performed. If the run was interrupted, for example, due to a power failure, Maconomy will continue the import. In the window</p>

Field	Description
	imported files you can see the status of the import process in the fields “Read,” “Converted,” and “Processed.”

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select the layout you wish to use for the printout of the log report which is automatically created when the report is performed. The log report shows, among other things, the number of lines imported as well as how many entries and erroneous entries Maconomy created during the import. If no other layouts have been created using Maconomy’s layout editing tools, “Standard” is the only option.

## Show Imported Files Workspace

Use this workspace to view the content of the files that you imported in the Import Data workspace.

The Show Imported Files tab displays general information about each import file and the import itself. The Input Data Lines sub-tab shows the content of each line in the import file.

### Show Imported Files Tab

This section includes the fields and descriptions for the Show Imported Files tab.

### Import Information Island

Field	Description
<b>Run No.</b>	This field shows the run number assigned to the current import. A mode number is automatically assigned to each import when it is started in the window Import Data.
<b>Inputfile</b>	This field shows the file name of the imported file.
<b>Delivery No.</b>	This field shows the delivery number from the import file.
<b>Data Type</b>	This field shows the data type. The data type can for example be G/L data, Job/Cost data or vendor data.
<b>Data Sender</b>	This field shows the data sender from the import file.
<b>Transmission date</b>	This field shows the transmission date from the import file.
<b>Data Recipient</b>	This field shows the data recipient. The data recipient will only have a value, if the data recipient is specified in the file, and the import format use this information.

Field	Description
<b>Read by</b>	This field shows the user who carried out the import of the file.
<b>Reading Date</b>	This field show when the file was imported.

### Selection Criteria Island

Field	Description
<b>Show Entries</b>	If you mark this field, the table part shows the entries matching the selection criteria. Please note that the entries do not have to be shown to be reallocated. When the action "Create Journal" is selected, Maconomy reallocates all entries matching the selection criteria, regardless of whether this field has been marked.

### Status Island

Field	Description
<b>No. Entries</b>	This field shows the number of entries contained in the imported file. The number includes both lines containing general information about the file and lines containing data for import.
<b>Number of Data Entries</b>	This field shows the number of data entries contained in the import. The first and last records are not included in this number.
<b>Number of Error Entries</b>	This field shows the number of error entries in the imported file. Error entries can, for example, occur if the import file contains dimension values which have not been created in Maconomy in advance or if the import file contains an external account number which was not included in the conversion table used for the import.
<b>Total amount</b>	This field shows the total amount of the import file. The field shows the absolute value of imported amounts, that is, the sign does not affect the amount. An import of two lines with respectively \$100 and \$-100 will thus produce the result \$200.
<b>Error Entries Total Amount</b>	This field shows the total amount entered on error entries in connection with the import. The field shows the absolute value of imported amounts, that is, the sign does not affect the amount. An import of two lines with respectively \$100 and \$-100 will produce the result \$200.
<b>Read</b>	This field show whether the import file of the current import has been read. The field can, for example, show where the import of data stopped in cases where the import was interrupted. If the import was interrupted, you may be able to restart the import by entering the mode number in the field "Mode No." in the window Import Data.
<b>Converted</b>	This field shows whether Maconomy has converted the dimensions in the imported line to the dimensions in Maconomy. The field can, for example, show where the import of data stopped in cases where the import was

Field	Description
	interrupted. If the import was interrupted, you may be able to restart the import by entering the mode number in the field "Mode No." in the window Import Data.
<b>Processed</b>	This field shows whether the import has been finalized. An import is finalized when all data are read and converted, and the relevant entries are created in the journals.

## Input Data Lines Sub-Tab

This section includes the fields and descriptions for the Input Data Lines sub-tab.

Field	Description
<b>Line No.</b>	This field shows the line number of the current line in the import file.
<b>External Reg. No.</b>	This field shows the external registration number entered on the current line in the import file.
<b>External Account No.</b>	This field shows the external account number entered on the current line in the import file.
<b>Account No.</b>	This field shows the G/L account number entered on the current line in the import file.
<b>Trans. No.</b>	This field shows the transaction number entered on the current line in the import file.
<b>Trans. Type</b>	This field shows the transaction type entered on the current line in the import file.
<b>Entry Date</b>	This field shows the posting date entered on the current line in the import file.
<b>Entry Description</b>	This field shows the posting text entered on the current line in the import file.
<b>Amount</b>	This field shows the amount entered on the current line in the import file. The amount is converted to Maconomy's base currency.
<b>Currency</b>	This field shows the currency entered on the current line in the import file.
<b>Amount in Currency</b>	This field shows the amount in currency entered on the current line in the import file.
<b>Quantity</b>	This field shows the quantity entered on the current line in the import file.
<b>Quantity 2</b>	This field shows the quantity entered in the field "Quantity 2" on the current line in the import file.

Field	Description
<b>Reference Date</b>	This field shows the reference date entered on the current line in the import file.
<b>Input Data Form</b>	This field shows the name of the data form which was used for the input of data.
<b>Error Entry</b>	This field shows whether the current import line contained any errors.
<b>Error Message</b>	If the field "Error Entry" is checked on the line, this field will describe the error.
<b>Changed</b>	You mark this field manually if you, for example, reallocate the current import line. This enables you to keep track of those import lines which have not yet been reallocated.
<b>Changed by</b>	This field show the user who changed the current import line. When the field "Changed" is checked, Maconomy automatically enters the name of the user. It is possible to change the name manually.
<b>Changed on</b>	This field shows when the current import line was modified. When the field "Changed" is checked, Maconomy will automatically enter today's date in this field, but the date can be changed.
<b>Remarks</b>	In this field you can enter remarks relevant to the current line.
<b>Journal No.</b>	If the current import has been finalized, and the import line has resulted in an entry, this field shows the number of the journal in which the entry was created.
<b>Journal Line No.</b>	If the current import has been finalized, and the import line has resulted in an entry, this field will show the line number containing the entry in the journal. The number of the journal is shown in the field "Journal No." above.

## Show Imported Data Workspace

Use this workspace to view the data that you imported from a file.

For each line in the import file, you can see the entries that were created in Maconomy.

The Show Imported Data tab displays information about the line that was imported; the Entries sub-tab displays the entry that was created in Maconomy based on the import line in the Show Imported Data tab. The Entries sub-tab lines are only displayed if the entries have been posted.

You can use this workspace to check whether the conversion of the imported lines is correct. You can also check whether all of the erroneous import lines were reallocated. For this purpose, you can use the Show workspace to perform a search of all of the import lines in which the **Error Entry** field is selected and the **Changed** field is not selected. You maintain the **Changed** field manually in the Show Imported Files workspace.

## Show Imported Data Tab

This section includes the fields and descriptions for the Show Imported Data tab.

## Import References Island

Field	Description
<b>Run No.</b>	This field shows the run number assigned to the current import. A run number is automatically assigned to an import when the import is started in the Import Data workspace.
<b>Line No.</b>	This field shows the delivery number of the current import file.

## Entry Information Island

Field	Description
<b>Amount in Base Currency</b>	This field shows the amount entered on the current line in the import file and recalculated to Maconomy's base currency.
<b>Currency</b>	This field shows the currency used on the current line in the import file.
<b>Amount in Currency</b>	This field shows the amount entered on the current line in the import file.
<b>Quantity</b>	This field shows the quantity entered on the current line in the import file.
<b>Quantity 2</b>	This field shows the quantity 2 value entered on the current line in the import file.

## External Information Island

Field	Description
<b>External Reg. No.</b>	This field shows the external registration number which was entered on the current line in the import file.
<b>External Account No.</b>	This field shows the external account number which was entered on the current line in the import file.
<b>Trans. No.</b>	This field shows the transaction number which was entered on the current line in the import file.
<b>Trans. Type</b>	This is the transaction type that was entered on the current line in the import file.
<b>Entry Date</b>	This field shows the posting date which was entered on the current line in the import file.

Field	Description
<b>Reference Date</b>	This field shows the reference date which was entered on the current line in the import file.
<b>Entry Description</b>	This field shows the entry text which was entered on the current line in the import file.

**Error Island**

Field	Description
<b>Error Entry</b>	This field shows whether the current import line contained any errors.
<b>Error Text</b>	If the field "Error Entry" is checked on the current line, this field will contain the text describing the error.

**Company Island**

Field	Description
<b>Company</b>	If the imported line contained a value for the dimension Company, the value will be shown in this field.

**Account Island**

Field	Description
<b>Account No.</b>	If the imported line contained a value for the dimension Account, the value will be shown in this field.

**Dimensions Island**

Field	Description
<b>Location</b>	If the imported line contained a value for the dimension Location, the value will be shown in this field.
<b>Entity</b>	If the imported line contained a value for the dimension Entity, the value will be shown in this field.
<b>Project</b>	If the imported line contained a value for the dimension Project, the value will be shown in this field.
<b>Purpose</b>	If the imported line contained a value for the dimension Purpose, the value will be shown in this field.
<b>Spec. 1-3</b>	If the imported line contained values for the dimensions Spec. 1-3, these values will be shown here.
<b>Local Spec. 1-3</b>	If the imported line contained values for the dimensions Local Spec. 1-3, these values will be shown here.

**Changed Island**

Field	Description
<b>Changed</b>	This field shows whether any reallocation of the current import line has been made. This will help you keep an overview of those import lines which have not yet been reallocated. The field shows the value from the window Show Imported Files where the field is maintained manually.
<b>Changed by</b>	If changes have been made, this field will show the name of the user who performed the change.
<b>Changed on</b>	This field shows when the current import line was changed.
<b>Remarks</b>	This field shows any remarks entered to describe the change.

**Entries Sub-Tab**

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Trans. No</b>	This field shows the transaction number of the entry which has been created in the import journal on the basis of the import line shown in the Show Imported Data tab. The transaction number can stem from the data agent, the import line itself, or from the Import Data workspace. For a more detailed description of the conditions for the transfer of transaction numbers, see the field "Transaction Number Series" in the Data Agents workspace.
<b>Trans. Type</b>	This is the transaction type of the entry that has been created in the import journal, based on the import line shown in the Show Imported Data tab.
<b>Entry Date</b>	This field shows the posting date of the entry which has been created in the import journal on the basis of the import line shown in the card part.
<b>Entry Description</b>	This field shows the posting text of the entry which has been created in the import journal on the basis of the import line shown in the Show Imported Data tab. The posting text can origin form the import line itself, the import mode, the data agent or from the Import Data workspace. For a more detailed description of the conditions for the transfer of posting texts, see the field "Standard Text" in the Data Agents workspace.
<b>Company No.</b>	This field shows the value for the dimension "Company" of the entry created on the basis of the import line shown in the Show Imported Data tab.
<b>Account No.</b>	The functionality of this field is similar to that of the field "Company."
<b>Location</b>	The functionality of this field is similar to that of the field "Company."

Field	Description
<b>Entity</b>	The functionality of this field is similar to that of the field "Company."
<b>Project</b>	The functionality of this field is similar to that of the field "Company."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company."
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company."
<b>Debits</b>	This field shows the debit amount which is based on the import line in the card part and transferred to the G/L entry. The amount is converted to Maconomy's base currency.
<b>Credits</b>	This field shows the credit amount which is based on the import line in the card part and transferred to the G/L entry. The amount is converted to Maconomy's base currency.
<b>Currency</b>	This field shows the value from the corresponding field in the entry which was created in the general journal on the basis of the import line shown in the Show Imported Data tab.
<b>Debit, Currency</b>	This field shows the debit amount in the currency of the import line. The amount is based on the import line in the Show Imported Data tab and transferred to the G/L entry.
<b>Credit, Currency</b>	This field shows the credit amount in the currency of the import line. The amount is based on the import line in the Show Imported Data tab and transferred to the G/L entry.
<b>Quantity</b>	This field shows the value from the field "Quantity." The value is based on the import line in the Show Imported Data tab, and transferred to the general journal.
<b>QuantityB</b>	This field shows the value from the field "Quantity 2." The value is based on the import line in the Show Imported Data tab, and transferred to the general journal.
<b>Prior-Period</b>	This field shows whether the current entry is a prior-period entry.
<b>Date Posted</b>	This field shows the posting date of the current entry.
<b>Journal No.</b>	This field shows the journal number in which the entry is included.
<b>Journal Line No.</b>	This field shows the number of the current line in the journal in which the entry is included.

## Export Data Workspace

Use this workspace to start an export of G/L or job data.

Before the export is started, you must indicate which data agent you want to use for the export. Maconomy performs the export in accordance with the conditions that you defined for the data agent in question in the Data Agents workspace.

### Export Data Tab

This section includes the fields and descriptions for the Export Data tab.

#### Run Mode Island

Field	Description
<b>Create File</b>	By marking this field, you indicate that you want to perform a new export. For reprints of previous exports, the mark should be removed, as Maconomy will otherwise create another file, not a reprint. The file is created when you select the "Create File" action.

#### Export Information Island

Field	Description
<b>Data Agent</b>	In this pop-up field you select the data agent whose format you want to use for the current export. Data agents are created in the Data Agents workspace.
<b>Data Type</b>	In this field, you can specify whether to export G/L entries or job entries.
<b>File Name</b>	In this field, you must specify the name of the file which will contain the exported data when you select the "Create File" action. The file is formatted in accordance with the format of the data agent you selected in the field "Data Agent." The file is placed in your Maconomy client folder, unless you specify another path.  If you do not specify a file name here, Maconomy will use the file and path name specified in the field "Standard Export File Name" in the Data Agents workspace. If no file name is specified there, Maconomy will display a dialog box in which you can select a file name and location.

#### Selection Criteria Island

Field	Description
<b>Company No.</b>	In these fields, you can limit the amount of data exported to a selection of companies in the Maconomy system.
<b>Executing Company No.</b>	In these fields, you can limit the amount of data exported to a selection of executing companies in the Maconomy system.

Field	Description
<b>G/L Entry Date</b>	In these fields, you can specify a range of G/L entry dates. Only entries with G/L entry dates within the specified range are included in the export.
<b>Job Entry Date</b>	These fields only apply when exporting job entries. In these fields, you can specify a range of job cost entry dates. Only job entries whose entry dates in the job cost system are within the specified range are included in the export.

**Selection Criteria, Dimensions Island**

Field	Description
<b>Location</b>	In these fields, you can specify a range of values for the Location dimension. Only entries with values falling within the specified range are included in the export.
<b>Entity</b>	In these fields, you can specify a range of values for the Entity dimension. Only entries with values falling within the specified range are included in the export.
<b>Project</b>	In these fields, you can specify a range of values for the Project dimension. Only entries with values falling within the specified range are included in the export.
<b>Purpose</b>	In these fields, you can specify a range of values for the Purpose dimension. Only entries with values falling within the specified range are included in the export.
<b>Spec. 1-10</b>	In these fields, you can specify a range of values for the Spec. 1 dimension, Spec. 2 dimension, Spec. 3 dimension, and so on. Only entries with values falling within the specified range are included in the export.
<b>Local Spec. 1-10</b>	In these fields, you can specify a range of values for the Local Spec. 1 dimension, Local Spec. 2 dimension, Local Spec. 3 dimension, and so on. Only entries with values falling within the specified range are included in the export.

**Reprint Island**

Field	Description
<b>Run No.</b>	If you specify the number of a previous export run in this field, the export will be written to a file again when you select the "Create File" action. If you want to do this, the field "Create File" in the Run Mode island must not be marked.

**Extra Fields Island**

Field	Description
<b>Remarks 1-5</b>	In these fields, you can enter a number of remarks about the current data export. The fields are for lookup and information only.

Field	Description
<b>Dates 1-5</b>	In these fields, you can enter a number of remarks about the current data export. The fields are for lookup and information only.

## Actions

This section shows the actions available in the Export Data workspace.

### Top Pane

Field	Description
<b>Create File</b>	<p>When you select this action, Maconomy creates a file with the exported data, according to the format specified for the selected data agent. For more information about the file name, see the description of the field "File Name" above.</p> <p>When Maconomy creates the file, the exported G/L or job entries are marked as exported, and a run number is stamped on each entry included in the export. Entries which have been marked as exported cannot be exported again.</p> <p>You can see the export status of each G/L entry in the Show G/L Entries workspace. The individual entries included in a job entry export can be viewed in the Show Exported Job Entries workspace.</p>

## Show Exported Files Workspace

Use this workspace to view details about the files that have been exported using the Export Data workspace.

The Show Exported Files tab displays information about the run number and the amount of data that was exported.

The Exported Data sub-tab displays details about each line in the exported file. You select data for export in the Conversion Groups workspace, and Maconomy applies one or more conversion rules to the exported data. This workspace displays the exported data after the conversion rules have been applied. For more information, see the description of the Conversion Groups and Conversion Rules workspaces. You can view the original data in the Show Exported Data workspace.

Each export file on disk is linked to this workspace using the run number that is associated with the file. Maconomy automatically generates a run number when you create the file in the Export Data workspace.

## Show Exported Files Tab

This section includes the fields and descriptions for the Show Exported Files tab.

### Export Information Island

Field	Description
<b>Run No.</b>	This field shows the number of the run associated with the current export file.
<b>No. Entries</b>	This field shows the number of entries in the current file. This includes Record Start/End lines, Sector Start/End lines, and so on that are included in the file in accordance with the export specification.
<b>Number of Data Entries</b>	This field shows the number of data entries exported in the current file. The field shows the actual number of G/L entries exported, that is, the number of lines in the file less the number of structure lines as described in the field "No. Entries" above.
<b>Total Amount</b>	This field shows the total amount of all exported entries in the current file. The field shows the absolute value of exported amounts, that is, the sign does not affect the amount. An export of two lines with an amount of "100" and "-100," respectively, will produce the result "200."

## Exported Data Sub-Tab

This section includes the fields and descriptions for the Exported Data sub-tab.

Field	Description
<b>Group No.</b>	This field shows the name of the conversion group used for selecting data for export.
<b>Line No.</b>	This field shows the line number in the conversion group that selected the current line of exported data.
<b>Date</b>	This field shows the date on which the current data was exported.
<b>Amount</b>	This field shows the amount associated with the current exported data line.
<b>Company No.</b>	This field shows the value of the dimension "Company" from the current exported data line. Please note that this value may be different from that of the originally exported data if a conversion rule has applied another value to this dimension.
<b>Account No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Location</b>	The functionality of this field is similar to that of the field "Company No." above.

Field	Description
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.

## Show Exported Data Workspace

Use this workspace to track how data was exported using the Export Data workspace.

The Show Exported Data tab displays one line of exported data as displayed in the Show Exported Files workspace. This means that the data is displayed as it was exported, that is, after Maconomy applied the conversion rules. The Entries sub-tab displays the original exported data, that is, before Maconomy applied the conversion rules.

### Show Exported Data Tab

This section includes the fields and descriptions for the Show Exported Data tab.

#### Run Island

Field	Description
<b>Run No.</b>	This field show the run number of the exported data, that is, which run number Maconomy assigned to the data export. All exported lines from a given run can be seen in the Show Exported Files workspace.
<b>Run Line No.</b>	This field shows the line number of the run (that is, exported file) which is currently displayed in the workspace.
<b>Run Group No.</b>	This field shows the line number of the run (that is, exported file) which is currently displayed in the workspace.
<b>Description</b>	This field shows the description assigned to the run (that is, exported file) which is currently displayed in the workspace.
<b>Date</b>	This field shows the date when the export was performed in the Export Data workspace.
<b>Amount</b>	This field shows the amount of the currently displayed export line.

**Company Island**

Field	Description
<b>Company No.</b>	This field shows the value of the dimension “Company” for the current export data line. The value is shown as it was exported, that is, after a conversion rule has been applied to the data.

**Account Island**

Field	Description
<b>Account No.</b>	The functionality of this field is similar to that of the field “Company No.” above.

**Dimensions Island**

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field “Company No.” above.
<b>Entity</b>	The functionality of this field is similar to that of the field “Company No.” above.
<b>Project</b>	The functionality of this field is similar to that of the field “Company No.” above.
<b>Purpose</b>	The functionality of this field is similar to that of the field “Company No.” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Company No.” above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Company No.” above.

**Entries Sub-Tab**

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Trans. No.</b>	This field shows the Maconomy transaction number of the exported data line. This makes it easy to identify the data line, for example, in the Show G/L Entries workspace.
<b>Trans. Type</b>	This is the entry’s transaction type. Transaction types are set up in the Transaction Types workspace.
<b>Entry Date</b>	This field shows the entry date of the exported data line.
<b>Entry Description</b>	This field shows the entry description of the exported data line as entered in, for example, the General Journal or Job Journal workspaces.

Field	Description
<b>Debit</b>	This field shows the debit amount associated with the current exported data line.
<b>Credit</b>	This field shows the credit amount associated with the current exported data line.
<b>Quantity</b>	This field shows the quantity associated with the current exported data line.
<b>Quantity 2</b>	This field shows the amount associated with the current exported data line.
<b>Company No.</b>	This field shows the original value of the dimension "Company" from the current exported data line
<b>Account No.</b>	The functionality of this field is similar to that of the field "Company No." above
<b>Location</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.

## Show Exported Job Entries Workspace

Use this workspace to track how job data was exported using the Export Data workspace.

In the Show Exported Job Entries sub-tab, you can browse among the job data exports that you ran in the Export Data workspace. The Show Exported Job Entries sub-tab displays the information that you entered about the current export when the export was run. The Job Entries sub-tab displays information about the individual job entries that are included in the export.

## Show Exported Job Entries Tab

This section includes the fields and descriptions for the Show Exported Job Entries tab.

### Export Information Island

Field	Description
<b>Run No.</b>	This field shows the number of the run associated with the current export.
<b>Data Agent</b>	This field shows the name of the data agent used in the current export.
<b>Exported by</b>	This field shows the name of the user who ran the current export.
<b>Export Date</b>	This field shows the date on which the current export was run.
<b>No. Entries</b>	This field shows the number of entries in the current export. This includes Record Start/End lines, Sector Start/End lines, and so on, that are included in the file in accordance with the export specification.
<b>Output Data File</b>	This field shows the name of the file created in the current export.

### Selection Criteria Island

Field	Description
<b>Show Lines</b>	If you mark this field, the individual job entries exported in the current export will be displayed in the Job Entries sub-tab. If you do not mark this field, no table lines are displayed.

### Selection Criteria, Export Island

Field	Description
<b>Company No.</b>	These fields show the range of company numbers included in the current export.
<b>G/L Entry Date</b>	These fields show the range of G/L entry dates included in the current export.
<b>Job Posting Date</b>	This field shows the job cost posting date of the exported job entry.

### Extra Fields Island

Field	Description
<b>Remarks 1-5</b>	These fields show the remarks entered in relation to the current export in the Export Data workspace when the export was run.

Field	Description
<b>Date 1-5</b>	These fields show the dates entered in relation to the current export in the Export Data workspace when the export was run.

### Job Entries Sub-Tab

This section includes the fields and descriptions for the Job Entries sub-tab.

Field	Description
<b>Job No.</b>	This field shows the number of the job to which the current exported job entry pertains.
<b>Job Name</b>	This field shows the name of the job displayed in the field "Job No." above.
<b>Activity No.</b>	This field shows the number of the activity to which the current exported job entry pertains.
<b>Activity Name</b>	This field shows the name of the activity displayed in the field "Activity No." above.
<b>Task</b>	This field shows the name of the task to which the current exported job entry pertains.
<b>Task Description</b>	This field shows the description of the task displayed in the field "Task" above.
<b>Employee No.</b>	This field shows the number of the employee to which the current exported job entry pertains.
<b>Employee Name</b>	This field shows the name of the employee displayed in the field "Employee No." above.
<b>G/L Entry Date</b>	This field shows the G/L entry date of the exported job entry.
<b>Job Posting Date</b>	This field shows the job cost posting date of the exported job entry.
<b>Trans. No.</b>	This field shows the transaction number of the exported job entry.
<b>Trans. Type</b>	This is the entry's transaction type. Transaction types are set up in the Transaction Types workspace.
<b>Description</b>	This field shows the entry description text assigned to the current exported job entry.
<b>Currency</b>	This field shows the currency applying to the current exported job entry.
<b>Quantity</b>	This field shows the quantity on the current exported job entry.

Field	Description
<b>Billing Price</b>	This field shows the billing price of the current exported job entry.
<b>Exec. Company No.</b>	This field shows the executing company number of the current exported job entry. For further information, see the corresponding field in the table part of the Job Card workspace.
<b>Base Currency, Exec. Company</b>	This field shows the currency used as base currency in the company shown in the field Executing Company No.” above.
<b>Cost Price, Exec. Company</b>	This field shows the cost price applying to the executing company for the current exported job entry. For further information, see the corresponding field in the table part of the Job Card workspace.
<b>Cost</b>	This field shows the cost price applying to the current exported job entry.
<b>Cost Price, Reg.</b>	This field shows the adjusted cost price applying to the current exported job entry. For further information, see the corresponding field in the table part of the Job Card workspace.
<b>Company No.</b>	This field shows the number of the company responsible for the current exported job entry.
<b>Location</b>	This field shows the location to which the current exported job entry pertains.
<b>Entity</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Project</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Purpose</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Vendor</b>	This field shows the number of the vendor to which the current exported job entry pertains. For further information, see the corresponding field in the table part of the Job Card workspace.
<b>Vendor Name</b>	This field shows the name of the vendor displayed in the field “Vendor No.” above.
<b>Vendor Invoice No.</b>	This field shows the number of any vendor invoice pertaining to the current exported job entry. For further information, see the corresponding field in the table part of the Job Card workspace.

Field	Description
<b>Origin</b>	This field shows the origin of the current exported job entry.
<b>Entry Type</b>	This field shows the entry type of the current exported job entry.
<b>Quantity</b>	This field shows any quantity specification applying to the current exported job entry. For further information, see the corresponding field in the table part of the Job Card workspace.
<b>Quantity 2</b>	This field shows any quantity 2 specification applying to the current exported job entry.
<b>Remarks</b>	This field shows any remark entered for the current exported job entry. For further information, see the corresponding field in the table part of the Job Card workspace.
<b>Overtime Spec.</b>	This field shows any overtime specification entered for the current exported job entry.
<b>Journal No.</b>	This field shows the number of the job journal in which the current job entry was posted.
<b>Journal Line No.</b>	This field shows the current exported job entry's line number in the job journal displayed in the field "Journal No." above.
<b>Date Posted</b>	This field shows the date on which the current exported job entry was posted.

## Data Agents Workspace

Use this workspace to enter information that defines how Maconomy is to handle the G/L data that you imported from or exported to external systems.

This information is used when you import and export G/L data in the Import Data and Export Data workspaces, respectively. The purpose is to ensure that all import and export files that are exchanged on a regular basis are treated in the same way every time. An example of such an exchange of data is an import file that contains payroll information from an external payroll system.

You can enter information about each data agent, including an identification number. Maconomy uses this number as a unique reference number that ensures that no data is imported or exported by mistake, for example, using a different data agent. You can enter a fixed conversion table that can be used for every data import from the data agent in question, and an export format and conversion group to be used for exports. You can also predefine file names and determine whether users should be allowed to view imported data in a general journal before posting.

For more information about conversion tables, see the description of the Conversion Tables workspace. For more information about conversion groups, see the description of the Conversion Groups workspace.

## Data Agents Tab

This section includes the fields and descriptions for the Data Agents tab.

## Data Agent Island

Field	Description
<b>Name</b>	In this field, you enter the name of the data agent. This is the unique reference to the data agent, and the name cannot be changed later.
<b>Address</b>	In these fields, you enter the address of the data agent.
<b>Your Phone</b>	In this field, you enter the phone number of the data agent.
<b>Your Contact</b>	In this field, you enter the name of the data agent's contact person.
<b>Our Phone</b>	In this field, you enter the phone number of the person in your own company who is responsible for the contact with the current data agent.
<b>Our Contact</b>	In this field, you enter the name of the person in your own company who is responsible for the contact with the current data agent.

## Export Control Island

Field	Description
<b>Create Detailed Export File</b>	<p>In this field, you can specify whether to create a detailed export file when exporting G/L entries using the current data agent. If you mark this field, export runs for G/L entries will include information about each G/L entry included in the export, which you can then look up in the Show Exported Data workspace. If you do not mark this field, running a G/L entry export using the current data agent will only result in a file containing the export run number. However, the export run number is also copied to all of the G/L entries matching the selection criteria, allowing you to look up these entries in the Show G/L Entries workspace.</p> <p>When you export job cost entries, the file that is created only contains the run number, regardless of the value in this field. The individual job entries covered by the export can be looked up in the Show Exported Job Entries workspace.</p>
<b>Export Format</b>	In this field you enter the export format to be used when exporting files to the current data agent. Formats are delivered by Maconomy A/S and are imported using the Import Format Descriptions program.
<b>Conversion Group</b>	In this field, you must enter a conversion group to be used when exporting data using the current data agent. A conversion group specifies a number of selection criteria for which G/L data is to be exported. At the same time, it assigns a conversion rule to each section of data. For more information, please see the description of the Conversion Groups workspace.

Field	Description
<b>Group Export Entries</b>	In this field, the user can specify whether Maconomy should create one export line for each entry or group entries that have the same dimensions.
<b>Standard Export File Name</b>	If the files you want to deliver to your data agent should always have the same name, you can enter the (standard) file name, including the path, in this field. If you enter a file name, Maconomy will automatically export to the right file, saving you the trouble of specifying the file manually in the Export Data workspace.

### Export Information Island

Field	Description
<b>Last Export Date</b>	This field shows the date of the last export to the current data agent.
<b>Last Run No.</b>	This field shows the number of the last export file to the current data agent. Maconomy automatically assigns a number to the exported files using the system number series "Automatic Payment."
<b>Next System No. 1-3</b>	The export format may specify that one or several system numbers must be included in the export file. Each number can be specified to increment in a different way, for example, starting over every day, month, or year. Maconomy will keep track of the system numbers, but if you need to set the number manually (for example, to set an initial value), you can do so in these fields.

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

### Company Island

Field	Description
<b>Company No.</b>	<p>In this field, you enter a value for the Company dimension. The company number will be inserted in all imported data. For each entry created, Maconomy will determine the company number to be used. The selection is carried out in accordance with the following order of priority:</p> <ol style="list-style-type: none"> <li>1. If a conversion table has been assigned to the data agent, Maconomy will check whether the combination of the external registration number and the external account number exists in the conversion table for the data agent from which the import has been carried out. If this is the case, Maconomy will check whether a company number is entered on the conversion table line, and, if so, that number will be used.</li> <li>2. If there is no company number on the conversion table line that fulfills the imported combination of the external registration number and the external</li> </ol>

Field	Description
	<p>account number, or if the combination does not exist in the conversion table, Maconomy will check whether the imported line contains a company number. If this is the case, that number will be used.</p> <ol style="list-style-type: none"> <li>3. If no company number has been entered on the imported line, the company number in this field will be used.</li> <li>4. If no company number is entered for the current data agent, Maconomy will try to derive a value in accordance with the order of priority defined in the Dimension Derivations workspace. If there is no value to derive, the standard value from the System Parameters workspace in the Set-Up module will be used.</li> </ol> <p>This field will also influence the number of general journals created when an import is carried out. If a value is entered in this field, only one general journal is created when import is carried out from the data agent. On the general journal, the company entered in this field will be used. The company number on the lines in the journal will depend on the above-mentioned order of priority. If entries of relevance to other companies are involved, intercompany entries are created, unless the system parameter "Create intercompany entries for companies with same parent company" is not marked, and the two companies involved are both assigned to the same parent company.</p> <p>If no value has been entered in this field, a general journal for each company involved is created when import is carried out. In this way you avoid intercompany balancing.</p>

### Account Island

Field	Description
<b>Account No.</b>	<p>In this field, you enter the value for the Account dimension. The account number assigned to imported entries will be influenced by this field. For each entry created, Maconomy will use the following order of priority to determine where the account number is derived from:</p> <ol style="list-style-type: none"> <li>1. Maconomy will examine whether the combination of the external registration number and external account number exists in the conversion table for the data agent from which the import is carried out. If this is the case, Maconomy will check whether an account number has been entered on the conversion table line and if so, that number will be used.</li> <li>2. If there is no account number on the conversion table line which fulfills the imported combination of the external registration number and the external account number, or if the combination does not exist in the conversion table, Maconomy will check whether an account number has been assigned to the imported line. If this is the case, that number will be used.</li> <li>3. If no account number has been entered on the imported line, the account number assigned to the data agent will be used.</li> </ol>

Field	Description
	4. If no account number is entered for the current data agent, Maconomy will try to derive a value in accordance with the order of priority, which has been defined in the Dimension Derivations workspace. If there is no value to derive, the standard value from the System Parameters workspace in the Set-Up module will be used.

### Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Account No."
<b>Entity</b>	The functionality of this field is similar to that of the field "Account No."
<b>Project</b>	The functionality of this field is similar to that of the field "Account No."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Account No."
<b>Spec. 1-3</b>	The functionality of this field is similar to that of the field "Account No."
<b>Local Spec. 1-3</b>	The functionality of this field is similar to that of the field "Account No."

### Import Control Island

Field	Description
<b>Import Format</b>	In this field you enter the import format to be used when importing files from the current data agent. Formats are delivered by Maconomy A/S and are imported using the Import Format Descriptions program.
<b>Create General Journal</b>	If you mark this field, a general journal is created with all imported entries of relevance to the current data agent. If this field is not marked, the imported files are registered in an import journal that will be ready for posting. In this case, you will not be able to inspect nor correct the imported data before posting is carried out.
<b>Transaction Type</b>	This the default transaction for the data agent. You can select from all transaction types that have been set up. There is no validation. Transaction types are set up in the Transaction Types workspace.
<b>Transaction Number Series</b>	In this field, you enter which transaction number series you wish to use for the entries that are created in connection with the import of data from the current data agent. If you do not enter a transaction number series for the data agent, Maconomy will use the transaction numbers that are entered on each line in the imported file. If no number is entered on the lines of the import file, the transaction number, which was entered in the Import Data

Field	Description
	workspace when the import was initiated, will be used. Transaction number series are created in the Trans. No. Series workspace.
<b>Consecutive Trans. No.</b>	If you mark this field, the transaction number of the entries created in the general journal will be incremented by one every time the balance is equal to zero. If this field is marked the number will be incremented.
<b>Standard Posting Text</b>	<p>In this field, you enter a posting text. This text is used for all entries created during an import from the current data agent. Maconomy will use the following order of priority to determine which posting text to transfer:</p> <ol style="list-style-type: none"> <li>1. If a posting text is entered on the line which is imported, this text will be used.</li> <li>2. If no posting text is entered in the import file, Maconomy will use the standard text, which is entered in the Import Modes workspace.</li> <li>3. If no text is entered for the import mode, Maconomy will use the standard text entered in this field.</li> <li>4. If no text is entered in this field, Maconomy will use the posting text which was entered in the Import Data workspace when the import was initiated. If no text was entered here, the text "Import" will be used instead.</li> </ol>
<b>Standard Import File Name</b>	If the files you receive from your data agent always has the same name, you can enter the (standard) file name, including the path, in this field. If you enter a file name, Maconomy will automatically find the right file, saving you the trouble of pointing out the file manually in the Import Data workspace.
<b>Receipt File Name</b>	If you enter a file name that includes the path, a receipt file is created every time you run an import from the current data agent. The file will contain information about the import. Receipt files are only created if a file name is entered in this field.
<b>Automatic Posting</b>	If you mark this field, Maconomy will automatically post the journals created as a result of an import from the current data agent.
<b>Open Period from</b>	In combination with the field "Open Period To," this field specifies a range of dates for the import of data from the current data agent. If you enter a period, entries will only be imported if their posting date is within the specified range. Entries outside the specified range will not be imported.
<b>Open Period to</b>	See the description of the field "Open Period From."
<b>Post. Ref. for Balancing Entry</b>	In this field, you can specify a dimension combination of the type "Posting Reference." The account and dimension values in this dimension combination are used for balancing imported journals where the debit and credit amounts do not balance. If the amounts on the entries in an imported file do not balance, Maconomy creates an extra entry after the import, using the account and dimension values specified through the dimension

Field	Description
	<p>combination in this field. The amounts on the balancing entry correspond to the amounts necessary to make the journal balance.</p> <p>If you leave this field blank, imports where balancing entries are created will fail.</p> <p>Entry text for balancing entry In this field, you can specify a posting description to be used on balancing entries. For a description of balancing entries, see the field "Post. Ref. for Balancing Entry" above. This field must be completed if you complete the field "Post. Ref. for Balancing Entry."</p>

### Import Information Island

Field	Description
<b>Identification No.</b>	In this field you enter the identification number to be used in the fields imported from the data agent. When data import is carried out, Maconomy will check if the number corresponds to the identification number entered in the imported file. The identification number ensures that no data from other data agents are imported by mistake.
<b>Conversion Table</b>	In this field you enter the conversion table that is to be used for import of data from the current data agent. When the import is carried out, the accounts in the import file are converted to the conversion combinations entered in the conversion table. For further information about conversion tables, see the description of the Conversion Tables workspace.
<b>Last Import Date</b>	This field shows the date of the last import from the current data agent.
<b>Last Run No.</b>	This field shows the number of the last import file from the current data agent.

## Import Modes Workspace

Use this workspace to enter information about how Maconomy should treat different types of data that you import in the Import Data workspace.

For each import mode, you can enter a posting reference and a posting text. Use these if you import an entry that cannot be posted (for example, an entry that refers to an unknown or blocked account or dimension value).

You assign each import mode to a data agent. You can assign more than one import mode to the same data agent. During the import, the type of the imported data determines which import mode is to be used for each line. Maconomy compares the import form that you enter on the import mode with the data type on the import line.

By creating different import modes, you can define that specific accounts and posting texts are to be used for the import of G/L data and the import of vendor data, respectively, from a specific data agent.

## Import Modes Tab

This section includes the fields and descriptions for the Import Modes tab.

### Import Mode Island

Field	Description
<b>Name</b>	In this field, you enter the name of the current import mode.
<b>Description</b>	In this field, you enter the description of the import mode.
<b>Contact Person</b>	In this field you enter the name of the contact person at the data agent to which the import mode is assigned.
<b>Phone</b>	In this field, you enter the phone number of the data agent to which the import mode is assigned.
<b>Data Agent</b>	In this field, you assign the import mode to a data agent. The import mode will be used when data is imported from the data agent which is entered in this field.
<b>Import Form</b>	In this field, you can enter a data type. The data type will determine when the import mode is used. Each import line contains information about the type of data which is entered on the line, for example, G/L data, vendor data, and so on. The import mode will only use lines that contain data of the same type as the type that is entered in this field.

### Posting Island

Field	Description
<b>Standard Text</b>	<p>In this field, you enter a posting text. This text is used for all entries created during an import from the current data agent. Maconomy will use the following order of priority to determine which posting text to transfer:</p> <ol style="list-style-type: none"> <li>1. If the imported line contains a posting text, this text will be used.</li> <li>2. If no posting text has been specified on the import line, Maconomy will use the standard text entered in the Import Modes workspace.</li> <li>3. If no text has been entered for the import mode, Maconomy will use the standard text entered in this field.</li> <li>4. If no text has been entered in this field, Maconomy will use the posting text entered in the Import Data workspace when the import was initiated. If no text was entered here, the text "Import" will be used instead.</li> </ol>
<b>Posting Ref., Error Entries</b>	In this field, you can enter the number of a dimension combination of the type "Posting Reference." This dimension combination contains the reference to the account number and other dimension values on which error entries will be posted. If the field "Create Error Entries" is checked, and the current import mode is used for the import line which contains an erroneous entry, the entry will be registered

Field	Description
	on the account referred to by the dimension combination in this field. An example of an error is the import of a dimension value that has not been created in Maconomy. If the field "Create Error Entries" is not marked, erroneous lines are ignored.
<b>Create Error Entries</b>	In this field, you specify whether erroneous entries from an import are to be ignored or whether they are to be posted on an error account. If this field is marked, and the current import mode is used on an import line that contains an error, the created entry will be registered on the account referred to by the dimension combination in the field "Posting Ref., Error Entries." An example of an error is the import of dimension values that have not been created in Maconomy.
<b>Verify Posting Date</b>	In this field you specify whether the posting dates of the imported entries are to be corrected if the posting dates on these entries are outside the open posting period. If this field is marked, and the import file contains a date outside the open posting period, Maconomy will correct the posting date to the first day of the open posting period. If this field is not marked, import lines with a posting date outside the open posting range are imported without any corrections. You can enter the open posting interval for each company in the Company Information workspace. If a company has no open posting period assigned, the posting period entered in the System Information workspace in the Set-Up module is used.
<b>Post on Error Account</b>	In this field you enter whether imported entries with an entry date outside the open posting period are to be posted on an error account. This field is only to be used if the field "Verify Posting Date" is checked for the import mode in question. If the field is marked, import lines outside the posting period will be posted on the account referred to by the dimension combination in the field "Posting Ref., Error Entries." If this field is not marked, the account used on lines outside the open posting period is determined in the same way as on lines inside the period.

### Import Control Island

Field	Description
<b>Description</b>	Further information about this field can be found in the detailed document for the current import form.
<b>Popup</b>	Further information about this field can be found in the detailed document for the current import form.
<b>Value</b>	Further information about this field can be found in the detailed document for the current import form.

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

## Conversion Tables Workspace

Use this workspace to list a number of references between external and internal accounts.

This workspace is a part of the add-on module Import of G/L Data; you can only use it if you purchased that module.

In the Conversion Tables tab you enter the name of the current conversion table, and in the Conversion Table Lines sub-tab you enter the references between the external account and registration numbers. For each combination of external account number and registration number, you can enter a value for each of the 12 G/L dimensions in Maconomy. If you use the dimensions, you can merge an external one-dimensional chart of accounts into the 12-dimensional chart of account in Maconomy.

You assign conversion tables to data agents in the Data Agents workspace. When you import G/L data for a specific data agent, Maconomy converts the account numbers in the import file into the allocation combinations that you entered in the conversion table for the data agent in question.

### Conversion Tables Tab

This section includes the fields and descriptions for the Conversion Tables tab.

#### Conversion Table Island

Field	Description
<b>Name</b>	In this field, you can enter the name of the current conversion table. Once the table is created, it is no longer possible to change the name.

#### Selection Criteria Island

Field	Description
<b>Show Lines</b>	When you mark this field, the lines matching the criteria specified in this island are shown in the Conversion Table Lines sub-tab.
<b>External Reg. No.</b>	In this field, you enter an external registration number, for example, an ID of a department at the external source.
<b>External Account No.</b>	In this field you enter an external account number.
<b>Company No.</b>	In this field you enter a value for the dimension Company.

#### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

## Conversion Table Lines Sub-Tab

This section includes the fields and descriptions for the Conversion Table Lines sub-tab.

Field	Description
<b>External Registration No.</b>	In this field, you can enter an external registration number, for example, an ID of a department at the external source. When the conversion table is used in connection with an import, entries which have an external registration and account number corresponding to the combination on the current conversion table line will be converted. The conversion means that the entries created in Maconomy will be posted with the allocation combination entered in the dimension fields on the current line.
<b>External Account No.</b>	In this field you enter an external account number. When the conversion table is used in connection with an import, entries which have an external registration and account number corresponding to the combination on the current conversion table line will be converted. The conversion means that the entries which are created in Maconomy will be posted with the allocation combination entered in the dimension fields on the current line.
<b>Company No.</b>	<p>In this field you enter a value for the dimension Company. The company number will be inserted in all imported data. For each entry created, Maconomy will determine which company number will be used. The selection is carried out in accordance with the following order of priority:</p> <ol style="list-style-type: none"> <li>1. If a conversion table has been assigned to the data agent, Maconomy will check whether the combination of the external registration number and the external account number exists in the conversion table for the data agent from which the import is carried out. If this is the case, Maconomy will check whether a company number is entered on the conversion table line, and, if so, that number will be used.</li> <li>2. If there is no company number on the conversion table line that fulfills the imported combination of the external registration number and the external account number, or if the combination does not exist in the conversion table, Maconomy will check whether a company number has been specified on the import line. If this is the case, that number will be used.</li> <li>3. If no company number has been entered for the imported line, the company number that has been assigned to the data agent in the window Data Agents in this field will be used.</li> <li>4. If no company number is entered for the current data agent, Maconomy will try to derive a value in accordance with the order of priority defined in the Dimension Derivations workspace. If there is no value to derive, the standard value from the System Parameters workspace in the Set-Up module will be used.</li> </ol>
<b>Account No.</b>	The functionality of this field is similar to that of the field "Company No."

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Company No."
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No."
<b>Project</b>	The functionality of this field is similar to that of the field "Company No."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No."
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No."

## Conversion Groups Workspace

Use this workspace to define cross-sections of the pool of Maconomy G/L data that can be exported.

This workspace is a part of the add-on module Import of G/L Data; you can only use it if you purchased that module.

You can define these cross-sections by entry date, dimension value, and journal type. Maconomy then assigns to each section a conversion rule that defines how the export is performed for that particular section of G/L data. For instance, you can specify that all data that you entered after 1 April 2000 in company "Main" that was posted on G/L account numbers between 1000 and 3999 should be exported according to a conversion rule called "ProfitLoss." Data that you entered after 1 April 2000 in the same company, but on all other accounts, should be exported according to another rule.

You define conversion rules in the Conversion Rules workspace. You assign conversion groups to individual data agents in the Export Control island in the Data Agents workspace.

### Conversion Groups Tab

This section includes the fields and descriptions for the Conversion Groups tab.

#### Conversion Group Island

Field	Description
<b>Name</b>	In this field, you specify the name of the conversion group when you create it. The name cannot later be changed.
<b>Description</b>	In this field, you can enter a description of the current conversion group.

**User Island**

See the chapter “Getting Started” for a description of the fields in the User island.

## Conversion Group Lines Sub-Tab

This section includes the fields and descriptions for the Conversion Group Lines sub-tab.

Field	Description
<b>Conversion Rule</b>	In this field, you enter the name of an existing conversion rule that has been created in the Conversion Rules workspace. The section of G/L data specified in the other fields on this table line is exported according to this rule.
<b>External Entry Description</b>	If you enter a description in this field, all exported data entries will have that description. If you do not enter a description, the entry description will be the same as on the original G/L entry.
<b>Entry Date From / Entry Date To</b>	If you enter a date range in these fields, data entered on and after the From date and up to the To date will be exported, provided it fulfills the other criteria in this table line.
<b>Company No. From / Company No. To</b>	These fields represent a range of companies. G/L entries for which the companies within this range are responsible will be exported (provided any other selection criteria on this line are fulfilled as well) and converted according to the conversion rule specified on this line.
<b>Account No. From / Account No. To</b>	The functionality of these fields is similar to that of the field “Company No. From” above.
<b>Location From / Location To</b>	The functionality of these fields is similar to that of the field “Company No. From” above.
<b>Entity From / Entity To</b>	The functionality of these fields is similar to that of the field “Company No. From” above.
<b>Project From / Project To</b>	The functionality of these fields is similar to that of the field “Company No. From” above.
<b>Purpose From/ Purpose To</b>	The functionality of these fields is similar to that of the field “Company No. From” above.
<b>Spec. 1-10 From / Spec. 1-10 To</b>	The functionality of these fields is similar to that of the field “Company No. From” above.
<b>Local Spec. 1-10 From / Local Spec. 1-10 To</b>	The functionality of these fields is similar to that of the field “Company No. From” above.

Field	Description
<b>Journal Type</b>	In this field, you can select a journal type. When you perform the export, G/L entries posted using a journal of the selected type will be exported and converted according to the conversion rule specified on this line (if they also fulfill the other criteria on this line).

## Conversion Rules Workspace

Use this workspace to define rules for the export of G/L data.

Maconomy assigns the rules that you define in this workspace to lines in the Conversion Groups workspace. Each line in that workspace identifies a section of G/L data to be exported, and the assigned rule defines any conversion that should take place during the export.

You assign one conversion group to each data agent in the Data Agents workspace. When you use that data agent, Maconomy selects the exported data using the conversion group and converts it according to the rules that you set up in this workspace.

### Conversion Rules Tab

This section includes the fields and descriptions for the Conversion Rules tab.

#### Conversion Rule Island

Field	Description
<b>Name</b>	In this field, you specify the name of a new conversion rule. The name cannot be changed once the rule has been created. Use this name when selecting the rule in the Conversion Groups workspace.
<b>Description</b>	In this field, you can enter a description of the current conversion rule.
<b>Export Entries</b>	<p>If you mark this field, data selected in the Conversion Groups workspace with a specification of this conversion rule will be exported when exporting data using the conversion group in question. If this field is not selected, the selected G/L entries to which this rule is assigned will not be exported.</p> <p>This is useful when excluding entries from being exported. If you, for example, want to export G/L entries related to companies 1-10, except for companies 3 and 5, you can create two conversion rules in this workspace: "CR1" with no mark in this field, and "CR2" with a mark in this field. In the Conversion Groups workspace, you can then enter "3" in the fields "Company No. From" and "Company No. To" on line 1, enter "5" in the same fields on line 2, and finally enter "1" in the field "Company No. From" and "10" in the field "Company No. To" on line 2. Then, assign the conversion rule "CR1" to lines 1 and 2 and "CR2" to line 3. When exporting using the data agent to which the conversion group is assigned, G/L entries for companies 1-10, except for companies 3 and 5, will be exported.</p>
<b>Export Form</b>	In this pop-up field, you select an export form to be used when converting exported data. This way, you can make the export file conform to the data

Field	Description
	agent's specifications. It may, for instance, be necessary to use one export form for customer data and another for vendor data. Also, the same form can be assigned to different export data records. Export forms are created in the Format Specification module.

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

### Company Island

Field	Description
<b>Company No.</b>	In this field you can enter a value for the Company dimension. The company number will be inserted into all exported data. If you do not enter a value, the value from the original G/L entry is transferred to the export entry.

### Account Island

Field	Description
<b>Account No.</b>	The functionality of this field is similar to that of the field "Company No." above.

### Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.

## Set-Up Section

This section includes the fields and descriptions for the Set-Up section workspaces.

### Company Information Workspace

Use this workspace to maintain information about the company—or companies, if you are working in an enterprise or a public agency that consists of multiple companies, and you have purchased Maconomy's multi-company model.

The information in this workspace includes the address, telephone number, fax number, and so on, of the company and a definition of an access level if you want to limit access to the company's data. You also use this workspace to create values in the Company dimension, to specify dimensions that are derived from the company, and to specify the dimension structure to be used when posting local specifications.

To preserve the audit trail, it is recommended that you print and file the Company Information workspace every time that you change it.

#### Company Information Tab

This section includes the fields and descriptions for the Company Information tab.

#### Company Island

Field	Description
<b>Company No.</b>	<p>In this field, you can specify the number of the company you are creating.</p> <p>In the remaining fields you can specify the name address of the company. If the current company is the main company, its name was inserted at the time Maconomy was installed and cannot be changed. The address fields include three optional text lines, zip code and city fields, and two more optional text lines.</p> <p>The information in this island is used when printing from the system, for example, order confirmations and invoices.</p> <p>It is only possible to create a company if you have purchased Maconomy's Multi-Company add-on. If you have installed Maconomy Lawyer, it is not possible to create more than one company.</p>
<b>Country</b>	<p>Here you enter your company's country code. This is used if your company does business within the European Union, in that you are only required to report on sales and purchases to and from other EU countries.</p>

#### General Ledger Island

Field	Description
<b>Posting Period Setup No.</b>	<p>In this field, you must specify a "Posting Period Setup" number. It is mandatory to define a posting period setup. It is used to describe the open posting periods where entries can be made in G/L and job cost. By default, all companies use the standard posting period setup. If a company-specific setup</p>

Field	Description
	<p>is needed, this posting period setup must be created and inserted here. Posting period setups are specified in the "Posting Period Setup" workspace. A posting period setup must be valid. The validation is done in the Posting Period Setup workspace.</p>
<b>Journal Setup No.</b>	<p>In this field, you must specify a "Journal Setup" number. It is mandatory to define a journal setup. It is used to describe the setup of all posting journals, that is: a specification of what transactions are allowed in different journals, and which default transaction number series is used in a specific journal. Journal setups are specified in the Journal Setup workspace.</p>
<b>Fiscal Year Template</b>	<p>In this field, specify the fiscal year template to be used for the current company. Once entries have been made for the company, you can no longer change the fiscal year template. The field must be completed.</p> <p>A fiscal year template is created in the Fiscal Year Templates workspace, and defines the start and end dates in the fiscal year of the company. The individual G/L periods in the fiscal year are defined in the Fiscal Year workspace. For further information about fiscal year functionality, please see the descriptions of these workspaces.</p> <p>When you create a company, Maconomy suggests the fiscal year template of the standard company specified in the System Information workspace in the Set-Up module, but you can select another template.</p>
<b>Fiscal Year</b>	<p>In this field, you specify the fiscal year to be used by the current company. The fiscal year must be entered with the start date for the fiscal year in accordance with the date format used, for example, 01/01/2002.</p> <p>The fiscal year must exist in the Fiscal Year Template workspace for the template specified in the field "Fiscal Year Template." The periods in the fiscal year are defined in the Fiscal Year workspace. You must always specify a fiscal year unless you have specified a parent company. If you have specified a parent company, the fiscal year is retrieved from the parent company, and cannot be changed here.</p> <p>If you do not enter a fiscal year in this field, the start date for the fiscal year entered in the System Information workspace in the SetUp module will be used.</p>
<b>Jobs Overrun Entry Date</b>	<p>When having jobs set up with overrun handling, overrun is checked on jobs when posting journals on the jobs. In case of an overrun, an overrun entry is posted to the job. The default date for the entry created is current date, in other words, the date that the journal is posted.</p> <p>In this field you can control the entry date by company for entries generated on jobs where over run handling is set up.</p>
<b>Separate Transaction Numbers</b>	<p>This means that separate transaction number series will automatically be created for the current company, regardless of whether a parent company exists or not. If a standard company is specified in the System Information workspace in the Set-Up module, the transaction number series created for the current will correspond to the number series created for the standard company. Note that the number series from the standard company is not reset</p>

Field	Description
	<p>when transferred to the current company. The company specific number series can be viewed in the Trans. No. Series workspace and the System Numbers and Number Series workspaces in the Set-Up module.</p> <p>If this field is not marked, a parent company must be specified. When a company does not use separate transaction numbers, the transaction numbers are taken from the company specified in the island Parent Company in this workspace.</p> <p>This field is marked by default.</p>
<b>Blocked</b>	<p>Here you can specify that the company cannot be used for new entries. If the box is checked, you cannot assign the company to new transactions or information cards. However, the company is used if it is assigned to non-posted G/L entries before the box is checked. You can make statistics for a blocked company.</p>

### Seq. No. Assignment Island

Field	Description
<b>Reporting Company</b>	Select this check box if the company is a reporting company. Only reporting companies can be used when assigning sequence numbers to finance entries and creating opening balances.
<b>Excl. Transaction Type Group</b>	If you select a transaction type group, finance entries with transaction types listed in the group are disregarded when Maconomy assigns sequence numbers to finance entries. These finance entries are also disregarded in the creation of opening balance entries.
<b>Sequence Numbering</b>	<p>Select a value from the drop-down list to specify the numbering system to use for the company: by transaction number, or by entry.</p> <p>If you select <b>By Transaction Number</b>, Maconomy provides all entries that have the same transaction number with the same sequence number.</p> <p>If you select <b>By Entry</b>, Maconomy provides each entry with a unique sequence number.</p>
<b>New Sequence per Period</b>	<p>If you select this check box, Maconomy restarts the sequence for each fiscal year period.</p> <p>If you leave this blank, the sequence numbers continue across fiscal year periods and thus span then entire fiscal year.</p>
<b>New Sequence per Trans. Type</b>	If you select this check box, Maconomy creates a sequence for each transaction type. This means that for each transaction type, entries are assigned sequence numbers from 1 to the number of entries with the same fiscal year or fiscal year period (depending on whether the <b>New Seq. per Period</b> check box is selected).
<b>Length of Sequence No.</b>	In this field, you specify the number of digits for the sequence number part of the combined sequence number. If a sequence number has fewer digits than the number you specify in this field, Maconomy pads the sequence number with leading zeroes. For example, if you specify '6' in this field and

Field	Description
	the sequence number is '4123', then the sequence number part of the combined sequence number is '004123'.
<b>Trans. Type on Opening Balance Combined Seq. No.</b>	If the <b>New Seq. per Trans. Type</b> check box is selected, Maconomy includes the transaction type in the combined sequence number. Maconomy also needs to know which value to use in the combined sequence numbers for opening balance entries. The value you specify in this field is used as the transaction type in the combined sequence numbers for opening balance entries.

### Currency Island

Field	Description
<b>Base Currency</b>	<p>In this field, you can specify a currency created in the Popup Fields workspace. The base currency is the currency in which the current company wants to register its information and base its reporting throughout the system. This makes it possible to, for example, present tax accounts in the selected currency.</p> <p>Amounts converted into base currency at registration are not always shown, but are used for internal calculations. The exchange rate table used for conversion into base currency depends on the conversion situation. In the fields/windows where currency conversion is directly related to sales and purchase transactions, Maconomy uses the exchange rate table for sales and purchase respectively, while the enterprise exchange rate table is used where the conversion is not directly related to sales or purchases. Such conversions can take place, for example, in connection with intercompany transactions or internal reporting. See the System Information workspace in the Set-Up module for a more detailed description of the enterprise exchange rate table and other exchange rate tables.</p> <p>You can only select a base currency that is different from the enterprise currency if the add-on module Company-Specific Base Currency has been acquired. The base currency is specified when creating a company and cannot be changed, once you have pressed Enter. The enterprise currency is specified in the System Information workspace in the Set-Up module.</p>
<b>EU Reporting Currency</b>	<p>In this field, you can specify the currency in which the current company is to perform reporting to the Sales List System and Intrastat, that is, the national currency for the current company. The EU reporting currency is only used in the EU Statistics module, where all amounts are shown in the base currency of the current company as well as in the EU reporting currency. When creating reporting files for the Sales List System and Intrastat, Maconomy displays all amounts in the currency specified in this field.</p> <p>The EU reporting currency is specified when creating a company and cannot be changed, once you have pressed Return.</p>

**Local Dimensions Island**

Field	Description
<b>Local Spec. 1-10 List</b>	<p>In these fields, you can specify which dimension list should be used for the Local Specification 1-3 dimensions, respectively.</p> <p>Dimension lists are created in the Local Specification 1- 3 workspaces.</p>

**Intercompany Settlement Island**

Field	Description
<b>Customer</b>	<p>In this field, you can specify the number of the customer in the Accounts Receivable system that should represent the current company in connection with intercompany invoicing.</p> <p>The field is used when intercompany invoicing is run in the Intercompany Invoicing workspace. When another company runs an intercompany invoicing involving intercompany entries for which the current company is responsible, Maconomy creates an invoice assigned to the customer in this field. At the same time, Maconomy creates a vendor invoice in the current company, assigning this vendor invoice to the vendor specified in the field "Vendor No." on the information card of the company running the intercompany invoicing. This way, the company running the intercompany invoicing can bill the current company for internally exchanged goods or services and the invoicing is automatically registered in the relevant companies.</p> <p>For further information on the use of this field and the exact intercompany invoicing procedure, please see the description of the "Print Invoice" action in the Intercompany Invoicing workspace. See also the description of the field "Vendor" below.</p>
<b>Vendor</b>	<p>In this field, you can specify the number of the vendor in the Accounts Payable system that should represent the current company in connection with intercompany invoicing.</p> <p>This field is used when the current company runs intercompany invoicing in the Intercompany Invoicing workspace. When the current company runs an intercompany invoicing, Maconomy creates a vendor invoice for each responsible company being billed. The vendor on each of these vendor invoices is the vendor in this field. At the same time, Maconomy creates an invoice for each of the companies billed, assigning each invoice to the customer specified in the field "Customer" on the information card of the respective companies. This way, the current company can bill the individual responsible companies for internally exchanged goods or services and the invoicing is automatically registered in the relevant companies.</p> <p>For further information on the use of this field and the exact intercompany invoicing procedure, please see the description of the "Print Invoice" action in the Intercompany Invoicing workspace, as well as the description of the field "Customer" above.</p>

### Template Island

Field	Description
<b>Customer</b>	<p>In this field, you can specify a customer number. The customer specified will be used as a template when additional customers are created for the current company in the Customer Information Card or Company Specific Customer Information Card workspaces in the A/R module.</p> <p>For information to be inherited from the standard customer to new customers, you must set up a linking rule in the Linking Rules workspace. When you create a linking rule between the tables "Customer" and "Customer" and marking this linking rule as a "Standard Linking Rule," the rule is automatically applied when creating customers, if you do not specify another linking rule when creating the customer.</p> <p>Using a template customer and a standard linking rule thus ensures fast and safe creation of customers. If you do not specify a standard customer in this field, any customer specified in the System Information workspace in the Set-Up module will be used when creating a customer. If you specify neither a customer number in this field, nor in the System Information workspace, customers must be created manually or by means of linking rules. See the description of the Linking Rules workspace for further information on the functionality of linking rules.</p>
<b>Vendor</b>	<p>In this field, you can specify a vendor number. The specified vendor will be used as a template when additional vendors are created for the current company in the Vendor Information Card or Company Specific Vendor Information Card workspaces in the A/P module. If you do not specify a standard vendor in this field, any vendor specified in the System Information workspace in the Set-Up module will be used when you create a vendor. See the description of the field "Customer" below for further information on the functionality of standard vendors/customers.</p>
<b>Employee</b>	<p>In this field you can select an employee template using the company information for the newly created employee.</p>

### Tax Reporting Units Island

Field	Description
<b>Tax Settlement Unit Table</b>	<p>In this field you can specify the name of a tax settlement unit table. Maconomy will, if specified, use the tax settlement unit table to find a tax settlement unit for finance entries in this company.</p>
<b>Settlement</b>	<p>In this field, you can specify which tax reporting unit is to be used for tax reporting to the national tax authorities. You must specify a reporting unit in this field in order to be able to post tax related entries.</p> <p>If multiple tax codes are enabled, the "Settlement" field will be replaced by the following fields: "Tax Settlement Unit 1," "Tax Settlement Unit 2," and, if enabled, "Tax Settlement Unit 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Reconciliation</b>	<p>In this field, you can specify which tax reporting unit you want used for tax reconciliation. The field is used by public institutions for specifying a tax reporting unit to, for example, the Ministry of Home Affairs. The reporting</p>

Field	Description
	<p>unit specified in this field collects tax entries concerning ratio tax. Ratio tax is specified in the G/L Tax Codes workspace.</p> <p>For more information about tax reporting units, please see “Introduction to the G/L Module” and the description of the Tax Reporting Unit Selection workspace.</p>

**Tax island**

Field	Description
<b>G/L Tax Table</b>	In this field, you can specify which G/L tax table to use for the current company.
<b>Tax Table</b>	<p>In this field, you can specify the name of a tax table created in the Tax Tables workspace. The field only has importance if the field “Use Tax Tables” is marked in the System Information workspace. If you specify a tax table, Maconomy uses the specified tax table when invoicing and crediting sales/item purchase orders and jobs that the current company is responsible for. The tax table is used for selecting the tax code used for calculation of tax on each item or activity.</p> <p>If you do not specify a tax table, Maconomy will not use tax tables to calculate tax for sales made by the current company. See the Tax Tables workspace for a more detailed description of tax tables.</p>
<b>Tax Type, Tax Exempt</b>	In this field, you can specify a tax type to be used when invoicing items or activities without a tax code. When posting invoices, Maconomy usually copies a tax type from the selected tax code to the G/L entry that concerns item sales. If you have not specified a tax code for a given item or job journal line, Maconomy copies the tax type from this field to the G/L entry created for the current item sale when posting the invoice. Item sales without a tax code occurs when, for example, tax on a given item should not be calculated.
<b>Standard Vendor Tax Code</b>	<p>In this field, you can specify a G/L tax code created in the G/L Tax Codes workspace.</p> <p>This G/L tax code is used when entering vendor invoices in the Vendor Invoices and Invoice Allocation workspaces, as it will be suggested on vendor invoices belonging to the current company. If you do not enter a standard vendor tax code, Maconomy attempts to find a G/L tax code by using a G/L tax table when you enter vendor invoices for the current company. For a detailed description of this procedure, please see the field “Tax Code” in the table part of the Vendor Invoices workspace.</p> <p>If multiple tax codes are enabled, the “Standard Vendor Tax Code” field will be replaced by the following fields: “Standard Vendor Tax Code 1,” “Standard Vendor Tax Code 2,” and, if enabled, “Standard Vendor Tax Code 3.” For further information on multiple tax codes, please see the description in “Tax Codes.”</p>

### Prefix Specifications Island

Field	Description
<b>Transaction Numbers</b>	In this field, you can specify a prefix for the company's transaction number series. The prefix can be used for differentiating the current company's transaction number series from those of other companies, if the Maconomy multi-company model is used. Any prefix entered must be larger than or equal to zero.
<b>System Numbers</b>	In this field, you can specify a prefix for the company's system numbers. The prefix can be used for differentiating the current company's system numbers from those of other companies, if the Maconomy multi-company model is used. Any prefix entered must be larger than or equal to zero.
<b>Number Series</b>	In this field, you can specify a prefix for the company's number series. The prefix can be used for differentiating the current company's number series from those of other companies, if the Maconomy multi-company model is used. Any prefix entered must be larger than or equal to zero.

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

### Extra Fields Island

Using Maconomy's layout editing tools, you can place the fields in this island differently and add a relevant text label next to the fields. Furthermore, you can place the fields in various printouts concerning company information.

Field	Description
<b>Text 1-20</b>	In these text fields, you can enter various information about the current company. These are regular text fields, and there are no restrictions as to the type of text that you enter.
<b>Date 1-5</b>	In these date fields, you can enter dates relevant to the company.
<b>Integer 1-5</b>	In these integer fields, you can enter integer information pertaining to the current company.
<b>Real Figure 1-5</b>	In these real figure fields, you can enter various information regarding the current company in the form of real numbers, that is, decimal numbers. The number of decimals depends on the setting in the field "No. of Decimals" in the Preferences workspace in the Edit menu. If you change this setting, all decimal numbers in Maconomy are displayed using the specified number of decimals, except amounts that are always displayed with two decimals.
<b>Popup 1-5</b>	In these pop-up fields, you can select various information regarding the company. The values that are displayed when you select the pop-up fields are created in the pop-up field "Company Popup 1-5" in the Popup Fields workspace.

**Remarks Island**

In these fields, you can add remarks and comments about the current company.

**Information Island**

Field	Description
<b>Phone</b>	Enter the current company's telephone number.
<b>Fax</b>	Enter the current company's fax number.
<b>Telex</b>	Enter the current company's telex number.
<b>Giro</b>	Enter the current company's giro account number. This applies in countries with a national giro system.
<b>Bank</b>	Enter the name of the current company's bank.
<b>Company Reg. No.</b>	Enter the registration number of the current company.
<b>Credit Card No.</b>	In this field, you can enter the company's number with a payment service.
<b>Tax No.</b>	Enter the current company's tax registration number. The number must be printed on invoices and credit memos to other EU member states. It also appears on reports to the tax authorities.

**Access Level Island**

Field	Description
<b>Name</b>	In this field, you specify the name of the access level to be assigned to the current company. If an access level is specified, only users who have been granted access to this access level or higher can see the data of the current company. This applies to both the company information card and transactions regarding the current company. Please note, however, that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to companies may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the "Introduction to the Access Control System" in the Set-Up module and "Multiple Companies" at the beginning of this module.
<b>Description</b>	This field displays the description of the selected access level.

**Print Control Island**

Field	Description
<b>Statistics 1-4</b>	In these fields you can enter an optional code that you can include in your search criteria for statistical purposes when printing.

**Related Companies Island**

Field	Description
<b>Parent Budget Company</b>	If a parent budget company exists, specify the name and number of that company here. When price-projecting a budget, a journal for each company in the budget model is created. If differences occur when price-projecting, the differences are posted on the difference account specified in the Create Budget Model workspace in the Budget module. If you specify a parent budget company in this field, the difference is posted on that company.
<b>Parent Company</b>	<p>If the current company is affiliated with a parent company, the name and number of the parent company are entered in this field. If you specify a parent company, the fiscal year and fiscal year template of the parent company are also used by the current company. If you change the fiscal year template of a parent company, the template is also changed on all subcompanies. You cannot change the fiscal year of a company assigned to a parent company.</p> <p>If the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are never created between the current company and other companies with the same parent company. For more information about this, see the description of the system parameter "Create intercompany entries for companies with same parent company."</p>
<b>Settling Company, Customer</b>	<p>In this field, you can enter the name and number of the company to be used as settling company for global customers. The field must be completed. If no settling company is specified on the customer information card, the customer is called a "global customer." In such cases, the company specified in this field on the company information card of the responsible company is used as the customer's settling company. In principle, all companies in the system can be used as settling companies. The responsible company will, for instance, be the company shown in the card part of the General Journal workspace or in the Company island in the Sales Orders workspace as the company that gives rise to a sales order. The responsible company will frequently be derived by the user; it is the company automatically shown in the Company island when a general journal or sales order is created by the user.</p> <p>For further information about the influence of a settling company and how such a company is selected, please see "Multiple Companies" in "Introduction to the G/L module."</p>
<b>Settling Company, Vendor</b>	In this field, you can enter the name and number of the company to be used as settling company for global vendors. The field must be completed. If no settling company is specified on the vendor information card, the vendor is called a "global vendor." In such cases, the company specified in this field on the company information card of the responsible company is used as the vendor's settling company. In principle, all companies in the system can be used as

Field	Description
	<p>settling companies. The responsible company will, for instance, be the company shown in the card part of the General Journal workspace or in the Company island in the Item Purchase Orders workspace as the company that gives rise to an item purchase order. The responsible company will frequently be derived by the user; it is the company that is automatically shown in the Company island when a general journal or an item purchase order is created by the user.</p> <p>For further information about the influence of a settling company and how such a company is selected, please see "Multiple Companies" in "Introduction to the G/L module."</p>

### Employees Island

Field	Description
<b>Employee 1-5</b>	In these fields, you can enter the numbers of five employees in the current company. This can be useful if you want a list of relevant contacts in the current company. The names of the specified employees are displayed in the Name column when you press Enter.

### Dimension Combination Island

Field	Description
<b>Dim. Comb. No.</b>	<p>In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the Dimension Combinations workspace.</p> <p>If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the current company. However, any dimension derivation values specified in this island will be used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the company information card.</p>

### Derived Account Island

Field	Description
<b>Account No.</b>	<p>In this field, you can enter a dimension value for the Account dimension, if you want this value to be derived from the current company. If you also want the specified value to overwrite any existing values for the dimension, you can indicate this by checking the "Overwrite" box. If you choose not to overwrite, the dimension value will only be transferred to a table line being created if the "Account No." field on the line is neither filled in manually nor through a registration code.</p> <p>Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used, rather than the value (if any) found for this dimension in the dimension combination in question. This means that the dimension combination only applies to this dimension if you have not entered a value in this field.</p>

Field	Description
	<p>Please note that if a dimension combination has been specified in the field "Dim. Comb. No.," a mark in the field "Overwrite" will only have effect if you have also entered a dimension value. If you mark the field "Overwrite," but you do not enter a dimension value in this field, the "Overwrite" field is ignored, as dimension values and overwriting specifications are always retrieved together from the same dimension derivation island, dimension combination, or dimension combination line.</p> <p>For more information about derived dimensions, please refer to "Introduction to the G/L Module" and the description of the Dimension Derivations and Dimension Combinations workspaces.</p>

### Derived Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Account No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Account No." above.

### Price Register Island

Field	Description
<b>Name</b>	<p>In this field, you can enter the name of a price register. Price registers are created in the Price Registers workspace in the Budget module and are used for projecting budgets. The price register in this field is used when projecting budget models for the current company, unless another price register is specified in the Create Budget Model workspace in the Budget module.</p>

## Company Locations Workspace

Use this workspace to set up global location numbers for the individual companies in your system.

You use global location numbers in electronic invoicing. A global location number is a unique number that identifies a specific legal, functional, or physical location within a business or organizational entity. For instance, a global location number can be a company; a specific department or function within a company, or a physical location, such as a specific warehouse,

delivery point, and so on. Global location numbers are issued centrally and are therefore unique worldwide. This means that when you specify a given global location number on an electronic invoice or payment, the address or delivery point is automatically derived from the location number, ensuring that the invoice or payment reaches the correct recipient.

You can specify multiple location numbers for each company. For instance, if company A has one global location number for its marketing department and another for its sales department, you can set up the global location number that is assigned to each of these entities in this workspace.

The location numbers that you enter in this workspace are used when receiving vendor invoices. Thus, you can inform vendors that a given location number should be applied to invoices that are going to a specific department in your organization.

For each location, you can specify information to be applied to vendor invoices that are received. When you receive a vendor invoice with a location number, the information from the location number in question—including the number of the company to which the location number is assigned—is automatically assigned to the invoice in the Vendor Invoices workspace, thus ensuring that, for example, the correct dimension values and the employee responsible for allocation are assigned to the invoice.

Your customers might also have global location numbers that they want you to enter on invoices. You enter the information about the location number to be used on invoices that you send to customers in the Payment Information/Company Specific Payment Control workspace. This information is automatically suggested on jobs, orders, invoices, and so on.

## Company Locations Tab

This section includes the fields and descriptions for the Company Locations tab.

### Company Island

Field	Description
<b>Company No.</b>	This field shows the number of the currently selected company. In the Global Location Numbers sub-tab, you can set up global location numbers assigned to this company. The remaining fields in this island show the name and address of the company.

### Information Island

Field	Description
<b>Phone</b>	This field shows the telephone number of the current company.
<b>Fax</b>	This field shows the fax number of the current company.
<b>Telex</b>	This field shows the telex number of the current company.
<b>Giro</b>	This field shows the giro number of the current company.

Field	Description
<b>Bank</b>	This field shows the name of the bank used by the current company.
<b>Company Reg. No.</b>	This field shows the company registration number of the current company.
<b>Credit Card No.</b>	This field shows the credit card number of the current company.
<b>Tax No.</b>	This field shows the tax number of the current company.

## Global Location Numbers Sub-Tab

This section includes the fields and descriptions for the Global Location Numbers sub-tab.

Field	Description
<b>Global Location No.</b>	In this field, you can specify a global location number, thus assigning the global location number to the company specified in the Company Locations tab. In the Rules of Validation workspace, you can set up validation rules for global location numbers to ensure that the numbers entered in this field are valid.
<b>Description</b>	In this field, you can specify a description of the current global location number and its use, for instance the name of the department, building, and so on to which the number applies.
<b>Blocked</b>	If you mark this field, the current global location number is blocked and can no longer be specified on new vendor invoices. You can unblock a location number at any time by unmarking this field.
<b>Registration Code</b>	<p>In this field, you can specify a registration code to be applied to vendor invoices going to the current location. This means that when the current global location number is specified on a vendor invoice, the registration code in this field is automatically transferred to the field "Registration Code" in the Vendor Invoices workspace, as if entered manually. However, the registration code on the vendor invoice can be changed.</p> <p>Assigning a registration code to a global location number is practical if certain dimension values should always be applied to vendor invoices belonging to the department, building, and so on represented by the global location number.</p>
<b>Allocation Responsible</b>	In this field, you can specify an allocation responsible to be applied to vendor invoices going to the current location. This means that when the current global location number is specified on a vendor invoice, the allocation responsible in this field is automatically transferred to the field "Responsible for Allocation" in the Vendor Invoices workspace, as if entered manually. However, the allocation responsible on the vendor invoice can be changed.

Field	Description
<b>Remarks 1-5</b>	In these fields, you can enter various remarks and additional information about the current global location number and its use.
<b>Created by</b>	This field shows the name of the user who created the current line.
<b>Created on</b>	This field shows the date on which the current line was created.
<b>Changed by</b>	This field shows the name of the last user to change information on the current line.
<b>Changed on</b>	This field shows the last date on which information on the current line was made.
<b>Version</b>	This field shows a number corresponding to the version of the information on the line. Maconomy automatically increases the version number by one every time the information on the line is changed. It is not possible to retrieve previous versions.

## Fiscal Year Templates Workspace

Use this workspace to create and maintain fiscal year templates.

Maconomy is delivered with one fiscal year template that contains twelve periods and follows the calendar year. You must create any additional fiscal years in this workspace before you can create entries for the year in question. You define the periods within each fiscal year in the Fiscal Year workspace.

You must assign all of the companies in Maconomy to a fiscal year template in the Company Information workspace, and you must specify a fiscal year for each company. After you post information in a company, you can no longer change the fiscal year template for the company in question.

When you create a fiscal year template, Maconomy suggests a fiscal year that corresponds to the calendar year. If you change the dates, for instance to a fiscal year that runs from 04/01/1999 to 03/31/2000, and you create a fiscal year, Maconomy automatically suggests the dates 04/01/2000 to 03/31/2001, that is, a whole year. However, you can change these dates as appropriate, ensuring that no two fiscal years can overlap, and that no gaps are allowed between fiscal years.

If you begin using Maconomy in April, but the fiscal year actually corresponds to the calendar year, you can thus use a fiscal year template that starts with a year that runs from April to December, while subsequent fiscal years correspond to the calendar year.

When you create fiscal years in this workspace, Maconomy creates a number of periods in the Fiscal Year Periods sub-tab of the Fiscal Year workspace. The first period starts on the starting date of the fiscal year, and the last period ends on the ending date of the fiscal year. Each period is one month long, but you can change this in the Fiscal Year workspace. Note that if you change the ending date of a fiscal year in this workspace, Maconomy deletes all of the periods and recreates them in the Fiscal Year workspace, and the new periods are once again one month long.

## Fiscal Year Template Tab

This section includes the fields and descriptions for the Fiscal Year Template tab.

### Template Island

Field	Description
<b>Template No.</b>	In this field, you enter a number for the new template.
<b>Name</b>	In this field, you can specify a name for the fiscal year template.

### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

## Fiscal Years Sub-Tab

This section includes the fields and descriptions for the Fiscal Years sub-tab.

Field	Description
<b>Fiscal Year Start</b>	In this field, you can enter the starting date of the fiscal year that you wish to create for the current template. You can create fiscal years before the first fiscal year and after the last existing fiscal year. Once a fiscal year has been created, it is no longer possible to change its starting date. The starting date of each fiscal year must be the day after the ending of the previous fiscal year.
<b>Fiscal Year End</b>	In this field, enter the ending date of the fiscal year on the line. The ending date can only be changed for the last fiscal year in the table part, and only as long as no registrations have been made in the year in question.

## Fiscal Year Workspace

Use this workspace to define each period in the fiscal years that you created in the Fiscal Year Templates workspace.

You can define the periods as needed, if you adhere to the following rules:

- A period starts the day after the ending of the previous period. This means that overlapping periods and gaps between periods are not allowed.
- The periods of a fiscal year are changed backward, meaning that the last period of a fiscal year is changed first, and so on.

Note that if you change the ending date of a fiscal year in the Fiscal Year Templates workspace, Maconomy deletes all of the periods in that fiscal year from this workspace, and Maconomy creates a number of additional monthly periods.

The Fiscal Year tab displays the fiscal year and fiscal year template whose periods you can define in the Fiscal Year Periods sub-tab.

While the fiscal year itself is being created, or if the fiscal year has not been fully defined (meaning that the periods in the fiscal year in question do not cover the whole year), you cannot create entries in that year. Maconomy shows that entries are not allowed by selecting the **Blocked** field in this workspace.

The Fiscal Year Periods sub-tab displays which periods correspond to which months. For instance, in the Print Balance Sheet workspace, you can print the balance sheet for a given period by specifying a month and a year. Maconomy uses the link between period and month in this workspace to determine the correct fiscal period to be printed.

## Fiscal Year Tab

This section includes the fields and descriptions for the Fiscal Year tab.

### Fiscal Year Island

Field	Description
<b>Name</b>	This field shows the name of the fiscal year template whose periods are shown in the Fiscal Year Periods sub-tab.
<b>Start</b>	This field shows the starting date of the current fiscal year in the current fiscal year template. This date corresponds to the date in the field "Period Start" on the first line of the Fiscal Year Periods sub-tab.
<b>End</b>	This field shows the ending date of the current fiscal year in the current fiscal year template. This date corresponds to the date in the field "Period End" on the last line of the Fiscal Year Periods sub-tab.
<b>Blocked</b>	When you start editing the fiscal year by, for example, deleting a period, this field is marked, and it is no longer possible to post entries to companies using the fiscal year template in question. The template is automatically unblocked when the fiscal year is complete again, meaning that the periods cover the whole fiscal year without any gaps.

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

## Fiscal Year Periods Sub-Tab

This section includes the fields and descriptions for the Fiscal Year Periods sub-tab.

Field	Description
<b>Period</b>	This field shows the number of the period on the current line.
<b>Period Start</b>	In this field, enter the starting date of the fiscal year period you are defining. The periods in a fiscal year must be changed backwards. When you start editing the fiscal year by, for example, deleting a period, the field "Blocked" is marked in the Fiscal Year Periods sub-tab, and it is no longer possible to post entries to companies using the fiscal year template in question. The template is automatically

Field	Description
	<p>unblocked when the fiscal year is complete again, meaning that the periods cover the whole fiscal year without any gaps.</p> <p>Once entries have been created in a given fiscal year, the periods in the year in question can no longer be changed.</p>
<b>Period End</b>	In this field, enter the ending date of the fiscal year period you are creating or editing. For further information, please see the description of the field "Period Start" above.
<b>Month</b>	<p>In this field, you can enter the number of a month. Maconomy creates a link between the specified month and the period number on the same line. When Maconomy needs you to specify a month and a year, for example, in the Print Balance Sheet workspace, the month you specify should correspond to a month number in this field. Maconomy uses the month specified in the Print Balance Sheet workspace to find the correct line in the Fiscal Year Periods sub-tab. Once the line has been found, Maconomy finds the correct period in the field "Period" on the line in question.</p> <p>If a fiscal year consists of, for example, four periods, period one could be month one, period two could be month four, and so on. If the month specified in, for example, the Print Balance Sheet workspace does not exist, Maconomy issues an error message.</p>
<b>Year</b>	In this field, enter the year which the current period concerns. The same combination of month and year can only be entered once.
<b>Name</b>	The user can enter the name of the period in this field. For example "January."

## Account Information Card Workspace

Use this workspace to enter and maintain information about the accounts in the chart of accounts.

You create an account with a number and a descriptive account text, and you assign it to a department. You create departments in the Posting References workspace. You specify whether the account is a Profit & Loss (P&L) or a Balance Sheet account, whether Maconomy should automatically create a tax entry for manual entries to the account, and how to handle Maconomy's dimensions in connection with this account. The account information card also shows the account balance if you select the "Update balance on account information card" system parameter.

You can only delete an account if there have been no entries to it in the current and previous fiscal years, and if the balance is 0. In Maconomy Lawyer, you cannot delete an account that you created as a client account in the Client Accounts workspace.

## Account Information Card Tab

This section includes the fields and descriptions for the Account Information Card tab.

### Account Island

Field	Description
<b>Account</b>	<p>Here you enter the name and number of the account you are creating. Maconomy checks that the number is not already being used. The account number is the sole and absolute identification of the account. To retrieve an existing account in the window, use the search functions in the Find menu.</p> <p>The structure of the chart of accounts is defined in the Account Structure workspace. The structure is thus independent of the account number. It will, however, be an advantage to sort the account numbers in numerical groups, as you select ranges of account numbers in many selection criteria fields. For further information, please see the field "Account Type."</p> <p>The field is alphanumeric; it can include both numbers and letters. Because accounts are sorted by number in the printed balance sheet, it is recommended that you use the same number of characters for all accounts. Also note that standard Maconomy printouts only include up to ten characters.</p>
<b>Department</b>	<p>Here you assign the account to a department selecting from existing departments in the pop-up field. Dividing the chart of accounts into departments is important when printing, as you can choose to print per department. Furthermore, as Maconomy's P&amp;L accounts all refer to a department, you can obtain individual departmental results and print these.</p> <p>You maintain your company's departments in the Posting References workspace.</p>
<b>Blocked</b>	<p>This field shows whether the account is blocked. If the field is marked, the account is blocked and Maconomy will reject all entries to it. You cannot post a journal with entries to a blocked account.</p>

### Account Information Island

Field	Description
<b>Account Type</b>	<p>In this field, you specify the account type. Maconomy has two kinds of posting accounts: "Manual" and "Control."</p> <ul style="list-style-type: none"> <li>"Manual" means that you can enter manual entries to the account in the General Journal workspace.</li> <li>"Control" means that you cannot enter manual entries in the General Journal workspace. This account type is used for accounts to which Maconomy makes automatic entries from other modules.</li> </ul> <p>When you create a control account or change a manual account into a control account, Maconomy will automatically create a dimension combination of the type "Posting Reference" in the Dimension</p>

Field	Description
	<p>Combinations workspace. The number of the automatically created dimension combination will be the number of the control account. Furthermore, the account description is transferred to the dimension combination.</p> <p>By preventing manual entries, you can balance accounts against the modules. For example, you can balance customer control accounts against a customer balance, aging list, or currency positions. Note that if the account type is changed from control to manual, you lose this ability to balance accounts. You are therefore recommended not to change account type.</p>
<b>P&amp;L/Balance Sheet</b>	<p>Here you specify whether the account is a Profit &amp; Loss (P&amp;L) or balance sheet account. This has significance for the year-end result. The closing balance for a balance sheet account is transferred as opening balance, whereas the closing balance for a P&amp;L account is transferred to the opening balance of the new Retained Earnings Account. The opening balance for a P&amp;L account will hereafter be zero in the new fiscal year. The Retained Earnings Account is entered as a dimension combination in the System Information workspace in the Set-Up module.</p> <p>Note that when the fiscal year is closed, you can no longer change existing P&amp;L accounts to balance sheet accounts and vice versa.</p>
<b>Tax Code</b>	<p>In this field you can select a tax code. The tax code is a reference to a G/L account for ingoing and outgoing tax, respectively. The options for this field are created in the G/L Tax Codes workspace. The G/L tax code is used by Maconomy to calculate tax when you add entries in various windows. Maconomy automatically retrieves the tax rate and the tax account when you enter the account number. However, you can change the tax code as you add entries. This field is only relevant for manual accounts.</p> <p>You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters workspace. When multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2," and, if enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Item Tax Code</b>	<p>In this field, you can specify a company tax code created in the Popup Fields workspace in the Set-Up module. The field is used by Maconomy for determining the tax code to be used in the calculation of tax on entries on which the current account is used. The item tax code is part of the criteria for the selection of a G/L tax code in the G/L Tax Tables workspace if a G/L tax table has been specified for the company responsible for the entry in question.</p> <p>If no G/L tax table has been specified, or if no lines in the G/L tax table match the entry in question, Maconomy uses the G/L tax code specified in the field "Tax Code" for the current account.</p>

Field	Description
	When you post entries, the item tax code is used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if the field "Extended Tax Reporting" has been selected in the System Information workspace.
<b>Account Group</b>	In this field, you select an account group. Account groups are used for grouping accounts so that when printing the Account Information Card you can print the accounts of all account groups together or just a single group. Account groups are created in the pop-up field "Account Group" in the PopUp Fields workspace in the Set-Up module.
<b>Allocation Code</b>	In this field, you can specify an allocation code. When you specify the current account on a line in the General Journal workspace, the allocation code specified here is automatically transferred to the line in question. Allocation codes are created in the Allocation Codes workspace and are used for automatic allocation of amounts entered in the General Journal workspace in percentages on a number of dimensions. See also the Allocation Codes workspace.
<b>Currency</b>	Here you can select the currency of the account. You cannot change the currency after making entries to the account.
<b>Currency Account</b>	If you mark this field, manual entries made to the account in the General Journal workspace must be made in the currency specified in the field "Currency" above. This may be practical if the account represents a bank account kept in a given currency.  Only accounts where this field is marked are included in currency reports.
<b>Reconciliation</b>	Here you determine whether to apply finance reconciliation to the account. If you mark the field, the account becomes accessible in the Finance Reconciliation workspace.
<b>Bank Reconciliation</b>	This field shows whether bank reconciliation is applied to the account. The box will be checked automatically if the current G/L account is attached to an external account which is reconciled with a bank. External accounts are created in the External Accounts workspace in the Banking module in connection with payments, customer payments, and bank reconciliation.

### Dimension Combination Island

Field	Description
<b>Dim. Comb. No.</b>	In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the Dimension Combinations workspace.  If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the current account. However, any dimension derivation values specified in this island will be used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the

Field	Description
	<p>dimensions for which no value has been entered on the account information card.</p> <p>The functionality on period-specific sets of derived dimension values in the Derived Dimensions workspace, which is described in the field "Location" below, also applies to this field.</p> <p>See the section on dimension derivation in "Introduction to the G/L module," as well as the description of the Dimension Derivation and Dimension Combinations workspaces in the G/L module for further information about dimension derivation.</p>
<b>Description</b>	In this field, you can enter a description for the dimension combination entered above.

### Print Control Island

Field	Description
<b>Statistics 1-4</b>	Here you can enter any code used to specify a target group in printed statistics.
<b>Invert Sign</b>	If you mark this field, movements and balances will be shown with inverted signs, that is, credit amounts will be shown as positive figures and debit amounts as negative figures. This applies to the Print Trial Balance and Print Balance Sheet workspaces.

### Balance Island

Field	Description
<b>Quantity 1</b>	This field shows the account's quantity balance. The field is updated when you post journals with quantity entries. Quantity can be entered in the general journal, and can be used for currency holdings, how much oil you have purchased during the year, and so on. If you have marked the "Post Quantity" field in the System Information workspace in the Set-Up module, Maconomy will transfer the quantities in the posted invoices and credit memos to the relevant item sales accounts when you post invoice journals. The field will also be updated at the year-end close and when you extend the fiscal year. Please note that if the system parameter "Update balance on account information card" is not marked, the amounts in this field are not kept up to date, neither when posting entries nor when performing year-end closing. If the system parameter "Update balance on account information card" is not marked, this field will therefore show the balance of the account at the time when the parameter was unmarked. You cannot change the field's value here.
<b>Quantity 2</b>	The functionality of this field is similar to that of the field "Quantity" above.

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

## Remarks Island

In these fields, you can enter supplementary comments regarding the current account.

## Derived Dimensions Island

Field	Description
<b>Location</b>	<p>In this field, you can specify a value for the Location dimension if you want this value to be derived from the current account. If you also want this value to overwrite any existing values for the dimension, you can indicate this by checking the "Overwrite" check box. If you do not choose overwriting, the dimension value will only be transferred to a table line being created if the "Location" field on the current table line is not filled in manually or through a registration code.</p> <p>Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used rather than the value (if any) found for this dimension in the dimension combination in question. This means that the dimension combination only applies to this dimension if you have not entered a value in this field.</p> <p>Please note that if a dimension combination has been specified in the field "Dim. Comb. No.," a mark in the field "Overwrite" will only have effect if you have also entered a dimension value. If you mark the field "Overwrite," but you do not enter a dimension value in this field, the "Overwrite" field is ignored, as dimension values and overwriting specification are always retrieved together from the same dimension derivation island, dimension combination or dimension combination line.</p> <p>In the Derived Dimensions workspace, you can create period-specific sets of derived dimensions if the dimension values to be derived from the current account should vary, depending on the entry date of the registrations to which dimension values are derived from the current account. In this context, the value in this field is always reflected in the corresponding field on the dimension derivation line that has a blank ending date, and changing the dimension values in this field will cause the corresponding information on that dimension derivation line to be updated accordingly, and vice versa.</p> <p>When you create an account, Maconomy automatically creates a line in the Derived Dimensions workspace with the information specified in this island, and a blank starting and ending date, indicating that this line applies on all registrations regardless of entry date. In effect, as long as you do not need the dimension values derived from the account to change on a given date, you only need to enter dimension derivation information in this island.</p> <p>Please note, however, that if you have added a period-specific set of derived dimensions in the Derived Dimensions workspace, the dimension derivation line that has a blank ending date is not necessarily the dimension derivation line valid on today's date. You should therefore be aware that if period specific sets of derived dimensions have been created for the account, the dimension values derived from the current account are not necessarily those specified in this island.</p>

Field	Description
	See the section on dimension derivation in “Introduction to the G/L module,” as well as the description of the Dimension Derivation and Dimension Combinations workspaces in the G/L module for further information about dimension derivation. For information on period specific sets of derived dimensions, see the Derived Dimensions workspace in the G/L module.
<b>Entity</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Project</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Purpose</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.

### Registration Control Island

Field	Description
<b>Employee No.</b>	<p>By marking the column “Allowed,” you can specify that entering an employee number is allowed when you post on the current account. If the field is not marked, Maconomy will reject any employee number specified on manual postings to the current account. Furthermore, an employee number specification will only be transferred from a journal to a G/L entry if this field is marked on the account information card.</p> <p>If you want to be able to enter an employee on a manually entered customer or vendor entry, this field must be marked on the associated customer and vendor control accounts.</p> <p>In the column “Required,” you can specify that an employee number must be entered on manual postings to the current account. If no employee number is specified, the entry will be rejected.</p>
<b>Tax Code</b>	<p>By marking the column “Allowed,” you can specify that entering a tax code is allowed when you post on the current account. This also includes postings made as a result of registering time and expenses on activities using the current account as P/L account. If the field is not marked, Maconomy will reject any tax code manually specified on manual postings to the current account.</p> <p>If you want to be able to enter a tax code on a manually entered customer or vendor entry, this field must be marked on the associated customer and vendor control accounts.</p>

### Registration Control, Dimensions Island

Field	Description
<b>Location</b>	<p>You can check the “Allowed” column to make it possible to assign any dimension value to the current account. If the field has not been checked, Maconomy will reject dimension values other than the standard dimension value when making entries on the current account. Also, location entries can only be transferred from a journal to a G/L entry if the dimension “Location” has been marked on the account information card.</p> <p>If you wish to enter a Location value on a manually entered customer or vendor entry, the relevant control accounts must also be marked here.</p> <p>You can check the “Required” field to make it mandatory for the user to enter a Location value, either through manual entry or a registration code. The user can, however, enter the standard dimension value, but only manually. Maconomy will disallow any entries without a Location specification.</p>
<b>Entity</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Project</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Purpose</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.

### Finance Entry Island

Field	Description
<b>Transfer</b>	<p>Mark the following check box(es) as appropriate:</p> <ul style="list-style-type: none"> <li>Customer No. — Here you can specify whether customer numbers should be transferred to G/L entries on the current account when Maconomy creates G/L entries in connection with posting customer or job entries. For instance, Maconomy creates a number of G/L entries when you post an invoice in the Sales Orders module or a job invoice in the Job Cost module. In this case, the number of the customer to whom the invoice or the job pertains will be transferred to G/L entries posted on the accounts on which this field is marked.</li> <li>Vendor No. — Here you can specify whether vendor numbers should be transferred to G/L entries on the current account when Maconomy creates G/L entries in connection with posting vendor entries. For instance, Maconomy creates a number of G/L entries when you post a vendor invoice or an invoice</li> </ul>

Field	Description
	<p>allocation in the A/P module. In this case, the number of the vendor to whom the vendor invoice pertains or the job number from an invoice allocation line will be transferred to G/L entries posted on the accounts on which this field is marked.</p> <ul style="list-style-type: none"> <li>■ <b>Job No.</b> — Here you can specify whether job numbers should be transferred to G/L entries on the current account when Maconomy creates G/L entries in connection with posting job entries. For instance, Maconomy creates a number of G/L entries when you post a job invoice in the Job Cost module. In this case, the number of the job to which the invoice pertains will be transferred to G/L entries posted on the accounts on which this field is marked.</li> <li>■ <b>Activity No.</b> — Here you can specify whether activity numbers should be transferred to G/L entries on the current account when Maconomy creates G/L entries in connection with posting job entries. For instance, Maconomy creates a number of G/L entries when you post a job journal in the Job Cost module. In this case, the number of the activity specified on each journal line will be transferred to G/L entries posted on the accounts on which this field is marked.</li> <li>■ <b>Task</b> — Here you can specify whether tasks should be transferred to G/L entries on the current account when Maconomy creates G/L entries in connection with posting job entries. For instance, Maconomy creates a number of G/L entries when you post a job journal in the Job Cost module. In this case, the task specified on each journal line will be transferred to G/L entries posted on the accounts on which this field is marked.</li> <li>■ <b>Item No.</b> — Here you can specify whether item numbers should be transferred to G/L entries on the current account when Maconomy creates G/L entries in connection with posting item entries. For instance, Maconomy creates a number of G/L entries when you post an inventory change transaction in the Inventory module. In this case, the number of the item to which the inventory change pertains will be transferred to G/L entries posted on the accounts on which this field is marked.</li> <li>■ <b>Asset No.</b> — Here you can specify whether asset numbers should be transferred to G/L entries on the current account when Maconomy creates G/L entries in connection with posting asset entries. For instance, Maconomy creates a number of G/L entries when you post an asset entry in the Fixed Assets module. In this case, the number of the asset to which the asset entry pertains will be transferred to G/L entries posted on the accounts on which this field is marked.</li> </ul>

## Local Charts of Accounts Workspace

Use the Local Charts of Accounts workspace to set up local chart of accounts and the associated local accounts.

Use the Local Chart of Accounts workspace to set up local chart of accounts and the associated local accounts. This window is similar to the windows for setting up local specification lists.

This workspace displays the local chart of accounts in the tab and associated local accounts in the sub-tab.

**Note:** The local accounts have fields for **Account Type, Group, P&L/Balance Sheet, Department, and Invert Sign**. The values of these must correspond to the ones on the associated global account. For that reason, they are read-only fields, auto-populated by Maconomy.

### Local Chart of Accounts Tab

This section includes the fields and descriptions for the Local Chart of Accounts tab.

#### Local Chart of Accounts Island

Field	Description
<b>Name</b>	Enter the name of the local chart of accounts.
<b>Description</b>	Enter the description of the local chart of accounts.

#### Access Level Island

Field	Description
<b>Description</b>	Enter the description of the selected access control level.
<b>Name</b>	Enter the name of access level restricting the use of this local chart of accounts. You are not required to set an access level.

### Local Accounts Sub-Tab

This section includes the fields and descriptions for the Local Accounts sub-tab.

Field	Description
<b>Local Account Number</b>	Enter the number or name of this local account.
<b>Description</b>	Enter the name of the local chart of accounts to which this local account is associated. This field is mandatory.
<b>Account Number</b>	Enter the (global) account number this local account belongs to. This field is mandatory.

Field	Description
<b>Overwrite Account</b>	Select this check box to control whether the account can be overwritten by the (global) account specified on this local account.
<b>P&amp;L/Balance Sheet</b>	This field shows whether this local account is a P&L or Balance Sheet account. This is derived from the (global) account.
<b>Blocked</b>	Select this check box to control whether the local account is blocked.
<b>Statistics 1-4</b>	Enter an optional code that you can include in your search criteria for statistical purposes when printing.
<b>Dim. Comb. No.</b>	<p>Enter a dimension combination number of the Dimension Derivation type. Dimension Derivations are created in the Dimension Combinations workspace.</p> <p>If you specify a dimension combination, Maconomy uses the values in this dimension combination when deriving dimensions from the current company. Note that any dimension derivation values specified in this are used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the company information card.</p>
<b>Derived Location</b>	Enter a value specified for the Location dimension if you want this value to be derived from the current local account.
<b>Overwrite Location</b>	Select this check box to control whether the location can be overwritten by the derived location specified on this account.
<b>Derived Entity</b>	The functionality of this field is similar to the <b>Derived Location</b> field above.
<b>Overwrite Entity</b>	The functionality of this field is similar to the <b>Overwrite Location</b> field above.
<b>Derived Project</b>	The functionality of this field is similar to the <b>Derived Location</b> field above.
<b>Overwrite Project</b>	The functionality of this field is similar to the <b>Overwrite Location</b> field above.
<b>Derived Purpose</b>	The functionality of this field is similar to the <b>Derived Location</b> field above.
<b>Overwrite Purpose</b>	The functionality of this field is similar to the <b>Overwrite Location</b> field above.
<b>Derived Specification 2-3</b>	The functionality of this field is similar to the <b>Derived Location</b> field above.
<b>Overwrite Specification 2-3</b>	The functionality of this field is similar to the <b>Overwrite Location</b> field above.

Field	Description
<b>Derived Local Specification 1-3</b>	The functionality of this field is similar to the <b>Derived Location</b> field above.
<b>Overwrite Local Specification 1-3</b>	The functionality of this field is similar to the <b>Overwrite Location</b> field above.
<b>Option List 1-10</b>	Enter the option lists containing the values you wish to use for further specification of the local account.
<b>Selected Value 1-10</b>	Select a value from the option list you chose in the <b>Option List 1-10</b> fields.
<b>Remarks 1-5</b>	Enter any remarks as appropriate.

## Actions

This section shows the actions available in the Local Charts of Accounts workspace.

### Top Pane

Field	Description
<b>New Local Chart of Accounts</b>	Use this action to create a new local chart of accounts. This action is always available.
<b>Delete Local Chart of Accounts</b>	Use this action to delete a local chart of accounts. <b>Note:</b> A local chart of accounts can only be deleted if it is not used by any company. Deleting a local chart of accounts also deletes all associated local accounts and thus the local chart of accounts can only be deleted if all associated local accounts can be deleted.

### Bottom Pane

Field	Description
<b>Add Local Account</b>	Use this action to create a new local account and associate it with the current local chart of accounts. Each local account name/number must be unique within each local chart of accounts.
<b>Delete Local Account</b>	Use this action to delete the local account. The local account can only be deleted if it is not referenced from any master or posted data.

## Locations Workspace

Use this workspace to create the locations that you want to use when the Location dimension is used in Maconomy's other workspaces.

In this way, you ensure that no typing mistakes are made when you enter locations so that a G/L entry is missing from an important statistic. When you enter a location, for example, in the General Journal workspace, Maconomy checks that the location value exists.

You can use the Location dimension in any way that is appropriate to describe different locations in the company, different geographical divisions of the market, or something completely different. You can use the Location dimension and the other dimensions in the chart of accounts for any type of statistical category. Your use of dimensions reflects the way in which the company wants to view its financial data. You should always use dimensions for the same category of information. When you use dimensions consistently, you can attach them to each G/L entry, thus creating the basis for statistics where the G/L entries are subdivided by dimensions.

If you want to derive other dimensions from the dimension values that you created for the Location dimension, you can specify the value that these dimensions should derive, and whether the derived value should overwrite any existing values. Derived dimensions in this workspace are only used if you indicate a derivation priority for the Location dimension in the Dimension Derivations workspace.

For auditing purposes, it is recommended that you print and file location information every time that you change it.

The Location dimension is one of the 12 dimensions of the chart of accounts.

### Locations Tab

This section includes the fields and descriptions for the Locations tab.

#### Location Island

Field	Description
<b>Name</b>	<p>Here you specify the name of the location, if you are creating one. Maconomy checks that the name does not already exist. This name is the unique identification of the location.</p> <p>You cannot change the name of an existing location. You can delete a location which has not been used in the current and previous fiscal years. This also applies to locations assigned to entries in unposted journals.</p>
<b>Description</b>	Here you give a full description of the location. This description is shown elsewhere in Maconomy.
<b>Blocked</b>	Here you can specify that the location cannot be used for new entries. If the box is checked, you cannot assign the location to new transactions or information cards. However, the location is used if it is assigned to non-posted G/L entries before the box is checked. You can make statistics for a blocked location.

**Dimension Combination Island**

Field	Description
<b>Dim. Comb. No.</b>	<p>In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the Dimension Combinations workspace.</p> <p>If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the current location. However, any dimension derivation values specified in this island will be used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the location information card.</p> <p>The functionality on period-specific sets of derived dimension values in the Derived Dimensions workspace, which is described in the field "Account No." below, also applies to this field.</p> <p>See the section on dimension derivation in "Introduction to the G/L module," as well as the description of the Dimension Derivation and Dimension Combinations workspaces in the G/L module for further information about dimension derivation.</p>

**Print Control Island**

Field	Description
<b>Statistics 1-4</b>	In each of these four fields, you can enter a code which can be used in the target group specification of various statistics printouts.

**User Island**

See the chapter "Getting Started" for a description of the fields in the User island.

**Remarks Island**

In these fields, you can enter additional information about the current dimension value for the Location dimension.

**Derived Account Island**

Field	Description
<b>Account No.</b>	<p>In this field, you can specify a value for the Account dimension if you want this value to be derived from the current location. If you also want this value to overwrite any manually entered values for the dimension, you can indicate this by checking the "Overwrite" check box. If you do not select to overwrite, the dimension value will only be derived if the dimension field to which the derivation is performed is not manually completed or completed by use of a registration code.</p> <p>Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used rather than the value (if any) found for this dimension in the dimension combination in question. This means that the dimension combination only applies to this dimension if you have not entered a value in this field.</p>

Field	Description
	<p>Please note that if a dimension combination has been specified in the field “Dim. Comb. No.,” a mark in the field “Overwrite” will only have effect if you have also entered a dimension value. If you mark the field “Overwrite,” but you do not enter a dimension value in this field, the “Overwrite” field is ignored, as dimension values and overwriting specification are always retrieved together from the same dimension derivation island, dimension combination or dimension combination line.</p> <p>In the Derived Dimensions workspace, you can create period-specific sets of derived dimensions if the dimension values to be derived from the current location should vary, depending on the entry date of the registrations to which dimension values are derived from the current location. In this context, the value in this field is always reflected in the corresponding field on the dimension derivation line that has a blank ending date, and changing the dimension values in this field will cause the corresponding information on that dimension derivation line to be updated accordingly, and vice versa.</p> <p>When you create an account, Maconomy automatically creates a line in the Derived Dimensions workspace with the information specified in this island, and a blank starting and ending date, indicating that this line applies on all registrations regardless of entry date. In effect, as long as you do not need the dimension values derived from the location to change on a given date, you only need to enter dimension derivation information in this island.</p> <p>Please note, however, that if you have added period specific set of derived dimensions in the Derived Dimensions workspace, the dimension derivation line that has a blank ending date is not necessarily the dimension derivation line valid on today’s date. You should therefore be aware that if period specific sets of derived dimensions have been created for the location, the dimension values derived from the current location are not necessarily those appearing in this island.</p> <p>See the section on dimension derivation in “Introduction to the G/L module,” as well as the description of the Dimension Derivation and Dimension Combinations workspaces in the G/L module for further information about dimension derivation. For information on period-specific sets of derived dimensions, see the Derived Dimensions workspace in the G/L module.</p>

### Derived Dimensions Island

Field	Description
<b>Entity</b>	The functionality of this field is similar to that of the field “Account No.” above. Entities are created in the Entities workspace.
<b>Project</b>	The functionality of this field is similar to that of the field “Account No.” above. Projects are created in the Projects workspace.
<b>Purpose</b>	The functionality of this field is similar to that of the field “Account No.” above. Purposes are created in the Purposes workspace.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Account No.” above. Specification values are created in the Specification 1-3 workspaces.

Field	Description
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Account No." above. Local Specification values are created in the Local Specification 1-3 workspaces.

## Entities Workspace

Use this workspace to create the entities that you want to use in Maconomy's other workspaces.

You can use the Entity dimension in any way that is appropriate to distinguish among employees in the company, among departments, or something completely different.

Entity is one of the 12 dimensions in the chart of accounts.

## Projects Workspace

Use this workspace to create the projects that you want to use in Maconomy's other workspaces.

You can use the Project dimension in any way that is appropriate to describe sales projects or development projects, or something completely different.

Project is one of the 12 dimensions in the chart of accounts.

## Purpose Workspace

Use this workspace to create the purposes that you want to use in Maconomy's other workspaces.

You can use the Purpose dimension in any way that is appropriate to describe the purpose of projects or development projects, or something completely different.

Purpose is one of the 12 dimensions in the chart of accounts.

## Specification 1 Workspace

Use this workspace to create the dimension values that you want to use when Specification 1 is used in Maconomy's other workspaces.

You can use the Specification 1 dimension in any way that is appropriate to further specify a G/L entry or something completely different.

Specification 1 is one of the 12 dimensions in the chart of accounts.

## Specification 2 Workspace

Use this workspace to create the dimension values that you want to use when Specification 2 is used in Maconomy's other workspaces.

You can use the Specification dimension in any way that is appropriate to further specify a G/L entry or something completely different.

Specification 2 is one of the 12 dimensions in the chart of accounts.

## Specification 3 Workspace

Use this workspace to create the dimension values that you want to use when Specification 3 is used in Maconomy's other workspaces.

You can use the Specification 3 dimension in any way that is appropriate to further specify a G/L entry or something completely different.

Specification 3 is one of the 12 dimensions in the chart of accounts.

## Local Specification 1 Workspace

Use this workspace to create the dimension values that you want to use when the Local Specification 1 dimension is used in Maconomy's other workspaces.

You can use the Local Specification dimension in any way that is appropriate to further specify a G/L entry or something completely different.

Local dimensions are different from the shared dimensions, in that instead of dimension values you can create dimension lists, each of which contains a number of dimension values. You can attach each dimension list to one or more companies. Only those dimension values that are part of the dimension list that is attached to a company are available to the particular company. You can create a structure list for each dimension list.

The fields in the Local Spec. 1 Entries sub-tab correspond fully to the fields that you use when creating dimension values for one of the shared dimensions. For a description of the fields in the Local Spec. 1 Entries sub-tab, see the description of the Locations workspace.

The Local Specification 1 dimension is one of the 12 dimensions in the chart of accounts.

## Local Specification 2 Workspace

Use this workspace to create the dimension values that you want to use when the Local Specification 2 dimension is used in Maconomy's other workspaces.

You can use the Local Specification 2 dimension in any way that is appropriate to further specify a G/L entry or something completely different.

Local dimensions are different from shared dimensions, in that instead of dimension values you can create dimension lists, each of which contains a number of dimension values. You can attach each dimension list to one or multiple companies. Only those dimension values that are part of the dimension list that is attached to a company are available to the particular company. You can create a structure list for each dimension list.

The Local Specification 2 dimension is one of the 12 dimensions in the chart of accounts.

## Local Specification 3 Workspace

Use this workspace to create the dimension values that you want to use when the Local Specification 3 dimension is used in Maconomy's other workspaces.

You can use the Local Specification 3 dimension in any way that is appropriate to further specify a G/L entry or something completely different.

Local dimensions are different from shared dimensions, in that instead of dimension values you can create dimension lists, each of which contains a number of dimension values. You can attach each dimension list to one or multiple companies. Only those dimension values that are part of the dimension list that is attached to a company are available to the particular company. You can create a structure list for each dimension list.

The Local Specification 3 dimension is one of the 12 dimensions in the chart of accounts.

## Posting Descriptions Workspace

Use this workspace to maintain entry texts for automatic entries from subledger modules.

These texts are assigned when Maconomy posts the entries.

The function and name of each type of subledger entry is fixed. This workspace is only used for entering and changing texts.

### Posting Descriptions Tab

This section includes the fields and descriptions for the Posting Descriptions tab.

#### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

### Subledger Texts Sub-Tab

This section includes the fields and descriptions for the Subledger Texts sub-tab.

Field	Description
<b>Entry Type</b>	This field shows the entry type. It cannot be changed. The following is a list of all the entry texts and a description of their function in Maconomy. You specify the entry text in the field next to the entry type.
<b>Description</b>	<p>Here you enter the entry text.</p> <p>The following entry types are used in Maconomy:</p> <ul style="list-style-type: none"> <li>■ Invoice Tax — Tax entries from invoices and credit memos in the Sales Orders and G/L modules. The entries are posted in an automatically created invoice journal.</li> <li>■ Cost of Sales — Cost of sales entered to cost of sales account and account for uninvoiced cost of sales from invoices and credit memos in the Sales Orders module. The entries are posted in an automatically created invoice journal.</li> <li>■ Sales — Item sales entries from invoices and credit memos in the Sales Orders module. The entries are posted in an automatically created invoice journal.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Amount Rounding — Entries created as a result of the rounding of external amounts, if this has been specified in the Currency Rounding workspace in the Set-Up module. The entries are posted in an automatically created invoice journal.</li> <li>Royalty Settlement — Royalty expenses from the Royalty Agreements and Royalty Billing workspaces. The entries are posted in an automatically created royalty journal.</li> <li>Job Allocation Variance — Job entries created as a result of rounding off amounts to the lowest currency unit. The entries are posted via a job journal.</li> <li>Item Invoice — Entries to the inventory value account and the account for uninvoiced cost of sales. The entries are created when items leave the warehouse in the Sales Orders and Accounts Receivable modules. The entries are posted in an automatically created item journal.</li> <li>Item Purchase — Inventory value from the window Item Receipt in the Item Purchase module. The entries are posted via an automatically created item journal.</li> <li>Item Cost Price Regulation — Adjustment of inventory value in the Inventory Change workspace in the Inventory module. Entries are posted in an automatically created item journal.</li> <li>Item Credit Memo — Entries to the inventory value account and the account for uninvoiced cost of sales. Entries are posted in an automatically created item journal.</li> <li>Item Manual — Inventory value from entering items arrivals and shipments in the Inventory Change workspace in the Inventory module. The entries are posted in an automatically created item journal.</li> <li>Item Up And Down Writing Shipment — Automatic up- and down-writing of the inventory value when removing items in the sales price system, where the cost calculated from sales price is different from the cost at the warehouse in question in the table part of the item information card. The entries are posted in an automatically created item journal.</li> <li>Item Up And Down Writing Production — Automatic write-up and write-down of the inventory value as a result of the production of items where the new items result in an adjustment to the cost of the items already in inventory. An example of this happens when you produce items using the "Last" cost method, and the produced item's cost is different from the last cost used at the warehouse in question. The entries are posted in an automatically created item journal.</li> <li>Item Write-Up/-Down Receipt — Automatic write-up and write-down of the inventory value when you receive items that cause an adjustment to the</li> </ul>

Field	Description
	<p>costs of the items already in a warehouse. An example of this happens when you receive items using the “Last” cost method, and the received item’s cost is different from the last cost used at the warehouse in question. The entries are posted in an automatically created item journal.</p> <ul style="list-style-type: none"> <li>▪ Item Inventory Count — Adjustment of inventory value after an inventory count in the Inventory Change and Approve Count workspaces in the Inventory module. The entries are posted via an automatically created item journal.</li> <li>▪ Item Carry-over — Adjustment of inventory value after transferring items from one warehouse to another in the Inventory Change workspace in the Inventory module. The entries are posted via an automatically created item journal.</li> <li>▪ Item Production — Production of bills of materials in the BOM Production workspace in the Inventory module. The entries are posted in an automatically created item journal.</li> <li>▪ Item Misc. Losses — Adjustment of inventory value after entering losses in the Inventory Change workspace in the Inventory module. The entries are posted in an automatically created item journal.</li> <li>▪ Item Duty — Entries with the duty amount in purchases, with reference to the vendor selected. The entries are posted in an automatically created item journal.</li> <li>▪ Service Contract Invoicing — Posting type from the window Create Service Contract Invoice. The posting type is used when periodic invoicing is made for service contracts. The entries are posted in an automatically created invoice journal.</li> <li>▪ Service Contract — Line text used as the external item description on automatically created service contract invoices. The entries are posted in an automatically created invoice journal.</li> <li>▪ Service Cost of Sales — Posting type from the Service Jobs workspace. The posting type is used for the registration of cost of sales in connection with service jobs.</li> <li>▪ Subscription Accrual — Entry type from the Print Invoice workspace. The entry is used when you invoice periodic subscriptions. The entries are posted in an automatically created invoice journal.</li> <li>▪ Customer Cash Discount — Cash discounts from the Customer Open Entry Reconciliation workspace in the Accounts Receivable module. The entries are posted via a customer reconciliation journal.</li> <li>▪ Customer Exchange Rate Gain — Exchange rate gains from the Customer Open Entry Reconciliation workspace in the Accounts Receivable module. The entries are posted in a customer reconciliation journal.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Customer Exchange Rate Loss — Exchange rate losses from the Customer Open Entry Reconciliation workspace in the Accounts Receivable module. The entries are posted in a customer reconciliation journal.</li> <li>Customer Collection — Entries created in connection with the creation of collection files in the Collection Files workspace in the Banking module. The entries are posted in a customer payment journal.</li> <li>Customer Interest Charge — Interest from the Interest Charge Selection and Approve Interest Selection workspaces in the Accounts Receivable module. The entries are posted in an interest charge notice journal.</li> <li>Customer Reminder — Reminder charges from the Reminder Selection and Approve Reminders workspaces in the Accounts Receivable module. The entries are posted in a reminder letter journal.</li> <li>Client Account Adjustment — Client account adjustments from the Approve Adjustment Selection workspace. The entries are posted in a client account adjustment journal.</li> <li>Vendor Payment — Payment of vendor invoices from the Payment Selection and Change Payment Selection workspaces by Vendor in the Banking module. Entries are posted in a payment journal.</li> <li>Vendor Invoice Reconciliation — Reconciling invoices in the Invoice Reconciliation workspace in the Accounts Payable module. The entries are posted in a vendor journal.</li> <li>Vendor Cash Discount — Cash discounts from the Payment Selection and Change Payment Selection by Vendor workspaces in the Banking module. The entries are posted in a vendor journal.</li> <li>Vendor Exchange Rate Gain — Exchange rate gains from the Payment Selection and Change Payment Selection by Vendor workspaces in the Banking module. The entries are posted in a vendor journal.</li> <li>Vendor Exchange Rate Loss — Exchange rate losses from the Payment Selection and Change Payment Selection by Vendor workspaces in the Banking module. The entries are posted in a vendor journal.</li> <li>Tax Settlement — Tax settlements from the Tax Settlement workspace. The entries are posted in an automatically created general journal.</li> <li>Invoice — Invoice entries to a customer in the Accounts Receivable module and to a customer control account in the G/L module. The entries are posted in an automatically created invoice journal.</li> <li>Invoice Discount — Invoice discount from invoices and credit memos in the Sales Orders module. The entries are posted in an automatically created invoice journal.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Order Charge 1-4 — Charge 1-4 from invoices and credit memos in the sales orders module. The entries are posted in an automatically created invoice journal.</li> <li>Non-Inventoried Cost of Sales — Set-off entries to cost of sales of non-inventoried items from invoices and credit memos in the Sales Orders module. The entries are posted in an automatically created invoice journal.</li> <li>Credit Memo — Credit memo entries to a customer in the accounts receivable module and to a customer control account in the G/L module. The entries are posted in an automatically created invoice journal.</li> <li>Interest Earnings Intercompany — When running interest calculations for intercompany entries, the interest earnings of each company included in the calculation are posted using this description.</li> <li>Interest Expenses Intercompany — When running interest calculations for intercompany entries, the interest expenses of each company included in the calculation are posted using this description.</li> <li>Payment (Error Reported Vendor Payments) — The entries are posted in a payment journal.</li> </ul>

## Posting References Workspace

Use this workspace to maintain departments and the posting references that are associated with them.

Maconomy uses posting references to generate automatic income and expense entries that are related to procedures such as invoice posting.

Maconomy retrieves account references by a fixed name to which you assign a dimension combination of the **Posting Reference** type, which contains the account number and any other dimension values to be applied in the context that is relevant for each posting reference. The posting references and their names are fixed in Maconomy; you use this workspace to assign dimension combinations to each reference.

For every department that you create, you must create a complete set of posting references if you want to be able to print things such as departmental income statements.

You only need to create departments to the extent that you want P&L entries posted automatically, each to a separate account. Instead, if you want to limit the number of accounts in your system, you can allocate departmental transactions to one of the dimensions in the chart of accounts, such as Locations. Using dimension combinations, you can also prepare company-independent sets of accounts, where entries posted by means of posting references are also posted on certain local accounts (created in one of the three local dimensions), depending on the company that makes the individual entry. For more information about this functionality, see the introduction to the Dimension Combinations workspace.

You cannot delete an existing department, although you can change its name. In Maconomy's **Department** pop-up fields, such as in the Customer Information Card, the departments are listed in the order in which you created them in this workspace.

For auditing purposes, it is recommended that you print and file the Posting References workspace every time that you change it.

## Posting References Tab

This section includes the fields and descriptions for the Posting References tab.

### Department Island

Field	Description
<b>Name</b>	<p>Enter the name of the department. This is the name that appears in “Department” popup fields in Maconomy.</p> <p>You can also add various information about the department, such as address and telephone number. This additional information is purely for reference.</p>

### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

## Account References Sub-Tab

This section includes the fields and descriptions for the Account References sub-tab.

Field	Description
<b>Entry Type</b>	<p>This is the entry type of the posting reference. It cannot be changed. The following is a list of all of the posting types in Maconomy, showing which account should be contained in the dimension combination assigned to the posting type.</p> <ul style="list-style-type: none"> <li>■ <b>Accrual Difference</b> — If you make accruals in the Job Cost module, the amount is sometimes not divisible by the number of accrual periods, and the remainder will therefore be posted to this account, provided that job entries are not posted by activity (that is, the field “Post by Activity” is not marked in the System Information workspace). For instance, if you want to accrue \$1 over a three-month period, an amount of 33 cents is accrued for each period. The last 1 cent, which cannot be divided, is posted to this account.</li> <li>■ <b>Amount Rounding</b> — Account for rounding of amounts on invoices. The account is used in connection with rounding of invoice totals, if external rounding has been defined in the Currency Rounding workspace in the Set-Up module. The difference between the actual invoice amount and amount rounded off on the invoice is posted on this account.</li> <li>■ <b>Cost Of Sales</b> — Account for cost of sales.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Customer Balancing Exchange Rate Gain —Select or enter the dimension combination number of the account to which the balance of a gain due to exchange rate variances is posted. For more information about working with multiple currencies, refer to the <i>Deltek Maconomy Concepts Guide</i>.</li> <li>Customer Balancing Exchange Rate Loss — Select or enter the dimension combination number of the account to which the balance of a loss due to exchange rate variances is posted. For more information about working with multiple currencies, refer to the <i>Deltek Maconomy Concepts Guide</i>.</li> <li>Customer Cash Discount — Account for cash discounts from the Customer Open Entry Reconciliation workspace in the A/R module.</li> <li>Customer Exchange Rate Gain — Select or enter the dimension combination number of the account to which gains due to exchange rate variances are posted. For more information about working with multiple currencies, refer to the <i>Deltek Maconomy Concepts Guide</i>.</li> <li>Customer Exchange Rate Loss — Select or enter the dimension combination number of the account to which losses due to exchange rate variances are posted. For more information about working with multiple currencies, refer to the <i>Deltek Maconomy Concepts Guide</i>.</li> <li>Customer Interest Charge — Account for interest from the Change Interest Charge Selection and Approve Interest Selection workspaces in the A/R module.</li> <li>Customer Payment Difference — Account for amount variances from the Customer Open Entry Reconciliation workspace in the A/R module. Amount variances between a customer payment and the entry/entries against which the payment is reconciled can be posted on this account depending on the values specified in the system parameter "Margin For Customer Payment Variances." See the description of this system parameter for further information on customer payment variances.</li> <li>Customer Reminder — Account for reminder charges from the Reminder Selection and Approve Reminders workspaces in the A/R module.</li> <li>Debtor Provisions — Account for debtor provisions created in the Debtor Provisions By Invoice workspace in the A/R module. When a provision is created, the provision is credited to a balance account specified on the current customer's control account in the Popup</li> </ul>

Field	Description
	<p>Fields workspace, and debited to this P&amp;L offset account. Reversing entries are made on the two accounts when the customer invoice is fully reconciled.</p> <ul style="list-style-type: none"> <li>■ <b>Intercompany Settlement Exchange Rate Variance</b> — Account for exchange rate variances in intercompany settlements. When you run an intercompany invoicing, Maconomy checks if there are exchange rate variances between the amounts in base currency on the original registrations in the individual companies invoiced and the amount in base currency on the vendor invoice created in the intercompany invoicing. If a variance occurs, the exchange rate variance is posted to this account. For further information on the calculation and posting of exchange rate variances occurring in intercompany invoicing, please see the description of the action “Print Invoice” in the Intercompany Invoicing workspace.</li> <li>■ <b>Interest Expenses Intercompany</b> — When running interest calculations for intercompany entries, the interest expenses of each company included in the calculation are posted to this account.</li> <li>■ <b>Interest Income Intercompany</b> — When running interest calculations for intercompany entries, the interest earnings of each company included in the calculation are posted to this account.</li> <li>■ <b>Invoice Discount</b> — Account for invoice discounts.</li> <li>■ <b>Invoiced On Account</b> — Account for cost of sales invoiced on account. When you make the final invoice from an invoice on account, Maconomy transfers the entries to the cost of sales account.</li> <li>■ <b>Job Balancing Exchange Rate Gain</b> — Select or enter the dimension combination number of the account to which the balance of a gain due to exchange rate variances is posted. Realized gains are posted to this account. For more information about working with multiple currencies, refer to the <i>Deltek Maconomy Concepts Guide</i>.</li> <li>■ <b>Job Balancing Exchange Rate Loss</b> — Select or enter the dimension combination number of the account to which the balance of a loss due to exchange rate variances is posted. Realized losses are posted to this account. For more information about working with multiple currencies, refer to the <i>Deltek Maconomy Concepts Guide</i>.</li> <li>■ <b>Job Exchange Rate Gain</b> - Select or enter the dimension combination number of the account to which gains due to exchange rate variances is posted. For more information about working with multiple currencies, refer to the <i>Deltek Maconomy Concepts Guide</i>.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Job Exchange Rate Loss - Select or enter the dimension combination number of the account to which loss due to exchange rate variances is posted. For more information about working with multiple currencies, refer to the <i>Deltek Maconomy Concepts Guide</i>.</li> <li>Non-Inventoried Cost of Sales — Account for cost of sales that has not been booked to warehouse. Maconomy uses the following method to account for cost of sales: When you create packing slips, the value of the stock is credited to the account for inventory value and debited to the account for non-invoiced cost of sales. These entries are gathered in an inventory journal. Their posting references are maintained in the Warehouse Information Card workspace in the inventory module. When you later print the invoice, the cost of sales of the stock is credited to the account for non-invoiced cost of sales. If part of the sale is for non-inventoried items, the cost of sales for these items is debited to the cost of sales account. These non-inventoried costs of sales are not credited to the account for non-invoiced cost of sales. The offsetting entry is instead posted to the account for non-inventoried cost of sales. These entries are collected in an invoice journal. The invoiced sales are credited to the item sales account, and any entries for tax payable, invoice discount, charges, and so on, are created. The customer control account is debited by the corresponding amount. These entries are also collected in an invoice journal. This accounting method ensures that item sales and cost of sales always balance. When you credit a customer, Maconomy completes the same sequence of accounting, with the distinction that both the invoice and the item journal are created when you print the credit memos.</li> <li>Order Charge 1-4 — Account for type 1-4. In Maconomy you can add four different types of charge to an invoice (for example, handling charge, delivery, and postage). Charge texts and amounts are managed in the Charges workspace in the Sales Orders module.</li> <li>Outlay Settlement — Account for outlays from expense sheets specified in the Expense Sheets workspace in the Job Cost module. The posting reference will usually be a balance sheet account showing the company's balance with its employees in connection with outlays.</li> <li>Royalty Consumption — Account for royalty expenses. The account is used when you post royalty.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Royalty Prepayment — Account for prepaid royalty expenses and payable royalty expenses. A royalty journal will be created when you approve the billing selection of each individual royalty agreement. Prepaid royalty is debited to the account whereas payable royalty is credited to the account.</li> <li>Sales Export — Account for export sales. For item sales that are normally taxed, but the customer lives abroad and is therefore not taxed.</li> <li>Sales Nontaxable — Account for non-taxable item sales. For sales that are not taxable (that is, the tax code in the item information card is blank).</li> <li>Sales Taxable — Account for item sales with normal tax.</li> <li>Subscription Accrual Sale — Account for accrued sale. See the description of the posting reference “Subscription Prepayment.”</li> <li>Subscription Prepayment — Account for subscription revenues paid in advance. The posting reference is used as a subtotal account when a subscription is invoiced prior to delivery. When you invoice, the part of the amount, which represents payment of future deliveries, will be posted to this account. At the same time, entries will be made ahead in time so that the amount is reallocated to the account for accrual sales. The amount is allocated equally to the delivery months, and only the part of the invoiced amount pertaining to future deliveries will be accrued. The accrual takes place automatically and is not optional.  For example: on 31 March, an invoice for USD 120 is posted as a result of a subscription running from 1 January until 31 December. This causes the following movements on the account for payment in advance:  On 31 March, USD 30 will be credited to the account for accrued sales, and USD 90 will be credited to the account for prepayment. On the first of each month, from 1 April until 1 December, the account for prepayment will thus be debited with USD 10, and USD 10 will be credited to the account for accrued sales, reaching a total of USD 90. If a credit order is created from an accrued invoice in the sales orders module, the credit order will also be accrued.</li> <li>Unrealized A/P Exchange Rate Variance — Account used for automatic registration of unrealized exchange rate variances pertaining to vendors. Entries are made to this account when running currency reports where the field “Create G/L Entries” is marked. For further information on the situations where entries are made to this account, see the description of the field “Create G/L Entries” in the Print Currency Report workspace.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Unrealized A/R Exchange Rate Variance — Account used for automatic registration of unrealized exchange rate variances pertaining to customers. Entries are made to this account when running currency reports where the field “Create G/L Entries” is marked. For further information on the situations where entries are made to this account, see the description of the field “Create G/L Entries” in the Print Currency Report workspace.</li> <li>Unrealized G/L Exchange Rate Variance — Account used for automatic registration of unrealized exchange rate variances pertaining to G/L accounts. Entries are made to this account when running currency reports where the field “Create G/L Entries” is marked. For further information on the situations where entries are made to this account, see the description of the field “Create G/L Entries” in the Print Currency Report workspace.</li> <li>Unrealized Job Balancing Exchange Rate Gain — An exchange rate difference created as a result of a fixed job exchange rate variance should be posted as a un-realized exchange rate variance gain or loss when the invoice allocation is posted. The un-realized exchange rate variance should be moved to realized exchange rate variance when the vendor entry is posted. This account is for the unrealized gain.</li> <li>Unrealized Job Balancing Exchange Rate Loss — An exchange rate difference created as a result of a fixed job exchange rate variance should be posted as a un-realized exchange rate variance gain or loss when the invoice allocation is posted. The un-realized exchange rate variance should be moved to realized exchange rate variance when the vendor entry is posted. This account is for the unrealized loss.</li> <li>Unrealized Job Exchange Rate Gain — Select or enter the dimension combination number of the account to which the balance of a gain due to exchange rate variances is posted. For more information about working with multiple currencies, refer to the <i>Deltek Maconomy Concepts Guide</i>.</li> <li>Unrealized Job Exchange Rate Loss — Select or enter the dimension combination number of the account to which the balance of a gain due to exchange rate variances is posted. For more information about working with multiple currencies, refer to the <i>Deltek Maconomy Concepts Guide</i>.</li> <li>Vendor Balancing Exchange Rate Gain — Select or enter the dimension combination number of the account to which balancing due to exchange rate variances is posted. For more information about working with multiple currencies, refer to the <i>Deltek Maconomy Concepts Guide</i>.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Vendor Balancing Exchange Rate Loss — Select or enter the dimension combination number of the account to which balancing loss due to exchange rate variances is posted. For more information about working with multiple currencies, refer to the <i>Deltek Maconomy Concepts Guide</i>.</li> <li>Vendor Cash Discount — Account for cash discounts from the Payment Selection and Change Payment Selection by Vendor workspaces in the Banking module.</li> <li>Vendor Exchange Rate Gain — Select or enter the dimension combination number of the account to which gains due to exchange rate variances are posted. For more information about working with multiple currencies, refer to the <i>Deltek Maconomy Concepts Guide</i>.</li> <li>Vendor Exchange Rate Loss —Select or enter the dimension combination number of the account to which losses due to exchange rate variances are posted. For more information about working with multiple currencies, refer to the <i>Deltek Maconomy Concepts Guide</i>.</li> </ul>
<b>Dimension Combination No.</b>	This field shows the number of the dimension combination when creating a dimension combination. If the dimension combination is created on the basis of a control account, it has automatically been assigned the number of the account in question.
<b>Description</b>	This field is used for sorting purposes. It is not editable.

## Intercompany Accounts Workspace

Use this workspace to specify the accounts to be used for intercompany balancing between two companies in the Company dimension.

You can define a set of intercompany accounts for each transaction type that can cause an intercompany balancing. You specify the posting reference to the individual intercompany account by using a dimension combination. The dimension combination also specifies the account number and any other dimension values needed in connection with the intercompany transaction type in question.

An intercompany balancing is an extra entry that Maconomy creates at the posting of entries that concern two different companies. Maconomy performs the balancing to ensure that equal amounts are debited and credited in both companies. The entries can be based on an invoice; the entry, reallocation, or allocation of a vendor invoice; item movements; hours entered in the Job Cost module; or entries in a general journal. Note, however, that if you do not select the **Create intercompany entries for companies with same parent company** system parameter, Maconomy only creates intercompany entries if the two companies that are involved are not both assigned to the same parent company.

Two designations are used for the companies that are involved in an intercompany balancing: Responsible company and Intercompany company. The responsible company is the company that you specified in the Company island in the tab in which you entered the transaction (for example: for jobs, the tab in the Jobs workspace; for vendor invoices, the tab in the Invoice Allocation workspace). Therefore, this is usually the company who employs the user who created the transaction.

The intercompany company is the company whose accounts are affected by the transactions. The field that determines the intercompany company depends on the type of transaction that you are posting. You identify the field that determines the intercompany company in the field description of each type of intercompany balancing.

When posting, Maconomy creates intercompany entries for the relevant amounts. On the account and any other dimension values that are listed in the dimension combination that you entered in the **Posting Reference, Responsible Company** field for the intercompany transaction type in question, Maconomy creates an entry that has the responsible company as the company dimension. On the account and any other dimension values that are listed in the dimension combination that you entered in the **Posting Reference, Intercompany Company** field for the intercompany transaction type in question, Maconomy creates an offset entry that has the intercompany company as the company dimension. Maconomy transfers the remaining dimension values from the line that causes the intercompany balancing. If there is no value for a dimension in the dimension combination, the value that you specified on the entry line that results in the intercompany posting is used.

If you select the **Create Intercompany Invoicing Basis** system parameter, the creation of intercompany balancing also results in the creation of intercompany entries. This is described in "Settling Intercompany Balances." However, because intercompany entries are only used as a basis for easy intercompany invoicing and are not, as such, related to the G/L accounts of the companies that are involved, intercompany entries are not included in the following descriptions of intercompany balancing.

The following figure shows an example of an intercompany balancing in a situation where company A sells a chair at the price of \$1,000 from a warehouse that belongs to company B. Tax is not considered in this example.

In the **Company Number** field in the tab of the Sales Orders workspace, company A has been specified, and is thus the responsible company. The warehouse specified on the sales order line is assigned to company B, making company B the intercompany company.

1. A normal sales situation causes a debit entry for the cost of the item on company A's account for uninvoiced cost of sales and an offset entry on company B's account for inventory value. Viewed separately, the accounts of the two companies are missing a credit entry in company A and a debit entry in company B. To make the accounts of both companies balance separately, an intercompany balancing must be performed.
2. In the preceding example, Maconomy creates a credit entry for the cost of the item on an intercompany account for the responsible company. The company dimension value on this entry is company A. In addition, Maconomy creates a debit entry for the same amount on the intercompany account for the intercompany company. The company dimension value on this entry is company B. The accounts of both companies now balance, because equal amounts have been debited and credited in both companies.

Deselecting the **Create intercompany entries for companies with same parent company** system parameter means that Maconomy does not create intercompany balancings between two companies that have the same parent company. In this example, this would mean that the entries to the two intercompany accounts would be skipped if the parameter was not selected and companies A and B were assigned to the same parent company. As a result, the accounts of the

two individual companies do not balance. However, because the same amount has been debited in one company and credited in the other, the accounts of the parent company balance.

### Intercompany Accounts Tab

This section includes the fields and descriptions for the Intercompany Accounts tab.

### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

### Intercompany References Sub-Tab

This section includes the fields and descriptions for the Intercompany References sub-tab.

Field	Description
<b>Intercompany Type</b>	<p>Each line in the table part represents an intercompany transaction type. For each type, you can specify a dimension combination and a posting description for the responsible company and the intercompany company, respectively. These posting descriptions and the accounts and any other dimension values specified in the dimension combinations in question will be used in intercompany balancing of the type in question. The intercompany transaction types are described below. The descriptions disregard situations where the system parameter “Create intercompany entries for companies with same parent company” is not marked and the two companies involved are both assigned to the same parent company (which would mean that no intercompany entries would be created).</p> <ul style="list-style-type: none"> <li> <b>A/P Control Account</b> — This type of intercompany balancing is used when posting vendor invoices if a company purchases items from a vendor who is assigned to another company. In a vendor invoice journal, this situation arises when the company specified in the island Company is different from the settling company of the vendor.         </li> </ul> <p>The settling company of the vendor is specified on the information card of the vendor in question. The company specified in the island Company in the card part is the responsible company while the settling company of the vendor is the intercompany company. For further information about the influence of a settling company and of how such a company is selected, please see “Multiple Companies” in the chapter “Introduction to the G/L module.”</p> <p>If, for example Company A registers a vendor invoice for \$100 covering items purchased from a vendor assigned to company B, Maconomy will create a debit entry for \$100 on the purchase account and a corresponding credit entry on the intercompany account for the responsible company. The value for the dimension Company will be company A on both entries. Maconomy also</p>

Field	Description
	<p>creates a credit entry for \$100 on the vendor control account and a corresponding debit entry on the intercompany account for the intercompany company. The value for the dimension Company will be company B on these two entries. The entries are created at the posting of the vendor invoice journal.</p> <p>This intercompany transaction type is also used when a vendor number has been specified on a general journal line, and the vendor in question is assigned to another company than the one specified in the island Company in the card part of the journal. In this case, the responsible company is the one specified in the card part, while the intercompany company is the settling company of the vendor.</p> <ul style="list-style-type: none"> <li>Inventory Journal — This intercompany transaction type is used when posting item journals containing transactions in which a company caused item movements in a warehouse assigned to another company. The item movement can be caused by sales or purchase.</li> </ul> <p>On a sales order, the situation where a company sells items from a warehouse assigned to another company is arises when one company is specified in the island Company and the warehouse on one of the sales order lines is assigned to a another company. In this case, the responsible company is the one specified in the island Company while the company to which the warehouse is assigned is the intercompany company. The warehouse is assigned to a company in the Warehouse Information Card workspace.</p> <p>On an item purchase order, the situation where a company buys items to be placed in a warehouse assigned to another company is arises when one company is specified in the island Company and the warehouse selected is assigned to a another company. In this case, the responsible company is the one specified in the island Company while the company to which the warehouse is assigned is the intercompany company.</p> <p>If, for example Company A buys items worth \$100 to be placed in a warehouse assigned to company B, Maconomy will create a credit entry for \$100 on the A/P suspense account and a corresponding debit entry on the intercompany account for the responsible company. The value for the dimension Company will be company A on both entries. Maconomy also creates a debit entry for \$100 on the account for inventory value and a corresponding credit entry on the intercompany account for the intercompany company. The value for the dimension Company will be company B on these two entries. The entries are created at the posting of the inventory journal.</p>

Field	Description
	<ul style="list-style-type: none"> <li> <b>Vendor Invoice</b> — This intercompany transaction type is used when posting two types of journals: When posting a vendor invoice journal if a vendor invoice has been allocated in the Invoice Allocation workspace, and the posting of a reallocation journal if a vendor invoice journal has been reallocated in the Reallocate Invoices workspace.   In both cases, Intercompany balancing is made if the company in the island Company is different from the one in the field “Company No.” on a line in the table part. The company in the card part is the responsible company while the company on the line in question is the intercompany company.   If, for example Company A registers a vendor invoice and allocates the invoice to a number of accounts, using company B in the field “Company No.,” the posting of the invoice journal will result in a credit entry for the full amount on the vendor control account and a debit entry for each allocation line on the intercompany account for the responsible company. The value for the dimension Company will be company A on all of these entries. On the account to which the amount was allocated, Maconomy also creates a debit entry for each allocation line, and a credit entry for the full amount on the intercompany account for the intercompany company. The value for the dimension Company will be company B on these entries. </li> <li> <b>General Journal</b> — This type of intercompany balancing is used when posting general journals in which different companies have been specified in the card and table parts. This could, for example, happen in a situation where one company covers an expense of another company. The company specified in the island Company in the card part is the responsible company while the company specified in the field Company No. on the journal line in question is the intercompany company.   If an offset account is specified, the company specified in the card part will be used on the offset entry created.   If, for example Company A creates a general journal in which a payment for \$100 is registered to cover the purchase of office supplies for company B, Maconomy will create a credit entry for \$100 on the cash account and a corresponding debit entry on the intercompany account for the responsible company. The value for the dimension Company will be company A on both entries. Maconomy also creates a debit entry for \$100 on the account for office supplies and a corresponding credit entry on the intercompany account for the intercompany company. The value for the dimension Company will be company B on these two entries. </li> </ul>

Field	Description
	<p>The posting references of this intercompany transaction type are only used if the account number specified in the field "Account No." on the general journal line is a G/L account. If a customer number or a vendor number is specified, Maconomy uses the intercompany posting references specified for the either the intercompany transaction type "A/R Control Account" or "A/P Control Account," depending on the type of account.</p> <ul style="list-style-type: none"> <li> <b>Job Registration</b> — This type of intercompany balancing is used when posting time or amount activities on a job in the Job Journal and Time Sheets workspaces. The job entries will only cause the creation of intercompany entries if the executing company specified on the job is different from the company responsible for the job.   In the Job Journal workspace, the responsible company is shown in the island Company in the card part of the workspace, while the executing company is specified in the field "Executing Company No." in the table part of the workspace. In the Time Sheets workspace, the executing company is the company to which the employee is assigned, while the responsible is the company specified on the job on which hours are being registered. </li> <li> <b>Budget Journal</b>— This type of intercompany balancing is used when approving budget journals, where entries have been made with reference to different companies in the island Company in the card part and the field "Company No." in the table part of the Budget Journal workspace. This will, for example, be the case if one company budgets for the accounts of another company. The responsible company is the company specified as a dimension value in the card part, and the intercompany company is the company specified as a dimension value in the table part of the budget journal. </li> <li> <b>Asset Journal</b> — This type of intercompany balancing is used when posting asset journals with entries that concern internal transfer or sales of fixed assets. The responsible company is the company from which the asset is transferred or sold, and the intercompany company is the company to which the asset is transferred or sold. </li> <li> <b>Tax at Cash Discount</b> — This type of intercompany balancing is used when posting payment journals if a company pays a vendor invoice assigned to another company. On a vendor invoice, this situation arises when the company responsible for the journal in which the vendor invoice is specified is different from the settling company of the vendor in question. However, this intercompany type is only used if the system parameter "Intercompany tax </li> </ul>

Field	Description
	<p>balancing” is marked and the vendor in question has a tax discount code on which tax adjustment is used. The intercompany type is used for intercompany posting of the tax included in any cash discount granted in connection with a payment.</p> <p>If, for example, Company A pays a vendor invoice which gives rise to a cash discount of which tax constitutes \$10, and company B is responsible for the vendor invoice in question, Maconomy will create a debit entry for the full cash discount amount on the A/P control account. Furthermore, Maconomy will create a credit entry for the cash discount amount less tax on the account for vendor cash discounts and a credit memo for the tax amount of \$10 on the intercompany account for the responsible company. The value for the dimension Company will be company A on all three entries. Maconomy also creates a debit entry for \$10 on the intercompany account for the intercompany company and a credit entry for the same amount on the account for ingoing tax. The value for the dimension Company will be company B on these two entries. The entries are created when the payment journal is posted.</p> <p>Please note that this functionality is only used if the payment is registered in the Change Payment Selection by Vendor workspace in the Banking module.</p> <ul style="list-style-type: none"> <li>■ <b>A/R Control Account</b> — This type of intercompany balancing is used when posting sales invoices if a company sells an item to a customer who is assigned to another company. On a sales order, this situation arises when the company specified in the island Company is different from the one shown in the field “Settling Company.” For further information about the influence of a settling company and of how such a company is selected, please see “Multiple Companies” in the chapter “Introduction to the G/L module.”</li> </ul> <p>The company specified in the island Company in the card part is the responsible company while the company shown in the island Settling Company is the intercompany company. The settling company is transferred from the information card of the customer in question.</p> <p>If, for example Company A invoices \$100 to a customer assigned to company B, Maconomy will create a credit entry for \$100 on the sales account and a corresponding debit entry on the intercompany account for the responsible company. The value for the dimension Company will be company A on both entries. Maconomy also creates a debit entry for \$100 on the customer control account and a corresponding credit entry on the intercompany account for the intercompany company. The value</p>

Field	Description
	<p>for the dimension Company will be company B on these two entries. The entries are created at the posting of the invoice.</p> <p>This intercompany transaction type is also used when a customer number has been specified on a general journal line, and the customer in question is assigned to another company than the one specified in the island Company in the card part of the journal. In this case, the responsible company is the one specified in the card part, while the intercompany company is the settling company of the customer.</p>
<b>Posting Reference, Responsible Company</b>	For each intercompany transaction type, you can specify the number of a dimension combination which refers to the account and any other dimension values to be used in connection with the current intercompany transaction type. The dimension values from the specified dimension combination will be applied to intercompany entries in the responsible company.
<b>Text, Responsible Company</b>	For each intercompany transaction type, the posting description to be used on intercompany entries in the responsible company is specified in this field.
<b>Posting Reference, Intercompany Company</b>	For each intercompany transaction type, you can specify the number of a dimension combination which refers to the account and any other dimension values to be used in connection with the current intercompany transaction type. The dimension values from the specified dimension combination will be applied to intercompany entries in the intercompany company.
<b>Text, Intercompany Company</b>	For each intercompany transaction type, the posting description to be used on intercompany entries in the intercompany company is specified in this field.

## Trans. No. Series Workspace

Use this workspace to maintain the transaction number series of each company.

In the General Journal workspace, select a transaction number series manually or automatically (by choosing a transaction type to which a transaction number series is assigned). When a transaction number series is used in a general journal, Maconomy automatically assigns the next available number to the lines that it creates in the journal. For example, you can use this functionality for keeping entries of different natures separated. You create the names of the number series in the Popup Fields workspace; you specify the number series of each company in this workspace.

This workspace only displays companies to which you have assigned separate system numbers, that is, you selected the **Separate Transaction Numbers** field in the Company Information workspace.

## Transaction No. Series Tab

This section includes the fields and descriptions for the Transaction No. Series tab.

### Company Island

Field	Description
<b>Company No.</b>	This field shows the number of the current company. The Numbers sub-tab only shows the transaction number series applying to the company shown in this field.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

### Prefix Specification Island

Field	Description
<b>Trans. No.</b>	This field shows the company prefix used on transaction number series in the current company. The prefix is transferred from the Company Information workspace, and it cannot be changed here. Whenever a number from a transaction number series is used, this prefix will be added in front of the number.

## Numbers Sub-Tab

This section includes the fields and descriptions for the Numbers sub-tab.

Field	Description
<b>Number Series</b>	This field shows the name of the transaction number series. Transaction number series are created in the pop-up field "Transaction No. Series" in the Popup Fields workspace.
<b>Next No.</b>	This field shows the next number in the current series. "Next No." must be an integer. When the transaction number series has been in use, Maconomy automatically updates this field.

## Allocation Codes Workspace

Use this workspace to maintain allocation codes that automate entries in the General Journal (G/L module) and the Vendor Invoices (Accounts Payable module) workspace.

An allocation code consists of one or more account numbers and possibly a dimension combination.

When you use an allocation code to create entries in the General Journal workspace, Maconomy automatically replaces the original entry with the number of entries that the allocation code describes.

When you use an allocation code to enter vendor invoices (in Vendor Invoices in the Accounts Payable module) Maconomy automatically creates the allocation lines for the invoice. These are

displayed in the Invoice Allocation workspace and use the account numbers in the allocation code. In this case, the original line in the Vendor Invoices workspace is unchanged.

Thus you use allocation codes to simplify entry work for standardized entries. On the individual lines in the allocation code you can enter an account number directly, and you can specify that the account number is to be used for the new entry lines.

Allocation codes have several useful purposes, for example:

Regular and fixed allocation of overhead expenses, if you use the Location dimension for the departments in your company. Create an allocation code that has a line for each location with an allocation percentage that identifies the department's share of costs.

Automatic entries to subtotal accounts. Create an allocation such as the one illustrated in the following table:

Account No.	Allocation Percentage
	100
1010	100
1020	-100

If you enter a debit entry of \$1,000 to account number 1000 in the General Journal workspace, Maconomy creates a debit entry of \$1,000 with account number 1000-corresponding to the line without an account number-a debit entry of \$1,000 to account number 1010, and a credit entry of \$1,000 to account number 1020.

For auditing purposes, Deltek recommends that you print and file the Allocation Codes workspace every time that you change it.

## Allocation Codes Tab

This section includes the fields and descriptions for the Allocation Codes tab.

### Allocation Code Island

Field	Description
<b>Name</b>	Enter the name of the allocation code. This is the name you enter in the field "Allocation Code" in Maconomy's other workspaces when you want to use the code.
<b>Description</b>	Here you can enter a detailed description of the allocation code. This field is for reference only.
<b>Control %</b>	This field shows the sum of the entered values in the field "Allocation Percent" in the table. If you want an allocation to cover no more than the original entry, the control % must be 100. However, Maconomy does not require that the control % be 100. If it is more or less than 100, the allocation code will result in a number of entry lines for which the sum of debit and credit allocations is more or less than the original entry.

**User Island**

See the chapter “Getting Started” for a description of the fields in the User island.

## Allocation Code Lines Sub-Tab

This section includes the fields and descriptions for the Allocation Code Lines sub-tab.

Field	Description
<b>Account No.</b>	<p>Here you can enter the number of an account of the Manual type. If you enter an account number here, Maconomy will copy it to the field “Account No.” on the entry line that is created for this allocation code.</p> <p>You can enter a value here or in the field “Account Specification,” but not in both fields. If you leave both fields blank, Maconomy will use the account number you enter on the original entry line in the journal.</p>
<b>Account Specification</b>	<p>Here you can enter an alphanumeric string consisting of the numbers 0 to 9 or the letters a to z. If you enter a value, Maconomy will, when creating an entry line from the allocation code, enter an account number in the field “Account No.,” where each letter is replaced with a digit from the original account number.</p> <p>For example, if you enter “abc5,” and you enter a line in a journal with account number 2010, Maconomy will create an entry line with account number 2015.</p> <p>You can either enter a value here or in the field “Account No.,” not in both fields. If you leave both fields blank, Maconomy will use the account number you enter on the original entry line in the journal.</p>
<b>Company No.</b>	<p>Here you can enter a company number from the Company Information workspace. If you enter a value, Maconomy will transfer the company number to the new entry line. If you wish to enter values in any of the fields “Local Spec. 1-3,” you must enter a value in this field. Note that if you enter a company in this field, no dimension values will be derived from the company when it is transferred to a line in the general journal or the Invoice Allocation workspace.</p>
<b>Location</b>	<p>Here you can enter a location from the Locations workspace. If you enter a value, Maconomy will transfer the location to the new entry line. If you leave it blank, Maconomy will use the location entered on the original entry line, and if no location has been entered on the original entry line, Maconomy retrieves the standard location from the system parameter “Standard Location” in the System Parameters workspace. Note that if you enter a value in this field, no dimension values will be derived from the location when it is transferred to a line in the general journal or the Invoice Allocation workspace.</p>
<b>Entity</b>	<p>The functionality of this field is similar to the functionality of the field “Location” above.</p>
<b>Project</b>	<p>The functionality of this field is similar to the functionality of the field “Location” above.</p>

Field	Description
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	Here you can enter a value for the dimensions Local Spec. 1-3. This fields can only be completed if a value has been specified in the field "Company No." on the current allocation code line. If you enter a value, Maconomy will transfer the local specification to the new entry line. Note that if you enter a local specification in this field, no dimension values will be derived when the local specification is transferred to a line in the general journal or the Invoice Allocation workspace.
<b>Allocation %</b>	Enter a percentage that will be calculated of the amount entered on the original entry line in the journal. A negative percentage will change an original debit amount to a credit amount on the new line, and vice versa. For example, if you enter an allocation percent of -250, and the original entry is for \$1,000, Maconomy will make a credit entry of \$2,500. The value here must be non-zero (that is, a positive or negative number).
<b>Summary Posting</b>	Here you can specify whether to combine entries that have the same account number. The value here is transferred to the new entry lines. In the System Information workspace you can choose whether to combine entries by transaction number or by journal number.
<b>Entry Description</b>	Here you can write an entry text that Maconomy will transfer to the new entry line. If you leave it blank, Maconomy will use the entry description from the original entry line.
<b>Transfer Account No.</b>	Here you can specify whether the entry description on the new line created is to include, in parentheses, the original account number entered in the journal. This allows you to track the account number used for the automatic entry.

## Registration Codes Workspace

Use this workspace to create and maintain registration codes that make it easier to use all of the dimensions of the 12-dimensional chart of accounts and other information (for example, job number, employee number).

You use registration codes as a replacement for and simplification of the manual entry of dimensions if you often need to enter several dimensions at a time. When you use registration codes, the risk of typing errors is reduced, because the dimensions that are attached to a registration code are automatically retrieved into the current workspace when you enter the code.

A registration code can, in principle, replace the use of derived dimensions, but you can use both registration codes and derived dimensions. Maconomy perceives dimensions that you retrieve by using a registration code as a manual entry.

You can use registration codes in the General Journal, Purchase Orders, Vendor Invoices, Invoice Allocation, Invoice Reconciliation, and Budget Journal workspaces.

## Registration Codes Tab

This section includes the fields and descriptions for the Registration Codes tab.

### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

## Registration Codes Sub-Tab

This section includes the fields and descriptions for the Registration Codes sub-tab.

Field	Description
<b>Name</b>	In this field, you can enter the name of the current registration code.
<b>Company No.</b>	In this field, you can specify the number of the company that the journal line refers to.
<b>Overwrite Company</b>	If you want the value in the field “Company No.” on the line to overwrite any manually entered values for the company dimension, you can indicate this by marking this field. If you do not select to overwrite, the company number on the line will only be derived if the dimension field to which the derivation is performed is blank.
<b>Account No.</b>	In this field, you can enter the account number to include in the current registration code. If you also want this value to overwrite any manually entered values for the dimension, you can indicate this by marking the field “Overwrite Account” on the line. If you do not select to overwrite, the dimension value will only be derived if the dimension field to which the derivation is performed is blank.
<b>Overwrite Account</b>	The functionality of this field is similar to the functionality of the field “Overwrite Company” above.
<b>Derived Location</b>	In this field, you can specify the value for the Location dimension to include in the current registration code.
<b>Overwrite Location</b>	The functionality of this field is similar to the functionality of the field “Overwrite Company” above.
<b>Derived Entity</b>	In this field, you can specify the value for the Entity dimension to include in the current registration code.
<b>Overwrite Entity</b>	The functionality of this field is similar to the functionality of the field “Overwrite Company” above.
<b>Derived Project</b>	In this field, you can specify the value for the Project dimension to include in the current registration code.
<b>Overwrite Project</b>	The functionality of this field is similar to the functionality of the field “Overwrite Company” above.

Field	Description
<b>Derived Purpose</b>	In this field, you can specify the value for the Purpose dimension to include in the current registration code.
<b>Overwrite Purpose</b>	The functionality of this field is similar to the functionality of the field "Overwrite Company" above.
<b>Derived Spec. 1-3</b>	In these fields, you can specify the value to include in the current registration code for the Specification 1, 2, and 3 dimensions, respectively.
<b>Overwrite Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Overwrite Company" above.
<b>Derived Local Spec. 1-3</b>	In these fields, you can specify the value to include in the current registration code for the Local Specification 1, 2, and 3 dimensions, respectively.
<b>Overwrite Local Spec. 1-3</b>	The functionality of this field is similar to the functionality of the field "Overwrite Company" above.
<b>Job No.</b>	In this field, you can specify the job number to include in the current registration code.
<b>Overwrite Job</b>	The functionality of this field is similar to the functionality of the field "Overwrite Company" above.
<b>Activity</b>	In this field, you can specify the activity number to include in the current registration code.
<b>Overwrite Activity</b>	The functionality of this field is similar to the functionality of the field "Overwrite Company" above.
<b>Task</b>	In this field, you can specify the task to include in the current registration code.
<b>Overwrite Task</b>	The functionality of this field is similar to the functionality of the field "Overwrite Company" above.
<b>Employee No.</b>	In this field, you can specify the employee number to include in the current registration code.
<b>Overwrite Employee</b>	The functionality of this field is similar to the functionality of the field "Overwrite Company" above.
<b>Access Level</b>	In this field, you can specify an access level. Only users with access to the specified level will be able to use the current registration code.
<b>Remark 1-5</b>	In these fields, you can enter a number of remarks about the current registration code.
<b>Overwrite Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Overwrite Company" above.

Field	Description
<b>Access Level</b>	In this field, you can specify an access level. Only users with access to the specified level will be able to use the current registration code.
<b>Remark 1-5</b>	In these fields, you can enter a number of remarks about the current registration code.

## Derived Dimensions Workspace

Use this workspace to set up date-dependent dimension derivation information for each location, job, employee, and so on, that should derive different sets of dimension values, depending on the date of the entry for which Maconomy performs dimension derivation.

The functionality of this workspace applies to locations, entities, projects, purposes, specification 1-3 values, local specification 1-3 values, jobs, and employees. The functionality is identical for all of these information types. However, to simplify the following description, the term "employee" is used throughout this section as a common designation for all of these information types.

In this workspace, you can set up an employee to derive one set of dimensions on one entry date and another set of dimensions on another entry date. This means that when Maconomy tries to derive dimension values from a given employee for a given entry, Maconomy checks the entry date of the entry against the lines in this workspace to determine the set of dimensions to derive. This functionality is useful if, for example, an employee is moving from one unit to another, and you want the dimension values to be derived from the employee to reflect this change.

For example: Employee Hugo Rune changes from location A to location B on May 1, 2003 because he is moving into a new district. To ensure correct dimension derivation from this employee, you can create two sets of derived dimensions in the Dimension Lines sub-tab: One that is valid until April 30 and derives location A, and one that is valid from May 1 and forward and derives location B. Each time that you create or change an entry where information should be derived from Hugo Rune, Maconomy will use the entry date of the entry to determine which of the two sets of dimension values should apply. Of course, instead of creating period-specific sets of derived dimensions, you can just change the information in the Derived Dimensions island in Hugo Rune's information card, but if you do that, any subsequent entries that are back-dated to before May 1 will use the new, updated information on the information card, causing location B to be derived when, in fact, location A is the correct value.

The Derived Dimensions tab displays information about the selected employee. On each line in the Dimension Lines sub-tab, you can identify a set of derived dimensions to apply to the selected employee in a given period. However, you cannot set up date-dependent derivation of company numbers. Therefore, the **Company No.** field in the Dimension Lines sub-tab is for information only. Each time that you create a line, Maconomy suggests the dimension values from the previous line, so that you only need to enter information in the dimensions that are affected by the change.

When you create an employee, Maconomy automatically creates a line in this workspace, on which the starting and ending dates are both blank, indicating that this line applies on all entries regardless of entry date. The dimension values on this line are the ones that you specified in the Derived Dimensions island on the information card of the employee in question. As long as you have not created any other lines for the employee in this workspace, changing the dimension values on the information card causes the corresponding information on the line in this workspace to be updated accordingly, and vice-versa. In effect, entering information in this workspace is only

necessary if you add lines in this workspace to make the dimension values that are derived from the employee change on a given date.

To add a period-specific set of derived dimensions, add a line in the Dimension Lines sub-tab. Setting up a period-specific set of derived dimensions is similar to setting up derived dimensions in regular employee information cards. However, for each line you also define the period during which the dimension values on the line should be valid. You identify the period by entering the appropriate starting date of the period. Maconomy then automatically assigns an ending date in accordance with the closest starting dates on the other lines in the Dimension Lines sub-tab. Similarly, if you delete a line, Maconomy adjusts the starting and ending dates of the lines that represent the adjacent periods before and after the period of the deleted line. For more information about the functionality of period specification, see the **From Date** field.

When the Dimension Lines sub-tab contains more than one line, the line that has the latest starting date always has an open ending date, and the original line that Maconomy automatically created when the employee was created always keeps the starting date blank. This ensures that there is always a valid set of dimension values to derive. The contents of the line that has the open ending date are shown in the Derived Dimensions island in the information card of the employee in question, and changes that you make in the information card cause the line to be updated accordingly.

Note that the dimension derivation procedure is the same whether you use date-dependent dimension derivation or not. Only Maconomy's method for finding the values to be derived from the employees that have period specific derived dimensions is affected.

## Derived Dimensions Tab

This section includes the fields and descriptions for the Derived Dimensions tab.

### Derived Dimensions Island

Field	Description
<b>Used in Relation</b>	This field shows whether the information in the workspace pertains to a location, an entity, a project, a purpose, a spec. 1-3 value, a local spec. 1-3 value, a job, or an employee.
<b>Key 1</b>	<p>This field shows the value of the first key field for the type of information for which the dimension combination has been specified. A key value is a unique identification of a certain job, activity, dimension value, and so on. No two items of the same information type can have the same key value.</p> <p>The field that contains the key value is called the key and varies from information type to information type. For instance, the key on jobs is the job number, and the key to entities is the entity number.</p> <p>In certain cases, a key consists of two key values, key 1 and 2. In these cases, the combination of the two key values constitutes the key of that information type. An example of this is local specification values, where the first key value points to the local specification list to which the local spec. value belongs, and the second key value is the actual local spec. value. So it is possible for several pieces of information to have the same value in key 1 or key 2, but there can be no more than one piece of information with the same combination of values in key 1 and 2.</p>

Field	Description
<b>Key 2</b>	This field shows the value of the second key field for the type of information currently shown in the workspace. For more information about key fields and values, please see the description of the field "Key 1" above.
<b>Description</b>	In this field, you can specify a description of the information in the workspace.
<b>Option List</b>	In this field, you can specify an option list. If you specify an option list, you can only select options from this list in the field "Selected Value" in the Dimension Lines sub-tab. This way, you can set up a number of options describing the reason for each change in the derived dimensions. If you leave the field blank, you can enter any value in the field "Selected Value."

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

### Dimension Lines Sub-Tab

This section includes the fields and descriptions for the Dimension Lines sub-tab.

Field	Description
<b>From Date</b>	<p>In this field, you can specify the starting date of the period in which the dimension values on the line should be derived from the current job, employee, and so on. When you specify a starting date, the ending date on the line covering the period before the specified starting date is changed to the day before the specified date. Furthermore, if you enter a date which lies within the period covered by another line, the current line will be assigned the ending date of the line whose period the current line overlaps.</p> <p>When the Dimension Lines sub-tab contains more than one line, the line with the latest starting date will always have an open ending date, and the original line that is automatically created when the employee was created always keeps the starting date blank. This ensures that there is always a valid set of dimension values to derive. The contents of the line with the open ending date are reflected in the Derived Dimensions island in the information card of the job, employee, and so on in question, and changes made in the information card will cause the line to be updated accordingly.</p> <p>If you delete a line, the period of the line above the deleted line is prolonged, as it is assigned the ending date of the deleted line.</p> <p>When registering hours in a time sheet, the dimensions derived for the lines in the table part are derived from the dimension derivation line covering the starting date of the time sheet. However, if the allocation method specified in the System Information workspace in the Set-Up module is "One Entry per Week," the dimensions derived for the entry covering the whole week will be those that apply to the entry date specified for the week in question in the week calendar assigned to the employee.</p>

Field	Description
<b>To Date</b>	This field shows the ending date of the period in which the dimension values on the line should be derived from the current job, employee, and so on. Maconomy automatically assigns an ending date to each line, causing the period of each line to end on the day before the starting date of the next period defined on a line in the Dimension Lines sub-tab. However, the line with the latest starting date will always have a blank ending date. For a detailed description of the functionality of the field, see the field "From Date" above.
<b>Description</b>	In this field, you can enter a description pertaining to the current dimension derivation line.
<b>Selected Value</b>	In this field, you can specify a value from the option list specified in the Derived Dimensions tab, for example, as a description of the reason for the change in derived dimensions. If no option list has been specified in the Derived Dimensions tab, you can enter any value in this field.
<b>Dimension Comb. No.</b>	In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the Dimension Combinations workspace.  If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the job, employee or dimension value selected in the Derived Dimensions tab. However, any dimension derivation values specified on this line will be used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the line.
<b>Dim. Comb. Description</b>	This field shows the description of the current dimension combination.
<b>Company No.</b>	This field shows the number of the company derived from the job, employee, or dimension value selected in the Derived Dimensions tab. The information is retrieved from the information card of the job, employee, and so on, and cannot be changed here, as it is not possible to specify date dependent derivation of company numbers. Therefore, the field is for information only.
<b>Company Name</b>	This field shows the name of the company specified in the field "Company No."
<b>Overwrite Company</b>	In this field, you can specify if any value specified in the field "Company No." on the current line should overwrite existing account values on entries when the account number is derived from the current dimension derivation line. The value in this field only has effect if a company has been specified on the current line. If you mark this field, but do not specify a company, the overwrite mark is ignored, as the company and the overwrite mark are always retrieved together from the same dimension derivation line, dimension combination, or dimension combination line.  For more information about the meaning of overwriting in connection with derived dimensions, please see the description of the field "Account No."

Field	Description
	below. Furthermore, please see the section about dimension derivation in "Introduction to the G/L Module" and the description of the Dimension Derivations workspace.
<b>Account No.</b>	<p>In this field, you can specify a value for the Account dimension if you want this value to be derived from the job, employee, or dimension value selected in the Derived Dimensions tab. If you also want this value to overwrite any manually entered values for the dimension, you can indicate this by marking the field "Overwrite Account." If you do not select to overwrite, the dimension value will only be derived if the dimension field to which the derivation is performed is not manually completed or completed by use of a registration code.</p> <p>Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used rather than the value (if any) found for this dimension in the dimension combination in question. This means that the dimension combination only applies to this dimension if you have not entered a value in this field.</p> <p>Please note that if a dimension combination has been specified in the field "Dim. Comb. No.," a mark in the field "Overwrite Account" will only have effect if you have also entered a dimension value. If you mark the field "Overwrite Account," but you do not enter a dimension value in this field, the "Overwrite Account" field is ignored, as dimension values and overwriting specification are always retrieved together from the same dimension derivation line, dimension combination or dimension combination line.</p> <p>For further information about derived dimensions, please see "Introduction to the G/L Module" and the description of the fields and functions in the Dimension Derivations and Dimension Combinations workspaces.</p>
<b>Account Name</b>	This field shows the name of the account specified in the field "Account No."
<b>Overwrite Account</b>	<p>In this field, you can specify whether any value specified in the field "Account No." on the current line should overwrite existing account values on entries when the account number is derived from the current dimension derivation line. The value in this field only has effect if an account has been specified on the current line. If you mark this field, but do not specify an account, the overwrite mark is ignored, as the account and the overwrite mark are always retrieved together from the same dimension derivation line, dimension combination, or dimension combination line.</p> <p>For more information about the meaning of overwriting in connection with derived dimensions, please see the description of the field "Account No." above. Furthermore, please see the section about dimension derivation in "Introduction to the G/L Module" and the description of the Dimension Derivations workspace.</p>

## Dimension Combinations Workspace

Use this workspace to create dimension combinations to be used in various contexts in Maconomy.

A dimension combination is a collection of dimension values that have a common name. For each dimension, you can apply company-specific values. In this way, the value that you specify for a given dimension in a given dimension combination depends on the company that makes the entry in question.

In the Dimension Combinations tab, you enter a name for the dimension combination. Then, for each dimension, you can enter a dimension value to be applied when the dimension combination is used.

If you want the dimension combination to derive a different value, depending on which company makes the actual entry, you can use the Dimension Combination Lines sub-tab. On each line, enter a range of company numbers and a value for one or more dimensions. The values that you enter are used instead of the values that you specified in the Dimension Combinations tab when a company within the specified range enters information in a situation where the current dimension combination is used. If the company that makes the entry is not included in the specified range of companies, Maconomy uses the information in the Dimension Combinations tab.

The following information explains the general function of dimension combinations first. This explanation is based on the functionality of the Dimension Combinations tab. Following that explanation, the usage of the Dimension Combination Lines sub-tab is described, including the setup of dimension combinations for specific posting needs.

Dimension combinations are used in the following contexts:

- As templates for Derived Dimensions islands
- As posting references

You define the use of each dimension combination in the **Type** field.

### Dimension Combinations as Templates for Derived Dimensions Islands

Dimension combinations that you use as templates for the Derived Dimensions islands are convenient if you often include the same derived dimension values on, for example, activities, jobs, customers, accounts, and so on. The following explanation uses activities as an example, but the functionality is identical for every information card on which you can enter derived dimensions.

When you use the same derived dimension values on every activity, you can choose to enter the dimension values manually on every activity. However, if you later want to change one or more

dimension values on all activities, you would need to update the information card for every single activity. A more convenient approach is to enter a certain dimension combination in the information card of every activity. A dimension combination contains the dimension values that you normally use for a specific activity. If you need to update the dimension values, you only need to change the value in the dimension combination. That change is then populated in all information cards that refer to the dimension combination in question.

Another advantage of using dimension combinations is that when you create an activity, you do not need to enter all of the dimension values, just the name of the dimension combination.

When you define a dimension combination, Maconomy performs the dimension derivation from the activity as if you had manually entered in the Derived Dimensions island the values that you defined in the dimension combination.

You can enter both a dimension combination and values for one or more dimensions in the Derived Dimension island for the same activity. Maconomy uses the values for the dimensions that you enter on the activity over those that you enter for the same dimensions in the dimension combination. Maconomy derives the remaining dimension values from the dimension combination. Values that you enter in the Derived Dimensions island for an individual activity can thus be regarded as exceptions to the values that you enter in the assigned dimension combination.

The following example shows the values that are used as derived dimensions for an activity to which both a dimension combination and dimension values for some dimensions have been assigned. For the sake of clarity, only a selection of the Maconomy dimensions is displayed in the following example.

In the example, it is assumed that activity 101 is assigned to dimension combination A, and that the Dimension Derivations workspace defines a derivation priority for activities. The dimension combination and the dimensions that are derived from the activity are set up as follows:

<b>Dimension</b>	<b>Value in Dimension Combination A</b>	<b>Value in the Island Derived Dimensions, Activity 101</b>
Location	NY	
Entity	BOS	CHI
Project		MB
Purpose		

In this table, Maconomy uses the value NY in the Location dimension on the dimension combination because no activity-specific value has been entered for this dimension. For the Entity dimension, however, a value has been entered on both the dimension combination and the activity. Because the activity-specific dimension value has first priority, Maconomy uses the value CHI. Also, Maconomy uses the value MB for the Project dimension because this value was entered on the activity. Even if another value was entered for this dimension in the dimension combination, Maconomy would use the value MB, just as it used the value CHI for the Entity dimension.

No value has been entered for the Purpose dimension, either in the dimension combination or on the activity. When entries are made on the current activity, Maconomy attempts to derive a value for this dimension from somewhere else, using the priorities that you set up in the Dimension Derivations workspace. In other words, the setup described previously corresponds to the following setup in the Derived Dimensions island for activity 101:

Dimension	Derivation Values used for Activity 101
Location	NY
Entity	CHI
Project	MB
Purpose	

Note that Maconomy always retrieves the **Overwrite** field for a given dimension from the same location as the dimension value. This means that if Maconomy retrieves the dimension value from the tab of a dimension combination, Maconomy also retrieves the value of the **Overwrite** field from the tab of the dimension combination, regardless of whether you selected the **Overwrite Entity** check box in the information card to which the dimension combination is assigned.

When you assign a dimension combination to an activity, Maconomy does not transfer the values from the dimension combination to the fields in the Derived Dimensions island.

### Dimension Combinations as Posting References

You create a posting reference in the Dimension Combinations single dialog workspace when you enter the account number to which Maconomy should post automatic G/L entries that it creates. For instance, Maconomy must know the G/L account on which to enter work in progress (WIP) when posting a job journal. In the same way, Maconomy must know on which G/L account it should post COGS when posting an item journal, which, for example, was created because of an item delivery.

In Maconomy, you can define posting references in several places. In the Posting References workspace, you enter a number of department-dependent posting references, for example, identifying where to post WIP, subscription prepayments, and so on.

To define a posting reference, enter a dimension combination of the type "Posting Reference" and specify an account number for this dimension combination. The account number is for the account where you want to post when you use this specific posting reference. When you create an account in the Account Information Card workspace or change it into a control account, Maconomy automatically creates a dimension combination that has the same number and description as the account. Thus you only need to manually create posting reference dimension combinations for manual accounts.

You enter specify values for other dimensions than Account on dimension combinations of the type "Posting Reference." This is, for example, useful if you always want a certain dimension to have a certain value when posting-for example, COGS-or if you use local charts of accounts as described in "Setting Up Dimension Combinations for Company-Specific Charts of Accounts."

On dimension combinations of the type "Posting Reference," you must select the **Overwrite** check box for all dimensions for which a value is provided. This ensures that the specified dimension values are always applied when you use the posting reference in question.

### Dimension Combination Lines Sub-Tab: Setting Up Dimension Combinations to Support Company-Specific Dimension Values

On every line of the Dimension Combination Lines sub-tab, you can enter a range of company numbers. In addition, you can enter a value for each dimension and specify whether the value should overwrite any existing dimension value.

The lines in the Dimension Combination Lines sub-tab represent exceptions to the dimension values in the Dimension Combinations tab. If you create an entry on, for example, an activity, the combination of the company that you specified on the entry and the activity itself determines which values Maconomy retrieves from the dimension combination. When Maconomy derives values from a certain information card, it follows these steps to determine which dimension values to derive:

1. If a value exists for the dimension in the Derived Dimensions island on the activity, Maconomy uses that value along with its **Overwrite** value.
2. If there is no value for the dimension in the Derived Dimensions island, Maconomy uses the value that you entered for the dimension in the topmost line that identifies the company for which the entry is made, along with its **Overwrite** value.
3. If Maconomy does not find a dimension value in step 2, either, it uses the value that you entered in the Dimension Combinations tab, along with its **Overwrite** value.
4. If Maconomy does not find a dimension value in the Dimension Combinations tab, it does not derive a value for the current dimension from the derivation priority in question.

In the same way as described for the Dimension Combinations tab, Maconomy always retrieves the **Overwrite** field value for a given dimension from the same location as the dimension value. This means that if Maconomy retrieves the dimension value from the Dimension Combination Lines sub-tab of a dimension combination, Maconomy also retrieves the value of the **Overwrite** field from the that sub-tab, regardless of whether you selected that field on the information card to which the dimension combination is assigned.

### Example: Dimension Combination with Company-Specific Values

In this example, the following dimension combination is used as a starting point:

Dimension Combination DC1						
Location	NY					
Entity						
Project	Promo					
Spec. 1	HQ					
Local Spec. 1						
Company No. From	Company No. To	Location	Entity	Project	Spec. 1	Local Spec. 1
A	C	BOS		Leads		A4415

This dimension combination is assigned to activity ACT1, for which the Derived Dimensions island contains the following values:

Dimension	Value
-----------	-------

Location	
Entity	Campaign
Project	Sales
Spec. 1	
Local Spec. 1	

Because a line was created in the Dimension Combination Lines sub-tab, the company that is making the entry is vital for determining the dimension derivation from activity ACT1. The dimension derivation yields different results depending on whether the company number is within the range of A-C. The following describes the values that are used in the dimension derivation for companies that are within the range and companies outside the range, respectively.

### Companies within the Range A-C

In this example, assume that company A makes an entry. The Location dimension is blank on the activity. Therefore, Maconomy looks in the line in the sub-tab that identifies company A. Here, Maconomy finds the value BOS and applies it, even though the Dimension Combinations tab specifies another location value.

Because the values that you enter in the Derived Dimensions island on the activity are always top priority, the Campaign entity and the Sales project are prioritized, even if other values exist in the Dimension Combinations tab and/or the Dimension Combination Lines sub-tab.

The dimension Spec. 1 is blank on the activity card. As in the case of the location value, Maconomy looks for a Spec. 1 value in the line in the sub-tab that identifies company A. Because no value is specified for Spec. 1 here, Maconomy uses the value that you entered in the Dimension Combinations tab.

Finally, Maconomy finds a value for Local Spec. 1 in the same way as it found the value for the Location dimension.

To sum up, for companies that are within the range of A-C, the preceding setup corresponds to having set up the Dimension Derivations island on the activity card as follows:

Dimension	Value
Location	BOS
Entity	Campaign
Project	Sales
Spec. 1	HQ
Local Spec. 1	A4415

### Companies Outside the Range A-C

When a company that has a number that is outside the range of A-C enters information on activity ACT1, the following dimension values are used:

The Location dimension is blank on the activity, and no lines in the Dimension Combination Lines sub-tab identify companies outside the range of A-C. Therefore, Maconomy uses the value in the Dimension Combinations tab. Here, Maconomy finds the value NY.

Because the values that you entered in the Derived Dimensions island on the activity are always top priority, Maconomy always uses the Campaign entity and the Sales project, even if other values exist in the Dimension Combinations tab.

Spec. 1 is found in the same way as Location.

Local Spec. 1 is blank on the activity card and in the Dimension Combinations tab. Therefore, Maconomy does not derive a local specification 1 value for this activity when companies outside the A-C range enter information.

To sum up, for companies outside the range of A-C, the preceding setup corresponds to having set up the Dimension Derivations island on the activity card as follows:

Dimension	Value
Location	NY
Entity	Campaign
Project	Sales
Spec. 1	HQ
Local Spec. 1	

### Dimension Combinations on Dimension Information Cards

When you enter a dimension combination on a dimension information card (that is, the Locations, Entities, Projects, Purposes, Spec. 1-3, and Local Spec. 1-3 workspaces), Maconomy ignores any values that you entered in the dimension combination for the dimension in question. This means that if you specify a dimension combination, for example, for the value NY in the Locations workspace, Maconomy does not use any values that you entered for the Location dimension in the tab and sub-tab of that dimension combination when it performs a dimension derivation from the location NY.

### Derivation of Company-Specific Dimension Values

Dimension combinations enable you to set up company-specific rules for the derivation of dimension values. This is especially useful if some companies in the multi-company model use local charts of accounts, for example, because local legal or reporting requirements. This section describes some examples of such situations. The later section "Setting Up Dimension Combinations for Company-Specific Charts of Accounts" describes the process of setting up Maconomy to support the examples shown in this section.

A situation such as this can occur if costs that are related to certain activities are posting on one account in the global chart of accounts (the Account dimension), but a certain company needs to post the activity costs on separate accounts, and the company has therefore created a local chart of accounts in the Local Specification 1 dimension.

This situation is illustrated in the following example:

Activity	Global Account	Local Spec. 1 in Company A	Local Spec. 1 in Company B
101 Training, unspecified	G3310	A4410	B6500
102 Training, internal	G3310	A4415	B6510

103 Training, external	G3310	A4420	B6520
------------------------	-------	-------	-------

In this case, costs on all three activities entered by company A are posted on account G3310 in the global chart of accounts, whereas the value in Local Specification 1 depends on whether the posting is made on activity 101, 102, or 103. When company B enters costs on the same activities, the amounts are still to be posted on account G3310 in the global chart of accounts, whereas entirely different values are to be used for Local Specification 1.

Company A and B are thus able to create separate reports on unspecified, internal, and external training, whereas only one account for training exists in the global accounts.

Another example could be a company that uses a chart of accounts that is structured differently than the global chart of accounts. As in the preceding example, it could be that the global chart of accounts has only one account for Training activities, but that account may be placed differently in the local chart of accounts for a particular company, for example, because of different legal requirements in the country in which the company is based.

Activity	Global Account	Local Spec. 1 in Company C
101 Training, unspecified	G3310	C4410
102 Training, internal	G3310	C4410
103 Training, external	G3310	C4410

In this case, when company C enters costs on the three activities, Maconomy posts the cost on account G3310 in the global chart of accounts, and on the value C4410 in the Local Specification 1 dimension, no matter which activity the entry is made on.

### Setting Up Dimension Combinations for Company-Specific Charts of Accounts

This section describes some examples of how you can set up dimension combinations to support company-dependent charts of accounts. The examples are based on the needs described in "Derivation of Company-Specific Dimension Values."

You create company-dependent charts of accounts in the Local Specification 1-3 workspaces, where you can create different lists of dimension values. You can then assign these lists to the individual companies, and each company can only use the local specification values in the list that you assigned to that company.

Assume that you want to set up a chart of accounts that supports the need described in the first example in "Derivation of Company-Specific Dimension Values." In that example, there was a requirement that costs on activities 101, 102, and 103 all be posted on the global account G3310 because there was no need to specify the nature of the training. Companies A and B, however, wanted to split the costs for these three activities into three specific accounts, to represent unspecified, internal, and external courses.

For this purpose, you create two lists in Local Specification 1 that contain the local chart of accounts for companies A and B, respectively. The charts of accounts contain, among other values, the values to be used for entering training costs. You assign the two lists to the two companies in the Company Information workspace.

Then, you create three dimension combinations, one for each activity.

You assign the first dimension combination to activity 101. Here, you enter G3310 in the **Account No.** field in the Dimension Combinations tab. In the Dimension Combination Lines sub-tab, you create a line for a range of companies A to A (that is, company A only). On this line, you enter the

value A4410 in the **Local Spec. 1** field. Finally, you create a line for a range of companies B to B. On this line, you enter the value B6500 in the **Local Spec. 1** field. After you create the lines, you can assign the dimension combination to activity 101 in the sub-tab of the Activities workspace as a posting reference. Because you did not enter any account numbers on either of the two dimension combination lines, Maconomy always uses the account number from the Dimension Combinations tab, regardless of which company is making the entry on activity 101. However, other than the account number, Maconomy uses local specification A4410 when company A enters costs on this activity, and local specification B6500 when company B enters costs on the activity. Maconomy does not transfer any local specific dimension values from the dimension combination when other companies enter costs on activity 101. Instead, Maconomy uses the local specifications that you provided on the entry.

You create the dimension combinations for the other two activities in the same way and assign them to the activities. These other two dimension combinations still use account G3310 in the Dimension Combinations tab, but the local specification 1 values in the Dimension Combination Lines sub-tab are A4415 and B6510, respectively, on the dimension combination that you assigned to activity 102, and A4420 and B6520, respectively, on the dimension combination that you assigned to activity 103.

In the second example in "Derivation of Company-Specific Dimension Values," you want all training costs to be posted on account G3310. Company C, however, needs to enter those costs on account C4410, no matter which of the three activities is used.

For this purpose, you create a list in **Local Specification 1** that contains the local chart of accounts for company C. The chart of accounts contains, among other values, the value C4410. You assign the list to company C in the Company Information workspace.

In the Dimension Combinations workspace, you then create a dimension combination by entering the account number G3310 in the Dimension Combinations tab. In the Dimension Combination Lines sub-tab, you create one line that has a company number range from C to C. On this line, you specify the value C4410 for the Local Spec. 1 dimension. Then, you assign this dimension combination to all three activities.

With this setup you can ensure that when company C enters costs on any of the three activities in question, Maconomy uses the account G3310 and the Local Specification 1 value C4410. When other companies enter costs on the activity, Maconomy uses the account G3310 as well, but it does not derive any local specification 1 values from the dimension combination. Instead, Maconomy uses the local specifications that are provided on the entry.

When you use local charts of accounts, you should create a full local chart of accounts in the local dimension in question, no matter whether the local chart of accounts only differs from the global chart of accounts on a few counts. In this way, you can be certain that you will be able to present the full accounts of that company without having to piece them together from two different dimensions, which may prove difficult. Consequently, for every company that uses a local chart of accounts, you should create company-specific lines in all dimension combinations so that all amounts are posted on both the global and the applicable local accounts.

## Dimension Combinations Tab

This section includes the fields and descriptions for the Dimension Combinations tab.

### Dimension Combination Island

Field	Description
<b>Dimension Comb. No.</b>	In this field, you specify the number of the dimension combination when creating a dimension combination. If the dimension combination is created on the basis of a control account, it has automatically been assigned the number of the account in question.
<b>Type</b>	<p>In this field, you can specify the usage of the dimension combination. The type determines the context in which the dimension combination can be applied. You can choose between the following types, whose functionality is described in the introduction to this window:</p> <ul style="list-style-type: none"> <li>■ <b>Posting Reference</b> — The dimension combination is used by making a reference to it in posting reference fields, for example, in the Posting References, Activities, Warehouse Information Card workspaces, and so on. Dimension combinations created automatically on the basis of control accounts are always of this type.</li> <li>■ <b>Dimension Derivation</b> — The dimension combination is used as a template for completing the Derived Dimensions island in a number of different information cards in which you can derive dimensions.</li> </ul>
<b>Description</b>	In this field, you specify a description of the current dimension combination. If the dimension combination is created on the basis of a control account, the description of the account in question has automatically been transferred to the dimension combination.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can specify the name and description for an access level for the current dimension combination. You only have access to the current dimension combination if you have been assigned to this or a higher access level in the User Access Levels workspace in the SetUp module. This means that you can only refer to dimension combinations to which you have access, for instance on a job. Furthermore, in this workspace, a user can only see the dimension combinations to which he or she has access. Please note that this access control only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to dimension combinations may depend on other factors. For further information about the standard access control configuration, please see "Introduction to the Access Control System" in the Set-Up module.</p> <p>If you do not specify an access level, all users will have access to the current dimension combination.</p>

## User Island

See the chapter “Getting Started” for a description of the fields in the User island.

## Derived Company and Account Island

Field	Description
<b>Company No.</b>	<p>In this field, you can specify a dimension value for the Company dimension, if you want this value to be derived whenever the current dimension combination is used. If you also want the specified value to overwrite existing dimension values when it is derived, mark the field “Overwrite.” If you do not select “Overwrite,” the dimension value will only be derived if the dimension field into which the value is derived is neither completed manually nor through a registration code.</p> <p>A value in this field is only used if the dimension combination type is “Dimension Derivation.” Furthermore, the value will only be used if the dimension combination is referenced on information cards on which it is possible to refer to a company number in the Derived Dimensions island, but no derivation value for the Company dimension is entered.</p> <p>Please note that a mark in the field “Overwrite” will only have effect if a company is also specified. If you only mark the field “Overwrite,” but do not specify a company, the overwrite mark is ignored, as the company and the overwrite mark are always retrieved together from the same dimension derivation island or dimension combination.</p> <p>For more information about derived dimensions, please see “Introduction to the G/L Module” and the description of the Dimension Derivations workspace. You can find more information about the priority of the values in the card part of the dimension combination in relation to company specific values and values on the individual information cards in the introduction to this workspace.</p>
<b>Account No.</b>	<p>In this field, you can specify a dimension value for the Account dimension, if you want this value to be derived whenever the current dimension combination is used. If you also want the specified value to overwrite existing dimension values when it is derived, mark the field “Overwrite.” If you do not select “Overwrite,” the dimension value will only be derived if the dimension field into which the value is derived is neither completed manually nor through a registration code. You must always specify an account number and mark the field “Overwrite” if the dimension combination type is “Posting Reference.”</p> <p>A value in this field will not be used, however, if lines have been created in the Dimension Combination Lines sub-tab, and the top line of those lines that match the number of the company which makes the entry contains a value for the Account dimension. If the dimension combination type is “Dimension Derivation,” the value will only be used in instances where the dimension combination is referenced on information cards on which it is possible to refer to an account number in the Derived Dimensions island, but no derivation value for the Account dimension is entered.</p> <p>Please note that a mark in the field “Overwrite” will only have effect if an account is also specified. If you only mark the field “Overwrite,” but do not specify an account, the overwrite mark is ignored, as the account and the overwrite mark are</p>

Field	Description
	<p>always retrieved together from the same dimension derivation island, dimension combination, or dimension combination line.</p> <p>For more information about derived dimensions, please see "Introduction to the G/L Module" and the description of the Dimension Derivations workspace. You can find more information about the priority of the values in the card part of the dimension combination in relation to company specific values and values on the individual information cards in the introduction to this workspace.</p>

### Derived Dimensions Island

Field	Description
<b>Location</b>	<p>In this field, you can specify a dimension value for the Location dimension, if you want this value to be derived whenever the current dimension combination is used. If you also want the specified value to overwrite existing dimension values when it is derived, mark the field "Overwrite." If you do not select "Overwrite," the dimension value will only be derived if the dimension field into which the value is derived is neither completed manually nor through a registration code. If the dimension combination type is "Posting Reference," the field "Overwrite" must be marked if you specify a location.</p> <p>A value in this field will not be used, however, if lines have been created in the Dimension Combination Lines sub-tab, and the topmost line of those lines that match the number of the company which makes the entry contains a value for the Location dimension. If the dimension combination type is "Dimension Derivation," the value will only be used in instances where the dimension combination is referenced on information cards on which it is possible to refer to a location in the Derived Dimensions island, but no derivation value for the Location dimension is entered.</p> <p>A value in this field will not be used if the dimension combination has been assigned to a location information card in the Locations workspace. This means that if the dimension combination, for example, has been specified for the location NY in the Locations workspace, a value in this field will not be applied when dimensions are derived from the location NY.</p> <p>Please note that a mark in the field "Overwrite" will only have effect if a location is also specified. If you only mark the field "Overwrite," but do not specify a location, the overwrite mark is ignored, as the location and the overwrite mark are always retrieved together from the same dimension derivation island, dimension combination, or dimension combination line.</p> <p>For more information about derived dimensions, please see "Introduction to the G/L Module" and the description of the Dimension Derivations workspace. You can find more information about the priority of the values in the card part of the dimension combination in relation to company specific values and values on the individual information cards in the introduction to this workspace.</p>
<b>Entity</b>	The functionality of this field is similar to that of the field "Location."

Field	Description
<b>Project</b>	The functionality of this field is similar to that of the field "Location."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location."
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location." Furthermore, when you enter a value in this field, Maconomy checks whether the current dimension combination is in use on any information cards (customers, vendors, employees, and so on) assigned to a specific company. If it is, Maconomy checks if the local spec. value entered in this field is also available in the local spec. list assigned to the companies in question.

### Dimension Combination Lines Sub-Tab

This section includes the fields and descriptions for the Dimension Combination Lines sub-tab.

Field	Description
<b>Line Description</b>	In this field, you can enter a description of the current dimension combination line.
<b>From Company No.</b>	<p>Together with the field "To Company No.," this field constitutes a range of company numbers. When the current dimension combination is used as a result of an entry being made, Maconomy will check if the dimension combination contains a line with a company number range which matches the company to which the entry pertains. If this is the case, Maconomy will apply the dimension specifications entered on the dimension combination line instead of the specifications from the card part of the window. This way, it is possible to create lines with company-specific exceptions to the values in the card part. If more than one line match the company to which the entry pertains, the topmost of those table lines is applied. If no lines match the company to which the entry pertains, or if no lines have been created at all, Maconomy will only use the information in the card part.</p> <p>For more information about how Maconomy assigns priorities to the use of values from dimension derivation islands, dimension combinations, and dimension combination lines, please see the introduction to this workspace and the description of the field "Account No." in the Dimension Combinations tab and the Dimension Combination Lines sub-tab.</p>
<b>To Company No.</b>	The functionality of this field is described in the field "From Company No." above.
<b>Company Name</b>	If the same company number is specified in the fields "From Company No." and "To Company No.," this field shows the name of the company in question. Otherwise, this field is blank.

Field	Description
<b>Local Spec. 1-10 List</b>	In these fields you can specify a Local Spec.1-3 list. When an entry is made in a company where the Local Spec. 1-10 list assigned to the company matches the Local Spec. 1-10 list on the line, the dimension values on the line will be applied to the entry.
<b>Account No.</b>	<p>In this field, you can specify a dimension value for the Account dimension, if you want this value to be derived whenever the current dimension combination is used. If you also want the specified value to overwrite existing dimension values when it is derived, mark the field "Overwrite Account." If you do not select "Overwrite Account," the dimension value will only be derived if the dimension field into which the value is derived is neither completed manually nor through a registration code. If the dimension combination type is "Posting Reference," you must always mark the field "Overwrite Account" when you specify an account number.</p> <p>When an entry is made, on which the current dimension combination is to be applied, the value in this field will only be used if the current line is the top line of those lines that match the number of the company to which the entry pertains. The company number range is specified in the fields "Company No. From" and "Company No. To." If the dimension combination type is "Dimension Derivation," the value will only be used when deriving from information cards which refer to the dimension combination, and where no derivation value for the Account dimension has been entered.</p> <p>A value in this field will not be used if the dimension combination has been assigned to an account information card in the Account Information Card workspace. This means that if the dimension combination, for example, has been selected for the account no. 1110 in the Account Information Card workspace, a value in this field will not be applied when dimensions are derived from account number 1110.</p> <p>Please note that a mark in the field "Overwrite Account" will only have effect if an account is also specified. If you only mark the field "Overwrite Account," but do not specify an account, the overwrite mark is ignored, as the account and the overwrite mark are always retrieved together from the same dimension derivation island, dimension combination, or dimension combination line.</p> <p>For more information about derived dimensions, please see "Introduction to the G/L Module" and the description of the Dimension Derivations workspace. You can find more information about the priority of the values in the Dimension Combinations tab in relation to company-specific values and values on the individual information cards in the introduction to this workspace.</p>
<b>Account Name</b>	This field shows the name of the account specified in the field "Account No."
<b>Overwrite Account</b>	In this field, you can specify if any value specified in the field "Account No." on the current line should overwrite existing account values on entries when the account number is derived from the current dimension combination line. The value in this field only has effect if an account has

Field	Description
	<p>been specified on the current line. If you mark the field, but do not specify an account, the overwrite mark is ignored, as the account and the overwrite mark are always retrieved together from the same dimension derivation island, dimension combination, or dimension combination line.</p> <p>For more information about the meaning of overwriting in connection with derived dimensions, please see the description of the field "Account No." above. Furthermore, please see the section about dimension derivation in "Introduction to the G/L Module" and the description of the Dimension Derivations workspace. You can find more information about the priority of the values in the Dimension Combinations tab in relation to company-specific values and values on the individual information cards in the introduction to this workspace window.</p>
<b>Location</b>	The functionality of this field is similar to that of the field "Account No."
<b>Location, Description</b>	This field shows a description of the location specified in the field "Location."
<b>Overwrite Location</b>	The functionality of this field is similar to that of the field "Overwrite Account."
<b>Entity</b>	The functionality of this field is similar to that of the field "Account No."
<b>Entity, Description</b>	This field shows a description of the entity specified in the field "Entity."
<b>Overwrite Entity</b>	The functionality of this field is similar to that of the field "Overwrite Account."
<b>Project</b>	The functionality of this field is similar to that of the field "Account No."
<b>Project, Description</b>	This field shows a description of the project specified in the field "Project."
<b>Overwrite Project</b>	The functionality of this field is similar to that of the field "Overwrite Account."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Account No."
<b>Purpose, Description</b>	This field shows a description of the purpose specified in the field "Purpose."

Field	Description
<b>Overwrite Purpose</b>	The functionality of this field is similar to that of the field "Overwrite Account."
<b>Spec. 1-10</b>	The functionality of these fields is similar to that of the field "Account No." Furthermore, when you enter a value in this field, Maconomy checks whether the current dimension combination is in use on any information cards (customers, vendors, employees, and so on.) assigned to a specific company. If it is, Maconomy checks whether the local spec. value entered in this field is also available in the local spec. list assigned to the companies in question.
<b>Spec. 1-10, Description</b>	These fields show the descriptions of the specification values specified in the fields "Spec. 1-10."
<b>Overwrite Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Overwrite Account."
<b>Local Spec. 1-10</b>	The functionality of these fields is similar to that of the field "Account No."
<b>Local Spec. 1-10, Description</b>	If the same company number is specified in the fields "From Company No." and "To Company No.," these fields show a description of the local specification values entered in the fields "Local Spec. 1-10." Otherwise, this field is blank.
<b>Overwrite Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Overwrite Account."

## Actions

This section shows the actions available in the Dimension Combinations workspace.

### Top Pane

Field	Description
<b>Copy Dimension Combination</b>	<p>When you select this action, Maconomy will create a dimension combination as a copy of the current dimension combination. The copy is assigned the number specified in the field "New Dimension Comb. No.," but all other information, including table lines, is copied from the original dimension combination to the new dimension combination.</p> <p>This action can only be selected when you have entered a number in the field "New Dimension Comb. No." and pressed Return.</p>

## Show Dimension Combination Usage Workspace

Use this workspace to view where each dimension combination is used.

For instance, you can see which jobs specify dimension combinations in the Dimension Derivations island. Use the Jobs workspace to enter the name of a specific dimension combination.

In the Show Dimension Combination Usage tab, you can browse through all of the dimension combinations in Maconomy. For every dimension combination, the Dimension Combination Usages sub-tab displays the places where the current dimension combination is specified. The information in the Show Dimension Combination Usage tab derives from the Dimension Combinations workspace. You cannot change any information in the Show Dimension Combination Usage tab or the Dimension Combination Usages sub-tab in this workspace.

### Show Dimension Combination Usage Tab

This section includes the fields and descriptions for the Show Dimension Combination Usage tab.

#### Dimension Combination Island

Field	Description
<b>Dimension Comb. No.</b>	This field shows the number of the current dimension combination. The Dimension Combination Usages sub-tab shows the places in which a reference has been made to this dimension combination.
<b>Type</b>	This field shows the type of the current dimension combination.
<b>Description</b>	This field shows the description of the current dimension combination.

#### Access Level Island

Field	Description
<b>Access Level</b>	This field shows the name and description of any access level assigned to the current dimension combination.

#### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

### Dimension Combination Usages Sub-Tab

This section includes the fields and descriptions for the Dimension Combination Usages sub-tab.

Field	Description
<b>Used In</b>	This field shows the type of information to which the current reference pertains. The field may, for example, show whether the dimension combination is

Field	Description
	referenced from an asset group, an activity, a job, and so on. If the dimension combination is referenced in a workspace in which you can specify posting references per department in the table part, the field "Department" shows the name of department for which the dimension combination is specified.
<b>Key 1</b>	<p>This field shows the value of the first key field for the type of information for which the dimension combination has been specified. A key value is a unique identification of a certain job, activity, dimension value, and so on. Two items of the same information type cannot have the same key value.</p> <p>The field that contains the key value is called the key and varies from information type to information type. For instance, the key on activities is the activity number, and the key to entities is the entity number.</p> <p>In certain cases, a key consists of two key values, key 1 and 2. In these cases, the combination of the two key values constitutes the key of that information type. An example of this is task list lines, where the first key value points to the task list to which the task line belongs, and the second key value is the line number. So it is possible for several pieces of information to have the same value in key 1 or key 2, but there can be no more than one piece of information with the same combination of values in key 1 and 2.</p>
<b>Key 2</b>	This field shows the value of the second key field for the type of information for which the dimension combination has been specified. For more information about key fields and values, please see the description of the field "Key 1" above.
<b>Department</b>	If the current line pertains to a reference to the current dimension combination in a workspace in which you can enter posting references for every department in the table part (for example, the Activities workspace), this field shows the department for which the dimension combination has been specified.

## Dimension Derivation Selection Workspace

Use this workspace to specify which dimension priorities Maconomy should use in different scenarios.

You can select the Default Dimension Derivation principle in the main tab, and the exceptions in the sub-tab. The exceptions can depend on company, period, and transaction type group.

### Dimension Derivation Header Tab

This section includes the fields and descriptions for the Dimension Derivation Header tab.

#### Default Island

Field	Description
<b>Default Dimension Derivation Name</b>	This field shows the default dimension derivation name. Maconomy uses this default dimension derivation if it cannot find a line in the table part of this window that matches the registration.

## User Role Island

See the chapter “Getting Started” for a description of the fields in the User Role island.

## Dimension Derivation Line Sub-Tab

This section includes the fields and descriptions for the Dimension Derivation Line sub-tab.

Field	Description
<b>Dimension Derivation Name</b>	In this field, you can enter the name of a dimension derivation principle. Maconomy will use the setting from this principle if the registration matches the target group specified in the following fields.
<b>Company No.</b>	In this field, you enter a company number for which you want this dimension derivation to be invoked.
<b>Period From</b>	In this field you enter a date. In combination with the field “Period To,” this field forms a range of this field forms an range of dates.
<b>Period To</b>	The functionality of this field corresponds to the “Period From” field above.
<b>Transaction Type Group No.</b>	In this field you enter the transaction type group for which you want this dimension derivation to be invoked. You cannot delete a transaction type group if it is used in a dimension derivation selection line.
<b>Created by</b>	This field shows the name of the user who created the dimension derivation selection. The name cannot be changed.
<b>Created on</b>	This is the date when the dimension derivation selection was created. It cannot be changed.
<b>Changed by</b>	This field shows the name of the user who changed the dimension derivation selection.
<b>Changed on</b>	This is the date when the dimension derivation selection was last changed.
<b>Version</b>	This field shows the dimension derivation selection’s version number. This is not the same as a revision number. The version number is updated every time that a user makes a change to the dimension derivation selection.

## Dimension Derivations Workspace

Use this workspace to create and maintain the priorities that apply to derived dimensions.

For a value to derive dimension values in other dimensions, you must define which values are derived in the information card of the particular dimension. For example, you can only derive dimension values from the Entity dimension if you assign a priority to the Entity dimension in this workspace.

Maconomy uses the sequence of priorities that you entered in the Dimension Derivation tab when there are several ways to derive a dimension. Maconomy does not derive any dimensions from items that have a priority of 0 in this workspace.

In the Dimension Derivation Rules sub-tab, you can enter a number of special cases in which dimension derivation should deviate from the standard functionality, so that dimensions are derived from a specific place.

## Dimension Derivations Tab

This section includes the fields and descriptions for the Dimension Derivations tab.

### Dimension Derivation Island

Field	Description
<b>Name</b>	In this field, you can enter the name of a dimension derivation principle. Maconomy will use the setting from this principle if the registration matches the target group specified in the following fields.

### Priority Island

Field	Description
<b>User Role</b>	Enter a priority in this field if you want to derive dimensions from the user role. Dimensions are only derived from the user role if the priority is different from 0.
<b>Account</b>	The functionality of this field is similar to that of the <b>User Role</b> field above.
<b>Local Account</b>	The functionality of this field is similar to that of the <b>User Role</b> field above.
<b>Company</b>	The functionality of this field is similar to that of the <b>User Role</b> field above.
<b>Customer</b>	The functionality of this field is similar to that of the <b>User Role</b> field above.
<b>Vendor</b>	The functionality of this field is similar to that of the <b>User Role</b> field above.
<b>Job</b>	The functionality of this field is similar to that of the <b>User Role</b> field above.
<b>Activity</b>	The functionality of this field is similar to that of the <b>User Role</b> field above.
<b>Employee Information</b>	The functionality of this field is similar to that of the <b>User Role</b> field above.
<b>Item</b>	The functionality of this field is similar to that of the <b>User Role</b> field above.

## User Island

See the chapter “Getting Started” for a description of the fields in the User island.

## Priority, Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the <b>User Role</b> field above.
<b>Entity</b>	The functionality of this field is similar to that of the <b>User Role</b> field above.
<b>Project</b>	The functionality of this field is similar to that of the <b>User Role</b> field above.
<b>Purpose</b>	The functionality of this field is similar to that of the <b>User Role</b> field above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the <b>User Role</b> field above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the <b>User Role</b> field above.

## Dimension Derivation Rules Sub-Tab

This section includes the fields and descriptions for the Dimension Derivation Rules sub-tab.

Field	Description						
Action	<p>In this field, you can select a situation or action in which dimension derivation should not take place according to the sequence of priorities specified in the card part. Instead, when performing the action in question, all dimensions are copied from a specific information type, which is specified in the field “Derivation From” on the line.</p> <p>The copying of dimension values from the specified information type requires that a reference to a specific entry in the information type in question is made when the action is performed. For instance, if you have created a line specifying “Create Customer Payment” in this field and “Invoice” in the field “Derivation From,” the dimension values on a customer payment being created are copied from the invoice specified on the payment. If no invoice is specified, dimension values are derived as usual.</p> <p>This functionality is available for the following combinations of actions and information types:</p> <table><tr><th>Action</th><th>Derivation From</th><th>Functionality</th></tr><tr><td>Create Customer Payment</td><td>Invoice</td><td>When creating a customer payment (for example, in the Customer Payments workspace), specifying an invoice number on the customer payment will</td></tr></table>	Action	Derivation From	Functionality	Create Customer Payment	Invoice	When creating a customer payment (for example, in the Customer Payments workspace), specifying an invoice number on the customer payment will
Action	Derivation From	Functionality					
Create Customer Payment	Invoice	When creating a customer payment (for example, in the Customer Payments workspace), specifying an invoice number on the customer payment will					

Field	Description		
			cause the dimensions from the invoice in question to be copied to the customer payment. If no invoice is specified on the customer payment, dimensions are derived according to the set-up in the Dimension Derivations tab.
	Post Customer Reconciliation	Customer Payment	When posting a customer reconciliation, the dimensions from the payment being reconciled will be copied to any exchange rate and discount entries created as a result of the customer reconciliation.
<b>Derivation From</b>	In this field, you can specify the information type from which dimension values should be copied when performing the action specified in the field "Action" above. For further information about the functionality of the field, see the field "Action."		

## G/L Allocation Combinations Workspace

Use this workspace to enter which G/L allocation combinations allow manual postings, that is, in connection with postings and entries made in the General Journal, Budget Journal, Purchase Orders, Invoice Allocation, Reallocate Invoices, Sales Orders workspaces, and so on.

An allocation combination is the combination of dimension values that you enter on an entry. Using G/L allocation combinations, you can set up rules that specify the dimension values that can be used together. You can also specify which employees and tax codes are allowed in connection with the individual dimension combinations that you set up in the Finance Allocation Lines sub-tab.

You define each G/L allocation combination rule on a line in the Finance Allocation Lines sub-tab, where each line represents an allowed allocation combination. You can set up each rule to apply to G/L-related information, Job Cost-related information, or both. Maconomy uses allocation combinations that apply to G/L to validate all entries where you provide an account number. Maconomy uses allocation combinations that apply to jobs to validate all entries on which a job is provided.

The rules that you set up in this workspace apply to all companies in the system. For instance, you might want to specify that a given account can only be used in combination with a given location (or range of locations). This minimizes the risk of error and allows you to ensure that the dimension values that you create for special purposes are only used in the intended connections. If you want to add specific allocation combination rules for the individual companies in Maconomy, you can create these rules in the Company Allocation Combinations workspace. Entries that relate to a given company are then only allowed if they comply with both the G/L allocation combinations and the company allocation combinations that you set up for the company in question. This is also true for allocation combination lines that apply to Job Cost, for which you should also note that the rules that you set up in this workspace and the Company Allocation Combinations workspace also apply to all jobs in Maconomy. If you want to add

specific allocation combination rules for the individual jobs, you can create these rules in the Job Allocation Combinations workspace in the Job Cost module. Then entries that relate to a given job are only allowed if they comply with the G/L allocation combinations, the company allocation combinations that you set up for the company in question, and the job allocation combinations that you assigned to the job in question.

In the G/L Allocation Combinations tab, you can enter selection criteria so that only allocation combinations that match those selection criteria are displayed in the Finance Allocation Lines sub-tab.

### G/L Allocation Combinations Tab

This section includes the fields and descriptions for the G/L Allocation Combinations tab.

#### Selection Criteria Island

Field	Description
<b>Account No.</b>	In this field, you can enter an account number. Only allocation combinations containing the account number are shown in the Finance Allocation Lines sub-tab. If no account number has been entered, all accounts containing the specified "Location," "Entity," "Project," "Purpose," "Spec. 1-3," and "Local Spec. 1-3" will be shown.
<b>Employee No.</b>	The functionality of this field is similar to the functionality of the field "Location."
<b>Tax Code</b>	In this field, you can specify a tax code (that is, a tax percentage). You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters workspace. When multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2," and, if enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Show Lines Applying to G/L</b>	If you mark this field, only allocation combination lines where the field "Applies to G/L" is marked are shown in the Finance Allocation Lines sub-tab.
<b>Show Lines Applying to Jobs</b>	If you mark this field, only allocation combination lines where the field "Applies to Jobs" is marked are shown in the Finance Allocation Lines sub-tab.
<b>Show Lines</b>	When you check this box, the Finance Allocation Lines sub-tab will display the allocation combinations. For performance reasons, it is advisable not to check the box until after you have entered the selection criteria.

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	In this field, you can enter a location. Only allocation combinations containing the location are shown in the Finance Allocation Lines sub-tab. If no location has been entered, all accounts containing the specified dimension information are shown.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

### Finance Allocation Lines Sub-Tab

This section includes the fields and descriptions for the Finance Allocation Lines sub-tab.

Field	Description
<b>Account No. From</b>	This field and the field "Account No. To" represent a range of accounts which, together with any other ranges specified for the other dimensions, represents an allowed G/L allocation combination. If the range of accounts is not filled in, all accounts are included.  For job cost registrations, the P&L account specified in the table part of the activity on the registration must be within this range of account numbers for the registration to comply with the current allocation combination.
<b>Account No. To</b>	See the description of the field "Account No. From" above.
<b>Location From</b>	This field and the field "Location To" represent a range of locations. If the range of locations is not filled in, all locations are included.
<b>Location To</b>	See the description of the field "Location From" above.
<b>Entity From</b>	This field and the field "Entity To" represent a range of entities. If the range of entities is not filled in, all entities are included.

Field	Description
<b>Entity To</b>	See the description of the field "Entity From" above.
<b>Project From</b>	This field and the field "Project To" represent a range of projects. If the range of projects is not filled in, all projects are included.
<b>Project To</b>	See the description of the field "Project From" above.
<b>Purpose From</b>	This field and the field "Purpose To" represent a range of purposes. If the range of purposes is not filled in, all purposes are included.
<b>Project To</b>	See the description of the field "Purpose From" above.
<b>Spec. 1-10 From</b>	These fields and the fields "Spec. 1-10 From" represent a range of specifications. If the range of specifications is not filled in, all specifications are included.
<b>Spec. 1-10 To</b>	See the description of the field "Spec. 1-10 From" above.
<b>Local Spec. 1-10 From</b>	These fields and the fields "Local Spec. 1-10 To" represent a range of local specifications. If the range of locations is not filled in, all local specifications are included.
<b>Local Spec. 1-10 To</b>	See the description of the field "Local Spec. 1-10 From" above.
<b>Access Level</b>	<p>In this field, you specify the name of the access level to be assigned to the current allocation combination. If an access level is specified, only users who have been granted access to this access level or higher can create entries on which the allocation combination matches the current line. In this workspace, a user can only see a given allocation combination line if he or she has been granted access to the access level specified for line in question, or a higher level. Please note, however, that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to allocation combinations may depend on other factors. For further information about the standard access control configuration, please see "Introduction to the Access Control System" in the Set-Up module.</p> <p>If you do not enter a value, all users can create entries with allocation combinations matching the current line.</p>
<b>Remarks</b>	In this field, you can enter any remarks to the current allocation combination line.
<b>Employee No. From</b>	This field and the field "Employee No. To" represent a range of employee numbers that, together with any other ranges specified for the other dimensions, represents an allowed G/L allocation combination. If the range of employee numbers is not filled in, all employees are included.

Field	Description
<b>Employee No. To</b>	See the description of the field "Employee No. From" above.
<b>Tax Code From</b>	<p>This field and the "Tax Code To" field represent a range of G/L tax codes that represents an allowed G/L allocation combination, along with any other range specified for the other dimensions. If the range of tax codes is not filled in, all tax codes are included.</p> <p>If multiple tax codes are enabled, the "Tax Code From" field will be replaced by the following fields: "Tax Code 1 From," "Tax Code 2 From," and, if enabled, "Tax Code 3 From." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Tax Code To</b>	See the description of the "Tax Code From" field above.
<b>Transaction Type Group No.</b>	This field represents a transaction type group. An allocation group is only allowed if the transaction type belongs to this transaction type group.
<b>Applies to G/L</b>	Mark this field if the current allocation combination line should apply when registering G/L related information. If the field is marked, the allocation combination will apply to all registrations on which you specify an account number.
<b>Applies to jobs</b>	Mark this field if the current allocation combination line should apply when registering information related to the Job Cost module. If the field is marked, the allocation combination will apply in all registrations on which you enter a job number.

## Company Allocation Combinations Workspace

Use this workspace to specify the allocation rules for one company at a time.

Use the G/L Allocation Combinations workspace to specify the rules for all companies.

### Company Allocation Combinations Tab

This section includes the fields and descriptions for the Company Allocation Combinations tab.

#### Company Island

Field	Description
<b>Company</b>	This field displays the name and number from the Company island in the window Company Information.

#### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

### Selection Criteria Island

Field	Description
<b>Account No.</b>	In this field, you can enter an account number. Only allocation combinations containing the account number are shown in the table part. If no account number has been entered, all accounts containing the specified "Location," "Entity," "Project," "Purpose," "Spec. 1-3," and "Local Spec. 1-3" will be shown.
<b>Employee No.</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Tax Code</b>	In this field, you can specify a tax code (that is, a tax percentage). You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters window. When multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2," and, if enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Show Lines Applying to G/L</b>	If you mark this field, only allocation combination lines where the field "Applies to G/L" is marked are shown in the table part.
<b>Show Lines Applying to Jobs</b>	If you mark this field, only allocation combination lines where the field "Applies to Jobs" is marked are shown in the table part.
<b>Show Lines</b>	When you check this box, the table part of the window will display the allocation combinations. For performance reasons, it is advisable not to check the box until after you have entered the selection criteria.

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	In this field you can enter a location. Only allocation combinations containing the location are shown in the table part. If no location has been entered, all accounts containing the specified dimension information are shown.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-10</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

Field	Description
<b>Local Spec. 1-10</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

## Company Allocation Lines Sub-Tab

This section includes the fields and descriptions for the Company Allocation Lines sub-tab.

Field	Description
<b>Account No. From / Account No. To</b>	<p>These fields represent a range of accounts which together with any ranges specified for the other dimensions represent an allowed company allocation combination. If the range of accounts is not filled in, all accounts are included.</p> <p>For job cost registrations, the P&amp;L account specified in the table part of the activity on the registration must be within this range of account numbers in order for the registration to comply with the current allocation combination.</p>
<b>Location From / Location To</b>	<p>See the description of the field "Account No. From / To" above.</p> <p>Entity From / Entity To See the description of the field "Account No. From" above.</p> <p>Project From / Project To See the description of the field "Account No. From" above.</p>
<b>Purpose From / Purpose To</b>	See the description of the field "Account No. From" above.
<b>Spec. 1-3 From / Spec. 1-3 To</b>	See the description of the field "Account No. From" above.
<b>Local Spec. 1-3 From / Local Spec. 1-3 To</b>	See the description of the field "Account No. From" above.
<b>Access Level</b>	<p>In this field, you specify the name of the access level to be assigned to the current company allocation combination. If an access level is specified, only users who have been granted access to this access level or higher can create entries on which the allocation combination matches the current line. In this window, a user can only see a given company allocation combination line if he has been granted access to the access level specified for line in question, or a higher level. Please note, however, that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to company allocation combinations may depend on other factors. For further information about the standard access control configuration, please see the sections "Introduction to the Access Control System" in the Set-Up module.</p>

Field	Description
	If you do not enter a value, all users can create entries with allocation combinations matching the current line.
<b>Remarks</b>	<p>In this field, you can enter any remarks to the current company allocation combination line.</p> <p>Employee No. From / Employee No. To These fields represent a range of employee numbers, which together with any other ranges specified for the other dimensions represents an allowed company allocation combination. If the range of employee numbers is not filled in, all employees are included.</p> <p>Tax Code From / Tax Code To These fields represent a range of tax codes, which represents an allowed G/L allocation combination along with any other range specified for the other dimensions. If the range of tax codes is not filled in, all tax codes are included.</p> <p>If multiple tax codes are enabled, the "Tax Code From" field will be replaced by the following fields: "Tax Code 1 From," "Tax Code 2 From," and, if enabled, "Tax Code 3 From." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Transaction Type Group No.</b>	This field represents a transaction type group. An allocation group is only allowed if the transaction type belongs to this transaction type group.
<b>Applies to G/L</b>	Mark this field if the current allocation combination line should apply when registering G/L related information. If the field is marked, the allocation combination will apply to all registrations on which you specify an account number.
<b>Applies to jobs</b>	<p>Mark this field if the current allocation combination line should apply when registering information related to the Job Cost module. If the field is marked, the allocation combination will apply in all registrations on which you enter a job number.</p> <p>As job entries do not include an account number, you cannot mark this field if a range of account numbers has been specified in the fields "Account No. From" and "Account No. To."</p>

## Dimension Sets Workspace

Use the Dimension Sets workspace to define a set of dimensions, such as Location and Entity.

## Dimension Set Tab

This section includes the fields and descriptions for the Dimension Set tab.

### Dimension Set Island

Field	Description
<b>Dimension Set Name</b>	Use this field to specify the name of the dimension set. The name cannot be changed after the dimension set is created.
<b>Description</b>	Use this field to specify a more comprehensive description for the dimension set.

### Access Level Island

Field	Description
<b>Name</b>	In this field, you can specify the name of the access level to be assigned to the transaction types.
<b>Description</b>	This field will show the description of the access level you have specified.

### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

### Dimensions Island

Field	Description
<b>Include:</b>	<ul style="list-style-type: none"> <li>Location — Mark this field to include the location in the dimension set.</li> <li>Entity — Mark this field to include the entity in the dimension set.</li> <li>Project — Mark this field to include the project in the dimension set.</li> <li>Purpose — Mark this field to include the purpose in the dimension set.</li> <li>Spec. 1-10 — Mark this field to include Specification 1-10 in the dimension set.</li> <li>Local Spec. 1-10 — Mark this field to include Local Specification 1-10 in the dimension set.</li> </ul>

## Line Styles Workspace

Use this workspace to create and maintain line styles that Maconomy uses for formatting G/L report output in RTF files.

A line style is a combination of RTF document styles to be used on the different parts of a G/L report output line. For each line style, you can specify RTF document styles for line descriptions, positive figures, and negative figures, respectively. In the G/L Report Set-Up workspace, you can then assign a line style to each line in the Report Lines sub-tab. The styles that you define in the

line style that you select on the line in question are thus applied to each of the output RTF lines that results from a given line in the Report Lines sub-tab of the G/L Report SetUp workspace. The specifications in this workspace contain no information about the formats that are implied by the RTF styles, because you should define those beforehand in a template RTF file. When you create an RTF file from the report, Maconomy prompts you for such a template RTF file, which then functions as a definition of the formats of the styles in question.

For example: In this workspace, you create two line styles: "Regular" and "Totals." The "Regular" line style specifies that line descriptions and positive figures should use the RTF style "Regular." Negative figures should use the style "Red." The "Totals" line style is intended for subtotals and grand totals and specifies that line descriptions and positive figures should use the RTF style "Bold," while negative figures should use the style "Bold Red."

In the G/L Report Set-Up workspace, you set up your report lines, assigning the "Regular" line style on all lines that contain the itemized information, and assigning the "Totals" line style on all lines that are used to calculate totals.

In the RTF file "Template," you define these styles as you want them to look in your reports.

When you use the **Create RTF File** action, and Maconomy asks you to select a template file that contains the relevant styles, select the "Template" file. Maconomy creates an RTF file in which each output data line is formatted in compliance with the template document's definitions of the styles that are implied by the line styles that you specified on the report line that results in the output line

## Line Styles Tab

This section includes the fields and descriptions for the Line Styles tab.

### Line Style Island

Field	Description
<b>Name</b>	In this field, you can specify the desired name when creating a line style.

### Style Selection Island

Field	Description
<b>Line Text Style</b>	In this field, you can specify the RTF style to be applied to the descriptions on G/L report output lines based on lines in the G/L Report Set-Up workspace, where the current line style has been selected. The options in this field are created as options in the pop-up type "Styles" in the Popup Fields workspace.
<b>Style of Positive Values</b>	In this field, you can specify the RTF style to be applied to positive figures on G/L report output lines based on lines in the G/L Report Set-Up workspace, where the current line style has been selected. The options in this field are created as options in the pop-up type "Styles" in the Popup Fields workspace.
<b>Style of Negative Values</b>	In this field, you can specify the RTF style to be applied to negative figures on G/L report output lines based on lines in the G/L Report Set-Up workspace, where the current line style has been selected. The options in this field are created as options in the pop-up type "Styles" in the Popup Fields workspace.

Field	Description
Note Style	This field is not used in the current version of Maconomy.

## Transaction Types Workspace

Use this workspace to create, edit, and delete transaction types.

Maconomy uses a number of posting journals such as General Journals, Vendor Invoice, and so forth. You can use these journals to create transactions. These transactions are identified by their transaction numbers and their transaction types.

Different journals can support different transaction types. You can define different transaction types for different companies and different users. You can configure which transactions are allowed in which journals by creating different transaction type groups.

You cannot delete a transaction type that is used in a transaction group or in entries. You cannot rename transaction types. Maconomy provides a number of predefined transaction types. If you plan to change them, it is a very good idea to do this before you start using transaction types, because you cannot rename or delete transaction types after they are in use.

### Setting Up Transaction Types, Transaction Type Groups and Journal Setups

Transaction Types, Transaction Type Groups, Journal Setups, and Posting Period Setups are all related. You must understand these relationships and plan what your needs are before you start setting any part of this up.

Together, Transaction Types, Transaction Type Groups, and Journal Setups enable you to specify very complex setups, where different companies use different transaction types and transaction number series, or where users have differentiated access to posting in journals, and so forth. On the other hand, if you do not need the more complex functionality, Maconomy provides standard functionality that works "out of the box."

The easiest way to explain and understand the relationship is to begin at the top, at the company level. When you implement a setup, however, you must start the setup at the lowest level, by creating Transaction Types.

In the Company Information workspace, you select a Journal Setup for the company. When you create a company, Maconomy suggests the Standard journal setup by default. If other journal setups exist, you can select one of those.

In the Journal Setup workspace you can create and change journal setups. A journal setup represents a setup of all posting journals in Maconomy. Therefore, a journal setup consists of a header part (consisting of the number and name, as well as the access level of the setup), and a table part that has exactly one line for each posting journal type in Maconomy. You can select a Transaction Type group for each of these journal types. There is also some information about the journal type displayed here that can otherwise be difficult to get an overview of (basically, whether the journal type uses a transaction number series, and whether you set the transaction manually or you must specify a default transaction type.)

Maconomy provides the Standard default journal setup. You cannot delete or rename it. When you create (and save) a journal setup, Maconomy adds a line to the Journal Setup Lines sub-tab of the Journal Setup workspace for each journal type. You cannot rename or delete those lines. You must then specify a transaction type group for each of these journal types. If you want to

create a journal setup that is similar to an existing journal setup, copy the existing journal setup and change the relevant transaction type groups.

You define the transaction type groups in the Transaction Type Groups workspace. The header part is quite similar to the header of the journal setup: you must give the transaction type group a number and name, and you can set an access level.

In the Transaction Type Group Lines sub-tab of the Transaction Type Groups workspace, you can add lines. Each line corresponds to a transaction type. There can be as few or as many transaction types in a transaction type group as you need. However, a transaction type group must have at least one transaction type.

Additionally, you can (but are not required to) set a Username and Transaction Number Series, and you can specify whether this is the default transaction type for the username, or whether the transaction type has a default transaction number series.

### Transaction Types Tab

This section includes the fields and descriptions for the Transaction Types tab.

#### Transaction Type Island

Field	Description
<b>Transaction Type</b>	In this field, you can specify the name. This is used to identify the transaction type in different dialogs, for example in the General Journal.
<b>Description</b>	In this field, you can specify a descriptive text for the transaction type.

#### Access Level Island

Field	Description
<b>Name</b>	In this field, you can specify the name of the access level to be assigned to the transaction type.
<b>Description</b>	This field will show the description of the access level you have specified.

#### Transaction Numbering Island

Field	Description
<b>Number Series</b>	Use this field to select the transaction number series to be used by this transaction type. Regardless of where the transaction type is used, it can be overwritten by the transaction number series specified in the transaction type groups.

#### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

## Transaction Type Groups Workspace

Use this workspace to create, edit, and delete transaction type groups.

You use transaction type groups to group transaction types, to make using transaction types more convenient. For example, most transactions have the same posting periods, so it is easier to define the posting period for a group of transaction types, instead of specifying it for each transaction type.

The transaction type groups are used by the posting period setups and the journal setups. Groups can be shared by different setups. A transaction type group must contain a minimum of one transaction type.

A transaction type group can contain a default transaction type for each user. This is used when Maconomy must derive a transaction type (any type, not a specific one), in a specific workspace, for a specific company and user.

You can identify a Transaction Number Series for a specific transaction type and a specific employee, within a specific group. This overrules the Transaction Number Series that you enter on the transaction type. The Transaction Number Series that you enter on the transaction types are generic, used by all companies, while the Transaction Number Series that you enter in the transaction type groups are company- and user-specific.

You can create user-specific Transaction Number Series if you are using different number series for different users. Also, different users can have access to different transaction types. The **Username** field controls the user-specific settings. By default, this field is empty, meaning that all users have the same transaction type settings within the group.

You cannot delete transaction type groups if they are used by journal setups or posting period setups.

By default, Maconomy provides a transaction type group that includes all of the predefined transaction types, and other transaction type groups used by the standard journal setup.

### Transaction Type Groups Tab

This section includes the fields and descriptions for the Transaction Type Groups tab.

#### Transaction Type Group Island

Field	Description
<b>Group No.</b>	In this field, you can specify the transaction type group number when creating a transaction type group. This is a string.
<b>Name</b>	In this field, you can specify a name or description for the transaction type group.

#### Access Level Island

Field	Description
<b>Access Level</b>	In this field, you can specify the description and name of the access level to be assigned to the transaction type group.

## User Island

See the chapter “Getting Started” for a description of the fields in the User island.

## Transaction Type Group Lines Sub-Tab

This section includes the fields and descriptions for the Transaction Type Group Lines sub-tab.

Field	Description
<b>Transaction Type</b>	Here you can enter a transaction type to include in the group.
<b>Description</b>	This fields shows the description of the transaction type (if a description exists.).
<b>Username</b>	Here you can enter the name of a user who can create transactions of the current type and with the current transaction number series.
<b>Transaction Number Series</b>	Here you can enter the transaction number series associated with the current transaction type and current user, in the current group.
<b>Default</b>	When marked, this field means that the current transaction type is the default transaction type for the current user in the current group. This is used to derive the transaction type in different dialogs.

## Actions

This section shows the actions available in the Transaction Type Groups workspace.

### Top Pane

Field	Description
<b>Copy</b>	This action copies lines (transaction types) from the transaction types group selected in the “From Transaction Type Group” field. All lines are copied, and existing lines of the same name are silently overwritten. After they are copied, both groups will contain the same transaction types.
<b>Create Lines For All Transaction Types</b>	This action adds line for every transaction type to the current transaction type group. The "Default," "Transaction Number Series," and "Username" fields will be empty.

## Journal Setup Workspace

Use this workspace to set up the connection between posting journals, transaction types, and transaction number series

Maconomy provides one predefined standard journal setup that you cannot delete or rename.

In the Journal Setup tab in the Journal Setup workspace, you can enter the name and number of the journal setup, as well as the access level.

In the Journal Setup Lines sub-tab, you must enter a transaction type group for each journal type. When you create a journal setup, Maconomy creates a line for each journal type in the sub-tab. You cannot rename or delete lines. You can copy the lines from an existing journal setup to make it faster and easier to create a journal setup.

### Journal Setup Tab

This section includes the fields and descriptions for the Journal Setup tab.

#### Journal Setup Island

Field	Description
<b>Journal Setup No.</b>	Here you can specify a number for the journal setup. It cannot be changed later.
<b>Name</b>	Here you can specify a name for the journal setup. It can be changed later.

#### Access Level Island

Field	Description
<b>Name</b>	In this field, you can specify the name of the access level to be assigned to the journal setup.
<b>Description</b>	This field will show the description of the access level you have specified.

#### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

### Journal Setup Lines Sub-Tab

This section includes the fields and descriptions for the Journal Setup Lines sub-tab.

Field	Description
<b>Journal Type</b>	The journal type. You cannot delete or rename this.
<b>Transaction Type Group No.</b>	In this field, you can enter the number of the transaction types group to be used by the current journal type. Only the transaction types included in the group can be used in the current journal type.
<b>Use Transaction Number Series</b>	In this field, you can see if the journal type uses Transaction Number Series. If the field is not marked, you should not spend time on defining default transaction number series for the types that are included in the current setup, as they will never be used.
<b>Manual Journal</b>	Shows whether the user can select or enter a transaction type when creating the journal.

Field	Description
	If this field is not marked, the user is not able to specify a transaction type in this journal; the system will derive the transaction type (the default transaction type of the journal).
<b>Default Transaction Type Mandatory</b>	Shows whether the journal must have a default transaction type, since the system will use it when deriving the transaction type.  Note the correlation between this field and the Manual Journal field; they are mutually exclusive. When one is marked, the other cannot be, and vice versa. If this field is marked, the group on the same line must have a default transaction type.

## Actions

This section shows the actions available in the Journal Setup workspace.

### Top Pane

Field	Description
<b>Validate</b>	This action is used to validate the current setup. Validation includes checking that a transaction type group is attached, that such transaction type groups are non-empty, and so forth. When the validation fails, an appropriate message will guide the user towards solving the problem. It is recommended that this action is run when the setup has been changed, and also after creating a setup.
<b>Copy</b>	This action copies lines from the journal setup selected in the "From Journal Setup" field. All lines are copied, and existing lines of the same name are silently overwritten.

## Posting Period Setup Workspace

Use this workspace to set up posting periods.

You can have two open posting periods: one for G/L, and another for job cost. Both open posting periods can be generic or company-specific.

The open job cost posting period represents the posting interval for all job cost entries (for example, time and expense sheet entries, job allocation entries, and so forth), while an open G/L posting period represents the posting interval for all finance entries.

You can create complex setups. For example, you can allow time sheets only between September 1 and September 30, expense sheets between September 2 and September 30, and customer payments between September 3 and September 30. However, if you do not need this complexity, you are not required to create it.

You can create complex setups. For example, you can allow time sheets only between September 1 and September 30, expense sheets between September 2 and September 30, and customer payments between September 3 and September 30. However, if you do not need this complexity, you are not required to create it.

Maconomy determines the posting periods for a specific transaction made by a specific company as follows:

1. Find the posting period setup for the company.
2. In the posting period setup, find the posting periods for the transaction group that includes the transaction type.

A posting period setup must cover all transaction types.

By default, all companies use the standard setup. If your company needs a different setup, create a company-specific setup and link it to the company in the Company Information workspace.

### Posting Period Setup Tab

This section includes the fields and descriptions for the Posting Period Setup tab.

#### Posting Period Setup Island

Field	Description
<b>Posting Period Setup No.</b>	Here you can enter a posting period setup number.
<b>Name</b>	Here you can specify a name for the posting period setup.

#### Access Level Island

Field	Description
<b>Access Level</b>	In this field, you can specify the description and name of the access level to be assigned to the posting period setup.

#### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

### Posting Period Setup Lines Sub-Tab

This section includes the fields and descriptions for the Posting Period Setup Lines sub-tab.

Field	Description
<b>Name</b>	In this field, you can enter a name for the posting period setup line.
<b>Description</b>	In this field, you can enter a description of the posting period setup line.
<b>G/L Start</b>	In this field, you can enter the start date of the open G/L posting period.
<b>G/L End</b>	In this field, you can enter the end date of the open G/L posting period.

Field	Description
<b>Job Cost Start</b>	In this field, you can enter the start date of the open job cost posting period.
<b>Job Cost End</b>	In this field, you can enter the end date of the open job cost posting period.
<b>Accrual End</b>	In this field, you can enter the last date allowed for accrual.
<b>Transaction Type Group No.</b>	In this field, you can enter the number of the transaction type group covered by this posting period setup line. Each transaction type in the group will use the posting periods specified on this line.
<b>Created By, Created On, Changed By, Changed On, Version</b>	These fields show by whom and when the line was created and changed. The "Version" is the number of times the line has been changed.

## Actions

This section shows the actions available in the Posting Period Setup workspace.

### Top Pane

Field	Description
<b>Validate</b>	This action is used to validate the current setup. This includes validating that there is at least one line in the setup, that the same transaction type group is not specified in more than one line, and that a transaction type does not end up having more than one posting period. The validation also ensures that the posting period setup is compatible with the journal setups with which it is used in connection. After changing the structure of a setup, you must manually validate it by invoking this action.
<b>Copy</b>	This action copies lines from the posting period setup selected in the "From Posting Period Setup" field. All lines are copied, and existing lines of the same name are silently overwritten.

## Sequence Number Criteria Workspace

This workspace provides company information and sequence number assignment information to support the Sequence Numbers functionality.

The Sequence Number Criteria workspace provides details on reporting company information and outlines relevant sequence numbering details. This information is also available on the **Information** sub-tab of the **Companies** workspace.

## Company Tab

This tab lists company information and sequence number assignment information.

## Company Information Island

Field	Description
<b>Reporting Company</b>	Select this check box if the company is a reporting company. Only reporting companies can be used when assigning sequence numbers to finance entries and creating opening balances.

## Seq. No. Assignment Island

Field	Description
<b>Excl. Transaction Type Group</b>	If you select a transaction type group, finance entries with transaction types listed in the group are disregarded when Maconomy assigns sequence numbers to finance entries. These finance entries are also disregarded in the creation of opening balance entries.
<b>Sequence Numbering</b>	Select a value from the drop-down list to specify the numbering system to use: by transaction number, or by entry.  If you select <b>By Transaction Number</b> , Maconomy provides all entries that have the same transaction number with the same sequence number.  If you select <b>By Entry</b> , Maconomy provides each entry with a unique sequence number.
<b>New Seq. per Period</b>	If you select this check box, Maconomy restarts the sequence for each fiscal year period.  If you leave this blank, the sequence numbers continue across fiscal year periods and thus span the entire fiscal year.
<b>New Seq. per Trans. Type</b>	If you select this check box, Maconomy creates a sequence for each transaction type. This means that for each transaction type, entries are assigned sequence numbers from 1 to the number of entries with the same fiscal year or fiscal year period (depending on whether the <b>New Seq. per Period</b> check box is selected).
<b>Length of Sequence No.</b>	In this field, you specify the number of digits for the sequence number part of the combined sequence number. If a sequence number has fewer digits than the number you specify in this field, Maconomy pads the sequence number with leading zeroes.  For example, if you specify '6' in this field and the sequence number is '4123', then the sequence number part of the combined sequence number is '004123'.
<b>Trans. Type on Opening Balance Combined Seq. No.</b>	If the <b>New Seq. per Trans. Type</b> check box is selected, Maconomy includes the transaction type in the combined sequence number. Maconomy also needs to know which value to use in the combined sequence numbers for opening balance entries. The value you specify in

Field	Description
	this field is used as the transaction type in the combined sequence numbers for opening balance entries.

Seq. No. Accounts Sub-tab

The sub-tab on the Sequence Number Criteria workspace.

### Fields

Field	Description
<b>From Local Account</b>	<p>In this field, enter the start of the local account interval for Maconomy to consider when assigning sequence numbers to finance entries and creating opening balance entries.</p> <p>Leaving this field blank results in an open start interval, and Maconomy will include all local accounts until the local account you select in the <b>To Local Account</b> field.</p>
<b>To Local Account</b>	<p>In this field, enter the end of the local account interval for Maconomy to consider when assigning sequence numbers to finance entries and creating opening balance entries.</p> <p>Leaving this field blank results in an open end interval, and Maconomy will include all local accounts starting from the local account you select in the <b>From Local Account</b> field.</p>
<b>Split Opening Balance by</b>	<p>If you select a value from the drop-down list, Maconomy will create multiple opening balance entries for each local account in the local account interval (that is, one entry for each customer or vendor with a balance not equal to zero).</p> <p>If you leave this field blank, Maconomy will create one opening balance entry for each local account in the local account interval.</p> <p>Maconomy does not consider this field when assigning sequence numbers to finance entries.</p>

## Structure Section

This section includes the fields and descriptions for the Structure section workspaces.

### Company Structure Workspace

Use this workspace to create and maintain a dimension structure that determines how reporting for the Company dimension is structured.

You can only create one structure list for the Company dimension.

In the tab, select the **Headings**, **Underlinings**, **Page Break**, and/or **Blocked Companies** check boxes if you want to view any of this information in the sub-tab.

The sub-tab shows all the lines. In a line, select the **Itemize** check box if you want to view all the lines on the lower level.

## Company Structure Tab

This section includes the fields and descriptions for the Company Structure tab.

### Show Island

Field	Description
<b>Headings</b>	Check this box if you want to see Heading lines in the Company Structure Lines sub-tab.
<b>Underlinings</b>	Check this box if you want to see Underlining lines in the Company Structure Lines sub-tab.
<b>Page Breaks</b>	Check this box if you want to see Page Break lines in the Company Structure Lines sub-tab.
<b>Blocked Companies</b>	Check this box if you want to see blocked companies in the Company Structure Lines sub-tab.

### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

## Company Structure Lines Sub-Tab

This section includes the fields and descriptions for the Company Structure Lines sub-tab.

Field	Description
<b>Line No.</b>	In this field you can specify a line number. If you do not specify a line number, the line will be placed at the end of the structure. The line number determines the structure used in reporting.
<b>Line Type</b>	<p>In this field you can select which line type you want to use. You can choose Sum, Heading, Page Break, Single Underscore, Double Underscore, and Posting lines. The line type cannot be changed later. If you want to change the line type, you must delete and re-create the existing line.</p> <p>Lines of the type Posting can only be created by creating a dimension value for the Company dimension in the Company Information workspace.</p> <p>Heading, Underscore, and Page Break lines are only displayed in the Company Structure Lines sub-tab if the check boxes Headings, Underlinings, or Page Break, respectively, are checked in the Show island in the Company Structure tab.</p>
<b>Sum Level</b>	Enter a sum level in this field if the line type is Sum.
<b>Itemize</b>	For sum-level lines, you can specify in this field whether the lines between the sum level of the current line and the same sum level or higher should be displayed. Only lines with a line number lower than that of the current line are affected by this.

Field	Description
<b>Name</b>	In this field you can enter the name of a company. A name is only needed if this is a sum or posting line.
<b>Description</b>	This field displays the description of the current company.
<b>Blocked</b>	If this field is checked, the current company is blocked. Blocked companies are only displayed if Blocked Companies is checked in the Show island of the Company Structure tab.
<b>New Line No.</b>	In this field, you can enter a new line number if you want the current line moved to a new line number. When you press Return, the line will be given the new line number, and if a line with the specified line number already exists, that line's number and all subsequent line numbers will be increased by one.

## Actions

This section shows the actions available in the Company Structure workspace.

### Top Pane

Field	Description
<b>Move Sum Levels</b>	<p>If you want to move an existing sum level to a higher sum level, you can do this by specifying the sum level from which the change should take effect in this field. When you choose this action, the sum levels from the sum level indicated will all be increased by one.</p> <p>If you, for instance, use four sum levels and wish to move the sum levels from level three, the sum levels three and four will both be moved up one sum level, that is, to sum level four and five, respectively, whereas the sum levels one and two will remain unchanged.</p>
<b>Itemize Structure</b>	<p>In this field, you can specify the sum level down to which you want to itemize the structure. When you now choose this action, all sum levels down to the sum level specified in this field will be itemized. This corresponds to indicating for all sum levels in the Company Structure Lines sub-tab that they should be itemized. This field is particularly useful if you have a very detailed structure and, consequently, many lines to be itemized.</p> <p>There is no limit to the number of sum levels. In principle you could use sum levels from 1 to 3,500 or more, where sum level 1 would be the lowest level. For practical purposes you will, however, often limit the number of sum levels that you use.</p>

## Account Structure Workspace

Use this workspace to create and maintain a dimension structure that determines how reporting for the Account dimension is structured.

Printouts from the Print Trial Balance, Print Balance Sheet, and Print Income Statement workspaces use the structure in this workspace.

When you print the structure, you get an overview of the chart of accounts grouped with headings, sum lines, and so on.

### Account Structure Tab

This section includes the fields and descriptions for the Account Structure tab.

#### Show Island

Field	Description
<b>Headings</b>	Check this box if you want to see Heading lines in the Account structure lines sub-tab.
<b>Underlinings</b>	Check this box if you want to see Underlining lines in the Account structure lines sub-tab.
<b>Page Breaks</b>	Check this box if you want to see Page Break lines in the Account structure lines sub-tab.
<b>Blocked Accounts</b>	Check this box if you want to see blocked accounts in the Account structure lines sub-tab.

#### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

### Account Structure Lines Sub-Tab

This section includes the fields and descriptions for the Account Structure Lines sub-tab.

Field	Description
<b>Line No.</b>	In this field you can specify a line number. If you do not specify a line number, the line will be placed at the end of the structure. The line number determines the structure used in reporting.
<b>Line Type</b>	<p>In this field you can select which line type you want to use. You can choose Sum, Heading, Page Break, Single Underscore, Double Underscore, and Posting lines. The line type cannot later be changed. If you want to change the line type, you must delete and recreate the existing line.</p> <p>Lines of the Posting type can only be created by creating a dimension value for the Account dimension in the Account Information Card workspace.</p> <p>Heading, Underscore, and Page Break lines are only displayed in the Account structure lines sub-tab if the check boxes Headings, Interlinings, or Page</p>

Field	Description
	Break, respectively, are checked in the Show island in the Account Structure tab
<b>Sum Level</b>	Enter a sum level in this field if the line type is Sum.
<b>Itemize</b>	For sum-level lines you can specify in this field whether the lines between the sum level of the current line and the same sum level or higher should be displayed. Only lines with a line number lower than that of the current line are affected by this.
<b>Name</b>	In this field you can enter the name of an account. A name is only needed if this is a sum or posting line.
<b>Description</b>	This field displays the description of the current account.
<b>P&amp;L/Balance Sheet</b>	In this field, you can specify whether the current structure line should be considered a P&L account or a balance sheet account. For accounts of the type Posting, this value is copied from the Account Information Card workspace when the account is created. For accounts of the types Sum, Heading, Underlining, and Page Break, the statement type must be specified manually. The statement type determines whether the current line is to be included in certain printouts. Printouts from the Print Trial Balance, Print Norwegian Balance, and Print Balance Sheet workspaces only include account structure lines of the type Balance Sheet, while printouts from the Print Income Statement workspace only include structure lines of the type P&L. This means that to include a heading in a trial balance, the heading must be marked as a Balance Sheet line in this workspace.
<b>Blocked</b>	If this field is checked, the current account is blocked. Blocked accounts are only displayed if Blocked Accounts is checked in the Show island in the Account Structure tab.
<b>New Line No.</b>	In this field you can enter a new line number, if you want the current line moved to a new line number. When you press Return, the line will be given the new line number, and if a line existed with the specified line number, that line and all subsequent line numbers will be increased by one.

## Actions

This section shows the actions available in the Account Structure workspace.

### Top Pane

Field	Description
<b>Move Sum Levels</b>	If you want to move an existing sum level to a higher sum level, you can do this by specifying the sum level from which the change should take effect in this field. When you choose this action, the sum levels from the sum level indicated will all be increased by one.

Field	Description
	If you, for instance, use four sum levels and wish to move the sum levels from level three, the sum levels three and four will both be moved up one sum level, that is, to sum level four and five, respectively, whereas the sum levels one and two will remain unchanged.
<b>Itemize Structure</b>	<p>In this field you can specify the sum level down to which you want to itemize the structure. When you choose this action, all sum levels down to the sum level specified in this field will be itemized. This corresponds to indicating for all sum levels in the Account structure lines sub-tab that they should be itemized. This field is particularly useful if you have a very detailed structure and, consequently, many lines to be itemized.</p> <p>There is no limit to the number of sum levels. In principle you could use sum levels from 1 to 3,500 or more, where sum level 1 would be the lowest level. For practical purposes you will, however, often limit the number of sum levels that you use.</p>

## Location Structure Workspace

Use this workspace to create and maintain a dimension structure that determines how reporting for the Location dimension is structured.

## Entity Structure Workspace

Use this workspace to create and maintain a dimension structure that determines how reporting for the Entity dimension is structured.

## Project Structure Workspace

Use this workspace to create and maintain a dimension structure that determines how reporting for the Project dimension is structured.

## Purpose Structure Workspace

Use this workspace to create and maintain a dimension structure that determines how reporting for the Purpose dimension is structured.

## Specification 1 Structure Workspace

Use this workspace to create and maintain a dimension structure that determines how reporting for the Specification 1 dimension is structured.

## Specification 2 Structure Workspace

Use this workspace to create and maintain a dimension structure that determines how reporting for the Specification 2 dimension is structured.

## Specification 3 Structure Workspace

Use this workspace to create and maintain a dimension structure that determines how reporting for the Specification 3 dimension is structured.

## Local Specification 1 Structure Workspace

Use this workspace to create and maintain a dimension structure that determines how reporting for the Local Specification 1 dimension is structured.

Local dimensions are different from common dimensions in that, instead of dimension values, you can create dimension lists, each of which contains a number of dimension values. You can attach each dimension list to one or more companies. Only those dimension values that are part of the dimension list that you attach to a company are available to the particular company. You can create a structure list for each dimension list.

## Local Specification 2 Structure Workspace

Use this workspace to create and maintain a dimension structure that determines how reporting for the Local Specification 2 dimension is structured.

Local dimensions are different from common dimensions in that, instead of dimension values, you can create dimension lists, each of which contains a number of dimension values. You can attach each dimension list to one or more companies. Only those dimension values that are part of the dimension list that you attach to a company are available to the particular company. You can create a structure list for each dimension list.

For more information about dimensions and Maconomy's twelve-dimensional chart of accounts, see "Introduction to the G/L Module" and the description of the Company Structure workspace, which corresponds to this workspace in terms of functionality.

## Local Specification 3 Structure Workspace

Use this workspace to create and maintain a dimension structure that determines how reporting for the Local Specification 3 dimension is structured.

Local dimensions are different from common dimensions in that, instead of dimension values, you can create dimension lists, each of which contains a number of dimension values. You can attach each dimension list to one or more companies. Only those dimension values that are part of the dimension list that you attach to a company are available to the particular company. You can create a structure list for each dimension list.

For more information about dimensions and Maconomy's twelve-dimensional chart of accounts, see "Introduction to the G/L Module" and the description of the Company Structure workspace, which corresponds to this workspace in terms of functionality.

## Delete Section

This section includes the fields and descriptions for the Delete section workspaces.

### Delete Posted General Journals Workspace

Use this workspace to delete the lines of a range of general journals that have been posted.

When you click **OK**, Maconomy deletes all of the lines in the general journals that match the selection criteria that you specify and that have not been specified as templates. However, the journals themselves are not deleted, and journal lines to which you do not have access are not deleted. Note that the journal lines that are deleted are the ones that you originally entered in the General Journal workspace. The G/L entries that are created as a result of posting those lines are, of course, not deleted.

General journal lines are deleted, which means that the journal can no longer be copied in the Journal Copying or General Journal Templates workspaces. There is no log of deleted lines.

#### Delete Posted General Journals Tab

This section includes the fields and descriptions for the Delete Posted General Journals tab.

#### Selection Criteria Island

Field	Description
<b>Posted Before</b>	In this field, you can specify a date. Only the lines of journals that were posted before this date are deleted. Journals posted on the specified date are not included.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. Only the lines of journals whose responsible company is within the specified range are deleted.

## Budget Overview

The budget module is used for creating, inspecting, and maintaining budget models and for comparing budget figures with actual amounts from the G/L module.

### Registration Section

This section includes the fields and descriptions for the Registration section workspaces.

### Finance Budgets Workspace

Use this workspace to link finance budget headers and finance budget lines and allow for creating, editing, deleting, submitting, and approving finance budgets and finance budget lines.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

### Line Types

Different line types can be used across the budget template and budgets. However, only some of the lines are allowed on certain budgets and sub budgets

On budget templates and sub budgets of the budget template, line types can be changed until the budgets are created from this template. On sub budgets of main budgets the line type cannot be changed once it has been set and the line has been saved. The only exception to this rule are the manual and calculation lines. Please see related section on how to convert between these two line types.

### Sum Line Type

This topic describes sum line types.

Sum lines exist on almost all budget types, except on the Direct Costs sub budget. Any line of this type simply sums up all lines below the sum line. The user cannot manually update or change sum lines. Whenever a subordinate line is updated, the sum line is automatically updated, as well as the sum lines on all types of budgets.

### Manual Lines

Manual lines are lines where a user can manually enter values for the periods or the total.

Lines of this type can be used on all types of budgets, except the Direct Costs and Settlements sub budgets.

If values are specified on the periods, the total field is automatically updated by summing up the periods on the line. If you prefer to only specify the total on the line and have it automatically allocated to the periods, either an allocation key can be specified on the line or you can manually specify an allocation type and the allocation values to be used on each period. Alternatively, you can specify that the total value on a manual line be allocated to the periods on the basis on the allocation of periods on another line. The reference line must be present on either the same budget as the manual line or, if the manual line is on a main budget, to a line on a sub budget (of type sub budget) to the main budget.

On sum budgets, the value of manual lines is the sum of all corresponding lines on the main and sum budgets directly below the sum budget in the budget hierarchy.

### Calculation Lines

Use the calculation line type when you must calculate the periods of a line on the basis of another line.

Each calculation line must refer to another line (on which the calculation should be based). Additionally, set a surcharge type as well as surcharge values for all periods. Alternatively, specify a surcharge key on the line.

The calculation line must refer to either a line on the same budget as the calculation line, or, if the calculation line is on a main budget, to line on a sub budget (of type sub budget) to the main budget.

On sum budgets, the value of calculation lines is the sum of all corresponding lines on the main and sum budgets directly below the sum budget in the budget hierarchy.

As with manual lines, use this line type on all budget types, except the direct costs and settlements budgets.

### Direct Cost Lines

When project or project group lines are created on the direct costs sub budget, a number of direct cost lines are automatically created as well.

The direct cost line type can exist on budget templates, main and sum budgets, as well as on the Direct Costs sub budget. However, it can only be added manually on the budget template.

Direct cost lines on direct costs sub budgets behave exactly as manual lines. This means that you can manually specify values on each period or have a total value allocated using an allocation type.

On main budgets, the value of the period and total fields of direct cost lines are the sum of the corresponding field on the associated direct cost line of all projects created on the direct costs sub budget.

On sum budgets, the value of calculation lines is the sum of all corresponding lines on the main and sum budgets directly below the sum budget in the budget hierarchy.

### Project Lines

Project Lines sum up all direct cost lines attached to the project line.

The project type can only be used on direct costs sub budgets. The type cannot be manually specified, but the type is automatically specified when the user creates a new line on the Direct Costs sub budget.

Project lines work more or less as sum lines, wherein they simply sum up all direct cost lines attached to the project line.

### Project Group Lines

Project group lines sum up all direct cost lines that are attached to a project group.

Project group lines are similar to project lines. They can only exist on direct costs sub-budgets, but you cannot manually create them. A project line is converted to a project group line when another project or project group line is indented to become a subordinate project or project group. Projects with subordinate projects become project groups.

Similar to project lines, project group lines sum up all direct cost lines that are attached to a project group.

### Settlement Line Type

Settlement lines are similar to manual lines in that you can specify period values or allocate a total.

A settlement line type exists only on the Settlements sub-budget.

Each settlement line must have a reference to another department to match settlements across departments/budgets. Because you can only make registrations on main budgets, you can only refer to main budgets on a settlement line.

Settlement lines work exactly as manual lines. You can either specify values for each period or specify a total and have it allocated to the periods using an allocation type, similar to manual lines.

When a settlement line is updated, the relevant internal and external settlements lines (on main and sum budgets) are updated accordingly.

### Internal Settlements Line Type

You can only use internal settlements line types on template budgets for main and sum budgets.

You can only create an internal settlements line type on template budgets. Internal settlements line types can only exist on main and sum budgets.

Each line of this type must refer to a settlements sub-budget that sums up settlements. For every settlements budget that is referred from a budget, there must be exactly two internal settlements lines on the budget that refer to the same settlement budget. These two lines should have different income/expense settings.

By definition, an internal settlement is a settlement between two departments in the sub-tree of the budget hierarchy that has the current budget as the root of the sub-tree. Because any main budget only has itself in the sub-tree having the main budget as root budget, all settlements registered on the main budget are external settlements. Hence, the internal settlements lines on main budgets are always 0.

On sum budgets, each internal settlements line sums up settlement lines satisfying the following criteria:

- The line is registered on a budget below the sum budget in the budget hierarchy.
- The referenced department/budget on the settlement line is also below the sum budget in the budget hierarchy.
- The line has the same income/expense setting as the internal settlements line.

- The line is registered on a settlements sub-budget that corresponds to the one referred to from the internal settlements line, that is, created from the same settlements sub-budget on the budget template.

### External Settlements Line Type

External settlements lines sum up settlement lines that refer to departments/budgets outside the sub-tree in the hierarchy of the main or sum budget of the external settlements line.

External settlements lines work in almost exactly the same way as internal settlement lines, except that they sum up the settlement lines that refer to departments/budgets outside the sub-tree in the budget hierarchy of the main or sum budget of the external settlements line.

For this reason, all settlements registered on a settlements sub-budget are summed up on the associated external settlements line on the main budget.

On sum budgets, the lines sum up settlements exactly as internal settlements lines except for this difference.

### Employee Line Type

An employee line on the Employees sub-budget contains information about a specific employee, such as salary, employment period, absence, and so on.

You can use lines of this type on the budget template, main and sum budgets, and the Employees sub-budget. You can manually specify the line type only on the budget template. On the Employees sub-budget, you create one employee line for each employee that you add to the sub-budget.

On the main and sum budgets, only one employee line can be present. This line and all subordinate lines (including their subordinate lines, and so on) are associated with each employee on the Employees sub-budget. On the main budget, all of these lines contain the summed values of all associated lines on the employees sub-budget, regardless of line type.

If there is no employee line on the main budget, you cannot use the Employees sub-budget from this main budget. Thus, you cannot use and budget on the employees who are already in Maconomy.

On the Employees sub-budgets, the employee lines contain information regarding the specific employee, such as monthly salary, employment period, absence, and so on.

On sum budgets, the value of employee lines is the sum of all corresponding lines on the main and sum budgets directly below the sum budget in the budget hierarchy.

### Salary Line Type

A salary line is associated with an employee.

You can use a salary line on the budget template, main and sum budgets, and on the Employees sub-budget. You can specify the line type manually only on the budget template.

On main and sum budgets, lines with the type Salary can only exist below an employee line, because a salary line must be associated with an employee.

If a salary line exists on a main budget, it exists for each employee on the associated Employees sub-budget. Salary lines on the Employees sub-budget are similar to calculation lines. However, salary lines cannot refer to another line on which the calculations should be based. Instead, calculations are performed on the monthly salary specified on the parent employee line. But just as for calculation lines, you specify a surcharge type on salary lines.

On sum budgets, the value of salary lines is the sum of all corresponding lines on the main and sum budgets directly below the sum budget in the budget hierarchy.

### Revenue Line Type

You can use a revenue line type on budget templates and main and sum budgets, similar to manual lines.

A revenue line type can exist on budget templates and main and sum budgets.

Revenue line behavior is similar to that of manual lines, except that the total expected employee income can be automatically updated on a revenue line. When the setting is enabled, the total field is automatically updated and the periods are recalculated (using the mandatory surcharge type/key) when the total expected employee income changes. If absence or a limited employment period has been set on the employee, this is taken into account when calculating the periods.

On sum budgets, the value of revenue lines is the sum of all corresponding lines on the main and sum budgets directly below the sum budget in the budget hierarchy.

### Type Conversion Line Type

You can use actions to convert manual lines to calculation lines and vice-versa.

When a line type is set on a line, you typically cannot change it. The only exception is that when you use actions, you can convert manual lines to calculation lines and vice-versa.

If you convert a manual line on a main budget to a calculation line, a sub-budget is created that contains two lines: a sum line and a subordinate manual line. The calculation line is set to refer to the sum line, and the previous amounts of the calculation line are copied to the manual line on the sub-budget. If you convert a manual line on a sub-budget, no additional sub-budget is created, and the calculation line is not set to refer to any other line.

If you convert a calculation line that refers to a line on a sub-budget to a manual line, and no other line refers to a line on the same sub-budget, the sub-budget is deleted.

In both types of conversion, any distribution values are reset, but the periodic and total amounts are maintained.

## Budget Types

There are two main budget types: Main Budget and Sum Budget.

**Main Budget** is used for budgets of departments that do not have any subordinate departments in the budget hierarchy.

**Sum Budget** is used for budgets of departments that have one or more subordinate departments in the budget hierarchy.

Regardless of budget type, you cannot change the following elements of lines created from a template line:

- Name
- Indentation
- Order
- Income/expense state

You cannot change these elements because those changes would affect automatic aggregation. For example, if you change the total expense line on one budget to be the sum of the result line, the values on the superior budget will not make sense. Also, if you change the names of the lines, it will be difficult for the employee who is responsible for a superior budget to compare the lines and values of the superior budget with the lines and values of the subordinate budgets.

### Sum Budget

The amounts from subordinate main and sum budgets are automatically aggregated when changed. They are then displayed on the sum budget.

You cannot modify any field on lines of sum budgets except the Comment fields. The amounts from all subordinate main and sum budgets are automatically aggregated when changed, and these sums are displayed on the sum budget.

The employee who is responsible for a sum budget must approve all subordinate budgets (after they are submitted) before the sum budget can be submitted for approval.

The amounts on almost all lines on a sum budget are simply sums of all associated lines—the lines created from the same template line as the line on the sum budget—on the main and sum budgets directly below the sum budget in the budget hierarchy. The only lines on sum budgets that are calculated in a different way are the internal and external settlements lines.

### Main Budget

If you have access to a main budget, you can specify value on it directly or on sub-budget lines.

If you have access to a main budget you can specify values on it, either directly on the lines of the budget or on lines of any sub-budget of the main budget. Depending on the type of the line, you can only change certain fields manually.

You can add lines, move lines, and delete lines.

Lines that you create based on a template have restrictions on which fields can be changed, such as the name, type, indentation, and order of the lines. However, you can change between the Manual and Calculation line types of some lines by using actions.

You can attach sub-budgets to each main budget. You can create some from the template and create, change, and delete others manually. Several budget types are available for use with these sub-budgets; each type has a different purpose and meaning.

### Employees Sub-Budget

The Employee sub-budget contains a line for each employee who is associated with a department in the main budget. You can manipulate employees in the Employees sub-budget to simulate changes in the department's headcount.

This sub-budget is only available if one of the lines of the associated main budget is of the type Employee. Otherwise, you cannot directly budget on employee income or expenses on the main budget. You cannot create the Employee sub-budget on the budget template; it is automatically created on main budgets when you create those from the template.

The Employee sub-budget contains a line for each employee who is associated with the department of the main budget. You can automatically fetch and copy all employees associated with the department into this sub-budget and also create, modify, and delete employees to simulate changes in the department's headcount. On the budget template, departments and employees are linked using dimensions. Note that any change done to (or deletion of) employees in this sub-budget does not change or delete the "original" employee in Maconomy. All changes only affect the budget employee in the budget module.

The lines on this sub-budget are configured in a tree structure, where any root line (a line that has no parent line) is of type Employee and represents a single employee. The Employee line can have a number of subordinate lines of types Sum, Calculation, Manual, or Salary.

All subordinate lines of the Employee line on the main budget are automatically copied onto the Employees sub-budget for each employee that you create. If, for example, the employee line on the main budget has one subordinate line, such as a Salary line, all employees created on the Employees sub-budget will have one subordinate Salary line.

When you make a change on a line in this sub-budget, the corresponding line on the main budget is updated accordingly.

### Direct Costs Sub-Budget

You can use the Direct Costs sub-budget to create lines of type project, project group, and direct cost.

You can use this type of sub-budget to create lines of type project, project group, and direct cost. However, the structure of this sub-budget is very strict, and the line type of the individual lines is controlled by the application logic. Thus, you cannot set or change the line type manually. When you create a line in this sub-budget, it is automatically interpreted as a project line. For each direct cost line that exists on the associated main budget, one similar direct cost line is created and attached as a subordinate line to this project line. You can understand the pairing of a project line and a number of subordinate direct cost lines as a building block in this sub-budget that you cannot change, break, or in any other way manipulate. You cannot manually delete direct cost lines; however, when you delete a project, all of the subordinate direct cost lines are deleted as well.

You can create multiple projects on the same direct costs sub-budget. Some of these projects can be indented to become subordinates of other projects. When this happens, the parent project is changed into a project group.

The only lines on this sub budget that allow you to specify amounts in the periods or the total fields are the direct cost lines that are attached to project lines. The direct cost lines that are associated with a project group line sum up the associated direct cost lines that are attached to

the projects and project groups that are subordinate to the project group of the direct cost lines. Project lines sum up the attached direct cost lines, and project group lines sum up the subordinate project and project group lines.

You cannot create the Direct Costs sub-budget on the budget template; it is automatically created on main budgets when you create those from the template.

### Settlements Sub-Budget

Use the Settlements sub-budget to create lines of the type sum and settlement.

Use this sub-budget to create lines of type sum and settlement. This budget also builds up in a tree structure, but the order and structure do not affect the way in which they are summed up on the main budget and any sum budgets above the main budget.

Settlements are summed up on the main budget depending on the budget of the associated main budget and the referenced budget on the settlement lines. All settlements on a main budget are by definition external settlements because they represent settlements with other departments. Each settlement on a Settlements sub-budget is summed up on the external settlements line (on the main budget) and linked to the specific settlements sub-budget, and has the same income/expense setting as the settlement line.

External settlement lines on the sum budgets are summed up using the same concept as the main budgets. An external settlement is a settlement between two departments/main budgets, of which exactly one of them is somewhere below the sum budget in the budget hierarchy and the other department/budget is not. Again, only the settlements that are registered on the settlements sub-budget that is referenced from the external settlements line and with the same income/expense setting as the external settlements line are summed up. This means that the external settlements lines do not only sum up settlements that are created on the associated settlements sub-budget, but also settlements that are registered with other main budgets and against the main budget of the external settlements line.

The internal settlements lines are summed up in almost the same way as external settlements lines, except that it only sums up the lines that are registered by and refer to departments/budgets somewhere below the sum budget in the budget hierarchy.

### Sub Budget

You can use the Sub-Budget type to create sub-budgets that are of the same kind and structure as the main budget. There is no special functionality linked to this type of sub-budget.

Sub-budgets of this type are of the same kind and structure as the main budget. They can contain lines of type Sum, Manual, and Calculation. Any line on this budget can be referred to from a calculation line on either this sub-budget or from a line on the main budget. There is no special functionality linked to this type of sub-budget.

## Distribution Types

Some line types allow for some kind of automatic calculation of the periods given either the total amount or amounts on another line. To make this possible, two distribution types are available - allocation and surcharge.

Distribution keys (allocation or surcharge keys) can be created for each of the distribution types. By doing this, it is much easier for users of budgets to have amounts distributed. On the relevant lines, the key can simply be selected, and the allocation or calculation is done according to the specification of the key. Another advantage is that when a specification of a key is changed, all lines that use this key are updated as well. For instance, if a key specifies how vacation pay should be calculated and the rules are changed, then the key can simply be updated to comply with the new rules and all lines calculating vacation pay are automatically updated as well.

### Allocation Distribution Type

The allocation type can be used on manual, direct cost, settlement, and revenue lines.

The purpose of the allocation type is to allow the user to specify the total amount on a line and then automatically have the amount distributed to the periods given an allocation type and allocation values for each period.

There are two types of allocation, the percentage and share types.

When the percentage type is used, the allocation values for all periods must sum up to 100 and then each period is updated with the associated percentage of the total amount. For example, if the total amount on the line is 300.00 and the allocation value for period 4 is 25, then period 4 will be assigned the amount 75.00.

When the share type is used, there is no requirement of what the allocation values must sum up to. Instead, the total amount is split up into even shares and allocated according to the allocation values. For example, if all allocation values on the line sum up to 120, the total amount is 300.00 and the allocation value on period 6 is 40, then period 6 will be assigned the amount 100.00, as  $40 \times 300.00 / 120 = 100.00$ .

The template enables the user to create allocation keys, which can be used across all budgets and sub budgets created from the template. Each allocation key specifies an allocation type and allocation values for each period. On any line that accepts allocation value, an allocation key can be used; however, the user should not specify an allocation type nor allocation values. When an allocation key is updated through the template, changes are pushed out to all lines using this allocation key.

### Surcharge Distribution Type

The surcharge type can be used on calculation and salary lines.

The surcharge type enables you to specify a reference line and then automatically have the periods and total calculated, depending on the values on the reference line. On salary lines however, no reference line is specified since calculations are based on the monthly salary of the associated employee.

There are two surcharge types: the percentage and factor types.

When the percentage type is used, each period is calculated as the percentage (specified in the surcharge value of the period) of the associated period on the reference line. For example, period 2 on the reference line is 500.00 and the surcharge value for period 2 on the calculation line is 20, then period 2 on the calculation line is assigned the amount 100.00, representing 20% of 500.00. The summed percentage across all surcharge periods need not be 100, as it does for allocations.

When the factor type is used, each period is calculated as the product of the surcharge value of the same period and the associated period on the reference line. For example, if period 3 on the reference line is 200.00 and the surcharge value for period 3 is 4.5, then period 3 on the calculation line is set to 900.00, or  $4.5 \times 200.00 = 900.00$ .

As with allocations, you can create surcharge keys on the template. These keys can then be referred to from calculation and salary lines, without having to specify the surcharge type and values manually. As with the allocation keys, if a surcharge key is updated on the template, then all calculation and salary lines using this surcharge key are updated as well.

## Finance Budget Tab

This section includes the fields and descriptions for the Finance Budget tab.

### Budget Island

Field	Description
<b>Name</b>	This field shows the name of the budget.
<b>Description</b>	This field shows the description of the budget.
<b>Finance Budget Type</b>	This field shows the type of finance budget.

### Currency Island

Field	Description
<b>Currency</b>	This field shows the currency used as base currency.
<b>Exchange Rate Table</b>	This field and the Exchange Rate Date field are used for all currency calculations made on this budget.
<b>Exchange Rate Date</b>	This field and the Exchange Rate Table field are used for all currency calculations made on this budget.

## Finance Budget Lines Sub-Tab

This section includes the fields and descriptions for the Finance Budget Lines sub-tab.

Field	Description
<b>Name</b>	This field displays the name of the finance budget line.
<b>Line Type</b>	This field shows the type of information that is represented on the line.
<b>Income</b>	This field shows whether the line is an income or expense line.
<b>Currency</b>	This field displays the currency of the budgeted amounts on the finance budget line.
<b>Total</b>	This field displays the total budgeted amount for this line.

## Finance Budget Line Details Workspace

Use this workspace to display finance budget lines in the Finance Budget Line tab and allow for editing on lines in the tab.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

## Finance Budget Line Tab

This section includes the fields and descriptions for the Finance Budget Line tab.

### Line Island

Field	Description
<b>Name</b>	In this field, enter the name of the finance budget line.
<b>Description</b>	In this field, enter a description for the selected line.
<b>Line Type</b>	This field shows the line type.

## Finance Budget Project Lines Workspace

Use this workspace to list and allow for the editing of all project and project group finance budget lines that are related to a single finance budget header.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

## Finance Budget Header Tab

This section includes the fields and descriptions for the Finance Budget Header tab.

### Budget Island

Field	Description
<b>Name</b>	This field shows the name of the finance budget.
<b>Description</b>	This field shows the description of the budget.
<b>Finance Budget Type</b>	This field shows the type of budget.

## Finance Budget Lines Sub-Tab

This section includes the fields and descriptions for the Finance Budget Lines sub-tab.

Field	Description
<b>Name</b>	This field displays the name of the finance budget line.
<b>Direct Cost 1-15</b>	These fields display the names of the first 15 direct cost lines on the main budget.
<b>Total</b>	This field displays the total budgeted amount for this line.

## Finance Budget Direct Cost Lines Workspace

Use this workspace to list and allow for the editing of all direct cost finance budget lines that are associated with a project or project group finance budget line.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

## Finance Budget Line Tab

This section includes the fields and descriptions for the Finance Budget Line tab.

### Card Part Island

Field	Description
<b>Name</b>	This field shows the name of the finance budget line.

## Finance Budget Lines Sub-Tab

This section includes the fields and descriptions for the Finance Budget Lines sub-tab.

Field	Description
<b>Name</b>	This field displays the name of the finance budget line.
<b>Currency</b>	This field displays the currency of the amounts on the finance budget line.
<b>Total</b>	This field displays the total budgeted amount for this line.

## Finance Budget Line Actuals Workspace

Use this workspace to display actuals that are related to a single finance budget line.

Actuals are shown for the fiscal year of the budget as well as the three previous fiscal years. You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

## Finance Budget Line Tab

This section includes the fields and descriptions for the Finance Budget Line tab.

### COPY TO COME

Field	Description

## Budget Settlement Line Details Workspace

Use this workspace to display settlement finance budget lines in the Finance Budget Line tab and allow for creating a settlement finance budget line with reversed amounts (reverse settlement) as the finance budget line in the tab.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

## Finance Budget Line Tab

This section includes the fields and descriptions for the Finance Budget Line tab.

### Line Island

Field	Description
<b>Name</b>	In this field, enter the name of the budget settlement line.

Field	Description
<b>Description</b>	In this field, enter a description for the selected line.

### Finance Budget Lines Sub-Tab

This section includes the fields and descriptions for the Finance Budget Lines sub-tab.

#### Contents

Field	Description
<b>Copy</b>	This field shows a link to the CreateReverseSettlement action, causing the line in the table to be copied.
<b>Name</b>	This field displays the name of the finance budget line.
<b>Budget</b>	This field displays the type of finance budget line.
<b>Income</b>	This field displays whether the line is an income or expense line.
<b>Currency</b>	This field displays the currency for the amounts Period1 - Period12 and Total.
<b>Total</b>	This field displays the total budgeted amount for this line.

## Referencing Budget Settlements Workspace

Use this workspace to list all settlement finance budget lines that refer to a specific finance budget header—the header of the finance budget line in the Finance Budget Header tab of this workspace.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

### Finance Budget Header Tab

This section includes the fields and descriptions for the Finance Budget Header tab.

#### Budget Island

Field	Description
<b>Name</b>	This field shows the name of the finance budget line.
<b>Description</b>	This field shows the description for the finance budget line.

## Reverse Budget Settlements Workspace

Use this workspace to display settlement finance budget lines based on which finance budget they refer to.

The Finance Budget Line tab displays any settlement finance budget line. The Finance Budget Lines sub-tab displays all of the settlement finance budget lines that reference the budget header of the line in the tab and that also belong to the budget header referenced from the line in the tab. You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

### Finance Budget Line Tab

This section includes the fields and descriptions for the Finance Budget Line tab.

#### Line Island

Field	Description
<b>Name</b>	This field shows the name of the reverse budget settlement line.
<b>Description</b>	This field shows the description for the selected line.

### Finance Budget Lines Sub-Tab

This section includes the fields and descriptions for the Finance Budget Lines sub-tab.

Field	Description
<b>Copy</b>	This field shows a link to the CreateReverseSettlement action, causing the line in the table to be copied.
<b>Name</b>	This field displays the name of the finance budget line.
<b>Income</b>	This field displays whether the line is an income or expense line.
<b>Currency</b>	This field displays the currency for the amounts Period1 – Period12 and Total.
<b>Total</b>	This field displays the total budgeted amount for this line.

## Related Budget Direct Cost Lines Workspace

Use this workspace is to list similar direct cost finance budget lines that are related to the same finance budget.

The Finance Budget Line tab displays direct cost finance budget lines located on a main finance budget header. The Finance Budget Lines sub-tab lists all of the associated (identically named)

direct cost finance budget lines on the subordinate direct costs sub-budget. The reason for this is that the direct cost finance budget lines on the main budget show the sum of all of the associated direct cost finance budget lines on the direct costs sub-budget. Thus, this workspace provides an overview of which lines and amounts make up the amounts on the finance budget line in the Finance Budget Line tab.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

### Finance Budget Line Tab

This section includes the fields and descriptions for the Finance Budget Line tab.

#### Line Island

Field	Description
<b>Name</b>	This field shows the name of the related budget direct cost line.
<b>Description</b>	This field shows the description for the selected line.
<b>Line Type</b>	This field shows the line type.

### Finance Budget Lines Sub-Tab

This section includes the fields and descriptions for the Finance Budget Lines sub-tab.

Field	Description
<b>Project</b>	This field shows the project number on which the amount of the current budget entry has been budgeted.
<b>Currency</b>	This field displays the currency of the line's budgeted amounts.
<b>Total</b>	This field displays the total budgeted amount for this line.

## Previous Finance Budget Lines Workspace

Use this workspace to display budget amounts from previous fiscal years.

The Finance Budget Line tab displays finance budget lines with the budget amounts of the fiscal year, along with budget amounts of the three previous fiscal years.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

## Budget Line Tab

This section includes the fields and descriptions for the Finance Budget Line tab.

Field	Description
<b>Compare with Budget Type</b>	This field is used to specify the budget (specified by budget type) to which to compare.

## Finance Budget Employees Workspace

This workspace includes information on finance budget employees.

## Finance Budget Tab

This section includes the fields and descriptions for the Finance Budget tab.

### Budget Island

Field	Description
<b>Name</b>	This field shows the name of the finance budget.
<b>Description</b>	This field shows the description of the budget.
<b>Finance Budget Type</b>	This field shows the type of budget.

## Finance Budget Lines Sub-Tab

This section includes the fields and descriptions for the Finance Budget Lines sub-tab.

Field	Description
<b>Name</b>	This field displays the name of the finance budget line.
<b>Line Type</b>	This field shows the type of information that is represented on the line.
<b>Currency</b>	This field displays the currency of all budgeted amounts on the line.
<b>Total</b>	This field displays the total budgeted amount for this line.

## Finance Budget Employee Income Workspace

Use this workspace to display all of the finance budget employees who are associated with the main finance budget in the Finance Budget tab.

The Finance Budget Lines sub-tab displays a line for each finance budget employee with all income-related fields. The finance Budget tab displays accumulated income fields for all employees in the tab to provide an overview of the total income amount on that main finance budget.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

### Finance Budget Header

This section includes the fields and descriptions for the Finance Budget Header tab.

#### Base Island

Field	Description
<b>Total Annual Hours</b>	This field shows the total number of hours for the employees associated with the budget (unproductive plus productive hours).
<b>Employees</b>	This field shows the total number of employees associated with this budget.

#### Absence Island

Field	Description
<b>Employees</b>	This shows how many employees are absent in each period (month) and thus not contributing to income/expense of that period.
<b>Hours</b>	This shows how many hours of absence in each period (month) and thus not contributing to income/expense of that period.

### Finance Budget Lines Sub-Tab

This section includes the fields and descriptions for the Finance Budget Lines sub-tab.

Each line in the table represents a single employee and each field shows a value of that specific employee.

Field	Description
<b>Name</b>	This field shows the name of the employee.
<b>Employee Category</b>	This field shows the employee category of the specific employee and is used to derive the productive and unproductive percentages (percentage of working hours) of the employee.

Field	Description
<b>Annual Hours</b>	This field shows the total number of hours for the specific employee represented on the line associated with the budget (unproductive plus productive hours).
<b>Unproductive Time Percentage 1-5</b>	Five fields show a percentage of the employed hours that are used on non-work related tasks, for example, vacation. Each field corresponds to the work type defined in System Information.
<b>Unproductive Time 1-5</b>	Five fields show the number of employed hours that are used on non-work related tasks, for example, vacation. Each field corresponds to the work type defined in System Information.
<b>Productive Hours</b>	This field is used to specify the number of available (productive) hours. It equals the difference between the Annual Hours and the sum of unproductive hours.
<b>Productive Time Percentage 1-5</b>	Five fields show a percentage of the working hours that are used on work related tasks, for example, invoicable hours. The 5 percentages should sum up to 100. Each field corresponds to the work type defined in System Information. This is a percentage of the total amount of productive hours, not a percentage of the total amount of annual hours.
<b>Productive Time Hours 1-5</b>	Five fields show an amount of hours calculated from the total amount of productive hours and the related Productive Time Percentage field. Each field corresponds to the work type defined in System Information.
<b>Productive Time Rate 1-5</b>	Five fields used to specify a rate for the working hours that are used on work related tasks, for example, invoicable hours.
<b>Productive Time Income 1-5</b>	Five fields show the income for the working hours that are used on work related tasks, for example, invoicable hours.
<b>Total Income</b>	Total expected income for all types of work hours.

## Finance Budget Employee Details Workspace

Use this workspace to display finance budget employees in the Finance Budget Line tab and allow for editing.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

## Finance Budget Line Tab

This section includes the fields and descriptions for the Finance Budget Line tab.

### Line Island

Field	Description
<b>Name</b>	This field displays the name of the finance budget employee.
<b>Line Type</b>	This field shows the type of information that is represented on the line.

## Related Budget Employees Workspace

Use this workspace to display finance budget employee lines that are related to specific finance budget lines on a main budget.

The Finance Budget Line tab displays finance budget lines that are related to budgeting on employees. The Finance Budget Lines sub-tab displays a list of the corresponding lines on the employees sub-budget. One line exists for each employee on the employees sub-budget. The reason for this is that these finance budget lines on the main budget show the sum of all of the associated lines on the employees sub-budget. Thus, this workspace provides an overview of which lines and amounts make up the amounts on the finance budget line in the Finance Budget Line tab.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

## Finance Budget Line Tab

This section includes the fields and descriptions for the Finance Budget Line tab.

### Budget Island

Field	Description
<b>Name</b>	This field shows the name of the finance budget.
<b>Description</b>	This field shows the description of the budget.

## Finance Budget Lines Sub-Tab

This section includes the fields and descriptions for the Finance Budget Lines sub-tab.

Field	Description
<b>Name</b>	This field displays the name of the finance budget employee.

Field	Description
<b>Currency</b>	This field displays the currency of the budgeted amounts of the finance budget employee.
<b>Total</b>	This field displays the total budgeted amount for this line.

## Previous Finance Budget Employees Workspace

Use this workspace to display budget amounts from previous fiscal years. The Finance Budget Line tab displays lines on the employees sub-budget with the budget amounts of the fiscal year, along with budget amounts of the three previous fiscal years.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

### Finance Budget Line Tab

This section includes the fields and descriptions for the Finance Budget Line tab.

Field	Description
<b>Compare with Budget Type</b>	This field is used to specify the budget (specified by budget type) to which to compare.

## Budget Journal Workspace

Use this workspace to create budget journals.

A budget journal is a collection of changes for an existing budget model. By entering lines into a budget journal, you can create budget entries and perform reallocations. When you approve a budget journal, Maconomy creates budget entries from the approved lines in the budget journal.

Use the Budget Journal tab to enter a company name and information about the budget model to which the budget journal applies. The sum of the amounts of the current budget journal lines is displayed.

Use the Budget Journal Lines sub-tab to enter opening and closing amounts (or quantities) and selection criteria within the 12 G/L dimensions and the 8 module dimensions. This enables you to create G/L budgets as well as budgets for customers, vendors, and so on. Maconomy distributes the difference between the opening and closing balances among the 12 periods of the year. You can distribute the amount (or quantity) manually or automatically by using an allocation key. Enter all amounts in the sub-tab in the base currency of the company that is responsible for the budget journal.

If you create budget entries for a company other than the one specified in the Budget Journal tab, Maconomy creates intercompany balances when the journal is approved. Maconomy maintains all dimensions (except for the account number and local dimension values) of the budget entry when the entry is part of another company's budget.

When Maconomy creates an intercompany balance, it converts the amounts into the base currencies of the different companies. Maconomy always performs the conversion of currencies based on the exchange rate on January 1 of the fiscal year of the budgeting company.

If a budget model is part of a budget group, when you approve a budget journal for the budget group, Maconomy creates corresponding budget journals for the other budget models in the budget group. You can specify whether these journals should be approved manually or automatically.

You can only approve a budget journal when the amounts of all periods balance, unless you are using a budget model that is set up to manage period variances, meaning that it has a dimension combination that is used to post period variances.

All periods balance when all of the control fields in the Budget Journal tab are equal to zero.

If you are using a budget model that is set up for period variances, Maconomy automatically creates offsetting budget lines for period variances when you approve a budget journal in which the periods do not balance, but for which the closing balance is zero.

If Maconomy creates a budget line that offsets period variances, and if the number in the **Company No.** field on the line is different from the company number in the **Company No.** field in the Budget Journal tab, Maconomy creates intercompany postings between these two companies when you post the journal.

When you approve a budget journal, it is no longer displayed in this workspace. You can use the Show Budget Entries and Budget Inspection workspaces to view the journal lines, which become budget entries, and assigned period variance entries, if any.

## Budget Journal Tab

This section includes the fields and descriptions for the Budget Journal tab.

### Journal Island

Field	Description
<b>Journal No.</b>	This field displays the number of the budget journal. New budget journals are automatically given the next available number from the current company's "Budget Journal" number series. The number series is created in the window System Numbers in the Set-Up module.
<b>Repeat Dimensions</b>	If you check this box, Maconomy will suggest the dimensions from the previous line when you create a budget journal line. The dimensions can be changed.
<b>Balance Amount</b>	<p>If you check this box, Maconomy will suggest an amount that will balance the budget journal when you create a budget journal line. The amount can be changed.</p> <p>If you enter an amount in for instance the field "Amount, Closing," which cancels out the other journal lines, the journal lines may still not be in balance. This is the case if the amounts on other lines cannot be rounded off exactly over the 12 periods.</p> <p>If an amount cannot be divided by 12, the first 11 periods are allocated equal amounts, whereas period 12 is allocated the amount with the variance. This balance cannot exceed 11 cents.</p> <p>If you let Maconomy fill in the line which is to balance the other journal lines, the budget journal can always be approved.</p>

Field	Description
	If the field “Balance Amount” is not checked, you have to enter amounts in the table part.
<b>Enter Value in Thousands</b>	If you check this box, Maconomy will multiply the amounts entered by 1000. If you change an amount on a line, the amount you enter will also be multiplied by 1000.
<b>Difference Entries Created</b>	<p>This field is automatically marked by Maconomy, if difference entries have been created for the budget journal in question. Difference entries are created by means of selecting the action “Create Difference Entries” in the Action menu.</p> <div style="border: 1px solid blue; padding: 5px;"> <p><b>Note:</b> Difference entries can only be made once for each budget journal. The field cannot be marked manually. See also the description of the action “Create Difference Entries.”</p> </div>

### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

### Budget Model Island

Field	Description
<b>Budget Model</b>	Use this field to enter the name of the budget model you wish to post journal entries to. This field is mandatory. The description of the budget model is transferred from the Budget Models workspace.
<b>Budget Type</b>	This field displays the budget type which was specified for the current budget model in the Budget Models workspace.
<b>Fiscal Year</b>	This field displays the fiscal year used in the current budget model. The fiscal year is retrieved from the Budget Models workspace.
<b>Price Year</b>	This field displays the price year that applies to the current budget model. The price year is used at price projection of the budget models.

### Budget Group Island

Field	Description
<b>Budget Group</b>	<p>In this field you can specify a budget group if the current budget model is attached to one or more budget groups in the Budget Groups workspace.</p> <p>If you specify a group, corresponding budget journals will be created for the other budget models in the budget group when you approve the current budget journal, so that the same changes are made in all the budget models in the group.</p> <p>This field also displays the description of the selected budget group.</p>

Field	Description
<b>Approve Automatically</b>	If you check this box, Maconomy will automatically approve budget journals created for the other budget models in the budget group specified above.

### Company Island

Field	Description
<b>Company</b>	<p>In this field, you can enter the number of the company to which the budget applies. The company must use the same financial year as the selected budget model. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the Dimension Derivation workspace in the G/L module. If no value can be derived, the standard value is transferred from the System Information workspace in the Set-Up module. See the description of the Dimension Derivations workspace in the G/L module for a discussion of dimension derivations.</p> <p>If you create lines in the budget Journal Lines sub-tab where the value in the "Company No." field is different from the value in this field, intercompany balances will be created when you approve the budget journal. In the intercompany balance, the responsible company will be the company displayed in this field.</p> <p>It is not possible to change budget journal lines for intercompany postings in budget journals that are created automatically through budget copying or by creating budget journals in a budget group described in the Budget Group island. The intercompany posting accounts are specified by means of dimension combinations in the Intercompany Accounts workspace in the G/L module.</p> <p>This field also displays the name that is associated with the company number specified in the first part of this field.</p>
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company" above. See the field "Base Currency" in the Company Information workspace in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### Batch Total Island

Field	Description
<b>Control, Opening</b>	This field shows the total opening amount yet to be allocated for the budget journal to balance. The value is calculated as the sum of the opening amounts in the Budget Journal Lines sub-tab.
<b>Control 1-12</b>	<p>These fields display the total amount that remains to be accounted for in the budget before the current budget journal for the period in question is in balance. The value is calculated as the sum of the budget figures for each period from the table part of the budget journal.</p> <p>For example: You have budgeted for item purchases amounting to USD 200,000 in period 3. The liquid assets account has a budget amount of USD -140,000. The</p>

Field	Description
	field "Control 3" will consequently display an amount difference of USD 60,000. This means that the budget journal will not be in balance until the balance amount has been budgeted, for example, on the Item Sales account.

## Budget Journal Lines Sub-Tab

This section includes the fields and descriptions for the Budget Journal Lines sub-tab.

Field	Description
<b>Reference Date</b>	In this field, you can enter a reference date for the current budget entry. When you create the first line in the budget journal, Maconomy suggests today's date as the reference date. On subsequent lines, Maconomy suggests the reference date used on the previous line.
<b>Entry Date</b>	In this field you can enter the entry date of the current budget line. The date in this field is also the date from which Maconomy accrues the amounts on the budget line in the remaining periods of the budget. When you create a budget journal line, Maconomy suggests today's date as entry date on the first budget journal line. If any subsequent budget journal lines are created, the entry date previously used is automatically suggested on new lines.
<b>Account No.</b>	Enter the number of the account on which you want to budget in this field. You can budget on all accounts except intercompany accounts
<b>Entry Description</b>	Here you can enter a text to describe the current journal line.
<b>Allocation Key</b>	<p>Here you can enter an allocation key to be used on the journal line. An allocation key specifies how the difference between the opening and the closing amounts is to be distributed among the 12 periods on the line.</p> <p>An allocation key can be a percentage allocation on all months or based on the allocation from a different budget model or an actual set of accounts. Allocation keys are created in the Allocation Keys workspace. If you want to use an allocation key based on percentages, the sum of the percentages must be 100 for it to be used.</p> <p>If you do not specify an allocation key, Maconomy will automatically allocate the amount to the periods in the year remaining from the date of entry. If you enter a change in the budget in the month of February, and the periods follow the months of the year, Maconomy will automatically allocate the amount evenly from March to December.</p> <p>You can allocate amounts manually by using the "Amount 1-12" fields. If you do this, you remove any allocation key previously entered, as the figures will then no longer match the allocation key. If you specify an allocation key after entering amounts manually in individual periods, these are overwritten with new values.</p> <p>Any allocation key specified is also transferred to the budget entry created as a result of the current line when the budget journal is posted.</p>

Field	Description
<b>Amount Opening, Base</b>	Here you can enter an opening amount for the journal line if you have specified a balance sheet account in the "Account No." field. If the journal line is for a P/L account, you cannot specify an amount in this field
<b>Amount Closing, Base</b>	<p>Here you can enter a closing amount for the budget entry. The value in this field is equal to the amount in the field "Amount, Opening" plus the sum of values in the fields "Amount 1-12."</p> <p>You can specify a closing amount for balance sheet accounts as well as for P/L accounts. A closing amount for a P/L account expresses the sum of budgeted activity on the account for the current fiscal year. The difference between the opening and the closing amount for a balance sheet account is an expression of the expected change in the stock value of the current account.</p> <p>If you specify an amount different from zero in this field, Maconomy will overwrite any values in the fields "Amount 1-12" and allocate the closing amount in accordance with the allocation key.</p> <p>If you enter changes in the fields "Amount 1-12" at a later stage, Maconomy updates the value in the field "Amount, Closing," which corresponds to the sum of the fields "Amount 1-12."</p> <p>The sum of the opening and closing amounts must amount to a total of zero for all the journal lines of the budget journal, so that the budget journal is in balance.</p>
<b>Registration Code</b>	In this field you can enter a registration code from the Registration Codes workspace in the G/L module. The registration code is convenient if you often use certain combinations of dimension values on the current line.
<b>Company Name</b>	This field displays the name of the company entered in the field "Company No."
<b>Company No.</b>	<p>In this field you can specify the number of the company that the journal line refers to. The company must use the same financial year as the selected budget model. If you do not enter a number, the company number from the Budget Journal tab is transferred to this field.</p> <p>If the number in this field is different from the company number in the "Company No." field in the Budget Journal tab, you have effectively made a transfer between two companies. When you approve the budget journal, Maconomy will create intercompany postings since you are not permitted to post on the budget of another company. See the description of the Intercompany Accounts workspace in the G/L module for a discussion of intercompany balances.</p>
<b>Location</b>	In this field you specify a value for the "Location" dimension. Together with the other 11 G/L dimensions and the 8 module dimensions (customer, vendor, job, employee, and so on), this value determines the allocation combination of the journal line.

Field	Description
<b>Entity</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Project</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Purpose</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Local Spec.1-3</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Customer No.</b>	In this field, you can specify a customer created in the A/R module. If you enter a job number on the line, the customer number in this field must be the customer specified on the job in question. If no customer number has been specified, and you enter a job number, the customer number from the specified job is automatically transferred to this field.
<b>Vendor No.</b>	In this field, you can specify a customer created in the A/P module. Together with the seven other module dimensions (customer, vendor, job, employee, and so on) and the 12 G/L dimensions, this value determines the allocation combination of the journal line.
<b>Job No.</b>	<p>The functionality of this field is similar to that of the field “Customer No.” above. If you enter a job number, the customer number in the field “Customer No.” above must be the customer specified on the job. If no customer number has been specified, and you enter a job number, the customer number from the specified job is automatically transferred to the budget journal line.</p> <div> <p><b>Note:</b> Any job allocation combination rules assigned to the job are ignored, as Maconomy does not check whether the allocation combination on the current line complies with the job allocation combination rules of the job. For further information about job allocation combination rules, see the description of the Job Allocation Combinations workspace in the Job Cost module.</p> </div>
<b>Activity No.</b>	The functionality of this field is similar to that of the field “Vendor No.” above.
<b>Task Name</b>	The functionality of this field is similar to that of the field “Vendor No.” above.
<b>Employee No.</b>	The functionality of this field is similar to that of the field “Vendor No.” above.
<b>Item No.</b>	The functionality of this field is similar to that of the field “Vendor No.” above.
<b>Asset No.</b>	The functionality of this field is similar to that of the field “Vendor No.” above.

Field	Description
<b>Amount 1-12, Base</b>	<p>If you have specified an opening amount, a closing amount, or both, and perhaps an allocation key, the values in the “Amount 1- 12” fields will be filled in automatically by Maconomy.</p> <p>As an alternative, you can specify allocated amounts manually for one or more periods, and you can manually change an allocated amount. If an amount in one of the “Amount 1-12” fields is changed, the closing amount will be changed accordingly for the current journal line. When allocating manually, any previously selected allocation key is canceled.</p>
<b>Quantity Opening</b>	<p>Here you can enter an opening quantity for the journal line, if you have specified a balance sheet account in the “Account No.” field. If the journal line is for a P/L account, you cannot specify a quantity in this field.</p>
<b>Quantity Closing</b>	<p>Here you can enter a closing quantity for the budget entry. You can enter a closing quantity for both balance accounts and P/L accounts. The value in this field is equal to the sum of values in the “Quantity 1-12” fields.</p> <p>A closing quantity for a P/L account expresses the sum of budgeted activity on the account for the current fiscal year. The difference between the opening and the closing quantity for a balance sheet account is an expression of the expected change in the stock value of the current account. If you later on enter changes in the “Quantity 1-12” fields, Maconomy updates the value in the “Quantity, Closing” field, which corresponds to the sum of the “Quantity 1-12” fields.</p> <p>The sum of the opening and closing quantities must amount to a total of zero for all the journal lines of the budget journal, so that the budget journal is in balance.</p>
<b>Quantity 1-12</b>	<p>If you have specified an opening quantity, a closing quantity, or both, and perhaps an allocation key, the values in the “Quantity1-12” fields will be filled in automatically by Maconomy. As an alternative, you can specify allocated quantities manually for one or more periods, and you can manually change an allocated quantity. If a quantity in one of the “Quantity 1-12” fields is changed, the closing quantity will be changed accordingly for the current journal line. When allocating manually, any previously selected allocation key is canceled.</p>
<b>Copy from Budget Model</b>	<p>In this field, you can specify a reference to an existing budget model, causing Maconomy to copy amount, quantity, and dimension information from a given budget entry within that model to the current line. The information is transferred from the budget entry that has the entry number specified in the field “Entry No.” in the specified budget model, overwriting any information previously entered on the line.</p> <p>Copying information from existing entries can be used for two purposes: reusing amount or dimension information on new entries, or reallocating existing budget entries.</p> <p>If you simply wish to reuse information from a given budget entry in a given budget model, enter the number of the budget model to which the entry belongs in this field. In the field “Entry No.,” you can then specify the number of the desired entry within that budget model. Maconomy suggests the budget</p>

Field	Description
	<p>model specified in the card part of the current budget journal. When you press Enter, Maconomy retrieves the dimensions, amounts, and quantities of the specified entry, and you can change the information as you desire.</p> <p>If you wish to use the functionality for reallocating a budget entry, you must create several lines to set off the original entry and post the correct budget information. For an example of this use of this field, please see the description of the field "Invert Sign" below.</p>
<b>Entry No.</b>	<p>In this field, you can specify a reference to an existing budget entry in the budget model specified in the field "Budget Model" above, causing Maconomy to copy amount, quantity, and dimension information from the specified budget entry. For further information on the use of this field, see the description of the field "Copy from Budget Model" above.</p>
<b>Invert Sign</b>	<p>In this field, you can specify that you wish the sign to be inverted (for instance from plus to minus) on amounts and quantities retrieved by specifying a budget model in the field "Copy from Budget Model" and an entry number in the field "Entry No." This field can, for example, be used if you wish to reverse an erroneous budget entry. The field is only used when an entry number has been specified on the line, and once you press Enter, the field cannot be changed.</p> <p>For example: In a previous budget journal, you entered a budget entry for 5,000 units in the base currency of the current company (in this case USD) to account number 2140, specifying the location "NY." This entry is to be reallocated to the location "LA," but with the same account and amount. In the Show Budget Entries workspace, you have found the entry number which is 1024 in the budget model "Budget 2003." Create a budget journal for budget model "Budget 2003." In the table part of the budget journal, specify "Budget 2003" in the field "Copy from Budget Model" and the number 1024 in the field "Entry No." Delete any values in the account, dimension, and amount fields, and mark the field "Invert Sign." Then press Enter. Maconomy now transfers the information from budget entry number 1024 in budget model "Budget 2003," but with inverted amounts and quantities.</p> <p>This entry will set off the original entry. Create a line, once again making sure that the account number, dimensions, and amount fields are empty, and once again specifying budget model "Budget 2003" and entry number 1024. The information is transferred again, but this time with the original sign on the amounts. The location can now be changed from "NY" to "LA."</p>

## Actions

This section shows the Actions available in the Budget Journal workspace.

### Top Tab

Field	Description
<b>Create Difference Entries</b>	<p>When you select this action, Maconomy creates difference entries for the specified budget journal lines. If you want to adjust the amount on an already approved budget journal line, you enter the new desired budget amount in a new budget journal for the relevant account number and select the “Create Difference Entries” action. Maconomy then adjusts the current budget journal line to display the difference between the amount entered and the budget amount that you wanted to adjust. This means that if you had approved a budget line of, for example, GBP 1000 on account X, and you wish to adjust that amount to GBP 1500, you enter a new budget journal line for account X specifying the new desired amount of GBP 1500 on the line. When you then select the “Create Difference Entries” action, Maconomy adjusts the amount on the budget line to GBP 500 as this amount is the difference between the original and the new amount.</p> <p>Having created one or more difference entries in a budget journal, you must set off the relevant entries in order to balance the journal. After approving the journal, the budget figures on the adjusted account now correspond to the amount specified in the new journal. According to the above example, the new amount for account X will thus be GBP 1500. The adjustments can be inspected in the window Budget Inspection.</p> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> The “Create Difference Entries” action can only be used once for each journal. Having used this action, you cannot assign allocation keys to the lines of the budget journal.</p> </div>
<b>Approve</b>	<p>When you select this action, budget entries are created from the journal lines entered. One entry is created per line. Furthermore, intercompany postings are made if the company number in the Budget Journal tab and the Budget Journal Lines sub-tab are not identical. In these intercompany balances the amounts on the entries created in the intercompany company (the company is specified on the budget line) are converted into the base currency of the intercompany company. You can inspect budget entries in the Show Budget Entries and Budget Specification workspaces.</p> <p>If you have specified a budget group in the budget journal, budget journals will be created for the remaining budget models in the budget group. These budget journals can be approved manually, whereupon they too are created as budget entries. If the box “Approve Automatically” is checked, the new budget journals will however be approved at the same time as the budget model indicated in the budget journal, and cannot be approved manually.</p> <p>The budget journal can only be approved if the journal lines balance, that is, when the “Control 1-12” and “Control Total” fields equal zero.</p>

Field	Description
<b>Cancel Journal</b>	When you select this action, the budget journal is canceled.

## Budget Reallocation Workspace

Use this workspace to reallocate budget entries, letting Maconomy create the necessary budget entries.

In this workspace, you can change the selection criteria for a range of budget entries, not including intercompany entries.

You perform a reallocation by creating a budget reallocation journal and then using the **Reallocate** action.

In the Selection Criteria island, enter the range of entries to be reallocated.

In the Reallocate To island, enter the dimension values to which the entries are to be reallocated. If you leave a dimension field blank, the reallocated entries keep their current values in that dimension field.

Select the **Show Lines** field to display the entries that match the selection criteria.

Use the **Reallocate** action to perform the reallocation. After reallocation, the Budget Entries sub-tab displays information about the budget entries that the reallocation created. The selection criteria are blocked for the current journal so that you can review the criteria that you used.

### Budget Reallocation Tab

This section includes the fields and descriptions for the Budget Reallocation tab.

#### Selection Criteria Island

Field	Description
<b>Show Entries</b>	<p>If this field is marked, the Budget Entries sub-tab shows the budget entries matching the selection criteria or, if the field "Reallocated" is marked the budget entries created as a result of the completed reallocation.</p> <div style="border: 1px solid #0070C0; padding: 10px; margin-top: 10px;"> <p><b>Note:</b> The entries do not have to be shown to be reallocated. When the "Reallocate" action is selected, Maconomy reallocates all budget entries matching the selection criteria, regardless of whether this field has been marked.</p> </div>
<b>Budget Model</b>	In these fields, you can specify a range of budget model names. The reallocation will only affect budget entries belonging to budget models within the specified range. If you leave the fields blank, the budget model name is ignored in the selection of budget entries to be reallocated or shown in the Budget Entries sub-tab.
<b>Budget Type</b>	In this field, you can select a budget type. The reallocation will only affect budget entries of the selected type. If you leave the field blank, the budget type

Field	Description
	is ignored in the selection of budget entries to be reallocated or shown in the Budget Entries sub-tab.
<b>Budget Group</b>	In this field, you can select a range of budget groups. The reallocation will only affect budget entries belonging to budget models that are assigned to a budget group within the specified range. If you leave the field blank, the budget group is ignored in the selection of budget entries to be reallocated or shown in the Budget Entries sub-tab.
<b>Fiscal Year</b>	The functionality of these fields is similar to that of the field "Budget Model."
<b>Company No.</b>	The functionality of these fields is similar to that of the field "Budget Model."
<b>Account No.</b>	The functionality of these fields is similar to that of the field "Budget Model."
<b>Customer No.</b>	The functionality of these fields is similar to that of the field "Budget Model."
<b>Vendor No.</b>	The functionality of these fields is similar to that of the field "Budget Model."
<b>Job No.</b>	The functionality of these fields is similar to that of the field "Budget Model."
<b>Activity No.</b>	The functionality of these fields is similar to that of the field "Budget Model."
<b>Task Name</b>	The functionality of these fields is similar to that of the field "Budget Model."
<b>Employee No.</b>	The functionality of these fields is similar to that of the field "Budget Model."
<b>Item No.</b>	The functionality of these fields is similar to that of the field "Budget Model."
<b>Asset No.</b>	The functionality of these fields is similar to that of the field "Budget Model."

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of these fields is similar to that of the field "Budget Model."
<b>Entity</b>	The functionality of these fields is similar to that of the field "Budget Model."
<b>Project</b>	The functionality of these fields is similar to that of the field "Budget Model."

Field	Description
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Budget Model."
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Budget Model."
<b>Local Spec.1-3</b>	The functionality of these fields is similar to that of the field "Budget Model."

### Journal Island

Field	Description
<b>Journal No.</b>	<p>This field displays the number of the budget reallocation journal. New journals are automatically given the next available number from the "Budget Journal" number series of the company specified in the field "Company No." in this island. If no company number is specified there, the number series of the company assigned to the current user is used. If no company is assigned to the user, the number series of the standard company specified in the System Information workspace is used.</p> <p>The number series is created in the System Numbers workspace in the Set-Up module.</p>
<b>Reallocated</b>	<p>This field shows whether the current reallocation journal has been reallocated, that is, whether the action "Reallocate" has been selected for the current journal. Once a journal has been reallocated, it is not possible to change any information in it.</p> <p>The field also determines what is shown in the Budget Entries sub-tab. If the field is not marked, the Budget Entries sub-tab shows the budget entries that match the selection criteria specified in the Selection Criteria island. If the field is marked, the Budget Entries sub-tab shows the budget entries created as a result of the reallocation.</p> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> However, note that in both cases, lines are only shown in the Budget Entries sub-tab if the field "Show Lines" is marked.</p> </div>
<b>Company No.</b>	<p>In this field, you can specify the number of the company whose number series should be used for assigning a journal number when creating a journal. If you specify a number, the journal number will be taken from the "Budget Journal" number series of the company in question. If you do not specify a number, the journal number is taken from the number series of the company assigned to the current user or, if no company is assigned to the user, the standard company specified in the System Information workspace.</p>

### Reallocate To Island

Field	Description
<b>Create Summary Posting</b>	In this field, you can specify whether the reallocation should result in one entry per original entry or one sum entry per allocation combination resulting from the reallocation.
<b>Company No.</b>	In this field, you can specify a company number. The entries matching the selection criteria will be reallocated to this value. If you leave the field blank, the reallocated entries will keep their current company numbers.
<b>Account No.</b>	The functionality of this field is similar to that of the field "Company No."
<b>Customer No.</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Vendor No.</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Job No.</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Activity No.</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Task Name</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Employee No.</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Item No.</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Asset No.</b>	The functionality of these fields is similar to that of the field "Company No."

### Reallocate To, Dimensions Island

Field	Description
<b>Location</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Entity</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Project</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Company No."

Field	Description
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Local Spec.1-3</b>	The functionality of these fields is similar to that of the field "Company No."

## Budget Entries Sub-Tab

This section includes the fields and descriptions for the Budget Entries sub-tab.

Field	Description
<b>Budget Model</b>	This field shows the budget model to which the budget entry on the current line belongs. Whether the current entry is an entry matching the selection criteria specified in the card part or an entry resulting from the completed reallocation depends on whether the field "Reallocated" has been marked.
<b>Budget Type</b>	This field shows the budget type of the budget model to which the budget entry on the current line belongs. Whether the current entry is an entry matching the selection criteria specified in the card part or an entry resulting from the completed reallocation depends on whether the field "Reallocated" has been marked.
<b>Fiscal Year</b>	This field shows the fiscal year to which the budget entry on the current line belongs. Whether the current entry is an entry matching the selection criteria specified in the card part or an entry resulting from the completed reallocation depends on whether the field "Reallocated" has been marked.
<b>Entry Description</b>	This field shows the description of the budget entry on the current line. Whether the current entry is an entry matching the selection criteria specified in the card part or an entry resulting from the completed reallocation depends on whether the field "Reallocated" has been marked.
<b>Company No.</b>	This field shows the company number to which the current entry is assigned. Whether the current entry is an entry matching the selection criteria specified in the card part or an entry resulting from the completed reallocation depends on whether the field "Reallocated" has been marked.
<b>Account No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Location</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No." above.

Field	Description
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Local Spec.1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Customer No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Vendor No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Job No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Activity No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Task Name</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Employee No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Item No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Asset No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Allocation Key</b>	This field shows the name of the allocation key assigned to the current entry, if any. Whether the current entry is an entry matching the selection criteria specified in the Budget Reallocation tab or an entry resulting from the completed reallocation depends on whether the field "Reallocated" has been marked.
<b>Opening Amount</b>	This field displays the opening amount of the current budget entry. Whether the current entry is an entry matching the selection criteria specified in the Budget Reallocation tab or an entry resulting from the completed reallocation depends on whether the field "Reallocated" has been marked.
<b>Amount 1-12</b>	These fields display the amounts for period 1-12 for the current budget entry. Whether the current entry is an entry matching the selection criteria specified in the Budget Reallocation tab or an entry resulting from the completed reallocation depends on whether the field "Reallocated" has been marked.
<b>Closing Amount</b>	This field displays the closing amount of the current budget entry. Whether the current entry is an entry matching the selection criteria specified in the Budget Reallocation tab or an entry resulting from the completed reallocation depends on whether the field "Real- located" has been marked.
<b>Opening Quantity</b>	This field displays the opening quantity of the current budget entry. Whether the current entry is an entry matching the selection criteria specified in the

Field	Description
	Budget Reallocation tab or an entry resulting from the completed reallocation depends on whether the field "Real- located" has been marked.
<b>Quantity 1-12</b>	These fields display the quantities for period 1-12 for the current budget entry. Whether the current entry is an entry matching the selection criteria specified in the Budget Reallocation tab or an entry resulting from the completed reallocation depends on whether the field "Reallocated" has been marked.
<b>Closing Quantity</b>	This field displays the closing quantity of the current budget entry. Whether the current entry is an entry matching the selection criteria specified in the Budget Reallocation tab or an entry resulting from the completed reallocation depends on whether the field "Reallocated" has been marked.
<b>Base Currency</b>	This field shows the currency in which the amounts on the current line are displayed.

## Lookup Section

This section includes the fields and descriptions for the Lookup section workspaces.

### Finance Sub Budget Lines Workspace

Use this workspace to display an overview of the amounts on finance budget lines on a sum budget.

The Finance Budget Line tab displays the finance budget lines of the sum budget; the Finance Budget Lines sub-tab displays a line for each associated finance budget line on the subordinate main and sum budgets.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

#### Finance Budget Line Tab

This section includes the fields and descriptions for the Finance Budget Line tab.

#### Line Island

Field	Description
<b>Name</b>	This field displays the name of the finance sub budget line.
<b>Description</b>	This field displays the description for the selected line.
<b>Budget Instance Key</b>	This field shows the instance key of the associated budget.
<b>Parent Budget Instance Key</b>	This field shows the instance key of the parent budget. That is, if the finance budget line in this card belongs to a sub budget, then the field refers to the instance key of the main budget and if the line belongs to a

Field	Description
	main budget, then the field refers to the instance key of the parent sum budget.

### Finance Budget Lines Sub-Tab

This section includes the fields and descriptions for the Finance Budget Lines sub-tab.

Field	Description
<b>Budget Name</b>	This field displays the name of the finance budget line.
<b>Total</b>	This field displays the total budgeted amount for this line.

## Budget Settlement Overview Workspace

Use this workspace to display an overview of settlements between the finance budget header in the Main Finance Budget Header tab and each of the other finance budget headers listed in the Finance Budget Headers sub-tab.

For each line in the sub-tab, four values are shown that sum up which amounts have been budgeted between the budget in the Main Finance Budget Header tab and the specific line in the Finance Budget Headers sub-tab. Color coding indicates whether two budgets have budgeted different amounts.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

### Main Finance Budget Header Tab

This section includes the fields and descriptions for the Main Finance Budget Header tab.

#### Budget Island

Field	Description
<b>Name</b>	This field displays the name of the finance budget header.
<b>Description</b>	This field displays the description of the budget header.
<b>Finance Budget Type</b>	This field displays the type of budget header.

**Currency Island**

Field	Description
<b>Currency</b>	This field shows the currency used as base currency.
<b>Exchange Rate Table</b>	This field and the Exchange Rate Date field are used for all currency calculations made on this budget.
<b>Exchange Rate Date</b>	This field and the Exchange Rate Table field are used for all currency calculations made on this budget.

## Finance Budget Headers Sub-Tab

This section includes the fields and descriptions for the Finance Budget Headers sub-tab.

Field	Description
<b>Name</b>	This field shows the name of the finance budget header.
<b>My Income</b>	This field shows the total amount of registered income in my budget.
<b>Their Costs</b>	This field shows the total amount of registered costs on their budget (settlements registered against my budget).
<b>My Costs</b>	This field shows the total amount of registered costs on my budget.
<b>Their Income</b>	This field shows the total amount of registered income on their budget (settlements registered against my budget).

**Sum Budget Settlement Overview Workspace**

Use this workspace to display an overview of subordinate budgets to a sum budget with respect to settlements.

The tab contains a finance budget header of a sum budget and the sub-tab contains a line and column for each subordinate budget having settlements registered.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

## Finance Budget Header Tab

This section includes the fields and descriptions for the Finance Budget Header tab.

**Budget Island**

Field	Description
<b>Name</b>	This field displays the name of the finance budget.

Field	Description
<b>Description</b>	This field displays the description of the budget.
<b>Finance Budget Type</b>	This field displays the type of budget.

### Currency Island

Field	Description
<b>Currency</b>	This field shows the currency used as base currency.
<b>Exchange Rate Table</b>	This field and the Exchange Rate Date field are used for all currency calculations made on this budget.
<b>Exchange Rate Date</b>	This field and the Exchange Rate Table field are used for all currency calculations made on this budget.

### Finance Budget Headers Sub-Tab

This section includes the fields and descriptions for the Finance Budget Headers sub-tab.

Field	Description
<b>Department</b>	This field shows the name of the finance budget header represented by the selected line.
<b>Internal</b>	This field shows a boolean which is TRUE if the budget (of the table line) is a subordinate budget to the budget in the card part.

## Budget Inspection Workspace

Use this workspace to review aggregate budget figures for a range of selection criteria.

Use the Budget Inspection tab to specify a budget model and a range of selection criteria for the budget figures that you want to review.

The Budget Sum sub-tab displays budget figures for the selection criteria that fall within the dimension values that you specify in the Budget Inspection tab. Each line displays the amount and quantity that are made up of the amounts and quantities of budget entries that have identical selection criteria.

The Amount and Quantity islands show the budget figures for the specified ranges in the current budget model.

You can review budget figures for one or more companies and specify values for all dimensions. Use the Budget Specification and Show Budget Entries workspaces to review the budget entries that underlie the budget figures.

## Budget Inspection Tab

This section includes the fields and descriptions for the Budget Inspection tab.

### Budget Model Island

Field	Description
<b>Name</b>	This field displays the budget model you wish to inspect in this field.
<b>Description</b>	This field displays the description of the selected budget model. The description is retrieved from the Budget Models workspace.
<b>Budget Type</b>	This field displays the budget type of the selected budget model.
<b>Fiscal Year</b>	The fiscal year which applies to the selected budget model is shown in this field.
<b>Price Year</b>	This field displays the price year that applies to the current budget model. The price year is used at price projection of budget models.

### Currency Island

Field	Description
<b>Reporting Currency</b>	In this pop-up field, you can select the reporting currency in which the budget figures should be displayed. If the current user has been assigned to a company in the Users workspace, Maconomy suggests the company base currency of the company in question. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected in the System Information workspace in the Set-Up module for conversion of currency amounts.

### Selection Criteria Island

Field	Description
<b>Show Entries</b>	The field controls whether or not lines are shown in Budget sums sub-tab.
<b>Account</b>	In this field you can enter a range of account numbers so that only budget figures that fall within this range are shown. The selected allocation combinations are displayed in the Budget Inspection tab, whereas the amount and quantity sums are displayed in the Budget sums sub-tab. You can further limit the inspection by specifying ranges for the other 11 dimensions.
<b>Company</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Customer</b>	The functionality of these fields is similar to that of the field "Account No." above.

Field	Description
<b>Vendor</b>	The functionality of these fields is similar to that of the field "Account No." above.
<b>Job</b>	The functionality of these fields is similar to that of the field "Account No." above.
<b>Activity</b>	The functionality of these fields is similar to that of the field "Account No." above.
<b>Task</b>	The functionality of these fields is similar to that of the field "Account No." above.
<b>Employee Information</b>	The functionality of these fields is similar to that of the field "Account No." above.
<b>Item</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Asset</b>	The functionality of this field is similar to that of the field "Account No." above.

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Account No." above.
<b>Local Spec.1-3</b>	The functionality of these fields is similar to that of the field "Account No." above.

#### Amount Island

Field	Description
<b>Opening</b>	This field displays the sum of the opening amounts of the allocation combinations specified in the Account island. The opening amount for every allocation combination is shown in the "Opening Amount" field in the Budget sum sub-tab.
<b>1-12</b>	The functionality of this fields is similar to that of the field "Opening" above.

Field	Description
<b>Closing</b>	The functionality of this field is similar to that of the field “Opening” above.

### Quantity Island

Field	Description
<b>Opening</b>	This field displays the sum of the opening quantities of the allocation combinations specified in the Account island. The opening quantity for every allocation combination is shown in the “Opening Quantity” field in the Budget sums sub-tab.
<b>1-12</b>	The functionality of these fields is similar to that of the field “Opening” above.
<b>Closing</b>	The functionality of this field is similar to that of the field “Opening” above.

### Budget Sums Sub-Tab

This section includes the fields and descriptions for the Budget Sums sub-tab.

Field	Description
<b>Budget Model</b>	This field displays the name of the budget model that applies to the current inspection line. The value corresponds to the budget model specified in the Budget Model island in the Budget Inspection tab.
<b>Company No.</b>	This field displays the company number that applies to the current inspection line. The number lies within the range of company numbers specified in the Budget Inspection tab
<b>Name</b>	This field displays the name of the company specified in the field “Company No.” above.
<b>Currency</b>	The functionality of this field is similar to that of the field “Company No.” above.
<b>Account No.</b>	The functionality of this field is similar to that of the field “Company No.” above.
<b>Account Name</b>	This field displays the account text attached to the “Account No.” field in the current inspection line.
<b>Opening Amount</b>	This field displays the opening amount budgeted for the allocation combination displayed in the current inspection line. The amount corresponds to the sum of all opening amounts for budget entries with the current allocation combination.
<b>Amount 1-12</b>	The functionality of these fields is similar to that of the field “Opening Amount” above.
<b>Closing Amount</b>	The functionality of this field is similar to that of the field “Opening Amount” above.

Field	Description
<b>Opening Quantity</b>	This field displays the opening quantity budgeted for the allocation combination displayed in the current inspection line. The quantity corresponds to the sum of all opening quantities for budget entries with the current allocation combination.
<b>Quantity 1-12</b>	The functionality of these fields is similar to that of the field "Opening Quantity" above.
<b>Closing Quantity</b>	The functionality of this field is similar to that of the field "Opening Quantity" above.
<b>Location</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Local Spec.1-3</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Customer No.</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Vendor No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Job No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Activity No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Task Name</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Employee No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Item No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Asset No.</b>	The functionality of this field is similar to that of the field "Company No." above.

## Budget Specification Workspace

Use this workspace to review budget entries and to get an overview of the budget entries on which the total budget figures are based.

The Entries sub-tab displays the budget entries that form the basis of the budget figure in the Budget Specification tab. The Entries sub-tab also displays opening and closing amounts and quantities for the whole period for the current selection criteria.

### Budget Specification Tab

This section includes the fields and descriptions for the Budget Specification tab.

#### Account Island

Field	Description
<b>Account No.</b>	In this field, you can specify a range of account numbers for which budget figures should be shown in the table part of the window. You can make further delimitations to the entries to be shown in the table part by specifying ranges for the other 11 G/L dimensions and the eight module dimensions. If you do not specify a range of account numbers, the table part will display budget figures for all accounts.

#### Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Account No." above.
<b>Local Spec.1-3</b>	The functionality of these fields is similar to that of the field "Account No." above.

#### Sub Module Dimensions Island

Field	Description
<b>Customer No.</b>	The functionality of this field is similar to that of the field "Account" above.

Field	Description
<b>Vendor No.</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Job No.</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Activity</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Task Name</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Employee No.</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Item No.</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Asset No.</b>	The functionality of this field is similar to that of the field "Account No." above.

### Budget Model Island

Field	Description
<b>Name</b>	Enter the name of the budget model you wish to inspect in this field.
<b>Description</b>	This field displays the description of the selected budget model. The description is retrieved from the window Budget Models.
<b>Budget Type</b>	This field displays the budget type of the selected budget model.
<b>Fiscal Year</b>	The fiscal year which applies to the selected budget model is shown in this field.
<b>Price Year</b>	<p>This field displays the first date of the price year that applies to the selected budget model. The price year, which is specified at the creation of the budget model, indicates the year whose prices you wish to apply to the budget model.</p> <p>If you want to see the budget figures of the current budget model using the prices of another year, you can open the window Budget Control and specify a different price year. In this way, you can achieve a general view of the development of the budget figures based on an expected price development.</p>

### Company Island

Field	Description
<b>Company</b>	This field displays the name and number of the company specified in the field "Company No." in the Sub-Module Dimensions island.

Field	Description
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the Company Information workspace in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### Amount Island

Field	Description
<b>Opening</b>	This field displays the sum of the opening amounts of the allocation combinations specified in the Account island. The opening amount for every allocation combination is shown in the "Amount, Opening" field in the table part.
<b>1-12</b>	The functionality of these fields is similar to that of the field "Opening" above.
<b>Closing</b>	The functionality of this field is similar to that of the field "Opening" above.

### Quantity Island

Field	Description
<b>Opening</b>	This field displays the sum of the opening quantities of the allocation combinations specified in the Account island. The opening quantity for every allocation combination is shown in the "Quantity, Opening" field in the table part.
<b>1-12</b>	The functionality of these fields is similar to that of the field "Opening" above.
<b>Closing</b>	The functionality of this field is similar to that of the field "Opening" above.

### Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Entry Date</b>	This field displays the date of creation of the current budget entry.
<b>Description</b>	This field displays the text attached to the budget entry. The text is retrieved from the budget journal line which formed the budget entry.
<b>Budget Version No.</b>	This field displays the version number that applied to the budget model at the time of creation of the current budget entry. Budget model versions are created in the Budget Models workspace.
<b>Allocation Key</b>	If an allocation key was specified on the budget journal line on which the current budget entry is based, this field shows the name of the allocation key in question.

Field	Description
<b>Amount Opening</b>	This field displays the opening amount of the current budget entry. The value in this field is retrieved from the budget journal line which formed the budget entry.
<b>Amount 1-12</b>	These fields display the amounts for period 1-12 for the current budget entry. The values in these fields are retrieved from the budget journal line which formed the budget entry. The value in the fields equals the difference between the “Amount Opening” and the “Amount Closing” fields.
<b>Amount Closing</b>	This field displays the closing amount of the current budget entry. The value in this field is retrieved from the budget journal line which formed the budget entry.
<b>Quantity Opening</b>	This field displays the opening quantity of the current budget entry. The value in this field is retrieved from the budget journal line which formed the budget entry.
<b>Quantity 1-12</b>	These fields display the quantities for period 1-12 for the current budget entry. The values in these fields are retrieved from the budget journal line which formed the budget entry. The value in the fields equals the difference between the “Quantity Opening” and the “Quantity Closing” fields.
<b>Quantity Closing</b>	This field displays the closing quantity of the current budget entry. The value in this field is retrieved from the budget journal line which formed the budget entry.

## Show Budget Entries Workspace

Use this workspace to review budget entries that you created.

Budget entries are created from budget journal lines when budget journals are approved. Every journal line creates one (and sometimes two) budget entries.

This workspace also displays a selection of information about the current budget entry.

### Show Budget Entries Tab

This section includes the fields and descriptions for the Show Budget Entries tab.

#### Entry Information Island

Field	Description
<b>Entry No.</b>	This field displays the number of the budget entry. The entries are numbered consecutively within every budget model.
<b>Reference Date</b>	This field displays the reference date of the budget entry.
<b>Entry Date</b>	This field displays the entry date of the budget entry.

Field	Description
<b>Entry Description</b>	This field displays the text entered on the budget journal line that formed the budget entry.
<b>Allocation Key</b>	If an allocation key was specified on the budget journal line on which the current budget entry is based, this field shows the name of the allocation key in question.
<b>Account No</b>	This field shows the account number on which the amounts of the current budget entry has been budgeted.
<b>Customer No.</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Vendor No.</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Job No.</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Activity No.</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Task Name</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Employee No.</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Item No.</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Asset No.</b>	The functionality of this field is similar to that of the field "Account No." above.

### Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Account No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Account No." above.

**Quantity Island**

Field	Description
<b>Opening</b>	This field displays the budgeted opening quantity for the current budget entry.
<b>1-12</b>	The functionality of these fields is similar to that of the field “Opening” above.
<b>Closing</b>	The functionality of this field is similar to that of the field “Opening” above.

**Journal Island**

Field	Description
<b>Journal No.</b>	This field displays the number of the budget journal in which the current budget entry was created.
<b>Journal Type</b>	This field displays the type of the budget journal in which the current budget entry was created.
<b>Journal Line No.</b>	This field displays the number of the budget journal line that formed the budget entry.
<b>Approval Date</b>	This field displays the date upon which the budget journal was approved. On approval, the journal lines were converted into budget entries.
<b>Approved by</b>	This field displays the name of the user who approved the current budget journal.

**Budget Model Island**

Field	Description
<b>Name</b>	This field displays the name of the budget model that concerns the current budget entry.
<b>Description</b>	This field displays the description of the budget model that concerns the current budget entry.
<b>Budget Type</b>	This field displays the budget type of the current budget entry. Budget types are defined in the Popup Fields workspace in the Set-Up module.
<b>Fiscal Year</b>	This field displays the fiscal year of the budget model.
<b>Price Year</b>	This field displays the price year of the budget model.
<b>Version</b>	This field displays the version of the budget model.

**Company Island**

Field	Description
<b>Company</b>	This field displays the name and number of the company on which the amounts on the current budget entry have been budgeted.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the Company Information workspace in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

**Amount Island**

Field	Description
<b>Opening</b>	This field displays the budgeted opening amount for the current budget entry.
<b>1-12</b>	The functionality of these fields is similar to that of the field "Opening" above.
<b>Closing</b>	The functionality of this field is similar to that of the field "Opening" above.

**Budget Control Workspace**

Use this workspace to compare budget figures with committed and actual figures.

The budgeted amounts are the sum of budget entries within the given range of selection criteria. Committed amounts are future expenses that you entered in purchase orders in the A/P module. Actual amounts are entries that you posted in the G/L module. The deviations between budgeted and actual amounts are stated in percentages.

By specifying a budget model, a price year, reporting currency, and a range of selection criteria, you can specify the budget control at different detail levels. Note that the Budget Control island only displays figures if you select the **Get Data** option in the Selection Criteria island.

**Budget Control Tab**

This section includes the fields and descriptions for the Budget Control tab.

**Selection Criteria Island**

Field	Description
<b>Get Data</b>	If you mark this field, budgeted and actual amounts are displayed in the island Budget Control in accordance with the selection criteria specified in this island. If you do not mark this field, the island Budget Control will not display any figures.
<b>Account</b>	In this field you can enter a range of account numbers. Budgeted and actual amounts will only be displayed for allocation combinations that fall within this range. For budget figures, however, only posting accounts and

Field	Description
	not summary accounts are included so that you can compare the budget figures and actual figures within the specified range of allocation combinations directly. The display may be further limited by entering selection criteria for the other 11 dimensions.
<b>Company</b>	This functionality of this field is similar to that of the field "Account" above.
<b>Customer</b>	The functionality of this field is similar to that of the field "Account" above. However, if you specify a value in this field, the window will not show committed amounts, as commitment accounts are not maintained on customer level.
<b>Vendor</b>	The functionality of this field is similar to that of the field "Customer" above.
<b>Job</b>	The functionality of this field is similar to that of the field "Customer" above.
<b>Activity</b>	The functionality of this field is similar to that of the field "Customer" above.
<b>Task</b>	The functionality of this field is similar to that of the field "Customer" above.
<b>Employee Information</b>	The functionality of this field is similar to that of the field "Customer" above.
<b>Item</b>	The functionality of this field is similar to that of the field "Customer" above.
<b>Asset</b>	The functionality of this field is similar to that of the field "Customer" above.

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	This functionality of this field is similar to that of the field "Account" above.
<b>Entity</b>	This functionality of this field is similar to that of the field "Account" above.
<b>Project</b>	This functionality of this field is similar to that of the field "Account" above.
<b>Purpose</b>	This functionality of this field is similar to that of the field "Account" above.
<b>Spec. 1-3</b>	This functionality of these fields is similar to that of the field "Account" above.

Field	Description
<b>Local Spec. 1-3</b>	This functionality of these fields is similar to that of the field "Account" above.

**Budget Control Island**

Field	Description
<b>Budget</b>	These fields display the budgeted opening and closing amounts for the fiscal year, respectively, and for the 12 periods of the fiscal year. The figures are retrieved from the posting accounts of the current budget model.
<b>Committed</b>	<p>These fields show the amount committed for the opening and closing of the fiscal year, respectively, and for the 12 periods of the fiscal year.</p> <p>Committed amounts are future expenses registered in approved purchase orders. Purchase orders are created and approved in the Purchase Orders workspace in the A/P module.</p> <p>The fields show the sum of amounts on approved purchase order lines within the specified allocation combination.</p> <p>When posting a vendor invoice assigned to a purchase order or manually closing a purchase order, the amount will no longer be shown in this workspace, but the vendor invoice amount posted is shown in the column "Actual."</p>
<b>Actual</b>	These fields display the actual opening and closing amounts for the fiscal year, respectively, and for the 12 periods of the fiscal year. The actual amounts are the sum of posted amounts of the current allocation combination.
<b>Deviation</b>	These fields show the deviation between the budgeted and the sum of actual and committed opening and closing amounts for the fiscal year, respectively, and for the 12 periods of the fiscal year.
<b>% (Percentage)</b>	These fields show the deviation between the budgeted and actual opening and closing amounts for the fiscal year, respectively, and for the 12 periods of the fiscal year. The deviation is measured in relation to the budgeted figures in the Budget column.

**Budget Model Island**

Field	Description
<b>Name</b>	Enter the name of the budget model for which you wish display budget and actual figures.
<b>Description</b>	This field displays the description of the selected budget model. The description is retrieved from the Budget Models workspace.
<b>Budget Type</b>	This field displays the budget type of the selected budget model, specified in the Budget Models workspace.

Field	Description
<b>Version</b>	In this field, you enter which version of the current budget model you want to use. If you do not enter a number, Maconomy assumes the latest version of the current budget model.
<b>Fiscal Year</b>	The fiscal year which applies to the selected budget model is shown in this field.
<b>Price Year</b>	This field shows the price year originally specified on the budget model in question. If you do not enter a specific price year in the Price Year island, the workspace will show budget figures for the price year displayed in this field.

### Price Year

Field	Description
<b>Price Year</b>	In this field, you can enter the price year of the budget model for which you wish to see budget figures. If you do not enter a price year in this field, Maconomy will use the price year originally specified on the current budget model. The original price year is displayed in the Budget Model island. If you specify a different price year than what the budget model indicates, the budget figures will be adjusted accordingly.
<b>Price Register</b>	In this field, you can specify a price register to be used in the price adjustment. If you do not specify a price register, Maconomy will use the primary register. A price register lists the price adjustment of a certain year within a number of price areas. Price areas are created and maintained in the Price Areas workspace.

### Currency

Field	Description
<b>Reporting Currency</b>	In this pop-up field, you can select the reporting currency in which the budget figures should be displayed. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected in the System Information workspace in the Set-Up module for conversion of currency amounts.

## Set-Up Section

This section includes the fields and descriptions for the Set-Up section workspaces.

### Budget Templates Workspace

Use this workspace to create budget templates by creating budget template headers in the Budget Template tab and associated budget template lines in the Budget Template Lines sub-tab.

When the budget template is fully set up, use the **Create Budgets From Template** action to create finance budgets from the template budget. If needed, use the **Delete Budgets And Reopen Template** action to delete all associated finance budgets; you can edit the template.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

## Budget Template Tab

This section includes the fields and descriptions for the Budget Template tab.

### Budget Island

Field	Description
<b>Name</b>	In this field, specify the name of the budget template line.
<b>Description</b>	In this field, enter a description of the budget template line.
<b>Budget Type</b>	This field displays the budget type of the selected budget model, specified in the Budget Models workspace.
<b>Budgets Created</b>	This field states whether or not the finance budgets have been created from this budget template. Most of the budget template settings/fields can be set and updated until the finance budgets have been created. When that happens, most settings/fields become closed and can no longer be changed by the user.

### Budget Model Island

Field	Description
<b>Budget Model</b>	Use this field to enter the name of the budget model you wish to post journal entries to. This field is mandatory. The description of the budget model is transferred from the Budget Models workspace. The budget model will automatically be created when the budget template is complete and finance budgets are created from the template.
<b>Posting Reference</b>	In this field, you can enter a dimension combination of the type Posting Reference. The dimension combination of the posting reference will be used for posting the balance of the budget when the budget is approved.
<b>Allow Unbalanced Journals</b>	This is used in combination with the Posting Reference field. This field must be set in order to post the budget balance on the posting reference.

### Fiscal Year Island

Field	Description
<b>Fiscal Year</b>	In this field, specify the fiscal year used in the current budget model.
<b>Fiscal Year Template No.</b>	In this field, specify the fiscal year template number.

## Currency Island

Field	Description
<b>Exchange Rate Table</b>	This field, and the Exchange Rate Date field, specifies the exchange rate table and date used for all currency conversions in all budgets created from this template.
<b>Exchange Rate Date</b>	This field, and the Exchange Rate Table field, specifies the exchange rate table and date used for all currency conversions in all budgets created from this template.

## User Island

See the chapter "Getting Started" for a description of the fields in the User Island.

## Budget Template Lines Sub-Tab

This section includes the fields and descriptions for the Budget Template Lines sub-tab.

Field	Description
<b>Name</b>	This field shows the name of the budget template line.
<b>Type</b>	This field shows the type of the budget template line.
<b>Income</b>	This field shows whether the line is an income or expense line.
<b>Transfer</b>	Value 'Yes' means that the line will be transferred to a budget journal line when the associated finance budget is approved. Value 'No' means that the line will not be transferred. Value 'Sub Budget Lines' means that the line itself will not be transferred, but any line on a sub budget created from the line will be transferred. This latter value only applies to Direct Cost and External Settlements lines.
<b>Distribution Key</b>	This field shows the name of the used allocation/surcharge keys.

## Actions

This section shows the Actions available in the Budget Templates workspace.

## Top Tab

Field	Description
<b>Copy Template</b>	When you select this action, the Copy Budget Template dialog box displays. Use this dialog box to create a new template from an existing template.

Field	Description
<b>Create Budgets From Template</b>	Select this action to create a new budget from an existing template.
<b>Delete Budgets And Reopen Template</b>	This action will delete all existing finance budgets and reopen the template. Please note, that all work in finance budgets will be lost. You have to delete finance budgets in order to edit the template.

## Budget Template Line Details Workspace

Use this workspace to display budget template lines in the Budget Template Line tab and allow for editing.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

### Budget Template Line Tab

This section includes the fields and descriptions for the Budget Template Line tab.

#### Line Island

Field	Description
<b>Name</b>	In this field, enter the name of the budget template line.
<b>Description</b>	In this field, enter a description for the selected line.
<b>Type</b>	In this field, select the line type.

#### Actions

This section shows the Actions available in the Budget Template Line Details workspace.

#### Top Tab

Field	Description
<b>Create And Attach Sub Budget</b>	Select this action to create a sub-budget and attach it to an existing budget.
<b>Create And Attach Settlement Budget</b>	Select this action to create a settlement budget and attach it to an existing budget.

## Budget Template Sub Budgets Workspace

Use this workspace to list all sub-budgets of a main budget template.

The Main Budget Template tab contains main budget templates, and the Sub Budget Templates sub-tab contains a line for each associated sub-budget.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

### Main Budget Template Tab

This section includes the fields and descriptions for the Main Budget Template tab.

#### Card Part Island

Field	Description
<b>Name</b>	This field shows the name of the main budget template.
<b>Description</b>	This field shows a description of the main budget template.
<b>Finance Budget Type</b>	This field shows the type of budget.
<b>Fiscal Year</b>	This field shows the fiscal year used in the current budget model.
<b>Access Level</b>	This field shows the name of the access level to be assigned to the current company. If an access level is specified, only users who have been granted access to this access level or higher can see the data of the current company.
<b>Instance Key</b>	The instance key of the finance budget header.
<b>Parent Budget Instance Key</b>	This field shows the instance key of the parent budget. That is, if the finance budget line in this card belongs to a sub budget, then the field refers to the instance key of the main budget and if the line belongs to a main budget, then the field refers to the instance key of the parent sum budget.
<b>Created by</b>	This field shows the name of the employee who created the current information about the layout.
<b>Created on</b>	This field shows the date on which the current information about the layout was created.
<b>Changed by</b>	This field shows the name of the employee who last changed information about the layout.
<b>Changed on</b>	This field shows the date on which the information about the layout was changed.

Field	Description
<b>Version</b>	This field shows a version number. The version number is increased by one every time the current information is changed.

### Sub Budget Template Sub-Tab

This section includes the fields and descriptions for the Sub Budget Template sub-tab.

Field	Description
<b>Name</b>	This field displays the name of the budget template.
<b>Description</b>	This field displays the description of the budget.
<b>Finance Budget Type</b>	This field shows the type of budget.

## Budget Distribution Key Details Workspace

Use this workspace is to create, edit, and delete distribution keys for use in budget templates and finance budgets.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

### Distribution Key Tab

This section includes the fields and descriptions for the Distribution Key tab.

#### Key Island

Field	Description
<b>Name</b>	Enter the name of the allocation key in this field when you create it.
<b>Description</b>	In this field you can enter a description of the current allocation key.

#### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

## Budget Hierarchies Workspace

Use this workspace to set up the budget hierarchy, meaning the relation between the finance budgets when these are created from the budget template.

The Budget Template Header tab contains main budget templates, and the Budget Hierarchy Lines sub-tab contains a line for each budget hierarchy line, that is, for each finance budget to be

created. Budget hierarchy lines can be indented to tell Maconomy that the finance budget to be created from that specific line should be set to be subordinate to the sum budget created from the parent budget hierarchy line.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

### Budget Template Header Tab

This section includes the fields and descriptions for the Budget Template Header tab.

#### Budget Island

Field	Description
<b>Name</b>	This field shows the name of the budget template.
<b>Description</b>	This field shows a description of the budget template.
<b>Fiscal Year</b>	This field shows the fiscal year which applies to the selected budget template.

### Budget Hierarchy Lines Sub-Tab

This section includes the fields and descriptions for the Budget Hierarchy Lines sub-tab.

Field	Description
<b>Name</b>	This field displays the name of the budget hierarchy.
<b>Responsible</b>	This field displays the name of the responsible employee. Additionally, this is the employee who will get a notification when the budget can be submitted and (if the budget is a Sum budget) get a notification when the subordinate budget is submitted and ready to be approved.
<b>Company Name</b>	This field displays the name of the company to which the budget hierarchy line pertains.
<b>Currency</b>	This field displays the currency used as base currency. Additionally, if a company is specified, the currency will be derived automatically from the company.
<b>Access Level</b>	This field displays the name of the access level which restricts access to the finance budget created from the basis on this budget hierarchy line.

### Budget Hierarchy Details Workspace

Use this workspace to show budget hierarchy lines in the Budget Hierarchy Line tab and allow for editing.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

## Budget Hierarchy Line Tab

This section includes the fields and descriptions for the Budget Hierarchy Line tab.

### Budget Island

Field	Description
<b>Name</b>	This field shows the name of the budget template.
<b>Description</b>	This field shows a description of the budget template.

### Company Island

Field	Description
<b>Company</b>	This field shows the company name as well as a description of the company.

### Account Island

Field	Description
<b>Account</b>	This field shows an account name as well as a description.

### Module Dimensions Island

Field	Description
<b>Customer</b>	This field allows you to specify which dimensions should be set for the specific finance budget created from this budget hierarchy line. Together with the other dimensions and module dimensions, this value determines the allocation combination of the budget hierarchy line.
<b>Vendor</b>	The functionality of this field corresponds to that of the field "Customer" above.
<b>Job</b>	The functionality of this field corresponds to that of the field "Customer" above.
<b>Activity</b>	The functionality of this field corresponds to that of the field "Customer" above.
<b>Task</b>	The functionality of this field corresponds to that of the field "Customer" above.
<b>Employee</b>	The functionality of this field corresponds to that of the field "Customer" above.
<b>Item</b>	The functionality of this field corresponds to that of the field "Customer" above.

Field	Description
<b>Asset</b>	The functionality of this field corresponds to that of the field “Customer” above.

### Dimensions Island

Field	Description
<b>Location</b>	This field shows a value for the “Location” dimension. Together with the other dimensions and module dimensions, this value determines the allocation combination of the budget hierarchy line.
<b>Entity</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Project</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Purpose</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Local Spec.1-3</b>	The functionality of these fields is similar to that of the field “Location” above.

### User Island

See the chapter “Getting Started” for a description of the fields in the User Island.

## Budget Employee Categories Workspace

Use this workspace to list budget employee categories that are associated with a budget template.

The Budget Template Header tab contains main budget templates, and the Budget Employee Categories sub-tab contains a line for each budget employee category. This workspace provides the **Fetch Categories** action for importing/copying regular employee categories into the budget and thus automatically creating budget employee categories. You do not use this workspace on its own; it is meant as a building block in other bigger workspaces.

The Finance Budget module enables you to budget on employees who are already in Maconomy. Companies might also expect to hire more employees during the fiscal year that the budget covers. Using budget employee categories enables you to specify some default employee data to be used when budgeting on future possible employees. When you do this, Maconomy copies all data-percentages, rates, and so on-from the budget employee category to the potential employee. Maconomy also uses the values on those budget employee categories as the default values on actual employees.

A Budget Employee Category specifies some default employee data to be used when budgeting on potential employees. Maconomy also uses the values on those budget employee categories as the default values on actual employees.

## Budget Template Header Tab

This section includes the fields and descriptions for the Budget Template Header tab.

### Budget Island

Field	Description
<b>Name</b>	This field shows the name of the budget template header.
<b>Description</b>	This field shows the description of the budget template header.
<b>Finance Budget Type</b>	This field shows the type of budget header (for example, Main or Sub-budget).

### Currency Island

Field	Description
<b>Exchange Rate Table</b>	This field displays the table that includes the reference currency to be used for currency conversion.
<b>Exchange Rate Date</b>	This field displays the exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected above.

## Budget Employee Categories Sub-Tab

This section includes the fields and descriptions for the Budget Employee Categories sub-tab.

A Budget Employee Category specifies some default employee data that will be used when budgeting on fictive employees. When doing so, a budget employee category can be specified for the fictive employee and all data (percentages, rates, and so on) is copied from the budget employee category to the fictive employee.

Field	Description
<b>Employee Category No.</b>	This field shows the number of an employee category.
<b>Name</b>	This field shows the name of the budget employee category.
<b>Currency</b>	This field shows the currency for all amounts specified on this budget employee category.
<b>Monthly Salary</b>	This field shows the monthly salary for the selected budget employee category.
<b>Hours per Year</b>	This field shows the number of hours per year for the selected budget employee category.

Field	Description
<b>Unproductive Time Percentage 1-5</b>	Five fields used to specify a percentage of the employed hours that are used on non-work related tasks, for example, vacation. Each field corresponds to the work type defined in System Information.
<b>Productive Time Percentage 1-5</b>	Five fields used to specify a percentage of the working hours that are used on work related tasks, for example, invoicable hours. The 5 percentages should sum up to 100. Each field corresponds to the work type defined in System Information.
<b>Productive Time Rate 1-5</b>	Five fields used to specify a rate for the working hours that are used on work related tasks, for example, invoicable hours.

## Actions

This section shows the Actions available in the Budget Employee Categories workspace.

### Top Tab

Field	Description
<b>Fetch Categories</b>	Select this action to retrieve employees category and related budget information from Maconomy.

## Budget Employee Category Details Workspace

Use this workspace to show budget employee categories in the Budget Employee Category tab and allow for editing them.

You do not use this workspace on its own; use it as a building block in other, bigger workspaces.

### Budget Employee Category Tab

This section includes the fields and descriptions for the Budget Employee Category tab.

#### Employee Category Island

Field	Description
<b>Employee Category No.</b>	This field shows the number of an employee category.
<b>Name</b>	This field shows the name of the budget employee category.
<b>Currency</b>	This field shows the currency for all amounts specified on this budget employee category.

**Employment Island**

Field	Description
<b>Monthly Salary</b>	This field shows the monthly salary for the selected budget employee category.
<b>Hours per Year</b>	This field shows the number of hours per year for the selected budget employee category.

**Unproductive Time Island**

Field	Description
<b>Unproductive Time Percentage 1-5</b>	Five fields used to specify a percentage of the employed hours that are used on non-work related tasks, for example, vacation. Each field corresponds to the work type defined in System Information.

**Productive Time Island**

Field	Description
<b>Percentage</b>	Five fields used to specify a percentage of the working hours that are used on work related tasks, for example, invoicable hours. The 5 percentages should sum up to 100. Each field corresponds to the work type defined in System Information.
<b>Rate</b>	Five fields used to specify a rate for the working hours that are used on work related tasks, for example, invoicable hours.

## Budget Models Workspace

Use this workspace to create and review budget models.

A budget model is a collection of a budget and the previous versions of the budget for a specific fiscal year.

When you create a budget model, you must provide a name and information about the fiscal year and price year. You can also attach a description and a budget type to the model.

You can also use this workspace to create additional versions of a budget model. The Versions sub-tab displays previous versions of the current budget model, including the version number and version type.

You can create a number of budget models for each budget year, but you can assign only one budget model for each year to a given budget type.

Use the Popup Fields workspace in the Set-Up module to create budget types.

You can block a budget model so that no additional budget entries can be created in it.

You can delete existing budget models, unless the model is used in an allocation key or a budget group. You can, however, use the Allocation Keys and Budget Groups workspaces to remove the use of a budget model in an allocation key or a budget group.

### Version Numbers

Use the versioning feature to ensure that budget entries are associated with a specific version of the current budget model.

When you create a budget model, Maconomy automatically assigns version number 1. If you create another version of the budget model, new budget entries are marked with version number 2. You can only create budget entries in the latest version of a budget model.

Budget entries that you create in version 1 continue to exist in the updated budget model, implying that the budget figures of a budget model are the sum of budget entries from all versions of the budget model.

You can apply predefined version types and notes to every budget model. You create version types in the Popup Fields workspace in the Set-Up module.

You can review previous versions of the current budget model or compare different budget versions within the same budget model. For example, you can separate preliminary versions from the final version.

### Dimension Combination for Period Variances

You can also specify a dimension combination used to create automatic offsets of period variances when you approve an assigned budget journal in which the periods do not balance, but for which the closing balance is zero.

You can only approve a budget journal when the amounts of all periods balance, unless you are using a budget model that has a dimension combination used to post period variances.

All periods balance when all control fields in the Budget Journal tab are equal to zero.

### Budget Models Tab

This section includes the fields and descriptions for the Budget Models tab.

#### Budget Model Island

Field	Description
<b>Name</b>	When creating a budget model, you can specify a name for the budget model here.
<b>Description</b>	In this field, enter a description of the current budget model.
<b>Budget Type</b>	In this field you can enter a budget type for the current budget model. Budget types are created in the window Popup Fields in the Set-Up module. A type could be, for example, Internal or External budget.
<b>Fiscal Year</b>	In this field you specify the fiscal year which applies to the current budget model.
<b>Price Year</b>	In this field you specify the price year which applies to the budget model. The price year is used in price projections.
<b>Blocked</b>	You can mark this field to specify that you want to block the creation of further budget entries in the current budget model. Any new versions of the budget

Field	Description
	model will continue to be blocked, until you remove the mark from this field before creating another version.

### Period Variances Island

Field	Description
<b>Posting Reference</b>	In this field, you can enter a dimension combination of the type Posting Reference. By means of this dimension combination Maconomy can make automatic offsets of period variances when you approve an assigned budget journal on which the periods do not balance but on which the closing balance is zero. Period variances are posted on the account specified on the dimension combination. In this way, you can approve budget journals on which the periods do not balance, but on which the closing balance is zero. If a dimension combination was specified at creation of the budget model, this field will show the specified dimension combination. However, you can change the dimension combination in this window. The dimension combination is not mandatory, and offsets for period variance entries should thus only be used if the current budget journal contains variances on current period entries. Period variances on approved budget journals can be inspected in the windows Show Budget Entries and Budget Inspection.
<b>Entry Description</b>	In this field, you can enter an entry text to be assigned to automatic offsets of period variances.
<b>Allow Unbalanced Journals</b>	Select this field to allow unbalanced journals.

### Version Information Island

Field	Description
<b>Version Type</b>	In this field you can specify a version type for the current version of the budget model, for example, to indicate whether it is a draft or an approved budget version. The value of this field is transferred to the Versions sub-tab when creating a version of the current budget model. Version types are created in the Popup Fields Workspace in the Set-Up module.
<b>Remarks</b>	Here you can add notes to the active version of the current budget model.

### User Island

See the chapter “Getting Started” for a description of the fields in the User Island.

**Basis Island**

Field	Description
<b>Budget Model</b>	This field displays the name and description of the budget model upon which basis the current budget model was created, if the current budget model is created on the basis of another budget model. A budget model can be created from another budget model in the Create Budget Model workspace.
<b>Version</b>	The functionality of this field is similar to that of the field “Budget Model” above.
<b>Price Year</b>	The functionality of this field is similar to that of the field “Budget Model” above.
<b>Price Register</b>	The functionality of this field is similar to that of the field “Budget Model” above.
<b>Difference Account</b>	The functionality of this field is similar to that of the field “Budget Model” above.
<b>Entry Description</b>	The functionality of this field is similar to that of the field “Budget Model” above.
<b>Reference Date</b>	The functionality of this field is similar to that of the field “Budget Model” above.
<b>Keep Budget Entries</b>	The functionality of this field is similar to that of the field “Budget Model” above.

**New Budget Model Island**

Field	Description
<b>Company</b>	In this field, enter the name and number of the company on which the amounts on the current budget entry have been budgeted.
<b>Account</b>	In this field, enter the account name and number for which the amounts of the current budget entry has been budgeted.
<b>Reset:</b>	<ul style="list-style-type: none"> <li>Customer No. — The functionality of this field is similar to that of the field “Account” above.</li> <li>Vendor No. — The functionality of this field is similar to that of the field “Account” above.</li> <li>Job. No. — The functionality of this field is similar to that of the field “Account” above.</li> <li>Activity No. — The functionality of this field is similar to that of the field “Account” above.</li> <li>Task Name — The functionality of this field is similar to that of the field “Account” above.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Employee No. — The functionality of this field is similar to that of the field “Account” above.</li> <li>Item No. — The functionality of this field is similar to that of the field “Account” above.</li> <li>Asset No. — The functionality of this field is similar to that of the field “Account” above.</li> </ul>

### New Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field “Account” above.
<b>Entity</b>	The functionality of this field is similar to that of the field “Account” above.
<b>Project</b>	The functionality of this field is similar to that of the field “Account” above.
<b>Purpose</b>	The functionality of this field is similar to that of the field “Account” above.
<b>Spec. 1-3</b>	The functionality of this field is similar to that of the field “Account” above.
<b>Use Default</b>	Select the local spec that you want to set as the default.
<b>Local Spec. 1-3</b>	The functionality of this field is similar to that of the field “Account” above.

### Versions Sub-Tab

This section includes the fields and descriptions for the Versions sub-tab.

Field	Description
<b>Version</b>	Here previous version numbers for the current budget model are shown. If, for example, two previous versions have been created, the first two lines in this column will have the value of “1” and “2,” respectively. Any postings on the current budget model will be marked with version 3.
<b>Version Type</b>	In this field you can enter a version type for the current version of the budget model, for example, to indicate whether it is a draft or an approved budget version. Version types are created in the Popup Fields workspace in the Set-Up module.
<b>Created By</b>	This field displays the name of the user who created the line’s version of the budget model.

Field	Description
<b>Date</b>	This field displays the date of creation of the line's version of the budget model.
<b>Remarks</b>	This field displays any note attached to the line's version of the budget model.

## Actions

This section shows the Actions available in the Budget Models workspace.

### Top Tab

Field	Description
<b>Create New Version</b>	When you select this action, Maconomy creates a new version of the current budget model. Maconomy displays all versions of the current budget model on the Versions sub-tab of the Budget Models workspace.

## Budget Groups Workspace

Use this workspace to create and maintain budget groups.

A budget group is a collection of several budget models.

The Budget Groups tab displays the name of the current budget group; you can change the description of the group. The Models sub-tab displays the group's budget models; you can attach budget models to the current group by adding more lines.

If you group multiple budget models within the same budget group, you can transfer approved budget journal lines from one budget model to other budget models in the group.

When you create a budget journal in a budget model, you can have the journal automatically create entries in the other budget models in the budget group. If you need to make the same changes to several budget models, you only have to enter the modifying journal lines once.

A budget model can be a member of an unlimited number of budget groups.

Only budget models that have the same price year can be members of the same budget group. This ensures that budget figures are consistent when Maconomy transfers them from one budget model to other budget models in the budget group.

## Budget Groups Tab

This section includes the fields and descriptions for the Budget Groups tab.

### Budget Group Island

Field	Description
<b>Name</b>	In this field you can enter a name for a group that you are creating. After a group has been created, its name cannot be changed.

Field	Description
<b>Description</b>	In this field you can enter a description of the current budget group.

**User Island**

See the chapter “Getting Started” for a description of the fields in the User Island.

## Models Sub-Tab

This section includes the fields and descriptions for the Models sub-tab.

Field	Description
<b>Budget Model</b>	This field displays the name of the budget model that is part of the current budget group.
<b>Description</b>	This field displays the description of the current budget model.
<b>Fiscal Year</b>	This field displays the fiscal year which applies to the current budget model. Only budget models with the same fiscal year can be members of the same budget group.
<b>Price Year</b>	This field displays the price year that applies to the current budget model. Only budget models attached to the same price year can be member of the same budget group.

## Commitment Levels Workspace

Use this workspace to create combinations of dimensions on which you perform commitment control when you create and approve purchase orders.

To use commitment levels, enter the use of commitment control in the Commitment Rules workspace. For each commitment level, enter a number and a description. You can also select the follow-up levels (dimensions) for the current commitment level.

## Commitment Levels Tab

This section includes the fields and descriptions for the Commitment Levels tab.

**Level Island**

Field	Description
<b>Level No.</b>	In this field, you can specify the number of the commitment level when creating a level. The number cannot be changed, once the level has been created.
<b>Description</b>	In this field, you can enter a description of the commitment level.

**User Island**

See the chapter “Getting Started” for a description of the fields in the User Island.

**Follow-Up Level Island**

Field	Description
<b>Company</b>	In this field, you can specify whether you wish to use the Company dimension as a follow-up level. If you mark this field, commitment control is made on this dimension when purchase orders are approved. However, this only applies if the dimension values on the purchase order being approved match a commitment rule line in the Commitment Rules workspace on which the current commitment level has been specified.
<b>Account</b>	The functionality of this field corresponds to that of the field “Company” above.

**Follow-Up Level, Dimensions Island**

Field	Description
<b>Location</b>	The functionality of this field corresponds to that of the field “Company” above.
<b>Entity</b>	The functionality of this field corresponds to that of the field “Company” above.
<b>Project</b>	The functionality of this field corresponds to that of the field “Company” above.
<b>Purpose</b>	The functionality of this field corresponds to that of the field “Company” above.
<b>Spec. 1-3</b>	The functionality of this field corresponds to that of the field “Company” above.
<b>Local Spec.1-3</b>	The functionality of this field corresponds to that of the field “Company” above.

## Commitment Rules Workspace

Use this workspace to enter rules for controlling purchase order amounts against the budget when you approve purchase orders.

For each line, enter a commitment level and the ranges within the 12-dimensional chart of accounts to determine when the commitment level on the line in question is to be used in the control of committed amounts.

In the Commitment Rules tab, enter a budget type and the rules for the control of committed amounts. Maconomy uses the budget type plus the entry date and company number for an entry to determine the relevant budget model. The budget model determines the fiscal year to which commitment accounting applies and the budget figures against which committed amounts are checked.

In the Commitment Rule Lines sub-tab, assign the relevant commitment levels and specify any follow-up values (dimension value ranges) to use as selection criteria for the use of each commitment level.

### Commitment Rules Tab

This section includes the fields and descriptions for the Commitment Rules tab.

#### Commitment Island

Field	Description
<b>Check Comm. Amount</b>	<p>In this field, you can specify whether Maconomy is to check the amounts on purchase orders against the budget.</p> <p>You can choose from the following values:</p> <ul style="list-style-type: none"> <li>▪ No — Maconomy does not check the amounts being committed.</li> <li>▪ Year to Date — The check is made against the budgeted, actual, and committed amounts from the beginning of the fiscal year to today's date.</li> <li>▪ Year Total — The check is made against the budgeted, actual, and committed amounts for the whole year.</li> </ul> <p>If you select "Year to Date" or "Year Total," you must also specify a budget type.</p>
<b>Budget Type</b>	In this field, specify the budget type against which committed amounts are to be checked.

#### User Island

See the chapter "Getting Started" for a description of the fields in the User island.

### Commitment Rule Lines Sub-Tab

This section includes the fields and descriptions for the Commitment Rule Lines sub-tab.

Field	Description
<b>Commitment Level</b>	In this field, you can specify the number of a commitment level created in the Commitment Levels workspace. The commitment level contains the combination of dimensions against whose budget committed amounts are to be checked when you approve a purchase order whose dimension values match the current commitment rule line.
<b>Company No. From / To</b>	These fields form a range of dimension values used as a criterion for the use of the current commitment rule line. If you do not specify a range, the commitment control for the current follow-up level will include all company numbers.
<b>Account No. From / To</b>	The functionality of this field is similar to that of the field "Company No. From / To" above.

Field	Description
<b>Location From / To</b>	The functionality of this field is similar to that of the field "Company No. From / To" above.
<b>Entity From / To</b>	The functionality of this field is similar to that of the field "Company No. From / To" above.
<b>Project From / To</b>	The functionality of this field is similar to that of the field "Company No. From / To" above.
<b>Purpose From / To</b>	The functionality of this field is similar to that of the field "Company No. From / To" above.
<b>Spec. 1-3 From / To</b>	The functionality of this field is similar to that of the field "Company No. From / To" above.
<b>Local Spec. 1-3 From / To</b>	The functionality of this field is similar to that of the field "Company No. From / To" above.

## Allocation Keys Workspace

Use this workspace to maintain allocation keys.

You use allocation keys in the Budget Journal workspace to specify how to allocate the total budget sum for an account over the 12 periods of the fiscal year. For instance, an allocation key can specify that a budget entry is allocated quarterly—that is, distributed evenly in four equal parts. Maconomy provides the following additional methods for allocating:

- **Base the allocation on an existing budget**—You enter the name and version of an existing budget model. Maconomy allocates new budget figures that have given selection criteria in the same way as it allocates budget figures that have the same selection criteria in the existing budget.
- **Base the allocation on an actual set of accounts**—You enter the fiscal year of the set of accounts. Maconomy allocates new budget figures using the actual figures for the fiscal year. If there are no actual figures (or earlier budget figures) for given selection criteria, Maconomy allocates the amount evenly among the 12 periods

When you use the allocation key in a budget journal, Maconomy uses the latest version of the key.

Changing an allocation key does not affect existing budget entries and budget journal lines.

## Allocation Keys Tab

This section includes the fields and descriptions for the Allocation Keys tab.

### Key Island

Field	Description
<b>Name</b>	Enter the name of the allocation key in this field when you create it.
<b>Description</b>	In this field you can enter a description of the current allocation key.
<b>Allocate From</b>	<p>In this field you specify the way in which the current allocation key should allocate amounts. You can choose between the values "Percentage," "Budget," and "Actual."</p> <p>If you select "Percentage," you must enter percentages in the Percent island. The values specified in the fields "Period 1-12" display the allocation of the key, and the value in the field "Control %" displays the sum of these fields. If the sum value is different from 100, you cannot use the current allocation key.</p> <p>If you select "Budget," you must specify which budget model to allocate from. If you do not specify a version number for the budget model, Maconomy will choose the latest version. In the budget journal, lines with allocation combinations that exist as budget entries in the existing budget, will be allocated in the same way as budget figures in the existing budget.</p> <p>If you select "Actual," you must specify the fiscal year to allocate from. In the budget journal, lines with allocation combinations that exist as G/L entries in the existing set of accounts, will be allocated in the same way as in the existing set of accounts.</p>

### Budget Island

Field	Description
<b>Name</b>	Enter the name of the budget model in this field if the allocation key is being created from an existing budget model. The function of the allocation method is described under the field "Allocate From" above.
<b>Description</b>	This field displays the description of the current budget model.
<b>Version</b>	In this field you enter a version number for the existing budget model. If you do not enter a value, Maconomy will automatically select the latest version of the budget model specified.

## Actual Island

Field	Description
<b>Fiscal Year</b>	Enter the first date of a fiscal year in this field, if the allocation key is to be based on an actual set of accounts. The function of the allocation method is described under the field "Allocate From" above.

## User Island

See the chapter "Getting Started" for a description of the fields in the User island.

## Percent Island

Field	Description
<b>Period 1-12</b>	If you selected Percentage in the "Allocate From" field, use these fields to specify a percentage for each period, making sure that the sum of periods 1-12 makes 100. Positive numbers, negative numbers, and zero are permitted values.
<b>Control %</b>	This field displays the sum of the percentages mentioned above. The allocation key can only be used if the sum is 100, indicating full allocation.

## Price Registers Workspace

Use this workspace to create and maintain price registers.

A price register specifies one year's price changes within certain price areas. Use price registers when you create budget models based on existing budget models and to control the budget.

Use the Price Register tab to view and edit information about the individual price register, including which fiscal year the price register applies to. The Price Areas sub-tab displays index values for price projection for all price areas. This index value specifies the price projection for the year to which the price register projects prices.

You can also specify whether the current price register is the primary price register for the fiscal year to which it applies. The primary price register is the default price register, used to project prices when no other price register exists.

If a given selection criterion falls within multiple price areas, Maconomy uses the price area that is listed first in the Price Areas sub-tab.

If no price register exists for a given year, Maconomy projects prices using an index value of 100.

You can block a price register, which prevents Maconomy from using it to project prices. You cannot delete a price register.

## Price Registers Tab

This section includes the fields and descriptions for the Price Registers tab.

### Price Registers Island

Field	Description
<b>Name</b>	Enter the name of the price register in this field when you create it. The name cannot be changed.
<b>Description</b>	This field displays the description of the current price register.
<b>Fiscal Year</b>	Enter the first date of the fiscal year to which you want the price register to project prices. If the price register is to project from 1998 to 1999, you enter 01/01/1999 as the fiscal year. A price register can only project prices one year at a time.
<b>Primary</b>	If you check this box, you specify that the price register is primary. A primary price register is used to project prices when no other price register is specified.
<b>Blocked</b>	If you check this box, the price register cannot be used for projecting prices.

### User

See the chapter “Getting Started” for a description of the fields in the User island.

## Price Areas Sub-Tab

This section includes the fields and descriptions for the Price Areas sub-tab.

Field	Description
<b>Price Area</b>	This field displays the name of the current price area. Price areas are created in the Price Areas workspace.
<b>Index</b>	In this field you can specify an index value for the price projection of the current area. If you do not enter a value in this field, Maconomy automatically displays the value of 100. Projecting prices be an index value of 100 means that prices for the current price area remain unchanged.

## Price Areas Workspace

Use this workspace to create and maintain price areas.

You use price areas when you project prices; price areas are part of price registers.

The Price Area List tab displays the standard User island. You cannot edit the fields in this island.

Use the Price Areas sub-tab to define price areas by using a number of ranges of Maconomy's dimensions in the chart of accounts. When the selection criteria of a journal line fall within a price area, the price area is valid for that journal line.

If you do not enter a price area range for a given dimension, Maconomy does not take the dimension into account when it assigns a price area to a given selection criterion.

For example, if you enter values in the range **Location From** and **Location To** and do not enter values for other dimensions, Maconomy selects the journal line or the budget entry based solely on the **Location** dimension, regardless of any other dimension values in the selection criteria.

If you do not enter ranges for any dimension values at all, the price area applies to all selection criteria.

After you create a price area, it appears in all price registers in which you can assign an index value to the price area. The default index value is 100 until you change it in the Price Registers workspace.

If you delete a price area, Maconomy deletes it from all price registers, and you can no longer use it for price projection. For example, if you create a budget model that is based on the budget model for a previous fiscal year and use price registers to project the prices, Maconomy automatically creates a budget journal for the new budget model, and the prices are projected accordingly. If you later delete the price area that was used for that project, the budget journal is not updated. Similarly, if the budget journal was approved before you deleted the price area, the budget entries are not updated.

If multiple price areas apply to a specific selection criterion, Maconomy uses the price area that is listed first in the Price Areas sub-tab.

## Price Area List Tab

This section includes the fields and descriptions for the Price Area List tab.

### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

## Price Areas Sub-Tab

This section includes the fields and descriptions for the Price Areas sub-tab.

Field	Description
<b>Price Area</b>	Enter the name of the price area in this field when you create it. The name cannot be changed.
<b>Company No. From / To</b>	These fields make up a range of company numbers. If you only enter a range for the Company No. dimension, the current price area will apply to budget entries with company numbers within the specified range, regardless of the values of the other dimensions. You can further limit the price area by entering ranges for the other common dimensions in Maconomy.
<b>Account No. From / To</b>	The functionality of this field is similar to that of the field “Company No. From / To” above.
<b>Location From / To</b>	The functionality of this field is similar to that of the field “Company No. From / To” above.

Field	Description
<b>Entity From / To</b>	The functionality of this field is similar to that of the field “Company No. From / To” above.
<b>Project From / To</b>	The functionality of this field is similar to that of the field “Company No. From / To” above.
<b>Purpose From / To</b>	The functionality of this field is similar to that of the field “Company No. From / To” above.
<b>Spec. 1-3 From / To</b>	The functionality of this field is similar to that of the field “Company No. From / To” above.
<b>Local Spec.1-3 From / To</b>	The functionality of this field is similar to that of the field “Company No. From / To” above.

## Procedures

This section describes procedures used in Financial Budgeting.

## Getting Started

This section provides an overview of the Financial Budgeting steps you need to perform to get started.

### Finance Budgeting Workflow

The budgeting process in the Maconomy Financial Budgeting module is built around three main steps, which must be performed in order:

1. Setting up a budget template (including creating budgets from the template).
2. Populating budgets with data.
3. Reviewing and approving budgets.

There are several different activities to be performed within each of above mentioned steps. See Related Topics for details.

## Set Up Budgets Template

Setting up budget templates is the first step in the budgeting process.

**To set up budget templates, follow these steps:**

1. Create the template and enter basic information
2. Create a budget hierarchy
3. Create a budget Chart of Accounts
4. Populate Employee Categories
5. Deploy the templates

## Create the Template

The first step to setting up your budgets template is to create the template and enter basic information.

### To create a template, complete the following steps:

1. Click New Template to create a new template, or Copy Template to create a template based on existing template.
2. On the Information tab, complete fields such as Name, Description, and Budget Type to indicate basic information about the budget. Note that Access levels shown in the Access Control field use the same functionality as core Maconomy. This means that if you need any access controls specific for budgeting purposes, you must create these controls in core Maconomy.
3. Click Save.

## Create a Budget Hierarchy

Budget Hierarchy includes all business units which must submit their budgets. In Financial Budgeting, they are organized in tree-like structure. Dark gray lines with bold font are the **Sum Budgets** (described later in this document), which are use as a consolidation points for all subordinate budgets. Light grey lines are the **Main Budgets** which are use for the budgeting.

To create a budget hierarchy, you must first create a budget unit. You can enter the needed information in each column visible on the workspace. Additionally, you can quickly customize which columns appear by right-clicking on the column header and choosing the *Customize Column* option.

### To create a budget unit, complete the following steps:

1. In the **Name** column, enter the name of the budget unit.
2. In the **Responsible** column, specify the employee(s) responsible for submitting the budget.
3. In the **Company** column, specify the related company. Budget template can use all Companies available in the Maconomy system.
4. In the **Currency** column, indicate the currency of the budgeting unit. Each budgeting unit can have each one currency. Conversion will be made based on information specified in exchange rate table set in main information in the template. Note that on the right side assistant you can specify dimensions in order to better identify this particular budgeting unit. Dimensions used in Financial Budgeting are the same as used in core Maconomy. Click Save.

## Create Chart of Accounts

After the budget unit structure is complete, create a budget-specific Chart of Accounts (CoA). CoA structure follows the same logic as the budgeting structure, including **Sum Lines**, used for summarizing all subordinate lines, and **Main Lines** where budgeting is done.

### To create a Chart of Accounts, complete the following steps:

1. In the **Name** column, enter the name of the Chart of Accounts.
2. In the **Type** column, select whether the line type (which are detailed later in this document). Line types are used for defining how information on this particular line is provided.
3. In the **Income** column, select the check box to indicate if this account is revenue or de-select to indicate if this is a cost income.
4. In the **Type** column, indicate if the distribution key is supposed to be used for this particular account. Distribution Keys are explained later in this document. Note that in right side assistant budget CoA can be linked to actual CoA from Maconomy. This link will be later on used in reporting (budget vs. actual).

If needed, add dimensions to identify a particular account. However, note that they cannot contradict dimensions set in the budget hierarchy.

### Add Dimensions

If needed, add dimensions to identify a particular account. However, note that they cannot contradict dimensions set in the budget hierarchy.

### To add dimensions, complete the following steps:

1. If revenue is to be automatically calculated based on income generated by individual employees, assign at least one account line to a **Revenue** line type.
2. Use the three additional tabs in the Budget workspace to set parameters:
  - Sub Budgets - Use to configure sub-budgets that are not pre-defined. This is an optional parameter.
  - Settlement Setup - Use to for configure Intercompany Settlements. This an optional parameter.
  - Employee Setup - Use to establish a Maconomy dimension based on which Employees are linked to which budgeting departments. If the Employee sub-budget is used, this parameter must be defined.

## Set Up Employee Categories

After creating the budget hierarchy is complete, next provide information about employee categories.

**To set up Employee Categories, complete the following steps:**

1. From the *Employee Categories*. tab, click *Fetch Categories* to transfer employee categories from Maconomy.
2. Edit the information as needed.
3. Add new columns through tab *Home » Information* in islands *Unproductive Time* and *Productive Time*:

## Deploy Templates

Once all of the above steps are complete, the template can be deployed to all budgeting units.

**To deploy templates, complete the following steps:**

1. Click *Create Budgets From Template*.  
This action freezes the budget template from editing and creates budgets for each budgeting unit defined in the Budget Hierarchy tab.
2. If the template must be edited, click *Delete Budgets And Reopen Template*  
Note that this deletes all existing budgets including any information in them.

## Review and Approval Process

Review budgets at any level during the review workflow and monitor through submission, approval, and completion.

Employees responsible for Sum Budgets will have access to consolidated information of all of their subordinate budgets (tab *Budget Lines*) and they can review each budget separately (tab *Subordinate budgets*).

The *Subordinate Budgets* tab contains a dashboard with the status of all subordinate budgets and actions for approving or approval removal.

If this sum budget is not the final sub budget, it can be also submitted for further approvals.

## Fixed Assets Overview

This chapter describes the Fixed Assets module in Maconomy. You use this module to manage company assets and to generate lists and reports used at the closing of the fiscal year.

The Fixed Assets module enables you to enter individual asset purchases. These are used to automatically calculate depreciation; you can manually enter improvements, write-ups, write-downs, and depreciations. You can also sell assets and transfer assets to and from different asset groups.

### Introduction to the Fixed Assets Module

There are legal and practical reasons for entering assets in a separate system. The law has made it compulsory for companies to keep detailed accounts of fixed assets and depreciation. The various transactions that are made during the life of some assets have direct effect on the year-end result, which is why they must be properly documented. Therefore, you should not delete entries that are related to fixed assets until the asset is no longer in use and the audit documentation retention period has expired. Using the Fixed Assets module, you can keep structured, thorough control of your fixed assets.

Companies have a basic legal duty to enter assets that they have purchased for long-term usage. These assets are known as fixed assets, for which accounting laws set out precise and comprehensive rules for depreciation, write-ups, write-downs, and other transactions.

Assets of similar character or purpose are sorted into asset groups. The law has defined various asset groups for the purpose of reporting year-end results, but there are no legal hindrances to companies to categorize their assets in greater detail.

After you enter the assets in Maconomy, they are depreciated over a number of years, that is, the life span of an asset. Maconomy depreciates the assets automatically, whereas you enter transactions, such as write-ups and write-downs manually. As long as the asset is not sold or otherwise cast off, you must keep its records in the system, as required by law.

The law also requires full documentation of all transactions made during the life of an asset. Maconomy keeps a record of every transaction made and cannot delete these records before the legal requirement for documentation is relieved.

### Structure of the Fixed Assets Module

The structure of the information contained in the Fixed Assets module is divided into the following levels:

1. At the top level are the asset groups, which represent assets of a similar character or purpose.
2. At the second level are the actual assets that are assigned to an asset group.
3. The third level contains the entries that describe the transactions that have been performed for the asset.

The asset groups have two purposes. One is to sort the financial transactions for the assets in the group; the other is to ensure full integration with the general ledger. The grouping of assets is required by law in some countries, because the total number of transactions that are represented in the group is used when accounts are closed at year end. Integration with the general ledger is ensured by attaching each type of transaction to a separate G/L account.

All assets are associated with a company. Whether a given user can see a given asset depends on whether he or she has access to the company to which the asset belongs. This applies to both the asset information card and any entries that are related to the asset in question. Note that this access control model only applies if you have not changed Maconomy's standard access control configuration. If you have, access to assets may depend on other factors. For more information about the standard access control configuration, see "Introduction to the Access Control System" in the Set-Up module.

In the Users workspace in the Set-Up module, you can attach a user to a company. You can assign an access level to each company in the Company Information workspace in the G/L module.

### **Documentation**

A company must typically be able to document the life of an asset. This includes two types of documentation:

- Entries to the asset.
- Changes to the asset.

Maconomy prevents any asset entries from being deleted during the legal lifetime of the asset. Maconomy also complies fully with the second requirement by ensuring automatic control of any changes in vital information about the assets. The following data is recorded:

- The time of the change.
- The user who was responsible for the change.
- The name of the field that was changed.
- The value of the change.
- The value after the change.

You can view asset changes in the Asset History workspace, where you can enter a note for each change. This provides full documentation for all changes to the assets.

### **Integration with the General Ledger**

The Fixed Assets module is integrated with the General Ledger module, which implies that all amount transactions performed for an asset are posted to the G/L accounts that are identified by the asset group and asset transaction type. This occurs during the posting of the asset journals, which are created when you approve asset adjustments.

For every asset group, you must specify which G/L accounts are to be used when posting transactions for the asset members. You must also enter the text that the G/L entries are to carry. This makes it easy to manage which G/L accounts are used for the individual asset groups and asset transaction types.

### **Asset Transaction Types**

In day-to-day administration, assets are the central concept and foundation for all transactions. When you purchase an asset on a long-term basis, you must enter it in the Fixed Assets module. You do this in the Assets workspace, where you can enter a wide variety of information about the asset. A large part of the information is of a non-financial character. The purpose of having this information is to ensure proper documentation of the asset. The remainder of the information

pertains to the life (depreciation period) of the asset, depreciation method, residual value, and the non-depreciable part of the purchase price. The residual value is the amount to which you want to depreciate the purchase price. The residual value can also be perceived as the price that you expect to be able to sell the asset for, after the depreciation period is over.

You enter the purchase price (cost) by creating a transaction of the type **Purchase**. You enter a purchase transaction in the Asset Adjustment workspace in the same way as other manual transactions. This happens if you enter a cost price when you create the asset, or it can happen later, by entering an asset adjustment after you create the asset.

After you enter the transaction, the only change that typically takes place for an asset is depreciation. Normally, the depreciation is generated automatically; this takes place in the Depreciation Adjustment workspace, where you enter the date on which you want to start depreciating. Maconomy then creates a depreciation adjustment suggestion, which you can view and edit manually in the Asset Adjustment workspace. After you have finished editing the asset adjustment, you approve it. This updates the information that is attached to the asset. At the same time, Maconomy creates a posting journal of the type **Asset Journal**, which you must post in the G/L module.

Occasionally you might need to make extraordinary write-ups, write-downs, depreciation, and corrections to previous years' depreciation. You do this in the Asset Adjustment workspace, where you can create entries manually. An improvement in an asset typically results in a manual entry that is similar to a new purchase.

There are four types of transactions that you cannot select manually in the Asset Adjustment workspace: **Sale**, **Internal Sale**, **Relocation**, and **Transfer**. You create these types of transactions in the Asset Disposal workspace.

### **Asset Relocation/Internal Sale**

If you want to change the physical location of one or more assets in the company, or if you want to sell assets to another department in the company or a subsidiary, and such a company is considered to be a separate legal entity, you might want to do so by relocating/selling the current assets internally. You change the physical location of an asset by redefining the asset's dimension and user information, including the asset's company association. You perform asset relocation transfer and sale in the Asset Relocation workspace.

If an asset is internally relocated, that asset's user information and dimension values are changed according to the specifications that you provide. However, this does not mean that an asset is created; instead, the company association of the asset and other dimension values are redefined. The remaining standard information is not changed. When you relocate assets between two companies, you create the necessary inter-company balances in the G/L module, unless you do not select the **Create intercompany entries for companies with same parent company** system parameter, and the two companies involved are both assigned to the same parent company.

When you enter the asset changes and the necessary G/L entries, Maconomy creates an asset adjustment of the type **Relocation**, which is automatically approved. The approved asset adjustments are displayed in the Asset Adjustment workspace. When approving an asset adjustment, Maconomy also creates a posting journal of the type **Asset Journal**, which is then posted in the G/L module.

If you sell an asset internally, you remove the asset from the company that is selling it and create an asset in the company to which the asset is being sold. The new asset is treated like an acquisition, and its sales price is the book value that you enter at the time of the sale. The

company that is selling the asset must ensure that possible depreciations are performed before the sale is completed. The company that is buying the asset takes over the depreciation period and the depreciation method from the company that is selling the asset.

At the same time, Maconomy creates an asset adjustment and automatically approves it. The entries in such asset adjustments are of the type **Internal Sale**. The approved asset adjustments are displayed in the Asset Adjustment workspace. Maconomy also creates an asset journal to be posted in the Posting workspace in the G/L module.

## Registration Section

This section includes the fields and descriptions for the Registration Section workspaces.

### Asset Adjustment Single Dialog Workspace

Use this workspace to enter manual transactions for assets.

You can enter information about acquisitions, improvements, write-ups, write-downs, corrections, depreciations, and tax depreciations.

You also use this workspace to approve depreciation selections that Maconomy makes.

When you approve an asset adjustment, Maconomy updates all of the totals in the asset and creates an asset journal, which you must post in the G/L module. This workspace only displays asset adjustments that have not yet been posted. The Show Asset Adjustments workspace displays posted asset adjustments.

### Asset Adjustment Tab

This section includes the fields and descriptions for the Asset Adjustment tab.

#### Journal Island

Field	Description
<b>Asset Adjustment No.</b>	This is the number given to the asset adjustment. The number is taken from the "Asset Adjustment" system numbers.

#### User Island

Field	Description
<b>Created</b>	This field shows the user name of the person who created the asset adjustment and the date on which it was created.
<b>Approved</b>	This field shows the user name of the person who approved the asset adjustment and the date on which it was approved.

**Transaction Numbering Island**

Field	Description
<b>Transaction Type</b>	In this field you can enter a transaction type. When creating a new asset adjustment, the field shows the default transaction type for the asset journal.
<b>Number Series</b>	In this field you can select a transaction number series. By default, the field shows the default transaction number series for the transaction type specified.

**Company Island**

Field	Description
<b>Company</b>	This field displays the name and number of the company to which the current asset is attached.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

## Asset Entries Sub-Tab

This section includes the fields and descriptions for the Asset Entries sub-tab.

Field	Description
<b>Date</b>	In this field, you specify the entry date of the adjustment. Maconomy automatically suggests today's date.
<b>Trans. No.</b>	<p>In this field, you enter the transaction number.</p> <p>If you have not checked the box "Reuse Trans. No." in the window System Information in the Set-Up module, Maconomy checks that the transaction number has not already been used for a journal entry in an unposted general or vendor invoice journal belonging to the company applying to the current line or for an already posted G/L entry belonging to the company applying to the current line.</p> <p>If the system parameter "Company specific transaction number check" has been marked, Maconomy checks that the transaction number has not already been used for a journal entry in an unposted general, asset, customer payment, or vendor invoice journal belonging to the company applying to the current line or for an already posted G/L entry belonging to the company applying to the current line. If the parameter has not been marked, Maconomy checks that the number has not been used on any other manual transaction in the system, regardless of company number.</p>
<b>Trans. Type</b>	In this field, you enter the transaction type. By default, the transaction type from the card part will be suggested. All entries that have the same Trans. No. must also have the same Trans. Type.

Field	Description
<b>Asset No.</b>	In this field, you enter the asset number.
<b>Asset Transaction Type</b>	In this field, you enter the asset transaction type.
<b>Amount, Base</b>	In this field, you enter the amount of the transaction in question. The amount is entered in the base currency of the company to which the asset in question is assigned.
<b>Amount, Currency</b>	This field displays the amount of the transaction in the currency of the company to which the asset entry in question is assigned.
<b>Currency</b>	This field displays the currency used as base currency in the company to which the asset entry in question is assigned. See the description of the field "Base Currency" in the window Company Information in the G/L module for further information about company base currencies and enterprise currencies.
<b>Sub-Type</b>	This field displays either "Sale" or "Transfer" if the transaction concerns either a sale or transfer of an asset to another group, or "Relocation" or "Internal Sale," if the transaction concerns an internal asset relocation or sale to, for example, another department in the company. See the description of the windows Asset Disposal and Asset Relocation for further information about these asset transaction types.
<b>Asset Group</b>	This field displays to which group the asset belongs.
<b>Asset Sub-Group</b>	This field displays to which sub-group the asset belongs.
<b>Pct. Sold</b>	This field shows the percentage sold, if applicable
<b>Entry Description</b>	In this field, you can enter a note to the transaction.
<b>Company No.</b>	This field displays the number of the company for which the current asset is registered.
<b>Location</b>	This field displays a value for the Location dimension. The value is transferred from the asset.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.

Field	Description
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>New Asset Group</b>	This is the new asset group, if the transaction is for a sale or transfer to another asset.
<b>New Asset Number</b>	This is the new asset number, if the transaction is for transfer to another asset group (see "Transfer to New Group").

## Actions

This section shows the Actions available in the Asset Adjustment workspace.

Field	Description
<b>Approve</b>	<p>When you select this action, the asset adjustment is approved.</p> <p>Having approved an asset adjustment, all totals for the relevant assets are updated and displayed in the company's base currency and in the enterprise currency. Furthermore, Maconomy creates an asset journal in the general ledger which is ready to be posted. Note that you cannot approve an asset adjustment having an entry date which is not within the open posting period.</p> <p>Note that between the time the adjustment is approved and the asset journal is posted, the Fixed Assets and G/L modules do not balance.</p>

## Asset Disposal Single Dialog Workspace

Use this workspace to enter the sale of all or part of an asset or to enter the transfer of one asset to another, for example, in connection with an asset group transfer.

### Asset Sale

Selling an asset normally involves several accounting transactions. When an asset (all or part of it) is sold at a given price, the law requires that the parts that are sold are reversed. This means that a sale results in one entry of each transaction type. You are also required to enter a gain or loss made from an asset sale separately. When you approve a sale in the Asset Disposal workspace, Maconomy creates an asset adjustment that contains all of the calculated entries. These entries are of the sub-type **Sale**; you cannot edit or delete them in the Asset Adjustment workspace. If you do not want the sale to go through, you must delete the whole asset adjustment.

### Transfer to New Group

The law also requires that the transfer of an asset to another group occurs by transferring all of the data for the asset to a new asset, which is a member of the new asset group.

The transfer of an asset from one group to another requires, in the same way as the sale, that you reverse the sum of all of the transactions for the asset to the original asset. You enter the

totals as opening entries to the new asset. When you approve the transfer, Maconomy creates the asset automatically. Maconomy also creates an asset adjustment that has an entry for every transaction type used for the old asset. All of the entries are of the **Transfer** sub-type, and you cannot edit or delete them in the Asset Adjustment workspace. If you do not want the transfer to go through, you must delete the whole asset adjustment.

## Asset Disposal Tab

This section includes the fields and descriptions for the Asset Disposal tab.

### Asset Island

Field	Description
<b>Asset No.</b>	This field shows the number of the asset.
<b>Asset Group</b>	This is the asset group the asset is in.
<b>Asset Sub-Group</b>	This is the asset's sub-group.

### Company Island

Field	Description
<b>Company No.</b>	This field displays the name and number of the company assigned to the current asset.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### Asset Information Island

Field	Description
<b>Description</b>	This is the description of the asset.
<b>Model</b>	This is the model of the asset.
<b>Located</b>	This is where the asset is located.

**Sales Island**

Field	Description
<b>Amount</b>	In this field you enter the price the asset (or part of it) is being sold for. You must enter a positive amount.
<b>Pct. Sold</b>	In this field you enter how large a percent of the asset is being sold.
<b>Date of Sale</b>	In this field you enter the date of the sale.
<b>Trans. Type</b>	In this field you can select the transaction type for the asset to be sold. You can only select a transaction type that is allowed in the asset journal for the current company and user. The value of this field has no effect on the field Numbering Series. The default value is set to the default transaction type of the asset sales journal in company of the asset.
<b>Number Series</b>	In this field you can choose a transaction number series from the Popup Fields window. The transaction number will then be allocated automatically. The default is set to the default transaction numbering series for the transaction type in this island.
<b>Trans. No.</b>	<p>In this field you enter the transaction number.</p> <p>If you have not checked the box "Reuse Trans. No." in the window System Information in the Set-Up module, Maconomy checks that the transaction number has not already been used for a journal entry in an unposted general or vendor invoice journal belonging to the company applying to the current line or for an already posted G/L entry belonging to the company applying to the current line.</p> <p>If the system parameter "Company specific transaction number check" has been marked, Maconomy checks that the transaction number has not already been used for a journal entry in an unposted general, asset, customer payment, or vendor invoice journal belonging to the company applying to the current line or for an already posted G/L entry belonging to the company applying to the current line. If the parameter has not been marked, Maconomy checks that the number has not been used on any other manual transaction in the system, regardless of company number.</p>
<b>Entry Description</b>	In this field you enter a comment to explain the sale.

**Transfer Island**

Field	Description
<b>New Asset Group</b>	In this field you enter the asset group of the new asset.

Field	Description
<b>New Asset Number</b>	In this field you enter the new asset number. If you do not enter a number manually, Maconomy will automatically take an asset number from the transaction numbering series that may be connected to the current company. If the number in the numbering series has been selected as zero, you should enter an asset number manually. Numbering series are entered in the window Trans. No. Series in the Set-Up module.
<b>Date Transferred</b>	In this field you enter the transfer date.
<b>Trans. Type</b>	In this field you can select the transaction type for the asset to be transferred. You can only select a transaction type that is allowed in the asset journal for the current company and user. The value of this field has no effect on the field Numbering Series. The default value is set to the default transaction type of the asset transfer journal in company of the asset.
<b>Number Series</b>	In this field you can choose a transaction number series from the Popup Fields window. The transaction number will then be allocated automatically. The default is set to the default transaction numbering series for the transaction type in this island.
<b>Trans. No.</b>	<p>In this field you enter the transaction number.</p> <p>If you have not checked the box "Reuse Trans. No." in the window System Information in the Set-Up module, Maconomy checks that the transaction number has not already been used for a journal entry in an unposted general or vendor invoice journal belonging to the company applying to the current line or for an already posted G/L entry belonging to the company applying to the current line.</p> <p>If the system parameter "Company specific transaction number check" has been marked, Maconomy checks that the transaction number has not already been used for a journal entry in an unposted general, asset, customer payment, or vendor invoice journal belonging to the company applying to the current line or for an already posted G/L entry belonging to the company applying to the current line. If the parameter has not been marked, Maconomy checks that the number has not been used on any other manual transaction in the system, regardless of company number.</p>
<b>Entry Description</b>	In this field you enter a comment to explain the transfer.

## Actions

This section shows the Actions available in the Asset Disposal workspace.

Field	Description
<b>Approve Sale</b>	When you approve a sale, Maconomy creates and approves a new asset adjustment containing the transactions with the entries needed to register the sale. When the asset adjustment is posted, Maconomy updates the asset and general ledger systems.
<b>Approve Transfer</b>	When you approve a transfer, Maconomy creates the new asset, transferring all the information from the old asset. A new asset adjustment is also created and approved, containing all the transactions with the entries needed to register the transfer. When the asset adjustment is posted, Maconomy updates the asset and general ledger systems.

## Asset Relocation Single Dialog Workspace

Use this workspace to change the internal location of assets in a company.

If an asset is relocated internally, Maconomy updates the asset's properties, including the assigned company, dimensions, and user (date sold, responsible, and so on) according to the specifications that you provide in this workspace. However, the asset's standard information (for example, its existing asset number, asset information, financial information, technical data, and so on) remains unchanged.

In connection with an asset relocation, Maconomy creates an asset adjustment. This asset adjustment contains one asset entry for each asset that was relocated for both the company from which the asset is moved and the company to which it is moved.

If the currencies that the two companies use are different, Maconomy converts the asset values into the currency that is used by the company to which the asset is relocated. The Asset Entries sub-tab of the Asset Adjustment workspace displays the company number and base currency of each asset entry. You cannot change the asset transaction type in the Asset Adjustment workspace. All entries are assigned the asset transaction type **Relocation**.

Note that you cannot delete an approved asset adjustment. If you do not want to move the asset, you must manually transfer it back in the system using this workspace.

## Asset Relocation Tab

This section includes the fields and descriptions for the Asset Relocation tab.

### Selection Criteria Island

Field	Description
<b>Asset No.</b>	In these fields, you can enter the range of asset numbers to be included in the asset relocation.
<b>Asset Group</b>	In this field, you can select the asset group to be included in the asset relocation.

Field	Description
<b>Asset Sub-Group</b>	In this field, you can select the job number that is currently associated with the fixed asset.

Field	Description
<b>Job No.</b>	In this field, you can select the asset sub-group to be included in the asset relocation.
<b>Activity</b>	In this field, you can select the activity that is currently associated with the fixed asset.
<b>Task</b>	In this field, you can select the task that is currently associated with the fixed asset.
<b>Company No.</b>	<p>In these fields, you can enter a range of values for the dimension Company to be included in the asset relocation.</p> <p>If this field is completed, Maconomy performs a normal dimension derivation procedure. See the description of the multi- company model in the G/L module for further information about dimension derivation in Maconomy.</p> <p>If this field has been completed, and the company number is different from the company currently assigned to the asset, the asset changes are registered in the standard information on the information card for the same asset. Furthermore, intercompany balancing will be created between the two companies when the asset journal is posted, unless the system parameter "Create intercompany entries for companies with same parent company" is not marked, and the two companies involved are both assigned to the same parent company.</p> <p>If the field is not completed, the dimension value for the asset being relocated will remain unchanged. The dimension value is copied from the asset's information card in the window Assets.</p>

### Selection Criteria, Dimension Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Company No."
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No."
<b>Project</b>	The functionality of this field is similar to that of the field "Company No."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No."
<b>Spec. 1-3</b>	The functionality of this field is similar to that of the field "Company No."
<b>Local spec. 1-3</b>	The functionality of this field is similar to that of the field "Company No."

**New Dimensions Island**

Field	Description
<b>Location</b>	<p>In this field, you can enter a new value for the dimension Location. The new value will be assigned to the asset that is relocated.</p> <p>If this field has been completed, Maconomy performs a normal dimension derivation procedure. See the description of the multi-company model in the G/L module for further information about dimension derivation in Maconomy.</p> <p>If assets are relocated from one location to another, Maconomy will create an asset adjustment and an asset journal.</p> <p>If the field is not completed, Maconomy keeps the dimension value for the asset being relocated. The dimension value is copied from the asset's information card in the window Assets.</p>
<b>Entity</b>	The functionality of this field is similar to that of the field "Location."
<b>Project</b>	The functionality of this field is similar to that of the field "Location."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location."
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Local spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."

**New Job Information Island**

Field	Description
<b>Job No.</b>	Select the job number with which you now want to associate the fixed asset.
<b>Activity</b>	Select the activity with which you now want to associate the fixed asset.
<b>Task</b>	Select the task with which you now want to associate the fixed asset.

**Posting Island**

Field	Description
<b>Entry Date</b>	<p>In this field, you enter the entry date for the asset relocation. The entry date will be registered along with the asset's standard information as the date of relocation. Maconomy automatically suggests today's date as entry date. The date specified must be within the open posting period.</p>

Field	Description
<b>Entry Description</b>	In this field, you can enter an entry description text.
<b>Transaction Type</b>	In this field, you can enter a transaction type. You can select all existing transaction types valid for the asset journal. It has no effect on the fields "Transaction Number Series" and "Transaction No." If the field "Transaction Type" is empty, the created asset entries, asset adjustments, and journals will use the default transaction type. If you select a specific transaction type, this will be validated when pressing OK and will be copied to the newly created asset entries, adjustments, and journals. The validation will test if the given transaction type is allowed for the (company number, user, asset journal) combination. The reallocation is allowed only if a valid transaction type was entered by the user or derived by the system.
<b>Transaction Number Series</b>	<p>In this field, you can select a transaction number series for the asset journals created in connection with the asset relocation. If a transaction number series is specified in this field, the next available transaction number in the transaction number series is automatically assigned to the asset entries by Maconomy.</p> <p>All entries created as a result of the asset relocation will be assigned consecutive transaction numbers which will be drawn from the transaction number series of the respective companies to which the assets are assigned. If no Transaction Number Series is set, and no Transaction No. either, the system will try to derive a Transaction Number Series.</p> <p>Please note that no transaction number series will be selected if a transaction number is manually entered in the field "Transaction Number."</p>
<b>Transaction No.</b>	<p>In this field, you can select a transaction number for the asset journals created in connection with the asset relocation. All entries created as a result of the asset relocation will be assigned the same transaction number. If no number is entered, the system will try to derive one from the Transaction Type.</p> <p>Please note that no transaction number series will be selected, if a transaction number is manually entered in this field.</p> <p>A transaction number can be reused, if the field "Reuse Trans. No." is marked in the window System Information in the Set-Up module.</p>
<b>Responsible</b>	<p>In this field, you can enter the name of a new responsible person for the asset.</p> <p>If the field is not completed, Maconomy keeps the name of the responsible person registered on the asset's standard information in the window Assets.</p>
<b>Post</b>	If this field is marked, all asset selections created are automatically approved and posted in connection with a relocation of assets.

## Asset Internal Sale Single Dialog Workspace

Use this workspace to sell assets internally, that is, to another department in the company or to a subsidiary that is a separate legal entity.

Maconomy transfers all of the information that you entered on the asset to a new asset, which Maconomy creates in the company to which the asset is sold. The sum of all transactions is saved to the new asset.

Maconomy transfers all of the dimension values and posting values to an asset that Maconomy creates in the company to which the asset is sold. In that company, Maconomy treats the asset as an acquisition. Maconomy enters the acquisition date as the date of sale and assigns to the asset a new asset number drawn from a predefined number series for the company in which the asset is created. Maconomy updates the asset's company information and dimension information and transfers all other asset information—such as asset group, subgroup, serial number, and financial information—from the asset that is being sold to the new asset. In the Assets workspace Maconomy selects the **Internal Purchase** field for the new asset, indicating that the asset has been acquired via an internal sale. Maconomy also transfers depreciation information, including the depreciation method and period, and resets the last depreciation automatically. Maconomy enters the depreciable value of the asset based on the transferred price of sale, along with non-depreciable and residual value. Maconomy also resets all improvements, write-ups, and write-downs. Maconomy transfers all of the remaining fields and values from the asset that was sold.

Upon approval of the internal asset sale, Maconomy creates an asset adjustment with asset entries for the company from which the current asset is being sold—one line per asset transaction type—and an asset entry for the company to which the current asset is sold.

If the currencies that the two companies use are different, Maconomy converts the asset values into the currency that the company to which the asset is sold uses. The Asset Entries sub-tab of the Asset Adjustment workspace displays the company number and base currency of each asset entry. You cannot change the asset transaction type in the Asset Adjustment workspace.

Maconomy assigns an asset transaction type of **Internal Sale** to all entries. If an internal sale causes currency conversions that result in profit or loss amounts, you can post those amounts on the accounts for internal sale specified for each asset group in the Asset Groups workspace.

Note that you cannot delete an approved asset adjustment. If you do not want to sell the asset, you must manually transfer it back in the system using this workspace.

### Asset Internal Sale Tab

This section includes the fields and descriptions for the Asset Internal Sale tab.

#### Selection Criteria Island

Field	Description
<b>Asset No.</b>	In these fields, you can enter the range of asset numbers to be included in the asset sale.
<b>Asset Group</b>	In this field, you can select the asset group to be included in the asset sale.

Field	Description
<b>Asset Sub-Group</b>	In this field, you can select the asset sub-group to be included in the asset sale.
<b>Job No.</b>	In this field, you can select the asset sub-group to be included in the asset relocation.
<b>Activity</b>	In this field, you can select the activity that is currently associated with the fixed asset.
<b>Task</b>	In this field, you can select the task that is currently associated with the fixed asset.
<b>Company No.</b>	<p>In these fields, you can enter a range of values for the dimension Company to be included in the asset sale.</p> <p>If this field is completed, Maconomy performs a normal dimension derivation procedure. See the description of the multi-company model in the G/L module for further information about dimension derivation in Maconomy.</p> <p>A new asset is created with the specified dimension values in the specified company. Furthermore, intercompany balancing will be created between the two companies when the asset journal is posted, unless the system parameter "Create inter- company entries for companies with same parent company" is not marked, and the two companies involved are both assigned to the same parent company.</p> <p>If the field is not completed, the dimension value for the asset being sold will remain unchanged. The dimension value is copied from the asset's information card in the window Assets.</p>

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Company No."
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No."
<b>Project</b>	The functionality of this field is similar to that of the field "Company No."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No."
<b>Spec. 1-3</b>	The functionality of this field is similar to that of the field "Company No."
<b>Local Spec. 1-3</b>	The functionality of this field is similar to that of the field "Company No."

**New Dimensions Island**

Field	Description
<b>Location</b>	<p>In this field, you can enter a new value for the dimension Location. The new value will be assigned to the asset that is sold.</p> <p>If this field has been completed, Maconomy performs a normal dimension derivation procedure. See the description of the multi-company model in the G/L module for further information about dimension derivation in Maconomy.</p> <p>If the field is not completed, Maconomy keeps the dimension value for the asset being sold. The dimension value is copied from the asset's information card in the window Assets.</p>
<b>Entity</b>	The functionality of this field is similar to that of the field "Location."
<b>Project</b>	The functionality of this field is similar to that of the field "Location."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location."
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."

**Posting Island**

Field	Description
<b>Entry Date</b>	<p>In this field, you enter the entry date for the asset sale. The entry date will be registered along with the asset's standard information as acquisition date on the new asset. Maconomy automatically suggests today's date as entry date. The date specified must be within the open posting period.</p>
<b>Entry Description</b>	In this field, you can enter an entry description text.
<b>Transaction Type</b>	<p>In this field, you can enter a transaction type. You can select all existing transaction types valid for the asset journal. It has no effect on the fields "Transaction Number Series" and "Transaction No." If the field "Transaction Type" is empty, the system will derive a transaction type. If you select a specific transaction type, this will be validated when pressing OK and will be copied to the newly created asset entries, adjustments, and journals. The validation will test if the given transaction type is allowed for the (company number, user, asset journal) combination. The sale is allowed only if a valid transaction type was entered by the user or derived by the system.</p>
<b>Transaction Number Series</b>	In this field, you can select a transaction number series for the asset journals created in connection with the asset sale. If a transaction number series is

Field	Description
	<p>specified in this field, the next available transaction number in the transaction number series is automatically assigned to the asset entries by Maconomy.</p> <p>All entries created as a result of the asset sale will be assigned consecutive transaction numbers which will be drawn from the transaction number series of the respective companies to which the assets are assigned. If no Transaction Number Series is set, and no Transaction No. either, the system will try to derive a Transaction Number Series.</p> <p>Please note that no transaction number series will be selected if a transaction number is manually entered in the field "Transaction Number."</p>
<b>Transaction No.</b>	<p>In this field, you can select a transaction number for the asset journals created in connection with the asset sale. All entries created as a result of the asset sale will be assigned the same transaction number. If no number is entered, the system will try to derive one from the Transaction Type.</p> <p>Please note that no transaction number series will be selected, if a transaction number is manually entered in this field.</p> <p>A transaction number can be reused, if the field "Reuse Trans. No." is marked in the window System Information in the Set-Up module.</p>
<b>Responsible</b>	<p>In this field, you can enter the name of a new responsible person for the asset.</p> <p>If the field is not completed, Maconomy transfers the name of the person responsible for the asset sold to the standard information of the new asset in the window Assets.</p>
<b>Post</b>	<p>If this field is marked, all asset selections created are automatically approved and posted in connection with a sale of assets.</p>

## Depreciation Adjustment Single Dialog Workspace

Use this workspace to create a depreciation adjustment for one or more assets. Maconomy creates an asset adjustment that contains the depreciation entries.

Maconomy calculates the depreciation by comparing the total approved depreciation with the expected depreciation per entry date. Maconomy calculates the expected depreciation as the proportionate part of the depreciable value.

Assets for which the **Manual Depreciation** field in the Assets workspace is selected are not included in Maconomy's depreciation calculations.

## Depreciation Adjustment Tab

This section includes the fields and descriptions for the Depreciation Adjustment tab.

### Selection Criteria Island

Field	Description
<b>Asset Group</b>	In this field, you can limit the target group to cover only one asset group. If you leave the pop-up blank, the adjustment will include all asset groups.
<b>Asset Sub-Group</b>	In these fields, you can limit the target group to cover only a range of asset sub-groups. If you do not enter values in these fields, the adjustment will include all asset sub-groups.
<b>Asset No.</b>	In these fields, you can limit the target group to cover only a range of assets.
<b>Company No.</b>	In these fields, enter a range of company numbers for which you wish to see asset adjustments. Maconomy creates one adjustment for each company in the specified range.

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	In these fields, you can limit the target group to cover only a range of locations.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location."
<b>Project</b>	The functionality of this field is similar to that of the field "Location."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location."
<b>Spec. 1-3</b>	The functionality of this field is similar to that of the field "Location."
<b>Local Spec. 1-3</b>	The functionality of this field is similar to that of the field "Location."

### Posting Island

Field	Description
<b>Entry Date</b>	In this field, you enter an entry date. All entries created in connection with the current asset adjustment will be assigned this entry date. Maconomy will automatically suggest the date of today in this field. The suggested date can be changed manually.
<b>Trans. Type</b>	In this field, you enter the transaction type for the depreciation adjustment. The transaction type validated, and in case of invalid transaction type a

Field	Description
	warning will be issued. If you do not enter a transaction type, the system will try to derive one. The value in this field has no effect on the fields Transaction Number Series and Transaction Number.
<b>Number Series</b>	<p>In this field, you can select a transaction number series for the asset journals created in connection with the current asset adjustment. Transaction number series are created in the window Popup Fields in the Set-Up module. If a transaction number series is specified in this field, the next available transaction number in the transaction number series is automatically assigned to the asset journals.</p> <p>All entries created as a result of the asset adjustment will be assigned the same transaction number.</p> <p>Please note that no transaction number series will be selected if a transaction number is manually entered in the field "Transaction Number." If neither this field nor Transaction Number has a value, the system will try to derive a Transaction Number Series.</p>
<b>Trans. No.</b>	<p>In this field, you can select a transaction number for the asset journals created in connection with the asset adjustment. All entries created as a result of the asset adjustment will be assigned the same transaction number.</p> <p>Please note that no transaction number series will be selected if a transaction number is manually entered in this field.</p> <p>A transaction number can be reused, if the field "Reuse Trans. No." is marked in the window System Information in the Set-Up module.</p>
<b>Entry Description</b>	In this field, you can enter a note to the adjustment.
<b>Book Depreciation</b>	Select this field to include the regular book depreciation in the calculation.
<b>Tax Depreciation</b>	Select this field to enable Maconomy to always automatically depreciate the greatest amount possible within the limitations you specified on the compensation model.
<b>Automatic Approval</b>	<p>This field controls the approval of the asset adjustment created for the depreciation, as follows:</p> <ul style="list-style-type: none"> <li>▪ If Automatic Approval is selected, the asset adjustment will be approved automatically.</li> <li>▪ If Automatic Approval is not selected, the asset adjustment will be created, but not approved, so it can be edited.</li> </ul> <p>By default, Automatic Approval is selected. If Automatic Posting is selected, the asset adjustment will be approved automatically and the asset depreciation journal will be posted automatically.</p>

Field	Description
<b>Automatic Posting</b>	If you mark this field, asset adjustments will automatically be approved and posted in connection with creation of the current asset depreciations.

## Tax Depreciation Tables Single Dialog Workspace

Use this workspace to set up tax depreciation on the table level. You can enter the maximum allowed depreciation for all the years in the asset's lifetime.

This provides alternative areas for countries with more complex rules. Checks in the system ensure that the sum in the table is equal to 100% to prevent user-input errors. This requires you to fill the table with valid values before you assign it as a Tax Depreciation model. You can also specify the depreciation percentage for each year.

### Tax Depreciation Table Tab

This section includes the fields and descriptions for the Tax Depreciation Table tab.

#### Tax Depreciation Table Information Island

Field	Description
<b>Name</b>	Enter the tax depreciation table name.
<b>100% Full</b>	This field shows if the tax depreciation percentage is full.

#### User Island

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the tax depreciation table.
<b>Changed</b>	This field shows the date and name of the user who last modified the tax depreciation table, including the sub-tab of the workspace.
<b>Version</b>	This field shows the latest version number of the current tax depreciation table, and is incremented with every change to the table, including the sub-tab of the workspace.

## Tax Depreciation Table Lines Sub-Tab

This section includes the fields and descriptions for the Tax Depreciation Lines sub-tab.

Field	Description
<b>Year</b>	This field shows the year the specified tax depreciation percentage takes effect. It starts with one, and is incremented each time you add a tax depreciation table line.
<b>Percentage</b>	This field shows the value of the allowed tax depreciation percentage for the specified year in the line.
<b>Accumulation</b>	This field shows the accumulated tax depreciation percentage from the preceding years up to the current line.
<b>Remainder</b>	This field shows the remaining tax depreciation percentage that you need to enter to fill the required 100%.

## Lookup Section

This section includes the fields and descriptions for the Lookup Section workspaces.

### [Asset Ledger Card Single Dialog Workspace](#)

Use this workspace to view the transactions entered for an asset within a given period.

## Asset Ledger Card Tab

This section includes the fields and descriptions for the Asset Ledger Card tab.

### Asset Island

Field	Description
<b>Asset No.</b>	This is the asset number.
<b>Asset Group</b>	This field shows the asset group name.
<b>Asset Sub-Group</b>	This field shows the asset sub-group name.
<b>Description</b>	This is the description of the asset, for example, its make.
<b>Model</b>	This field shows the model of the asset.
<b>Located</b>	This is the asset's location in the company.

**Company Island**

Field	Description
<b>Company No.</b>	This field displays the number of the company assigned to the current asset.
<b>Company Name</b>	This field displays the name of the company specified in the field "Company No." above.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

**Selection Criteria Island**

Field	Description
<b>Entry Date</b>	Here you define the period for which you wish to see transactions.
<b>Asset Transaction Type</b>	Here you enter the asset transaction type you wish to see. If you leave the pop-up blank, the table part will show all asset transaction types.
<b>Include Unapproved</b>	If you mark this field, the table part will also display entries which have not yet been approved. Note that if you have marked this field, the field "Amount, Enterprise" in the table part of the window will display the value zero on all unapproved asset entries, as the contents of that field are not calculated until the asset adjustment in question has been approved.

## Asset Entries Sub-Tab

This section includes the fields and descriptions for the Asset Entries sub-tab.

Field	Description
<b>Adjustment No.</b>	This field shows the adjustment number the transaction is for.
<b>Line No.</b>	This field shows the transaction line number in the asset adjustment.
<b>Date</b>	This field shows the entry date for the adjustment in question.
<b>Trans. No.</b>	This field shows the transaction number of the adjustment.
<b>Trans. Type</b>	This field shows the transaction type of the adjustment.
<b>Amount, Base</b>	This field shows the amount of the transaction in question in the base currency of the company to which the asset in question is assigned.

Field	Description
<b>Amount, Currency</b>	This field displays the amount of the transaction in the currency of the company to which the asset entry in question is/was assigned.
<b>Currency</b>	This field displays the currency used as base currency in the company to which the asset entry in question is/was assigned. See the description of the field "Base Currency" in the window Company Information in the G/L module for further information about company base currencies and enterprise currencies.
<b>Pct. Sold</b>	This field shows the percentage sold, if applicable.
<b>Amount, Enterprise</b>	This field shows the amount of the transaction in question in the system's enterprise currency.
<b>Gain/Loss, Base</b>	This field shows any losses/gains generated as a result of the transaction in question. The amount is displayed in base currency.
<b>Gain/Loss, Enterprise</b>	This field shows any losses/gains generated as a result of the transaction in question. The amount is displayed in enterprise currency.
<b>Entry Description</b>	This field shows any comments relating to the transaction.
<b>Asset Transaction Type</b>	This field shows the asset transaction type.
<b>Sub-Type</b>	This field shows "Internal Sale" or "Transfer" if the transaction is for a sale or transfer to another asset.
<b>Company No.</b>	This field displays the number of the company assigned to the current transaction.
<b>Location</b>	This field displays a value for the Location dimension. The value is transferred from the asset adjustment.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Transferred to Asset No.</b>	This is the new asset number, if applicable.

Field	Description
<b>Approved</b>	This field is marked if the transaction is approved.
<b>Journal No.</b>	This is the journal number. It is shown once the asset adjustment is approved.

## Asset History Single Dialog Workspace

Use this workspace to view the changes made to an asset since it was created in Maconomy.

For audit purposes, you must explain all of the changes by entering an explanation in the **Note** field.

### Asset History Tab

This section includes the fields and descriptions for the Asset History tab.

#### Asset Island

Field	Description
<b>Asset No.</b>	This is the number of the asset.
<b>Period</b>	Here you define a period from which to see changes made to the asset information.
<b>Asset Group</b>	This field shows the asset group.
<b>Asset Sub-Group</b>	This field shows the asset sub-group.
<b>Description</b>	This field shows the description of the asset.
<b>Model</b>	This is the asset's model.
<b>Located</b>	This field shows where the asset is located.

#### Company Island

Field	Description
<b>Company No.</b>	This field displays the name and number of the company assigned to the current asset.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in

Field	Description
	the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### Asset History Sub-Tab

This section includes the fields and descriptions for the Asset History sub-tab.

Field	Description
<b>Date</b>	This is the date the change was entered.
<b>Field Name</b>	This is the name of the field which was changed.
<b>Changed By</b>	This is the name of the user who entered the change.
<b>Changed From</b>	This is the content of the field before it was changed.
<b>Changed To</b>	This is the content of the field after the change.
<b>Entry Description</b>	In this field you must enter the reason for the change.
<b>Company No.</b>	This field shows the number of the company for which the current asset post has been registered.
<b>Currency</b>	This field shows the currency that has been selected as the base currency of the company to which the current asset post belongs. For a detailed description of company base currency and group currency, see the description of the field "Base Currency" in the window Company Information in the G/L module.
<b>Amount, Currency</b>	This field shows the size of the transaction in the base currency of the company to which the current asset post belongs.

## Show Asset Adjustments Single Dialog Workspace

Use this workspace to view all posted asset adjustments.

### Show Asset Adjustments Tab

This section includes the fields and descriptions for the Show Asset Adjustment tab.

#### Journal Island

Field	Description
<b>Asset Adjustment No.</b>	This field shows the number given to the asset adjustment. The number is taken from the Asset Adjustment system numbers.

#### User Island

Field	Description
<b>Created by</b>	This field shows the user name of the person who created the asset adjustment.
<b>Date</b>	This field shows the date on which the asset adjustment was created.
<b>Approved by</b>	This field shows the user name of the person who approved the asset adjustment.
<b>Date</b>	This field shows the date on which the asset adjustment was approved.

#### Transaction Numbering Island

Field	Description
<b>Transaction Type</b>	This field shows a default transaction type to be used when creating the lines. The default transaction type that is set up for the asset adjustment in the given company will be shown initially.
<b>Number Series</b>	This field shows a transaction number series created in the popup field "Transaction No. Series" in the window Popup Fields in the Set-Up module. If you select a number series, Maconomy will automatically number your journal lines.

#### Company Island

Field	Description
<b>Company</b>	This field shows the name and number of the company to which the asset is attached.

## Asset Entries Sub-Tab

This section includes the fields and descriptions for the Asset Entries sub-tab.

Field	Description
<b>Date</b>	This field shows the date on which the adjustment was entered.
<b>Trans. No.</b>	The number of the transaction that generated the asset adjustment.
<b>Trans. Type</b>	This field is the transaction type of the entry line.
<b>Asset No.</b>	This field shows the number of the asset to which the adjustment pertains.
<b>Asset Transaction Type</b>	This field shows the asset transaction type.
<b>Amount, Base</b>	This field shows the amount of the adjustment in question in the base currency of the company to which the asset in question is assigned.
<b>Amount, Currency</b>	This field shows the amount of the adjustment in the currency of the company to which the asset entry in question is/was assigned.
<b>Currency</b>	This field shows the currency that is used as the base currency in the company to which the asset entry is assigned.
<b>Sub-Type</b>	<p>This field shows one of the following values:</p> <ul style="list-style-type: none"> <li>▪ Sale or Transfer if the transaction is related to a sale or transfer of an asset to another group.</li> <li>▪ Relocation or Internal Sale if the transaction relates to an internal asset relocation or sale to another department in the company.</li> </ul>
<b>Asset Group</b>	This field shows the group to which the asset belongs.
<b>Asset Sub-Group</b>	This field shows the sub-group to which the asset belongs.
<b>Pct. Sold</b>	This field shows the sales percentage, if applicable.
<b>Entry Description</b>	This field shows the text for the entry.
<b>Company No.</b>	This field shows the number of the company for which the asset is registered.
<b>Location</b>	This field shows the Location value that Maconomy transfers from the asset.

Field	Description
<b>Entity</b>	This field shows the entity dimension value which is assigned to the current entry.
<b>Project</b>	This field shows the project dimension value which is assigned to the current entry.
<b>Purpose</b>	This field shows the purpose dimension value which is assigned to the current entry.
<b>Spec. 1 – 3</b>	These fields show the values in the dimensions Specification 1 - 3 assigned to the current entry.
<b>Local Spec. 1 – 3</b>	These fields show the values in the dimensions Local Specification 1-3 assigned to the current entry.
<b>New Asset Group</b>	This column shows the new asset group, if the asset adjustment is for a sale or transfer to another asset.
<b>New Asset Number</b>	This is the new asset number, if the asset adjustment is for transfer to another asset group.

## Show Asset Entries Single Dialog Workspace

Use this workspace to display asset transactions.

### Job Information Island

Field	Description
<b>Post Depreciation as Job Entry, if job specified</b>	When depreciating an asset, if a value is set, a job entry is shown
<b>Job Number</b>	This field shows the job number for the job you want to associate with the selected asset.  If the asset entry has the type depreciation, and Post Depreciation as Job Entry is set, a job entry with this job number is created.
<b>Activity</b>	This field shows the activity that is added to asset entries, when these are created for the selected asset. You can only use amount activities.  If the asset entry has the type depreciation, and Post Depreciation as Job Entry is set, a job entry with this activity is created.
<b>Task Name</b>	This field shows the activity that is added to asset entries, when these are created for the selected asset. You can only use amount activities.  If the asset entry has the type depreciation, and Post Depreciation as Job Entry is set, a job entry with this activity is created.

## Reporting Section

This section includes the fields and descriptions for the Reporting Section workspaces.

### Print Asset Listing Single Dialog Workspace

Use this workspace to print a list of your assets.

The printed asset list displays all of the transactions for all or part of the assets that are assigned to an asset group. The amounts that the printout displays are shown in the selected reporting currency as well as in the enterprise currency. You use this list at the closing of the fiscal year.

#### Print Asset Listing Tab

This section includes the fields and descriptions for the Print Asset Listing tab.

#### Selection Criteria Island

Field	Description
<b>Asset No.</b>	In these fields you enter an interval of asset numbers. The print will only include assets with numbers within the entered interval. If you do not enter a delimitation for asset numbers, the print will include all assets.
<b>Asset Group</b>	Here you can limit the target group to one asset group. If you leave the pop-up blank, the list will include all asset groups.
<b>Asset Sub-Group</b>	Here you can enter a range of asset sub-groups.
<b>Period</b>	Here you can enter an interval of dates of asset transactions.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. The printout will only include transactions regarding assets assigned to a company within the specified range. Currency Island

#### Currency Island

Field	Description
<b>Reporting Currency</b>	In this field, you can specify the currency in which figures on the printout should be displayed. All report figures will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question. When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below. In the conversion, the currency table for sales is used in the case of customers while the currency table for purchases is used in the case of vendors.

Field	Description
	In the case of G/L accounts, the currency table for sales is used if the account has a debit balance, while the currency table for purchases is used if the account is a credit balance. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency".

### Print Control Island

Field	Description
<b>Number Format</b>	In this field, you can choose the number format in which the figures in the asset listing should be displayed. You can choose between "Decimal," "In Whole Numbers," "Thousands," "Millions with one decimal," and "Millions."
<b>Layout</b>	In this field, you can select which layout to use for the printout.

## Set-Up Section

This section includes the fields and descriptions for the Set-Up Section workspaces.

### Asset Groups Single Dialog Workspace

Use this workspace to create groups of fixed assets.

Asset groups represent assets of a similar character and/or similar purpose. Typical categories might be "Property and Buildings," "Plant and Equipment," and "Technical Installations and Machinery."

The asset groups determine the integration with the general ledger, because you specify the G/L accounts and any other dimension combinations that should be used for each transaction type by means of dimension combinations.

You can enter default information for assets that belong to an asset group. Maconomy copies the default information to an asset when you create the asset. You can enter default information for finance dimensions and depreciation information.

## Asset Groups Tab

This section includes the fields and descriptions for the Asset Groups tab.

### Asset Group Island

Field	Description
<b>Name</b>	Here you enter the name of the asset group. In all other windows in the Fixed Assets module, the Asset Group field will be a pop-up field which will contain the names created here.
<b>Description</b>	Here you enter a list or description of those assets the group covers.

### Book Depreciation Information Island

The values in the fields in this island will be used as default values when you create a new asset that belongs to this asset group. This makes it easier and less error-prone to create new assets.

Field	Description
<b>Depreciation Method</b>	Select a default depreciation method to use when creating a new asset that belongs to this group.
<b>Depreciation Period</b>	Specify a default depreciation period to use when creating a new asset that belongs to this group.
<b>Post Depreciation as Job Entry</b>	Use this field to specify whether you want a job entry to be posted when depreciating an asset.  This is the default setting for all assets in this asset group but can be changed for each asset.

### Tax Depreciation Information Island

Field	Description
<b>Asset Cost Factor</b>	Enter the taxable value of the asset, which can be more than the cost price. This field allows you to adjust the taxable value.  It is independent from the other fields in the Tax Depreciation Information island.
<b>Table</b>	Enter or select the Tax Depreciation Table name to use in the table-based depreciation.  <div style="border: 1px solid blue; padding: 5px;"><b>Note:</b> You cannot use the tax depreciation table in combination with the <b>Years</b>, <b>First Year Factor</b>, or <b>Strict Yearly Limit</b> fields.</div>
<b>Years</b>	Specify the number of years to depreciate the asset through straight line depreciation.
<b>Yearly Percentage</b>	This field shows the yearly percentage according to the number specified in the <b>Years</b> field.

Field	Description
<b>First Year Factor</b>	Enter the first year factor that balances the asset depreciation in the first year's limit. The value in this field extends the depreciation into an additional fiscal year in the end. The default value 100% indicates that there is no change to the amount.
<b>First Year Percentage</b>	This field shows the first year percentage when the <b>Yearly Percentage</b> field is further restricted by the <b>First Year Factor</b> field for the first year only.
<b>Strict Yearly Limit</b>	Specify whether the yearly percentage is set as a limit for each year. Delayed depreciation cannot be added on top of the yearly percentage. This field is deselected by default, which allows depreciation if the accumulated yearly depreciation do not exceed the accumulated yearly percentage.

### Dimensions Island

The values in the fields in this island will be used as default values for Dimensions when you create a new asset that belongs to this asset group. This makes it easier and less error-prone to create new assets. See the Assets windows for more information about dimensions on an asset.

### Access Level Island

Field	Description
<b>Access Level</b>	In this field, you can specify the name and description of an access level. You only have access to the current asset group if you have been assigned to this level or a level above this in the User Access Levels window. This access control ensures that when working with, for instance, an asset, you can only enter an asset group to which you have access, and you can only see the asset groups to which you have access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to asset groups may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see "Introduction to the Access Control System" in the Set-Up module. If no access level is specified, all users have access to the current asset groups.

### User Island

Field	Description
<b>Created</b>	This field shows the user name of the person who created the asset adjustment as well as the date in which it was created.
<b>Approved by</b>	This field shows the user name of the person who approved the asset adjustment as well as the date on which it was approved.

**Acquisitions Island**

Field	Description
<b>Posting Reference</b>	Here you enter the dimension combination containing the G/L account to which purchase and improvement entries are to be posted. The dimension combination can also contain other dimension values to be used in this connection.
<b>Offset</b>	Here you enter a dimension combination containing the assigned offset account. The dimension combination can also contain other dimension values to be used in this connection.
<b>Description</b>	Here you enter the text to be attached to the entries to the G/L module.

**External Sale Island**

Field	Description
<b>Posting Reference</b>	Here you enter the dimension combination containing the G/L account to which asset sales figures are to be posted. The dimension combination can also contain other dimension values to be used in this connection.
<b>Loss</b>	Here you enter the dimension combination containing the G/L account to which losses from asset sales are to be posted. The dimension combination can also contain other dimension values to be used in this connection.
<b>Gain</b>	Here you enter the dimension combination containing the G/L account to which gains from asset sales are to be posted. The dimension combination can also contain other dimension values to be used in this connection.
<b>Description</b>	Here you enter the text to be attached to the entries to the G/L module.

**Book Depreciation Island**

Field	Description
<b>Posting Reference</b>	Here you enter the dimension combination containing the G/L account to which write-downs and depreciation entries are to be posted. The dimension combination can also contain other dimension values to be used in this connection.
<b>Offset</b>	Here you enter a dimension combination containing the assigned offset account. The dimension combination can also contain other dimension values to be used in this connection.
<b>Description</b>	Here you enter the text to be attached to the entries to the G/L module.

### Write-Ups Island

Field	Description
<b>Posting Reference</b>	Here you enter the dimension combination containing the G/L account to which write-ups are to be posted. The dimension combination can also contain other dimension values to be used in this connection.
<b>Offset</b>	Here you enter a dimension combination containing the assigned offset account. The dimension combination can also contain other dimension values to be used in this connection.
<b>Description</b>	Here you enter the text to be attached to the entries to the G/L module.

### Internal Sales Island

Field	Description
<b>Posting Reference</b>	Here you enter the dimension combination containing the G/L account to which asset sales figures for internal sales are to be posted. The dimension combination can also contain other dimension values to be used in this connection.
<b>Loss</b>	Here you enter the dimension combination containing the G/L account to which losses from asset sales for internal sales are to be posted. The dimension combination can also contain other dimension values to be used in this connection.
<b>Gain</b>	Here you enter the dimension combination containing the G/L account to which gains from asset sales for internal sales are to be posted. The dimension combination can also contain other dimension values to be used in this connection.
<b>Description</b>	Here you enter the text to be attached to the entries to the G/L module.

### Asset Group Lines Sub-Tab

This section includes the fields and descriptions for the Asset Group Lines sub-tab.

Field	Description
<b>From Company No.</b>	Select the starting company number to which the asset depreciation rules apply. The values you enter in the other fields in the Group Lines sub-tab and Asset Group Lines sub-tab overwrite the values specified in the Group tab and Asset Groups sub-tab.
<b>To Company No.</b>	Select the ending company number to which the asset depreciation rules apply.
<b>Method, Book Depreciation</b>	Select the book depreciation method to use when creating a new asset that belongs to this group. The possible methods are:

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Straight Line</b></li> <li>▪ <b>Straight Line, By month</b></li> </ul>
<b>Period, Book Depreciation</b>	Specify the depreciation period to use when creating a new asset that belongs to this group.
<b>Post Depreciation as Job Entry, Book Depreciation</b>	Select the checkbox if you want to post a job entry when depreciating an asset.
<b>Asset Cost Factor, Tax Depreciation</b>	Enter the taxable value of the asset, which can be more than the cost price. This field allows you to adjust the taxable value. It is independent from the other fields in the Information tab.
<b>Table, Tax Depreciation</b>	Enter or select the Tax Depreciation Table name to use in the table-based depreciation.  <b>Note:</b> You cannot use the tax depreciation table in combination with the <b>Years</b> , <b>First Year Factor</b> , or <b>Strict Yearly Limit</b> fields.
<b>Years, Tax Depreciation</b>	Specify the number of years to depreciate the asset through straight line depreciation.
<b>First Year Factor, Tax Depreciation</b>	Enter the first year factor that balances the asset depreciation in the first year's limit. The value in this field extends the depreciation into an additional fiscal year in the end. The default value 100% indicates that there is no change to the amount.
<b>Strict Yearly Limit, Tax Depreciation</b>	Specify whether the yearly percentage is set as a limit for each year. Delayed depreciation cannot be added on top of the yearly percentage. This field is deselected by default, which allows depreciation if the accumulated yearly depreciation do not exceed the accumulated yearly percentage.

## Assets Single Dialog Workspace

Use this workspace to enter assets into Maconomy.

This workspace has two purposes: to store the information that is used for automatic depreciation, and to provide a total overview of the asset status, displayed in the Depreciable Value and Net Book Value islands. When you create an asset, you can also enter the acquisition price in the **Cost** field in the Depreciable Value island.

The asset card is a very comprehensive record of information, because it must comply with legal requirements and exhaustive accounting standards.

## Assets Tab

This section includes the fields and descriptions for the Assets tab.

**Asset Information Island**

Field	Description
<b>Asset No.</b>	In this field you enter the number of the asset. If you do not enter a number, Maconomy will automatically find the asset number from the number series related to the asset; however, you should enter the number manually if the number in the number series is set to zero. The number series "Asset Series" is specified in the window Number Series in the Set-Up module. The asset number must be unique, and it cannot be changed afterwards.
<b>Asset Group</b>	Here you select an asset group. You cannot re-select a group after the asset has been created. If you need to change the group; however, you must make a Transfer transaction. The field determines which G/L accounts are to be used for the different transactions made for the asset. See also the Asset Groups window.
<b>Asset Sub-Group</b>	Here you enter an asset sub-group. This facility lets you work with a sub-division of the traditional asset groups.
<b>Description</b>	Here you enter a description of the asset, such as its make.
<b>Model</b>	Here you enter its model.
<b>Located</b>	Here you enter where the asset is located.
<b>Serial No.</b>	Here you can enter the serial number of the asset. It is purely for reference.
<b>Internal Serial No.</b>	Here you can enter the serial number you use internally, if applicable. It is purely for reference.

**Financial Information Island**

Field	Description
<b>Assessed Value</b>	In this field you enter the last official assessed value of the asset, if it is a property.
<b>Market Value</b>	In this field you enter the asset's market value, if it is a property.
<b>Lien</b>	In this field you enter the mortgage value, if applicable.
<b>Insured Value</b>	In this field you enter the insured value, if applicable.

Field	Description
<b>Policy No.</b>	If the asset is insured, enter your policy number here.
<b>Internal Purchase</b>	Mark this field if the asset is bought within the company.
<b>Internal Markup</b>	In this field you enter the internal markup if the asset is bought within the company.

**Job Information Island**

Field	Description
<b>Post Depreciation as Job Entry, if job specified</b>	When depreciating an asset, if this value is set, a job entry is posted.
<b>Job No.</b>	The job number for the job you want to associate with the selected asset. If the asset entry has the type depreciation, and Post Depreciation as Job Entry is set, a job entry with this job number is created.
<b>Activity</b>	The activity that is added to asset entries, when these are created for the selected asset. You can only use amount activities. If the asset entry has the type depreciation, and Post Depreciation as Job Entry is set, a job entry with this activity is created.
<b>Task Name</b>	The task that is added to asset entries, when these are created for the selected asset. If the asset entry has the type depreciation, and Post Depreciation as Job Entry is set, a job entry with this task is created.

**Book Depreciation Information Island**

Field	Description
<b>Disallow Automatic Book Depreciation</b>	Previously called Manual Depreciation. Select this check box to disallow the automatic book depreciation in the Depreciations tab of the Registrations section. When this check box is selected, you are required to depreciate the assets manually in the Adjustments tab of the Registrations section.
<b>Depreciation Method</b>	Here you enter the depreciation method. You can choose between the methods that are defined in the Depreciation Methods pop-up field. If nothing is entered, the value will be copied from the asset group.
<b>Depreciation Start Date</b>	This field shows the date when the asset starts to depreciate. It must be earlier or the same as the depreciation base date.

Field	Description
<b>Depreciation Period</b>	Here you enter the number of months the asset is to be depreciated over. If nothing is entered, the value will be copied from the asset group.
<b>Depreciation Base Date</b>	This field shows the date when you purchased the asset.
<b>Periods After Depreciation Base Date</b>	This field shows the number of months the asset is to be depreciated after the depreciation base date.
<b>Last Depreciation</b>	This is the date the asset was last depreciated.

### Tax Depreciation Information Island

Field	Description
<b>Disallow Automatic Tax Depreciation</b>	Select this check box to disallow the automatic tax depreciation in the Adjustments tab of the Registrations section. When this check box is selected, you are required to depreciate the assets in the Depreciations tab of the Registrations section.
<b>Asset Cost Factor</b>	Enter the taxable value of the asset, which can be more than the cost price. This field allows you to adjust the taxable value. It is independent from the other fields in the Tax Depreciation Information island.
<b>Table</b>	Enter or select the Tax Depreciation Table name to use in the table-based depreciation. <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"><b>Note:</b> You cannot use the tax depreciation table in combination with the <b>Years</b>, <b>First Year Factor</b>, or <b>Strict Yearly Limit</b> fields.</div>
<b>Years</b>	Specify the number of years to depreciate the asset using the straight line depreciation.
<b>Yearly Percentage</b>	This field shows the yearly percentage according to the number specified in the <b>Years</b> field.
<b>First Year Factor</b>	Enter the first year factor that balances the asset depreciation in the first year's limit. The value in this field extends the depreciation into an additional fiscal year in the end. The default value 100% indicates that there is no change to the amount.
<b>First Year Percentage</b>	This field shows the first year percentage when the <b>Yearly Percentage</b> field is further restricted by the <b>First Year Factor</b> field for the first year only.

Field	Description
<b>Strict Yearly Limit</b>	Specify whether the yearly percentage is set as a limit for each year. Delayed depreciation cannot be added on top of the yearly percentage. This field is deselected by default, which allows depreciation if the accumulated yearly depreciation do not exceed the accumulated yearly percentage.

**Transaction Island**

Field	Description
<b>Transaction Type</b>	In this field you enter the transaction type.
<b>Transaction Number Series</b>	In this field you enter a transaction numbering series.

**Technical Data Island**

Here you enter various technical data about the asset.

**Remarks Island**

Here you can enter any comments about the asset.

**Contact Island**

Field	Description
<b>Responsible</b>	Here you enter the name and number or initials of the person who is responsible for the asset.
<b>Employee No.</b>	If you specify an employee name and number in this field, this employee name and number will be transferred to the G/L entry every time a posting related to this asset takes place.

**Company Island**

Field	Description
<b>Company</b>	<p>In this field you can indicate the name and number of the company to which the current asset is attached. If another company makes entries to the asset, Maconomy will automatically create inter-company balances when the entry in question is posted. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, inter-company entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>The company in this field is also the company whose accounts include the current asset, which means that the value in this field is transferred to the asset entries created on the current asset upon posting.</p>

Field	Description
	<p>The value of the field also determines the users who have access to the asset. In the window Company Information in the G/L module, it is possible to assign each company an access level. Users only have access to see information about an asset if they have been assigned the same or a higher access level. For instance, a user can only see assets and asset entries regarding assets whose company is assigned an access level to which the user has been granted access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system.</p> <p>If it has, the access to assets may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the set-up module.</p>
<b>Base Currency</b>	<p>This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.</p>

### Dimensions Island

Field	Description
<b>Location</b>	<p>Here you enter a value for the Location dimension. If no value is entered or derived, the default value from the System Parameter window in the set-up module is used. See the chapter "Introduction to the G/L module" for a description of dimension derivations.</p>
<b>Entity</b>	<p>The functionality of this field is similar to that of the field "Location" above.</p>
<b>Project</b>	<p>The functionality of this field is similar to that of the field "Location" above.</p>
<b>Purpose</b>	<p>The functionality of this field is similar to that of the field "Location" above.</p>
<b>Spec. 1-3</b>	<p>The functionality of these fields is similar to that of the field "Location" above.</p>
<b>Local Spec. 1-3</b>	<p>The functionality of these fields is similar to that of the field "Location" above.</p>

**History Island**

Field	Description
<b>Acquired</b>	In this field you enter the date the asset was acquired. It is also the date the depreciation takes effect.
<b>Acquisition Responsible</b>	In this field you enter the name or initials of the person who is responsible for buying the asset.
<b>Closed</b>	This field shows the date the asset was either sold or transferred to another asset, if applicable.
<b>Closing Responsible</b>	This field shows the name of the person who was responsible for selling or transferring the asset.
<b>Transferred to</b>	This field shows the number of the new asset to which the asset was transferred, if applicable.
<b>Tax</b>	Mark this field if the price of the asset was subject to tax.

**Depreciable Value Island**

Field	Description
<b>Currency</b>	This field shows the currencies used as base currency and enterprise currency for the asset in question. All amounts in this island are displayed in the two currencies displayed in these two columns.
<b>Cost</b>	Here you can enter the acquisition price for the asset. Maconomy will create and approve an asset adjustment journal with the acquisition information.
<b>Non-Depreciable</b>	Here you enter how much of the asset's price is non-depreciable.
<b>Residual Value</b>	Here you enter the asset's residual value.
<b>Improvements</b>	This is the sum of the improvements entered since the asset was created.
<b>Write-Ups</b>	This is the sum of the write-ups entered since the asset was created.
<b>Write-Downs</b>	This is the sum of the write-downs entered since the asset was created.
<b>Depreciable Value</b>	This is the asset's depreciable value. It is calculated from the amounts in the fields above.

**Net Book Value Island**

Field	Description
<b>Currency</b>	This field shows the currencies used as base currency and enterprise currency for the asset in question. All amounts in this island are displayed in the two currencies displayed in these two columns.
<b>Cost</b>	This field shows the sum of the purchase entries made since the asset was created in the system.
<b>Improvements</b>	This is the sum of the improvements entered since the asset was created.
<b>Write-Ups</b>	This is the sum of the write-ups entered since the asset was created.
<b>Depreciation</b>	This is the sum of the depreciation entries made since the asset was created.
<b>Write-Downs</b>	This is the sum of the write-downs entered since the asset was created.
<b>Book Value</b>	This is the book value of the asset. It is calculated from the amounts in the fields above.
<b>Hereof depreciation in G/L</b>	The G/L depreciation in base and enterprise currency. This field is only visible if an asset entry that is depreciated as a job entry exists (in the Workspace Client). Depreciation will not be listed here if it is listed in the <b>Hereof depreciation in Job Cost</b> field.
<b>Hereof depreciation in Job Cost</b>	The job cost depreciation in base and enterprise currency. This field is only visible if it is a non-zero value. Depreciation will not be listed here if it is listed in the <b>Hereof depreciation in G/L</b> field.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the asset in question. By assigning a document archive to an asset, you can keep track of the various documents related to the asset. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.

**Access Level Island**

Field	Description
<b>Access Level</b>	In this field, you can specify the name of an access level. You only have access to the current asset group if you have been assigned to this level or a level above this in the User Access Levels window. This access control ensures that when working with, for instance, an asset, you can only enter an asset group to which you have access, and you can only see the asset groups to which you have access. Please note that this access control model only applies if the

Field	Description
	standard access control configuration has not been changed in your Maconomy system. If it has, the access to asset groups may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see "Introduction to the Access Control System" in the Set-Up module. If no access level is specified, all users have access to the current asset groups.
<b>Description</b>	This field shows the description for that access level.

### User Island

Field	Description
<b>Created</b>	This field shows the user name of the person who created the asset adjustment as well as the date on which it was created.
<b>Changed</b>	This field shows the user name of the person who changed the asset adjustment as well as the date on which it was last changed.
<b>Version</b>	This field shows the current version number.

### Actions

This section shows the Actions available in the Assets workspace.

Field	Description
<b>Reuse Asset</b>	By selecting this action an asset already closed can be reopened. This action can only be selected for assets that have already been closed. By selecting this action, the enter fields that are closed for a closed asset will be reopened, and the fields in the island User Information will be reset.
<b>Attach Document</b>	This action allows you to attach a document to the asset.

## Accounts Receivable Overview

Use the Accounts Receivable module to manage activities that are related to customers and their payments, including entering and maintaining general information about customers, payment terms, discount and credit agreements, and interest and reminder policies.

You can also generate aging reports, balance lists, account statements, and other customer reports.

### Registration Section

This section includes the fields and descriptions for the Registration section workspaces.

### Customer Payments Single Dialogs Workspace

Use this workspace to enter and post customer payments.

A customer payment can be reconciled against one customer entry by entering an invoice number or a transaction number directly on the customer payment. A customer payment can also be reconciled against several customer entries in the Customer Open Entry Reconciliation workspace. The customer payment can be reconciled both before and after the payment has been reconciled.

You can enter payment lines in multiple currencies; Maconomy converts each payment amount. The Customer Payments sub-tab displays information about the current payment journal. In the Customer Payments sub-tab you can enter a number of lines that represent customer payments. You can enter several customer payments in the same customer payment journal, and you can edit those entries until you post the journal.

Customer payments can be reconciled against one or multiple invoices in this workspace. You can only perform a reconciliation against posted invoices that are not already selected for reconciliation in one of the Customer Open Entry Reconciliation or General Journal. Payments workspaces. Payments that are not reconciled against an invoice when posted are posted as open customer entries. You can display and reconcile these payments the Customer Open Entry Reconciliation workspace.

Depending on the setting of the **Submission of Customer Payment Journal required** system parameter, you might need to submit the journal before you can post it. In addition, you cannot post a customer payment journal until all payment lines in the journal have been released for posting. Using the **Manual Release of Customer Payment** system parameter in the Set-Up module, you indicate whether payments should be released manually or that Maconomy should release them automatically. If you select this parameter, you must release all customer payments manually before you post them. If you do not select the parameter, Maconomy automatically marks customer payments as released when you enter them.

After you have entered the customer payments and released them for posting, you can post the journal in this workspace or in the Posting workspace in the G/L module. Note, however, that customer payments can only be released and posted by users who have access to these actions. Access to releasing customer payments and posting is granted in the Actions workspace in the Set-Up module.

## Customer Payments Tab

This section includes the fields and descriptions for the Customer Payments tab.

### Journal Island

Field	Description
<b>Journal No.</b>	This field shows the number of the current customer payment journal. When a new journal is created, Maconomy automatically assigns a number from the system number series "Journal" from the window System Numbers in the Set-Up module, along with a prefix if a prefix has been defined for the company in question in the window Company Information in the G/L module.
<b>Created by</b>	This field shows the name of the user who created the current journal.
<b>Date</b>	This field shows the creation date of the journal.
<b>Submitted by</b>	This field shows the name of the user who submitted the journal.
<b>Date</b>	This field shows the date the user submitted the journal.
<b>Post</b>	In this field, you can specify whether the journal should be released for posting. If the field is marked, the journal can be posted directly from this window, but it will also be included when posting journals in the windows Posting and Print Posting Journal in the G/L module. If you do not mark the field, the journal can neither be posted in this window nor in the windows Posting or Print Posting Journal. However, a journal can be marked as released for posting in the window Posting, which has the same effect as marking the field in this window.

### Transaction Numbering Island

Field	Description
<b>Transaction Type</b>	In this field, you can enter a transaction type. By default, the field will show the default transaction type for the customer payment journal.
<b>Number Series</b>	In this field, you can enter a transaction number series. Transaction number series are created in the window Trans. No. Series in the G/L module. If you have selected a transaction number series, the field "Trans. No." in the table part of the window is automatically assigned the next available number in the selected series when a new line is created. By default, the field shows the transaction number series for the transaction type specified in the Transaction Type field.
<b>Auto Transaction No.</b>	In this field, you can mark whether the transaction number in the field "Trans. No." in the table part of the window should be increased by one on each new customer payment line entered. The field can be marked if no transaction number series has been selected in the field "Number Series" above. If the

Field	Description
	field is not marked, the transaction number from the previous line is repeated on each new line created. However, you can change the transaction number on each line manually.

### Company Island

Field	Description
<b>Company</b>	<p>In this field, you can enter the name and number of the company responsible for the customer payment journal. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>If you create lines in the customer payment journal on which you specify a company different from the value in this field, Maconomy will automatically create intercompany balances between the companies at the posting of the general journal. In the intercompany balance, the company in this field will be the responsible company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p>
<b>Base Currency</b>	This field shows the currency used as base currency in the company specified in the field "Company No." above. For a further description of company base currencies, please see the description of the field "Base Currency" in the window Company Information in the G/L module.

### Batch Total Island

Field	Description
<b>Control</b>	<p>Here you can enter a control sum that is the expected total of all entries in the journal. The batch total is calculated as the sum of all of the amounts in the field "Amount, Base" on the lines in the journal.</p> <p>If you enter a control sum, the customer payment journal can only be posted if the total is the same as the batch total calculated by Maconomy, shown in the field "Current," that is, the value in the field "Balance" must be 0. If the control sum is 0, the batch total is ignored. A journal can only be posted as long as it balances, that is, that the total of debit entries are equal to the total of credit entries.</p> <p>The control sum is used as an extra check on that you have entered the correct amounts in the entry lines. Before you enter any amounts, you can count up all the entries and enter the total in this field. If you forget a transaction, or if you enter a wrong amount, the batch total will not balance with the total Maconomy calculates in the field "Current."</p>
<b>Current</b>	This field shows the batch total of the journal. The batch total is the sum of the amounts in the field "Amount, Base" on all lines in the table part.

Field	Description
<b>Balance</b>	This field shows the difference between the amounts in the fields "Control" and "Current." If you have entered an amount in the field "Control," the customer payment journal can only be posted if the value in this field is 0.

### Document Archive Island

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

### Customer Payments Sub-Tab

This section includes the fields and descriptions for the Customer Payments sub-tab.

Field	Description
<b>Entry Date</b>	In this field, you can enter the entry date of the payment. On the first transaction in a customer payment journal, Maconomy suggests today's date as the entry date. On subsequent lines, Maconomy suggests the entry date of the previous line. The date can be changed manually. The date specified must be within the open posting period specified in the window Posting Period Setup.
<b>Trans. No.</b>	<p>In this field, enter the transaction number of the payment. The field must always be completed on the first line in a journal. On subsequent lines, Maconomy will suggest a transaction number when you enter a new payment line. The transaction number is determined through the following procedure:</p> <ul style="list-style-type: none"> <li>■ If you have selected a transaction number series in the island Transaction Number Series in the card part, the transaction number is transferred from the selected transaction number series in the window Trans. No. Series in the G/L module.</li> <li>■ If the field "Auto. Trans. No." has been marked; the transaction number from the previous line is increased by one on each new line created.</li> <li>■ If you have neither selected a transaction number series nor marked the field "Auto. Trans. No.," the transaction number from the previous line is repeated on each new line.</li> </ul>
<b>Trans. Type</b>	In this field, you can enter a transaction type. By default, the field shows the transaction type selected in the card part.

Field	Description
<b>Description</b>	In this field, you can enter a text describing the payment. If you used a standardized text for several payments, it is easier to use the field "Std. Descr.."
<b>Std. Description</b>	In this field, you can select a standardized text describing the payment. This can, for example, be useful if you use the same text on several payments (for example, "Customer payment"). If you do not complete the field "Description" manually, the value in this field is transferred to the posting description field when you press Return. Standard texts are created in the window Popup Fields in the Set-Up module.
<b>Customer No.</b>	In this field, you can enter a customer number. This number refers to the bill-to customer. If you enter a customer number in this field and an invoice number in the field "Recon. Invoice No.," the customer and the paying customer must be identical. If you only enter an invoice number in the field "Recon. Invoice No.," the customer number registered on the invoice in question is automatically transferred to this field.
<b>Name</b>	This field shows the name of the customer specified in the field "Customer No.."
<b>Amount, Currency</b>	In this field, you can enter the paid amount in the currency specified in the field "Currency." The amount entered is credited on the customer control account when the journal is posted.
<b>Currency</b>	In this field, you can specify the currency in which the customer payment is made. The amount in the field "Amount, Currency" must be entered in this currency. The currency is used for converting the amount paid into the base currency, enterprise currency and the currency of the customer.
<b>Amount, Base</b>	In this field, you can enter the paid amount in the base currency of the company responsible for the current journal. If you only enter an amount in the field "Amount, Currency" and specify a currency, Maconomy calculates the base currency amount in this field. If you enter an amount in both this field and the field "Amount, Currency," Maconomy converts the amount entered in this field into the specified currency and overwrites the amount in the field "Amount, Currency."
<b>Charge, Currency</b>	<p>In this field, you can enter a charge amount in currency. If the bank which effected the payment has charged an amount for the service, you can enter the amount here. If you have agreed with the customer that you will carry the charge, enter the full charge amount in this field. If the customer is to carry the charge, you should not enter the charge in this field, but subtract the charge amount from the amount paid. When reconciling the customer entry with the amount, select "Partial" reconciliation in the table part. This way, the charge amount will still be an open entry with the customer, which can then be settled later. The amount is shown in the field "Charge, Base" below in the base currency of the responsible company.</p> <p>When posting, the amount entered in this field is debited the account specified in the field "Charge Account" in the window Payment Agents in the Banking module for the payment agent assigned to the current customer entry. A</p>

Field	Description
	corresponding amount is credited the external bank account assigned to the payment agent, which is shown in the fields "Reg. No." and "External Account No." on the current table line.
<b>Charge, Base</b>	The functionality of this field is similar to that of the field "Charge, Currency" above, but the charge amount is entered in the company's base currency. The amount is shown in the field "Charge, Currency" above in the currency selected in the field "Currency" in this island.
<b>D/C</b>	In this field, you specify whether the amount registered is a debit or credit amount. Maconomy suggests debit because a customer payment usually means your company receives a payment.
<b>Reconc. Invoice No.</b>	<p>In this field, you can enter an invoice number if the current payment should be reconciled fully or partly against an invoice. Note that you cannot specify an invoice which has already been selected for reconciliation in another payment journal. At the time of registration, Maconomy checks whether reconciliation is possible. If the payment cannot be reconciled against the invoice, Maconomy issues an error message. If the reconciliation can be made, the payment is automatically reconciled against the invoice when the journal is posted.</p> <p>If you have specified a customer number in the field "Customer No." and you specify an invoice in this field, the customer on the line and the bill-to customer on the invoice must be the same. If you only enter an invoice number on the current payment line, leaving the field "Customer No." blank, Maconomy transfers the customer from the invoice to the field "Customer No." on the current line.</p> <p>If you have set up the table part of the window Dimension Derivations in the G/L module to derive dimensions from invoices when creating a customer payment, specifying an invoice in this field will cause the dimension values on the specified invoice to be copied to the dimension fields on the current line. However, fields in which a value has manually been specified are not overwritten by the dimension values from the invoice. For further information, see the field "Action" in the table part of the window Dimension Derivations.</p>
<b>Reconcile Transaction No.</b>	This field allows you to enter a transaction number if the payment should be reconciled fully or partly against a posted customer entry. The field can only be completed on unposted payments. Note that you cannot specify a transaction number that has already been selected for reconciliation in another payment journal. If you select a transaction number and press Return, the customer entry assigned to the specified transaction number is displayed in the table part of the window. Moreover, the transaction number and information on the assigned customer number and settling company number is subsequently derived to the islands Selection Criteria, Customer and Settling Company. Note that when you have entered a transaction number in this field and pressed Return, you cannot change the payment amount in the fields "Amount, Currency" or "Amount, Base" in this island. If you wish to change the payment amount in such a situation, you must remove the reconciliation of the customer entry in the table part, change the payment amount and re-enter the transaction number.

Field	Description
	<p>If you have set up the table part of the window Dimension Derivations in the G/L module to derive dimensions from invoices when creating a customer payment, specifying a transaction number in this field while creating a new customer payment will cause the dimension values on the specified customer entry to be copied to the dimension fields on the current line. However, fields in which a value has been specified manually are not over-written by the dimension values from the customer entry. For further information, see the field "Action" in the table part of the window Dimension Derivations.</p> <p>If the window shows an already posted payment, you cannot change the value in this field.</p>
<b>Released</b>	<p>In this field, you can mark whether the current payment is released for posting. Payments can be released for posting either manually or automatically. Using the system parameter "Manual Release of Customer Payments" in the Set-Up module, you decide whether payments should be released manually or automatically by Maconomy. If this parameter is marked, all customer payments must be released manually before posting. If the parameter is not marked, Maconomy automatically marks this field on all customer payments when they are entered. A customer payment journal cannot be posted until all lines in the journal have been released for posting.</p> <div style="border: 1px solid blue; padding: 5px; margin: 10px 0;"> <p><b>Note:</b> Payments can only be released by users who have access to doing so. User access to releasing customer payments is granted in the window Actions in the Set- Up module.</p> </div> <p>If this window shows an unposted payment which has been created in, for example, the window Customer Open Entry Reconciliation and for which entries have been approved for reconciliation, this field will be marked on the payment in question. By removing the mark in this field on an unposted payment, the entries approved for reconciliation and the payment to which these entries were assigned will no longer be released for posting. This feature is useful if you regret a reconciliation approval made in the window Customer Open Entry Reconciliation. See the description of the action "Approve Reconciliation" in the window Customer Open Entry Reconciliation for further information on the functionality of this field.</p>
<b>Cust. Payment Mode</b>	<p>In this field, you can select a customer payment mode. If you specify the number of a customer on a line, the payment mode of that customer is automatically transferred to this field, but it can be changed manually. The customer payment mode is used for finding an offset account for the current payment. You can specify offset accounts by means of a dimension combination in the window External Accounts in the Banking module. A customer payment mode can, for example, be manual payment, check or a bank account. Customer payment modes are created in the window Customer Payment Modes in the Banking module</p>
<b>Payment Agent</b>	<p>In this field, you select a customer payment agent, if completing the field "Cust. Payment Mode" above did not complete the field for you. The customer payment agent is used to find an offset account for the current payment. You</p>

Field	Description
	<p>can specify offset accounts by means of a dimension combination in the window External Accounts in the Banking module.</p> <p>If you change the value in this field, any value selected in the field "Cust. Payment Mode" above will be reset to be blank.</p>
<b>Reg. No.</b>	<p>In this field, you select a bank registration number, if completing the field "Cust. Payment Mode" above did not complete the field for you. This number is the bank registration number of the payment agent selected in the field "Payment Agent" above. The combination of this field and the field "External Account No." must match a number registered for the current payment agent on the external account for the current company in the window External Accounts.</p> <p>If you change the value in this field, any value selected in the field "Cust. Payment Mode" above will be reset to be blank.</p>
<b>External Account No.</b>	<p>In this field, you select an external account number, if completing the field "Cust. Payment Mode" above did not complete the field for you. In other respects, the functionality of this field is similar to that of the field "Reg. No." above.</p>
<b>Settling Company</b>	<p>In this field, you can specify the number of the settling company of the payment. If you only enter a customer number on the current line, leaving this field blank, Maconomy transfers the settling company of the customer in question to this field. However, you can change the company number manually.</p> <p>If you only enter an invoice number in the field "Recon. Invoice No." on the current line, leaving this field blank, Maconomy transfers the settling company on the invoice in question to this field.</p> <p>If the settling company is not the same as the company specified in the card part, Maconomy will create intercompany trans- actions between the two companies when the journal is posted. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, inter- company entries are only created if the two companies involved are not both assigned to the same parent company.</p>
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations. Any manually entered value will, however, be over- written if a value is derived for which "Overwrite" is selected. If no value can be derived, the standard value is transferred from the window System Parameters in the Set-Up module.</p> <p>If you have set up the table part of the window Dimension Derivations in the G/L module to derive dimensions from invoices when creating a customer payment, specifying an invoice in the field "Reconc. Invoice No." will cause the location on the specified invoice to be copied to this field on the current line. However, if you have manually specified a location before pressing Enter, this value is not overwritten by the dimension value from the invoice. For further information, see the field "Action" in the table part of the window Dimension Derivations.</p>

Field	Description
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Job No.</b>	<p>In this field, you can specify a job number if the current payment pertains to a job. If you have set up the table part of the window Dimension Derivations to derive from invoices when creating customer payments, the field is automatically completed if you specify a job related invoice in the field "Reconc. Invoice No." on the line.</p> <p>When a job number has been specified, the job is taken into consideration when dimensions are derived to the line. Furthermore, the job number is copied to the G/L entries created when the customer payment is posted. However, no job entries are created as a result of specifying a job number in this field.</p>
<b>Customer Payment Reference</b>	In this field, you can enter a reference to the current customer payment. If the current payment has been created in the window Customer Open Entry Reconciliation, the value, if any, from the field "Payment Reference" in the card part of the window Customer Open Entry Reconciliation will be transferred to this field. However, the value can be changed in this field and will be updated accordingly in the window Customer Open Entry Reconciliation as long as the payment in question has not been posted.

## Actions

This section shows the actions available in the Customer Payments workspace.

### Journal Sub-Tab

Field	Description
<b>View Document</b>	Select the needed Journal, then use this action to display the document attached to the Journal, if any.

## Customer Open Entry Reconciliation Single Dialogs Workspace

Use this workspace to enter customer payments and credit memos and reconcile them against customers' open entries, in total or in part. Maconomy closes an entry when it is fully reconciled.

Select one, several, or all of a customer's open entries for reconciliation in one workflow. You can reconcile already posted payments against customers' open entries, in total or in part.

You can reconcile already posted payments against customers' open entries.

This workspace also lets you handle any charges in connection with the customer payment.

In the Customer Open Entry Reconciliation tab, Maconomy displays a payment or credit memo, as well as other information about the assigned customer. The payment is either a new entry or a previously posted customer payment. The A/R Entries sub-tab displays any additional open posted entries for the customer, such as invoices, interest entries, reminder entries, and currency adjustment entries, as well as other payments and credit memos that have not been selected for reconciliation by another user in this workspace or in the Customer Payments workspace in this module or the General Journal workspace in the G/L module.

If you create a payment in this workspace, you can enter ranges of customer-related information such as customer and company numbers, invoice dates, due dates, and amounts in the Selection Criteria island, or you can search for this information using the Find menu. You can thus use this workspace for correct identification of a certain customer and for delimiting the number of open entries to be displayed in the A/R Entries sub-tab. Note that you must select the **Show Lines** field in the Show Lines island for Maconomy to display open entries in the A/R Entries sub-tab.

To ensure maximum flexibility in this workspace, information flows from the Customer Open Entry Reconciliation tab to the A/R Entries sub-tab, and vice-versa. If you create a payment and entered ranges of customer numbers, due dates, or invoice dates in the Selection Criteria island, that information flows to A/R Entries sub-tab, which then only displays open entries that apply to the specified selection criteria. Conversely, if you select an open entry for total or partial reconciliation in the A/R Entries sub-tab, information that you provide for the entry in question automatically flows to Customer Open Entry Reconciliation tab.

You can create a payment in this workspace without entering an assigned customer or an assigned settling company. However, you cannot release such a payment for posting unless you provide a customer number and a settling company for the payment.

Because payments can be made in one currency, invoiced in another, and reconciled in a third currency, Maconomy displays the amounts that are related to a payment in the relevant currencies in the Customer Payment and Reconciliation Information islands. These islands contain fields that display the current payment amount, remainder amount, variances, and so on, in the relevant currencies (the base currency of the assigned company, the currency of the current customer payment, and the currency in which reconciliation is performed). If the original currency (the currency of the original invoice or credit note) and the currency in which payment is made are identical, Maconomy performs the reconciliation in the original currency; otherwise, Maconomy performs the reconciliation in the standard currency of the customer in question.

At reconciliation, which is performed when the reconciliation is approved, Maconomy checks whether the selected entries can be reconciled against the current payment. This check is performed based on a predefined margin for reconciliation, which you enter in the **Margin For Customer Payment Variances** system parameter.

If a reconciliation causes an amount variance, and if you entered a value in the **Margin For Customer Payment Variances** system parameter, Maconomy reconciles the payment against

the selected customer entries at the time of posting if the difference between the amount of the payment and the amount of the entry or entries is within the margin that you entered in that system parameter. You post amount variances on an account for customer payment variances by using a dimension combination that you enter in the Posting References workspace in the G/L module. If you do not provide a value in the system parameter, or if the difference between a payment amount and a customer entry is larger than the margin, you must perform the reconciliation and closing of the entries manually, or you can choose to have the amount variance posted as a cash discount on the selected entries.

An exchange rate difference occurs when the exchange rate is different for two entries that reconcile each other. The following example illustrates this. A customer that uses GBP as its standard currency has received an invoice for 100 GBP. The exchange rate is 80. When you receive payment, the exchange rate has increased to 85. This produces an exchange rate variance of 5 base currency units when the payment is reconciled. These types of exchange rate variances are added to a customer reconciliation journal, which is posted in the Posting workspace in the G/L module. You define the posting reference to the Customer Exchange Rate Gain or the Customer Exchange Rate Loss account by using a dimension combination in the Posting References workspace in the G/L module.

If you have set up the Dimension Derivation Rules sub-tab in the Dimension Derivations workspace in the G/L module to derive dimensions from the payment when posting customer reconciliations, the dimensions from the payment that is displayed in the Customer Open Entry Reconciliation tab in the Customer Open Entry Reconciliation workspace are copied to any exchange rate variance entries and cash discount entries that Maconomy creates when you post the reconciliation. For more information, see the **Action** field in the Dimension Derivation Rules sub-tab in the Dimension Derivations workspace.

If you want to fully reconcile all of the open entries that the A/R Entries sub-tab in the Customer Open Entry Reconciliation workspace displays against the payment that the Customer Open Entry Reconciliation tab displays, you can use the **Mark All For Reconciliation** action. However, this action is only available if the sum of all remainder amounts to be reconciled equals the payment amount that the Customer Open Entry Reconciliation tab displays.

You use the **Release for Posting** action to release for posting payments that you enter in this workspace that you do not select for reconciliation.

When you create a payment in this workspace and select one or more entries for reconciliation of the payment, Maconomy automatically releases the payment for posting when the reconciliation is approved. If you have reconciled entries against an already posted payment, the reconciliation approval generates a customer reconciliation journal that you must post.

Depending on the setting of the **Automatic posting of customer reconciliations** system parameter, Maconomy might automatically post the customer reconciliation journal when you use the **Approve Reconciliation** action. If you select that system parameter, Maconomy posts the journal automatically when you approve the reconciliation. If do not select the system parameter, you must post the reconciliation manually in the Posting or Print Posting Journal workspace in the G/L module. This also applies to the removal of reconciliations in the Show Customer Reconciliation workspace.

Note also that if you select the **Automatic Reconciliation** field in the Payment Information workspace, Maconomy automatically reconciles payments and credit memos with the oldest open entry. This means that a customer who has a debit balance cannot have open credit entries, and that the open debit entries are always the newest in the system. Similarly, a customer who has a credit balance cannot have open debit entries, and the open credit entries are always the newest in the system.

In the General Journal workspace in the G/L module, you can enter an invoice number on a payment entry as you can in this workspace. This means that Maconomy automatically reconciles the payment and closes the invoice entry when you post the general journal. This function operates independently of the **Automatic Reconciliation** field in the Payment Information workspace.

### Customer Open Entry Reconciliation Tab

This section includes the fields and descriptions for the Customer Open Entry Reconciliation tab.

#### Show Lines Island

Field	Description
<b>Show Lines</b>	If you mark this field, the table part displays the open customer entries which match the selection criteria specified in the island Selection Criteria. The lines will only be shown if a customer payment has been entered in the island Customer Payment. If you have not specified any selection criteria, Maconomy will issue a warning and subsequently show all open entries registered in the system which have not yet been selected for reconciliation by another user.

#### Customer Payment Island

Field	Description
<b>Posted</b>	This field shows whether or not the current payment has been posted. The field is automatically marked by Maconomy when a payment is posted and cannot be edited manually.
<b>Entry Date</b>	If you are creating a new payment, you must specify the entry date of the payment in this field. Maconomy suggests today's date, but this date can be changed manually. If the window displays an already posted payment, this field shows the entry date of the payment in question. You cannot change the entry date of an already posted payment.
<b>Trans. No.</b>	<p>In this field, enter the transaction number of the new payment. The field must always be completed.</p> <p>The transaction number is determined through the following procedure:</p> <ul style="list-style-type: none"> <li>■ If you have selected a transaction number series in the island Transaction Number Series, the transaction number is transferred from the selected transaction number series created in the window Trans. No. Series in the G/L module.</li> <li>■ If you have not selected a transaction number series, you must enter a transaction number manually.</li> <li>■ If the window displays an already existing payment or credit memo, this field shows the transaction number of the payment or credit memo. If the entry is from a general journal, the trans- action number</li> </ul>

Field	Description
	was entered manually on the journal. If the entry is from a credit memo from the sales orders module, the number will correspond to the credit memo number allocated by Maconomy.
<b>Trans. Type</b>	In this field, you can enter a transaction type for the customer payment. By default, the field is empty. If the transaction type is not specified when a new customer payment is created, the default transaction type for the customer payment journal will be used. The transaction type cannot be changed for customer payments that have been posted.
<b>Description</b>	In this field, you can enter a text describing the new payment. If you want to use a standardized text for several payments, it is easier to use the below field "Std. Description." If the window shows an already posted payment, you cannot change the value in this field.
<b>Std. Description</b>	In this field, you can select a standardized text describing the payment. This can, for example, be useful if you use the same text on several payments. Maconomy automatically suggests the text "Customer payment" as default description on new payments. If you do not complete the above field "Description" manually, the value in this field is transferred to the description field when you press Return. If the window shows an already posted payment, you cannot change the value in this field. Standard texts are created in the window Popup Fields in the Set-Up module.
<b>Amount, Currency</b>	<p>This field shows the amount paid in the original currency of the customer payment. If you create a new payment in this window, you must enter a payment amount in this field or in the field "Amount, Base" below. The amount entered is credited on the customer's control account when the journal is posted. Maconomy automatically converts the currency amount entered in this field into the base currency and displays the amount in the field "Amount, Base" below.</p> <p>If the window displays an already existing payment, the field displays the amount paid in currency. Note that you cannot change the amount of an already posted payment.</p>
<b>Currency</b>	<p>This field shows the original currency of the payment. If you create a new payment in this window, you can select the desired payment currency in this pop-up field.</p> <p>If the window displays a payment created in one of the windows General Journal or Customer Payments, this field displays the currency in which the current payment was made.</p>
<b>Amount, Base</b>	This field shows the amount paid in the base currency of the company to which the customer is assigned. If you create a new payment in this window, you must enter a payment amount in this field or in the field "Amount, Currency" above, and specify a currency in the field "Currency." Maconomy automatically converts the base amount entered in this field into the selected currency and displays the amount in the field "Amount, Currency" above.

Field	Description
	If the window displays an already existing payment, the field displays the amount paid in base currency. The base currency of the company assigned to the customer in question is displayed in the island Company. Note that you cannot change the amount of an already posted payment.
<b>Charge, Currency</b>	<p>In this field, you can enter a charge amount in the original currency of the customer payment. If the bank which effected the payment has charged an amount for the service, you can enter the amount here. If you have agreed with the customer that you will carry the charge, enter the full charge amount in this field. If the customer is to carry the charge, you should not enter the charge in this field, but subtract the charge amount from the amount paid. When reconciling the customer entry with the amount, select "Partial" reconciliation in the table part. This way, the charge amount will still be an open entry with the customer, which can then be settled later. The amount is shown in the field "Charge, Base" below in the base currency of the responsible company.</p> <p>When posting, the amount entered in this field is debited the account specified in the field "Charge Account" in the window Payment Agents in the Banking module for the payment agent assigned to the current customer entry. A corresponding amount is credited the external bank account assigned to the payment agent, which is shown in the island External Account in the card part of the window.</p>
<b>Charge, Base</b>	The functionality of this field is similar to that of the field "Charge, Currency" above, but the charge amount is entered in the company's base currency. The amount is shown in the field "Charge, Currency" above in the currency selected in the field "Currency" in this island.
<b>D/C</b>	In this field, you specify whether the amount registered is a debit or credit amount. Maconomy suggests debit because a customer payment usually means your company receives a payment.
<b>Customer Payment Reference</b>	In this field, you can enter a reference to the current customer payment. If the current payment has been created in the window Customer Payments, the value, if any, from the field "Payment Reference" in the table part of the window Customer Payments will be transferred to this field. However, the value can be changed in this field and will be updated accordingly in the window Customer Payments as long as the payment in question has not been posted.
<b>Reference Date</b>	In this field, you can enter a reference date for the current entry. This might, for example, be the date of a telephone call which gave rise to the current entry. If you do not enter a date, Maconomy suggests the date from the field "Entry Date" above. This date is transferred to the customer entries resulting from the reconciliation.
<b>Reconc. Invoice No.</b>	In this field, you can enter an invoice number if the payment should be reconciled fully or partly against a posted invoice. The field can only be completed on unposted payments. Note that you cannot specify an invoice which has already been selected for reconciliation in another payment

Field	Description
	<p>journal or which has not yet been posted. If you select an invoice and press Return, the customer entry assigned to the specified invoice is displayed in the table part of the window. Moreover, the invoice number and information on the assigned customer number and settling company number is subsequently derived to the islands Selection Criteria, Customer and Settling Company. Note that when you have entered an invoice number in this field and pressed Return, you cannot change the payment amount in the fields "Amount, Currency" or "Amount, Base" in this island. If you wish to change the payment amount in such a situation, you must remove the reconciliation of the customer entry in the table part, change the payment amount and re-enter the invoice number.</p> <p>If you have set up the table part of the window Dimension Derivations in the G/L module to derive dimensions from invoices when creating a customer payment, specifying an invoice or credit memo in this field while creating a new customer payment will cause the dimension values on the specified invoice or credit memo to be copied to the dimension fields on the current line. However, fields in which a value has been specified manually are not overwritten by the dimension values from the invoice. For further information, see the field "Action" in the table part of the window Dimension Derivations.</p> <p>If the window shows an already posted payment, you cannot change the value in this field.</p>
<b>Reconcile Transaction No.</b>	<p>This field allows you to enter a transaction number if the payment should be reconciled fully or partly against a posted customer entry. The field can only be completed on unposted payments. Note that you cannot specify a transaction number that has already been selected for reconciliation in another payment journal. If you select a transaction number and press Return, the customer entry assigned to the specified transaction number is displayed in the table part of the window. Moreover, the transaction number and information on the assigned customer number and settling company number is subsequently derived to the islands Selection Criteria, Customer and Settling Company. Note that when you have entered a transaction number in this field and pressed Return, you cannot change the payment amount in the fields "Amount, Currency" or "Amount, Base" in this island. If you wish to change the payment amount in such a situation, you must remove the reconciliation of the customer entry in the table part, change the payment amount and re-enter the transaction number.</p> <p>If you have set up the table part of the window Dimension Derivations in the G/L module to derive dimensions from invoices when creating a customer payment, specifying a transaction number in this field while creating a new customer payment will cause the dimension values on the specified customer entry to be copied to the dimension fields on the current line. However, fields in which a value has been specified manually are not overwritten by the dimension values from the customer entry. For further information, see the field "Action" in the table part of the window Dimension Derivations.</p>

Field	Description
	If the window shows an already posted payment, you cannot change the value in this field.
<b>Job No.</b>	<p>For credit memos, this field shows the number of the job to which the credit memo is assigned. For customer payments, you can specify a job number for reference.</p> <p>When a job number has been specified on a customer payment, the job is taken into consideration when dimensions are derived to the payment. Furthermore, the job number is copied to the G/L entries created when the customer payment is posted. However, no job entries are created as a result of specifying a job number in this field.</p> <p>If you have set up the table part of the window Dimension Derivations to derive from invoices when creating customer payments, the field is automatically completed if you specify a job related invoice in the field "Reconc. Invoice No." on the line.</p>
<b>Released</b>	<p>When this field is marked, the current payment and selected reconciliation is released for posting. The field is automatically marked by Maconomy when a customer entry is approved for reconciliation by means of the action "Approve Reconciliation" in this window. The field cannot be filled in manually.</p> <p>This field is closely related to the field "Released" in the table part of the window Customer Payments in which the mark can be manually set or removed on unposted customer payments and the field in this window will thus be updated accordingly. Posting of a payment is done in the window Customer Payments or in one of the windows Posting or Print Posting Journal in the G/L module. See the description of the action "Approve Reconciliation" for further information on the functionality of this field.</p>
<b>Approved for Reconciliation</b>	This field shows whether or not a reconciliation has been approved. The field is automatically marked by Maconomy when a customer payment and one or more assigned entries are approved for reconciliation by means of the action "Approve Reconciliation." The field cannot be marked manually.

### Company Island

Field	Description
<b>Company No.</b>	<p>In this field, you can enter the number of the company responsible for the customer reconciliation journal. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>If you want to assign a new payment to an existing customer reconciliation journal, that is, if the number in the field "Journal No." is equal to an already existing customer reconciliation journal number, Maconomy will derive the company number assigned to the journal last entered by the current user.</p>

Field	Description
	If you create a customer payment on which the number of the settling company is different from the company number of the journal, Maconomy will automatically create intercompany balances between the companies at the posting of the journal. In the intercompany balance, the company in this field will be the responsible company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.
<b>Name</b>	This field displays the name of the company shown in the field "Company No." above.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### Settling Company Island

Field	Description
<b>Company</b>	In this field, you can enter the name and number of the settling company of the customer. If you have not entered a company number in this field, and if you select a customer entry for reconciliation in the table part of the window, the settling company number specified for the customer registered on the entry in question will flow to this field and the table part will subsequently show only customer entries registered with the customer number and settling company number displayed in this field and in the field "Customer No." above.
<b>Currency</b>	This field shows the currency used as standard currency in the company specified as settling company in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### Other Information Island

Field	Description
<b>Balance, Standard</b>	This field shows the customer's current balance, displayed in the customer's standard currency. The balance is updated when you post journals with customer entries.
<b>Balance, Base</b>	This field shows the customer's current balance in the base currency of the company. The balance is updated when you post journals with customer entries.
<b>Blocked</b>	If this field is marked, the customer in question is blocked. This means you cannot create orders, manual invoices, and so on, for the customer.  The field is displayed in this window as the payment to be reconciled might cover all overdue bills and remove the need to block the customer in

Field	Description
	question. However, the mark in this field can only be changed in the windows Payment Information or Company Specific Payment Information.
<b>Last Statement No.</b>	This is the number of the latest historical account statement printed out for the customer. Historical account statements are printed out in the window Print Historical Customer Statement. The value is automatically updated by Maconomy and cannot be changed.
<b>Date of Last Statement</b>	This is the date of the latest historical statement created for the customer. The value is automatically updated by Maconomy and cannot be changed.
<b>Current Reminder Level</b>	This is the customer's current reminder level. The customer's reminder level is the highest level of one of the customer's open entries. The reminder level of an entry is automatically raised every time you send a reminder to the customer. The value is automatically updated by Maconomy and cannot be changed. The reminder level is set to "0" if the customer has no overdue bills to be collected.
<b>Date of Last Reminder</b>	This is the date on which you last sent a reminder to the customer. The value is automatically updated by Maconomy and cannot be changed. When you create reminder codes, you can specify how many days must pass between reminders to the same customer.

### Dimensions Island

Field	Description
<b>Location</b>	This field shows the value of the dimension Location on the current customer payment. If the payment displayed in the window was created in the window Customer Payments or in the General Journal, this field shows the value specified in the field "Location" on the journal line in question. If you create a new payment in this window, you must specify a value in this field. If you do not enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations. If no value can be derived, the standard value is transferred from the window System Parameters in the Set-Up module. However, if you have set up the table part of the window Dimension Derivations in the G/L module to derive dimensions from invoices when creating a customer payment, specifying an invoice in the field "Reconc. Invoice No." will cause the location on the specified invoice to be copied to this field on the current line, unless you have manually specified a location before pressing Enter, in which case this value is not overwritten by the dimension value from the invoice. For further information, see the field "Action" in the table part of the window Dimension Derivations.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.

Field	Description
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec.1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

### Remarks Island

Field	Description
<b>Remarks</b>	You can use this field to enter remarks about the current customer payment. If the payment is the result of reading a customer payment file in the Banking module, and the payment has an error, then the error message will be displayed in this field, for example, "Unknown Payer ID" or "No Collection Order Found."

### Customer Island

Field	Description
<b>Customer</b>	<p>In this field, you can enter the name and number of the customer for whom a new payment should be registered. When you enter a customer number and press Return, the customer number and the assigned settling company number is copied to the island Selection Criteria. Moreover, if you have marked the field "Show Lines" in the island Show Lines, the table part will subsequently show the open customer entries assigned to the customer in question.</p> <p>If you have not filled in this field, and select a customer entry in the table part of this window, the information on the customer assigned to the entry in question will flow to this field. Moreover, the island Settling Company will automatically be filled in and this information will subsequently also flow to the relevant fields in the island Selection Criteria.</p> <p>Moreover, if you have not filled in this field, and if you enter an invoice number in the field "Recon. Invoice No.," the customer number registered on the invoice in question is automatically transferred to this field.</p> <p>The island also shows the first two lines of the customer's name and address as well as the name of the customer's attention person. The information is retrieved from the Customer Information Card.</p>
<b>Attn.</b>	This field shows the customer contact.
<b>Std. Currency</b>	This field displays the currency used as standard currency by the customer in question. If you have created a payment on which no customer has been specified, this field displays the currency selected in the pop-up field "Currency, Original" in the island Customer Payment and Reconciliation Information. When

Field	Description
	you assign a customer to the payment, this field will subsequently show the standard currency of the customer. A customer's standard currency is specified in the field "Currency" in the window Customer Information Card.

### Reconciliation Information Island

Field	Description
<b>Reconciliation Currency</b>	This field shows the currency in which the reconciliation is made.
<b>Customer Payment, Reconciliation Currency</b>	This field shows the amount paid by the customer in the currency specified in the field "Reconciliation Currency" above.
<b>Remainder, Reconciliation Currency</b>	<p>This field shows how much of the original payment or credit memo amount can still be used to reconcile entries. You cannot reconcile more than the amount in this field. The field is automatically updated by Maconomy when you select entries for reconciliation. The value cannot be changed manually.</p> <p>If the balance does not cover a full invoice amount, and if you do not wish to post the difference as a cash discount, you can choose to reconcile the invoice in part.</p>
<b>Reconciled in Debit</b>	This field displays the debit amount reconciled against the current payment. The amount in this field cannot be changed manually.
<b>Reconciled in Credit</b>	This field displays the credit amount reconciled against the current payment. The amount in this field cannot be changed manually.
<b>Cash Discount, Reconciliation Currency</b>	<p>This field shows any cash discount manually specified in the reconciliation currency. If you make a full reconciliation of an open entry with an amount smaller than the payment amount, this field will show the cash discount resulting from the reconciliation. The amount is shown as a positive figure. When you approve such a reconciliation, Maconomy suggests that the balance is posted as a cash discount.</p> <p>When you approve reconciled open entries, Maconomy transfers the cash discount, if any, to a customer reconciliation journal that is ready to be posted in the G/L module or in the window Customer Payments - unless it is posted automatically (see the description of the action "Approve Reconciliation"). When you approve the reconciled payments, Maconomy verifies that the Difference, Reconciliation Currency amount does not exceed the cash discount limit. This limit is the percentage specified in the field "Max. Cash Discount" in the cash discount code specified for the current customer in the window Payment Information.</p>

Field	Description
	<p>You specify the posting reference to the customer cash discount account by means of a dimension combination in the window Posting References in the G/L module.</p> <p>The amount in this field cannot be changed manually.</p>
<b>Difference, Reconciliation Currency</b>	<p>This field shows any difference between the debit and credit amounts, that is, the total amount variance between the current payment amount and the entries selected for reconciliation. If you select an open entry with an amount which exceeds the payment amount, the figure in this field will be positive. When you approve such reconciliation, Maconomy suggests that this exceeding amount is posted as a cash discount or as a customer payment variance depending on the value, if any, specified in the system parameter "Margin For Customer Payment Variances" in the Set-Up module.</p> <p>If the reconciliation gives rise to a cash discount, Maconomy verifies that the amount added to any existing cash discount does not exceed the cash discount limit which applies to the customer in question. This limit is the percentage specified in the field "Max. Cash Discount" in the cash discount code specified for the current customer in the window Payment Information. Maconomy transfers the cash discount to a customer reconciliation journal, which is ready to be posted in the G/L module or in the window Customer Payments - unless it is posted automatically (see the description of the action "Approve Reconciliation").</p> <p>If you have specified a value in the system parameter "Margin For Customer Payment Variances" and if the reconciliation gives rise to an amount variance which is within the value specified in the parameter, variance amounts are posted on an account for customer payment variances. The posting reference for customer payment variances is specified in the window Posting References in the G/L module.</p> <p>See the description of the action "Approve Reconciliation" in this window and the description of the system parameter "Margin For Customer Payment Variances" in the window System Parameters for further information on how Maconomy handles reconciliation variances.</p> <p>If the payment or crediting is not fully used to reconcile an invoice, the balance in this field is shown as a negative figure. The amounts in this field cannot be changed manually.</p>
<b>Cash Discount, Base</b>	<p>This field shows any cash discount manually specified in the base currency. For more information on cash discounts, see the description of "Cash Discount, Reconciliation Currency."</p>
<b>Difference, Base</b>	<p>This field shows any difference between the debit and credit amounts, that is, the total amount variance between the current payment amount and the entries selected for reconciliation, expressed in the base currency. For more information on differences, see the description of "Difference, Reconciliation Currency."</p>

Field	Description
<b>Transaction Type, Reconciliation</b>	Transaction type used for the reconciliation. Examples of types: Cash Discount, Exchange Rate Difference. If the user does not specify a transaction type, the system will try to derive it, as the default transaction type of the Customer Reconciliation journal, but only if the customer payment is posted. If the customer payment is created in this dialog, then this field is ignored.

### Transaction Numbering Island

Field	Description
<b>Transaction Number Series</b>	In this field, you can select a transaction number series. If a transaction number series has been selected when you create a new payment, the field "Transaction No." in the island Customer Payment in this window and the field "Trans. No." in the table part of the window Customer Payments are automatically assigned the next available number in the selected series. Transaction number series are created in the window Trans. No.Series in the G/L module. By default, the field shows the transaction number series for the transaction type specified in the "Customer Payment" island.

### Reconciliation Island

Field	Description
<b>Date Reconciled</b>	In this field, you can enter a date for the current reconciliation. The reconciliation date is used as posting date in connection with reconciliation of a customer payment against open customer entries. If the current customer payment has been posted, Maconomy suggests today's date as reconciliation date. If the payment has not yet been posted, Maconomy suggests the entry date of the customer payment as reconciliation date. All currency conversions made at reconciliation are made on the basis of the date specified in this field. You can change the reconciliation date in this field on posted as well as on unposted payments.

### External Account Island

In this island, you can specify an external account in connection with entering customer payments in this window. For more information about external accounts, please see the description of the window External Accounts in the Banking module.

Field	Description
<b>Cust. Payment Mode</b>	In this field, you select a customer payment mode. If the window shows an already posted payment, you cannot change the value in this field. The customer payment mode is used to find an offset account for the current payment. You can specify offset accounts by means of a dimension combination in the window External Accounts in the Banking module. A customer payment mode can, for example, be a manual payment, a check or a bank account. Customer payment modes are created in the window Customer Payment Modes in the Banking

Field	Description
	module. If a link between the customer payment mode, the company, and the external account has been set up in the window External Accounts, the remaining fields in this island will be completed when you press Return.
<b>Payment Agent</b>	<p>In this field, you select a customer payment agent, if completing the field “Cust. Payment Mode” above did not complete the field for you. If the window shows an already posted payment, you cannot change the value in this field. The customer payment agent is used to find an offset account for the current payment. You can specify offset accounts by means of a dimension combination in the window External Accounts in the Banking module.</p> <p>If you change the value in this field, any value selected in the field “Cust. Payment Mode” above will be reset to be blank.</p>
<b>Reg. No.</b>	<p>In this field, you select a bank registration number, if completing the field “Cust. Payment Mode” above did not complete the field for you. This number is the bank registration number of the payment agent selected in the field “Payment Agent” above. The combination of this field and the field “External Account No.” must match a number registered for the current payment agent on the external account for the current company in the window External Accounts. If the window shows an already posted payment, you cannot change the value in this field.</p> <p>If you change the value in this field, any value selected in the field “Cust. Payment Mode” above will be reset to the blank value.</p>
<b>External Account No.</b>	In this field, you select an external account number, if completing the field “Cust. Payment Mode” above did not complete the field for you. In other respects, the functionality of this field is similar to that of the field “Reg. No.” above.

### Journal Island

Field	Description
<b>Journal No.</b>	This field shows the number of the current customer payment journal. If you create a new journal, and if you do not enter an existing journal number, Maconomy automatically assigns a number from the system number series “Journal” from the window System Numbers in the Set-Up module, along with a prefix if a prefix has been defined for the company in question in the window Company Information in the G/L module.
<b>Line No.</b>	This field shows the line number of the registration of the customer payment in the journal.

### Selection Criteria Island

Field	Description
<b>Customer No.</b>	If you enter a range of customer numbers in these fields, the table part will display only open customer entries with customer numbers within the specified range. The fields in this island are usable if you need to search for a

Field	Description
	<p>specific customer entry or if you want to delimit the number of entries displayed in the table part of the window.</p> <p>If you assign a customer number to a new payment in the field "Customer No." in the island Customer, this number will flow to these fields. As a result, the table part will subsequently show only customer entries registered on the customer in question, if you have marked the field "Show Lines" in the island Show Lines.</p> <p>When a value has been specified in the field "Customer No." in the island Customer in the card part of the window, you cannot change the values in these fields. If you wish to do so, you must remove the customer number specified in the field "Customer No." in the card part of the window before you can enter a new range of customer numbers in these fields. Note that when you remove a customer number in the field "Customer No." in the island Customer in the card part of the window, these fields are not automatically blanked.</p> <p>If you have created a new payment in this window and have not filled in the field "Customer No." in the island Customer in the card part of the window, and if you select an entry for reconciliation in the table part of the window, information on the customer assigned to the selected entry will flow to the fields in this island as well as to the islands Customer and Settling Company.</p>
<b>Settling Company No.</b>	If you enter a range of settling company numbers in these fields, the table part will display only open customer entries with settling company numbers within the specified range. The functionality of these fields is similar to that of the field "Customer No." above.
<b>Company No.</b>	If you enter a range of company numbers in these fields, the table part will display only open customer entries with company numbers within the specified range. The functionality of these fields is similar to that of the field "Customer No." above.
<b>Trans. No.</b>	If you enter a range of transaction numbers in these fields, the table part will display only open customer entries with transaction numbers within the specified range. Note that a transaction number can be similar to an invoice number. The functionality of these fields is similar to that of the field "Customer No." above.
<b>Invoice Date</b>	If you enter a range of invoice dates in these fields, the table part will display only open customer entries with invoice dates within the specified range. The functionality of these fields is similar to that of the field "Customer No." above.
<b>Due Date</b>	If you enter a range of due dates in these fields, the table part will display only open customer entries with invoices whose due date is within the specified range. The functionality of these fields is similar to that of the field "Customer No." above.
<b>Original Amount</b>	If you enter a range of original amounts in these fields, the table part will display only open customer entries with original amounts within the specified range. The functionality of these fields is similar to that of the field "Customer No." above.

Field	Description
<b>Remainder, Original</b>	If you enter a range of remainder amounts in these fields, the table part will display only open customer entries with remainder amounts within the specified range. The functionality of these fields is similar to that of the field "Customer No." above.
<b>Original Currency</b>	If you select a currency in this field, the table part will display only open customer entries with amounts registered in the selected currency. The functionality of this field is similar to that of the field "Customer No." above.

## A/R Entries Sub-Tab

This section includes the fields and descriptions for the A/R Entries sub-tab.

Field	Description
<b>Customer No.</b>	This field shows the number of the customer assigned to the current customer entry.
<b>Customer Name</b>	This field shows the name of the customer assigned to the current customer entry.
<b>Invoice Date</b>	This field shows the date on which the entry was posted to the Accounts Payable and Accounts Receivable.
<b>Due Date</b>	This field shows the date on which the entry is due for payment. The due date is calculated on the basis of the invoice date and the customer's payment terms. The date is used when sending reminders and when calculating interest in the windows Change Interest Charge Selection and Change Reminder Selection.
<b>Entry Description</b>	This field shows the text assigned to the entry.
<b>Trans. No.</b>	This field shows the transaction number of the entry. If the entry is from a general journal, the transaction number was entered manually. If the entry is from an invoicing or crediting in either of the A/R, Sales Order or Job Cost modules, the transaction number corresponds to the invoice, credit memo or job invoice number, which was allocated automatically by Maconomy. If the entry is an interest charge entry or a reminder charge, the transaction number is allocated automatically from the Interest Notice system numbers in the Set-Up module.
<b>Trans. Type</b>	This field shows the transaction type of the customer entry.
<b>Reconciliation Currency</b>	This field shows the currency in which the current reconciliation will be made. If payment is made in a currency identical to the currency in which the customer entry was originally registered, reconciliation will be made in the original currency. If payment is made in a currency different from the currency in which the customer entry was originally registered, reconciliation will be made in the assigned customer's standard currency.

Field	Description
	Maconomy automatically shows the currency to be used for reconciliation in the field "Reconciliation Currency" on each line.
<b>Reconciliation</b>	<p>In this field, you can specify how much of the entry to reconcile. You only have to enter an amount in this field, if the entry is to be partly reconciled against an amount smaller than the amount of the payment, or if you wish to give a cash discount. If the entry is fully reconciled, Maconomy automatically inserts a value corresponding to the balance on the line. Any value specified in this field is shown in the island Customer Payment and Reconciliation Information in the card part of the window.</p> <div> <p><b>Note:</b> Note that you cannot change the value in this field once the entry has been approved for reconciliation by means of the action "Approve Reconciliation." However, if the payment in question has not yet been posted, you can remove the mark in the field "Released" on the current payment in the window Customer Payments and the entry selected for reconciliation in this window is subsequently editable again. See the description of the action "Approve Reconciliation" for further information on this action.</p> </div>
<b>T/P</b>	<p>In this field, you select whether to reconcile the entry totally or partly by selecting one of the pop-up options "Totally" or "Partly."</p> <p>If you select the option "Totally," the remainder amount of the entry is automatically inserted in the field "Reconciliation" on the current line and the amounts in the island Payment &amp; Reconciliation Information in the card part of the window are updated accordingly. If the entry is totally reconciled, and the amount entered in the field "Reconciliation" is less than entry's balance, the difference is automatically suggested as cash discount.</p> <p>If you select the option "Partly" and press Return, Maconomy automatically inserts the largest possible amount in the field "Reconciled." The amount inserted depends on the payment's balance. You can also enter an amount in the field "Reconciled" and select the option "Partly," if you wish to only partly reconcile part of the payment.</p> <p>If you have created a new payment in this window, but not specified an assigned customer or settling company, and if you select an entry for partial or total reconciliation against this payment, information on the customer and assigned settling company registered on the entry selected for reconciliation will flow to the card part of the window. Moreover, the table part is updated accordingly so that it only displays open entries registered on the customer in question.</p> <p>Payments and credit memos are reconciled with debit entries, if you select "Totally."</p> <p>In order to approve the reconciliations, you must select the action Approve Reconciliation. See the description of this action for further information on how Maconomy handles amount variances and exchange rate variances when reconciling entries.</p>

Field	Description
<b>Original Amount</b>	This field shows the original amount of the entry.
<b>Remainder, Original</b>	This field shows the amount which remains to be reconciled in the original currency of the entry. When this balance is zero, the entry is fully reconciled. Maconomy automatically updates the remaining balance in this field when the reconciliation is approved. The value in this field cannot be changed manually.
<b>Original Currency</b>	This field shows the original currency of the entry, that is, the currency specified on the invoice, credit memo, interest note, currency adjustment entry or customer payment.
<b>Debit, Standard</b>	This field shows the entry's original amount in the customer's standard currency, if it is a debit entry.
<b>Credit, Standard</b>	This field shows the entry's original amount in the customer's standard currency, if it is a credit entry.
<b>Remainder, Standard</b>	This field shows the amount which remains to be reconciled in the customer's standard currency. Amounts that have been selected for reconciliation will not be included in the amount remaining to be reconciled. When this balance is zero, the entry is fully reconciled. Maconomy automatically updates the remaining balance.
<b>Debit, Base</b>	This field shows the entry's original amount in the base currency, if it is a debit entry.
<b>Credit, Base</b>	This field shows the entry's original amount in the base currency, if it is a credit entry.
<b>Remainder, Base</b>	This field shows the amount which remains to be reconciled on the current entry in base currency. When this balance is zero, the entry is fully reconciled.
<b>Company of Origin, No.</b>	This field shows the number of the company which is responsible for the invoice, credit memo, general journal or interest charge or reminder selection that has caused the current customer entry. See the description of the field "Company of Origin, Name" below for further information on company of origin.
<b>Company of Origin Name</b>	This field shows the name of the company which is responsible for the invoice, credit memo, general journal or interest charge or reminder selection that has caused the current customer entry. On invoices, credit memos, and general journals, the responsible company can be specified in the field "Company No." in the island Company whereas the responsible company on customer entries which are created upon approval of the interest charge or reminder selection is automatically transferred from the field "Company No." in the island Settling Company on the user or the customer information card. In the window Dimension Derivations in the G/L module, you can prioritize the units from where Maconomy will transfer the value.

Field	Description
<b>Customer Payment Reference</b>	This field shows a payment reference assigned to the current entry, if any.

## Actions

This section shows the Actions available in the Customer Open Entry Reconciliation workspace.

### Top Tab

Field	Description
<b>Mark All For Reconciliation</b>	<p>When you select this action, all entries displayed in the table part of the window are automatically marked for total reconciliation and the information in the island Payment &amp; Reconciliation Information is updated accordingly. However, the entries displayed in the table part can only be marked for total reconciliation by means of this action, if the total remainder amount for all entries displayed equals the remainder amount of the payment. The remainder amount of the payment is displayed in the field "Remainder, Payment" in the island Payment &amp; Reconciliation Information. Note that you can only mark entries for reconciliation for one customer at a time.</p> <p>If you reconcile entries against a payment which has been created in this window and which has not yet been posted, posting of such a payment must be made in either the window Customer Payments or in one of the windows Posting or Print Posting Journal in the G/L module. The reconciliation of the selected entries is carried out at the actual time of posting of the payment.</p>
<b>Approve Reconciliation</b>	<p>When you select this action, you approve the reconciliation shown in the window. If you have created a new payment in this window and prepared reconciliation of one or more entries, Maconomy checks whether or not reconciliation can be carried out. If reconciliation is possible, the payment is automatically released for posting and the field "Released" in the island Customer Payment is subsequently marked by Maconomy. Posting of a payment created in this window is done in either the window Customer Payments or in one of the windows Posting or Print Posting Journal in the G/L module.</p> <p>If you have prepared reconciliation of an already posted payment against one or more entries, use of this action generates a customer reconciliation journal. If the system parameter "Automatic posting of customer reconciliations" is marked, then the generated customer reconciliation journal is automatically posted in the G/L module. If the parameter is not marked, the journal must be posted manually in the windows Posting or Print Posting Journal in the G/L module.</p> <p>Once you have approved one or more entries for reconciliation, they cannot be edited in this window.</p>

Field	Description
	<p><b>Note:</b> Note that a user can only use this action if he has been granted access to release customer payments for posting in the window Actions in the Set-Up module.</p> <p>If a reconciliation gives rise to an amount variance or an exchange rate variance, and if you have specified a value in the system parameter "Margin For Customer Payment Variances," Maconomy will reconcile the payment against the selected customer entries at the time of posting, if the difference between the amount of the payment and the amount on the entry (-ies) is within the margin specified in the parameter. Maconomy automatically uses the margin (amount or percentage) resulting in the lowest amount. Amount variances are posted on an account for customer payment variances by means of a posting reference. If you do not specify a margin, or if the current difference between a payment amount and a customer invoice is greater than the margin, or if the difference cannot be reconciled, the reconciliation and closing of the invoices must be done manually, or you can choose to have the amount variance posted as cash discount on the selected entries. Please note that the functionality of the above mentioned parameter is only available if you have not marked the system parameter "Manual Release of Customer Payments." The posting reference for customer payment variances is specified in the window Posting References in the G/L module.</p> <p>If the reconciliation gives rise to a cash discount, Maconomy verifies that the amount added to any existing cash discount does not exceed the cash discount limit which applies to the customer in question. This limit is the percentage specified in the field "Max. Cash Discount" in the cash discount code specified for the current customer in the window Payment Information. Maconomy transfers the cash discount to a customer reconciliation journal, which must be posted in the window Posting in the G/L module or in the window Customer Payments.</p> <p>If you have set up the table part of the window Dimension Derivations in the G/L module to derive dimensions from the payment when posting customer reconciliations, the dimensions from the payment in the card part will be copied to any exchange rate variance entries and cash discount entries created when the reconciliation is posted. For further information, see the field "Action" in the table part of the window Dimension Derivations.</p> <p>Fully reconciled open entries change status to closed entries which can be reviewed in the window Show Customer Reconciliation.</p>
<b>Release for Posting</b>	<p>When you select this action, the payment displayed in the window is released for posting and transferred to a customer payment journal. However, only payments which have not been selected for reconciliation can be released by means of this action. Note that payments can only be released by users who have access to doing so. User access to releasing customer payments is granted in the window Actions in the Set-Up module. A customer payment can be posted in either the window Customer Payments in this module or in the windows Posting or Print Posting Journal in the G/L module.</p>

Field	Description
<b>Remove Approval</b>	This action can be used to remove approvals for reconciliations that have not been posted. The intended main use is to make it possible to remove, and perhaps delete, imported customer payments, but it can also be used for manually created customer payments.

## Debtor Provisions by Invoice Single Dialogs Workspace

Use this workspace to evaluate the amounts that customers owe you.

For each outstanding invoice, evaluate the amount that you can reasonably hope to collect. You can enter a fixed amount or a percentage of the invoiced amount that should be recognized as revenue.

This workspace is similar to the Evaluation of Work in Progress workspace in the Job Cost module, except that it is based on invoiced amounts, not on work in progress. This workspace displays invoices from both the Job Cost and Sales Orders modules.

Using this approach, you can apply a conservative view when calculating future revenue.

When you send an invoice to a customer, you normally expect the customer to pay the full amount of the invoice, so the full amount is included in your calculations of future revenue (revenue recognition). However, to be cautious, it might be preferable to only revenue-recognize a part of the invoice amount.

In this workspace you can enter a fixed amount or a percentage of the invoiced amount to be revenue-recognized. When you print new invoices, you can adjust the revenue recognition in this workspace by creating provisions. You can create reports that display invoiced amounts, provisions, and expected payment, for example. Such reports can help you evaluate future revenue flow.

When you approve a debtor provision in this workspace, Maconomy creates a debtor provision journal. Maconomy either posts that journal automatically or readies it for posting in the G/L module, depending on the setting of the **Automatic posting of debtor provisions** system parameter. The journal contains entries that credit the provisioned amount to a dimension combination that you associated with the current customer's control account.

You define this dimension combination in the **A/R Control Accounts** pop-up field in the Popup Fields workspace in the Set-Up module. The provision is offset on a G/L posting reference called **Debtor Provisions**, which you define in the Posting References workspace in the G/L module.

When the invoice is eventually closed-when the invoice is fully reconciled against a customer payment-Maconomy reverses the provision transaction.

If the customer makes a payment against an invoice for which provisions have been made, but the invoice is not fully reconciled, one of two things can happen depending on the amount that the customer paid:

- The customer paid less than the invoice amount including provisions, or
- The customer paid less than the invoice amount, but more than was expected (that is, more than the invoice amount less provisions)

What happens is best illustrated by the following example.

You send an invoice to a customer for USD 1,000. For various reasons, you only expect the customer to pay USD 900, so you create a provision for USD 100 in this workspace.

The following table shows this transaction and a number of scenarios (note that it does not show the offset account for the A/R Control Account):

Event	A/R Control Account	Debtor Provision	Offset
Provision created	No movement	+100	-100
Scenario 1: Customer pays USD 900, inv. reconc. in part	-900	No movement	No movement
Scenario 2: Customer pays USD 950, inv. reconc. in part	-950	-50	+50
Scenario 3: Customer pays USD XX (any amount), inv. fully reconciled	-XX	-100	+100

You can adjust the debtor provision manually in this workspace at any time.

In the Debtor Provisions by Invoice tab, you can select the invoices that you want to view in the A/R Entries sub-tab. When you have found the invoice or invoices for which you want to create provisions, you can create a provision suggestion for all of the invoices in the sub-tab by transferring a percentage from the Debtor Provisions by Invoice tab to all of the lines in the A/R Entries sub-tab, for instance, specifying that you expect 90% of the invoice amounts to be paid. This sets off 10% of the invoice amounts as provisions. You can adjust the individual amounts later, before you approve the provisions.

The A/R Entries sub-tab displays information about the selected invoices and lets you enter provisions on individual invoices. There is one line in this sub-tab for each invoice.

When you have decided on the provision amounts, approve the provisions using the **Approve Provision** action.

## Debtor Provisions by Invoice Tab

This section includes the fields and descriptions for the Debtor Provisions by Invoice tab.

### Selection Criteria Island

Field	Description
<b>Show Lines</b>	When you mark this field, the table part shows the invoices that match the selection criteria specified in this island. By default, the field is not marked. Please note that you cannot carry out any actions in this window unless this field is marked.
<b>Include invoices with provisions only</b>	When you mark this field, the table part only shows invoices that match the selection criteria specified in this island and for which provisions have been made previously.

Field	Description
<b>Customer No.</b>	In these fields, you can specify a range of customer numbers. The table part will only display invoices for customers with numbers within the specified range.
<b>Job No.</b>	In these fields, you can specify a range of job numbers. The table part will only display invoices for jobs with numbers within the specified range.
<b>Due Date</b>	In these fields, you can specify a range of dates. The table part will only display invoices which are due for payment within the specified range of dates.
<b>Currency</b>	In this field, you can specify a currency. The table part will only display invoices issued in the specified currency.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The table part will only show invoices for jobs with a responsible company within the specified range.
<b>Interest Reminder Block</b>	Here you can specify if you want to see the entries blocked for interest and reminder calculation, for a specific reason (for example, invoices sent to debt collection).

### Provision Island

Field	Description
<b>Provision Date</b>	In this field you must enter a provision date. When you select the action "Approve Provision" in the Action menu, the debtor provisions and the customer accounts will be calculated as per the date in this field. The date in this field will also be used as posting date in the subsequent debtor provision journal. The Provision Date must be in the G/L posting period for the default transaction type of the Debtor Provisions journal.
<b>New Adjusted %</b>	In this field, you can enter a percentage value. The percentage applies to the invoice amount - that is, if you specify, for example, 90%, it means that you expect to collect 90% of the invoice, and you want to create a provision for 10% of the invoice amount. When you select the function "Transfer Percentage" in the Action menu, the value in this field will be transferred to the field "Adjusted %, New" in the table part for all shown invoices, and the new amount value of each invoice is calculated. The percentage or the amount can subsequently be edited for each invoice. For more information, please see the description of the field "Adjusted %, New" in the table part.
<b>Entry Description</b>	In this field, you must enter an entry description. This text is used as posting description on the G/L entries created when the debtor provisions are approved and the journal is subsequently posted.

**Selection Criteria, Dimensions Island**

Field	Description
<b>Location</b>	In these fields, you can specify a range of locations. The table part will only show invoices for jobs with a location within the specified range.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location."
<b>Project</b>	The functionality of this field is similar to that of the field "Location."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location."
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Local Spec.1-3</b>	The functionality of these fields is similar to that of the field "Location."

**Triviality Limit**

Field	Description
<b>Amount</b>	<p>In this field, you can enter a triviality limit to apply to each adjustment entry made on the invoices. Any amount adjustment made which is less than this triviality limit will not result in the creation of a debtor provision journal upon approval of the provision. The triviality limit thus allows you to leave out amount adjustments which are considered too small when making debtor provisions.</p> <p>Note that the triviality limit specified in this field is applied to each adjustment entry, that is, to the invoices displayed on the lines in the table part of the window. The default value of this field is 0.</p> <p>You can also use this field as an additional search criterion to omit small invoices from the table part. If you, for example, enter 1,000 in this field, invoices for less than 1,000 will not be shown in the table part.</p>
<b>Currency</b>	In this field, you can choose the currency to apply to the triviality limit specified in the above field in this island. The default value in this field is the enterprise currency of the system.

**A/R Entries Sub-Tab**

This section includes the fields and descriptions for the A/R Entries sub-tab.

Field	Description
<b>Customer No.</b>	This field shows the number of the ship-to customer who received the goods or services represented by the invoice on the current line.
<b>Customer Name</b>	This field shows the name of the ship-to customer to whom the invoice on the current line is issued.

Field	Description
<b>Job No.</b>	This field shows the number of the job for which the invoice on the current line was made.
<b>Job Name</b>	This field shows the name of the job for which the invoice on the current line was made.
<b>Std. Currency</b>	This field shows the currency selected for the invoice on the current line.
<b>Open Amount</b>	This field shows the current open amount of the invoice on the current line, that is, the part of the invoice which has not been paid or for which no provisions have been made. The first time you evaluate the invoice, this amount will correspond to the amount owed to you by the customer for the current invoice. Please note that the amounts in this field and all other fields except "Customer Balance Incl. Tax" are shown without tax.
<b>Previous Provisions</b>	This field shows the total amount of previously made provisions on the invoice on the current line. When you approve a new provision, the adjusted amount is added to or subtracted from the amount in this field.
<b>Adjusted Amount</b>	This field shows the amount which you estimate that you will be able to collect on the invoice, that is, the open invoice amount from the field "Open Amount" less the provisions made on the invoice from the field "Previous Provisions."
<b>New Provision</b>	This field shows the amount which will be created as a provision if you select the action "Approve Provision." Maconomy calculates the amount in this field by subtracting the amount in the field "New Adjusted Amount" from the amount in the field "Adjusted Amount" (original invoice amount less previous provisions). Note that the provision can be negative - see the description of the field "New Adjusted Amount" below.
<b>New Adjusted Amount</b>	<p>In this field, you can enter an amount. When you approve the provision, this will be the new expected value of the invoice. When you change the amount in this field and press Return, the new provision is calculated and displayed in the field "New Provision." Note that you can create a negative provision by specifying a higher amount than what is shown in the field "Adjusted Amount." This can, for example, happen if you initially predict that only 80% of the invoice will be paid, but later change your mind and specify that 90% of the invoice will be paid.</p> <p>If you change this field, the field "Adjusted %, New" is updated to reflect the change as a percentage of the open invoice amount.</p> <p>Conversely, if you change the field "Adjusted %, New," this field will be updated to reflect the change of provision percentage as an amount value.</p>
<b>Adjusted %, New</b>	<p>This field shows the percentage ratio between the amounts in the fields "Open Amount" and "New Adjusted Amount." As long as you have not created any provisions for an invoice, this percentage will be "100."</p> <p>If you transfer a percentage from the card part using the action "Transfer Percentage," the percentage is transferred to this field, and the calculation is performed.</p>

Field	Description
<b>Provision Cause</b>	In this pop-up field you can choose a provision cause from the options entered in the window Popup Fields. This enables you to enter a standardized text which can, for example, be used as selection criterion in reports.
<b>Provision Remark</b>	In this field you can enter a remark for the current provision, for example, elaborating on the provision cause selected in the field "Provision Cause." This remark can also be transferred to reports, but is not used elsewhere in Maconomy.
<b>Invoice No.</b>	This field shows the invoice number of the current invoice. Note that the invoice may stem from either the Job Cost module or the Sales Orders module.
<b>Trans. Type</b>	This field shows the transaction type of the customer entry.
<b>Due Date</b>	This field shows the date on which the current invoice is due.
<b>Entry Date</b>	This field shows the invoice date of the current invoice.
<b>Bill to Customer</b>	This field shows the number of the customer who received the invoice.
<b>Bill to Customer Name</b>	This field shows the name of the customer who received the invoice.
<b>Customer Balance Incl. Tax</b>	This field shows the current customer's total outstanding balance (that is, balance of all invoices) with you, including tax. Note that all other amounts in this window are shown without tax.
<b>Base Currency</b>	This field shows the base currency of the customer to whom the invoice on the current line is issued.
<b>Company No.</b>	This field shows the number of the company responsible for the invoice on the current line.
<b>Company Name</b>	This field shows the name of the company responsible for the invoice on the current line.
<b>Location</b>	This field shows the value for the dimension "Location" which was assigned to the invoice on the current line.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location."
<b>Project</b>	The functionality of this field is similar to that of the field "Location."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location."

Field	Description
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Local Spec.1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Block Type</b>	This field shows if the current line is blocked for interest calculation.
<b>Block Date</b>	This field shows the date that the line was blocked for interest calculation.
<b>Blocked by</b>	This field shows who blocked the field for interest calculation.

## Actions

This section shows the Actions available in the Debtor Provisions by Invoice workspace.

### Top Tab

Field	Description
<b>Transfer Percentage</b>	When you select this action, the percentage selected in the field "New Adjusted %" in the card part is transferred to the field "Adjusted %, New" in the table part for all selected invoices. The percentage applies to the invoice amount. This percentage is then calculated automatically, and the amounts and percentages in the table part are updated.
<b>Approve Provision</b>	When you select this action, the debtor provisions specified in the table part are approved.  Upon approval, Maconomy creates a journal of the type "Debtor Provisions," which is then ready for posting in the G/L module. Note, however, that the journal is posted automatically if the system parameter "Automatic posting of debtor provisions" is marked. The journal contains entries crediting the provisioned amount to a dimension combination associated with the current customer's control account, and debiting a G/L posting reference called "Debtor Provisions." The posting description is taken from the field "Entry Description" in the card part, and the posting date is taken from the field "Provision Date" in the card part.

## Select Interest Criteria Single Dialogs Workspace

Use this workspace to create interest charge selections that you can apply to company-specific customers.

You can only specify one interest charge selection per customer at a time. You can also use the Change Interest Charge Selection workspace to create an interest charge selection for a specific customer or to customize an existing selection for a specific customer.

The procedure for interest charge selection is as follows:

1. Create and print an interest charge selection. You create interest selections for individual company-specific customers in this workspace. If you only need to create an interest charge selection for one company-specific customer, you can also do that in the Change Interest Charge Selection workspace.
2. Review the selection and adjust it, if needed, for the individual customer in the Change Interest Charge Selection workspace. You can remove the interest charge if you do not want to send an interest note.
3. Approve the interest selection from the Change Interest Charge Selection workspace for one customer, or approve interest criteria for a group of customers. When you perform the approval, the interest charge notices are printed in the Approve Interest Selection workspace.

The interest charge policy that you establish here is general; you can adjust it for individual customers in the Change Interest Charge Selection workspace. Maconomy does not create a posting journal-with interest charge entries to the Accounts Receivable and General Ledger-until you approve the interest in the Approve Interest Selection workspace.

Maconomy calculates interest charges using the following principle:

- "Net" means that Maconomy calculates interest charges from a given percentage rate, regardless of how long the entry has been due for payment.
- "EOM" means that Maconomy calculates interest charges for the number of days that the entry has been due for payment. Every day, Maconomy adds 1/365 of the percentage rate. If an interest charge has been added to the entry before, Maconomy adds any additional interest charges starting from the day on which the interest charge was last added.

The difference between the two principles is illustrated in the following example:

The balance due on June 1, 1990, is 1.000 base currency units. Interest has not been added since June 1, and there have been no interest charge settlements on June 15 and July 1, until Maconomy calculates the interest charge again on August 1.

Date 6/15 7/1 8/1

Net 2% 20.00 20.00 20.00

Curr. 24% 9.21 19.73 40.11

When every interest charge calculation has been made, Maconomy checks that the total interest charge amount exceeds the interest charge limit. If the amount is below the limit, Maconomy deletes the interest charge from the entries. If the total interest charge amount is below the minimum interest, Maconomy adds the minimum interest. For more information about interest charge and reminder principles, see the description of the Interest Charge/Reminder Principles workspace.

You can block entries for interest calculation at different stages: after creating the entries, before paying the invoice, or after paying the invoice. Entries that you block for interest calculation are, by default, excluded from the interest charge selection and interest charge notice, and have no effect on the interest charge.

Entries that you block for interest calculation have no interest charge and interest date. You can unblock the entries blocked for interest calculation.

You can also close entries for interest calculation. This should be regarded as a final blocking, and it is not easily undone. You can, however, see the entries that have been closed.

You can block entries in the Change Interest Charge Selection workspace or in the Show Customer Reconciliation workspace.

### Select Interest Criteria Tab

This section includes the fields and descriptions for the Select Interest Criteria tab.

#### Selection Criteria Island

Field	Description
<b>Customer No.</b>	In these fields, you can specify a range of customer numbers. The interest charge selection created and printed will only apply to company-specific customers within this range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The interest charge selection created and printed will only be based on customer entries with a settling company within the specified range.
<b>Customer Group</b>	In this field, you can select a customer group. The interest charge selection created and printed will only apply to customers in this group.
<b>Interest Charge/Reminder Principle</b>	In this field, you can specify the name of an interest charge/reminder principle. The interest charge selection created and printed will only apply to company-specific customers using the specified interest charge/reminder principle. An interest charge/reminder principle is specified on each company-specific customer's payment information card. If you do not specify an interest charge/reminder principle in this field, the printout will display all principles assigned to customers applying to the selection criteria entered in the above fields in this island.

#### Interest Charge Selection Island

Field	Description
<b>Assessment Date</b>	In this field, you specify an assessment date. This is the date on which the interest charge calculation begins. This means that you can calculate interest charges on the 5th of the month with effect from the 1st of the month. Maconomy automatically suggests today's date. You must enter a date.
<b>Grace Period</b>	The interest charge calculation will only include open entries, which have been due for payment for longer than or for the grace period exactly. The grace period runs from the value date. You can specify any amount of days here - shaping a relaxed or tough company policy on customer arrears. A grace period of one week means an entry has to be overdue for at least one week before you start calculating interest.
<b>Include Entries Blocked for</b>	If the field is marked, all entries blocked for interest calculation will also be included in the interest charge selection. be included in the interest charge selection.

Field	Description
<b>Interest Calculation</b>	

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.
<b>Currency</b>	<p>In this field, you can specify the currency in which the interest charge selection should be displayed. The interest charge selection will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."
<b>Incl. Overdue Entries w/out Interest</b>	<p>Here you specify whether to include entries, which are due for payment, but not yet owing interest. If you mark this field, the printout includes these entries. There are three situations in which an entry can be overdue but not owing interest:</p> <ul style="list-style-type: none"> <li>■ The customer is not included in the interest charge calculation.</li> <li>■ The interest charge is removed manually after having been calculated. You can do this in the window Change Interest Charge Selection.</li> <li>■ The entry has not been overdue for longer than the grace period.</li> </ul>

## Select Reminder Criteria Single Dialogs Workspace

Use this workspace to create reminder selections that you can apply to company-specific customers.

You can only specify one reminder selection per customer at a time. You can also use the Change Reminder Selection workspace to create a reminder selection for a specific customer or to customize an existing selection for a specific customer.

You can also create reminder selections for individual company-specific customers in the Change Reminder Selection workspace.

The procedure for creating, maintaining, and approving reminders is as follows:

1. Create and print a reminder selection. You create reminder selections for individual company-specific customers in this workspace. If you only need to create a reminder selection for one company-specific customer, you can also do that in the Change Reminder Selection workspace.
2. Review the selection and revise it, if needed, for the individual customer in the Change Reminder Selection workspace. You can deselect a customer entry if you do not want to send a reminder note to that customer.
3. You can edit the reminder text that is assigned to the unapproved reminder to make it reminder-specific in the Change Reminder Texts workspace.
4. Approve the reminder selection in the Change Reminder Selection workspace (for one customer) or in the Approve Reminder Criteria workspace (for a group of customers). When you perform the approval, the reminders are printed in the Approve Reminders workspace.

The interest charge policy that you establish here is general; you can adjust it for individual customers in the Change Reminder Selection workspace. Maconomy does not create a posting journal-with entries to the Accounts Receivable and General Ledger-until you approve reminder charges in the Approve Reminders workspace.

Maconomy creates reminder selections based on the interest charge/reminder principle that you specified on the current company-specific customer's payment information card. For more information about interest charge and reminder principles, see the description of the Interest Charge/Reminder Principles workspace.

Maconomy performs the reminder calculation as follows: All open payments and credit memos are added up. Maconomy then goes through all overdue bills, one by one, in the order in which they were due for payment. All invoices that are covered by a payment or a credit memo are set at reminder level 0. The reminder level is increased on all invoices that are not covered by payments or credit memos-that is, the reminder level is controlled for each individual entry. Maconomy decreases the level when the entry is paid. The company-specific customer's reminder level is the highest reminder level of one of the open entries. If the company-specific customer's reminder level is higher than 0, Maconomy adds a reminder charge, if specified by the reminder code.

When you have reviewed all invoices, Maconomy checks whether the total overdue amount exceeds the reminder limit. You specify the reminder limit for each interest charge/reminder principle in the Interest Charge/Reminder Principles workspace. If the amount due is below the limit, Maconomy sets the reminder level to 0.

Maconomy adds a reminder charge to the company-specific customer balance using a reminder charge and a specification of the number of days that must pass before the same company-specific customer is notified again. You cannot create a reminder selection within this period.

If a company-specific customer's overdue balance is less than the reminder limit, you cannot create a reminder selection for this customer.

If a company-specific customer's overdue balance is less than the reminder limit, you cannot create a reminder selection for this customer.

### Select Reminder Criteria Tab

This section includes the fields and descriptions for the Select Reminder Criteria tab.

#### Selection Criteria Island

Field	Description
<b>Customer No.</b>	In these fields, you can specify a range of customer numbers. The reminder selection created and printed will only apply to customers within this range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The reminder selection created and printed will only be based on customer entries with a settling company within the specified range.
<b>Customer Group</b>	In this field, you can select a customer group. The reminder selection created and printed will only apply to customers in this group.
<b>Interest Charge/Reminder Principle</b>	In this field, you can specify the name of an interest charge/reminder principle. The reminder selection created and printed will only apply to company-specific customers using the specified interest charge/reminder principle. An interest charge/reminder principle is specified on each company-specific customer's payment information card.
<b>Next Reminder Level</b>	In this field you can enter a reminder level range. The reminder selection and the reminder letter will include only the open entries which will have the reminder level in the new reminder level in this range. Example: if you specify range from 1 to 2, the reminder selection and reminder letter will include all open entries currently having reminder level 0 or 1. When this reminder selection will be approved, all selected open entries will have reminder level 1 or 2. Choosing 0 (default) disables any filters.

#### Reminder Selection Island

Field	Description
<b>Assessment Date</b>	In this field, you specify an assessment date. This is the date on which the reminder calculation is based. This means that you can make a reminder selection on the 5th of the month effective on the 1st of the month. Maconomy automatically suggests today's date. You must enter a date in this field.

Field	Description
<b>Grace Period</b>	The reminder calculation will only include open entries which have been due for payment for longer than or for the grace period exactly. The grace period runs from the value date. You can specify any number of days here - allowing a loose or strict company policy on customer arrears. A grace period of one week means an entry has to be overdue for at least one week before you send a reminder.
<b>Include Entries Blocked for Reminder Calculation</b>	If the field is marked, all entries blocked for reminder calculation will be included in the reminder selection.

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.
<b>Currency</b>	<p>In this field, you can specify the currency in which the reminder selection should be displayed. The reminder selection will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."
<b>Incl. All Past Due Entries</b>	<p>Here you specify whether to include entries, which are due for payment, but not yet prompted. If the field is marked, the printout includes these entries.</p> <p>There are three situations in which an entry can be overdue but not prompted:</p> <ul style="list-style-type: none"> <li>▪ The company-specific customer is not included in the reminder calculation.</li> </ul>

Field	Description
	<ul style="list-style-type: none"><li>▪ The reminder is stopped manually after having been calculated. You can do this in the window Change Reminder Selection.</li><li>▪ The entry has not been overdue for longer than the grace period.</li></ul>

## Approve Interest Criteria Single Dialogs Workspace

Use this workspace to approve interest charge selections and print interest charge notices.

Maconomy prints interest charge notices automatically when you approve the interest selection from the Interest Charge Selection workspace (for one customer) or the Approve Interest Criteria workspace (for a group of customers).

After you approve an interest charge selection, you cannot change it. However, you can reprint interest charge notices.

When you use the Standard print layout, you must first prepare company-specific customers for interest charge selection. That is, you must reconcile all of the invoices for the selected customers with the payments that you have received from the customers before you print interest charge notices. The reason for this is that Standard layout based printouts include the full amount that is due on an invoice entry, whereas the interest charge calculation is based on the remainder amount due.

When you use the Detailed print layout, the printout includes entries that are relevant to the interest charge calculation—that is, entries that have been fully or partially reconciled with the original entry, and credit entries that have not yet been reconciled with other entries, if the associated interest charge/reminder principle applies to "Open" or "Open and Closed" entries.

After you create and revise it (if needed), you approve the interest charge selection. There can only be one interest charge selection per company-specific customer at the time. You create interest charge selections individually for each company-specific customer in the Change Interest Charge Selection workspace or for a range of company-specific customers in the Interest Charge Selection workspace.

You can specify whether or not Maconomy should print interest charge notices at the same time that you approve interest charge selections. Interest charge notices can also be reprinted.

After you approve the interest charge selection, you cannot change it. After you approve interest charge selections, Maconomy creates a journal of the type "Interest Charge Notice" that contains the interest charge entries. You can then post this journal in the Posting workspace in the G/L module.

## Approve Interest Criteria Tab

This section includes the fields and descriptions for the Approve Interest Criteria tab.

### Selection Criteria Island

Field	Description
<b>Customer No.</b>	In these fields, you can specify a range of customer numbers. The current interest charge selection will only be based on company-specific customers within the specified range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The current interest charge selection will only be based on customer entries for company-specific customers whose settling company is within the specified range.
<b>Customer Group</b>	In this field, you can select a customer group. Only the interest charge selection for the specified group will be created and printed.

### Run Mode Island

Field	Description
<b>Do Not Print</b>	In this field, you can specify if interest charge notices should be printed in connection with approval of the interest charge selection. If you do not mark this field, interest charge notices are printed.  Even if you choose not to print interest charge notices in connection with approval of an interest charge selection, the individual interest charge entries are assigned an interest charge notice number, so that these can be printed later.
<b>Include Entries Blocked for Interest Calculation</b>	If the field is marked, all entries blocked for interest calculation will also be included in the interest charge selection.

### Reprint Island

Field	Description
<b>Interest Charge Notice No.</b>	In these fields, you can specify a range of interest charge notice numbers. The fields should only be completed if you have chosen to reprint interest charge notices. Only interest charge notices within the specified range are included on the printout.
<b>Interest Charge Notice Date</b>	In these fields, you can specify a range of interest charge notice dates.

**Print Control Island**

Field	Description
<b>Layout</b>	<p>In this field, you can specify which layout to be used on the printout. When using the print layout "Standard," the printout shows the full amount due on an invoice entry, whereas the interest charge calculation is based on the amount due minus possible payments and credit memos. If an invoice entry has been partially reconciled with a payment, the printout only shows remainder amounts due.</p> <p>When using the print layout "Detailed," the printout will include entries that are relevant to the interest charge calculation, that is, entries that have been fully or partially reconciled with the original entry, and credit entries not yet reconciled with other entries, if the associated interest charge/reminder principle apply to "Open" or "Open and Closed" entries.</p>

## Approve Reminder Criteria Single Dialogs Workspace

Use this workspace to approve reminder selections and print reminder letters.

Maconomy prints reminder letters automatically when you approve reminder selections. After you approve a reminder selection, you cannot change it, but you can reprint the reminder letters.

When you use the Standard print layout, you must first prepare company-specific customers for reminder selection. That is, you must reconcile all of the invoices for the selected customers with the payments that you have received from the customers before you print reminder letters. The reason for this is that printouts Standard layout based printouts only include debit entries and therefore include an excessive amount due if you have not performed this reconciliation

When you use the Detailed print layout, the printout includes entries that are relevant to the interest charge calculation-that is, entries that have been fully or partially reconciled with the original entry, and credit entries that are not due and have not yet been reconciled against other entries.

After you create and possibly revise the reminder selection you approve it. There can only be one reminder selection per company-specific customer at the time. You create reminder selections individually for each company-specific customer in the Change Reminder Selection workspace or for a range of company-specific customers in the Interest Reminder Selection workspace.

After you approve the reminder selection, you can no longer change it. After you approve a reminder selection, Maconomy enters the reminder entries into a journal of the type "Reminder Letter," which you can post in the Posting workspace in the G/L module. You can only approve reminder selections for customers who have a debit total larger than zero. If you received a payment after you created the reminder selection, but before you approved the selection, Maconomy will not approve the reminder selection.

If you want to calculate tax on the reminder charges, you must first enter a tax code in the System Information workspace in the Set-Up module. Maconomy automatically posts the tax amount to the account and any other dimension values that you specify for the tax code using a dimension combination.

## Approve Reminder Criteria Tab

This section includes the fields and descriptions for the Approve Reminder Criteria tab.

### Selection Criteria Island

Field	Description
<b>Customer No.</b>	Here you specify a range of customer numbers. Only company-specific customers within this range are included in the reminder selection.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. Only customer entries with a settling company within this range are included in the reminder selection.
<b>Customer Group</b>	Here you select a customer group. Only customers in this group are included in the reminder selection.
<b>Next Reminder Level</b>	In this field you can enter a reminder level range. The reminder selection and the reminder letter will include only the open entries which will have the reminder level in the new reminder level in this range. Example: if you specify range from 1 to 2, the reminder selection and reminder letter will include all open entries currently having reminder level 0 or 1. When this reminder selection will be approved, all selected open entries will have reminder level 1 or 2. Choosing 0 (default) disables any filters.

### Run Mode Island

Field	Description
<b>Reminder Date</b>	Here you can specify the reminder date printed in the reminder letter and on the reminder charge. Thus it is possible to specify an earlier date than the date on which the reminder selection has been created or possible changed. This is useful if the reminder selection is created some days before it is approved and printed. If you do not specify a date in this field, Maconomy uses the original creation date of the reminder selection.
<b>Include Entries Blocked for Reminder Calculation</b>	If the field is marked, all entries blocked for reminder calculation (for example, under dispute and sent to debt collection), will be included in the reminder letter.

### Reprint Island

Field	Description
<b>Reminder No.</b>	In these fields, you can enter a range of reminder numbers. The fields are only used when reprinting reminders and the printout will only include reminders within the specified range. The possibility of being able to reprint reminders can be especially useful if specific reminder texts have been assigned to reminders.

Field	Description
	As all specific reminder texts are stored in the Maconomy database, these can always be reprinted from this window.
<b>Reminder Date</b>	In these fields, you can enter a range of reminder dates. The fields are only used when reprinting reminders and the printout will only include reminders within the specified range. The possibility of being able to reprint reminders can be especially useful if specific reminder texts have been assigned to reminders. As all specific reminder texts are stored in the Maconomy database, these can always be reprinted from this window.

### Print Control Island

Field	Description
<b>Layout</b>	Here you select the layout to be used on the printout. If you select the print layout "Standard," the printout shows the current debit entries and non-reconciled credit entries. If you select the print layout "Detailed," the printout shows entries that are relevant to the reminder calculation, that is, entries that have been fully or partially reconciled with the original entry, or credit entries which are not yet due and have not yet been reconciled against other entries.

## Change Interest Charge Selection Single Dialogs Workspace

Use this workspace to change existing interest charge selections.

Use the Interest Charge Selections workspace to create interest charge selections.

When you use the **Approve Interest Selection** action, Maconomy creates an interest charge notice journal that contains entries for the customer and G/L ledger, respectively. After you approve it, you cannot change the interest charge selection.

Maconomy calculates interest charges based on the interest charge/reminder principle that you specify in the Company Specific Payment Information workspace for each company-specific customer. You can also review that charge/reminder principle in this workspace, but you cannot change it here.

The workflow for creating interest charge notices is as follows:

1. Create the interest charge selection.
2. Check the interest charge selection and revise it if needed.
3. Approve the interest charge selection.
4. When you approve the interest charge, Maconomy automatically prints an interest charge notice.

You can approve the interest charge selection in this workspace or in the Approve Interest Selection workspace, where you can also reprint interest charge notices.

The Change Interest Charge Selection tab displays information about the company-specific customer and possible terms that you specified in the Company Specific Payment Information and Interest Charge/Reminder Principles workspaces. The Interest Charge/Reminder Principle island, which displays information about the selected interest charge/reminder principle, also

shows the interest charge limit that, if exceeded, results in the creation of interest charge notices to the company-specific customer in question. If the customer's overdue payments are less than the specified amount, you cannot create an interest charge notice. The A/R Entries sub-tab displays information about the entries that are associated with each company-specific customer. Maconomy can also create a batch of interest charge selections based on a range of customers. You do this in the Interest Charge Selection workspace.

You revise selections that Maconomy created automatically in this workspace. You approve a batch of interest charge selections in the Approve Interest Selection workspace.

### Change Interest Charge Selection Tab

This section includes the fields and descriptions for the Change Interest Charge Selection tab.

#### Customer Island

Field	Description
<b>Customer No.</b>	This field displays the customer number. The field cannot be changed in this window.  The name and the first address line for the company-specific customer are also displayed. The fields are copied from the window Company Specific Customer Information Card and cannot be changed in this window.
<b>Currency</b>	This field displays the standard currency of the company-specific customer.
<b>Reminder Text Group</b>	This field displays the reminder text group assigned to the current customer. The reminder text group is copied from the window Company Specific Payment Information and cannot be changed in this window.
<b>Blocked</b>	This field displays whether or not the company-specific customer has been blocked for payment. If the field is marked, the company-specific customer has been blocked for payment. If this is the case, sales orders and/or invoices cannot be created for the customer in question. If the corresponding field in the window Company Specific Payment Information has been marked, Maconomy automatically marks this field. The field cannot be changed in this window.

#### Payment Information Island

Field	Description
<b>Payment Terms</b>	This field displays the payment terms associated with sales orders to the current company-specific customer. The payment terms are used for calculation of overdue invoice amounts.  The payment terms of the company-specific customers are selected in the window Company Specific Payment Information.
<b>Credit Limit</b>	This field displays the credit limit of the current company-specific customer. The amount is copied from the field "Company Level, Base" in the window Company Specific Payment Information. If you try to create a sales order, a

Field	Description
	<p>quote or an invoice for the current company-specific customer and the sum of the customer's invoice balance and order balance is greater than this amount, Maconomy shows an error message. However, it is still possible to create sales orders to the current customer.</p> <p>The value is copied from the window Company Specific Payment Information.</p> <p>If the current customer should be blocked for payment, so that it is not possible to create sales orders, quotes and invoices for that customer, you can mark the field "Blocked" in the window Company Specific Payment Information.</p>
<b>Automatic Reconciliation</b>	<p>This field displays whether or not Maconomy reconciles payments with the first-in invoices based on due dates. If the field is marked, Maconomy automatically reconciles payments with invoices, that is, open invoice entries will be closed. If the payment amount is greater than the customer's invoice balance, Maconomy will not perform automatic reconciliation of payments with invoices. If this is the case, payment entries are registered as open entries and the reconciliation should be done manually.</p>

### Company Island

Field	Description
<b>Settling Company</b>	This field displays the name and number for the settling company of the customer.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the "Settling Company" field above.

### Balance Island

Field	Description
<b>Balance, Currency</b>	This field displays the current balance of the company-specific customer's standard currency. The balance is updated in connection with posting of journals with references to the current customer. The field is completed automatically and cannot be changed in this window.
<b>Balance, Base</b>	This field displays the current balance of the company-specific customer's base currency. The balance is updated in connection with posting of journals with references to the current customer. The field is completed automatically and cannot be changed in this window.

### Account Statement Island

Field	Description
<b>Last Statement No.</b>	This field displays the number of the last historic statement printed for the current company-specific customer. Historical customer statements are printed in the window Print Historical Customer Statement.

Field	Description
<b>Date of Last Statement</b>	This field displays the date of the last creation of a historic statement for the current company-specific customer. Maconomy automatically updates this field and it cannot be changed in this window.

**Interest Charge Status Island**

Field	Description
<b>Date Approved</b>	This field displays the last date of approval of an interest charge for the company-specific customer. The field is automatically completed by Maconomy and cannot be changed in this window.
<b>Current Interest Charge</b>	<p>This field displays the calculated interest charge total for the company-specific customer. The amount is calculated/updated both when you select the action "Create Interest Charge Selection" and when you change an interest amount in an entry.</p> <p>This field is reset to zero, when you select the action "Approve Interest Selection."</p> <p>Maconomy also checks that the amount in this field is within the boundaries of the interest charge limit and minimum interest charge of the customer.</p>
<b>Show Entries Closed for Interest Calculation</b>	In this field you can specify if entries closed for interest calculation should be shown in the table part. This can be used to reopen entries closed for interest calculation.

**Reminder Status Island**

Field	Description
<b>Date Approved</b>	This field displays the last date of approval of a reminder selection for the company-specific customer. The field is automatically completed by Maconomy and cannot be changed in this window.
<b>Current Reminder Level</b>	<p>This field displays the reminder level of the company-specific customer. The company-specific customer's reminder level equals the highest reminder level specified on an entry for the current customer. The reminder level is raised by 1 for each time a reminder is sent to the customer. The field is automatically updated by Maconomy and cannot be changed in this window.</p> <p>The reminder level is reset to zero, if the company-specific customer does not have reminder entries due.</p>
<b>No. Entries Prompted</b>	This field displays the number of entries that have been prompted for inclusion in a reminder letter to the company-specific customer. When creating reminder selections, Maconomy checks how many entries should be included in the reminder letter to the current customer. The field is automatically updated by Maconomy and cannot be changed in this window.

Field	Description
<b>Reminder Charge</b>	This field displays the reminder amount charged to the company-specific customer. The amount is copied from the interest charge/reminder principle assigned to the current customer, which is displayed in this window if at least one entry has been included in a reminder letter to the customer.

### Interest Charge/Reminder Principle Island

Field	Description
<b>Interest Charge/Reminder Principle</b>	This field displays the name of the interest charge/reminder principle assigned to the current customer. An interest charge/reminder principle is assigned to a customer in the island Interest Charge/Reminder Control for each customer in the window Company Specific Payment Information. The contents of the remaining fields in this island are copied from the assigned interest charge/reminder principle. Interest charge/reminder principles are maintained in the window Interest Charge/Reminder Principles.
<b>Charge Interest</b>	This field displays whether or not overdue invoices for the current company-specific customer are subject to interest charge. If this field is marked, overdue invoices for the customer are subject to interest charge.
<b>Interest Charge Basis</b>	This field displays the interest charge basis specified in the current interest charge/reminder principle.
<b>Net/EOM</b>	This field displays which of the two interest charge principles "EOM" and "Net" is used in the current interest charge/reminder principle.
<b>Percentage p.a.</b>	This field displays the interest charge percentage calculated per year in the current interest charge/reminder principle.
<b>No. of Days Since Last Calculation</b>	This field displays the minimum number of days that may pass before a new interest charge calculation is made on the current customer's overdue payments.
<b>Paym. Terms on Notice</b>	In this field, you select the payment terms on the current interest charge notices. The selected payment terms in this field will be printed on interest notices and will overrule the customer's normal payment terms.
<b>Reminders</b>	This field displays whether or not the company-specific customer should be sent reminder letters, if that customer has overdue payments that have passed their due date.
<b>Currency</b>	This field displays the standard currency (Std. Currency) and Interest Principle Currency types for the company-specific customer.
<b>Minimum Interest Charge</b>	This field displays the minimum amount that may become subject to interest charge calculation. The amount is displayed in the standard currency and the interest principle currency of the company-specific customer.

Field	Description
<b>Interest Charge Limit</b>	This field displays the minimum interest charge amount to be calculated before adding an interest charge to the current company-specific customer's overdue payments. Maconomy will not add interest charges to overdue payments if the calculated interest charge amount is less than the one displayed in this field. The amount is shown in the standard currency and the interest principle currency of the company-specific customer.

### A/R Entries Sub-Tab

This section includes the fields and descriptions for the A/R Entries sub-tab.

Field	Description
<b>Orig. Due Date</b>	This is the original due date of the entry.
<b>Due Date</b>	<p>This field displays the due date of the entry. The calculation of the due date suggested by Maconomy is based on the invoice date and the customer's payment terms on the current invoice. The due date can be changed in this field. The original due date is shown in the window Periodic Customer Statement.</p> <p>The due date is the basis for calculation of interest charges.</p>
<b>Entry Date</b>	This field displays the date on which the entry was posted in the customer and G/L ledger and thereby which period the entry is a part of.
<b>Trans. No.</b>	This field displays the entry's transaction number. If the entry is copied from a G/L journal, the transaction number has been entered manually. If the entry is copied from an invoice created in the Sales Orders module, the transaction number corresponds to the invoice number and is automatically assigned by Maconomy. The field cannot be changed.
<b>Trans. Type</b>	This field displays the entry's transaction type. The field cannot be changed.
<b>Description</b>	This field displays the entry description. The field cannot be changed.
<b>Debit, Standard</b>	<p>This field displays the debit entry amount in the standard currency of the company-specific customer. The field cannot be changed.</p> <p>Only open debit entries are shown in this window.</p>
<b>Credit, Standard</b>	<p>This field displays the credit entry amount in the standard currency of the company-specific customer. The field cannot be modified.</p> <p>Only open credit entries are shown in this window.</p>
<b>Remainder, Standard</b>	This field displays the overdue amount on the entry in the standard currency of the company-specific customer. The remainder amount is the basis for interest charge calculation. The field cannot be changed.

Field	Description
<b>Interest, Standard</b>	<p>This field displays the calculated interest charge amount for the entry in the standard currency of the company-specific customer. The interest charge is calculated on the basis of the interest charge/reminder principle assigned to the current customer.</p> <p>The field is updated when you select the action "Create Interest Charge Selection." The field can be changed if, for example, a special arrangement has been made with the customer. The field is reset to zero, when you select the action "Approve Interest Selection."</p> <p>If the amount is changed, the assessment date is set to today's date.</p>
<b>Assessment Date</b>	<p>In this field, Maconomy displays the assessment date of the current entry, as this date might have been set in connection with the creation of an interest charge selection, for example, in the window Interest Charge Selection. If the interest charge selection has been created in this window, the assessment date is today's date.</p>
<b>Last Appr. Date</b>	<p>This field displays the assessment date of the last approved interest charge selection created on the basis of the current entry. The contents of the field cannot be changed.</p>
<b>Open/ Closed</b>	<p>This field displays whether the current entry is open or closed.</p>
<b>Date Reconciled</b>	<p>If the current entry has been fully reconciled, this field displays the entry date of the last of the payments that have reconciled the current entry, that is, the date to which interest charges can be calculated, if the interest basis is either "Open" or "Open and Closed" has been used. If the entry has not been reconciled, the field is empty. The field is automatically completed by Maconomy and cannot be changed in this window.</p>
<b>Reminder Level</b>	<p>In this field, Maconomy displays the calculated reminder level for the current entry.</p>
<b>Interest Days</b>	<p>In this field, Maconomy displays the number of days that are used in calculating interest charges.</p>
<b>Remarks</b>	<p>In this field, you can enter a text describing the reason for the dispute. This text is shown in the card part of the window Show Customer Reconciliation.</p>
<b>Block Type</b>	<p>In this field you can specify if the entry is blocked for reminder and/or interest calculation and the reason why it is blocked. You can define the possible states in the Interest Reminder Block pop-up.</p>
<b>Block Date</b>	<p>In this field you can enter the date that the entry was blocked. By default, when setting the "Block Type" field to a specific value, this field will be set to the current date.</p>
<b>Blocked By</b>	<p>In this field you can enter who blocked the entry. By default, when the "Block Type" field is set to a specific value, this field will be set to the current user.</p>

Field	Description
<b>Closed for Interest Calculation</b>	If this field is marked, the entry is closed for interest calculation.

## Actions

This section shows the Actions available in the Change Interest Charge Selection workspace.

### Top Tab

Field	Description
<b>Create Interest Selection</b>	<p>When you select this action, an interest charge selection is created for the current company-specific customer. As implied, an interest charge selection is only a selection. This means you can only change created selections in this window. When you select the action "Approve Interest Selection," an interest charge notice journal is created with entries for the customer and G/L ledger respectively. Once approved, the interest charge selection cannot be changed. Maconomy calculates interest charges based on the interest charge/reminder principle of the current company-specific customer.</p> <p>Interest charges are only calculated if the invoice balance of the current company-specific customer is greater than zero. If this is the case, all open payment and credit memo entries are summed up in a combined total and all invoices with overdue amounts are checked one by one in order of due date. When the balance is greater than zero, that is, payments and credit memos cannot cover the invoices, the interest charge calculation is initiated.</p> <p>When all invoices have been checked, Maconomy checks whether or not the interest charge amount total exceeds the interest charge limit. If this is not the case, the interest charges are removed from the entries. If the interest charge limit has been exceeded and the interest charge total is less than the minimum interest charge, the minimum interest charge amount is used.</p> <p>When calculating interest charges, the interest charge amount and the assessment date is stamped on the entry in question.</p>
<b>End Interest Calculation</b>	When you select this action, interest charge calculations are removed from all selected entries on the company-specific customer. The field "Current Interest Charge" in the card part of the window is also reset to zero.
<b>Approve Interest Selection</b>	<p>When you select this action, the current interest charge selection for the company-specific customer is approved. Once approved, the selection cannot be changed, but a selection can be created. Upon approval, all interest charge entries are added to an interest charge notice journal which is then ready for posting in the window Posting in the G/L module.</p> <p>If the selection has been created in the window Interest Charge Selection, the interest charge notice, and thereby the posting in the customer G/L ledger is stamped with the selected assessment date. If the selection has been created</p>

Field	Description
	using the action "Create Interest Charge Selection," the interest charge notice and posting is stamped with today's date. At the same time as the selection is approved, an interest charge notice is printed.

## Change Reminder Selection Single Dialogs Workspace

Use this workspace to change existing reminder selections.

Use the Select Reminder Criteria workspace to create reminder selections.

As implied, a reminder selection is only a selection. This means that you can only change existing selections in this workspace. When you use the **Approve Reminders** action, Maconomy creates a reminder letter journal that contains entries for the customer and general ledger, respectively. After you approve it, you cannot change the reminder selection.

Maconomy calculates reminders based on the interest charge/reminder principle that you specify in the Company Specific Payment Information workspace for each company-specific customer. You can also review that principle in this workspace, but you cannot change it here.

The workflow for creating reminder letters is as follows:

1. Create the reminder selection.
2. Check the reminder selection.
3. If needed, edit the reminder text in the Change Reminder Texts workspace.
4. Approve the reminder selection.
5. When you approve the reminder selection is approved, Maconomy automatically prints a reminder letter.

You can approve the reminder selection in this workspace or in the Approve Reminders workspace, where you can also reprint reminder letters.

The Change Reminder Selection tab displays information about the company-specific customer and possible terms that you entered in the Company Specific Payment Information and Interest Charge/Reminder Principles workspaces. The Interest Charge/Reminder Principle island, which displays information about the selected interest charge/reminder principle, also shows the reminder limit which, once exceeded, results in the creation of reminder letters to the company-specific customer in question. If the company-specific customer's overdue payments are less than the specified amount, you cannot create a reminder letter. The A/R Entries sub-tab displays information about the entries that are associated with each company-specific customer.

If you change the reminder level of a reminder selection, and if you created a reminder-specific reminder text for the current reminder selection, Maconomy issues a message saying that the specific reminder text should be changed by using the **Get Reminder Text** action. If you change the reminder level for a reminder selection to which you assigned a predefined reminder text as specified in the Reminder Texts workspace, Maconomy automatically changes the reminder text that you assigned to the reminder selection.

Maconomy can also create a batch of reminder selections based on a range of customers. You do this in the Reminder Selection workspace.

You revise automatically created selections in this workspace, whereas you can approve a batch of reminder selections in the Approve Reminders workspace.

### Change Reminder Selection Tab

This section includes the fields and descriptions for the Change Reminder Selection tab.

#### Customer Island

Field	Description
<b>Customer No.</b>	This field displays the customer number. The field cannot be changed in this window.  The name and the first address line for the company-specific customer are also displayed. The fields are copied from the window Company Specific Customer Information Card and cannot be changed in this window.
<b>Currency</b>	This field displays the standard currency of the company-specific customer.
<b>Blocked</b>	This field displays whether or not the company-specific customer has been blocked for payment. If the field is marked, the company-specific customer has been blocked for payment. If this is the case, sales orders and/or invoices cannot be created for the customer in question. If the corresponding field in the window Company Specific Payment Information has been marked, Maconomy automatically marks this field. The field cannot be changed in this window.
<b>Reminder Text Group</b>	This field displays the reminder text group assigned to the current customer. The reminder text group is copied from the window Company Specific Payment Information and cannot be changed in this window.

#### Selection Criteria Island

Field	Description
<b>Next Reminder Level</b>	In this field you can enter a reminder level range. The reminder selection and the reminder letter will include only the open entries which will have the reminder level in the new reminder level in this range. Example: if you specify range from 1 to 2, the reminder selection and reminder letter will include all open entries currently having reminder level 0 or 1. When this reminder selection will be approved, all selected open entries will have reminder level 1 or 2. Choosing 0 (default) disables any filters.

#### Payment Information Island

Field	Description
<b>Payment Terms</b>	This field displays the payment terms associated with sales orders to the current company-specific customer. The payment terms are used for calculation of overdue invoice amounts.

Field	Description
	The payment terms of the company-specific customers are selected in the window Company Specific Payment Information.
<b>Credit Limit</b>	<p>This field displays the credit limit of the current company-specific customer. The amount is copied from the field "Company Level, Base" in the window Company Specific Payment Information. If you try to create a sales order, a quote or an invoice for the current company-specific customer, and the sum of the customer's invoice balance and order balance is greater this amount, Maconomy shows an error message. However, it is still possible to create sales orders to the current customer.</p> <p>The value is copied from the window Company Specific Payment Information.</p> <p>If the current customer should be blocked for payment, so that it is not possible to create sales orders, quotes and invoices for that customer, you can mark the field "Blocked" in the window Company Specific Payment Information.</p>
<b>Automatic Reconciliation</b>	This field displays whether or not Maconomy reconciles payments with the first-in invoices based on due dates. If the field is marked, Maconomy automatically reconciles payments with invoices, that is, open invoice entries will be closed. If the payment amount is greater than the customer's invoice balance, Maconomy will not perform automatic reconciliation of payments with invoices. If this is the case, payment entries are registered as open entries and the reconciliation should be done manually.

### Company Island

Field	Description
<b>Settling Company</b>	This field shows the name of the settling company.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Settling Company" above.

### Account Statement Island

Field	Description
<b>Last Statement No.</b>	This field displays the number of the last historic statement printed for the current company-specific customer. Historical customer statements are printed in the window Print Historical Customer Statement.
<b>Date of Last Statement</b>	This field displays the date of the last creation of a historic statement for the current company-specific customer. Maconomy automatically updates this field and it cannot be changed in this window.

**Status Island**

Field	Description
<b>Last Reminder Approval Date</b>	This field displays the last date of approval of a reminder selection for the company-specific customer. The field is automatically completed by Maconomy and cannot be changed in this window.
<b>Customer Reminder Level</b>	<p>This field displays the current reminder level of the company-specific customer. The company-specific customer's reminder level equals the highest reminder level specified on an entry for the current customer. The reminder level is raised by 1 for each time a reminder is sent to the customer. The field is automatically updated by Maconomy and cannot be changed in this window.</p> <p>The reminder level is reset to zero, if the company-specific customer does not have reminder entries due.</p>
<b>Current Reminder Level</b>	<p>This field displays the current reminder level of the company-specific customer. The company-specific customer's reminder level equals the highest reminder level specified on an entry for the current customer. The reminder level is raised by 1 for each time a reminder is sent to the customer. The field is automatically updated by Maconomy and cannot be changed in this window.</p> <p>The reminder level is reset to zero, if the company-specific customer does not have reminder entries due.</p>
<b>No. Entries Prompted</b>	This field displays the number of entries that have been prompted for inclusion in a reminder letter to the company-specific customer. When creating reminder selections, Maconomy checks how many entries should be included in the reminder letter to the current customer. The field is automatically updated by Maconomy and cannot be changed in this window.
<b>Reminder Charge</b>	This field displays the reminder amount charged to the company-specific customer. The amount is copied from the interest charge/reminder principle assigned to the current customer, which is displayed in this window if at least one entry has been included in a reminder letter to the customer.
<b>Suggested Interest Sum</b>	This field sums up the interest of all customer entries in the table part of the window, and thus shows the outstanding interest sum for the company customer in the card part of the window.

**Interest Charge/Reminder Principle Island**

Field	Description
<b>Interest Charge/Reminder Principle</b>	This field displays the name of the interest charge/reminder principle assigned to the current customer. An interest charge/reminder principle is assigned to a customer in the island Interest Charge/Reminder Control in the window Company Specific Payment Information. The contents of the remaining fields in this island are copied from the assigned interest charge/reminder principle. Interest charge/reminder principles are maintained in the window Interest Charge/Reminder Principles.

Field	Description
<b>Charge Interest</b>	This field displays whether or not overdue invoices for the current company-specific customer are subject to interest charge. If this field is marked, overdue invoices for the customer are subject to interest charge.
<b>Reminders</b>	This field displays whether or not the company-specific customer should be sent reminder letters, if the current customer has overdue payments that have passed their due date.
<b>No. of Days Since Last Calculation</b>	This field displays the minimum number of days that may pass before a reminder letter is created to the current customer.
<b>Paym. Terms on Reminder</b>	This field shows the payment terms selected for reminders on the interest charge/reminder principle in question.
<b>Currency</b>	This field displays the standard currency (Std. Currency) and Reminder Principle Currency types for the company-specific customer.
<b>Reminder Charge</b>	These fields display the reminder charge specified on the current interest charge/reminder principle in the customer's currency and in the currency of its interest charge/reminder principle, respectively.
<b>Reminder Limit</b>	These fields display the reminder limit specified on the current interest charge/reminder principle in the customer's currency and in the currency of its interest charge/reminder principle, respectively. If the company-specific customer's overdue invoice balance is less than the specified amount, reminder letters will not be created to the customer.

### Balance Island

Field	Description
<b>Balance, Currency</b>	This field displays the current balance of the company-specific customer. The amount is displayed in the customer's standard currency. The balance is updated in connection with posting of journals with references to the current customer. The field is completed automatically and cannot be changed in this window.
<b>Balance, Base</b>	This field displays the current balance of the company-specific customer. The amount is displayed in the customer's base currency. The balance is updated in connection with posting of journals with references to the current customer. The field is completed automatically and cannot be changed in this window.

## A/R Entries Sub-Tab

This section includes the fields and descriptions for the A/R Entries sub-tab.

Field	Description
<b>Due Date</b>	<p>This field displays the due date of the entry. The calculation of the due date suggested by Maconomy is based on the invoice date and the customer's payment terms on the current invoice. The due date can be changed in this field. The original due date is shown in the window Periodic Customer Statement.</p> <p>The due date is the basis for calculation of interest charges.</p>
<b>Entry Date</b>	<p>This field displays the date on which the entry was posted in the customer and G/L ledger and thereby which period the entry is a part of.</p>
<b>Trans. No.</b>	<p>This field displays the entry's transaction number. If the entry is copied from a G/L journal, the transaction number has been entered manually. If the entry is copied from an invoice created in the Sales Orders module, the transaction number corresponds to the invoice number and is automatically assigned by Maconomy. The field cannot be changed.</p>
<b>Trans. Type</b>	<p>Shows the transaction type of the customer entry.</p>
<b>Description</b>	<p>This field displays the entry description. The field cannot be changed.</p>
<b>Debit, Standard</b>	<p>This field displays the entry amount in the standard currency of the company-specific customer. The field cannot be changed.</p> <p>Only open debit entries are shown in this window.</p>
<b>Credit, Standard</b>	<p>This field displays the entry amount in the standard currency of the company-specific customer. The field cannot be changed.</p> <p>Only open credit entries are shown in this window.</p>
<b>Remainder, Standard</b>	<p>This field displays the overdue amount on the entry. The remainder amount is the basis for reminder and interest charge calculation. The field cannot be changed.</p>
<b>Selected</b>	<p>If this field is marked, the entry is included in the remainder selection. Unmark the field to exclude the entry from the remainder selection.</p>
<b>Level</b>	<p>In this field, Maconomy displays the calculated reminder level of the current entry. The reminder level is raised by 1 for each time a reminder is sent to the customer. Updating of the reminder level is done when you select the action "Approve Reminder Selection."</p> <p>The field can be changed if the reminder letter should constitute a more or less friendly reminder of payment due or have a more severe wording. However, the reminder level cannot be set to a greater value than the one specified in the field "Current Reminder Level" in the card part of the window.</p> <p>The company-specific customer's reminder level equals the reminder level on the entry with the highest reminder level.</p>

Field	Description
	If the reminder level on all entries is reset to zero, it will not be possible to approve the reminder selection.
<b>Remarks</b>	In this field, you can enter a text. This text is shown in the card part of the window Show Customer Reconciliation.
<b>Block Type</b>	In this field you can specify why the entry is blocked. The possible values are defined in the Interest Reminder Block pop-up.
<b>Block Date</b>	In this field you can specify the date that the entry was blocked. By default, it is set to the current date when the Block Type is set. You can set it to any date, though.
<b>Blocked By</b>	This field specifies the user that blocked the entry. It is set to the name of the user that changes the Block Type field, but can be changed to anything.

## Actions

This section shows the Actions available in the Change Reminder Selection workspace.

### Top Tab

Field	Description
<b>Create Reminder Selection</b>	<p>When you select this action, a reminder selection is created for the current company-specific customer. As implied, a reminder selection is only a selection. This means you can only change created selections in this window. When you select the action "Approve Reminders," a reminder letter journal is created with entries for the customer and G/L ledger respectively. Once approved, the reminder selection cannot be changed.</p> <p>Note that the remainder level is no increased when you create a selection., but only when the selection is approved.</p> <p>Maconomy calculates reminders based on the interest charge/reminder principle of the current company-specific customer and creates reminder letters according to the following procedure.</p> <p>All open payment and credit memo entries are summed up in a combined total and all invoices with overdue amounts are checked one by one in order of due date. All invoices that are reconciled with one or more payments and/or credit memos are reset to reminder level 0. The reminder level is automatically decreased by Maconomy, once the reconciling payments/credit memos have been received. The company-specific customer's reminder level is determined by the entry with the highest reminder level. If the company-specific customer's reminder level is greater than zero, the interest charge specified in the applied interest charge/reminder principle is charged to the customer.</p> <p>When all invoices have been checked, Maconomy checks whether or not the reminder amount total exceeds the reminder limit. If this is not the case, the reminder level is reset to zero on the entries.</p>

Field	Description
<b>Approve Reminders</b>	<p>When you select this action, the current reminder selection for the company-specific customer is approved. Once approved, the selection cannot be changed, but a new selection can be created. Upon approval, all reminder entries are added to a journal of the type "Reminder Letter" which is then ready for posting in the window Posting in the G/L module. Only reminder selections for company-specific customers with a debit balance greater than zero are approved. If a payment from the customer is received after the reminder selection has been created, but before the reminder selection has been approved, Maconomy does not approve the selection. The reminder level is raised by 1 on all invoices that are not reconciled with payments/credit memos, that is, the reminder level is controlled on each entry.</p> <p>At the same time as the selection is approved, a reminder letter is printed.</p>
<b>Clear Reminder Calculation</b>	<p>When you select this action, all reminder calculation is removed from the open entries for the current company-specific customer. The current reminder level is also reset to zero.</p>
<b>Get Reminder Texts</b>	<p>If the reminder level of a reminder is changed, any reminder specific reminder text assigned to the reminder selection should also be changed. This change is, however, not carried out automatically, as only predefined reminder texts are automatically changed by the system. Using this action, the reminder specific reminder text assigned to the current reminder selection is deleted and a new predefined reminder text is assigned to the reminder selection in accordance with the new reminder level and the predefined reminder text group assigned to the customer. The new reminder text is displayed in the window Change Reminder Texts, where it can be edited until the reminder selection is approved. See the introduction of the window Change Reminder Texts for further information about reminder specific reminder texts.</p>

## Change Reminder Texts Single Dialogs Workspace

Use this workspace to edit the predefined text for a specific reminder.

When you generate a reminder letter to prompt a customer to pay an invoice, the reminder letter includes predefined text, based on the reminder level of the unpaid invoice lines. Use this workspace to change that text. The edited text remains in effect until you change it again.

When you create a reminder selection in one of the Reminder Selection or Change Reminder Selection workspaces, each reminder that you create is assigned a reminder text according to the reminder level applied to the customer entries in question. However, in some situations you need to edit a predefined reminder text—that is, you need to be able to enter a specific reminder text to apply to a given reminder. This might be the case if you contact a customer about a reminder and you reach an agreement on the payment of this reminder. In this situation, you can enter a reminder-specific reminder text in this workspace to apply to the reminder in question.

The Change Reminder Texts tab displays information about the current unapproved reminder; the Reminder Letter Text Lines sub-tab displays the predefined reminder text that you can edit.

Maconomy applies the reminder text to the reminder based on the reminder level. You can change this text until you approve the reminder letter. You cannot make any changes after you

have approved the reminder letter. After you approve a reminder selection that has reminder-specific reminder texts, this workspace no longer displays the reminder.

All reminder texts that you create in this workspace are stored in the Maconomy database. This enables you to keep track of the texts that you have assigned to each individual reminder. For example, if a customer does not pay his debts as agreed, you can find and reprint the reminder-specific reminder text that you created for the customer in question. You reprint reminders in the Approve Reminders workspace.

### Change Reminder Texts Tab

This section includes the fields and descriptions for the Change Reminder Texts tab.

#### Interest Charge/Reminder Principle Island

Field	Description
<b>Name</b>	This field shows the interest charge/reminder principle assigned to the customer displayed in the island Customer below.
<b>Payment Terms</b>	This field shows the payment terms assigned to the customer displayed in the island Customer below.

#### Customer Island

Field	Description
<b>Customer No.</b>	This field shows the number of the customer for whom the current unapproved reminder has been created.
<b>Name</b>	This field displays the name of the customer shown in the field "Customer No." above.

#### Company Island

Field	Description
<b>Company No.</b>	This field displays the number of the company registered as the current customer's settling company in the window Company Specific Customer Information Card.
<b>Name</b>	This field displays the name of the company shown in the field "Company No." above.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

## Reminder Letter Text Lines Sub-Tab

This section includes the fields and descriptions for the Reminder Letter Text Lines sub-tab.

Field	Description
<b>Description</b>	In this field, you can edit the reminder text assigned to the reminder selection currently made on the customer displayed in the card part of the window. As this window displays only reminder texts for unapproved reminder selections, the reminder selection must be approved in either the window Approve Reminder Selection or in the window Change Reminder Selection by using the action Approve Reminder Selection.

## Export Customer Entries Single Dialogs Workspace

Use this workspace to generate a file with information about customer entries that belong to the selection criteria that you enter.

When you create this file, Maconomy prints a specification of all of the entries included in the file. The format of the file depends on the customer payment format that you selected on the payment agent.

## Export Customer Entries Tab

This section includes the fields and descriptions for the Export Customer Entries tab.

### Run Mode Island

Field	Description
<b>Create File</b>	If you mark this field, Maconomy will create a file. In reprints, the mark should be removed as Maconomy will otherwise create a new file. The file is created when you select the action "Create File."

### Reprint Island

Field	Description
<b>Invoice File No.</b>	If you specify a previously run export file number in this field, the entries list will be written to a file again when you select the action "Create File."

### File Information Island

Field	Description
<b>File Name</b>	In this field, you must specify the name of the file which will contain the exported entries when you select the action "Create File." The file is placed in your Maconomy client folder.

### Selection Criteria Island

Field	Description
<b>Payment Agent</b>	In this pop-up field, you select a payment agent whose format you want to use for the current customer entries list. The list will only show entries related to this payment agent.
<b>Customer Payment Mode</b>	Here, you select a customer payment mode. The list will only show entries related to this payment mode.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The entries file will only include companies within the specified range.
<b>Customer No.</b>	In these fields, you can specify a range of customer numbers. The entries file will only include companies within the specified range.

### Actions

This section shows the Actions available in the Export Customer Entries workspace.

### Top Tab

Field	Description
<b>Create File</b>	When you select this action, Maconomy creates a file with the name specified in the field "File Name," and prints a specification of the entries included in the payment.  The action is also used if you wish to reprint a specification and when you have chosen not to create a payment file.

## Lookup Section

This section includes the fields and descriptions for the Lookup section workspaces.

### Open Entry Customer Statement Single Dialogs Workspace

Use this workspace to review all of the open entries for a given customer, regardless of the period in which they were entered.

You cannot make any changes in this workspace.

Use the Periodic Customer Statement workspace to see both open and closed entries for a single period.

## Open Entry Customer Statement Tab

This section includes the fields and descriptions for the Open Entry Customer Statement tab.

### Customer Island

Field	Description
<b>Customer No.</b>	This is the customer number. The island also shows the first two lines of the customer's name and address. The information is retrieved from the Customer Information Card.
<b>Currency</b>	This field displays the standard currency of the customer. The standard currency is specified in the field "Currency" in the window Customer Information Card.

### Company Island

Field	Description
<b>Settling Company</b>	This field displays the name and number of the settling company of the customer.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the "Settling Company" field above.

### Balance Island

Field	Description
<b>Balance, Currency</b>	This is the customer's current balance in the standard currency of the customer. The balance is updated when you post journals with customer entries. The field is automatically updated.
<b>Balance, Base</b>	This is the customer's current balance in the base currency of the company. The balance is updated when you post journals with customer entries. The balance is updated automatically.

### Interest Charge/Reminder Island

Field	Description
<b>Date of Last Reminder</b>	This is the date the customer was last notified. The field is updated by Maconomy when you send a reminder.
<b>Current Reminder Level</b>	This is the customer's reminder level. This level corresponds to the highest level of one of the customer's entries. The reminder level of an entry is raised every time you send a reminder. Maconomy updates the field automatically.  The reminder level is set at 0 if the customer has no overdue entries to prompt.

Field	Description
<b>Last Interest Date</b>	This is the date the customer was last charged interest. The field is automatically updated when the customer is charged interest.

### A/R Entries Sub-Tab

This section includes the fields and descriptions for the A/R Entries sub-tab.

Field	Description
<b>Due Date</b>	This is the date the entry is due for payment. The due date is calculated from the invoice date and the customer's payment terms. The interest charge and reminder procedures are determined by the due date. The interest charge is calculated from the due date, and entries due before the value date, are included in the reminder procedure.
<b>Entry Date</b>	This is the entry date in the General Ledger and Accounts Receivable. This date determines the posting period.
<b>Description</b>	This is the entry text.
<b>Trans. No.</b>	This is the entry's transaction number. If the entry is from a general journal, the transaction number was entered manually. If the entry originates in an invoice or credit memo in the sales orders module, the transaction number will correspond to the number of the invoice or credit memo which was allocated by Maconomy. If the entry is an interest entry or a reminder charge the transaction number was allocated from the Interest Notice number series in the window System Numbers in the Set-Up module.
<b>Trans. Type</b>	Shows the transaction type of the customer entry.
<b>Debit, Currency</b>	This is the entry amount in the customer's standard currency, if the entry is a debit entry. This window only shows open entries.
<b>Credit, Currency</b>	This is the entry amount in the customer's standard currency, if the entry is a credit entry. This window only shows open entries.
<b>Remainder, Currency</b>	This is the unpaid balance in the customer's standard currency. Interest is calculated from this amount.
<b>Original Currency</b>	This is the original currency of the entry.
<b>Amount, Original Currency</b>	This is the entry amount in the original currency.

Field	Description
<b>Level</b>	This is the reminder level calculated for the entry. This level is raised each time the entry is included in a reminder notice. The reminder procedure takes place either in the window Change Reminder Selection or in the window Reminder Selection.
<b>Interest Charge Amount, Currency</b>	This field shows the calculated amount of interest, if the entry was subject to interest. Interest is calculated either in the window Change Interest Charge Selection or in the window Interest Charge Selection.
<b>Assessment Date</b>	This is the value date of the last interest calculated for the entry.
<b>Journal No.</b>	This is the number of the journal to which the entry was posted.

## Periodic Customer Statement Single Dialogs Workspace

Use this workspace to review all of the open and closed entries for a given company customer for any single period.

You cannot make any changes in this workspace.

Use the Open Entry Customer Statement workspace to see all open entries, regardless of the period in which they were entered.

### Periodic Customer Statement Tab

This section includes the fields and descriptions for the Periodic Customer Statement tab.

#### Customer Island

Field	Description
<b>Cust. No.</b>	This is the customer number. The field also shows the first two lines of the customer's name and address. This information is retrieved from the Customer Information Card.
<b>Currency</b>	This field displays the standard currency of the customer. The standard currency is specified in the field "Currency" in the window Customer Information Card.

#### Company Island

Field	Description
<b>Settling Company</b>	This field displays the name and number of the settling company of the customer.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the "Settling Company" field above.

**Balance Island**

Field	Description
<b>Balance, Currency</b>	This is the customer's current balance in the customer's standard currency. The balance is updated at posting.
<b>Balance, Base</b>	This is the customer's current balance in the base currency of the company. The balance is updated at posting.

**Period Island**

Field	Description
<b>Month/Yr.</b>	In this field, you enter the month and year of the statement. The month is written as a number, "1" is for January, "2" is for February, and so on. Using the customer number, month and year, Maconomy retrieves the periodic figures and monthly movements.
<b>Date</b>	In this field, you enter an interval of dates covering the period for which you wish to see the customer statement.  If you use these fields, the months in the interval month/year above will be replaced by the months that correspond to the specified date interval.

**Account Statement Island**

Field	Description
<b>Last Statement No.</b>	This field shows the number of the last historical statement printed out for the customer. Historical customer statements are printed out from the window Print Historical Customer Statement.  The field is automatically updated by Maconomy.
<b>Date of Last Statement</b>	This is the date on which the customer's last historical statement was created. The field is automatically updated by Maconomy.

**Period Balances: Opening/Closing Island**

Field	Description
<b>Balance, Currency</b>	This field shows the customer's opening and ending balances in the given month, expressed in the customer's standard currency. The balances are updated by Maconomy at posting.
<b>Balance, Base</b>	These are the customer's opening and ending balances in the base currency of the company in the given month. The balances are updated at posting.

## Global Periodic Customer Statement Single Dialogs Workspace

Use this workspace to review all of the open and closed entries for a given customer for a single period.

You cannot make any changes in this workspace.

### A/R Entries Sub-Tab

This section includes the fields and descriptions for the A/R Entries tab.

Field	Description
<b>Entry Date</b>	This is the entry date in the Accounts Receivable and General Ledger. This date identifies the posting period.
<b>Trans. No.</b>	This is the entry's transaction number. If the entry is from a general journal, the transaction number was entered manually. If the entry originates from an invoice or credit memo in the sales orders module, the transaction number will correspond to the invoice number or credit memo number that was assigned by Maconomy. If the entry is an interest entry or a reminder charge, the transaction number was allocated from the Interest Notice number series in the window System Numbers in the Set-Up module.
<b>Company No.</b>	This is the number of the company.
<b>Description</b>	This is the entry text.
<b>Trans. Type</b>	Shows the transaction type of the customer entry.
<b>Debit, Currency</b>	This is the entry amount in the customer's standard currency, if the entry is a debit entry.
<b>Credit, Currency</b>	This is the entry amount in the customer's standard currency, if the entry is a credit entry.
<b>Remainder, Currency</b>	This is the amount due in the customer's standard currency. Interest is calculated from this balance.
<b>O/C</b>	This field shows whether the entry is open or closed, specified by either "Open" or "Closed."
<b>Debit, Enterprise</b>	This is the entry amount in enterprise base currency if the entry is a debit entry.
<b>Credit, Enterprise</b>	This is the entry amount in enterprise base currency if the entry is a credit entry.
<b>Currency</b>	This is the original currency of the entry.

Field	Description
<b>Original Amount</b>	This is the entry amount in the original currency.
<b>Debit, Base</b>	This is entry amount in the base currency, if the entry is a debit entry.
<b>Credit, Base</b>	This is entry amount in the base currency, if the entry is a credit entry.
<b>Remainder, Base</b>	This is the amount due in the base currency. Interest is calculated from this balance.
<b>Statement No.</b>	This is the number of the statement on which the entry appears. The first time an entry is printed in a statement, it is given the same number as the statement.
<b>Level</b>	<p>This is the level calculated for the entry. It is raised every time the entry is prompted.</p> <p>The customer's reminder level is the highest level of one of the customer's open entries.</p> <p>The reminder procedure takes place either in the window Change Reminder Selection or in the window Reminder Selection.</p>
<b>Interest Charge Amount, Currency</b>	<p>This field shows the calculated amount of interest, if the entry was subject to interest.</p> <p>The interest procedure takes place either in the window Change Interest Charge Selection or in the window Interest Charge Selection.</p>
<b>Assessment Date</b>	This field shows the value date of Maconomy's last interest charge calculation.
<b>Date Posted</b>	This is the date the entry was posted to the Accounts Receivable and General Ledger.
<b>Orig. Due Date</b>	This is the original due date of the customer entry. The date applied can be changed in the windows Change Interest Charge Selection and Change Reminder Selection.
<b>Journal No.</b>	This is the number of the journal to which the entry was posted.
<b>Date Reconciled</b>	This is the date on which the entry was reconciled. The field is blank until the entry is fully reconciled. Entries are reconciled in the window Customer Open Entry Reconciliation, in the window General Journal in the G/L module or automatically if the customer's entries are automatically reconciled.

## SD\_AR\_Global\_Periodic\_Customer\_StatementWS\_A R Entries Sub-Tab

This section includes the fields and descriptions for the A/R Entries tab.

Field	Description
<b>Entry Date</b>	This is the entry date in the Accounts Receivable and General Ledger. This date identifies the posting period.
<b>Description</b>	This is the entry text.
<b>Trans. No.</b>	This is the entry's transaction number. If the entry is from a general journal, the transaction number was entered manually. If the entry originates from an invoice or credit memo in the sales orders module, the transaction number will correspond to the invoice number or credit memo number that was assigned by Maconomy. If the entry is an interest entry or a reminder charge, the transaction number was allocated from the Interest Notice number series in the window System Numbers in the Set-Up module.
<b>Trans. Type</b>	Shows the transaction type of the customer entry.
<b>Debit, Currency</b>	This is the entry amount in the customer's standard currency, if the entry is a debit entry.
<b>Credit, Currency</b>	This is the entry amount in the customer's standard currency, if the entry is a credit entry.
<b>Remainder, Currency</b>	This is the amount due in the customer's standard currency. Interest is calculated from this balance.
<b>O/C</b>	This field shows whether the entry is open or closed, specified by either "Open" or "Closed."
<b>Currency</b>	This is the original currency of the entry.
<b>Amount, Original Amount</b>	This is the entry amount in the original currency.
<b>Debit, Base</b>	This is entry amount in the base currency, if the entry is a debit entry.
<b>Credit, Base</b>	This is entry amount in the base currency, if the entry is a credit entry.
<b>Remainder, Base</b>	This is the amount due in the base currency. Interest is calculated from this balance.
<b>Statement No.</b>	This is the number of the statement on which the entry appears. The first time an entry is printed in a statement, it is given the same number as the statement.

Field	Description
<b>Level</b>	<p>This is the level calculated for the entry. It is raised every time the entry is prompted.</p> <p>The customer's reminder level is the highest level of one of the customer's open entries.</p> <p>The reminder procedure takes place either in the window Change Reminder Selection or in the window Reminder Selection.</p>
<b>Interest Charge Amount, Currency</b>	<p>This field shows the calculated amount of interest, if the entry was subject to interest.</p> <p>The interest procedure takes place either in the window Change Interest Charge Selection or in the window Interest Charge Selection.</p>
<b>Assessment Date</b>	<p>This field shows the value date of Maconomy's last interest charge calculation.</p>
<b>Date Posted</b>	<p>This is the date the entry was posted to the Accounts Receivable and General Ledger.</p>
<b>Orig. Due Date</b>	<p>This is the original due date of the customer entry. The date applied can be changed in the windows Change Interest Charge Selection and Change Reminder Selection.</p>
<b>Journal No.</b>	<p>This is the number of the journal to which the entry was posted.</p>
<b>Date Reconciled</b>	<p>This is the date on which the entry was reconciled. The field is blank until the entry is fully reconciled. Entries are reconciled in the window Customer Open Entry Reconciliation, in the window General Journal in the G/L module or automatically if the customer's entries are automatically reconciled.</p>

## Customer Entry Analysis Single Dialogs Workspace

Use this workspace to review customer entries.

### Customer Entry Tab

This section includes the fields and descriptions for the Customer Entry tab.

#### Customer Island

Field	Description
<b>Customer No.</b>	<p>This is the customer number assigned to the current entry. The island also shows the first three lines of the customer's name and address. The information is retrieved from the customer's information card.</p>
<b>Std. Currency</b>	<p>This field displays the standard currency of the customer. The standard currency is specified in the field "Currency" on the customer's information card.</p>

**Company Island**

Field	Description
<b>Company No.</b>	This is the number of the company to which the current entry is assigned.

**Interest and Reminder Island**

Field	Description
<b>Closed for Interest Calculation</b>	If this field is marked, the entry is closed for interest calculation. Entries that are closed for interest calculation are not included in the interest charge selection and interest charge notice printouts, and such entries are ignored when calculating interest charge.
<b>Block Type</b>	In this field you can specify why the entry is blocked. The possible values are defined in the Interest Reminder Block pop-up.
<b>Block Date</b>	In this field you can specify the date that the entry was blocked. By default, it is set to the current date when the Block Type is set. You can set it to any date, though.
<b>Blocked By</b>	This field specifies the user that blocked the entry. It is set to the name of the user that changes the Block Type field, but can be changed to anything.
<b>Remarks</b>	You can enter text that adds further information about the reasons for blocking the entry.

**Entry Information Island**

Field	Description
<b>Entry Date</b>	This field shows the date on which the entry was registered in the accounts receivable or general ledger.
<b>Entry Type</b>	<p>This field shows the customer entry type, which can be one of the following:</p> <ul style="list-style-type: none"> <li>■ Invoice from invoicing in the Sales Orders module.</li> <li>■ Credit memo from crediting in the Sales Orders module.</li> <li>■ Interest from approval of interest charge selection in the A/R module.</li> <li>■ Reminder from approval of reminder selection in the A/R module.</li> <li>■ Payment, a credit entry made in the window General Journal.</li> <li>■ Payment, a debit entry made in the window General Journal.</li> <li>■ Cash Discount Positive, a cash discount entered in the window Customer Open Entry Reconciliation.</li> <li>■ Currency Variance Positive, currency gain entered in the window</li> <li>■ Customer Open Entry Reconciliation or the window General Journal.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ Currency Variance Negative, currency loss entered in the window</li> <li>▪ Customer Open Entry Reconciliation or the window General Journal.</li> </ul>
<b>Description</b>	This field shows the text assigned to the entry.
<b>Trans. No.</b>	This field shows the entry's transaction number. If the entry is from a general journal, the number was entered manually. If the entry is from invoicing or crediting in the sales orders module, the transaction number is the same as the invoice or credit memo number which was given automatically by Maconomy from the system numbers "Invoice" or "Credit Memo." If the entry is an interest entry or reminder charge, the number was given automatically from the system numbers "Interest Notice."
<b>Trans. Type</b>	Shows the transaction type of the customer entry.
<b>Open/Closed</b>	This field shows whether the entry is "Open" or "Closed."
<b>Due Date</b>	This field shows the entry's due date. The due date is always the entry date of the assigned payment or credit memo.
<b>Date Reconciled</b>	This field shows the date on which the invoice was fully reconciled. The field is blank for other types of entries and for invoices which are not fully reconciled.
<b>Date Posted</b>	This field shows the date on which the entry was posted.
<b>Journal No.</b>	This field shows the number of the posting journal in which the entry was posted.
<b>Company of Origin</b>	This field shows the name of the company responsible for the invoice, credit memo, general journal or interest or reminder selection that has caused the current customer entry. On invoices, credit memos, and general journals, the responsible company can be specified in the field "Company No." in the island Company whereas the responsible company on customer entries created upon approval of an interest or reminder selection is automatically transferred from the field "Company No." in the island Settling Company on the relevant customer's information card.
<b>Export Entry</b>	If this field is marked, the customer entry will be included in the export file generated from the window Export Customer Entries.
<b>Exported</b>	This field shows whether the customer entry has been exported.

**Entry Island**

Field	Description
<b>Debit, Standard</b>	This field shows the entry amount in the customer's standard currency, if the entry is a debit entry.
<b>Credit, Standard</b>	This field shows the entry amount in the customer's standard currency, if the entry is a credit entry.
<b>Remainder, Standard</b>	This field shows how much of the entry has not been reconciled. The amount is displayed in the customer's standard currency.
<b>Debit, Base</b>	This field shows the entry amount in the base currency, if the entry is a debit entry.
<b>Credit, Base</b>	This field shows the entry amount in the base currency, if the entry is a credit entry.
<b>Remainder, Base</b>	This field shows how much of the entry has not been reconciled. The amount is displayed in base currency.
<b>Amount, Original</b>	This field shows the entry amount in the original currency.
<b>Remainder, Original</b>	This field shows how much of the entry has not been reconciled. The amount is displayed in the original currency.
<b>Original Currency</b>	This field shows the original currency of the entry.

**Origin Object Island**

Field	Description
<b>Origin Object</b>	The relation name of the origin object, for example, Time Sheet Header.
<b>Origin Object Instance Key</b>	The instance key of the origin object
<b>Object Key 1, String</b>	If any of the key fields of the origin object is of type String, then this field contains the value of the first String key field.
<b>Object Key 2, String</b>	If two or more of the key fields of the origin object are of type String, then this field contains the value of the second String key field.
<b>Object Key 1, Integer</b>	If any of the key fields of the origin object is of type Integer, then this field contains the value of the first Integer key field.
<b>Object Key 2, Integer</b>	If two or more of the key fields of the origin object are of type Integer, then this field contains the value of the second Integer key field.
<b>Object Key 3, Integer</b>	If three or more of the key fields of the origin object are of type Integer, then this field contains the value of the third Integer key field.

Field	Description
<b>Object Key 1, Date</b>	If any of the key fields of the origin object is of type Date, then this field contains the value of the first Date key field.
<b>Object Payment Agent</b>	If any of the key fields of the origin object is a reference to a Payment Agent, then this field contains the name of that Payment Agent.

#### Origin Line Island

Field	Description
<b>Origin Line</b>	The relation name of the origin line, for example, Time Sheet Line.
<b>Origin Line Instance Key</b>	The instance key of the origin line.
<b>Line Key 1, String</b>	If any of the key fields of the origin line is of type String, then this field contains the value of the first String key field.
<b>Line Key 2, String</b>	If two or more of the key fields of the origin line are of type String, then this field contains the value of the second String key field.
<b>Line Key 1, Integer</b>	If any of the key fields of the origin line is of type Integer, then this field contains the value of the first Integer key field.
<b>Line Key 2, Integer</b>	If two or more of the key fields of the origin line are of type Integer, then this field contains the value of the second Integer key field.
<b>Line Key 3, Integer</b>	If three or more of the key fields of the origin line are of type Integer, then this field contains the value of the third Integer key field.
<b>Line Payment Agent</b>	If any of the key fields of the origin line is a reference to a Payment Agent, then this field contains the name of that Payment Agent.

#### Transaction Entries Island

Field	Description
<b>Finance</b>	This field shows the number of finance entries related to the same transaction as the customer entry.
<b>Customer</b>	This field shows the number of customer entries related to the same transaction as the customer entry.
<b>Vendor</b>	This field shows the number of vendor entries related to the same transaction as the customer entry.
<b>Job</b>	This field shows the number of job entries related to the same transaction as the customer entry.
<b>Asset</b>	This field shows the number of asset entries related to the same transaction as the customer entry.

Field	Description
<b>Intercompany</b>	This field shows the number of intercompany entries related to the same transaction as the customer entry.

## Show Customer Reconciliation Single Dialogs Workspace

Use this workspace to view customer entries and the entries against which they were balanced, for any period that you need to see.

For example, review a payment and see the invoices that were partly or fully reconciled by the payment.

The Show Customer Reconciliation tab displays an entry and, if it is fully or partly reconciled, the Reconciliations sub-tab displays the entries that reconciled it or were reconciled by it. For example, if the tab displays a credit memo or payment, the sub-tab displays the invoices that were fully or partly reconciled by the credit memo/payment. If the tab displays an invoice, a reminder charge, or interest charge, the sub-tab displays the payments that reconciled the invoice, reminder, or interest charge.

Maconomy uses one the following methods to reconcile entries:

- You select entries for reconciliation and approve the reconciliation in the Customer Open Entry Reconciliation workspace. You manually select the payment or credit note and the invoices that should be reconciled against that payment or credit note, or use the **Mark All For Reconciliation** action.
  - In the General Journal workspace in the G/L module and in the Customer Payments workspace in this module, you can enter an invoice number when you enter a customer payment. When you post the journal, Maconomy fully or partly reconciles the payment against the invoice.
  - If you select the **Automatic Reconciliation** field in the Payment Information workspace, Maconomy always reconciles against the oldest open entry when you post entries.
- You can use Maconomy's search facilities to find the right entries. You can search by transaction number, entry date, amount, or currency.

You can use this workspace to balance customers. The information in this workspace is for reference; you cannot change it.

The Find window (press **Ctrl+F** or use **Find Entry** in the Find menu) associated with this workspace contains two fields that are not shown in the Show Customer Reconciliation workspace: the **Selected for Reconciliation** and **Reconciliation Status** fields. These fields have the following features:

- **Selected for Reconciliation** — Use this field to search for all customer entries that have been (or have not been) selected for reconciliation in any Maconomy workspace. Possible values are "Yes" and "no."
- **Reconciliation Status** — If the value of the **Selected for Reconciliation** field is "Yes," the A/R entry is being reconciled. This field displays the status of the reconciliation of the current entry (or its current location in the reconciliation flow). The status can have the following values:

- **Selected for Collection** — If you created a collection selection that includes the current customer entry in the Collection Selection or Change Collection Selection workspace in the Banking module.
- **Selected for Reconciliation in General Journal** — If you entered a customer payment in the General Journal workspace and reconciled it against a posted invoice.
- **Selected for Reconciliation in Open Entry Reconciliation** — If a posted customer payment is reconciled fully or partly against a customer entry in the A/R Entries sub-tab in the Customer Open Entry Reconciliation workspace, and the reconciliation is not yet approved.
- **Removed Reconciliation** — If you remove an approved reconciliation in this workspace, but have not yet posted it. When you post the reconciliation removal, this field changed to blank, and the **Selected for Reconciliation** field changes to "No."
- **Approved Automatic Customer Payment** — If Maconomy reads customer payments in the Banking module without errors, and the collected amount agrees with the invoiced amount.
- **Approved for Reconciliation in Open Entry Reconciliation** — If a posted customer payment is reconciled fully or partly against a customer entry in the A/R Entries sub-tab in the Customer Open Entry Reconciliation workspace, and the reconciliation is approved.

These two fields in the Find window make it easier to find specific A/R entries and to monitor their location in the A/R reconciliation process.

### Show Customer Reconciliation Tab

This section includes the fields and descriptions for the Show Customer Reconciliation tab.

#### Customer Island

Field	Description
<b>Customer No.</b>	This is the customer number assigned to the current entry. The island also shows the first three lines of the customer's name and address. The information is retrieved from the customer's information card.
<b>Std. Currency</b>	This field displays the standard currency of the customer. The standard currency is specified in the field "Currency" on the customer's information card.

#### Remove Reconciliation Island

Field	Description
<b>Entry Date</b>	In this field, you can specify the date to be used as entry date and reconciliation date on the customer entry created when a reconciliation is removed using the action "Remove Reconciliation." The date will also be applied as entry date on the customer reconciliation journal created.

**Company Island**

Field	Description
<b>Company</b>	This field displays the name of the company registered as settling company for the current customer.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company" above.

**Dimensions Island**

Field	Description
<b>Location</b>	This field shows the value of the dimension Location on the current customer entry. If the entry is caused by an invoice or a credit memo, the value is transferred from the field "Location" in the card part of the current invoice or credit memo. If the customer entry is caused by a general journal, the value is transferred from the field "Location" on the general journal line containing the customer entry. If the customer entry is caused by an interest or reminder selection, the value is transferred from the field "Location" on the information card of the current customer.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

**Entry Information Island**

Field	Description
<b>Entry Date</b>	This field shows the date on which the entry was registered in the accounts receivable or general ledger.
<b>Entry Type</b>	This field shows the customer entry type, which can be one of the following: <ul style="list-style-type: none"> <li>■ Invoice from invoicing in the Sales Orders module.</li> <li>■ Credit memo from crediting in the Sales Orders module.</li> <li>■ Interest from approval of interest charge selection in the A/R module.</li> <li>■ Reminder from approval of reminder selection in the A/R module.</li> <li>■ Payment, a credit entry made in the window General Journal.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Payment, a debit entry made in the window General Journal.</li> <li>Cash Discount Positive, a cash discount entered in the window Customer Open Entry Reconciliation.</li> <li>Currency Variance Positive, currency gain entered in the window Customer Open Entry Reconciliation or the window General Journal.</li> <li>Currency Variance Negative, currency loss entered in the window Customer Open Entry Reconciliation or the window General Journal.</li> <li>Description — This field shows the text assigned to the entry.</li> </ul>
<b>Trans. No.</b>	This field shows the entry's transaction number. If the entry is from a general journal, the number was entered manually. If the entry is from invoicing or crediting in the sales orders module, the transaction number is the same as the invoice or credit memo number which was given automatically by Maconomy from the system numbers "Invoice" or "Credit Memo." If the entry is an interest entry or reminder charge, the number was given automatically from the system numbers "Interest Notice."
<b>Trans. Type</b>	Shows the transaction type of the customer entry.
<b>Open/Closed</b>	This field shows whether the entry is "Open" or "Closed."
<b>Due Date</b>	This field shows the entry's due date. The due date is always the entry date of the assigned payment or credit memo.
<b>Date Reconciled</b>	This field shows the date on which the invoice was fully reconciled. The field is blank for other types of entries and for invoices which are not fully reconciled.
<b>Date Posted</b>	This field shows the date on which the entry was posted.
<b>Journal No.</b>	This field shows the number of the posting journal in which the entry was posted.
<b>Company of Origin</b>	<p>This field shows the name of the company responsible for the invoice, credit memo, general journal or interest or reminder selection that has caused the current customer entry. On invoices, credit memos, and general journals, the responsible company can be specified in the field "Company No." in the island Company whereas the responsible company on customer entries created upon approval of an interest or reminder selection is automatically transferred from the field "Company No." in the island Settling Company on the relevant customer's information card.</p> <ul style="list-style-type: none"> <li>Export Entry — If this field is marked, the customer entry will be included in the export file generated from the window Export Customer Entries.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Exported — This field shows whether the customer entry has been exported.</li> </ul>

### Entry Island

Field	Description
<b>Debit, Standard</b>	This field shows the entry amount in the customer's standard currency, if the entry is a debit entry.
<b>Credit, Standard</b>	This field shows the entry amount in the customer's standard currency, if the entry is a credit entry.
<b>Remainder, Standard</b>	This field shows how much of the entry has not been reconciled. The amount is displayed in the customer's standard currency.
<b>Debit, Base</b>	This field shows the entry amount in the base currency, if the entry is a debit entry.
<b>Credit, Base</b>	This field shows the entry amount in the base currency, if the entry is a credit entry.
<b>Remainder, Base</b>	This field shows how much of the entry has not been reconciled. The amount is displayed in base currency.
<b>Amount, Original</b>	This field shows the entry amount in the original currency.
<b>Remainder, Original</b>	This field shows how much of the entry has not been reconciled. The amount is displayed in the original currency.
<b>Original Currency</b>	This field shows the original currency of the entry.

### Interest and Reminder Island

Field	Description
<b>Closed for Interest Calculation</b>	If this field is marked, the entry is closed for interest calculation. Entries that are closed for interest calculation are not included in the interest charge selection and interest charge notice printouts, and such entries are ignored when calculating interest charge.
<b>Block Type</b>	In this field you can specify why the entry is blocked. The possible values are defined in the Interest Reminder Block pop-up.
<b>Block Date</b>	In this field you can specify the date that the entry was blocked. By default, it is set to the current date when the Block Type is set. You can set it to any date, though.
<b>Blocked By</b>	This field specifies the user that blocked the entry. It is set to the name of the user that changes the Block Type field, but can be changed to anything.

Field	Description
<b>Remarks</b>	You can enter text that adds further information about the reasons for blocking the entry.

## Reconciliations Sub-Tab

This section includes the fields and descriptions for the Reconciliations sub-tab.

Field	Description
<b>Entry Date</b>	This field shows the date on which the entry was registered in the A/R or the G/L module.
<b>Trans. No.</b>	This field shows the entry's transaction number. If the entry is from a general journal, the number was entered manually. If the entry is from invoicing or crediting in the sales orders module, the transaction number is the same as the invoice or credit memo number which was given automatically by Maconomy from the "Invoice" or "Credit Memo" system numbers. If the entry is an interest entry or reminder charge, the number was given automatically from the "Interest Notice" system numbers.
<b>Trans. Type</b>	This field shows the transaction type of the customer entry against which the customer entry in the card part was reconciled.
<b>Description</b>	This field shows the text assigned to the entry.
<b>Orig. Amount</b>	This field shows the entry amount in the original currency.
<b>Original Currency</b>	This field shows the original currency of the entry.
<b>Reconciled, Original</b>	This field shows the amount reconciled on the original entry. The amount is displayed in the currency used on the entry in question.
<b>Cash Disc., Original</b>	This field shows the cash discount amount registered on the entry, if any. The amount is displayed in the currency used on the entry in question.
<b>Cust. Paym. Variance, Original</b>	This field shows the payment variance amount registered on the entry, if any. The amount is displayed in the currency used on the entry in question.
<b>Type</b>	See the field "Entry Type" in the card part of the window for a detailed description of customer entry types.
<b>Reconciliation Currency</b>	This field shows the currency in which reconciliation of the current line has been made.
<b>Debit, Standard</b>	This field shows the entry amount in the customer's standard currency, if the entry is a debit entry.

Field	Description
<b>Credit, Standard</b>	This field shows the entry amount in the customer's standard currency, if the entry is a credit entry.
<b>Reconciled, Standard</b>	This field shows the amount reconciled of the original entry. The amount is displayed in the customer's standard currency.
<b>Cash Discount, Standard</b>	This field shows the cash discount amount registered on the entry, if any. The amount is displayed in the customer's standard currency.
<b>Cust. Paym.Variance, Standard</b>	This field shows the payment variance amount registered on the entry, if any. The amount is displayed in the customer's standard currency.
<b>Debit, Base</b>	This field shows the entry amount in the base currency, if the entry is a debit entry.
<b>Credit, Base</b>	This field shows the entry amount in the base currency, if the entry is a credit entry.
<b>Reconciled, Base</b>	This field shows how much of the original entry has been reconciled. The amount is displayed in the base currency.
<b>Cash Discount, Base</b>	This field shows the cash discount amount registered on the entry, if any. The amount is displayed in the base currency.
<b>Cust. Paym. Variance, Base</b>	This field shows the payment variance amount registered on the entry, if any. The amount is displayed in the base currency.
<b>Open/Closed</b>	This field shows whether the entry is open or closed.
<b>Due Date</b>	This field shows the entry's due date. If the entry is an invoice, the due date is calculated on the basis of the invoice date and the customer's terms of payment. Otherwise the due date is the entry date.
<b>Date Posted</b>	This field shows the date on which the entry was posted.
<b>Journal No.</b>	This field shows the number of the posting journal in which the entry was posted.
<b>Company of Origin</b>	This field shows the name of the company responsible for the invoice, credit memo, general journal or interest or reminder selection that has caused the current customer entry. On invoices, credit memos, and general journals, the responsible company can be specified in the field "Company No." in the island Company whereas the responsible company on customer entries created upon approval of the interest or reminder selection is automatically transferred from the field "Company No." in the island Settling Company on the relevant customer information card.

Field	Description
<b>Company No.</b>	This field shows the value of the dimension Company on the current customer entry. The value is transferred from the field "Company No." in the island Settling Company on the information card of the current customer.
<b>Location</b>	This field shows the value of the dimension Location on the current entry. If the entry is caused by an invoice or a credit memo, the value is transferred from the field "Location" in the card part of the current invoice or credit memo. If the customer entry is caused by a general journal, the value is transferred from the field "Location" on the general journal line with the customer entry. If the customer entry is caused by an interest or reminder selection, the value is transferred from the field "Location" on the information card of the current customer.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

## Actions

This section shows the Actions available in the Show Customer Reconciliation workspace.

### Top Tab

Field	Description
<b>Remove Reconciliation</b>	<p>When you select this action, the reconciliation of the current customer entry is removed, and all reconciled amounts in the table part of the window will be reset to zero. When you remove a customer reconciliation, the entries which were part of the reconciliation are all re-established and the customer entries which were closed are reopened.</p> <p>If the reconciliation caused any G/L entries such as exchange rate variances, cash discounts, or customer payment variances, Maconomy automatically creates a customer reconciliation journal with offset entries for the G/L entries in question. If the system parameter "Automatic posting of customer reconciliations" is marked, the journal will be posted automatically. If the parameter is not marked, the customer reconciliation journal must subsequently be posted in one of the windows Posting or Print Posting Journal in the G/L module.</p>

Field	Description
	<p>The action can only be selected if you have completed reconciliations against the current entry. The current entry must therefore be the entry, that is, the payment or the credit memo, shown in the card part of the window Customer Open Entry Reconciliation when the reconciliation was completed. This action is not available for other entries.</p> <p>After having removed a reconciliation, the open customer entries can be reconciled again in the windows Customer Open Entry Reconciliation and Customer Payments in this module or in the window General Journal in the G/L module.</p>

## Show Customer Accrual Journals Single Dialogs Workspace

Use this workspace display information about posted customer accrual journals.

### Customer Accrual Journal Tab

This section includes the fields and descriptions for the Customer Accrual Journal tab.

#### Journal Island

Field	Description
<b>Journal No.</b>	This field shows the journal number of the customer accrual journal.
<b>Created by</b>	This is the name of the user who created the Customer Accrual Journal.
<b>Date</b>	This field shows the date on which the customer accrual journal was created.

#### Company Island

Field	Description
<b>Company</b>	This field shows the name of the company responsible for the journal used as a basis for the current template. The company number cannot be changed.
<b>Base Currency</b>	This field shows the currency used as base currency in the company specified in the field "Company No." above.

#### Transaction Numbering Island

Field	Description
<b>Transaction Type</b>	This field shows a default transaction type to be used when creating the lines. The default transaction type that is set up for the Customer Accrual Journal in the given company will be shown initially.

Field	Description
<b>Number Series</b>	This field shows a transaction number series created in the pop-up field "Transaction No. Series" in the window Popup Fields in the Set-Up module. If you select a number series, Maconomy will automatically number your journal lines.

### Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Trans. No.</b>	This field shows the transaction number of the transaction that generated the customer accrual journal line.
<b>Transaction Type</b>	This field is the transaction type of the customer accrual journal line.
<b>Entry Date</b>	This field shows the date on which the customer accrual was created.
<b>Entry Description</b>	This is the description of the customer accrual journal line.
<b>Entry Line No.</b>	This field shows the customer accrual journal line number.
<b>Line No.</b>	This field shows the number of the line on which the entry was placed in the journal.
<b>Posted</b>	This check box is selected if the journal was posted.
<b>Date Posted</b>	This is the date the entry was posted to the customer accrual.
<b>Amount for Provision, Currency</b>	This field shows the customer accrual (debtor provision) amount, in the job's currency.
<b>Amount for Provision, Base</b>	This field shows the customer accrual (debtor provision) amount, in the base currency.
<b>Amount for Provision, Enterprise</b>	This field shows the customer accrual (debtor provision) amount, in the enterprise currency.
<b>Currency</b>	This field shows the currency of the registration (original currency).
<b>Job No.</b>	This field shows the job number, if the customer accrual is related to a job.

Field	Description
<b>Customer No.</b>	This field shows the customer number for which the accrual was made.
<b>Approved by</b>	This field shows the user name of the person who approved the customer accrual journal line.
<b>Approval Date</b>	This field shows the date on which the customer accrual journal line was approved.
<b>Provision Cause</b>	This field shows the reason for the customer accrual.
<b>Provision Remark</b>	This field shows additional information about why the customer accrual was necessary.
<b>Company No.</b>	This field shows the company number of the customer accrual journal line.
<b>Location</b>	This field shows the location of the current entry.
<b>Entity</b>	This field shows the entity dimension value which is assigned to the current entry.
<b>Project</b>	This field shows the project dimension value which is assigned to the current entry.
<b>Purpose</b>	This field shows the purpose dimension value which is assigned to the current entry.
<b>Spec. 1-3</b>	These fields show the values in the dimensions Specification 1-3 assigned to the current entry.
<b>Local Spec. 1-3</b>	These fields show the values in the dimensions Local Specification 1-3 assigned to the current entry.

## Show Reminders Single Dialogs Workspace

Use this workspace to view all reminder letters that have been created, including reminder lines and levels, for any period that you need to review.

You cannot change any of the information shown in this workspace, but you can reprint letters and reverse an existing reminder from this workspace.

Reminder text is not displayed in this workspace, but it is displayed in reminder letters. The reminder lines also display the reminder level.

## Show Reminders Tab

This section includes the fields and descriptions for the Show Reminders tab.

### Reminder Island

Field	Description
<b>Reminder No.</b>	The number of the reminder.
<b>Reminder Date</b>	The date the reminder letter was created and sent to the customer.
<b>Transaction Type</b>	This field displays the transaction type that generated the reminder letter. This will be the default transaction type of the Reminder journal, as specified in the Journal Setup.
<b>Journal No.</b>	The number of the journal in which the reminder was posted.

### Customer Island

Field	Description
<b>Customer No.</b>	The customer number of the customer that the reminder is for.
<b>Standard Currency</b>	The standard currency of the company-specific customer that the reminder is for.

### Company Island

Field	Description
<b>Company No.</b>	The company number of the company that is registered as the settling company of the current customer (as set up in the Company Specific Customer Information Card window.
<b>Name</b>	The name of the company that has the company number described above.
<b>Base Currency</b>	The currency that is used as base currency in the company that has the company number described above.

### Print Control Island

Field	Description
<b>Layout</b>	You can select a layout to use when reprinting the reminder letter. The list of layouts is taken from Approve Reminders window.

### Payment Information Island

Field	Description
<b>Due Date</b>	This field shows when the reminder is due for payment (the date that the reminder must be paid.)
<b>Payer Identification</b>	This field shows the payer identification for the company-specific customer that the reminder is for. The payer identification is used in connection with electronic payments.
<b>Payment Terms</b>	The payment terms that are associated with the reminder.
<b>Interest Charge/Reminder Terms</b>	This field displays the interest charge/reminder principle set up for the current customer.

### Status Island

Field	Description
<b>Reminder Level</b>	This field displays the reminder level of the reminder letter. The reminder level of the letter is the highest level of one of the reminder letter lines.
<b>Reminder Charge, Standard</b>	This field displays the amount charged to the company-specific customer, in the customer's currency. The amount is copied from the interest charge/reminder principle assigned to the current customer, if at least one entry has been included in the reminder letter to the customer.
<b>Reminder Charge, Base</b>	Same as above but in Base currency.
<b>Reminder Charge, Enterprise</b>	Same as above but in Enterprise currency.
<b>Total Remainder, Standard</b>	This field displays the total outstanding debt of the company-specific customer, in the customer's currency, based on all open entries for the customer. The amount is calculated by extracting the total credit from the total debit.
<b>Balance, Standard</b>	This field displays the total debt of the company-specific customer, including the reminder charge. The amount is calculated as sum of the Reminder Charge and Total Remainder fields.
<b>Reversed</b>	If marked, this field indicates that the reminder has been reversed.
<b>Reversed By</b>	If the reminder has been reversed, this field shows who reversed it.

Field	Description
<b>Reversal Date</b>	If relevant, shows the date that the reminder was reversed.
<b>Reversing Journal No.</b>	If relevant, shows the number of the Reversing Journal in which the reversal was made.

### Reminder Letter Lines Sub-Tab

This section includes the fields and descriptions for the Reminder Letter Lines sub-tab.

Field	Description
<b>Due Date</b>	Shows the due date of the entry that corresponds to the reminder line.
<b>Entry Date</b>	Shows the date when the entry that corresponds to the reminder line was posted in the customer and G/L ledgers.
<b>Trans. No.</b>	Shows the transaction number of the entry that corresponds to the reminder line.
<b>Trans. Type</b>	Shows the transaction type of the entry that corresponds to the reminder line.
<b>Description</b>	Shows the description of the entry that corresponds to the reminder line.
<b>Amount, Standard</b>	Shows the entry amount in the standard currency of the company-specific customer. The amount will be negative for credit entries and positive for debit entries.
<b>Amount, Original</b>	Shows the entry amount in the original currency of the entry. The amount will be negative for credit entries and positive for debit entries.
<b>Original Currency</b>	Shows the original currency of the entry (as used in the previous field.)
<b>Remainder, Standard</b>	Shows the overdue amount on the entry in the standard currency of the company-specific customer. The remainder amount is the basis for the reminder calculation.
<b>Reminder Level</b>	This field displays the calculated reminder level of the specific reminder line.
<b>Block Type</b>	Shows if the entry is blocked for reminder and/or interest calculation, and the reason why it is blocked. Block types are set up in the Interest Reminder Block pop-up field.
<b>Block Date</b>	Shows the date that the entry was blocked.
<b>Blocked By</b>	Shows who blocked the entry.

Field	Description
<b>Job No.</b>	Shows the job number of the entry that corresponds to the reminder line.
<b>Job Name</b>	Shows the job name of the entry that corresponds to the reminder line.
<b>Payer Id.</b>	Shows the payer identification of the entry that corresponds to the reminder line.
<b>Payer Att.</b>	Shows the payer attention of the entry that corresponds to the reminder line.

## Show Interest Charge Notices Single Dialogs Workspace

Use this workspace to view all existing interest charge notices that have been created, for any period that you need to see.

You cannot change any of the information that this workspace displays, but you can print or reprint interest charge notices and reverse an existing interest charge notice from this workspace.

### Show Interest Charge Notices Tab

This section includes the fields and descriptions for the Show Interest Charge Notices tab.

#### Interest Island

Field	Description
<b>Interest Charge Notice No.</b>	The number of the interest charge notice.
<b>Interest Charge Notice Date</b>	The date the notice was issued and sent to the customer.
<b>Transaction Type</b>	This field displays the transaction type of the notice, that is: you can see what kind of transaction that generated the notice. This is the default transaction type of the Interest journal.
<b>Journal Number</b>	The number of the interest journal that the interest charge was posted in.

#### Customer Island

Field	Description
<b>Customer No.</b>	The number of the customer that the interest charge notice is for.
<b>Standard Currency</b>	The standard currency of the company-specific customer that the notice is for.

**Company Island**

Field	Description
<b>Company No.</b>	The company number of the company that is registered as the settling company of the current customer (as set up in the Company Specific Customer Information Card window.
<b>Company Name</b>	The name of the company that the company number described above.
<b>Base Currency</b>	The currency that is used as base currency in the company that has the company number described above.

**Print Control Island**

Field	Description
<b>Layout</b>	You select a layout to use when reprinting the notice.

**Payment Information Island**

Field	Description
<b>Due Date</b>	This field shows when the interest charge notice is due for payment (the date that the interest charge must be paid.)
<b>Payer Identification</b>	This field shows the payer identification for the company-specific customer that the notice is for. The payer identification is used in connection with electronic payments.
<b>Payment Terms</b>	The payment terms that are associated with the interest charge notice.
<b>Interest Charge/Reminder Terms</b>	This field displays the interest charge/reminder principle set up for the customer that the notice is for.

**Status Island**

Field	Description
<b>Printed</b>	Shows whether the notice has been printed.
<b>Interest Charge, Standard</b>	Shows the amount that has been charged as interest to the company-specific customer. This amount is a sum of the Interest fields in the table part.
<b>Interest Charge, Base</b>	As above, but in base currency.

Field	Description
<b>Interest Charge, Enterprise</b>	As above, but in enterprise currency.
<b>Amount Rounding, Base</b>	Represents the rounding amount, in base currency. If currency rounding is used (in Currency Rounding window), the total interest amount should be rounded up, based on the currency rounding.
<b>Amount Rounding, Enterprise</b>	As above, but in enterprise currency.
<b>Total Remainder, Standard</b>	Shows the total outstanding debt of the company-specific customer, based on all open entries (excluding the current interest charge) for the customer. The amount is calculated by extracting the total credit from the total debit.
<b>Balance, Standard</b>	Shows the total debt of the company-specific customer, including the interest charge. The amount is calculated as the sum of the Interest Charge and the Total Remainder fields.
<b>Reversed</b>	Shows whether the notice has been reversed.
<b>Reverse Last Approval Date</b>	This field is used when reversing the interest note in the card part of the window. If the field is checked, the last approval date on the customer entries included in this interest note is reset by setting it to the previous interest date.
<b>Reversed By</b>	If relevant, shows who reversed the notice.
<b>Reversal Date</b>	If relevant, shows the date when the notice was reversed.
<b>Reversing Journal No.</b>	If relevant, shows the number of the interest journal which reversed the current interest charge notice.

## Interest Charge Notice Lines Sub-Tab

This section includes the fields and descriptions for the Interest Charge Notice Lines sub-tab.

Field	Description
<b>Due Date</b>	Shows the due date of the entry that corresponds to the interest charge notice line.
<b>Entry Date</b>	This field is used when reversing interest notes and allows you to set the entry date on the reversed customer journal to be created. The default value of the field is set to the date on the interest note or reminder letter.

Field	Description
<b>Payment Date</b>	Shows the date when the entry that corresponds to the interest charge notice line was fully reconciled against payments.
<b>Trans. No.</b>	Shows the transaction number of the entry that corresponds to the interest charge notice line.
<b>Trans. Type</b>	Shows the transaction type of the entry that corresponds to the interest charge notice line.
<b>Description</b>	Shows the description of the entry that corresponds to the interest charge notice line.
<b>Amount, Standard</b>	Shows the entry amount in the standard currency of the company-specific customer. The amount will be negative for credit entries and positive for debit entries.
<b>Amount, Original</b>	Shows the entry amount in the original currency of the entry. The amount will be negative for credit entries and positive for debit entries.
<b>Original Currency</b>	Shows the original currency of the entry (as used in the previous field.)
<b>Remainder, Standard</b>	Shows the overdue amount on the entry in the standard currency of the company-specific customer. The remainder amount is the basis for the interest calculation.
<b>Interest, Standard</b>	Shows the interest amount in the standard currency of the company-specific customer. The amount will be negative for credit entries and positive for debit entries.
<b>Interest, Original</b>	Shows the interest amount in the original currency of the entry. The amount will be negative for credit entries and positive for debit entries.
<b>Interest, Base</b>	Same as above, but in Base Currency.
<b>Interest, Enterprise</b>	Same as above, but in Enterprise Currency.
<b>Interest Days</b>	Shows the number of days for which interest was calculated.
<b>Previous Interest Date</b>	Shows the date that the previous interest charge notice was created and sent to the customer.
<b>Block Type</b>	Shows if the entry is blocked for reminder and/or interest calculation, and the reason why it is blocked. Block types are set up in the Interest Reminder Block pop-up field.
<b>Block Date</b>	Shows the date that the entry was blocked.
<b>Blocked By</b>	Shows who blocked the entry.

Field	Description
<b>Job No.</b>	Shows the job number of the entry that corresponds to the interest charge notice line.
<b>Job Name</b>	Shows the job name of the entry that corresponds to the interest charge notice line.
<b>Payer Id.</b>	Shows the payer identification of the entry that corresponds to the interest charge notice line.
<b>Payer Att.</b>	Shows the payer attention of the entry that corresponds to the interest charge notice line.

## Show All Invoices Single Dialogs Workspace

Use this workspace review information about any kind of invoice or credit note.

This workspace displays information about job invoices and credit notes, trade invoices and credit notes, and intercompany invoices. You can also review information about invoices and credit notes in the context-specific workspaces.

### Invoice Tab

This section includes the fields and descriptions for the Invoice tab.

#### Billing Address Island

Field	Description
<b>Bill to Customer</b>	This field shows the name and number of the customer who received the invoice.
<b>Attn.</b>	This field shows the customer contact.
<b>Country</b>	This field shows the customer country.

#### Price Island

Field	Description
<b>Currency</b>	This is the currency of the invoice. The currency is retrieved from the invoice in the window Invoices or the sales order in the window Sales Orders.
<b>Exchange Rate Date</b>	This field shows the exchange rate date for the calculation of prices on the invoice. If no exchange rate date was specified on the sales order on which the invoice is based, or if the invoice was created in the window Invoices, this field is blank.
<b>Sales</b>	This is the sum of the prices in the item lines of the invoice. All line and quantity discounts have been deducted.

Field	Description
<b>Invoice Discount %</b>	This is the percentage rate used to calculate the invoice discount on the invoice. The percentage rate is retrieved from the invoice in the window Invoices or on the sales order in the window Sales Orders.
<b>Invoice Discount</b>	This is the calculated invoice discount amount deducted from the invoice. The discount is retrieved from the invoice in the window Invoices or the sales order in the window Sales Orders.
<b>Tax on Sales</b>	This is the tax calculated by Maconomy. The amount is automatically added to the invoice.
<b>Items on Account</b>	This field shows how much of the item sum of the sales order was invoiced on account before this invoice was created. It is deducted from the item sum on the invoice. If the invoice is an on account invoice, the value is "0.00." The field is only used by Maconomy Trade.
<b>Tax on Account</b>	This field shows the tax amount added to any on account invoices before this invoice was created. The amount is deducted from the total tax amount on the invoice. If the invoice is an on account invoice, the value is "0.00." The field is only used by Maconomy Trade.
<b>Balance Due</b>	This is the total amount due from the bill-to customer. The amount is calculated from the sales amount, less any invoice discount, plus charges and tax.
<b>Std. Currency</b>	This is the bill-to customer's standard currency. The currency is retrieved from the Customer Information Card.
<b>Total In Standard</b>	This field the "Total Amount Due" converted into the standard currency of the bill-to customer.

#### Extra Fields Island

Field	Description
<b>Popup 1-5</b>	In each of these fields, you can specify a customer pop-up value. The printout will only include customers for which the values in the fields "Popup 1-5" in the window Customer Information Card correspond to the values specified here. However, if you leave a given pop-up field blank, customers with any value in the field in question are included.

#### Credit Card Island

Field	Description
<b>Credit Card No.</b>	If the displayed invoice was created on the basis of a sales order to be paid by credit card, this field shows the number of the credit card which will be used for payment of the current invoice. The value is retrieved from the field "Credit Card No." on the current sales order.
<b>Expiry Date</b>	If the displayed invoice was created on the basis of a sales order to be paid by credit card, this field shows the expiry date entered for the credit card

Field	Description
	specified in the field "Credit Card No." above. The value in this field is retrieved from the field "Expiry Date" on the current sales order.
<b>Amount Authorized</b>	If the displayed invoice was created on the basis of a sales order to be paid by credit card, this field shows the amount which the credit card issuer has accepted to pay for the current sales order. The value in this field is retrieved from the field "Amount Authorized" on the current sales order.
<b>Authorization Code</b>	If the displayed invoice was created on the basis of a sales order to be paid by credit card, this field shows the authorization code which the credit card issuer has specified in connection with the payment of the amount in the field "Amount Authorized" above. The value in this field is retrieved from the field "Authorization Code" on the current sales order.
<b>Authorization Date</b>	If the displayed invoice was created on the basis of a sales order to be paid by credit card, this field shows the date on which the credit card issuer authorized payment of the amount in the field "Amount Authorized" above. The value in this field is retrieved from the field "Authorization Date" on the current sales order.

**Remarks Island**

Field	Description
<b>Remarks</b>	Here you can enter comments about the invoice. Your comments can only be edited and seen in this window.

**Ship to Address Island**

Field	Description
<b>Customer</b>	<p>This is the name and number of the customer to whom the items were delivered. It is retrieved from the invoice in the window Invoices or the sales order in the window Sales Orders.</p> <p>The other lines in this field show the ship-to customer's name and address. The text is retrieved from the invoice in the window Invoices or from the sales order in the window Sales Orders.</p>
<b>Attn.</b>	This is the ship-to customer's attention person - the person to whom shipping information is directed. The name is retrieved from the invoice in the window Invoices or from the sales order in the window Sales Orders.
<b>Country</b>	This is the customer's country code. It is retrieved from the relevant invoice in the window Invoices or sales order in the window Sales Orders.

**Company Island**

Field	Description
<b>Company No.</b>	This field shows the number of the company responsible for the current invoice. The number is transferred from the island Company on the invoice or the sales order on which the invoice is based.

**Invoice Island**

Field	Description
<b>Invoice No.</b>	This is the number of the invoice. If you cannot remember the number of an invoice, you can use the search functions in the Find menu. You determine how invoice numbers are allocated in the window Numbers in the Set-Up module.
<b>Printed</b>	This field shows whether the invoice has been printed or not. If you wish to reprint it, select "Print..." in the File menu. If you remove the mark here first, the invoice will be treated as if it has not been printed. Alternatively, you can mark that you wish to reprint invoices, which means that the invoice in the window will be included although the mark is not removed. When you reprint the invoice, Maconomy does not invoice the amount again. The printout is merely registered as a copy of the original invoice.
<b>Order No.</b>	This is the number of the sales order in the window Sales Orders which generated the invoice. If it is a blanket invoice, the field will show the lowest sales order number in the invoice. If the invoice was created in the window Invoices, the value is "0."
<b>Packing Slip No.</b>	This is the number of the packing slip for the invoice. If you have made more than one packing slip, the field shows the last one.
<b>Version</b>	This is the version number of the sales order which generated the invoice. The value cannot be changed here.
<b>Invoice Date</b>	This is the invoice date.
<b>Due Date</b>	This is the due date which is assigned to the invoice shown. The due date is automatically calculated from the invoice date and the customer's payment terms. If the field "Due Date from Printing Date" in the window System Information has been marked, the due date will be calculated from the printing date.
<b>Printed by</b>	Here, the name of the employee, who printed the invoice, is shown. The value does not change at reprinting.
<b>Printing Date</b>	Here, the date of invoice printing is shown. The value does not change at reprinting.

**Dimensions**

Field	Description
<b>Location</b>	This field shows the value of the dimension Location on the current customer entry. If the entry is caused by an invoice or a credit memo, the value is transferred from the field "Location" in the card part of the current invoice or credit memo. If the customer entry is caused by a general journal, the value is transferred from the field "Location" on the general journal line containing the customer entry. If the customer entry is caused by an interest or reminder selection, the value is transferred from the field "Location" on the information card of the current customer.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

**Customer Information Island**

Field	Description
<b>Department</b>	This is the department assigned to the invoice in the window Invoices or the sales order in the window Sales Orders.
<b>Warehouse</b>	This is the warehouse from which the invoiced items were delivered. The information is retrieved from the invoice in the window Invoices or the sales order in the window Sales Orders.
<b>Reference</b>	This field shows the note entered in the field "Reference" in the invoice in the window Invoices or the sales order in the window Sales Orders.
<b>Tax No.</b>	This is the customer's tax number. It is retrieved from the relevant invoice in the window Invoices or sales order in the window Sales Orders.

**Sales Orders Island**

Field	Description
<b>Main Order No.</b>	If the invoice has been created from a sales order which is linked to a main order, the number of the main order is displayed in this field. If the invoice is created from the main order itself, the number of the current main order is displayed.

## Show Customer Payment Journals Single Dialogs Workspace

Use this workspace to review information about customer payments.

This workspace displays information about a customer payment and how it has been reconciled.

### Customer Payment Tab

This section includes the fields and descriptions for the Customer Payment tab.

#### Customer Island

Field	Description
<b>Customer No.</b>	This field displays the number of the customer for whom a new payment is registered.
<b>Attn.</b>	This field shows the customer contact.
<b>Std. Currency</b>	This field displays the currency used as standard currency by the customer in question.

#### Customer Payment Island

Field	Description
<b>Entry Date</b>	This field shows the entry date of the payment in this field. Maconomy suggests today's date, but this date can be changed manually. If the window displays an already posted payment, this field shows the entry date of the payment in question. You cannot change the entry date of an already posted payment.
<b>Description</b>	This field displays text describing the new payment.
<b>Std. Description</b>	This field displays you can standardized text describing the payment.
<b>D/C</b>	In this field, you specify whether the amount registered is a debit or credit amount. Maconomy suggests debit because a customer payment usually means your company receives a payment.
<b>Journal No.</b>	This field shows the number of the current customer payment journal.
<b>Line No.</b>	This field shows the line number of the registration of the customer payment in the journal.
<b>Trans. No.</b>	This field shows the transaction number of the new payment.
<b>Transaction Type</b>	This field displays the transaction type for the customer payment.

Field	Description
<b>Reference Date</b>	This field displays a reference date for the current entry.
<b>Reconc. Invoice No.</b>	This field displays an invoice number if the payment should be reconciled fully or partly against a posted invoice
<b>Reconcile Transaction No.</b>	This field displays a transaction number if the payment should be reconciled fully or partly against a posted customer entry
<b>Job No.</b>	For credit memos, this field shows the number of the job to which the credit memo is assigned. For customer payments, this field displays a job number for reference.
<b>Released</b>	When this field is marked, the current payment and selected reconciliation is released for posting. The field is automatically marked by Maconomy when a customer entry is approved for reconciliation by means of the action "Approve Reconciliation" in this window.
<b>Posted</b>	This field shows whether or not the current payment has been posted. The field is automatically marked by Maconomy when a payment is posted and cannot be edited manually.
<b>Approved for Reconciliation</b>	This field shows whether or not a reconciliation has been approved. The field is automatically marked by Maconomy when a customer payment and one or more assigned entries are approved for reconciliation by means of the action "Approve Reconciliation."

**External Account Island**

Field	Description
<b>Cust. Payment Mode</b>	This field displays a customer payment mode.
<b>Payment Agent</b>	This field displays a customer payment agent.
<b>Reg. No.</b>	This field displays a bank registration number.
<b>External Account No.</b>	This field displays an external account number.

**Other Information Island**

Field	Description
<b>Last Statement No.</b>	This is the number of the latest historical account statement printed out for the customer.
<b>Date of Last Statement</b>	This is the date of the latest historical statement created for the customer.

Field	Description
<b>Current Reminder Level</b>	This is the customer's current reminder level. The customer's reminder level is the highest level of one of the customer's open entries. The reminder level of an entry is automatically raised every time you send a reminder to the customer.
<b>Date of Last Reminder</b>	This is the date on which you last sent a reminder to the customer.

#### Remarks Island

Field	Description
<b>Remarks</b>	In this field, you can enter remarks about the current customer payment. If the payment is the result of reading a customer payment file in the Banking module, and the payment has an error, then the error message will be displayed in this field, for example, "Unknown Payer ID" or "No Collection Order Found."

#### Company Island

Field	Description
<b>Journal Company</b>	This field displays the name and number of the journal company of the customer.
<b>Settling Company</b>	This field displays the name and number of the settling company of the customer.

#### Dimensions Island

Field	Description
<b>Location</b>	This field shows the value of the dimension Location on the current customer entry. If the entry is caused by an invoice or a credit memo, the value is transferred from the field "Location" in the card part of the current invoice or credit memo. If the customer entry is caused by a general journal, the value is transferred from the field "Location" on the general journal line containing the customer entry. If the customer entry is caused by an interest or reminder selection, the value is transferred from the field "Location" on the information card of the current customer.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

Field	Description
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

**Amounts Island**

Field	Description
<b>Amount, Currency</b>	This field shows the amount paid in the original currency of the customer payment.
<b>Amount, Base</b>	This field shows the amount paid in the base currency of the company to which the customer is assigned.
<b>Charge, Currency</b>	This field displays a charge amount in the original currency of the customer payment.
<b>Charge, Base</b>	This field displays a charge amount in the base currency of the customer payment.

**Reconciliation Information Island**

Field	Description
<b>Reconciliation Currency</b>	This field shows the currency in which the reconciliation is made.
<b>Customer Payment, Reconciliation Currency</b>	This field shows the amount paid by the customer in the currency specified in the field "Reconciliation Currency" above.
<b>Remainder, Reconciliation Currency</b>	This field shows how much of the original payment or credit memo amount can still be used to reconcile entries. You cannot reconcile more than the amount in this field. The field is automatically updated by Maconomy when you select entries for reconciliation.
<b>Reconciled in Debit</b>	This field displays the debit amount reconciled against the current payment.
<b>Reconciled in Credit</b>	This field displays the credit amount reconciled against the current payment.
<b>Cash Discount, Reconciliation Currency</b>	This field shows any cash discount manually specified in the reconciliation currency. If you make a full reconciliation of an open entry with an amount smaller than the payment amount, this field will show the cash discount resulting from the reconciliation. The amount is shown as a positive figure. When you approve such a reconciliation, Maconomy suggests that the balance is posted as a cash discount.

Field	Description
	<p>When you approve reconciled open entries, Maconomy transfers the cash discount, if any, to a customer reconciliation journal that is ready to be posted in the G/L module or in the window Customer Payments - unless it is posted automatically (see the description of the action "Approve Reconciliation"). When you approve the reconciled payments, Maconomy verifies that the amount does not exceed the cash discount limit. This limit is the percentage specified in the field "Max. Cash Discount" in the cash discount code specified for the current customer in the window Payment Information.</p> <p>You specify the posting reference to the customer cash discount account by means of a dimension combination in the window Posting References in the G/L module.</p>
<b>Difference, Reconciliation Currency</b>	<p>This field shows any difference between the debit and credit amounts, that is, the total amount variance between the current payment amount and the entries selected for reconciliation. If you select an open entry with an amount which exceeds the payment amount, the figure in this field will be positive. When you approve such a reconciliation, Maconomy suggests that this exceeding amount is posted as a cash discount or as a customer payment variance depending on the value, if any, specified in the system parameter "Margin For Customer Payment Variances" in the Set-Up module.</p> <p>If the reconciliation gives rise to a cash discount, Maconomy verifies that the amount added to any existing cash discount does not exceed the cash discount limit which applies to the customer in question. This limit is the percentage specified in the field "Max. Cash Discount" in the cash discount code specified for the current customer in the window Payment Information. Maconomy transfers the cash discount to a customer reconciliation journal, which is ready to be posted in the G/L module or in the window Customer Payments - unless it is posted automatically.</p> <p>If you have specified a value in the system parameter "Margin For Customer Payment Variances" and if the reconciliation gives rise to an amount variance which is within the value specified in the parameter, variance amounts are posted on an account for customer payment variances. The posting reference for customer payment variances is specified in the window Posting References in the G/L module.</p> <p>If the payment or crediting is not fully used to reconcile an invoice, the balance in this field is shown as a negative figure.</p>
<b>Cash Discount, Base</b>	<p>This field shows any cash discount manually specified in the base currency</p>
<b>Difference, Base</b>	<p>This field shows any difference between the debit and credit amounts, that is, the total amount variance between the current payment amount and the entries selected for reconciliation, expressed in the base currency.</p>

## Show Customer Reconciliation History Single Dialogs Workspace

Use this workspace to review customer entries and the entries against which they were balanced, for any period that you need to see.

For example, you can review a payment and see the invoices that were partly or fully reconciled by that payment.

This workspace is similar to the Show Customer Reconciliation workspace. The Show Customer Reconciliation workspace only shows the current reconciliation; however, the Show Customer Reconciliation History workspace also shows reconciliations that you have reopened or removed.

### Show Customer Reconciliation History Tab

This section includes the fields and descriptions for the Show Customer Reconciliation History tab.

#### Customer Island

Field	Description
<b>Customer No.</b>	This is the customer number assigned to the current entry. The island also shows the first three lines of the customer's name and address. The information is retrieved from the customer's information card.

#### Company Island

Field	Description
<b>Company</b>	This field displays the company name and number of the company registered as settling company for the current customer.

#### Dimensions Island

Field	Description
<b>Location</b>	This field shows the value of the dimension Location on the current customer entry. If the entry is caused by an invoice or a credit memo, the value is transferred from the field "Location" in the card part of the current invoice or credit memo. If the customer entry is caused by a general journal, the value is transferred from the field "Location" on the general journal line containing the customer entry. If the customer entry is caused by an interest or reminder selection, the value is transferred from the field "Location" on the information card of the current customer.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.

Field	Description
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

### Interest and Reminder Island

Field	Description
<b>Closed for Interest Calculation</b>	If this field is marked, the entry is closed for interest calculation. Entries that are closed for interest calculation are not included in the interest charge selection and interest charge notice printouts, and such entries are ignored when calculating interest charge.
<b>Block Type</b>	This field displays the reason the entry is blocked.
<b>Block Date</b>	This field displays the date the entry was blocked.
<b>Blocked By</b>	This field displays the name of the user who blocked the entry.
<b>Remarks</b>	This field displays any remarks associated with the blocked entry.

### Entry Information Island

Field	Description
<b>Entry Date</b>	This field shows the date on which the entry was registered in the A/R or the G/L module.
<b>Entry Type</b>	This field shows the customer entry type, which can be one of the following: <ul style="list-style-type: none"> <li>■ Invoice from invoicing in the Sales Orders module.</li> <li>■ Credit memo from crediting in the Sales Orders module.</li> <li>■ Interest from approval of interest charge selection in the A/R module.</li> <li>■ Reminder from approval of reminder selection in the A/R module.</li> <li>■ Payment, a credit entry made in the window General Journal.</li> <li>■ Payment, a debit entry made in the window General Journal.</li> <li>■ Cash Discount Positive, a cash discount entered in the window Customer Open Entry Reconciliation.</li> <li>■ Currency Variance Positive, currency gain entered in the window Customer Open Entry Reconciliation or the window General Journal.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Currency Variance Negative, currency loss entered in the window Customer Open Entry Reconciliation or the window General Journal.</li> </ul>
<b>Description</b>	This field shows the text assigned to the entry.
<b>Trans. No.</b>	This field shows the entry's transaction number. If the entry is from a general journal, the number was entered manually. If the entry is from invoicing or crediting in the sales orders module, the transaction number is the same as the invoice or credit memo number which was given automatically by Maconomy from the "Invoice" or "Credit Memo" system numbers. If the entry is an interest entry or reminder charge, the number was given automatically from the "Interest Notice" system numbers.
<b>Trans. Type</b>	This field shows the transaction type of the customer entry against which the customer entry in the card part was reconciled.
<b>Open/Closed</b>	This field shows whether the entry is "Open" or "Closed."
<b>Due Date</b>	This field shows the entry's due date. The due date is always the entry date of the assigned payment or credit memo.
<b>Date Reconciled</b>	This field shows the date on which the invoice was fully reconciled. The field is blank for other types of entries and for invoices which are not fully reconciled.
<b>Date Posted</b>	This field shows the date on which the entry was posted.
<b>Time Posted</b>	This field shows the time at which the entry was posted.
<b>Journal No.</b>	This field shows the number of the posting journal in which the entry was posted.
<b>Company of Origin</b>	This field shows the name of the company responsible for the invoice, credit memo, general journal or interest or reminder selection that has caused the current customer entry. On invoices, credit memos, and general journals, the responsible company can be specified in the field "Company No." in the island Company whereas the responsible company on customer entries created upon approval of an interest or reminder selection is automatically transferred from the field "Company No." in the island Settling Company on the relevant customer's information card.

### Entry Island

Field	Description
<b>Debit, Standard</b>	This field shows the entry amount in the customer's standard currency, if the entry is a debit entry.

Field	Description
<b>Credit, Standard</b>	This field shows the entry amount in the customer's standard currency, if the entry is a credit entry.
<b>Remainder, Standard</b>	This field shows how much of the entry has not been reconciled. The amount is displayed in the customer's standard currency.
<b>Debit, Base</b>	This field shows the entry amount in the base currency, if the entry is a debit entry.
<b>Credit, Base</b>	This field shows the entry amount in the base currency, if the entry is a credit entry.
<b>Remainder, Base</b>	This field shows how much of the entry has not been reconciled. The amount is displayed in base currency.
<b>Amount, Original</b>	This field shows the entry amount in the original currency.
<b>Remainder, Original</b>	This field shows how much of the entry has not been reconciled. The amount is displayed in the original currency.
<b>Original Currency</b>	This field shows the original currency of the entry.

### Customer Reconciliations Sub-Tab

This section includes the fields and descriptions for the Customer Reconciliations sub-tab.

Field	Description
<b>Removed Reconc. Date</b>	If an approved reconciliation was removed, this shows the date it was removed.
<b>Entry Date</b>	This field shows the date on which the entry was registered in the A/R or the G/L module.
<b>Trans. No.</b>	This field shows the entry's transaction number. If the entry is from a general journal, the number was entered manually. If the entry is from invoicing or crediting in the sales orders module, the transaction number is the same as the invoice or credit memo number which was given automatically by Maconomy from the "Invoice" or "Credit Memo" system numbers. If the entry is an interest entry or reminder charge, the number was given automatically from the "Interest Notice" system numbers.
<b>Trans. Type</b>	This field shows the transaction type of the customer entry against which the customer entry in the card part was reconciled.
<b>Description</b>	This field shows the text assigned to the entry.
<b>Orig. Amount</b>	This field shows the entry amount in the original currency.

Field	Description
<b>Original Currency</b>	This field shows the original currency of the entry.
<b>Reconciled, Original</b>	This field shows the amount reconciled on the original entry. The amount is displayed in the currency used on the entry in question.
<b>Cash Discount, Original</b>	This field shows the cash discount amount registered on the entry, if any. The amount is displayed in the currency used on the entry in question.
<b>Cust. Paym. Variance, Original</b>	This field shows the payment variance amount registered on the entry, if any. The amount is displayed in the currency used on the entry in question.
<b>Type</b>	<p>This field shows the customer entry type, which can be one of the following:</p> <ul style="list-style-type: none"> <li>■ Invoice from invoicing in the Sales Orders module.</li> <li>■ Credit memo from crediting in the Sales Orders module.</li> <li>■ Interest from approval of interest charge selection in the A/R module.</li> <li>■ Reminder from approval of reminder selection in the A/R module.</li> <li>■ Payment, a credit entry made in the window General Journal.</li> <li>■ Payment, a debit entry made in the window General Journal.</li> <li>■ Cash Discount Positive, a cash discount entered in the window Customer Open Entry Reconciliation.</li> <li>■ Currency Variance Positive, currency gain entered in the window Customer Open Entry Reconciliation or the window General Journal.</li> <li>■ Currency Variance Negative, currency loss entered in the window Customer Open Entry Reconciliation or the window General Journal.</li> </ul>
<b>Reconciliation Currency</b>	This field shows the currency in which reconciliation of the current line has been made.
<b>Debit, Standard</b>	This field shows the entry amount in the customer's standard currency, if the entry is a debit entry.
<b>Credit, Standard</b>	This field shows the entry amount in the customer's standard currency, if the entry is a credit entry.
<b>Reconciled, Standard</b>	This field shows the amount reconciled of the original entry. The amount is displayed in the customer's standard currency.

Field	Description
<b>Cash Discount, Standard</b>	This field shows the cash discount amount registered on the entry, if any. The amount is displayed in the customer's standard currency.
<b>Cust. Paym. Variance, Standard</b>	This field shows the payment variance amount registered on the entry, if any. The amount is displayed in the customer's standard currency.
<b>Debit, Base</b>	This field shows the entry amount in the base currency, if the entry is a debit entry.
<b>Credit, Base</b>	This field shows the entry amount in the base currency, if the entry is a credit entry.
<b>Reconciled, Base</b>	This field shows how much of the original entry has been reconciled. The amount is displayed in the base currency.
<b>Cash Discount, Base</b>	This field shows the cash discount amount registered on the entry, if any. The amount is displayed in the base currency.
<b>Cust. Paym. Variance, Base</b>	This field shows the payment variance amount registered on the entry, if any. The amount is displayed in the base currency.
<b>Open/Closed</b>	This field shows whether the entry is open or closed.
<b>Due Date</b>	This field shows the entry's due date. If the entry is an invoice, the due date is calculated on the basis of the invoice date and the customer's terms of payment. Otherwise the due date is the entry date.
<b>Date Posted</b>	This shows the date the entry was posted.
<b>Journal No.</b>	This field shows the number of the posting journal in which the entry was posted.
<b>Company of Origin</b>	This field shows the name of the company responsible for the invoice, credit memo, general journal or interest or reminder selection that has caused the current customer entry. On invoices, credit memos, and general journals, the responsible company can be specified in the field "Company No." in the island Company whereas the responsible company on customer entries created upon approval of the interest or reminder selection is automatically transferred from the field "Company No." in the island Settling Company on the relevant customer information card.
<b>Company No.</b>	This field shows the value of the dimension Company on the current customer entry. The value is transferred from the field "Company No." in the island Settling Company on the information card of the current customer.

Field	Description
<b>Location</b>	This field shows the value of the dimension Location on the current entry. If the entry is caused by an invoice or a credit memo, the value is transferred from the field "Location" in the card part of the current invoice or credit memo. If the customer entry is caused by a general journal, the value is transferred from the field "Location" on the general journal line with the customer entry. If the customer entry is caused by an interest or reminder selection, the value is transferred from the field "Location" on the information card of the current customer.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

## Show Customer Reconciliation Journals Single Dialogs Workspace

Use this workspace to review information about customer reconciliation journals.

This workspace displays all customer reconciliation journals, including those that you have reopened, and the customer reconciliation journals that reopen the previously performed reconciliations.

### Customer Reconciliation Journal Tab

This section describes the Customer Reconciliation Journal tab.

#### Copy to Come

Field	Description

## Show Debtor Provisions Single Dialogs Workspace

Use this workspace to review customer provisions.

Customer provisions are created when you approve a customer provision in the Debtor Provisions by Invoice workspace.

## Debtor Provision Tab

This section includes the fields and descriptions for the Debtor Provision tab.

### Journal Island

Field	Description
<b>Journal No.</b>	This is the number of the journal to which the entry was posted.
<b>Line No.</b>	This field shows the number of the line on which the entry was placed in the journal.
<b>Trans. No.</b>	This field shows the transaction number of the transaction that generated the customer accrual journal line.
<b>Transaction Type</b>	This field is the transaction type of the customer accrual journal line.
<b>Entry Line No.</b>	This field shows the customer accrual journal line number.
<b>Entry Date</b>	This field shows the invoice date of the current invoice.
<b>Entry Description</b>	This field shows the entry description. This text is used as posting description on the G/L entries created when the debtor provisions are approved and the journal is subsequently posted.
<b>Approved by</b>	This field shows the user name of the person who approved the customer accrual journal line.
<b>Approval Date</b>	This field shows the date on which the customer accrual journal line was approved.
<b>Posting Date</b>	This field shows the date on which the customer accrual journal line was posted.

### Provision Island

Field	Description
<b>Provision Cause</b>	This field shows the provision cause which can, for example, be used as selection criterion in reports.
<b>Provision Remark</b>	This field shows the remark for the current provision, for example, elaborating on the provision cause selected in the Provision Cause field. This remark can also be transferred to reports, but is not used elsewhere in Maconomy.

**Amount Island**

Field	Description
<b>Amount for Provision, Currency</b>	This field shows the customer accrual (debtor provision) amount, in the job's currency.
<b>Amount for Provision, Base</b>	This field shows the customer accrual (debtor provision) amount, in the base currency.
<b>Amount for Provision, Enterprise</b>	This field shows the customer accrual (debtor provision) amount, in the enterprise currency.

**Company Island**

Field	Description
<b>Company</b>	This field shows the company name number of the current customer.

**Customer Island**

Field	Description
<b>Customer</b>	This field shows the customer name and number.

**Job Island**

Field	Description
<b>Job</b>	This field shows the job name and number, if the customer accrual is related to a job.

**Dimensions Island**

Field	Description
<b>Location</b>	This field shows the value of the dimension Location on the current customer entry. If the entry is caused by an invoice or a credit memo, the value is transferred from the field "Location" in the card part of the current invoice or credit memo. If the customer entry is caused by a general journal, the value is transferred from the field "Location" on the general journal line containing the customer entry. If the customer entry is caused by an interest or reminder selection, the value is transferred from the field "Location" on the information card of the current customer.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.

Field	Description
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

## Reporting Section

This section includes the fields and descriptions for the Reporting section workspaces.

### Print Historical Customer Statement Single Dialogs Workspace

Use this workspace to generate historical statements about all customer entries that were not included on a previous historical statement, including historical entries and the customers' current balance due.

Use the Periodic Customer Statement workspace to review all of the entries for a single period. Use the Open Entry Customer Statement workspace to review all open entries, regardless of period.

A historical statement consists of entries that have not appeared on earlier historical statements. When you create a historical statement, Maconomy assigns the next statement number to the new entry. This means that you can reprint historical statements by specifying the statement number.

The statement also shows the customer's due balance on a given date.

### Print Historical Customer Statement Tab

This section includes the fields and descriptions for the Print Historical Customer Statement tab.

#### Selection Criteria Island

Field	Description
<b>Customer No.</b>	<p>Here you specify a range of customer numbers. The printout only includes customers within this range.</p> <p>If you wish to reprint a statement, you only fill in the first of the two fields. You then print a statement for the specified customer. Maconomy registers a statement number for each customer. For example, one customer has reached statement number 6, while another has reached number 11.</p> <p>Maconomy can also print the last statement for a range of customers. To do this, the "Create Statement" field has to be blank and the "Statement No." field marked "0."</p>

Field	Description
<b>Company No.</b>	In these fields, you can enter a range of company numbers. The printout will only be based on customer entries with a settling company within the specified range.
<b>Customer Type</b>	Here you can select a customer type. The printout will only include statements for customers of this type.
<b>Customer Group</b>	Here you can select a customer group. The printout will only include statements for customers in this group.
<b>Department</b>	Here you can select a department. The printout will only include statements for customers handled by this department.
<b>Language</b>	Here you select a language code. The printout will only include statements for customers with this language code.  You can use the language code to print credit memos in different languages. You can use Maconomy's layout editing tools to create customer statements in different languages. When you define the printout, select the language code of the credit memo and layout in the same language.
<b>Country</b>	In this field, you can select a country. The report will only include customers located in the selected country.
<b>Currency</b>	In this field, you can select a currency. The report will only include customers whose currency specified in the customer information card corresponds to the currency in this field.
<b>Control Account</b>	In this field, you can select a control account. The report will only include customers assigned to this control account.
<b>Balance Due On</b>	Here you can enter a date on which to see the customer's balance. The balance due is the sum of the overdue amounts on all open debit entries due before or on the given date, less the sum of the overdue amounts on all open credit entries, regardless of the when these were due. Maconomy suggests the current date.
<b>Statistics 1-4</b>	In these fields, you can select a number of statistics codes. The report will only include customers whose values in the corresponding statistics fields in the customer information card correspond to the values specified here.

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	In these fields, you can specify a range of dimension location numbers. The printout will only include customers for which the Location field in the window Customer Information Card contains a value within the specified range.
<b>Entity</b>	The functionality of these fields is similar to that of the Location field above.
<b>Project</b>	The functionality of these fields is similar to that of the Location field above.

Field	Description
<b>Purpose</b>	The functionality of these fields is similar to that of the Location field above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the Location field above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the Location field above.

#### Derived Dimensions Island

Field	Description
<b>Dimension Comb.</b>	In these fields, you can specify a range of dimension combination numbers. The printout will only include customers for which the field "Dimension Comb. No." in the window Customer Information Card contains a value within the specified range.

#### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, the only options will be "External" and "Internal."  The external statement is in the customer's standard currency, while the internal statement shows all figures in both the base currency of the assigned company and the customer's standard currency.
<b>Create Statement</b>	If you mark this field, Maconomy will create and print new statements. These are automatically given a number for every customer. These numbers are updated by Maconomy. When you create historical account statements, one customer might be given statement number 3, while another is given number 8 because you have made more statements for the second customer.  When you reprint historical statements, you must leave this field blank.

#### Reprint Island

Field	Description
<b>Statement No.</b>	In this field, you enter the number of the statement you wish to reprint. You only have to enter a number if you are reprinting one specific historical statement for a specific customer.  If you do not enter a figure (that is, the field shows 0) and you do not mark the "Create Statement" field, Maconomy will reprint the latest statements for the customers in the range entered above.

**Extra Fields Island**

Field	Description
<b>Enterprise</b>	In this field, you can select an enterprise. The printout will only include customers for which the value in the field "Enterprise" in the window Customer Information Card corresponds to the value specified here. However, if you leave the field blank, customers with any value in the enterprise field are included.
<b>Segment</b>	In this field, you can select a segment. The printout will only include customers for which the value in the field "Segment" in the window Customer Information Card corresponds to the value specified here. However, if you leave the field blank, customers with any value in the segment field are included.
<b>Area</b>	In this field, you can select an area. The printout will only include customers for which the value in the field "Area" in the window Customer Information Card corresponds to the value specified here. However, if you leave the field blank, customers with any value in the area field are included.
<b>Popup 1-5</b>	In each of these fields, you can specify a customer pop-up value. The printout will only include customers for which the values in the fields "Popup 1-5" in the window Customer Information Card correspond to the values specified here. However, if you leave a given pop-up field blank, customers with any value in the field in question are included.

## Print A/R Balance List Single Dialogs Workspace

Use this workspace to print a balance list for your customers, including both credit and debit balances.

The report is sorted by A/R control account, and can show the current open entry total or a sum of open entries on a prior date. Use the report to balance your accounts receivable with the general ledger.

The list is divided into A/R control accounts. It shows the current sum of open entries or a historical sum for each of the relevant customers. The balance list includes both debit and credit balances. You can use this list to balance the Accounts Receivable and the General Ledger.

Note that the balance can take a long time to generate if you specify a date far back in time in the **Date** field.

### Print A/R Balance List Tab

This section includes the fields and descriptions for the Print A/R Balance List tab.

**Selection Criteria Island**

Field	Description
<b>Customer No.</b>	Here you specify a range of customer numbers. The printout will only include balances for customers within this range.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. The balance will only be calculated for customer entries with a settling company within

Field	Description
	the specified range. Please note that Maconomy prints one line per combination of company and customer.
<b>Dimension Comb. No.</b>	In this field, you specify the number of the dimension combination when creating a new dimension combination. If the dimension combination is created on the basis of a control account, it has automatically been assigned the number of the account in question.
<b>Date</b>	In this field, you enter the date of the balance you wish to see. The date entered must be a past date. Maconomy calculates which balance your customers have/had on this date, and sums up the balances per control account. These balances can be matched with the General Ledger provided you have not deleted entries between the given date and today's date. Note that the balance may take a long time to generate if you specify a date far back in time.
<b>Customer Group</b>	Here you select a customer group. The printout will only include customers in this group.
<b>Department</b>	Here you select a department. The printout will only include customers assigned to this department.
<b>Country</b>	Here you select a country. The printout will only include customers from this country.
<b>Currency</b>	Here you select a currency. The printout will only include customers with this currency as their standard currency.
<b>Control Account</b>	In this field, you can select a control account. The report will only include customers assigned to this control account.
<b>Customer Type</b>	In this field, you can select a customer type. The report will only include customers of the specified type.
<b>Language</b>	In this field, you can select a language. The report will only include customers whose standard language corresponds to the language specified in this field.
<b>Statistics 1-4</b>	In these fields, you can select a number of statistics codes. The report will only include customers whose values in the corresponding statistics fields in the customer information card correspond to the values specified here.

### Selection Criteria, Dimensions

Field	Description
<b>Location</b>	In these fields, you can specify a range of location numbers. The printout will only include customers for which the Location field in the window Customer Information Card contains a value within the specified range.
<b>Entity</b>	The functionality of these fields is similar to that of the Location field above.

Field	Description
<b>Project</b>	The functionality of these fields is similar to that of the Location field above.
<b>Purpose</b>	The functionality of these fields is similar to that of the Location field above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the Location field above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the Location field above.

### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which the balance list should be printed. The balance list will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	<p>In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."</p>

### Print Control Island

Field	Description
<b>Layout</b>	<p>Here you choose the layout of the printout. You can choose between "Standard" and "Detailed" of which the latter shows entries that are open on the balance list start date for each customer.</p> <p>If you want the printout in "Standard" or "Detailed" to give a fully updated customer balance list, it is necessary to post all customer-related journals (that is, journals of the type Collection, Customer Reconciliation, Interest Charge, and Reminder) before you print out the balance list.</p>
<b>Include Zero Balances</b>	<p>If you mark this field, you include customers with a zero balance. If you do not mark the field, you only include customers with either a debit or credit balance.</p>

**Extra Fields**

Field	Description
<b>Enterprise</b>	In this field, you can select an enterprise. The printout will only include customers for which the value in the field "Enterprise" in the window Customer Information Card corresponds to the value specified here. However, if you leave the field blank, customers with any value in the enterprise field are included.
<b>Segment</b>	In this field, you can select a segment. The printout will only include customers for which the value in the field "Segment" in the window Customer Information Card corresponds to the value specified here. However, if you leave the field blank, customers with any value in the segment field are included.
<b>Area</b>	In this field, you can select an area. The printout will only include customers for which the value in the field "Area" in the window Customer Information Card corresponds to the value specified here. However, if you leave the field blank, customers with any value in the area field are included.
<b>Popup 1-5</b>	In each of these fields, you can specify a customer pop-up value. The printout will only include customers for which the values in the fields "Popup 1-5" in the window Customer Information Card correspond to the values specified here. However, if you leave a given pop-up field blank, customers with any value in the field in question are included.

## Print A/R Aging Report Single Dialogs Workspace

Use this workspace to print an aging report for one or more customers.

You can use the aging report to calculate your company's liquidity and to decide when to start interest and reminder procedures.

Aging is based on either the due date of the entries or the entry date of the entries. The report shows ranges of dates and which payments are due in each range.

You can specify whether you want to print the aging report based on the due date of the entries or based on the entry date. If you choose to base the report on the entry date, an entry is considered due on the entry date. However, if you choose to base the report on the due date, each entry is considered due on the due date specified on the entry in question. The report shows in which range of dates the entries are due for payment. You enter the date range in the target group fields.

You can select to include customers who have a credit balance. The amount limit that you enter applies to the debit balance on the day of the printout.

## Print A/R Aging Report Tab

This section includes the fields and descriptions for the Print A/R Aging Report tab.

### Selection Criteria Island

Field	Description
<b>Customer No.</b>	In this field, you enter a range of customers. The printout will only include customers within this range.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. The aging report will only be calculated for customer entries with a settling company within the specified range. Maconomy prints one line per combination of company and customer.
<b>Dimension Comb. No.</b>	In this field, you specify the number of the dimension combination when creating a new dimension combination. If the dimension combination is created on the basis of a control account, it has automatically been assigned the number of the account in question.
<b>Statement Date</b>	In this field, you can specify the statement date of the current balance. Maconomy calculates the balances for the company's customers on this date and summarizes the balances per A/R control account. You cannot specify a future date in this field. This field has to be filled out.
<b>Customer Group</b>	In this field, you can select a customer group. The report will only include customers in this group.
<b>Department</b>	In this field, you can select a department. The report will only include customers assigned to this department.
<b>Country</b>	In this field, you can select a country. The report will only include customers from this country.
<b>Currency</b>	In this field, you can select a currency. The report will only include customers with this currency as their standard currency.
<b>Control Account</b>	In this field, you can select a control account. The report will only include customers assigned to this control account.
<b>Customer Type</b>	In this field, you can select a customer type. The report will only include customers of the specified type.
<b>Language</b>	In this field, you can select a language. The report will only include customers whose standard language corresponds to the language specified in this field.
<b>Statistics 1 - 4</b>	In these fields, you can select a number of statistics codes. The report will only include customers whose values in the corresponding statistics fields in the customer information card correspond to the values specified here.

**Selection Criteria, Dimensions**

Field	Description
<b>Location</b>	In these fields, you can specify a range of location numbers. The printout will only include customers for which the Location field in the window Customer Information Card contains a value within the specified range.
<b>Entity</b>	The functionality of these fields is similar to that of the Location field above.
<b>Project</b>	The functionality of these fields is similar to that of the Location field above.
<b>Purpose</b>	The functionality of these fields is similar to that of the Location field above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the Location field above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the Location field above.

**Currency Island**

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which the A/R aging report should be printed. The A/R aging report will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

**Print Control Island**

Field	Description
<b>Aging Principle</b>	This field displays the aging principle to use. The field is mandatory.

Field	Description
<b>Start Date</b>	<p>In this field, you enter the date for which to calculate the debit balance. You must enter a date.</p> <p>Maconomy calculates the debit balance for five dates - according to how you mark fields in the island Print Control.</p> <p>If the report looks forward, Maconomy calculates the balance for the following periods and dates:</p> <ol style="list-style-type: none"> <li>1. Today's date (the date of the printout)</li> <li>2. The period before the start date</li> <li>3. 1 month/day after the start date</li> <li>4. 2 months/days after the start date</li> <li>5. Other months/days after the start date</li> </ol> <p>The balance today's date (1) is the sum of the balances for periods 2 to 5.</p> <p>If the report looks back in time, Maconomy calculates the balance for the following dates:</p> <ol style="list-style-type: none"> <li>1. Today's date (the date of the printout)</li> <li>2. The period after the given start date</li> <li>3. 1 month/day before the start date</li> <li>4. 2 months/days after the start date</li> <li>5. Other months/days after the start date</li> </ol> <p>The balance today's date (1) is the sum of the balances for periods 2 to 5.</p>
<b>Layout</b>	<p>In this field, you can choose the layout of the printout. You can choose between "Standard" and "Detailed" of which the latter shows the entry date, transaction number, and text in addition to customer number, name, balance three months back, and previous balance.</p>

### Limit Island

Field	Description
<b>Include only customers with a balance of more than</b>	<p>Here you can enter an amount and a currency. The report will only include customers whose balance on the start date is larger than the specified amount. Customers with a credit balance are only included if you select a negative balance limit. A credit balance is thus considered a negative debit balance.</p>

### Extra Fields Island

Field	Description
<b>Enterprise</b>	<p>In this field, you can select an enterprise. The printout will only include customers for which the value in the field "Enterprise" in the window Customer Information</p>

Field	Description
	Card corresponds to the value specified here. However, if you leave the field blank, customers with any value in the enterprise field are included.
<b>Segment</b>	In this field, you can select a segment. The printout will only include customers for which the value in the field "Segment" in the window Customer Information Card corresponds to the value specified here. However, if you leave the field blank, customers with any value in the segment field are included.
<b>Area</b>	In this field, you can select an area. The printout will only include customers for which the value in the field "Area" in the window Customer Information Card corresponds to the value specified here. However, if you leave the field blank, customers with any value in the area field are included.
<b>Popup 1-5</b>	In each of these fields, you can specify a customer pop-up value. The printout will only include customers for which the values in the fields "Popup 1-5" in the window Customer Information Card correspond to the values specified here. However, if you leave a given pop-up field blank, customers with any value in the field in question are included.

## Print Customer Statistics Single Dialogs Workspace

Use this workspace to print the sales and gross profit statistics that are associated with specific customers

The report shows monthly sales and profit figures for each customer, based on the bill-to customer number. The report ignores invoice discounts.

Use the Print Invoice Statistics workspace in the Sales Orders module to see statistics for ship-to customers.

### Print Customer Statistics Tab

This section includes the fields and descriptions for the Print Customer Statistics tab.

#### Selection Criteria Island

Field	Description
<b>Customer No.</b>	Specify a range of customer numbers here. The statistics will only include customers within this range.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. The statistics will only be based on customer entries with a settling company within the specified range.
<b>Year</b>	Here you specify a range of years. The statistics will only include activity within this range. This field must be completed.
<b>Cust. Group</b>	Here you select a customer group. The statistics will only include customers in this group.

Field	Description
<b>Department</b>	Here you select a department. The statistics will only include customers assigned to this department.
<b>Country</b>	Here you select a country. The statistics will only include customers from this country.
<b>Currency</b>	Here you select a currency. The statistics will only include customers with this currency as standard currency.
<b>Statistics 1-4</b>	Here you can specify a range of statistics codes in each of the four statistics categories. The statistics will only include customers with statistics codes in the given range.

### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which the grand total of the customer statistics should be printed. The customer statistics will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

## Print Customer Group Statistics Single Dialogs Workspace

Use this workspace to print the sales and gross profit statistics that are associated with specific customers and customer groups.

The report shows total sales, gross profit, and gross profit as a percentage of either sales or cost of sales, for a given month and year-to-date. The statistics are based on the bill-to customer number.

Use the Print Invoice Statistics workspace in the Sales Orders module to see statistics for ship-to customers.

On the printout, the gross profit percentage is called the gross margin, regardless of how it is calculated. The value in the **Gross Margin** field in the System Information workspace in the Set-Up module determines how Maconomy calculates the gross margin. "From Sales Price" means that Maconomy calculates the gross margin from sales, in line with standard practice.

### Print Customer Group Statistics Tab

This section includes the fields and descriptions for the Print Customer Group Statistics tab.

#### Selection Criteria Island

Field	Description
<b>Customer No.</b>	Here you specify a range of customer numbers. The statistics will only include customers within this range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The statistics will only include customer entries whose settling company lies within this range.
<b>Cust. Group</b>	Here you select a customer group. The statistics will only include customers in this group.
<b>Department</b>	Here you select a department. The statistics will only include customers assigned to this department.
<b>Country</b>	Here you select a country. The statistics will only include customers from this country.
<b>Statistics 1-4</b>	Here you can specify a range of statistics codes in each of the four statistics categories. The statistics will only include customers with statistics codes within the given range.

#### Currency Island

Field	Description
<b>Reporting Currency</b>	In this field, you can specify the currency in which the customer group statistics should be printed. The customer group statistics will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.

Field	Description
	When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

### Period Island

Field	Description
<b>Month/Year</b>	Here you specify the month and year for which to make statistics. You enter "1" for January, "2" for February, and so on. The field is mandatory.

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.
<b>Show Info. by Customer</b>	Mark this field if you wish to see sales and gross profit per customer. If this field is not marked, the printout shows totals per customer group.
<b>Include Inactive Customers</b>	Here you specify whether to include customers for whom there are no sales in the given month. If the field is marked, the printout includes inactive customers. Note, this only applies if you mark the "Show Info. by Customer" field.

## Set-Up Section

This section includes the fields and descriptions for the Set-Up section workspaces.

### Customer Information Card Single Dialogs Workspace

Use this workspace to enter and maintain information about your customers, such as name, address, and general information used to process customer sales orders.

Customers that you enter in this workspace are centralized, enterprise-wide customers, and are the basis from which you create company-specific customers. Use the Company Specific Customer Information Card workspace to create company-specific customers.

You can create, change, and delete information in this workspace. However, you can only delete a customer for whom there are no entries this fiscal year and last fiscal year, and whose balance is 0. You cannot delete a customer for whom entries are ready to be posted, for whom entries are being collected in the G/L module, or if company-specific customers are assigned to the customer.

You maintain company-specific customers in the Company Specific Customer Information Card workspace. If you create a customer using a particular linking rule in the Parent Customer island, the setup of that linking rule determines which information Maconomy copies to the new customer and whether this information should be changeable. The ability to enter, change, or view a value in each field also depends on the setup of the linking rule that you assigned to the customer, if any.

If you want Maconomy to automatically copy information from a template/standard customer that you entered in the System Information or Company Information workspace to new customers, you must specify this template customer in one of those workspaces. For Maconomy to copy the information from such a template customer to new customers, you must create a standard linking rule between the database tables "Customer" and "Customer" in the Linking Rules workspace in the Set-Up module. You must create the linking rule with "Customer" in the main table and "Customer" in the subordinate table. In this linking rule, you also specify the fields that are to be copied from the template customer to new customers. If you designate this linking rule as "Standard Linking Rule," Maconomy automatically applies the linking rule applied when you create customers if you do not specify any other linking rule when you create this additional customer. For more information about linking rules, see the description of the Linking Rules workspace in the Set-Up module.

Customer information is split between the Customer Information Card workspace and the Payment Information workspace. This enables you to have a workspace that many users can access and change (Customer Information Card) and another workspace where fewer users can access and change finance information (Payment Information).

For auditing purposes, it is recommended that you print and file the Customer Information Card each time that you change information here or in the Payment Information workspace. To print the Customer Information Card, use the **Print this** function in the File menu.

When you delete a customer that you assigned to a contact company, Maconomy also deletes the contact company in question, unless you have installed an add-on that grants access to the Contact Companies workspace. In that case you must manually delete the relevant contact company if needed.

## Customer Information Card Tab

This section includes the fields and descriptions for the Customer Information Card tab.

**Ship to Customer Island**

Field	Description
<b>Customer No.</b>	<p>In this field, you enter a unique customer number. If you do not specify a number but you have specified a company number in the field "Company No.," the customer number in this field will be derived from the company-specific number series "Customer Series" belonging to the specified company. If you enter neither a number nor a company, the customer number will be derived from the 'global' number series belonging to the first company created in the system. The Ship to Customer is the customer to whom you deliver items. If another customer is paying for the items, you must also enter the Bill to Customer.</p> <p>You also enter the customer's name and address. This information is for reference and is shown on several printouts, for example, order documents. Note, you must fill in the line below the customer number.</p> <p>The fourth line has two fields, one for zip code, the other for postal district. If you enter a zip code and leave the postal district field blank, the postal district field is automatically completed, provided that the zip code in question has been entered for the relevant country in the window Postal Districts in the Set-Up module. For further information, see the description of the window Postal Districts.</p>
<b>Attn.</b>	In this field, you enter the name of an attention person - the person to whom you want shipping information directed. The information is used on printouts.
<b>Country</b>	<p>Here you select the customer's country. The information is used for reference, and it can be used to make statistics.</p> <p>States and countries are maintained in the window Countries in the Set-Up module.</p>
<b>Phone</b>	In this field, you enter the customer's telephone number. The information is used for reference.
<b>Fax</b>	In this field, you enter the customer's fax number. The information is used for reference.
<b>Telex</b>	In this field, you enter the customer's telex number. The information is used for reference.
<b>E-mail</b>	Here you can enter the customer's electronic mail address. The field is used for reference.
<b>Contact Person</b>	Here you can enter a contact with the customer. The field is merely for reference.
<b>Our Contact</b>	Here you can enter the number of the employee who is in charge of the customer in question. The employee must exist in Maconomy.

Field	Description
<b>Termination Date</b>	If you have ceased co-operation with the current customer, you can specify in this field the date on which cooperation was terminated.
<b>Account Manager</b>	In this field, you can enter the account manager of the customer. The information is used on jobs.

### Settling Company Island

Field	Description
<b>Company No.</b>	<p>In this field, you can enter a value for the dimension Company, which thus becomes the settling company of the customer. The settling company is the company which has the claim against the customer and the company to which the customer must make payments. The settling company's accounts also include the customer which means that the value in this field is transferred to the customer entries created on the current customer upon posting. If another company completes postings on the customer, this will automatically lead to intercompany entries of the type "CustomerCollection" between the two companies. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, inter-company entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>The fields in this island are not mandatory. If no settling company is specified, the customer is called a "global customer," and Maconomy will determine the settling company from the responsible company at the time of posting. The responsible company is the company which gave rise to the posting.</p> <p>In the window Company Information in the G/L module you must enter a company number in the island Customer Settling Company. This company is regarded as the settling company for global customers and is entered on the transactions performed by the current company. When postings are made to a global customer, Maconomy will automatically create a company-specific customer, unless it already exists.</p>
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### General Information Island

Field	Description
<b>Department</b>	In this field, you select the department that the customer usually deals with. You can specify other departments on item purchase orders and invoices to the customer.

Field	Description
	<p>The department selected here determines which G/L accounts are used when you invoice customer transactions. The department is a reference to item sales accounts, charge accounts, discount accounts, and so on. The posting references are also used when posting interest and reminder charges, as well as when posting cash discounts and exchange rate differences occurring from open item reconciling.</p> <p>G/L posting references are specified by means of dimension combinations in the window Posting References in the G/L module. If the window System Information in the Set-Up module specifies that entries are posted by item group or by activity, the posting references for item sales and cost of sales are retrieved from the Item Group Information Card in the Inventory module and from the window Activities in the Job Cost module respectively.</p>
<b>Language</b>	<p>In this field, you select the language of the customer. The selected language is used, for example, on printouts of item descriptions on sales order documents and in connection with language texts. For further information about this window, see the description of the window Language Texts in the Set-Up module.</p> <p>Languages are maintained in the pop-up field "Language" in the window Popup Fields in the Set-Up module.</p>
<b>Currency</b>	<p>In this field, you select the customer's standard currency. All customer transactions are converted into the customer's standard currency. This means you can print and send account statements in the customer's own currency. All customer transactions are registered in three currencies:</p> <ul style="list-style-type: none"> <li>Standard Currency. This is the currency in which the customer has requested you hold their account. For example DEM if the customer is from Germany.</li> <li>Base Currency. This is the currency used in your country (USD in the United States) and in which your books are kept.</li> <li>Original Currency. This is the currency of a given transaction. For example FFR, if a German customer pays in French Francs.</li> </ul> <p>To prevent inconsistencies, you cannot change the customer's currency if entries have been posted or are ready to be posted on the customer.</p> <p>Currencies are maintained in the pop-up field "Currencies" in the window Popup Fields in the Set-Up module.</p>
<b>Customer Type</b>	<p>In this field, you select the customer type of the current customer. The field is used for organizing customers.</p> <p>Customer types are maintained in the pop-up field "Customer Types" in the window Popup Fields in the Set-Up module.</p>
<b>Customer Group</b>	<p>In this field, you select to which group of customers the customer belongs. This field is used to classify customers - primarily for statistics.</p> <p>Customer groups are maintained in the pop-up field "Customer Groups" in the window Popup Fields in the Set-Up module.</p>

Field	Description
<b>Enterprise</b>	Here you can assign an enterprise to the customer. Enterprises are maintained in the pop-up field "Enterprises" in the window Popup Fields in the Set-Up module. The field is used for statistics.
<b>Segment</b>	Here you can assign a segment to the customer. Segments are maintained in the pop-up field "Segments" in the window Popup Fields in the Set-Up module. The field is used for statistics.
<b>Area</b>	Here you can assign an area to the customer. Areas are maintained in the pop-up field "Segments" in the window Popup Fields in the Set-Up module. The field is used for statistics.
<b>Company Tax Code</b>	<p>In this field, you can specify a company tax code created in the window Popup Fields. The field is used by Maconomy for determining the tax code to be used in the calculation of tax for the current customer, as the reporting code is part of the criteria for the selection of a tax code in the window Tax Tables in the G/L module. However, the tax code is only selected from a tax table if the field "Use Tax Tables" is marked in the window System Information and if the company specified as the responsible company for the order or job in question is assigned to a tax table. If no tax table is specified for the responsible company or if you use differentiated tax but you do not use tax tables, Maconomy uses the tax code specified for the account, item or activity, depending on the transaction in question. If you use neither differentiated tax nor tax tables, Maconomy uses the standard tax code specified in the window System Information in the Set-Up module.</p> <p>If you use tax tables, and the system parameter "Get on account tax code from tax table" is marked, the tax code to be transferred to account invoices is found in a tax table. But instead of using the item tax code specified on an activity, item or account, Maconomy uses the on account tax code in the field "On Account Tax Code" in the window System Information in the Set-Up module (along with various other information) to point out the relevant tax table line. If the system parameter "Get on account tax code from tax table" is not marked, the standard tax code specified in the window System Information is always used as the tax code on invoices on account. For further information about the information used to point out the correct tax code, please see the description of the window Tax Tables in the G/L module.</p> <p>When posting entries, the reporting code is used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if extended tax reporting has been selected in the window System Information.</p>
<b>Tax</b>	In this field, you specify whether to charge the customer tax on a normal basis. If the field is marked, Maconomy adds tax. The value can be changed on individual orders.
<b>Tax No.</b>	In this field, you enter the customer's number that relates to the field "Tax." If you have entered tax number validation rules for the customer's country in the window Rules of Validation in the Set-Up module, Maconomy will verify that the tax number complies with these validation rules.

Field	Description
<b>Comp. Reg. No.</b>	In this field, you can enter the customer's company registration number if you are dealing with a company. If you have entered company registration number validation rules for the customer's country in the window Rules of Validation in the Set-Up module, Maconomy will verify that the company registration number complies with these validation rules. The completion of this field is optional.
<b>CNR No.</b>	In this field, you can enter the customer's CNR number if you are dealing with a private person. If you have entered CNR number validation rules for the customer's country in the window Rules of Validation in the Set-Up module, Maconomy will verify that the CNR number complies with these validation rules. The completion of this field is optional.
<b>Agreement</b>	Here you can describe any agreement you might have with the customer that has significance for sales orders to the customer. The information is not used anywhere else in the system.
<b>Remarks</b>	Here you can enter any notes, which will be shown in quotes, sales orders and credit orders in the Sales Orders module.
<b>Holiday Calendar Name</b>	Name of a holiday calendar used by the customer.
<b>Stock Symbol</b>	This field allows for specifying the stock symbol if the customer refers to a listed company. If contact customers are used, the stock symbol on both customer and contact company will always be synchronized. When a stock symbol is set, the customer home, company customer home, and contact company home sections in the Workspace Client will have integrations to Google Finance, showing information about the stock.
<b>Fiscal Year End Month</b>	Use this field to enter the month that the customer's fiscal year ends. The month is used for calculating due date and extension date on customer tax returns.

### Job Cost Island

Field	Description
<b>Job Price List, Cost</b>	In this field, you can select a job price list for the calculation of cost prices. In the Job Cost module, this job price list will be transferred to the new job when you create a job with the current customer.
<b>Job Price List, Intercomp.</b>	In this field, you can select a job price list for the calculation of intercompany prices. In the Job Cost module, this job price list will be transferred to the new job when you create a job with the current customer.
<b>Job Price List, Sales</b>	In this field, you can select a job price list for the calculation of sales prices. In the Job Cost module, this job price list will be transferred to the new job when you create a job with the current customer.

Field	Description
<b>Job Price List, Std. Sales</b>	In this field, you can choose a job price list to be used for calculating the standard billing prices of the activities used for the job. The functionality of this field is similar to that of the field "Job Price List, Sales."
<b>Markup %</b>	In this field, you can select a markup percentage for amount activities. If the field is completed, the specified value will be transferred when you create a new job on the current customer in the Job Cost module. When the field is completed, the field "Fixed Markup (Amts.)" on the current job will be marked, regardless of the percentage entered in the field "Markup %" in the window System Information in the Set-Up module.
<b>Job Surcharge Rule</b>	In this field, you can specify a job surcharge rule. The rule specified in this field is copied to the window Job Information when you create a new job on the current customer. The rule must be created in the window Job Surcharge Rules and can be changed in the windows Job Information or Job Budgets in the Job Cost module. See the description of the window Job Surcharge Rules for a detailed description.
<b>Invoice Layout</b>	In this field, you can enter an invoice layout rule. The specified rule will be suggested on every new job created with the current customer as the bill-to customer. The field must be completed, and Maconomy will automatically suggest the first rule created, when a new customer is created. Please see the description of the window Invoice Layout Rules in the Job Cost module for further information.
<b>Detailed Invoice Specification</b>	Use this field to select a detailed invoice specification.
<b>Show Customer Balances on Invoice</b>	Select this field to indicate that you want to see the customer's prior and new balance on the job invoice printout. The default value is inherited from the customer / company-specific customer; however, you can override it in the Invoice Selection, On Account Invoice Selection, and Blanket Invoice Selection windows.
<b>Show Customer Statement on Invoice</b>	Select this field to indicate that you want to see the customer statement on the job invoice printout. You can override this selection in the Company Customer Information Card and in Invoice Selection.
<b>Show Customer Aging on Invoice</b>	Select this field to indicate that you want to see the A/R aging on the job invoice printout. You can override this selection in the Company Customer Information Card and in Invoice Selection.

#### Vendor Payment Exchange Rate Variances Island

Field	Description
<b>Post Vendor Exch. Rate</b>	Use this field to specify how to post exchange rate variances that occur when you register vendor payments.

Field	Description
<b>Variances on Job</b>	<p>If you select this check box, the exchange rate variances are posted to the jobs to which the paid vendor invoices were allocated.</p> <p>If you do not select this check box, the exchange rate variances are posted to the Vendor Exchange Rate Gain or Vendor Exchange Rate Loss account.</p> <p>The default value is that the check box is not selected.</p> <p>Maconomy uses the value of this field as the default value for the Post Vendor Exch. Rate Variances on Job field for newly created company-specific customers for this customer.</p>

### Employees Island

Field	Description
<b>Employee 1-10</b>	In these 10 fields, you can assign up to 10 employees to the current job. When you enter an employee number, the name of the employee is displayed in the field "Name."

### Charges Island

Field	Description
<b>Charge 1-4</b>	<p>In these fields, you can select up to four charge codes normally added to an order to the customer. The customer might, for example, pay a handling charge or a delivery charge.</p> <p>Every charge code is a reference to a text and an amount. Charge codes are maintained in the window Charges in the Sales Orders module.</p> <p>The charge is posted to a G/L account for charges. The reference to the G/L account is specified by means of a dimension combination in the window Posting References in the G/L module. You can thus sort charges by department.</p> <p>You can enter up to four different charges to a customer (codes 1 - 4).</p> <p>Please note that these charge codes cannot be used when creating invoices and credit memos to the customer in the Accounts Receivable module.</p>

### Account Stmt. Cust. Island

Field	Description
<b>Customer No.</b>	<p>In this field, you can enter an account statement customer number, if items are delivered to one customer and the account statement is sent to another.</p> <p>Maconomy checks that the account statement customer already exists.</p> <p>By means of MPL, you can add the name and address variables assigned to the account statement customer in question to the print window of the window Periodic Customer Statement. Printing out a periodic account statement to which an account statement customer has been assigned thus means that the account statement customer and not the ship-to customer receives the account statement printout.</p>

Field	Description
	<p>If you leave this field blank, the account statement customer is automatically identical to the ship-to customer.</p> <p>Maconomy also shows the name and address of the account statement customer. The fields are completed when you press Return, and cannot be changed here.</p>
<b>Attn.</b>	This is the account statement customer's attention person - the person to whom payment information is directed. The field is completed when you press Return, and you cannot change it here.
<b>Country</b>	This is the account statement customer's country. The field is completed when you press Return, and you cannot change it here.
<b>Phone</b>	This is the account statement customer's telephone number. The field is completed when you press Return, and you cannot change it here.
<b>Fax</b>	This is the account statement customer's telex number. The field is completed when you press Return, and you cannot change it here.
<b>E-mail</b>	This is the account statement customer's electronic mail address. The field is completed when you press Return, and you cannot change it here.

### Catalog Island

Field	Description
<b>Catalog No.</b>	<p>This field is only used if you have installed the add-on module Maconomy Web Shop. By specifying a catalog number, you can assign the current customer to a catalog created in the window Catalogs in the Inventory module. If you have the Maconomy Procurement Portal, this will cause the catalog to appear in the list of catalogs in the component My Catalogs when the current customer has been selected in the Portal. However, this functionality only applies if you are using the standard configuration of the My Catalogs component. If the configuration has been changed, other criteria may determine the catalogs to be shown in the My Catalogs component.</p>

### Access Level Island

Field	Description
<b>Name</b>	<p>Here you can enter the name of the access level. Users only have access to information about the current customer if they have been assigned to this or a higher access level in the window User Access Levels in the Set-Up module. This means that a user can only specify the customer on, for example, sales orders if he has access to the customer. In addition, a user can only see customer information cards of customers to which he has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to customers may depend on other factors. For further information about the standard access control configuration, please see the section "Introduction to the Access Control System" in the Set- Up module.</p>

Field	Description
	If you do not specify an access level, all users will have access to see information about the current customer.

### Subscription Island

Field	Description
<b>Price Adjustment Principle</b>	In this field, you can specify a price adjustment principle to be suggested on subscriptions created for the current customer. For further information about price adjustment principles, see the window Price Adjustment Principles in the Subscription module.

### Teams Island

Field	Description
<b>Team 1-6</b>	In these fields, you can specify the name and number of a team of employees to be assigned to the customer, for instance because the customer prefers to work with a given team. Teams are created in the window Teams in the Set-Up module. When you create a new job for the current customer, the teams specified for the customer are automatically copied to the job, unless another team is specified in the corresponding field on the job.

### Print Control Island

Field	Description
<b>Statistics 1-4</b>	<p>Here you can enter an optional code and specify the option lists containing the values you wish to be available in these fields.</p> <p>The four codes can be selected/not selected in the selection criteria islands in windows where statistics are printed. If a statistics list has been specified in a given statistics list field in this island, only values available in the list in question can be selected in the corresponding statistic value field. If a statistics list field has been left blank, any text can be entered in the corresponding value field.</p> <p>In the fields "Statistics 1-4" in this island, you can only select values from these lists. However, if you leave a given statistics list field blank, any text can be entered in the corresponding statistics value field.</p>

### Remarks Island

Field	Description
<b>Remarks</b>	Here you can write remarks about the customer. They are not used elsewhere in the system.

**Bill to Customer Island**

Field	Description
<b>Customer No.</b>	<p>In this field, you enter a bill-to customer number, if items are delivered to one customer, but billed to another. Maconomy checks that the bill-to customer exists.</p> <p>When you invoice a ship-to customer, for whom there is a bill-to customer, the bill-to customer is debited by the amount.</p> <p>If you leave this field blank, the bill-to customer is automatically the same as the ship-to customer.</p> <p>When you make entries to a customer in the window General Journal in the G/L module, Maconomy does not look for a bill-to customer. The amount is always debited/credited to the given customer number.</p> <p>Maconomy also shows the name and address of the bill-to customer. The fields are completed when you press Return, and cannot be changed here.</p> <p>When using linking rules, please note that it is not possible to create a field specific linking rule for the field "Bill to Customer" between the relations Customer and CompanyCustomer in the window Linking Rules in the Set-Up module. This limitation ensures that company-specific customers always have the same bill-to customer as the global customer to which they are assigned.</p>
<b>Attn.</b>	This is the name of the bill-to customer's attention person - the person to whom payment information directed. The field is completed when you press Return, and you cannot change it here.
<b>Country</b>	This is the bill-to customer's country. The field is completed when you press Return, and you cannot change it here.
<b>Phone</b>	This is the bill-to customer's telephone number. The field is completed when you press Return, and you cannot change it here.
<b>Fax</b>	This is the bill-to customer's telex number. The field is completed when you press Return, and you cannot change it here.
<b>Telex</b>	This is the bill-to customer's telex number. The field is completed when you press Return, and you cannot change it here.
<b>E-mail</b>	This is the customer's electronic mail address. The field is completed when you press Return, and you cannot change it here.

**Sales Orders Island**

Field	Description
<b>Sales Rep. No.</b>	In this field, you enter the sales representative responsible for the customer. The information is used when creating sales orders. It can be changed on individual orders.
<b>Sales Rep.</b>	This field shows the name of the sales representative specified in the field "Sales Rep. No." above.

Field	Description
<b>Price List</b>	<p>In this field, you select from which price list Maconomy should normally retrieve sales prices, when you create sales orders and invoices. The price list and price can, however, always be changed as you register a sales order.</p> <p>If you leave the field blank, Maconomy will always calculate the price of an item from its cost price and gross margin, as specified in the table part of the Item Information Card.</p> <p>Price lists are maintained in the windows Price Lists and Quantity Discounts in the Inventory module.</p>
<b>Price Step</b>	<p>In this field, you select from which price step in the above price list Maconomy should retrieve a sales price when creating quotes, sales orders or invoices. This means you “tie” the customer to a certain price step. If you select price step 1, for example, the customer will not receive any quantity discounts. The sales price can, however, always be changed as you register an order.</p> <p>If you enter price step zero, the customer will always receive a maximum quantity discount, based on the amount of items ordered.</p>
<b>Keep Price</b>	<p>In this field, you can specify whether unit prices and discount percentages on order lines, invoice lines and credit memo lines pertaining to the current customer should be recalculated when changing the quantity. The value in this field is transferred to the card part of sales and credit orders as well as invoices and credit memos pertaining to the current customer, but can be changed for each order, and so on.</p>
<b>Invoice Discount %</b>	<p>In this field, you enter the discount percentage you normally give the customer, or leave the field blank. You can change it on individual orders.</p>
<b>Show Price Mark</b>	<p>This field is only used if you have Maconomy's layout editing tools. Using Maconomy's layout editing tools, you can add fields to invoice and packing slip layouts, which, with a plus or minus sign, indicate if the item is sold at a higher or lower price than in the previous sale to the same customer. The unit price in the previous sale can be seen in the window Item Assortment in the Inventory module.</p> <p>If the field is marked, higher and lower prices will highlighted. It indicates to the customer, that the price calculation should be adjusted if the items are being sold to others.</p>
<b>Show Price on Packing Slip</b>	<p>This field is only used if you have Maconomy's layout editing tools. Using Maconomy's layout editing tools, you can add prices of individual items to the packing slip. If the field is marked, the prices will be shown.</p>
<b>Blanket Invoice</b>	<p>If you mark this field, the customer is invoiced on a blanket invoice. The value can be changed on individual orders.</p> <p>Blanket invoicing means, that all non-invoiced orders involving the same bill-to customer, currency, department and ware- house, for which you have printed a packing slip or which are released for invoicing, are gathered in one invoice to</p>

Field	Description
	the customer. This takes place in the window Print Invoice in the Sales Orders module.
<b>Total Packing List</b>	<p>If this field is marked for the ship-to customer, and you select "Print Packing List" in the window Sales Orders, Maconomy will print a packing list which, in addition to the current order, will also include any orders to the customer that have not yet been delivered. This feature is used to ensure full delivery of old back orders in connection with delivery of new orders.</p> <p>If this field is not marked on the customer's information card, Maconomy will only print a packing list for the current order.</p> <p>When you create a new customer, Maconomy transfers the value in the corresponding field in the window System Information.</p>
<b>EU Trade Type</b>	Here you can enter either "Normal" or "Triangulation" to indicate the EU trade type. Triangulation means you act as agent for a vendor in another EU country and a customer in a third EU country. Triangulation sales are not included in the EU sales part of the tax specification. The trade type can be changed during order processing.

#### Dimension Combination Island

Field	Description
<b>Dim. Comb. No.</b>	<p>In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the window Dimension Combinations.</p> <p>If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the current customer. However, any dimension derivation values specified in this island will be used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the customer information card.</p>

#### Derived Company Island

Field	Description
<b>Company No.</b>	<p>In this field, you can enter a value for the dimension Company if you want a value to be derived from the current company. If you also want the specified value to overwrite existing values for the dimension, mark the field "Overwrite." If you do not choose overwriting, the dimension value will only be derived if the dimension field for which derivation is taking place has neither been completed manually nor by entering a registration code.</p> <p>Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used rather than the value (if any) found for this dimension in the dimension combination in question. This means that the dimension combination only applies to this dimension if you have not entered a value in this field.</p>

Field	Description
	Please note that if a dimension combination has been specified in the field "Dim. Comb. No.," a mark in the field "Overwrite" will only have effect if you have also entered a dimension value. If you mark the field "Overwrite" but you do not enter a dimension value in this field, the "Overwrite" field is ignored, as dimension values and overwriting specification are always retrieved together from the same dimension derivation island, dimension combination or dimension combination line.

### Derived Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Company No." above. Note that when posting an automatically created customer-related journal, for example, in connection with customer open entry reconciliation or approval of a reminder selection, Maconomy will transfer the Location value to the G/L entries in question. This takes place at the time of posting.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec.1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

### Parent Customer Island

Field	Description
<b>Insert Below Parent in Hierarchy</b>	<p>This field determines whether or not the customer should be inserted in a hierarchy. This field is only available if Customer Levels are set up using the designated System Parameters.</p> <p>If the field is not selected, then the customer will be on the top level in the hierarchy and the parent customer will only be used as a template.</p> <p>If the field is selected, the customer will be inserted into the hierarchy. This means its level will be set to its parent's level + 1 and the hierarchy structure from top parent to the customer will be saved on the customer card.</p>
<b>Customer No.</b>	In this field you can enter the number of the customer that you want to be the parent of the current customer. By entering a parent customer in this field and a linking rule in the field "Linking Rule" below, information can thus be copied from the parent customer to the new customer. This avoids the entering of similar information. If a template customer has been specified in one of the windows

Field	Description
	<p>System Information or Company Information, this field is automatically provided with the number of the template customer when creating a new customer. If you have also created a standard linking rule, information is automatically copied from the template customer to the new customer in accordance with the information specified on the template customer and the linking rule in question.</p> <p>If you do not wish to apply a template customer for copying information, the customer number may be changed manually in this window, or you can delete the information entered for the template customer in one of the windows System Information or Company Information.</p>
<b>Name</b>	This field displays the name of the customer specified as parent customer in the field "Customer No." above.
<b>Linking Rule</b>	<p>In this field, you can specify the linking rule that you want to use between the parent customer and the new customer. If you have specified a parent customer in the field "Customer No." above and you do not specify a linking rule in this field, Maconomy will use the standard linking rule created between the tables "Customer" and "Customer" in the window Linking Rules in the Set-Up module, if any. If no standard linking rule has been created, Maconomy will display a message. Linking rules contain information about what information should be copied from a parent customer to the current customer. Linking rules are maintained in the window Linking Rules in the Set-Up module. For further information about linking rule creation and usage and rules concerning the copying of field information from parent customers, see the description of the window Linking Rules in the Set-Up module.</p>

### Hierarchy Island

Field	Description
<b>Level 1-3</b>	These fields show the customers in the hierarchy above the customer in question. These fields are only available if Customer Levels are set up using the designated System Parameters.

### Contact Management Island

Field	Description
<b>Company No.</b>	<p>If the customer is assigned to a contact company, a contact company number is shown in this field.</p> <p>When creating a new customer, it is possible to assign the customer to a contact company by specifying the number of the desired contact company in this field. The information on the contact company is then transferred to the corresponding fields on the customer information card, overwriting any manually entered information in those fields.</p> <p>Customers can also be assigned to contact companies in the window Contact Companies. For further information on this, see the description of the field "New Customer No."</p>

Field	Description
<b>Campaign No.</b>	In this field you can enter the number of a marketing campaign that has resulted in the creation of the current customer. Note, however, that the campaign number is not transferred to quotes, sales orders, and so on, which are created for the customer.

### Delivery Island

Field	Description
<b>Back Order Handling</b>	Here you choose how to process back orders to this customer. You can always change the value for an individual order during order processing. You can select three different back order handling methods: "Save," "Delete" and "Transfer." For further information about handling of back orders, see the description of the window Sales Orders in the Sales Orders module.
<b>Blanket Order</b>	In this field, you can specify whether quotes and orders for the current customer should be created as blanket orders. If you mark this field, quotes and orders created for the customer will be created as blanket orders, that is, with the corresponding field marked. See the description of the field "Blanket Order" in the window Sales Orders in the Sales Orders module for further information on the functionality of blanket orders.
<b>Warehouse</b>	In this field, you enter the warehouse from which items are normally delivered to the customer. The value is used when registering orders and invoices. Maconomy checks that the items are available from the warehouse. The value can be changed in individual orders.  Warehouses are maintained in the Warehouse Information Card in the Inventory module.
<b>Delivery Terms</b>	In this field, you select which delivery terms normally apply to the customer. The field is used when you handle orders.  Delivery Terms are maintained in the pop-up field "Delivery Terms" in the window Popup Fields in the Set-Up module.
<b>Delivery Mode</b>	In this field, you select which delivery mode normally applies to the customer. The field is used when you handle orders.  Delivery Modes are maintained in the pop-up field "Delivery Modes" in the window Popup Fields in the Set-Up module.
<b>Carrier</b>	In this field, you select which means of transport you use to deliver items to the customer. The field is used when you handle orders.  Carriers are maintained in the pop-up field "Carriers" in the window Popup Fields in the Set-Up module.
<b>Consignment Type</b>	In this field, select the consignment type normally used when delivering goods to the current customer.

Field	Description
<b>Destination No.</b>	In this field, you can enter a destination number if items to the current customer are usually delivered to a given destination.
<b>Charge Table</b>	In this field, you can select the charge table to be used in the calculation of charges on transactions regarding the current customer. When quotes, sales orders, and credit orders are created for the current customer, the charge table is transferred to the transaction in question.
<b>Charge Discount %</b>	In this field, you can specify a charge discount percentage to be applied to charges on transactions regarding the current customer.

### Extra Fields Island

Field	Description
<b>Popup 1-5</b>	In these fields, you can specify further information regarding the current customer. You might, for example, specify a “hold” code or information about substitution items. The pop-up options are maintained in the pop-up fields “Customer Popup 1-5” in the window Popup Fields in the Set-Up module.

### Allowed Use Island

While a customer is in the creation process, you may not want users to be able to use them in all areas; however, you may want to allow customer use in certain areas right away. The Allow fields control the areas where the customer can be used and the approval hierarchy controls how Allow fields are set. You might decide to set up the approval hierarchy to change all the Allow fields to **Yes** after all steps in the approval workflow are complete. Alternatively, you may want to set it up to change specific Allow fields to **Yes** after certain approval steps have been completed.

For example, you may have set up approval hierarchy to change the **Allow Payments** field value from **Yes** to **Requested** if the payment information for a customer is changed after the customer has been approved. This prevents payments from being made from the customer until the new information has been approved. You can then set up the system to change the **Allow Payments** field value back to **Yes** after the new information is approved.

The Allow fields have three possible settings:

- **Yes** — This allows users to use the customer in the specified area.
- **No** — This disallows users from using the customer in the specified area.
- **Requested** — If the *Allow Users to Manually Set Allow Fields on Customers to Yes* system parameter is not set, you cannot manually change an Allow field to **Yes**. If you want to be able to use a customer in a certain area, you can set an Allow field to **Requested**.

The following are the customer Allow fields:

- **Allow for use as Inter Company Customer** — Use this field to specify whether the customer can be used as an intercompany customer. This is validated when the customer is selected or changed on the company information card or on an outlay account. It is also validated when the intercompany invoice is created.

- **Allow Company Customer Creation** — Use this field to specify whether you can create a new company specific customer based on this customer. A company specific customer can either be created manually or automatic when a user makes a registration on a customer in a new company. This is only validated at the time of creation.
- **Allow Budgets** — Use this field to specify whether this customer can be used in a G/L or job budget. Maconomy validates when the job budget is created, a G/L budget line is created or changed, and when the G/L budget is approved.
- **Allow Registrations** — Use this field to specify whether this customer can be used in a general journal or in bank reconciliation. Maconomy validates when the line is created or changed, and when the journal is posted or the bank reconciliation is approved.
- **Allow Payments** — Use this field to specify whether this customer can be used for payments. Maconomy will validate at the time of registration if the system parameter "Allow Payments on blocked customers" is not marked, and when the payment is approved. Maconomy will only validate customer payments created in the customer payment window. The validation in the G/L journal and bank reconciliation windows is based on the field "Allow Registrations."
- **Allow Reporting** — Use this field to specify whether this customer can be used in standard customer reports. For the following reports, Maconomy ignores customers who are not allowed to be included for reporting where the user has selected Customer as dimension.
  - A/R aging
  - A/R balance list
  - A/R Historical Statement
  - Open Entry Statement
  - Periodic Statement
  - A/R Statistics
  - Customer Group Statistics
  - Customer budgets
  - Customer information
  - G/L report lines
- **Allow for use as Template/Parent Customer** — Use this field to specify whether this customer may be used as a template or parent customer. A template customer can be entered into system information or company information. Maconomy will suggest the template customer as parent customer when a new customer is created. Maconomy validates when the new customer is created.
- **Allow Interests and Reminders** — Use this field to specify whether this customer can be used when creating interests and reminders. Maconomy validates when the interest or reminder is created, and when the interest or reminder is approved.
- **Allow for use on Jobs and Orders** — Use this field to specify whether this customer may be used on a job, sales order, or subscription order. Maconomy validates when the sales order or subscription order is created or changed, and when the invoice is

approved/printed. Maconomy will also validate when the job is created. You can still use a customer on a template job even if they are not allowed for use on jobs.

- **Allow Delivery** — Use this field to specify whether deliveries on either sales or subscription orders in which the current customer acts as payment or delivery customer can be made to this customer.

You can set default values for the Allow fields using a customer template which can be used whenever a new customer is created. When you create a new customer, this template customer is added in the **Parent Customer** island on the Customer Information card.

You can set up the system not to use approval hierarchy for customers but still make use of the Allow fields.

### User Island

Field	Description
<b>Created</b>	This field displays the name of the user who initially created the information in the window and the date on which it was created.
<b>Changed</b>	This field displays the name of the user who changed the information in the window and the date on which it was changed.
<b>Version</b>	This field displays a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

### Document Archive Island

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

### Option List Fields Island

Field	Description
<b>List/Value</b>	In these fields, you can select a number of option lists containing values that you wish to use for further specification of the customer. In the Value field, you can then select values from these lists. If you do not enter an option list in one of the option list fields, you can enter any value in the corresponding value field.

## Customer Job Option Lists Island

Field	Description
<b>List/Value</b>	In these fields, you can assign option lists to the customer. The information is used on jobs.

## Action

This section shows the Actions available in the Customer Information Card workspace.

## Top Tab

Field	Description
<b>Attach Document</b>	This action allows you to attach a document to the customer.

## Payment Information Single Dialogs Workspace

Use this workspace to maintain financial information about your customers, including payment terms, credit limits, and interest and reminder information.

You can change payment information for only one customer at a time.

To set up new customers, use the Customer Information Card workspace or the Company Specific Customer Information Card workspace.

If you change any information in the Payment Information workspace, Maconomy updates the **Updated by**, **Date** (of the change) and **Version** fields in the User island on the Customer Information Card.

If you create a customer using a particular linking rule, the setup of that linking rule determines which information Maconomy copies to the new customer and whether this information should be changeable. The ability to enter, change, or view a value in each field depends on the setup of the linking rule that you assigned to the customer, if any. For more information about linking rules, see the description of the Linking Rules workspace in the Set-Up module.

It is recommended that you print and file the payment information each time that you change it in this workspace or in the Customer Information Card workspace. You print the current payment information by using the **Print This** action in the File menu.

## Payment Information Tab

This section includes the fields and descriptions for the Payment Information tab.

## Customer Island

Field	Description
<b>Customer</b>	This field displays the name and number of the customer. It cannot be changed. To retrieve a customer, you can use the search functions in the Find menu.  The other lines in this field show the customer's address. This information can be changed here or in the window Customer Information Card.

Field	Description
<b>Attn.</b>	This field displays the customer's attention person. This information can be changed here or in the window Customer Information Card.
<b>Country</b>	This field displays the country code of the customer. This information can be changed here or in the window Customer Information Card. When you change the country code in this window, Maconomy checks that the rules of validation for tax and social security/federal ID numbers in the window Rules of Validation are observed.
<b>Phone</b>	This field displays the customer's telephone number. The information can be changed here or in the window Customer Information Card.
<b>Giro</b>	This field displays the customer's giro account number. (This applies to countries with a national giro system.) The information is for reference purposes only and can be changed here or in the window Customer Information Card.
<b>Currency</b>	This field displays the customer's standard currency. The standard currency is specified in the field "Currency" in the window Customer Information Card.

### Settling Company Island

Field	Description
<b>Company No.</b>	This field displays the number of the company specified as the settling company on the current customer's customer information card. The settling company is the company which has the claim against the customer and the company to which the customer must make payments. The settling company's accounts also include the customer which means that the value in this field is transferred to the customer entries created on the current customer upon posting. If another company completes postings on the customer, this will automatically lead to intercompany entries of the type "Customer Collection" between the two companies. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### Payment Control Island

Field	Description
<b>Customer Payment Mode</b>	In this field you select the mode in which the customer will normally be paying. The customer payment mode is used for selecting the customer payment mode and the payment agent and is transferred when you create

Field	Description
	invoices and credit memos. The customer payment mode can, however, be changed on the individual invoice or credit memo or in the window Change Payment Selection in the Banking module. The customer payment mode is furthermore used for calculating the customer's payer ID. Payment modes are maintained in the window Payment Modes in the Banking module.
<b>Collection Agreement</b>	In this field, you can enter the agreement number that the current customer has been assigned at the payment agent who is connected to the selected customer payment mode. The field is only used for electronic customer payment modes.
<b>Collection Group No.</b>	In this field, you can specify the collection group number to which the current customer belongs. The collection group number is supplied by the payment agent. If the payment mode of the customer is electronic, you must specify a collection group number in this field.
<b>Global Location No.</b>	<p>If the customer has requested that you use a specific global location number on invoices, you can specify the location number in question here. The number specified here will be suggested on all sales orders, jobs, and so on, assigned to the customer, and thus in turn flow to the resultant invoices. However, the global location number can be changed on the individual sales orders, jobs, and so on, if another location number is to be used in a specific context.</p> <p>For further information about the concept of global location numbers, see the introduction to the window Company Locations.</p>
<b>Control Account</b>	<p>Here you can select a posting reference to a G/L account. All entries to the customer are posted to the General Ledger to the A/R control account specified here. Accounts Receivable is thus an aggregation of the A/R control accounts in the General Ledger. For example, you can group your customers in domestic and foreign customers in the General Ledger.</p> <p>References to control accounts are maintained in the pop-up field "A/R Control Accounts" in the window Popup Fields in the Set-Up module.</p>
<b>Aut. Reconciliation</b>	<p>Mark this field if you want Maconomy to automatically reconcile accounts receivable entries (payments, invoices, credit memos) during posting. If marked, Maconomy will always reconcile against the oldest open entry or entries that can be reconciled totally or partially by the amount being posted. This means that a customer with a debit balance will never have open credit entries, and the customer's open debit entries will always be their most recent. Similarly, a customer with a credit balance will never have open debit entries, and this customer's open credit entries will also be their most recent.</p> <p>If this field is not marked, all entries to the customer will be registered as open entries. The user must then manually reconcile each entry in the window Customer Payments in the Accounts Receivable module.</p> <p>Payments can also be reconciled in the General Journal by entering the number of the invoice the payment covers.</p>

Field	Description
<b>Status</b>	Active or Inactive. If the customer is active, then they can be used in all areas stipulated by the Allow fields. If inactive, the customer cannot be used for anything.
<b>First Activation Date / Active Period</b>	When the <b>Status</b> field is set to <b>Active</b> , this field name is <b>First Activation Date</b> and it displays the date that the customer was first made active. When the <b>Status</b> field is set to <b>Inactive</b> , this field name is <b>Active Period</b> and it displays the date interval that the customer was active.
<b>Payment Terms</b>	Here you select the payment terms that will normally apply to the customer. These terms are used to calculate the date an invoice becomes due for payment.  Payment Terms are maintained in the pop-up field "Payment Terms" in the window Popup Fields in the Set-Up module.
<b>Expected Days to Payment</b>	Use this field to enter the expected number of days to payment (the expected number of days from the invoice date to the date of payment). If the expected days to payment is set to zero days, then the expected payment date will be the same as the due date. The expected days to payment is currently used only for calculating expected payment date on job invoicing plans.
<b>Cash Discount</b>	Here you can select a code to specify the maximum cash discount given to the customer when entries are reconciled. Maconomy verifies that the discount limit is not exceeded upon reconciliation of payments. A cash discount code is a reference to a discount percentage. The codes are maintained in the pop-up field "Cash Discount Codes" in the window Popup Fields in the Set-Up module.  The cash discount is automatically posted to a G/L account for cash discounts. The reference to this account and any other dimension values used in connection with cash discounts is maintained by means of a dimension combination in the window Posting References in the G/L module. This allows you to sort cash discounts by department in the General Ledger.
<b>Credit Card No.</b>	If the customer wants to pay by credit card, you can enter the number of the credit card in this field. Information in this field will automatically be transferred to new quotes and sales orders. Please note that the field is for information only, as Maconomy's Banking module does not support payment by credit card. If you enter a credit card number, you must also specify an expiry date.
<b>Expiry Date</b>	In this field, you enter the expiration date of the credit card specified in the field "Credit Card No." above.

**Bill to Customer Island**

Field	Description
<b>Bill to Customer</b>	<p>In this field, enter a customer name number if items are delivered to one customer, but billed to another. The bill-to customer thus represents the customer to whom invoices are to be sent.</p> <p>The bill-to customer can be changed here or in the window Customer Information Card.</p>

**Balance Island**

Field	Description
<b>Balance, Currency</b>	<p>This field displays the customer's balance in the standard currency of the customer. If one or more company-specific customers are assigned to the customer in question, this field displays the balance of all entries registered on the assigned company-specific customers and the parent customer in question. However, you should note that if one or more of the assigned company-specific customers use a currency which is different from the standard currency of the parent customer, Maconomy sums the balance of the entries irrespective of the assigned currencies, and the amount in this field will not be a valid figure. The balance in this field is updated when you post journals with customer entries.</p>
<b>Balance, Enterprise</b>	<p>This field displays the customer's balance in the enterprise currency of the system. Maconomy automatically updates the balance when you post journals with customer entries. See also the description of the above field "Balance, Currency."</p>
<b>Order Volume, Enterprise</b>	<p>This field displays the customer's current order volume, expressed in the enterprise currency of the system. It is updated when you approve sales and credit orders for which the customer is invoiced. The order sum is also updated when you enter and delete lines in previously approved sales and credit orders. After invoices and credit memos have been posted, the amount is transferred to the customer's balance.</p> <p>The order volume is included in the credit limit calculation. If the order volume and balance add up to more than the customer's credit limit, the limit is exceeded.</p> <p>Note that sales and credit orders which have been transferred to a job are not included in the calculation of the order volume. As the order volume only represents information on the total amount on approved sales and credit orders, this field does not show the amount registered on jobs to which the current customer has been assigned. Non-invoiced job cost registrations are therefore not included in the calculation of the customer's credit limit.</p>

**Credit Limit Island**

Field	Description
<b>Enterprise Level, Enterprise</b>	<p>In this field, you enter a credit limit amount in the enterprise currency of the system. This amount represents the credit limit of the current customer across all companies in the organization. If the total of the customer's balance owing and amounts on order exceed this amount, Maconomy displays a warning upon the creation of invoices, orders and quotes in the Sales Orders module. Maconomy also verifies that the customer's credit limit is not exceeded as you enter items in a quote, sales order or invoice. However, you are always allowed the option of continuing the sale.</p> <p>A similar warning is displayed in the Job Cost module when you create a job where the bill-to customer's credit limit has been exceeded. Note that the warning does not appear when registering entries on or invoicing the job.</p> <p>If company-specific customers have been assigned to the current customer and you try to create invoices, sales orders and quotes to these company-specific customers, Maconomy will verify that the credit limit of both each company-specific customer and the parent customer is not exceeded. If either credit limit is exceeded, Maconomy displays an error message.</p> <p>In this context it should be noted that the amount specified in this field need not correspond to the combined total of the assigned company-specific customer's credit limits. It is therefore possible for a customer to have a credit limit of, for example, USD 25,000 and at the same time have four assigned company-specific customers each having a credit limit of USD 10,000. When creating an invoice for one of these four company-specific customers, Maconomy will first verify that the company-specific customer's individual credit limit of USD 10,000 has not been exceeded, and if not, the system will then verify that the parent customer's credit limit of USD 25,000 has not been exceeded.</p> <p>If you wish to block the customer, to prevent the processing of quotes, sales orders or invoices, you must mark the "Blocked" field.</p> <p>If you have marked the "Credit Blocked" field in the window System Information, sales orders will automatically be blocked at approval, if the Bill to Customer's credit maximum has been exceeded. If the customer is blocked, it will not be possible to print order documents for the order. See also the sections on Sales Orders and Unblocking in the Sales Orders module.</p>
<b>Company Level, Enterprise</b>	<p>In this field, you enter an amount in the enterprise currency of the system. This amount corresponds to the credit limit of company-specific customers that may have been created manually or automatically on the basis of the current customer. Upon creation of a company-specific customer, the amount specified in this field will be copied to the company-specific customer's payment information card (after possible currency conversion). Note that the set-up of the linking rule assigned to the current customer decides whether or not you can change the amount in this field.</p> <p>In this context, you should also consider that if this field has been assigned to a linking rule using the linking method "Partial" between a customer and a company-specific customer, and if the enterprise currency corresponds to the company-specific customer's base currency, Maconomy will use the linking</p>

Field	Description
	<p>method “Partial” as normal. However, if the enterprise currency and the base currency do not correspond, Maconomy will automatically convert the amount specified in this field to the company-specific customer’s base currency and copy it to the field “Company Level, Base” in the window Company Specific Payment Information. Maconomy performs this currency conversion considering that the user has decided the contents of this field, meaning that the amount specified in base currency will not be changed when the amount in enterprise currency is changed in this window.</p> <p>When creating invoices, sales orders and quotes to company-specific customers, Maconomy verifies that the credit limit of both each company-specific customer and the parent customer is not exceeded. If either credit limit is exceeded, Maconomy displays an error message.</p>

### Interest Charge/Reminder Control Island

Field	Description
<b>Interest Charge/Reminder Principle</b>	In this field, you specify the interest charge/reminder principle to be used for the current customer. Interest charge/reminder principles are maintained in the window Interest Charge/Reminder Principles. For further information about interest charge/reminder principles, see the description of this window.
<b>Reminder Text Group</b>	In this field, you can specify the name of a reminder text group that you want to associate with the dispatch of reminder letters to the current customer. For further information about reminder texts, see the description of the windows Reminder Texts and Reminder Text Groups.
<b>Last Interest Date</b>	This field displays the last interest charge date of the current customer. The date in this field is set on the basis of the date in the corresponding field on the assigned company-specific customers’ payment information cards. The customer’s last interest charge is therefore the last of the company-specific customers’ registered interest charge dates.
<b>Current Reminder Level</b>	<p>This field displays the reminder level of the customer. The customer’s reminder level equals the highest reminder level specified on an entry for the current customer. The reminder level is raised by 1 for each time a reminder is sent to the customer. The field is automatically updated by Maconomy and cannot be changed in this window.</p> <p>The reminder level is calculated on the basis of the contents of the corresponding field on the assigned company-specific customers’ payment information cards. The customer’s current reminder level is therefore the highest among the assigned company-specific customers’ reminder levels.</p>
<b>Date of Last Reminder</b>	This field displays the last reminder date of the current customer. The date in this field is set on the basis of the date in the corresponding field on the assigned company-specific customers’ payment information cards. The customer’s last reminder date is therefore the last of the assigned company-specific customers’ registered reminder dates.

### Electronic Collection Island

Field	Description
<b>Selected for Collection</b>	This field shows whether the current customer has been selected for collection. If the field is completed, the customer is either selected or being selected for collection. Collection selections can be created in the window Collection Selection in the Banking module. The field cannot be changed.
<b>No. Entries Selected</b>	This field shows the number of entries that have been selected for collection on the current customer. The number in this field is the collective total of all assigned company-specific customer's selected entries.

## Company Specific Customer Information Card Single Dialogs Workspace

Use this workspace to enter and maintain information about your company-specific customers, such as name, address, and general information used to process customer sales orders.

Maconomy identifies a company-specific customer by a combination of customer number (set up in the Customer Information Card workspace) and company number. Certain information about the customer is unique to the customer/company combination.

A company-specific customer is a division of a customer number, meaning that certain information about this customer can be made dependent on which company in Maconomy is responsible for the customer in question. For example, you might create a customer information card for a customer that is used by different parts of your organization (company); in that case, you use a company-specific customer for each combination of customer and company. This means that you can change certain information for each company-specific customer on the associated information card. For example, one payment mode is used in connection with sales from company A to customer X, and another payment mode is used in connection with sales from company B to the same customer. In this way, all customers can use a common customer number for any given number of company-specific customers, while each of the customers is linked to their own settling company. Maconomy distinguishes company-specific customers by the combination of customer number and settling company, not by their customer numbers.

This is especially useful if you consider customers that you create using the Customer Information Card to be "enterprise customers" that should Maconomy should use as a kind of template for the creation of company-specific customers that you create in the associated settling companies. You can use a customer as template if you have not entered a settling company for the "enterprise customer" in the Customer Information Card workspace. However, although you entered a settling company for the "enterprise customer," you can still use this customer as a template for the creation of company-specific customers. However, the new company-specific customer inherits the settling company from the "enterprise customer," when you do not enter a settling company for each company-specific customer.

The following description illustrates the use of this workspace.

Two settling companies want the information from an "enterprise customer's" information card, but they also need to enter data in certain data fields, such as **Att.**, **Phone**, or **Delivery Terms**. By creating company-specific customers that are linked to an existing customer (the "enterprise customer"), the two settling companies can access a large amount of information inherited from the existing customer; however, they can only change the data fields that they need to change.

The company-specific customers thus have the same customer number as the "enterprise customer," but the settling company number and the contents of certain fields, such as **Att.** and **Phone**, are different.

In addition, the setup of linking rules in the Linking Rules workspace in the Set-Up module defines the information that company specific-customers inherit from customers. The setup of linking rules also defines the information that you can change in this workspace. For example, if you create a linking rule from the table "Customer" to the table "CompanyCustomer," and that linking rules specifies that all customer information, except for a few fields such as **Att.** and **Phone**, should be inherited by company-specific customers that have the standard linking method **Full**, Maconomy copies the relevant information to the company-specific customer's information cards using this linking rule. The selected linking rule thus determines which fields you can change on the company-specific customer information card. The ability to enter, change, or view a value in each field depends on the setup of the linking rule that you assigned to the customer, if any. For more information about linking rules, see the description of the Linking Rules workspace in the Set-Up module.

The creation of company-specific customers in this workspace, however, depends on whether or not you selected the **Centralized Customer Creation Only** system parameter in the Set-up module. If you select this system parameter, you can only create company-specific customers if you already created them as customers in the Customer Information Card workspace. If you did not select this parameter, there are no restrictions as to the creation of company-specific customers in this workspace, and the creation of a company-specific customer automatically results in the creation of a customer that has the same information as the company-specific customer, if this customer did not already exist.

In addition, if you select the **Aut. company specific customer creation** system parameter, Maconomy automatically creates company-specific customers when anyone tries to enter information on such non-existing company-specific customers. If you did not select this parameter and someone makes an entry on a non-existing company-specific customer, Maconomy displays an error message, and you must to create the company-specific customer manually in the Company Specific Customer Information Card workspace, before you try to make any entries.

For auditing purposes, it is recommended that you print and file the Company Specific Customer Information Card each time that you change information here or in the Payment Information workspace. To print the Company Specific Customer Information Card, use the **Print This** function in the File menu.

## Company Specific Customer Information Card Tab

This section includes the fields and descriptions for the Company Specific Customer Information Card tab.

### Ship to Customer Island

Field	Description
<b>Customer No.</b>	In this field, you enter a unique customer number. If you do not specify a number, the customer number in this field will be derived from the company-specific number series "Customer Series" belonging to the company to which the customer belongs.

Field	Description
	<p>The Ship to Customer is the customer to whom you deliver items. If another customer is paying for the items, you must also enter the Bill to Customer.</p> <p>If the system parameter "Centralized Customer Creation Only" in the Set-up module has been marked, company-specific customers can only be created, if these have already been created as customers in the window Customer Information Card. You can use the function "Find customer" in the Find menu to display a list of existing customers and select a customer that you want to use as company-specific customer. If the parameter has not been marked, you are free to enter a customer number in this field.</p> <p>You also enter the customer's name and address. This information is for reference and is shown on several printouts, for example, order documents. Note, you must fill in the line below the customer number.</p> <p>The fourth line has two fields, one for zip code, the other for postal district. If you enter a zip code and leave the postal district field blank, the postal district field is automatically completed, provided that the zip code in question has been entered for the relevant country in the window Postal Districts in the Set-Up module. For further information, see the description of the window Postal Districts.</p>
<b>Attn.</b>	In this field, you enter the name of an attention person the person to whom you want shipping information directed. The information is used on printouts.
<b>Country</b>	<p>Here you select the customer's country. The information is used for reference, and it can be used to make statistics.</p> <p>States and countries are maintained in the window Countries in the Set-Up module.</p>
<b>Phone</b>	In this field, you enter the customer's telephone number. The information is used for reference.
<b>Fax</b>	In this field, you enter the customer's fax number. The information is used for reference.
<b>Telex</b>	In this field, you enter the customer's telex number. The information is used for reference.
<b>E-mail</b>	Here you can enter the customer's electronic mail address. The field is used for reference.
<b>Contact Person</b>	Here you can enter a contact with the customer. The field is merely for reference.
<b>Our Contact</b>	Here you can enter the number of the employee who is in charge of the customer in question. The employee must exist in Maconomy.
<b>Termination Date</b>	If you have ceased co-operation with the current customer, you can specify in this field the date on which co-operation was terminated.
<b>Account Manager</b>	In this field, you can enter the account manager of the customer. The information is used on jobs.

**Settling Company Island**

Field	Description
<b>Company No.</b>	<p>In this field, you can enter a value for the dimension Company, which thus becomes the settling company of the customer. The settling company is the company which has the claim against the customer and the company to which the customer must make payments. The settling company's accounts also include the customer which means that the value in this field is transferred to the customer entries created on the current customer upon posting. If another company completes postings on the customer, this will automatically lead to intercompany entries of the type "Customer Collection" between the two companies. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, inter-company entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>The contents of this field also determine which users have access to see information about the company-specific customer. In the window Company Information in the G/L module it is possible to assign each company to an access level. A user only has access to see information about a company-specific customer if he has granted access to the access level in the window Access Levels in the Set-Up module that the settling company is assigned to or a superordinate level. A user will, for example, be able to see company-specific customer information cards and customer entries for customers whose settling company has been assigned an access level that the user himself has access to. In addition, the user must have access to the access level specified in the island Access Level in order to have access to the current company-specific customer. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to company-specific customers may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.</p>
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

**General Information Island**

Field	Description
<b>Department</b>	<p>In this field, you select the department that the customer usually deals with. You can specify other departments on item purchase orders and invoices to the customer.</p> <p>The department selected here determines which G/L accounts are used when you invoice customer transactions. The department is a posting reference to</p>

Field	Description
	<p>item sales accounts, charge accounts, discount accounts, and so on. The posting references are also used when posting interest and reminder charges, as well as when posting cash discounts and exchange rate differences occurring from open item reconciling.</p> <p>G/L posting references are maintained in the window Posting References in the G/L module. If the window System Information in the Set-Up module specifies that entries are posted by item group or by activity, the posting references for item sales and cost of sales are retrieved from the Item Group Information Card in the Inventory module and from the window Activities in the Job Cost module respectively.</p>
<b>Language</b>	<p>In this field, you select the language of the customer. The selected language is used, for example, on printouts of item descriptions on sales order documents and in connection with language texts. For further information about this window, see the description of the window Language Texts in the Set-Up module.</p> <p>Languages are maintained in the pop-up field "Language" in the window Popup Fields in the Set-Up module.</p>
<b>Currency</b>	<p>In this field, you select the customer's standard currency. All customer transactions are converted into the customer's standard currency. This means you can print and send account statements in the customer's own currency.</p> <p>All customer transactions are registered in three currencies:</p> <ul style="list-style-type: none"> <li>Standard Currency. This is the currency in which the customer has requested you hold their account. For example DEM if the customer is from Germany.</li> <li>Base Currency. This is the currency used in your country (USD in the United States) and in which your books are kept.</li> <li>Original Currency. This is the currency of a given transaction. For example FFR, if a German customer pays in French Francs.</li> </ul> <p>To prevent inconsistencies, you cannot change the customer's currency if entries have been posted or are ready to be posted on the customer.</p> <p>Currencies are maintained in the pop-up field "Currencies" in the window Popup Fields in the Set-Up module.</p>
<b>Customer Type</b>	<p>In this field, you select the customer type of the current customer. The field is used for organizing customers.</p> <p>Customer types are maintained in the pop-up field "Customer Types" in the window Popup Fields in the Set-Up module.</p>
<b>Customer Group</b>	<p>In this field, you select to which group of customers the customer belongs. This field is used to classify customers - primarily for statistics.</p> <p>Customer groups are maintained in the pop-up field "Customer Groups" in the window Popup Fields in the Set-Up module.</p>

Field	Description
<b>Enterprise</b>	Here you can assign an enterprise to the customer. Enterprises are maintained in the pop-up field "Enterprises" in the window Popup Fields in the Set-Up module. The field is used for statistics.
<b>Segment</b>	Here you can assign a segment to the customer. Segments are maintained in the pop-up field "Segments" in the window Popup Fields in the Set-Up module. The field is used for statistics.
<b>Area</b>	Here you can assign an area to the customer. Areas are maintained in the pop-up field "Areas" in the window Popup Fields in the Set-Up module. The field is used for statistics.
<b>Company Tax Code</b>	<p>In this field, you can specify a company tax code created in the window Popup Fields. The field is used by Maconomy for determining the tax code to be used in the calculation of tax for the current customer, as the reporting code is part of the criteria for the selection of a tax code in the window Tax Tables in the G/L module. However, the tax code is only selected from a tax table if the field "Use Tax Tables" is marked in the window System Information and if the company specified as the responsible company for the order or job in question is assigned to a tax table. If no tax table is specified for the responsible company or if you use differentiated tax but you do not use tax tables, Maconomy uses the tax code specified for the account, item or activity, depending on the transaction in question. If you use neither differentiated tax nor tax tables, Maconomy uses the standard tax code specified in the window System Information in the Set-Up module.</p> <p>If you use tax tables, and the system parameter "Get on account tax code from tax table" is marked, the tax code to be transferred to on account invoices is found in a tax table. But instead of using the item tax code specified on an activity, item or account, Maconomy uses the on account tax code in the field "On Account Tax Code" in the window System Information in the Set-Up module (along with various other information) to point out the relevant tax table line. If the system parameter "Get on account tax code from tax table" is not marked, the standard tax code specified in the window System Information is always used as the tax code on invoices on account. For further information about the information used to point out the correct tax code, please see the description of the window Tax Tables in the G/L module.</p> <p>When posting entries, the reporting code is used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if extended tax reporting has been selected in the window System Information.</p>
<b>Tax</b>	In this field, you specify whether to charge the customer tax on a normal basis. If the field is marked, Maconomy adds tax. The value can be changed on individual orders.
<b>Tax No.</b>	In this field, you enter the customer's number that relates to the field "Tax." If you have entered tax number validation rules for the customer's country in the window Rules of Validation in the Set-Up module, Maconomy will verify that the tax number complies with these validation rules.

Field	Description
<b>Comp. Reg. No.</b>	In this field, you can enter the customer's company registration number if you are dealing with a company. If you have entered company registration number validation rules for the customer's country in the window Rules of Validation in the Set-Up module, Maconomy will verify that the company registration number complies with these validation rules. The completion of this field is optional.
<b>CNR No.</b>	In this field, you can enter the customer's CNR number if you are dealing with a private person. If you have entered CNR number validation rules for the customer's country in the window Rules of Validation in the Set-Up module, Maconomy will verify that the CNR number complies with these validation rules. The completion of this field is optional.
<b>Agreement</b>	Here you can describe any agreement you might have with the customer that has significance for sales orders to the customer. The information is not used anywhere else in the system.
<b>Remarks</b>	Here you can enter any remarks, which will be shown in quotes, sales orders and credit orders in the Sales Orders module.
<b>Holiday Calendar Name</b>	Name of a holiday calendar used by the company-specific customer.
<b>Stock Symbol</b>	This field allows for specifying the stock symbol if the customer refers to a listed company. If contact customers are used, the stock symbol on both customer and contact company will always be synchronized. When a stock symbol is set, the customer home, company customer home, and contact company home sections in the Workspace Client will have integrations to Google Finance, showing information about the stock.

### Job Cost Island

Field	Description
<b>Job Price List, Cost</b>	In this field, you can select a job price list for the calculation of cost prices. In the Job Cost module, this job price list will be transferred to the new job when you create a job with the current customer. The description is transferred from the window Job Price Lists in the Job Cost module.
<b>Job Price List, Intercomp.</b>	In this field, you can select a job price list for the calculation of intercompany prices. In the Job Cost module, this job price list will be transferred to the new job when you create a job with the current customer. The description is transferred from the window Job Price Lists in the Job Cost module.
<b>Job Price List, Sales</b>	In this field, you can select a job price list for the calculation of sales prices. In the Job Cost module, this job price list will be transferred to the new job when you create a job with the current customer. The description is transferred from the window Job Price Lists in the Job Cost module.

Field	Description
<b>Job Price List, Std. Sales</b>	In this field, you can choose a job price list to be used for calculating the standard billing prices of the activities used for the job. The functionality of this field is similar to that of the field "Job Price List, Sales." The description derives from the window Job Price Lists in the Job Cost module.
<b>Markup %</b>	In this field, you can select a markup percentage for amount activities. If the field is completed, the specified value will be transferred when you create a new job on the current customer in the Job Cost module. When the field is completed, the field "Fixed Markup (Amts.)" on the current job will be marked, regardless of the percentage entered in the field "Markup %" in the window System Information in the Set-Up module.
<b>Job Surcharge Rule</b>	In this field, you can specify a job surcharge rule. The rule specified in this field is copied to the window Job Information when you create a new job on the current customer. The rule must be created in the window Job Surcharge Rules and can be changed in the windows Job Information or Job Budgets in the Job Cost module. See the description of the window Job Surcharge Rules for a detailed description.
<b>Invoice Layout</b>	In this field, you can enter an invoice layout rule. The specified rule will be suggested on every new job created with the current customer as the bill-to customer. The field must be completed, and Maconomy will automatically suggest the first rule created, when a new customer is created. Please see the description of the window Invoice Layout Rules in the Job Cost module for further information.
<b>Detailed Invoice Specification</b>	Use this field to select a detailed invoice specification.
<b>Show Customer Balances on Invoice</b>	Select this field to indicate that you want to see the customer's prior and new balance on the job invoice printout. The default value is inherited from the customer / company-specific customer; however, you can override it in the Invoice Selection, On Account Invoice Selection, and Blanket Invoice Selection windows.
<b>Show Customer Statement on Invoice</b>	Select this field to indicate that you want to see the customer statement on the job invoice printout. The default value is inherited from the customer / company-specific customer; however, you can override it in the Invoice Selection, On Account Invoice Selection, and Blanket Invoice Selection windows.
<b>Show Customer Aging on Invoice</b>	Select this field to indicate that you want to see the A/R aging on the job invoice printout. The default value is inherited from the customer / company-specific customer; however, you can override it in the Invoice Selection, On Account Invoice Selection, and Blanket Invoice Selection windows.

**Vendor Payment Exchange Rate Variances Island**

Field	Description
<b>Post Vendor Exch. Rate Variances on Job</b>	<p>Use this field to specify how to post exchange rate variances that occur when you register vendor payments.</p> <p>If you do not select this check box, the exchange rate variances are posted to the Vendor Exchange Rate Gain or Vendor Exchange Rate Loss account. The default value is that the check box is not selected.</p> <p>Maconomy uses the value of this field as the default value for the Post Vendor Exch. Rate Variances on Job field for newly created company-specific customers for this customer.</p>

**Employees Island**

Field	Description
<b>Employee 1-10</b>	In these 10 fields, you can assign up to 10 employees to the current customer. The employees will be suggested as Employees 1-10 when you create a job on the given company-specific customer.

**Contact Management Island**

Field	Description
<b>Contact Comp. No.</b>	If the customer has been created as a contact company, the contact company number in question is shown in this field.
<b>Campaign No.</b>	In this field you can enter the number of a marketing campaign that has given rise to the creation of the current company-specific customer. Note, however, that the campaign number is not transferred to quotes, sales orders, and so on, which are created for the company customer.

**Charges Island**

Field	Description
<b>Charge 1-4</b>	<p>In these fields, you can select up to four charge codes normally added to an order to the customer. The customer might, for example, pay a handling charge or a delivery charge.</p> <p>Every charge code is a reference to a text and an amount. Charge codes are maintained in the window Charges in the Sales Orders module.</p> <p>The charge is posted to a G/L account for charges. The reference to the G/L account is specified by means of a dimension combination in the window Posting References in the G/L module. You can thus sort charges by department.</p> <p>You can enter up to four different charges to a customer (codes 1 - 4).</p> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> These charge codes cannot be used when creating invoices and credit memos to the customer in the accounts receivable module.</p> </div>

**Extra Fields Island**

Field	Description
<b>Popup 1-5</b>	In these fields, you can specify further information regarding the current customer. You might, for example, specify a “hold” code or information about substitution items. The pop-up options are maintained in the pop-up field “Customer Popup 1-5” in the window Popup Fields in the Set-Up module.

**User Island**

Field	Description
<b>Created</b>	This field displays the name of the user who initially created the information in the window and the date on which it was created.
<b>Changed</b>	This field displays the name of the user who changed the information in the window and the date on which it was changed.
<b>Version</b>	This field displays a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

**Catalog Island**

Field	Description
<b>Catalog No.</b>	This field is only used if you have installed the add-on module Maconomy Web Shop. By specifying a catalog number, you can assign the current customer to a catalog created in the window Catalogs in the Inventory module.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

**Option List Fields Island**

Field	Description
<b>List/Value</b>	In these fields, you can select a number of option lists containing values that you wish to use for further specification of the customer. In the Value field, you can select values from these lists. If you do not enter an option list in one of the option list fields, you can enter any value in the corresponding value field.

**Customer Job Option Lists Island**

Field	Description
<b>List/Value</b>	In these fields, you can assign option lists to the customer. The information is used on jobs.

**Print Control Island**

Field	Description
<b>Statistics 1-4</b>	<p>Here you can enter an optional code and specify the option lists containing the values you wish to be available in these fields.</p> <p>The four codes can be selected/not selected in the selection criteria islands in windows where statistics are printed. If a statistics list has been specified in a given statistics list field in this island, only values available in the list in question can be selected in the corresponding statistic value field. If a statistics list field has been left blank, any text can be entered in the corresponding value field.</p> <p>In the fields "Statistics 1-4" in this island, you can only select values from these lists. However, if you leave a given statistics list field blank, any text can be entered in the corresponding statistics value field.</p>

**Remarks Island**

Field	Description
<b>Remarks</b>	Here you can write remarks about the customer. They are not used elsewhere in the system.

**Bill to Customer Island**

Field	Description
<b>Customer No.</b>	<p>In this field, you enter a bill-to customer number, if items are delivered to one customer, but billed to another. Maconomy checks that the bill-to customer exists.</p> <p>When you invoice a ship-to customer, for whom there is a bill-to customer, the bill-to customer is debited by the amount.</p> <p>If you leave this field blank, the ship-to customer is automatically the same as the bill-to customer.</p> <p>When you make entries to a customer in the window General Journal in the G/L module, Maconomy does not look for a bill-to customer. The amount is always debited/credited to the given customer number.</p> <p>Maconomy also shows the name and address of the bill-to customer. The fields are completed when you press Return, and cannot be changed here.</p>
<b>Attn.</b>	This is name of the bill-to customer's attention person - the person to whom payment information directed. The field is completed when you press Return, and you cannot change it here.

Field	Description
<b>Country</b>	This is the bill-to customer's country. The field is completed when you press Return, and you cannot change it here.
<b>Phone</b>	This is the bill-to customer's telephone number. The field is completed when you press Return, and you cannot change it here.
<b>Fax</b>	This is the bill-to customer's telefax number. The field is completed when you press Return, and you cannot change it here.
<b>Telex</b>	This is the bill-to customer's telex number. The field is completed when you press Return, and you cannot change it here.
<b>E-mail</b>	This is the customer's electronic mail address. The field is completed when you press Return, and you cannot change it here.

### Sales Orders Island

Field	Description
<b>Sales Rep. No.</b>	In this field, you enter the sales representative responsible for the customer. The information is used when creating sales orders. It can be changed on individual orders.
<b>Sales Rep.</b>	This field shows the name of the sales representative specified in the field "Sales Rep. No." above.
<b>Price List No.</b>	In this field, you select from which price list Maconomy should normally retrieve sales prices, when you create sales orders and invoices. The price list and price can, however, always be changed as you register a sales order.  If you leave the field blank, Maconomy will always calculate the price of an item from its cost price and gross margin, as specified in the Item Information Card.  Price lists are maintained in the windows Price Lists and Quantity Discounts in the Inventory module.
<b>Price Step</b>	In this field, you select from which price step in the above price list Maconomy should retrieve a sales price when creating quotes, sales orders or invoices. This means you "tie" the customer to a certain price step. If you select price step 1, for example, the customer will not receive any quantity discounts. The sales price can, however, always be changed as you register an order.  If you enter price step zero, the customer will always receive a maximum quantity discount, based on the amount of items ordered.
<b>Keep Price</b>	In this field, you can specify whether unit prices and discount percentages on quote and order lines pertaining to the current customer should be recalculated when changing the quantity. The value in this field is transferred to the card part of quotes and sales and credit orders pertaining to the current customer, but can be changed for each quote or order.
<b>Invoice Discount %</b>	In this field, you enter the discount percentage you normally give the customer, or leave the field blank. You can change it on individual orders.

Field	Description
<b>Blocked for Delivery</b>	If you mark this field, it will no longer be possible to make deliveries on either sales or subscription orders in which the current customer acts as payment or delivery customer.
<b>Show Price Mark</b>	<p>This field is only used if you have Maconomy's layout editing tools. Using Maconomy's layout editing tools, you can add fields to invoice and packing slip layouts, which, with a plus or minus sign, indicate if the item is sold at a higher or lower price than in the previous sale to the same customer. The unit price in the previous sale can be seen in the window Item Assortment in the Inventory module.</p> <p>If the field is marked, higher and lower prices will be highlighted. It indicates to the customer, that the price calculation should be adjusted if the items are being sold to others.</p>
<b>Show Price on Packing Slip</b>	This field is only used if you have Maconomy's layout editing tools. Using Maconomy's layout editing tools, you can add prices of individual items to the packing slip. If the field is marked, the prices will be shown.
<b>Blanket Invoice</b>	<p>If you mark this field, the customer is invoiced on a blanket invoice. The value can be changed on individual orders.</p> <p>Blanket invoicing means, that all non-invoiced orders involving the same bill-to customer, currency, department and warehouse, for which you have printed a packing slip or which are released for invoicing, are gathered in one invoice to the customer. This takes place in the window Print Invoice in the Sales Orders module.</p>
<b>Total Packing List</b>	<p>If this field is marked for the ship-to customer, and you select "Print Packing List" in the window Sales Orders, Maconomy will print a packing list which, in addition to the current order, will also include any orders to the customer that have not yet been delivered. This feature is used to ensure full delivery of old back orders in connection with delivery of new orders.</p> <p>If this field is not marked on the customer's information card, Maconomy will only print a packing list for the current order.</p> <p>When you create a new customer, Maconomy transfers the value in the corresponding field in the window System Information.</p>
<b>EU Trade Type</b>	Here you can enter either "Normal" or "Triangulation" to indicate the EU trade type. Triangulation means you act as agent for a vendor in another EU country and a customer in third EU country. Triangulation sales are not included in the EU sales part of the tax specification. The trade type can be changed during order processing.

**Dimension Combination Island**

Field	Description
<b>Dim. Comb. No.</b>	<p>In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the window Dimension Combinations.</p> <p>If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the current company-specific customer. However, any dimension derivation values specified in this island will be used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the company-specific customer information card.</p>

**Derived Company Island**

Field	Description
<b>Company No.</b>	<p>In this field, you can enter a value for the dimension Company if you want a value to be derived from the current company. If you also want the specified value to overwrite existing values for the dimension, mark the field "Overwrite." If you do not choose over- writing, the dimension value will only be derived if the dimension field for which derivation is taking place has neither been completed manually nor by entering a registration code.</p> <p>Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used rather than the value (if any) found for this dimension in the dimension combination in question. This means that the dimension combination only applies to this dimension if you have not entered a value in this field.</p> <p>Please note that if a dimension combination has been specified in the field "Dim. Comb. No.," a mark in the field "Overwrite" will only have effect if you have also entered a dimension value. If you mark the field "Overwrite" but you do not enter a dimension value in this field, the "Overwrite" field is ignored, as dimension values and overwriting specification are always retrieved together from the same dimension derivation island, dimension combination or dimension combination line.</p>

**Derived Dimensions Island**

Field	Description
<b>Location</b>	<p>The functionality of this field is similar to that of the field "Company No." above. Note that when posting an automatically created customer-related journal, for example, in connection with customer open entry reconciliation or approval of a reminder selection, Maconomy will transfer the Location value to the G/L entries in question. This takes place at the time of posting.</p>
<b>Entity</b>	<p>The functionality of this field is similar to the functionality of the field "Location" above.</p>

Field	Description
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

### Parent Customer Island

Field	Description
<b>Customer No.</b>	<p>In this field, you can specify the number of a customer which should be the parent customer of the current customer. If you specify a parent customer in this field, you also have to specify a linking rule in the field "Linking Rule" below. If you do not specify a linking rule, Maconomy will use a standard linking rule, insofar as one has been created between the tables "Customer" and "Customer" in the window Linking Rules in the Set-Up module. On the basis of these two choices you may then create a company-specific customer with the number that you have entered in the field "Customer No." in the island Delivery Customer and a customer with the same number in the window Customer Information Card. This corresponds to the procedure of first creating a customer in the "normal" customer information card on the basis of the information entered in the fields "Customer No." and "Linking Rule," and in this window then creating a company-specific customer with the indicated company-specific link. What information is copied to the different customer information cards will depend on the linking rules that are indicated.</p> <p>If you want to create a company-specific customer, and a parent customer for the customer whose number you apply in the field "Customer No." in the island Delivery Customer has already been entered, the fields "Customer No." and "Linking Rule" in this island will automatically be filled in with the information that is contained in the applied Customer's Information Card. For further information on parent customers and rules for the copying of field information from customers, see the description of the window Linking Rules in the Set-Up Module.</p>
<b>Name</b>	This field displays the name of the customer specified as parent customer in the field "Customer No." above.
<b>Linking Rule</b>	In this field, you can specify the linking rule that you want to use for the current customer. If you have specified a parent customer in the field "Customer No." above and you do not specify a linking rule in this field, Maconomy will use a standard linking rule between the relations Customer and Customer in the window Linking Rules in the Set-Up module, if any. If no standard linking rule has been created, Maconomy will display an error message. Linking rules contain information about what information should be copied from a parent customer to the current customer. Linking rules are maintained in the window Linking Rules in

Field	Description
	the Set-Up module. For further information about linking rule creation and usage and rules concerning the copying of field information from parent customers, see the description of the window Linking Rules in the Set-Up module.
<b>Company Specific Linking</b>	<p>In this field, you can specify the linking rule that you want to use for the current company-specific customer. Linking rules contain information about what information should be copied from a parent customer to the current company-specific customer. If you do not complete this field and a linking rule has been created between the tables "Customer" and "CompanyCustomer," which is used as a standard linking rule, the field is completed automatically with the name of the associated standard linking rule.</p> <p>Linking rules are maintained in the window Linking Rules in the Set-Up module. For further information about linking rule creation and usage and rules concerning the copying of field information from parent customers, see the description of the window Linking Rules in the Set-Up module.</p>

### Delivery Island

Field	Description
<b>Back Order Handling</b>	Here you choose how to process back orders to this customer. You can always change the value for an individual order during order processing. You can select three different back order handling methods: "Save," "Delete," and "Transfer." For further information about handling of back orders, see the description of the window Sales Orders in the Sales Orders module.
<b>Blanket Order</b>	In this field, you can specify whether quotes and orders for the current company-specific customer should be created as blanket orders. If you mark this field, quotes and orders created for the company-specific customer will be created as blanket orders, that is, with the corresponding field marked. See the description of the field "Blanket Order" in the window Sales Orders in the Sales Orders module for further information on the functionality of blanket orders.
<b>Warehouse</b>	<p>In this field, you enter the warehouse from which items are normally delivered to the customer. The value is used when registering orders and invoices. Maconomy checks that the items are available from the warehouse. The value can be changed in individual orders.</p> <p>Warehouses are maintained in the Warehouse Information Card in the Inventory module.</p>
<b>Delivery Terms</b>	In this field, you select which delivery terms normally apply to the customer. The field is used when you handle orders.
<b>Delivery Mode</b>	<p>In this field, you select which delivery mode normally applies to the customer. The field is used when you handle orders.</p> <p>Delivery Terms are maintained in the pop-up field "Delivery Terms" in the window Popup Fields in the Set-Up module.</p>

Field	Description
<b>Carrier</b>	In this field, you select which means of transport you use to deliver items to the customer. The field is used when you handle orders.  Carriers are maintained in the pop-up field "Carriers" in the window PopUp Fields in the Set-Up module.
<b>Consignment Type</b>	In this field, select the consignment type normally used when delivering goods to the current customer.
<b>Destination No.</b>	In this field, you can enter a destination number if items to the current customer are usually delivered to a given destination.
<b>Charge Table</b>	In this field, you can select the charge table to be used in the calculation of charges on transactions regarding the current customer. When quotes, sales orders, and credit orders are created for the current customer, the charge table is transferred to the transaction in question.
<b>Charge Discount %</b>	In this field, you can specify a charge discount percentage to be applied to charges on transactions regarding the current customer.

**Account Stm. Cust. Island**

Field	Description
<b>Customer No.</b>	In this field, you enter an account statement customer number, if items are delivered to one customer and the account statement is sent to another. Maconomy checks that the account statement customer already exists.  Printing out a periodic account statement to which an account statement customer has been assigned thus means that the account statement customer and not the ship-to customer receives the account statement printout.  If you leave this field blank, the account statement customer is automatically identical to the ship-to customer.  Maconomy also shows the name and address of the account statement customer. The fields are completed when you press Return, and cannot be changed here.
<b>Attn.</b>	This is the account statement customer's attention person - the person to whom payment information is directed. The field is completed when you press Return, and you cannot change it here.
<b>Country</b>	This is the account statement customer's country. The field is completed when you press Return, and you cannot change it here.
<b>Phone</b>	This is the account statement customer's telephone number. The field is completed when you press Return, and you cannot change it here.
<b>Fax</b>	This is the account statement customer's telex number. The field is completed when you press Return, and you cannot change it here.

Field	Description
<b>E-mail</b>	This is the account statement customer's electronic mail address. The field is completed when you press Return, and you cannot change it here.

### Access Level Island

Field	Description
<b>Name</b>	<p>Here you can enter the name of the access level. Users only have access to information about the current customer if they have been assigned to this or a higher access level in the window User Access Levels in the Set-Up module. This means that a user can only specify the customer on, for example, sales orders if he has access to the customer. In addition, a user can only see customer information cards of customers to which he has access. In addition, the user must have access to the access level specified for the customer's settling company in order to have access to the current company-specific customer. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to vendors may depend on other factors. For further information about the standard access control configuration and access control in a multi- company model, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If you do not specify an access level, all users will have access to see information about the current customer, provided that they have access to the settling company of the customer.</p>

### Subscription Island

Field	Description
<b>Price Adjustment Principle</b>	In this field, you can specify a price adjustment principle to be suggested on subscriptions created for the current customer. For further information about price adjustment principles, see the window Price Adjustment Principles in the Subscription module.

### Teams Island

Field	Description
<b>Team 1-6</b>	In this field, you can specify the name and number of a team of employees to be assigned to the customer, for instance because the customer prefers to work with a given team. Teams are created in the window Teams in the Set-Up module. When you create a new job for the current customer, the teams specified for the customer are automatically copied to the job, unless another team is specified in the corresponding field on the job.

## Actions

This section shows the Actions available in the Company Specific Customer Information Card workspace.

### Top Tab

Field	Description
<b>Attach Document</b>	This action allows you to attach a document to the company-specific customer.

## Company Specific Payment Information Single Dialogs Workspace

Use this workspace to maintain financial information about your company-specific customers, including payment terms, credit limits, and interest and reminder information.

You can change payment information for only one customer at a time.

If you create a company-specific customer from an enterprise-wide customer, Maconomy populates the company-specific customer's payment information automatically, using information from the enterprise-wide customer's Payment Information workspace.

The information that the new company-specific customer inherits depends on the linking rule that you assigned to the company-specific customer in question.

The ability to enter, change, or view a value in each field depends on the setup of the linking rule that you assigned to the company-specific customer, if any. For more information about linking rules, see the description of the Linking Rules workspace in the Set-Up module.

If you change the information on a company-specific customer's payment information card, Maconomy updates the **Changed by**, **Date** (of the change), and **Version No.** fields.

It is recommended that you print and file the company-specific payment information each time that you make a change in this workspace or in the Company Specific Customer Information Card workspace. You print the current payment information by using the **Print This** action in the File menu.

### Company Specific Payment Information Tab

This section includes the fields and descriptions for the Company Specific Payment Information tab.

#### Customer Island

Field	Description
<b>Customer No.</b>	This field displays the number of the customer. It cannot be changed. To retrieve a customer, you can use the search functions in the Find menu.  The other lines in this field show the customer's name and address. This information is copied from the window Company Specific Information Card.

Field	Description
<b>Attn.</b>	This field displays the customer attention person. This information is copied from the window Company Specific Information Card.
<b>Country</b>	This field displays the country code of the customer. This information is copied from the window Company Specific Information Card.  When you change the country code in this window, Maconomy checks that the rules of validation for tax and social security/federal ID numbers in the window Rules of Validation are observed.
<b>Phone</b>	This field displays the customer's telephone number. This information is copied from the window Company Specific Information Card.
<b>Giro</b>	This field displays the customer's giro account number. (This applies to countries with a national giro system.) This information is used for references and is copied from the window Company Specific Information Card.
<b>Currency</b>	This field displays the customer's standard currency. The standard currency is specified in the field "Currency" in the window Company Specific Customer Information Card.

### Settling Company Island

Field	Description
<b>Settling Company</b>	This field displays the name and number of the settling company on the current company-specific customer's information card. The settling company is the company which has the claim against the customer and the company to which the customer must make payments. The settling company's accounts also include the customer which means that the value in this field is transferred to the customer entries created on the current customer upon posting. If another company completes postings on the company-specific customer, this will automatically lead to inter-company entries of the type "CustomerCollection" between the two companies. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### Payment Control Island

Field	Description
<b>Cust. Payment Mode</b>	In this field you select the mode in which the customer will normally be paying. The customer payment mode is used for selecting the customer payment mode and the payment agent and is transferred when you create invoices and credit memos. The customer payment mode can, however, be

Field	Description
	changed on the individual invoice or credit memo or in the window Change Payment Selection in the Banking module. The customer payment mode is furthermore used for calculating the customer's payer ID. Payment modes are maintained in the window Payment Modes in the Banking module.
<b>Collection Agreement</b>	In this field, you can enter the agreement number that the current customer has been assigned at the payment agent who is connected to the selected customer payment mode. The field is only used for electronic customer payment modes.
<b>Collection Gr. No.</b>	In this field, you can specify the collection group number to which the current customer belongs. The collection group number is supplied by the payment agent. If the payment mode of the customer is electronic, you must specify a collection group number in this field.
<b>Global Location No.</b>	<p>If the customer has requested that you use a specific global location number on invoices, you can specify the location number in question here. The number specified here will be suggested on all sales orders, jobs, and so on, assigned to the customer, and thus in turn flow to the resultant invoices. However, the global location number can be changed on the individual sales orders, jobs, and so on. if another location number is to be used in a specific context.</p> <p>For further information about the concept of global location numbers, see the introduction to the window Company Locations.</p>
<b>Payer Id.</b>	This field displays the company-specific customer's payer identification. The payer identification is used in connection with electronic payments. For further information about payment modes, see the description of the window Payment Modes in the Banking module.
<b>Control Account</b>	<p>Here you can select a posting reference to a G/L account. All entries to the customer are posted to the General Ledger to the A/R control account specified here. Accounts Receivable is thus an aggregation of the A/R control accounts in the General Ledger. For example, you can group your customers in domestic and foreign customers in the General Ledger.</p> <p>References to control accounts are specified in the window Popup Fields in the Set-Up module.</p>
<b>Automatic Reconciliation</b>	<p>Mark this field if you want Maconomy to automatically reconcile accounts receivable entries (payments, invoices, credit memos) during posting. If marked, Maconomy will always reconcile against the oldest open entry or entries that can be reconciled totally or partially by the amount being posted. This means that a customer with a debit balance will never have open credit entries, and the customer's open debit entries will always be their most recent. Similarly, a customer with a credit balance will never have open debit entries, and this customer's open credit entries will also be their most recent.</p> <p>If this field is not marked, all entries to the customer will be registered as open entries. The user must then manually reconcile each entry in the window Customer Payments in the Accounts Receivable module.</p>

Field	Description
	Payments can also be reconciled in the General Journal by entering the number of the invoice the payment covers.
<b>Blocked</b>	<p>Here you specify whether the customer is blocked or on stop. If this field is marked, the customer is blocked and you cannot create quotes, sales orders, manual invoices or jobs for the given customer. However, you can create invoices from the Job Cost module for existing, open jobs.</p> <p>This functionality can be used, for example, in connection with a current reminder procedure.</p>
<b>Payment Terms</b>	<p>Here you select the payment terms that will normally apply to the customer. These terms are used to calculate the date an invoice becomes due for payment.</p> <p>Payment Terms are maintained in the pop-up field "Payment Terms" in the window Pop-up Fields in the Set-Up module.</p>
<b>Expected Days to Payment</b>	<p>This field is similar to the Expected Days to Payment field in the Payment Information window. However, in this field, you have the option to enter the value provided by the customer.</p> <p>The set-up of linking rules in the Linking Rules window in the Set-up module determined what information is inherited from customers to company-specific customers. For example, if there is a linking rule from the "Customer" table to the "Company Customer" table that specifies that all customer information, except for fields such as Att. and Phone, should be inherited to company-specific customers with the standard linking method "Full," Maconomy copies the relevant information to the company-specific customer's information cards using this linking rule. The selected linking rule therefore determines if this field is changeable.</p>
<b>Cash Discount</b>	<p>Here you can select a code to specify the maximum cash discount given to the customer when entries are reconciled. Maconomy verifies that the discount limit is not exceeded upon reconciliation of payments. A cash discount code is a reference to a discount percentage. The codes are maintained in the pop-up field "Cash Discount Codes" in the window Pop-up Fields in the Set-Up module.</p> <p>The cash discount is automatically posted to a G/L account for cash discounts. The reference to this account is specified by means of a dimension combination in the window Posting References in the G/L module. This allows you to sort cash discounts by department in the General Ledger.</p>
<b>Credit Card No.</b>	If the customer wants to pay by credit card, you can enter the number of the credit card in this field. Information in this field will automatically be transferred to new quotes and sales orders. Please note that the field is for information only, as Maconomy's Banking module does not support payment by credit card. If you enter a credit card number, you must also specify an expiry date.
<b>Expiry Date</b>	In this field, you enter the expiration date of the credit card specified in the field "Credit Card No." above.

### Bill to Customer Island

Field	Description
<b>Customer No.</b>	<p>In this field, enter a bill-to customer number if items are delivered to one customer, but billed to another. The bill-to customer thus represents the customer to whom invoices are to be sent.</p> <p>This bill-to customer is copied from the window Company Specific Information Card and cannot be changed in this window.</p> <p>Maconomy also shows the name and address of the bill-to customer. This information is copied from the window Company Specific Information Card and cannot be changed in this window.</p>
<b>Attn.</b>	<p>This is name of the bill-to customer's attention person - the person to whom payment information directed. The field is completed when you press Return, and you cannot change it here.</p>
<b>Country</b>	<p>This is the bill-to customer's country. The field is completed when you press Return, and you cannot change it here.</p>
<b>Phone</b>	<p>This is the bill-to customer's telephone number. The field is completed when you press Return, and you cannot change it here.</p>

### Balance Island

Field	Description
<b>Balance, Currency</b>	<p>This field displays the company-specific customer's balance in the standard currency of the customer. Maconomy updates the balance when you post journals with customer entries. It cannot be changed.</p> <p>Note that the corresponding field in the window Payment Information displays the collective balance of the parent customer for the assigned company-specific customers in the customer's standard currency.</p>
<b>Balance, Base</b>	<p>This field displays the customer's balance in the base currency of the customer's settling company. Maconomy automatically updates the balance when you post journals with customer entries. It cannot be changed.</p> <p>Note that the field "Balance, Enterprise" in the window Payment Information displays the collective balance of the parent customer for the assigned company-specific customers in the enterprise currency of the system.</p>
<b>Order Volume, Base</b>	<p>This field displays the customer's current order volume, expressed in the base currency of the customer's settling company. It is updated when you approve sales and credit orders for which the customer is invoiced. The order sum is also updated when you enter and delete lines in previously approved sales and credit orders. After invoices and credit memos have been posted, the amount is transferred to the customer's balance.</p> <p>The order volume is included in the credit limit calculation. If the order volume and balance add up to more than the customer's credit limit, the limit is exceeded.</p>

Field	Description
	<p>Note that the field "Order Volume, Enterprise" in the window Payment Information displays the collective order volume of the parent customer for the assigned company-specific customers in the enterprise currency of the system.</p> <p>Note that sales and credit orders which have been transferred to a job are not included in the calculation of the order volume. As the order volume only represents information on the total amount on approved sales and credit orders, this field does not show the amount registered on jobs to which the current customer has been assigned. Non-invoiced job cost registrations are therefore not included in the calculation of the customer's credit limit.</p>

### Credit Limit Island

Field	Description
<b>Company Level, Base</b>	<p>In this field, you specify the company-specific customer's credit limit in the base currency of the customer's settling company.</p> <p>If you create a company-specific customer from an existing customer for whom an amount has been specified in the field "Company Level, Enterprise," this amount will be copied from the customer's payment information card to this company-specific customer. If the base currency of the company-specific customer is different from the enterprise currency, the amount copied will be converted into the base currency of the customer in question.</p> <p>In this context, you should also consider that if this field has been assigned to a linking rule using the linking method "Partial" between a customer and a company-specific customer, and if the enterprise currency corresponds to the company-specific customer's base currency, Maconomy will use the linking method "Partial" as normal. However, if the enterprise currency and the base currency do not correspond, Maconomy will automatically convert the amount specified in this field to the company-specific customer's base currency and copy it to the field "Company Level, Base" in the window Company Specific Payment Information. Maconomy performs this currency conversion considering that the user has decided the contents of this field, meaning that the amount specified in base currency will not be changed when the amount in enterprise currency is changed in this window.</p> <p>Whether or not you are able to change the amount in this field after creation, will depend on the linking rule used in the current situation.</p> <p>If you try to create invoices, sales orders and quotes to a company-specific customer, Maconomy will verify that the credit limit of both the company-specific customer and the parent customer is not exceeded. If either credit limit is exceeded, Maconomy displays an error message.</p>

**Interest Charge/Reminder Control Island**

Field	Description
<b>Interest Charge/Reminder Principle</b>	In this field, you specify the interest charge/reminder principle to be used for the current customer. Interest charge/reminder principles are maintained in the window Interest Charge/Reminder Principles. For further information about interest charge/reminder principles, see the description of this window.
<b>Reminder Text Group</b>	In this field, you can specify the name of a reminder text group that you want to associate with the dispatch of reminder letters to the current customer. For further information about reminder texts, see the description of the windows Reminder Texts and Reminder Text Groups.
<b>Last Interest Date</b>	This field displays the last interest charge date of the current customer. The date in this field is set on the basis of the date in the corresponding field on the assigned company-specific customer's payment information cards. The customer's last interest charge is therefore the last of the company-specific customer's registered interest charge dates.
<b>Current Reminder Level</b>	<p>This field displays the reminder level of the customer. The customer's reminder level equals the highest reminder level specified on an entry for the current customer. The reminder level is raised by 1 for each time a reminder is sent to the customer. The field is automatically updated by Maconomy and cannot be changed in this window.</p> <p>The contents of this field can also be copied to a parent customer. The functionality of this field is similar to that of the field "Last Interest Date."</p>
<b>Date of Last Reminder</b>	This field displays the last reminder date of the current customer. If the current company-specific customer has been assigned to a parent customer, the date in this field will affect the date displayed in the corresponding field on the parent customer's payment information card. As the date of the last reminder is always copied to the parent customer, the date of the last reminder is therefore the last of the assigned company-specific customer's registered reminder dates.

**Electronic Collection Island**

Field	Description
<b>Selected for Collection</b>	This field shows whether the current customer has been selected for collection. If the field is completed, the customer is either selected or being selected for collection. Collection selections can be created in the window Collection Selection in the Banking module. The field cannot be changed.
<b>No. Entries Selected</b>	This field shows the number of entries that have been selected for collection on the current customer. The number in this field is the collective total of all assigned company-specific customer's selected entries.

**Print Status Island**

Field	Description
<b>Last Statement No.</b>	This shows the number of the last historical account statement printed out for the customer. Historical statements are printed out in the window Print Historical Customer Statement. The field is automatically updated by Maconomy and cannot be changed.
<b>Date of Last Statement</b>	This is the date the customer's last historical statement was created. The field is automatically updated by Maconomy and cannot be changed.
<b>Date of Last Account Printout</b>	This is the date a customer statement was last printed. The field is automatically updated by Maconomy and cannot be changed.

## Customer Discount Agreements Single Dialogs Workspace

Use this workspace to maintain customer discount agreements.

You can create and maintain multiple discount agreements for the same customer.

Maconomy applies the discount when a user creates an entry on a sales order, credit order, invoice, or credit memo in the Sales Order module.

Maconomy always calculates discounts at the line level, and you always enter discounts at the line level. If several discount agreements overlap, Maconomy selects the one that gives the customer the maximum discount.

The agreement is controlled by several parameters, including item number and delivery date. This means that if you specify an item group and a range of delivery dates, the agreement only covers items in the item group and deliveries made within that range of delivery dates.

If you have Maconomy Bill Of Materials, note that the items that release the discount must be under price control. If a bill of materials is not under price control on the highest level, each individual element of the bill of materials must be covered by a discount agreement.

### Customer Discount Agreements Tab

This section includes the fields and descriptions for the Customer Discount Agreements tab.

**Customer Island**

Field	Description
<b>Customer</b>	This is the customer name and number and includes the first two lines of the customers address. The field cannot be changed. The information is retrieved from the Customer Information Card and cannot be changed here.

## Customer Discount Agreements Sub-Tab

This section includes the fields and descriptions for the Customer Discount Agreements sub-tab.

Field	Description
<b>Item Group</b>	In this field, you select the item group covered by the agreement. The item group is a classification of items, based on costing method and other factors. Item groups are maintained in the Item Group Information Card in the Inventory module. If you select "blank," item group has no influence on the target group.
<b>Item Type</b>	In this field, you select which the item type covered by the agreement. Item type is a classification of items, independent of item group. It is mainly used for statistics. Item type is specified in the window Item Information Card in the Inventory module. If you select "blank," item type has no influence on the target group.
<b>From Item No.</b>	This field and the field "To Item No." identify a range of item numbers. The discount agreement will only apply to items within this range. If you leave this field blank, the range will include all items with numbers up to the value specified in the field "To Item No."
<b>To Item No.</b>	This field and the field "From Item No." identify a range of item numbers. The discount agreement will only apply to items within this range. If you leave this field blank, the range will include all items with numbers from the value specified in the field "To Item No." and up.
<b>First Delivery Date</b>	This field and the field "Last Delivery Date" identify a range of delivery dates. The discount will only be granted on orders with a preferred delivery date within the specified range of dates. If you leave this field blank, the range will include all dates up until the date specified in the field "Last Delivery Date."
<b>Date of Last Shipment</b>	This field and the field "First Delivery Date" identify a range of delivery dates. The discount will only be granted on orders with a preferred delivery date within the specified range of dates. If you leave this field blank, the range will include all dates from the value specified in the field "Last Delivery Date" and up.
<b>Min. Amount, Enterprise</b>	In this field, you enter the minimum purchase amount for which you give a discount. If you enter 0, the discount covers all purchases, however small. The amount applies to the order line, not the whole order.
<b>Discount %</b>	In this field, you enter the discount percentage. You must enter a positive figure.
<b>Discount Desc.</b>	In this field, you enter the discount text in the primary language of the system. The primary language is the one appearing on the first table line for the pop-up type "Languages" in the table part of the window Popup Fields. The description appears on quotes, orders, and invoices assigned to the primary language, as the text is transferred the "Discount Desc." field on the table lines where the current discount is granted.

Field	Description
	The text you enter is furthermore created as an entry in the window Language Texts in the Set-Up module. It is then possible to assign translations of the discount description in the languages used in Maconomy. This makes it possible, for example, to send an invoice to a German company with the discount descriptions in German. In those cases where no translation of the discount description has been made in the language used in a given context - for instance on the printout of an order confirmation, Maconomy uses the description in this field instead. For more information about discount descriptions in other languages, please see the description of the window Language Texts in the Set-Up module.
<b>Fixed Price List</b>	<p>Here you can tie the items in the discount agreement to a price list. This means the discount specified in the "Discount %" field is only released if the item ordered is priced according to this price list (on the order line in the sales orders module). In other words, a discount agreement can evoke a different price list from the one originally specified on the order.</p> <p>However, the discount agreement will only take effect, if the item price, calculated from the fixed price list, less the discount, gives a price that is lower than the price determined by the price list specified on the order.</p> <p>If you select "blank," the discount is released regardless of which price list is used.</p>
<b>Fixed Price Step</b>	<p>Here you select whether to tie the items in the discount agreement to a specific price step. This means the discount specified in the "Discount %" field only applies to this price step in the price list.</p> <p>By tying the discount to a price step, you might give the customer a quantity discount even though the quantity of items ordered does not justify the discount. A fixed price step can also lead to the reverse situation.</p> <p>However, the discount agreement will only take effect, if the item price, calculated from the fixed price step, less the discount, gives a price that is lower than the price determined by the price list specified on the order.</p> <p>This field is only relevant if you enter a price list in the "Fixed Price List" field.</p> <p>If you do not enter a fixed price step, the discount is released regardless of which price step the ordered items correspond to in the price list.</p>
<b>Created By</b>	This field shows the name of the user who created the current discount line.
<b>Created On</b>	This field shows the date on which the current discount line was created.
<b>Changed By</b>	This field shows the name of the last user who made changes to the current discount line.
<b>Changed on</b>	This field shows the date on which the last user made changes to the current discount line.
<b>Version</b>	This field shows a number corresponding to the version of the information on the line. Maconomy automatically increases the version number by one every

Field	Description
	time the information on the line is changed. It is not possible to retrieve previous versions.
<b>Remarks 1- 5</b>	In these fields, you can enter a number of remarks about the current discount agreement.

## Fixed Exchange Rates Information Workspace

Use this workspace to specify a fixed exchange rate for company-specific customers.

Each time you create a job for a customer with a defined exchange rate, Maconomy automatically copies that information to the job.

### Fixed Exchange Rate Information Tab

This section includes the fields and descriptions for the Fixed Exchange Rate Information tab.

#### Job Specific Fixed Exchange Rates

Field	Description
<b>Use Fixed Exchange Rates from Job</b>	<p>Select this check box when specifying fixed exchange rates for a company customer.</p> <p>Each time you create a job for the company customer, Maconomy automatically copies the value of this check box to the check box with the same name in the Jobs workspace.</p>
<b>Standard Exchange Rate Date</b>	<p>You use this field when creating a new job for the company customer.</p> <p>Each time you create a new job for the company customer and you enter a value in this field, Maconomy automatically copies that value to the field with the same name in the Jobs workspace.</p> <p>If you specify a standard exchange rate table but do not specify an exchange rate for the currency used in a transaction for the job, Maconomy uses the standard exchange rate date as a reference date.</p> <p>If you leave this field blank, Maconomy uses the entry date specified in the transaction.</p>
<b>Standard Exchange Rate Table</b>	<p>In this field, select a value from the drop-down list to specify the exchange rate table from which you want to copy initial company customer-specific exchange rates.</p> <p>The reference currency of the selected table must be the same as the enterprise currency.</p> <p>Each time you create a job for the company customer, Maconomy automatically copies the value you specify here to the field with the same name in the Jobs workspace.</p>

Field	Description
	If you do not specify an exchange rate for the currency used in a transaction for the job, Maconomy uses the exchange rate from the specified standard exchange rate table.

## Exchange Rates Sub-Tab

This section includes the fields and descriptions for the Exchange Rates sub-tab.

Field	Description
<b>Date</b>	In this field, specify the starting date of the exchange rate to be used for the company customer. The exchange rate is valid from the date you specify until the next date with an exchange rate for the specified currency in the Exchange Rate currency line.
<b>Currency</b>	In this field, select the currency for which you want to create a fixed exchange rate. Currency codes are maintained in the Popup Fields single dialog workspace.
<b>Exchange Rate</b>	In this field, enter the exchange rate between the currency specified in the line and the reference currency of the exchange rate table. You can also choose to retain the value from the standard exchange rate table you copied. You can enter the exchange rate as the price of the foreign currency in base or the other way round, depending on whether the <b>Exch. Rate in Ref. Currency</b> check box in the System Information single dialog workspace is selected. Use the unit entered in the <b>Standard Unit</b> field in the System Information single dialog workspace.

## Actions

This section shows the actions available in the Fixed Exchange Rates workspace.

### Fixed Exchange Rate Information Tab

Field	Description
<b>Copy Standard Exchange Rates to Customer</b>	Click this action to open the wizard for specifying fixed exchange rates for a company customer.

## End Users Single Dialogs Workspace

Use this workspace to maintain information about end users. An end user is a customer with whom you have no direct sales contact, but who buys from you through one of your customers.

Use this workspace to enter general information about an end user and to identify your customers who sell goods to the end user. When you make a sale intended for an end user, you can enter the end user number on quotes, credit orders, and sales orders.

If a sale is going to an end user, you can enter the end user's customer number on quotes, credit orders, and sales orders. Use the Popup Fields workspace in the Set-Up module to specify that an order mode involves end user sales. If you forget to enter an end user for such order modes, Maconomy displays an error message.

## End Users Tab

This section includes the fields and descriptions for the End Users tab.

### End User Island

Field	Description
<b>End User No.</b>	<p>In this field, you enter a unique end customer number. The end customer is a customer who buys from one or more of your direct customers.</p> <p>You also enter the end customer's name and address. Note, you must complete the line under the end customer number.</p> <p>The fourth line has two fields: One for zip code and the other for postal district. If you enter a zip code and leave the postal district field blank, the postal district field is automatically completed, provided that the zip code in question has been entered for the relevant country in the window Postal Districts in the Set-Up module. For further information, see the description of the window Postal Districts.</p>
<b>Attn.</b>	In this field, you enter the end customer's attention person.
<b>Country</b>	In this field, you enter the end customer's country. Countries are maintained in the window Countries in the Set-Up module.
<b>Phone</b>	In this field, you enter the end customer's phone number.
<b>Fax</b>	In this field, you enter the end customer's fax number.
<b>Telex</b>	In this field, you enter the end customer's telex number.
<b>E-mail</b>	In this field, you enter the e-mail address of the end user.

### Remarks Island

Field	Description
<b>Remarks</b>	In these fields, you enter remarks concerning the current end user.

## End Customers Sub-Tab

This section includes the fields and descriptions for the End Customers sub-tab.

Field	Description
<b>Customer No.</b>	In this field, you enter the number of one of your direct customers, who sells your items on to the end customer.
<b>Name</b>	This is the name of the customer who sells to the end customer. It is retrieved from the customer's information card and cannot be changed here.

## Customer Budgets Single Dialogs Workspace

Use this workspace to enter and maintain monthly revenue budgets for customers, which is the amount of revenue expected from the customer.

For each month in the fiscal year, you can enter a summary budget amount or break out budgets by activity type or item group.

The Customer Budgets tab displays information about the current customer and the fiscal year for which you are budgeting. In the Budget Lines sub-tab, you can enter the expected budget figures for each month. You can also enter budget figures by activity type (time/amount), by item group, or as a summary for each month.

## Customer Budgets Tab

This section includes the fields and descriptions for the Customer Budgets tab.

### Customer Island

Field	Description
<b>Customer</b>	This field shows the name and number of the current customer.

### Budget Island

Field	Description
<b>Fiscal Year</b>	In this field, you can specify the fiscal year for which you are budgeting.
<b>Budget Type</b>	In this field, you can select a budget type. Budget types are maintained in the pop-up field "Budget Type" in the window Popup Fields in the Set-Up module.

## Budget Lines Sub-Tab

This section includes the fields and descriptions for the Budget Lines sub-tab.

Field	Description
<b>Act. Type</b>	In this field, you can select an activity type.
<b>Item Group</b>	In this field, you can select an item group among the groups that exist in Maconomy.
<b>Period 1-12</b>	These fields are used for specifying budget figures for each period in the current fiscal year.

## Customer Level Setup Single Dialogs Workspace

Use this workspace to build a customer hierarchy, which you can use for many purposes.

The hierarchy can have one to five levels.

For example, you might have a client at the top level and a number of brands at the second level, and a number of products at the third level.

### Customer Level Setup Tab

This section includes the fields and descriptions for the Customer Level Setup tab.

#### Customer Linking Rules Island

Field	Description
<b>Level 1 - Level 2</b>	In this field, you can enter the standard linking rule from level one to level two. If no linking rule is specified, the standard linking rule will be used.
<b>Level 2 - Level 3</b>	In this field, you can enter the standard linking rule from level two to level three. If no linking rule is specified, the standard linking rule will be used.
<b>Level 3 - Level 4</b>	In this field, you can enter the standard linking rule from level three to level four. If no linking rule is specified, the standard linking rule will be used.
<b>Level 4 - Level 5</b>	In this field, you can enter the standard linking rule from level four to level five. If no linking rule is specified, the standard linking rule will be used.

#### Contact Company Linking Rules Island

Field	Description
<b>Level 1 - Level 2</b>	In this field you can enter the standard linking rule from level one to level two. If no linking rule is specified the standard linking rule will be used.
<b>Level 2 - Level 3</b>	In this field, you can enter the standard linking rule from level two to level three. If no linking rule is specified, the standard linking rule will be used.

Field	Description
<b>Level 3 - Level 4</b>	In this field, you can enter the standard linking rule from level three to level four. If no linking rule is specified, the standard linking rule will be used.
<b>Level 4 - Level 5</b>	In this field, you can enter the standard linking rule from level four to level five. If no linking rule is specified, the standard linking rule will be used.

#### Level Names Island

Field	Description
<b>Level 1 Name - Level 5 Name</b>	In this field, you specify the name of Customer level 1 through 5.

## Interest Charge / Reminder Principles Single Dialogs Workspace

Use this workspace to enter and maintain interest charge/reminder principles.

These principles determine how Maconomy applies interest and reminders to customer entries that have exceeded their due dates, both in general and at the time of reconciliation. Use the Payment Information workspace or Company Specific Payment Information workspace to apply the principles to specific customers.

You can assign an interest charge/reminder principle to a customer or a company-specific customer in the Payment Information and Company Specific Payment Information workspaces.

When you use the **Open** and **Open and Closed** interest charge calculation principles for interest charge and reminder calculation, Maconomy reconciles open credit entries with open debit entries. Maconomy reconciles the oldest open debit entries before the newest debit entries.

### Interest Charge Reminder Principles Tab

This section includes the fields and descriptions for the Interest Charge/Reminder Principles tab.

#### Interest Charge/Reminder Principle Island

Field	Description
<b>Name</b>	In this field, you enter the name of the interest charge/reminder principle. The name is used for specification of an interest charge/reminder principle on a customer's or company-specific customer's payment information card in the island Interest Charge/Reminder Control.
<b>Description</b>	In this field, you enter a description of the interest charge/reminder principle. The description will be included on printouts of interest charge notices, reminder letters, invoices, and so on. You can translate the description in the window Language Texts in the Set-Up module.
<b>Customer Payment Mode</b>	In this field, you select a customer payment mode. The customer payment mode is used to find an offset account for the current payment. A customer payment mode can, for example, be a manual payment, a check or a bank account.

**Currency Island**

Field	Description
<b>Currency</b>	In this field, you select the currency to apply to the amounts specified in this window. When creating a new interest charge/reminder principle, the currency in this field is by default set to the enterprise currency of the system, but it can be changed. When making interest charge selections or reminder selections, Maconomy automatically converts interest charges and reminder amounts from the currency specified in this field into the currencies of the customers for which selections are made.

**Interest Charge Calculation Principle Island**

Field	Description																								
Charge Interest	If you mark this field, the current interest charge/reminder principle can be used for calculation of interest charges on customers.																								
Interest Charge Basis	<p>If you mark this field, the current interest charge/reminder principle can be used for calculation of interest charges on customers.</p> <p>In this field, you can select the interest basis to be used in the current interest charge/reminder principle. You can choose between three calculation principles, namely “Open,” “Closed,” or “Open and Closed.”</p> <p>The difference between these three principles can be outlined using the following example:</p> <p>First consider that the interest charge calculation principle “EOM” is used and that the annual interest charge is 24 percent.</p> <p>The table below forms the basis for the following examples:</p> <table><tr><th>Date</th><th>Activity</th><th>Entry</th><th>Remainder</th></tr><tr><td>January 1st</td><td>Invoice due</td><td>USD 10.000</td><td>USD 10.000</td></tr><tr><td>February 1st</td><td>Payment 1</td><td>USD -3.000</td><td>USD 7.000</td></tr><tr><td>March 1st</td><td>Interest Charge 1</td><td>(*)</td><td>(*)</td></tr><tr><td>April 1st</td><td>Payment 2</td><td>USD -7.000</td><td>USD 0</td></tr><tr><td>May 1st</td><td>Interest Charge 2</td><td>(**)</td><td>(**)</td></tr></table> <p>■ Open entries — Interest charge calculation is only performed on entries for which payment has been made. “Payment 1” on February 1st has covered a part of the amount due, USD 10.000, meaning that the remainder of USD 7.000 is open on the current entry. The interest charge on this entry therefore has to be calculated on USD 7.000 EOM over 59 days (Jan. 1st to Feb. 28th). The interest charge is determined using the following calculation:</p> <p><math display="block">(59/365) * (24/100) * \text{USD } 7.000 = \text{USD } 271,56.</math></p>	Date	Activity	Entry	Remainder	January 1st	Invoice due	USD 10.000	USD 10.000	February 1st	Payment 1	USD -3.000	USD 7.000	March 1st	Interest Charge 1	(*)	(*)	April 1st	Payment 2	USD -7.000	USD 0	May 1st	Interest Charge 2	(**)	(**)
Date	Activity	Entry	Remainder																						
January 1st	Invoice due	USD 10.000	USD 10.000																						
February 1st	Payment 1	USD -3.000	USD 7.000																						
March 1st	Interest Charge 1	(*)	(*)																						
April 1st	Payment 2	USD -7.000	USD 0																						
May 1st	Interest Charge 2	(**)	(**)																						

Field	Description
	<p>The interest charge of USD 271,56 can now be added to the remainder amount of USD 7.000, resulting in a new remainder of USD 7.271.56 ("Payment 2").</p> <p>Once the second payment has taken place, the entry is closed and "Interest Charge 2" is therefore USD 0,00.</p> <ul style="list-style-type: none"> <li> <p>Closed entries — Interest charge calculation is only performed on entries for which payment has been made, but where the payment has possibly been made after the due date on the entry. "Interest Charge 1" on March 1st shows that the entry has not been closed yet, meaning that the interest charge at this point in time is USD 0,00.</p> <p>"Interest Charge 2" on May 1st shows that the entry has been closed and the interest charge on the entry is therefore calculated on USD 10.000 over 31 days (Jan. 1st to Jan. 31st) plus on USD 7.000 over 59 days (Feb. 1st to Mar. 31st). The interest charge is determined using the following calculation:</p> <math display="block">(31/365) * (24/100) * \text{USD } 10.000 + (59/365) * (24/100) * \text{USD } 7.000 = \text{USD } 475,40.</math> </li> <li> <p>Open and closed entries — Interest charge calculation is performed on both open and closed entries. "Interest Charge 1" on March 1st shows that interest charge is calculated on USD 10.000 over 31 days (Jan. 1st to Jan. 31st) plus on USD 7.000 over 28 days (Feb. 1st to Feb. 28th). The interest charge is determined using the following calculation:</p> <math display="block">(31/365) * (24/100) * \text{USD } 10.000 + (28/365) * (24/100) * \text{USD } 7.000 = \text{USD } 332,71.</math> <p>The interest charge of USD 332,71 can now be added to the remainder amount of USD 7.000, resulting in a new remainder of USD 7.332,71 ("Payment 2").</p> <p>"Interest Charge 2" on May 1st shows that the interest charge is calculated on USD 7.000 over 31 days (Mar. 1st to Mar. 31st) and is determined using the following calculation:</p> <math display="block">(31/365) * (24/100) * \text{USD } 7.000 = \text{USD } 142,68.</math> <p>If you want to calculate interest on the interest charge determined earlier, this charge will have to be added to the remainder amount resulting in the following calculation:</p> <math display="block">(31/365) * 24/100) * \text{USD } 332,71 = \text{USD } 6,78.</math> </li> </ul>
<b>Net/EOM</b>	<p>In this field, you can choose between the two interest charge calculation principles "Net" and "EOM."</p> <p>"Net" results in an interest charge calculation using the specified percentage in the field "Percentage p.a.." The calculation is made no matter how long each entry has been due for payment.</p>

Field	Description												
	<p>“EOM” results in an interest charge calculation for the number of days that each entry has been due for payment. For each day, an interest charge of 1/365 of the specified percentage in the field “Percentage p.a.” is calculated. If an earlier interest charge calculation has been made on an entry, the interest charge is only calculated from the date of the last interest charge calculation.</p> <p>The difference between these two principles can be outlined using the following example:</p> <p>The balance due on June 1st is USD 1,000.00. Consider that interest charge has only been calculated on the specified date since the due date June 1st. Thus when performing the interest charge calculation on August 1st, no interest charges have been calculated on June 15th and on July 1st.</p> <table><tr><td>Date</td><td>June 15</td><td>July 1st</td><td>August 1st</td></tr><tr><td>Net 2%</td><td>20.00</td><td>20.00</td><td>20.00</td></tr><tr><td>EOM 24%</td><td>9.21</td><td>19.73</td><td>40.11</td></tr></table> <p>The table above shows that by selecting the interest calculation principle “Net” a fixed interest charge is calculated no matter for how long the entry has been due for payment. If you select the interest charge calculation principle “EOM” the calculated interest charge depends the number of days that the current entry has been due for payment. Note that the interest charge calculation principle “Net” is only used if the you have selected “Open” in the field “Interest Basis.”</p>	Date	June 15	July 1st	August 1st	Net 2%	20.00	20.00	20.00	EOM 24%	9.21	19.73	40.11
Date	June 15	July 1st	August 1st										
Net 2%	20.00	20.00	20.00										
EOM 24%	9.21	19.73	40.11										
Percentage p.a.	In this field, you specify the interest charge percentage per year. If you have selected the interest charge calculation principle “Net,” you have to specify a percentage in this field. If you have selected the principle “EOM,” the percentage specified is the annual interest charge percentage.												
Number of Days since Last Interest Charge	In this field, you specify the minimum number of days that must pass before making a new interest charge calculation on a customer. This rule, however, only applies if a given interest charge calculation has resulted in an added interest charge to a customer entry.												
Minimum Number of Days since Entry Date	This field allows you to specify the minimum number of days since entry date that must pass before an interest calculation can be made.												
Maximum Number of Days since Entry Date	This field allows you to specify the maximum number of days that an interest calculation can be made. If the number of days since the entry date exceeds the value specified in this field, the entry will be considered too old and will be excluded from the interest calculation.												
Minimum Interest Charge	In this field, you specify the minimum interest charge amount that can be added to a customer entry. The amount should be specified in the currency selected in the island Currency. The difference between the minimum												

Field	Description
	interest charge and the interest charge limit can be outlined using the following example: Consider that the minimum interest charge is USD 25.00 and the interest charge limit is USD 10.00. This will not affect the customer if the calculated interest charge is USD 8.00. But if the calculated interest charge is USD 15.00, the customer will be charged USD 25.00 in interest.
<b>Total Interest Charge Limit</b>	In this field, you specify the minimum total interest charge amount that has to be calculated before charging interest on a customer entry. The amount should be specified in the currency selected in the island Currency. Maconomy will not charge interest on a customer entry, if the total interest charge amount is less than the amount specified in this field.
<b>Entry Interest Charge Limit</b>	In this field, you can specify the minimum interest charge amount that has to be calculated on the specific entry before charging interest on the entry. If the interest charge amount for this specific entry is less than the value of this field, the entry will be excluded from the interest calculation. As result, the entry will not be included in the interest charge selection printout and interest charge notice printout.
<b>Payment Terms on Memo</b>	In this field, you specify the payment terms that should apply to interest charge notices. The payment terms specified are used for determining the due date on interest charges.
<b>Calculate interest from interest and reminder charges</b>	In this field you can specify whether interest charge selections should also include overdue interest and reminder charges created in previous interest charge or reminder selections, thus resulting in compound interest and interest from reminder charges.  If you mark the field, interest charge selections will calculate interest from overdue interest/reminder charge entries as well as overdue customer entries. If you do not mark the field, only overdue customer entries will be included.
<b>Calculate interest from credit memos</b>	If you mark this field, credit memo selections will also include overdue credit memos. This means that interest will also be generated from credit memos. If you do not mark the field, no interest will be calculated from credit memos.
<b>Derive Dimensions from Original Transaction</b>	In this field, you can specify how the dimensions on the finance entries that are created when posting the interest journal should be derived. If marked, the finance entries for the interest account will have the dimensions derived from the original transaction (for example, invoice), while the offset finance entries and customer entries will have the dimensions derived from the customer. This happens, however, only if the total interest is not the minimum interest. If unmarked, all entries will derive the dimensions from the customer. By default, the field is unmarked.
<b>Calculate Interest from Original Due Date</b>	This field controls whether interest notes are being calculated based on the original due date on the customer entry (if marked) or calculated based on the actual due date on the customer entry (if not marked).

Field	Description
<b>Default Block Type for Interest Notes</b>	A customer entry will be created when posting an interest note with an amount. The block type on the customer entry will be set to the default block type for interest notes.

### Reminder Calculation Principle Island

Field	Description
<b>Reminders</b>	If you mark this field, the current interest charge/reminder principles will be used for reminder calculations on customer entries.
<b>Reminder Charge</b>	In this field, you can specify a reminder charge. The amount should be specified in the currency selected in the island Currency.
<b>Number of Days since Last Reminder</b>	In this field, you can specify the number of days that must pass before a new reminder calculation can be made on a customer entry.
<b>Reminder Limit</b>	In this field, you can specify the minimum reminder charge amount in enterprise currency that must be calculated before a reminder is sent to a customer. Maconomy will not send a reminder to a customer, if the calculated reminder charge is less than the amount specified in this field. The amount should be specified in the currency selected in the island Currency.
<b>Payment Terms on Reminder</b>	In this field, you specify the payment terms that should apply to reminders. The payment terms specified are used for determining the due date on reminders. Payment terms are created in the window PopUp Fields in the Set-Up module.
<b>Include Only Due Credit Memos</b>	In this field, you can specify whether or not reminder charges should only be calculated on due credit memos.  If you mark the field, reminder charges will only be calculated on due credit memos. If you do not mark the field, the reminder will include all open credit memos.
<b>Default Block Type for Reminder Letters</b>	A customer entry will be created when posting an reminder letter with an amount. The block type on the customer entry will be set to the default block type for reminder letters.

### User Island

Field	Description
<b>Created</b>	This field displays the name of the user who initially created the information in the window and the date on which it was created.

Field	Description
<b>Changed</b>	This field displays the name of the user who changed the information in the window and the date on which it was changed.
<b>Version</b>	This field displays a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

## Reminder Text Groups Single Dialogs Workspace

Use this workspace to group reminder texts according to wording or severity.

This is useful if certain reminders are friendly reminders of payments due, while other reminders must be more severely worded. You can reuse reminder texts on several levels in one or more reminder text groups.

Reminder letters contain reminder texts that are based on the interest charge/reminder principle specified for the customer in the Company Specific Payment Information workspace.

You create reminder texts in the Reminder Texts workspace, where you can divide reminder texts into language-specific groups. For example, you can create French reminder texts to assign to French customers.

You assign a reminder text group to a customer in the **Reminder Text Group** field in the Payment Information workspace.

Note that when you print reminders, Maconomy prints out the text lines on the top level where the level is less than or equal to the customer's current reminder level. For example, if you created reminder texts on level 1, 2, and 3, Maconomy only prints the text lines for level 3 for a customer who has reminder level 4.

### Reminder Text Groups Tab

This section includes the fields and descriptions for the Reminder Text Groups tab.

#### Reminder Text Group Island

Field	Description
<b>Name</b>	In this field, you enter the name of the reminder text group. The field is only open for entry upon creation of a new reminder text group.

#### User Island

Field	Description
<b>Created</b>	This field displays the name of the user who initially created the information in the window and the date on which it was created.
<b>Changed</b>	This field displays the name of the user who changed the information in the window and the date on which it was changed.

Field	Description
<b>Version</b>	This field displays a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

### Reminder Levels Sub-Tab

This section includes the fields and descriptions for the Reminder Levels sub-tab.

Field	Description
<b>Reminder Level</b>	In this field, you specify the reminder level to which you want to assign reminder texts.
<b>Reminder Text Name</b>	In this field, you specify the name of the reminder text you want to use on the current level.

## Reminder Texts Single Dialogs Workspace

Use this workspace to create reminder texts, which are used in reminder letters that Maconomy sends to customers to prompt them to pay outstanding invoices.

You can divide reminder texts into language-specific groups. For example, you can create French reminder texts to assign to French customers. Use the Payment Information and Company Specific Payment Information workspaces to assign reminder text groups to customers.

In the Reminder Texts tab, you enter the name of the reminder text; in the Reminder Text Lines sub-table you enter one or more lines of text to be printed on reminders. In the Reminder Text Groups workspace, you can group the reminder texts that you create in this workspace and enter the reminder levels on which the individual texts should be used.

Maconomy automatically uses as predefined reminder texts the reminder texts that it inserts into reminder text groups for customers who have a reminder principle when you create reminder selections in the Reminder Selection or Change Reminder Selection workspaces.

Note, however, that you can edit a predefined reminder text for each individual reminder in the Change Reminder Texts workspace until the reminder is approved.

### Reminder Texts Tab

This section includes the fields and descriptions for the Reminder Texts tab.

#### Reminder Text Island

Field	Description
<b>Name</b>	In this field, you enter the name of the reminder text. The field is only open for entry upon the creation of a new reminder text.
<b>Remarks</b>	Here you can enter a remark about the text.

## User Island

Field	Description
<b>Created</b>	This field displays the name of the user who initially created the information in the window and the date on which it was created.
<b>Changed</b>	This field displays the name of the user who changed the information in the window and the date on which it was changed.
<b>Version</b>	This field displays a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

## Reminder Text Lines Sub-Tab

This section includes the fields and descriptions for the Reminder Text Lines sub-tab.

Field	Description
<b>Description</b>	<p>In this field, you enter the text to be used in the reminder letter.</p> <p>When Maconomy prints a reminder after it has been approved in the window Approve Reminders, Change Interest Charge Selection or Change Reminder Selection, Maconomy prints the text lines belonging to the highest level which is below or at the customer's reminder level.</p>

## Accounts Payable Overview

Use the Accounts Payable module to manage vendor-related activities, including entering and maintaining information about vendors, entering and approving vendor invoices, and creating and tracking purchase orders.

You can also generate aging reports, payment approval lists, vendor statements, and other reports.

### Registration Section

This section includes the fields and descriptions for the Registration section workspaces.

### Vendor Invoices Workspace

Use this workspace to enter vendor invoices and vendor credit memos.

Information is held in a posting journal for future allocation and posting.

You enter this information into a posting journal that you can post either directly from this workspace or from the Posting or Print Posting Journal workspaces in the G/L module. More than one posting journal can be active at a time.

When you enter the vendor invoice, you must allocate it to indicate the accounts and job-, item-, or asset-related purchases to which the invoice pertains. You can perform the allocation in the Invoice Allocation workspace before you post the invoice or in the Reallocate Invoices workspace after you post the invoice. Depending on the type of purchase that the invoice covers, you can enter the allocation or reallocation using the following methods:

- If the invoice is for items for your warehouse, you must allocate the invoice in the Invoice Allocation or Reallocate Invoices workspace and select the **For Inventory Purchase** field for the invoice allocation line. If you select the **For Inventory Purchase** field in the System Information workspace, Maconomy automatically selects the corresponding field in this workspace when you create a vendor invoice. When you select this field, Maconomy creates an allocation line that contains the full invoice amount and with the **For Inventory Purchase** field selected. You can edit the allocation line manually if needed. If you specify a purchase order number and a packing slip number that matches the delivery note number of a receipt that pertains to that order, Maconomy automatically creates an allocation line for each line on that receipt that resulted in an item movement. On the automatically created allocation lines, the **For Inventory Purchase** field is selected.

The selection of the **For Inventory Purchase** field and the allocation of the amount cause Maconomy to create purchase transactions in the sub-tab of the Invoice Reconciliation workspace that corresponds to the vendor invoice that you entered. After you post it, you can reconcile the vendor invoice with the corresponding item receipt in the Invoice Reconciliation workspace.

- If the invoice is not for items for your warehouse, you do not need to create any purchase transactions. In this case, enter the relevant P&L cost accounts or job numbers in the Invoice Allocation workspace, depending on whether you want to enter the purchase directly in the G/L module or relate it to a job.

- If the invoice is for acquisitions of fixed assets, you can create a fixed asset-related invoice allocation line. You can enter the information about the specific assets before or after the posting of the vendor invoice.
- If you have not yet decided where to enter the vendor invoice, you can postpone entering it until after it is posted. You can then enter it in the Reallocate Invoices workspace to the relevant cost accounts or jobs. In this case, do not allocate the invoice in the Invoice Allocation workspace.

If a vendor invoice pertains to goods for your warehouse as well as goods or services not for your warehouse, you can combine these three methods for the same vendor invoice. You can allocate part of the total invoice amount and create a purchase transaction for this, allocate part of the amount without creating purchase transactions, and finally post the remainder of the amount with no allocation. In this case you need to reconcile invoice allocation lines for inventory purchase and perform a reallocation of the unallocated invoice amount. If you select the **Aut. Appr. of Purchase Transactions** system parameter in the Set-Up module, Maconomy automatically reconciles vendor invoices against the corresponding purchase transactions. If you do not select this system parameter, you perform the reconciliation in the Invoice Reconciliation workspace

Use the **Margin, Appr. of Purchase Transactions** system parameter in the Set-Up module to specify the size of the difference allowed between a purchase transaction and a vendor invoice. If the difference is less than the specified margin, Maconomy automatically allocates the difference. If the difference exceeds the allowed amount, you still need to perform the reallocation in the Reallocate Invoices workspace.

When you have entered all of the information for a vendor invoice, you use the **Submit Line for Approval** action. Next, the invoice must be approved according to the approval principle that is specified for vendor invoices.

When you submit a vendor invoice, Maconomy checks if the approval should be based on approval hierarchies or if the vendor invoice can be approved by all users with access to the approval actions. You create and maintain approval hierarchies in the Approval Hierarchies workspace in the Set-Up module. You can perform the approval at several levels, coordinated by an approval hierarchy. If so, Maconomy picks an approval hierarchy based on the invoice allocation information. Through this hierarchy, Maconomy identifies the people who are to approve the allocation. The criteria for whether a vendor invoice requires approval and who is to perform the approval can be the size of the amount on the allocation lines or the number of the vendor in question, for example. You can only transfer the invoice and post the amount after all required people have approved the allocation lines of the invoice. See the description of the Approval Hierarchies workspace in the Set-Up module for more information about approval hierarchies.

When you edit an allocation that is already approved for posting, you must approve the allocation for posting again by using the **Approve (Line) for Posting** action in either this workspace or in the Invoice Allocation workspace.

If a vendor invoice corresponds to a purchase order that you entered in the Purchase Orders workspace and then sent to the vendor, you can save time by entering the purchase order number in the sub-tab. If you do this, Maconomy automatically allocates the entered vendor invoice in the Invoice Allocation workspace to a number of entries that correspond to the purchase order lines.

If you selected the **Allow fully received purchase orders only** system parameter in the System Parameters workspace, you can only submit invoices on which a purchase order has been specified if the purchase order has been fully received.

In the sub-tab you can specify a vendor invoice to be copied to the new invoice. You can also choose to have the new entry reverse the effect of an existing invoice. This functionality facilitates the creation of vendor invoices and credit memos and is thus also useful in situations in which a credit memo should reverse the effect of an original vendor invoice.

If you selected automatic approval at submission in the approval hierarchy set-up, Maconomy automatically approves vendor invoices when you submit them by using the **Submit Line for Approval** action. This parameter is useful if the user who submits the invoice is also the person who should approve the invoice for posting, because both actions can be performed by using the **Submit Line for Approval** action.

The **Status** field on each line in the sub-tab displays the current status-such as **Awaits Allocation** and **Awaits Posting**-of each invoice.

If you create an invoice manually in this workspace, you can assign a file that contains, for example, a scanned image of the original vendor invoice to the vendor invoice. To assign such a file to the invoice, you specify the entire path of the file in the **File Name** field in the sub-tab. If you do this, Maconomy automatically creates a document archive in which it stores the file. You can also specify a document archive and the name of a file that is already assigned to that document archive. See the description of the **File Name** field for more information about this functionality. You can use the **Show Document** action to use a third-party program like Acrobat Reader or a browser to display the file.

If you select the **Margin for purchase order reconciliation** system parameter in the Set-Up module, you set up Maconomy to automatically control and reconcile purchase orders against assigned vendor invoices. In that parameter, you specify the maximum amount or percentage difference allowed between a purchase order and a vendor invoice so that Maconomy reconciles these automatically. If the difference is greater than is allowed, you must perform the reconciliation in the Invoice Allocation and Reallocate Invoices workspaces.

When posting a vendor invoice that is reconciled against a purchase order to which job accruals are assigned, Maconomy automatically reconciles the assigned job accruals within the margin specified in the **Margin, job accrual reconc.** system parameter in the Set-Up module. For more information about job accruals, see the description of the Job Accruals workspace in the Job Cost module.

In connection with the creation of a purchase order, the amounts that you enter on each purchase order line are included in the financial commitment accounts. When you post a vendor invoice to which a purchase order is assigned, Maconomy releases the commitment to an actual obligation. Maconomy calculates the amount that is released from the number of items specified on the individual vendor invoice lines and from the unit prices specified on the purchase order. You can only enter a purchase order on the line in the sub-tab if the purchase order has been approved.

The following example illustrates the calculation of released commitment amounts:

Purchase Order	Account No.	Text	Number	Unit Price	Amount	Commitment
83001	1010	Books	10	250	2,500	2,500

Purchase Order	Account No.	Text	Number	Unit Price	Amount	Released Commitment
250001	83001	Books	6	260	1560	1500

As this example illustrates, the commitment amount that is released is the amount from the vendor invoice. See the Purchase Orders workspace for more information.

If you have started an invoice allocation in the Invoice Allocation workspace, the vendor invoice journal cannot be posted before the allocation has been approved for posting in the same workspace.

If a company other than the company displayed in the tab of this workspace is specified in the sub-tab of the Invoice Allocation and Reallocate Invoices workspaces, intercompany postings between the responsible company and the specified company occur at the time of posting. These intercompany postings are of the type **Vendor Invoice**. However, if you do not select the **Create intercompany entries for companies with same parent company** system parameter, Maconomy only creates intercompany entries if the two companies involved are not both assigned to the same parent company.

## Vendor Invoices Tab

This section includes the fields and descriptions for the Vendor Invoices tab.

### Journal Island

Field	Description
<b>Journal No.</b>	This is the journal number. When you create a journal, Maconomy automatically gives it a number. The number, which runs in consecutive order, is retrieved from the journal system numbers in the window System Numbers in the Set-Up module.
<b>Created by</b>	This is the name of the user who created the vendor invoice journal. You cannot change name.
<b>Date</b>	This is the date on which the vendor invoice journal was created. The date cannot be changed.
<b>Period No.</b>	<p>This field shows the journal's period number in the current fiscal year. If your company uses periods that follow the months of the year, the field will, for example, show 1 for January, 2 for February, 3 for March, and so on. However, the periods do not necessarily follow the months of the year. The duration of the period is shown in the fields "Period Start" and "Period End" below.</p> <p>When you have completed the first entry line, Maconomy checks the current fiscal year defined in the Fiscal Year window and finds the period that covers this entry's date. This period is assigned to this field, and in this way, the first entry line determines the journal's posting period. All entries in a journal must be within the same period. This ensures that each period balances. The date in this field cannot be changed manually.</p>
<b>Period Start</b>	<p>This field shows the first date in the period covered by the journal. The period of the journal goes from the period starting date to the date shown in the field "Period End" below. It is only possible to specify entry dates within this period to ensure that each period balances. The date in this field cannot be changed manually.</p> <p>When you have completed the first entry line, Maconomy checks the current fiscal year defined in the Fiscal Year window in the G/L module and finds the period that covers this entry's date. This period is assigned to the journal, and this field shows</p>

Field	Description
	the first day of that period. In this way, the first entry line determines the journal's posting period.
<b>Period End</b>	This field shows the last date in the period covered by the journal. For further description, please see the field "Period Start" above.
<b>Fiscal Year</b>	This field shows the fiscal year to which the journal is assigned.
<b>Auto. Trans. No.</b>	In this field, you specify whether the transaction number should be increased automatically when you enter a new vendor invoice. If this field is marked, the transaction number is increased by one automatically. The number can be changed, however.
<b>Post</b>	<p>In this field, you specify whether the journal should be included when you post journals using the Posting window in the G/L module. If this field is marked, the journal is included, but you can unmark it in the Posting window.</p> <p>If this field is marked, and you make a change on a line in the table part of this window on which the field "Released for Posting" has been marked, the mark in this field will automatically be removed by Maconomy. This functionality ensures that a vendor invoice is not posted unless all lines in the journal have been released for posting.</p>
<b>Prior-Period</b>	<p>In this field, you can choose whether the vendor invoice journal is to be a prior-period journal and in that case select the prior period in which the G/L entries are to be posted. However, you can only select a prior period if you have been given access to perform this action in the Actions window. If you select a period, the journal is a prior-period journal. The periods are created in the Popup Fields window in the Set-Up module. Here, you also state whether the prior period is open and in which prior period the existing prior period can be used. The marking of the journals is shown in the Journal Listing window in which you can also choose to have an overview of prior-period journals only. In the Print Posting Journal window, it is possible to choose that the posting of journals or the reprinting of journals is to include prior-period journals only.</p> <p>In the G/ L Reports window, it is possible to generate a report which includes G/L entries with a particular prior period only.</p> <p>Prior-period journals are used for posting in closed periods, including posting in previous fiscal years.</p>

### Batch Total Island

Field	Description
<b>Control</b>	<p>In this field, you can enter the expected batch total of the invoice entries. The batch total is the sum of all of the values entered in the field "Amount Incl. Tax, currency" in the vendor invoice journal lines, regardless of whether the value is debit or credit.</p> <p>If you enter a control sum, the invoice journal can only be posted if it balances with the batch total calculated by Maconomy, which appears in the field "Current," that is, the value in the field "Balance" must be 0. If the control sum is 0 it will not be applied.</p>

Field	Description
	The control sum is thus an extra check that you are entering the correct amounts in the entry lines in the table. Before you enter the entry lines, you count all of the invoice entries, including both debit and credit amounts. If you forget one or enter the wrong amount, the difference will be revealed in the field "Balance."
<b>Current</b>	This is the batch total calculated by Maconomy. It is the total of the amounts in the fields "Amount Incl. Tax, Currency," including both debit and credit amounts.
<b>Balance</b>	This is the difference between the "Control" sum and the "Current" sum. If you have entered a control sum, the journal can only be posted if the value here is 0.

### Transaction Numbering Island

Field	Description
<b>Transaction Type</b>	In this field, you can enter a transaction type. By default, the field shows the default transaction type for the vendor invoice journal.
<b>Number Series</b>	In this field, you can select a transaction number series. By default, the field shows the transaction number series for the transaction type.

### Vendor Island

Field	Description
<b>Vendor No.</b>	<p>When you press Return after entering the vendor invoice, this field will show a vendor number.</p> <p>The field also shows the vendor's name and address. The information is used for checking that you have entered the correct vendor number. This information is retrieved from the Vendor Information Card. It cannot be changed here.</p>

### Pay to Vendor Island

Field	Description
<b>Vendor No.</b>	<p>When you press Return after entering a vendor in the Vendor island, Maconomy shows a Pay to Vendor number here. The pay-to vendor is retrieved from the information card of the vendor specified in the Vendor island.</p> <p>This field also includes the vendor's name and address. The information is used to control that you have entered the correct vendor number.</p> <p>Use this field if a different vendor is receiving payment for the delivery. The Pay to Vendor number indicates the address to which payment is sent.' The "original" (delivery) vendor is debited to the amount.</p>
<b>Giro No.</b>	This field shows the giro number assigned to the pay-to vendor displayed in this island.
<b>Reg. No.</b>	This field shows the registration number assigned to the pay-to vendor displayed in this island.

Field	Description
<b>Bank Acct. No.</b>	This field shows the bank account number assigned to the pay-to vendor displayed in this island.

### Company Island

Field	Description
<b>Company</b>	<p>In this field, you can enter the number of the company responsible for the vendor invoice journal. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module. This name also shows the company that is associated with that company number.</p> <p>If the table part contains vendor invoices from vendors whose settling company is different from the one shown in this field, Maconomy will automatically create intercompany balances at the posting of the vendor invoice journal. In the intercompany balance, the company in this field will be the responsible company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company. See the section "Multiple Companies" in the chapter "Introduction to the G/L Module" and the window Intercompany Accounts in the G/L module for a further description of the concept of responsible companies and intercompany balances.</p>
<b>Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. For a detailed description of the concepts of base currency and enterprise currency, see the description of the field "Base Currency" in the window System Information in the Set-Up module.

### Posting Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use when the journal is posted. The "Standard" layout includes detailed information about each entry. The "Journal Overview" layout shows summary information with totals for the journal, including any resulting intercompany journals.

### Vendor Invoices Sub-Tab

This section includes the fields and descriptions for the Vendor Invoices sub-tab.

Field	Description
<b>Entry Date</b>	This is the entry date of the vendor invoice. The first vendor invoice entered to a journal determines the journal's posting period (month). The field "Period" is automatically filled in after you enter information on the first line. When you

Field	Description
	<p>enter vendor invoices, Maconomy checks that the entry date is within the open posting range. You must enter a value.</p> <p>The open posting range is maintained in the window System Information in the Set-Up module.</p>
<b>Trans. No.</b>	<p>This is the vendor invoice's journal number. The number is automatically increased by one if the field "Auto. Trans. No." in the card part is marked. You must enter a value.</p> <p>If you have not checked the box "Reuse Trans. No." in the window System Information in the Set-Up module, Maconomy checks that the transaction number has not already been used for a journal entry in an unposted general or vendor invoice journal belonging to the company applying to the current line or for an already posted G/L entry belonging to the company applying to the current line.</p> <p>If the system parameter "Company specific transaction number check" has been marked, Maconomy checks that the transaction number has not already been used for a journal entry in an unposted general, asset, customer payment or vendor invoice journal belonging to the company applying to the current line or for an already posted G/L entry belonging to the company applying to the current line. If the parameter has not been marked, Maconomy checks that the number has not been used on any other manual transaction in the system, regardless of company number.</p>
<b>Trans. Type</b>	<p>In this field, you can enter a transaction type. The default is that the transaction is set to the same as the transaction type in the card part. Entries that the same transaction number must also have the same transaction type.</p>
<b>Description</b>	<p>In this field, you enter an entry text. If you use standard texts, you can save time by using the field "Std. Description."</p>
<b>Std. Description</b>	<p>If you often use the same entry texts, such as "Purchase" or "Sales," you can define them in the system. You can then select them in the "Std. Description" pop-up field. The text is copied to the field "description" when you press Return, unless it already has a text. Standard texts are maintained in the Pop-up Fields window in the Set-Up module.</p>
<b>Vendor No.</b>	<p>In this field, you enter the vendor account number from the invoice. Maconomy checks that the vendor exists. You must enter a value.</p> <p>If payment is being sent to another vendor, enter the Pay to Vendor number in the Pay to Vendor island.</p> <p>When you press Return, Maconomy retrieves various information from the window Payment Control, such as payment terms, and so on. Furthermore, Maconomy checks that the current vendor is not blocked.</p> <p>You can change the vendor number after a purchase order number has been entered in the field "Purchase Order No."</p>
<b>Name</b>	<p>This field shows the name of the vendor entered in the above field "Vendor No."</p>

Field	Description
<b>Type</b>	<p>In this field, you specify whether the amount registered is a debit or credit amount. Maconomy suggests credit because a vendor invoice usually means your company is billed.</p> <p>The field also controls whether tax is going to be credited or debited an account for tax receivable.</p> <p>You cannot change the value here after the invoice has been entered and you have pressed Return.</p>
<b>Amount Incl. Tax, Currency</b>	<p>In this field, you enter the invoice amount in the currency of the invoice. If the invoice is subject to tax, you must enter the full amount, including tax, and also specify the relevant G/L tax code in the field "Tax Code."</p> <p>For EU purchases, that is, purchases from a tax-registered vendor in another EU country, you must enter the invoice amount without tax, and also select the G/L tax code for EU acquisition tax. Maconomy will then calculate your national purchase tax from the invoice and post it to the EU acquisition tax account.</p>
<b>Currency</b>	<p>In this field, you select the currency of the invoice. The currency specification is used to convert the invoice amount into the base currency of the current company and into the standard currency of the vendor.</p>
<b>Invoice No.</b>	<p>This is the vendor's invoice number. You must enter a value. Please note that the system parameters "Block for reuse of vendor inv. no." and "Control of reused vendor inv. no. only this year" can cause the rejection of an invoice number or cause Maconomy to show a warning. For a detailed description of these parameters, please see the window System Parameters in the Set-Up module.</p>
<b>Invoice Date</b>	<p>This is the invoice date. Maconomy suggests the date from the field "Entry Date." The date is used to calculate the invoice due date, using the vendor's payment terms. You can change the date after entering the invoice, in which case Maconomy recalculates the due date.</p> <p>The payment terms are retrieved from the window Payment Control.</p>
<b>Reference Date</b>	<p>In this field, you can enter a reference date for the current vendor invoice line. The date is transferred to the G/L entries resulting from the current line. If the current entry refers to a job, Maconomy checks that the date specified in this field is within the open posting period for job entries. Furthermore, if a job is specified, the date in this field is used as the job cost posting date on the job entries resulting from the current vendor invoice line.</p>
<b>Purch. Order No.</b>	<p>In this field, you can enter the number of a purchase order from the window Purchase Orders, if the vendor invoice relates to a purchase order placed with the vendor. If the vendor invoice pertains to a specific item receipt, you can also enter the number of the packing slip representing the receipt in the field "Packing Slip No."</p> <p>If you only specify a purchase order number, Maconomy will automatically create allocation lines allocating the vendor invoice to entries for the open lines on the purchase order. The quantities on these lines will correspond to</p>

Field	Description
	<p>the quantities received in the window Purchase Receipt. However, if the system parameter "Suggest Quantity Received on Vendor Invoice" is not marked, the quantities on allocation lines based on a purchase line for which a quantity of zero has been received (or no receipt has been registered) will be set to the quantity remaining to be invoiced for that purchase line.</p> <p>If you specify a packing slip number in the field "Packing Slip No." that matches a packing slip number entered in the window Purchase Receipt for the purchase order in question, allocation lines are only created for those lines on the purchase receipt that pertain to an item and resulted in an item movement. On these allocation lines, the amounts and quantities will match those received on the item receipt (any delivery costs and expense percentages specified on the purchase order will be added to the prices), and the field "For Inventory Purchase" will be marked.</p> <p>If the allocation lines created in this process match the amount of the invoice and the system parameter "Manual Release of Vend. Inv." is not marked, the invoice is automatically approved for posting.</p> <p>If the entry is a vendor credit memo, the previously invoiced amount will be transferred from each purchase order line, and Maconomy creates allocation lines for the closed purchase order lines.</p> <p>Maconomy retrieves most of the information from the purchase order, and you only have to complete "Entry Date," "Trans. No." and "Invoice No."</p> <p>In case you did not specify a vendor at the time of entering the purchase order, the field "Vendor No." must be filled in along with the field "Purchase Order No." in the table part of the window. When posting the vendor invoice, the specified vendor number is transferred to the purchase order.</p>
<b>Packing Slip No.</b>	<p>In this field, you can enter a packing slip number that pertains to the receipt of the items covered by the current purchase order. If you specify a packing slip number that matches a packing slip number entered in the Purchase Receipt window for the purchase order specified on the invoice, Maconomy will automatically create an invoice allocation line for each purchase receipt line on the order in question on which items were received.</p> <p>If the packing slip number does not match a packing slip number for the purchase order, no allocation lines are made.</p> <p>The prices and quantities on the automatically created allocation lines will match those of the item receipt (any delivery costs and expense percentages specified on the purchase order will be added to the prices), and the field "For Inventory Purchase" will be marked.</p>
<b>Job No.</b>	<p>In this field, you can enter a job number. In the window Invoice Allocation, this job will be suggested on new allocation lines.</p>
<b>For Inventory Purch.</b>	<p>When creating a vendor invoice, you can mark this field if you want Maconomy to make a purchase transaction when the invoice is posted. If the field "For Inventory Purch." in the window System Information is marked, Maconomy will automatically mark this field. If this field is marked, Maconomy automatically creates an allocation line in the table part of the window Invoice</p>

Field	Description
	Allocation for the full invoice amount. This means that when the invoice is posted, a purchase transaction is created for the amount in the field "Inventory Amount." Purchase transactions are shown in the Invoice Reconciliation window and are used for balancing item receipts from the Item Purchase Orders and A/P modules against vendor invoices. You must thus create a purchase transaction if the invoice is for items to your warehouse and are received in the Item Receipt or Purchase Receipt window.
<b>Allocation Code</b>	<p>In this field, you can enter an allocation code. You can use the allocation codes created in the Allocation Codes window in the G/L module. Allocation codes are used for easing registration of standard entries.</p> <p>When you enter an allocation code and press Return, Maconomy will automatically create the number of allocation lines that the code specifies, and this field is subsequently blanked. In this way, specifying an allocation code in this field corresponds to creating an invoice allocation line in the Invoice Allocation window. However, the allocation lines that are created are not shown in this window, but can be inspected and edited in the table part of the Invoice Allocation window. In this connection, you should use allocation codes with positive percentages.</p> <p>If you do not enter an allocation code in this field, and a standard allocation code has been specified in the information card of the vendor for whom the invoice is created, the standard allocation code of the vendor is automatically transferred to the vendor invoice, and allocation lines are created in the same way as if you had manually specified an allocation code.</p>
<b>Allocation Account</b>	<p>In this field, you can enter the number of an account on which allocation entries should be posted. If you use an allocation code on which no account numbers have been specified, you can enter an account number in this field to be used for the allocation of the invoice. When you specify an allocation code in the field "Allocation Code" and specify an allocation account number in this field, Maconomy will create the number of lines specified in the chosen allocation code, and the lines created are allocated on the account number specified in this field. The lines can subsequently be seen and edited in the Invoice Allocation window.</p> <p>If you do not use an allocation code and specify an allocation account in this field, Maconomy will create one allocation line in the table part of the Invoice Allocation window with the account number that is specified in this field.</p>
<b>Due Date</b>	<p>The due date of the entry is shown here when you press Return. Maconomy calculates the date from the invoice date and the vendor's payment terms. The date can be changed. The payment terms are retrieved from the window Payment Control.</p> <p>The due date is used to select entries when making payment selections. Maconomy selects entries due before or on a given date. Payments are maintained in either of the windows Change Payment Selection by Vendor, Payment Selection or Approve Payment Selection.</p>
<b>Tax Code</b>	In this field, you specify a G/L tax code if the invoice is subject to tax. Maconomy suggests a G/L tax code for tax receivable, if the vendor is

Field	Description
	<p>marked in the field "Tax" in the window Payment Control. You can select another code or leave the field blank, if the invoice is not subject to tax.</p> <p>Maconomy suggests a tax code on the basis of the following procedure:</p> <ul style="list-style-type: none"> <li>■ If a standard tax code for vendor invoices which is specified in the field "Standard Vendor Tax Code" in the window Company Information has been selected for the company responsible for the current journal, Maconomy will suggest the specified G/L tax code.</li> <li>■ If no standard tax code has been specified for vendor invoices, the tax code will be found as follows: <ul style="list-style-type: none"> <li>■ If a G/L tax table has been specified in the window Company Information, a G/L tax code will be transferred from the G/L tax table on the basis of the information registered on the current invoice. When searching for a line in the G/L tax table, Maconomy searches for a match between the value of the tax table line in the field "Account No." and the A/P Control Account as well as the information on the line. If no line is found in the G/L tax table corresponding to the current line's registrations and the A/P Control Account, or if no G/L tax table has been specified for the current company, Maconomy will suggest the G/L tax code specified for the A/P Control Account in question in the window Account Information Card.</li> </ul> </li> </ul> <p>Maconomy adds tax automatically if you specify a tax code in this field. The amount is displayed in the field "Tax Amount." The tax is posted in debit or credit to the tax account, depending on the value selected in the field "D/C."</p> <p>For EU purchases, that is, purchases from a tax-registered vendor in another EU country, the invoice will include tax. You then have to specify the G/L tax code for EU acquisition tax and enter the invoice amount in the field "Amount incl. Tax, Currency."</p> <p>Maconomy will then calculate your national purchase tax from the invoice amount and post it to the EU acquisition tax account.</p> <p>In connection with automatic taxing, tax amounts and tax account are registered on the individual entries for reconciliation purposes. The tax account to which the entries are posted is specified by means of a dimension combination on the current G/L tax code in the window G/L Tax Codes in the G/L module.</p> <p>You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters window. When multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2" and, if enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p>

Field	Description
<b>Tax Amount, Currency</b>	<p>This is the tax amount in the currency of the invoice if you specify a tax code in the "Tax Code" field. The amount is calculated from the code, but it can be changed. See the above description of the field "Tax Code."</p> <p>If multiple tax codes are enabled, the "Tax Amount, Currency" field will be replaced by the following fields: "Tax Total, Currency," "Tax Amount 1, Currency," "Tax Amount 2, Currency" and, if enabled, "Tax Amount 3, Currency." The "Tax Total, Currency" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Amount Excl. Tax, Currency</b>	<p>This field shows the price less tax of the allocation line in the currency of the vendor invoice. You can change this amount. The amount is calculated as the quantity multiplied by the unit price less tax and any discount. When an allocation line is created, Maconomy will suggest the amount from the field "Remainder Excl. Tax" in the card part of the window. If you manually enter an amount in this field, Maconomy will recalculate the unit price based on the total amount in this field. If you enter an amount in this field, Maconomy also updates the fields "Tax Amount" and "Amount Incl. Tax" based on the entered amount.</p>
<b>Payment Mode</b>	<p>In this field, you choose how to pay the invoice. The suggested value is retrieved from the field "Payment Mode" in the window Payment Control, but you can change it here.</p>
<b>Pay when Paid</b>	<p>In this field, you can specify whether payment when paid functionality should apply to the current vendor invoice. Maconomy suggests the value from the corresponding field on the payment term selected for the current invoice. The field can only be marked if the system parameter "Enable Payment when Paid" has been marked.</p> <p>Payment when paid functionality is used in the Banking module to ensure that vendor invoices are not paid until they are allocated, and that vendor invoices allocated to jobs are not paid until you have received payment from the customer of the job in question.</p> <p>The value in this field does not have any effect on the vendor invoice itself, but the value here is suggested in the corresponding field on the vendor entries created as a result of posting the invoice. This means that in the window Change Payment Selection by Vendor, you can change the value for the individual vendor invoices resulting from the allocation of the invoice. Therefore, the effects of the field are described in the section about the field "Pay when Paid" in the window Payment Selection by Vendor.</p>
<b>Registration Code</b>	<p>In this field you can enter a registration code from the window Registration Codes in the G/L module. The registration code is used instead of manually entering a number of dimension values on the current line. See the description of the window Registration Codes for more information about registration codes.</p> <p>If a global location number is specified in the field "Global Location No." on the line, any registration code assigned to the location number in question is suggested.</p>

Field	Description
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the Dimension Derivation window in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the field "Location" in the card part of the window.</p> <p>See the section on dimension derivation in "Introduction to the G/L Module," as well as the description of the Dimension Derivation window, for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Local Spec.1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Global Location No.</b>	<p>If a global location number has been specified on the vendor invoice, you can enter the global location number here. Global location numbers are used in electronic invoices, and there this field will typically be completed automatically on electronically read vendor invoices.</p> <p>Global location numbers are set up in the Company Locations window in the G/L module and indicate the company, department, warehouse, or other entity to receive the invoice. For further information about the concept of global location numbers, see the introduction to the Company Locations window in the G/L module.</p> <p>When a global location number is specified, any registration code and allocation responsible specified for the global location number are transferred to the invoice as if they were entered manually.</p>
<b>Responsible</b>	In this field you can specify the employee responsible for the vendor. If not specified, Maconomy copies the responsible person from the company specific vendor to the invoice when the invoice is created.
<b>Responsible for Allocation</b>	In this field, you can enter the name of the person to be responsible for the allocation of the invoice. The field is for information only.
<b>Name</b>	This field displays the name of the approval responsible displayed in the above field "Approval Responsible."
<b>Attn.</b>	In this field, you can enter the name of the attention person specified on the invoice received from the vendor.

Field	Description
<b>Enterprise</b>	<p>In this field, you can specify an enterprise. When you create a vendor invoice manually, Maconomy suggests the value for this field from the purchase order or (if there is no purchase order) from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables.</p> <p>You maintain enterprises in the <b>Enterprises</b> field in the Popup Fields single dialog workspace under the Set-Up module.</p>
<b>Segment</b>	<p>In this field, you can specify a segment. When you create a vendor invoice manually, Maconomy suggests the value for this field from the purchase order or (if there is no purchase order) from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables.</p> <p>You maintain segments in the <b>Segments</b> field in the Popup Fields single dialog workspace under the Set-Up module.</p>
<b>Area</b>	<p>In this field, you can specify an area. When you create a vendor invoice manually, Maconomy suggests the value for this field from the purchase order or (if there is no purchase order) from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables.</p> <p>You maintain areas in the <b>Area</b> field in the Popup Fields single dialog workspace under the Set-Up module.</p>
<b>Copy from vendor no.</b>	<p>In this field, you can enter a vendor number to be used for identifying a vendor invoice to be copied to the new vendor invoice. If you fill in this field, you must also enter an invoice number in the field "Copy From Invoice No." on the line.</p> <p>If you want to copy the information from one invoice to a new invoice, you enter a new transaction number and a new invoice number on the line, fill in this field and the field "Copy From Invoice No," and press Return, and Maconomy copies the vendor invoice specified including any assigned allocation lines. However, these lines cannot be inspected in this window, but are displayed in the Invoice Allocation window. Fields filled in by the user on the new invoice are not affected by the copying.</p> <p>Entering a vendor number in this field can also be used for reversing the effect of an already posted invoice. See the description of the field "Reverse At Copying" for further information on the functionality of copying and reversing vendor entries.</p>
<b>Copy from invoice no.</b>	<p>In this field, you can enter an invoice number to be used for identifying a vendor invoice to be copied to the new vendor invoice. If you fill in this field, you must also enter a vendor number in the field "Copy From Vendor No." on the line. As the functionality of this field is similar to that of the field "Copy From Vendor No.," you should see the description of that field for further information.</p>

Field	Description
<b>Copy from journal no.</b>	In this field, you can enter a journal number to be used for identifying a vendor invoice to be copied to the new vendor invoice. You can fill in this field, if you do not know either the vendor number or the invoice number of the invoice that you want to copy. If you fill in this field, you must also enter a journal line number in the field "Copy From Journal Line No." on the line. As the functionality of this field is similar to that of the field "Copy From Vendor No.," you should see the description of that field for further information.
<b>Copy from journal line no.</b>	In this field, you can enter a journal line number to be used for identifying a vendor invoice to be copied to the new vendor invoice. You can fill in this field if you do not know either the vendor number or the invoice number of the invoice that you want to copy. If you fill in this field, you must also enter a journal number in the field "Copy From Journal No." on the line. As the functionality of this field is similar to that of the field "Copy from vendor No.," you should see the description of that field for further information.
<b>Reverse at Copying</b>	In this field, you can choose whether the new vendor invoice should reverse an existing invoice at copying. If you mark this field, the new entry is assigned the opposite value in the field "Debit/Credit" as the existing entry; that is, if the original entry is a credit entry (a vendor invoice), the new entry will be a debit entry (a credit memo). In this way, the new entry reverses the effect of the existing entry. If the invoice or credit memo being copied has not already been reconciled, it is automatically reconciled against the new invoice or credit memo. To avoid exchange rate differences when copying, mark the field "Use Original Exchange Rate" below.
<b>Use Original Exchange Rate</b>	If you are reversing an existing vendor invoice, you can mark this field to use the same exchange rate as was used for the original vendor invoice. If you do this, there will be no exchange rate differences when you reverse the vendor invoice, unless the original currency has moved in relation to the enterprise currency. If this is the case, the difference must be handled at the time of posting.  The vendor invoices can be inspected in the Show Vendor Invoices window.
<b>Card Type Code</b>	In this field, you can enter the vendor invoice card type code. It is used by Maconomy to create payment files for the electronic payment of vendors. These payment files are created in the window Payment Files in the Banking module. If you enter neither a card type code nor a payer identification, the vendor's standard card type code is copied to the vendor entry when the invoice is posted. This card type code is entered in the field "Card Type Code" in the window Payment Control.
<b>Payer Identification</b>	Here you enter the vendor invoice's payer identification. It is used by Maconomy to create payment files for electronic payment of vendors. These payment files are created in the window Payment Files in the Banking module. If you enter neither a card type code nor payer identification, the vendor's standard payer identification is copied to the vendor entry when the invoice is posted. This payer identification is entered in the field "Payer Identification" in the window Payment Control. Maconomy checks that the value entered is a correct payer identification.

Field	Description
<b>Payment Description</b>	Here you can enter a code for the goods or services covered by the vendor invoice if the vendor invoice concerns import. Maconomy uses the payment description in the creation of payment files for electronic payment of vendors.
<b>Giro</b>	This field shows the giro number assigned to the pay-to vendor. It is copied from the card part, but can be changed here.
<b>Bank Acct. No.</b>	This field shows the bank account number assigned to the pay-to vendor. It is copied from the card part, but can be changed here.
<b>Reg. No.</b>	This field shows the registration number assigned to the pay-to vendor. It is copied from the card part, but can be changed here.
<b>Credit Card No.</b>	This field shows the credit card number assigned to the pay-to vendor. It is copied from the card part, but can be changed here.
<b>CPC No.</b>	This field shows the CPC number assigned to the pay-to vendor. It is copied from the card part, but can be changed here.
<b>Cash Discount Date</b>	This field displays a cash discount date, if any, for the current vendor entry. When creating a vendor invoice for a vendor, who has been assigned a cash discount condition of, for example, "Net 10 days, 2%" in the window Payment Control, this field will automatically contain a date being 10 days later than the current entry date. In this way, the cash discount date displays the latest date on which payment should be made, if cash discount is wanted for the current vendor invoice.
<b>Possible Cash Discount, Currency</b>	<p>In this field, you can specify a cash discount that can be gained by paying the vendor invoice by the cash discount date specified above. This discount may vary from the standard cash discount rate granted by the vendor, for instance because of a special offer.</p> <p>When a payment selection is created for the invoice, the discount in this field is suggested on the payment selection, unless the cash discount date has been exceeded. However, if the field is blank, the cash discount suggested on the payment will be calculated from the cash discount terms of the vendor.</p> <p>When you enter a value in this field, Maconomy automatically updates the field "Possible Cash Discount %" accordingly, based on the invoice amount and cash discount.</p>
<b>Amount Excl. Discount</b>	This field shows the invoice amount minus the calculated cash discount that is possible (see two fields above.)
<b>Import Date</b>	In this field, you can enter the date on which the goods or services covered by the vendor invoice were imported. Maconomy uses the import date in the creation of payment files for electronic payment of vendors. These payment files are created in the window Payment Files in the Banking module.
<b>Pay to Vendor No.</b>	This is the number of the Pay to Vendor. The field is filled in automatically if you specify a Pay to Vendor in the Vendor Information Card. Use this field if a different vendor is receiving payment for the delivery. The Pay to Vendor number indicates the address to which payment is sent. The "original"

Field	Description
	(delivery) vendor is debited by the amount. Maconomy verifies that the vendor number exists.
<b>Payment Vendor Name</b>	This field shows the name of the pay to vendor assigned to the vendor invoice journal line.
<b>Vendor Giro No.</b>	This field shows the giro number used by the pay to vendor assigned to the vendor invoice journal line.
<b>Vendor Reg. No.</b>	This field shows the bank registration number used by the pay to vendor assigned to the vendor invoice journal line.
<b>Vendor Bank Acct. No.</b>	This field shows the bank account number used by the pay to vendor assigned to the vendor invoice journal line.
<b>Credit Memo Reference</b>	This field is the invoice number of the invoice to reconcile a credit memo against.
<b>Journal no. reference</b>	This field is the journal number of the invoice to reconcile a credit memo against.
<b>Journal line no. reference</b>	This field is the line number of the entry in the journal of the invoice to reconcile a credit memo against.
<b>Disclosable</b>	<p>By checking this field you specify that an obligation of disclosure is attached to the vendor invoice. This field is used if, for example, the vendor is a person for whom special taxation rules apply. If you wish to check this field, the company-specific vendor's information card must contain a CNR or Corporate Registration Number.</p> <p>If a company-specific vendor has been marked as disclosable on the vendor information card, this field will automatically be marked when you create an invoice on the vendor in question.</p>
<b>Status</b>	<p>This field shows the current status of the invoice line. This field can show one of the following options:</p> <ul style="list-style-type: none"> <li>▪ <b>Awaits Allocation</b> — The invoice has been submitted and approved for posting, but no invoice allocation line has yet been created for the invoice in question.</li> <li>▪ <b>Allocation Started</b> — The invoice has been submitted and approved for posting, but no invoice allocation lines have been created, but have not yet been submitted or have not been fully allocated. Allocation lines can be inspected in the Invoice Allocation window.</li> </ul>

Field	Description
	<p>If the field "Standard Allocation Code" is marked on the vendor for whom an invoice is created, and if the system parameter "Manual Release of Vend. Inv." is not marked, the allocation of the invoice will automatically be started once you press Return on the line. The allocation line(s) that are created can be approved in one of the Vendor Invoices and Invoice Allocation windows.</p> <ul style="list-style-type: none"> <li>■ Awaits Approval — The invoice has been submitted and approved for posting, but no invoice allocation lines have been created, but have not yet been submitted or have not been fully allocated. Allocation lines can be inspected in the Invoice Allocation window.</li> <li>■ Awaits Posting — The invoice journal has been approved, but has not yet been posted. Note that if the system parameter "Manual Release of Vend. Inv." is not marked invoices are automatically submitted for approval and approved for posting. In such cases, the option "Awaits Posting" is displayed on the line once the vendor invoice has been created.</li> </ul> <p>If you do not use approval hierarchies, and if the system parameter "Approve vend. Inv. at submission" has been marked, vendor invoices are automatically approved once they are submitted, and this option is thus displayed on the line. See the description of the actions "Submit Line for Approval" and "Approve Line for Posting" for further information.</p> <ul style="list-style-type: none"> <li>■ Allocation Completed — The allocation has been fully approved and posted, and is thus completed.</li> </ul>
<b>Allocation Started</b>	<p>This field shows whether you have started allocating the invoice in the Invoice Allocation window. If this field is marked, the allocation has started. You cannot change the field's value manually.</p> <p>If you have entered a value in one of the fields "Purchase Order No." and "Allocation Code" on the line, this field is automatically marked by Maconomy. Also, if an allocation code has been specified in the field "Standard Allocation Code" on the information card of the vendor for whom the vendor invoice is registered, that allocation code is automatically used on the line in question, and this field is thus automatically marked. The vendor invoice will then be allocated according to the purchase order lines or allocation code specified.</p> <p>If you post a vendor invoice journal before all invoice lines have been allocated, you can use the Reallocate Invoice window to allocate the posted vendor invoice lines.</p>
<b>Released for Posting</b>	<p>this field shows whether the invoice or the invoice allocation, if any, has been approved for posting in this window or in the Invoice Allocation window. If this field is marked, the allocation has been approved for posting. If the system parameter "Manual Release of Vend. Inv." is not marked, vendor invoices are automatically submitted for approval and approved for posting once they are created, and this field will consequently be marked by default.</p>

Field	Description
	<p>If you do not use approval hierarchies, and the system parameter “Approve vend. Inv. at submission” has been marked, vendor invoices are automatically approved once they are submitted, and this field will thus be marked on the line in question.</p> <p>The vendor invoice journal can only be posted in this window or in the Posting window when this field is marked. If you wish to post the journal, but not all lines are released for posting, you can select the action “Transfer to New Journal” to transfer all non-released vendor invoice lines to a new journal. You can then post the current journal.</p>
<b>Exchange Rate</b>	In this field, you enter the exchange rate to be used when posting invoices in foreign currencies. Maconomy suggests the rate from the current exchange rate table, but you can change it.
<b>Fixed Exchange Rate at Payment</b>	If you mark this field, the exchange rate in which the entry is posted will be fixed when the payment is posted, even though the exchange rate may have changed according to the current exchange rate table.
<b>Company Tax Code</b>	<p>In this field, you can specify a company tax code created in the Popup Fields window. This field is used by Maconomy for determining the tax code to be used in the calculation of tax for the current vendor invoice, as the reporting code is part of the criteria for the selection of a tax code in the Tax Tables window in the G/L module. When selecting a tax code, Maconomy uses the tax table specified for the responsible company for the vendor invoice in the Company Information window. However, the tax code is only selected from a tax table if the company that is responsible for the current invoice is assigned to a tax table in the System Information window. If no tax table is specified for the responsible company, or if you use differentiated tax, and you do not use country-dependent tax, Maconomy uses the tax code of the account or activity specified when the vendor invoice is allocated or reallocated. If you use neither differentiated tax nor tax tables, Maconomy uses the standard tax code specified in the System Information window in the Set-Up module.</p> <p>When posting entries, the reporting code is used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports that show the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be done if extended tax reporting has been selected in the System Information window.</p> <p>If a purchase order has been specified for the vendor invoice, Maconomy retrieves the reporting code from the card part of the purchase order in question, and if no purchase order has been specified, the reporting code is transferred from the vendor’s information card. However, you can select another reporting code here.</p>
<b>Document Archive No.</b>	<p>In this field, you can enter a document archive to be assigned to the vendor invoice in question. By assigning a document archive to a vendor invoice, you can keep track of the documents relevant to the vendor invoice.</p> <p>If you need to assign a specific document, for example, a scanned image of the original vendor invoice to an invoice line, this can be done by specifying</p>

Field	Description
	the name of the file in the field "File Name" on the line. If you do so, Maconomy will check if you have specified the number of a document archive in this field. If an archive has already been specified, the file will be stored in that archive. If you have not specified an archive in this field, Maconomy will create an archive on the basis of the number series specified for document archives in the window Number Series in the Set-Up module. Document archives are created in the window Document Archives in the Set-Up module.
<b>File Name</b>	<p>In this field, you can enter the name of a file to be assigned to the invoice. The file name specified can refer to a document containing, for example, a scanned image of the original invoice or any other document being of particular relevance for the vendor invoice. You can use the function "Find" in the Find menu to search for documents already assigned to a document archive.</p> <p>If you create an invoice manually in this window, and the file you want to insert on the line cannot be found by using the function "Find" in the Find menu, you must specify the entire path of the file in this field in order to assign the file to the invoice. When you press Return, a new document archive is created in which the file is automatically stored if Maconomy can locate the file specified. The number series for document archives to be used by Maconomy are specified in the window Number Series in the Set-Up module. If the desired file is already stored in a document archive, you can also specify the number of the document archive in the field "Document Archive No." and enter the name of the file in this field.</p> <p>If you need to assign a file to an invoice after having pressed Return, that is, after the invoice is created, you specify only the number of the document archive in which the file is stored and the file name, not the entire path. Once the invoice has been posted, you cannot specify a file name in this field.</p> <p>The file assigned to the invoice can be displayed by a third party program, for example, Acrobat Reader or a browser by selecting the action "Show Document" in the Action menu of this window. In this way, you can always inspect the original invoice when processing the Maconomy invoice through allocation and reallocation in the system.</p>
<b>Document Count</b>	This field displays the number of documents in the Document Archive.
<b>Remarks 1-5</b>	In these fields, you can specify remarks to apply to the current invoice journal line.

## Invoice Allocation Workspace

Use this workspace to enter new vendor invoices, allocate invoices to accounts and jobs, process vendor invoices, reallocate a vendor invoice, or credit memo after it has been posted, and submit the allocation for approval.

You can also use this workspace to reconcile a vendor invoice against a purchase order.

The Invoice Allocation tab contains general and account information about the invoice or credit memo. In the Invoice Allocation Lines sub-tab, you allocate the invoice lines to the appropriate cost accounts/jobs.

When you enter a vendor invoice in this workspace or in the Vendor Invoices workspace, you must allocate it to indicate the accounts and job-, item-, or asset-related purchases to which the invoice pertains. You can perform the allocation in this workspace before or after you post the invoice. You can also choose to accrue the cost of a vendor invoice over multiple periods.

Depending on the type of purchase that the invoice covers, you can enter the allocation or reallocation using the following methods:

- If the invoice is for items for your warehouse, you must allocate the invoice and select the **For Inventory Purchase** field for the allocation line. If you select the **For Inventory Purchase** field in the System Information workspace, Maconomy creates an allocation line with the full invoice amount and with the **For Inventory Purchase** field selected. You can edit the allocation line manually if needed. If you specify a purchase order number and a packing slip number that matches the delivery note number of a receipt that pertains to the specified order, Maconomy automatically creates an allocation line for each line on that receipt that resulted in an item movement. Select the **For Inventory Purchase** field on the automatically created allocation lines.

The selection of the **For Inventory Purchase** field and the allocation of the amount cause Maconomy to create purchase transactions in the sub-tab of the Invoice Reconciliation workspace that corresponds to the vendor invoice that you entered. After you post it, you can reconcile the vendor invoice against the corresponding item receipt in the Invoice Reconciliation workspace.

- If the invoice is for acquisitions of fixed assets, you can create a fixed asset-related invoice allocation line. You can enter the information about the specific assets before or after the posting of the vendor invoice.
- If the invoice is not for items for your warehouse, you do not need to create any purchase transactions. Enter the relevant P&L cost accounts or job numbers in the Invoice Allocation workspace, depending on whether you want to enter the purchase directly in the G/L module or relate it to a job. To post the vendor invoice, you must approve the allocation by using the **Approve (Line) for Posting** action in this workspace.
- If you have not yet decided where to enter the vendor invoice, you can postpone it until after it is posted.

You can pay the vendor invoice regardless of which accounts you later enter it to in Maconomy. This means that you do not forego any cash discount, since you can pay the invoice early and settle accounts later.

This workspace also displays all vendor invoices and credit memos that have been posted but not yet allocated. You can always check whether there are any unallocated invoices in Maconomy, and see which people in the company are responsible for handling them. Additionally, the **Status** field in the Allocation, Currency island shows the current submission/approval status of the invoice journal in the workspace.

You can reconcile purchase orders automatically in this workspace. You can perform the control and reconciliation of remainder amounts automatically by selecting the **Margin for Purchase Order Reconciliation** system parameter, or manually by using the **Allocate Remainder** action in the Action menu. For a detailed description of automatic purchase order reconciliation, see the introduction to the Vendor Invoices workspace and the description of the **Margin for Purchase**

**Order Reconciliation** system parameter in the System Parameters workspace in the Set-Up module.

You can also automatically allocate the invoice to expense accounts by entering an allocation code in the Vendor Invoices workspace or in this workspace. Maconomy then posts the invoice in accordance with the allocation code.

You can specify a vendor invoice to be copied to a new invoice or you can reverse the effect of an already posted vendor invoice in the Copy Vendor Invoice island. You can use the **Reverse at Copying** field to specify whether the invoice that you enter in this island should be reversed, that is, you can create a credit memo that is based on any given invoice.

Use the **Submit for Approval** action to submit the invoice after the invoice allocation has completed. Next, the allocation must be approved according to the approval principle selected for vendor invoices.

When you submit a vendor invoice, Maconomy checks if the approval should be based on approval hierarchies or if all users with access to the approval actions can approve the vendor invoice. You create and maintain approval hierarchies in the Approval Hierarchies workspace in the Set-Up module. You can perform the approval at several levels, coordinated by an approval hierarchy. If so, Maconomy picks an approval hierarchy based on the invoice allocation information, and through this hierarchy, Maconomy identifies the people who need to approve the allocation. The criteria for whether a vendor invoice requires approval and who is to perform the approval can be the size of the amount on the allocation lines or the number of the vendor in question, for example. You can only transfer the invoice and post the amount after all required people have approved the allocation lines of the invoice.

You can only approve an invoice allocation for posting if the sum of the allocated amounts, less any inventory purchase amounts, in the **Balance** and **Tax Balance** fields is zero. If you make any more changes after you approve the allocation, you must approve it again.

You cannot post a vendor invoice journal if it includes invoices for which allocation has been started in this workspace, but allocation is not yet approved. In other words, the **Allocation Started** and **Released for Posting** fields in the Allocation, Currency island must either both be selected or empty before you can post the vendor invoice. The **Status** field in the same island displays the current status, such as **Awaits Allocation** and **Awaits Posting** of the invoice journal that is displayed in the workspace.

When you approve the invoice reallocation for posting, Maconomy creates a posting journal with the entries. If there is such a journal in the system already, Maconomy adds the entries to it. The entries are set off against the account for unreconciled vendor entries specified by a dimension combination for the vendor's control account code. For those dimensions for which no other values are in the dimension combination, Maconomy uses the dimensions entered in the Invoice Allocation tab in this workspace. You set up control account codes in the Popup Fields workspace in the Set-Up module. If the tax in the original invoice or credit memo is not the same as the tax calculated here, either because of a different amount or because of different tax code, Maconomy creates the relevant tax entries to fully reconcile the original amount. You post the reallocation journal in the Posting or Print Posting Journal workspace in the Set-Up module.

If you specify in the sub-tab of this workspace a company other than the company that is displayed in the Vendor Invoices tab of the Vendor Invoices workspace, intercompany postings between the responsible company on the vendor invoice and the specified company occur when you post the vendor invoice. These intercompany postings are of the type **Vendor Invoice**. However, if you do not select the **Create intercompany entries for companies with same**

**parent company** system parameter, Maconomy only creates intercompany entries if the two companies involved are not both assigned to the same parent company.

## Invoice Allocation Tab

This section includes the fields and descriptions for the Invoice Allocation tab.

### Invoice Island

Field	Description
<b>Reallocation Date</b>	This dynamic field shows the date when you reallocated the invoice. Maconomy suggests the date on which the invoice or credit memo was registered, but you can change the date manually. Maconomy checks that the date is within the open posting period.
<b>Date Posted</b>	This dynamic field shows the date when you posted the vendor invoice or credit memo. This dynamic field shows only when you post the vendor invoices and credit memos.
<b>Entry Date</b>	In this field, you specify the entry date of the invoice/credit memo.
<b>Trans. No.</b>	In this field, you specify the transaction number of the invoice/credit memo. If you have not checked the box "Reuse Trans. No." in the System Information window in the Set-Up module, Maconomy checks that the transaction number has not already been used for a journal entry in an unposted general or vendor invoice journal that belongs to the company that applies to the current line or for an already posted G/L entry that belongs to the company that applies to the current line. If the system parameter "Company specific transaction number check" has been marked, Maconomy checks that the transaction number has not already been used for a journal entry in an unposted general, asset, customer payment, or vendor invoice journal that belongs to the company that applies to the current line or for an already posted G/L entry that belongs to the company that applies to the current line. If the parameter has not been marked, Maconomy checks that the number has not been used on any other manual transaction in the system, regardless of company number.
<b>Trans. Type</b>	In this field, you can enter a transaction type for the vendor invoice. When you create a vendor invoice, the field is empty. If it is left empty, Maconomy will set it to the default transaction type for the vendor invoice journal, the specified company, and user.
<b>Description</b>	In this field, you enter an entry text. If you use standard texts, you can save time by using the field "Std. Description."
<b>Std. Description</b>	If you often use the same entry texts, such as "Purchase" or "Sales," you can define them in the system. You can then select them in the "Std. Description" pop-up field. The text is copied to the field "description" when you press Return, unless it already has a text. Standard texts are maintained in the Popup Fields window in the Set-Up module.

Field	Description
<b>Type</b>	In this field, you can specify whether the entry is an invoice or a credit memo.
<b>Amount Incl. Tax</b>	<p>In this field, you can enter the invoice amount in the currency of the vendor invoice including tax. If the invoice is subject to tax, enter the full amount, including tax, and choose the relevant G/L tax code in the field "Tax Code" in the island Tax.</p> <p>When registering EU item purchases, that is, purchase from a tax registered vendor in another EU country, enter the invoice amount, which does not include taxes, and select the tax code for EU acquisition tax. Maconomy will then calculate your local purchase tax from the invoice amount and set off the tax amount on the account for EU acquisition tax.</p>
<b>Currency</b>	In this field, you can specify the currency of the invoice or credit memo. The currency is used when converting the invoice amount into the base currency of the current company and the vendor's standard currency.
<b>Time Unit</b>	<p>In this field, you can specify the time unit. You can specify hours or days.</p> <p>When you specify a vendor, this field copies the value from that vendor's information. However, you can change the value up until an invoice allocation line is created.</p>
<b>Invoice No.</b>	In this field, you specify the invoice number of the invoice or the credit memo number of the credit memo.
<b>Invoice Date</b>	In this field, you can specify the vendor invoice or credit memo date. If you do not manually enter a date in this field when creating an invoice, Maconomy will suggest the date entered in the field "Entry Date." The date is used along with the vendor's payment terms for calculating the due date of the vendor invoice. However, you can change the date after entering the vendor invoice. If you do so, Maconomy will recalculate the due date.
<b>Reference Date</b>	<p>In this field, you can enter a reference date for the current vendor invoice or credit memo. The date is transferred to the G/L entries resulting from the current line. If the current line refers to a job, Maconomy checks that the date specified in this field is within the open posting period for job entries.</p> <p>Furthermore, if a job is specified, the date in this field is used as the job cost posting date on the job entries resulting from the current vendor invoice line or credit memo line. If you specify a date, this date is suggested in the corresponding field on every line in the table part of the window.</p>
<b>Due Date</b>	<p>In this field, you can specify the date on which the vendor invoice or credit memo is due for payment. Maconomy calculates the due date on the basis of the invoice date and the vendor's payment terms but you can change the date.</p> <p>The due date is used when creating payment selections, as only entries whose due dates lie before or on a given date are selected for payment.</p>
<b>Packing Slip No.</b>	In this field, you can enter a packing slip number that pertains to the receipt of the items covered by the current purchase order.

Field	Description
	<p>If you, while creating a vendor invoice, specify a packing slip number that matches a packing slip number entered in the Purchase Receipt window for the purchase order specified on the invoice, Maconomy will automatically create an invoice allocation line for each purchase receipt line on the order in question on which items were received. If the packing slip number does not match a delivery number for the purchase order, no allocation lines are made. Similar functionality applies when using the action "Get Purchase Order."</p> <p>The prices and quantities on the automatically created allocation lines will match those of the item receipt (any delivery costs and expense percentages specified on the purchase order will be added to the prices), and the field "For Inventory Purchase" will be marked.</p>
Attn.	Specify the vendor's attention person; that is, the person to whom shipping and payment information is directed.
Cash Discount Date	<p>This field shows the cash discount date that applies to the current vendor entry. When a vendor invoice is created for a vendor whose payment information contains a cash discount code in the field "Cash Discount payment," for example, "10 days Net, 2%," Maconomy automatically completes this field with a date that corresponds to the entry date plus the number of days specified in the cash discount terms. If the cash discount terms are "10 days Net, 2%," this field will show a date that corresponds to the entry date plus 10 days.</p> <p>The cash discount date represents the latest day on which payment can be made if you wish to receive the cash discount on the current invoice.</p>
Possible Cash Discount %	<p>In this field, you can specify a cash discount that can be gained by paying the vendor invoice by the cash discount date specified above. This discount may vary from the standard cash discount rate granted by the vendor, for instance because of a special offer.</p> <p>When a payment selection is created for the invoice, the discount in this field is suggested on the payment selection, unless the cash discount date has been exceeded. However, if the field is blank, the cash discount suggested on the payment will be calculated from the cash discount terms of the vendor.</p> <p>When you enter a value in this field, Maconomy automatically updates the field "Possible Cash Discount %" accordingly, based on the invoice amount and cash discount.</p>
Possible Cash Discount	<p>In this field, you can specify a cash discount that can be gained by paying the vendor invoice by the cash discount date specified above. This discount may vary from the standard cash discount rate granted by the vendor, for instance because of a special offer.</p> <p>When a payment selection is created for the invoice, the discount in this field is suggested on the payment selection, unless the cash discount date has been exceeded. However, if the field is blank, the cash discount suggested on the payment will be calculated from the cash discount terms of the vendor.</p>

Field	Description
	When you enter a value in this field, Maconomy automatically updates the field "Possible Cash Discount %" accordingly, based on the invoice amount and cash discount.
<b>Amount Excl. Discount</b>	This field shows the invoice amount minus the calculated cash discount that is possible.
<b>For Inventory Purch.</b>	When creating a vendor invoice, you can mark this field if you want Maconomy to make a purchase transaction when the invoice is posted. If the field "For Inventory Purch." in the System Information window is marked, Maconomy will automatically mark this field. If this field is marked, Maconomy automatically creates an allocation line in the table part for the full invoice amount. This means that when the invoice is posted, a purchase transaction is created for the amount in the field "Inventory Amount." Purchase transactions are shown in the Invoice Reconciliation window and are used for balancing item receipts from the Item Purchase Orders and A/P modules against vendor invoices. You must thus create a purchase transaction if the invoice is for items to your warehouse and are received in the Item receipt or Purchase Receipt window.
<b>Allocation Code</b>	<p>In this field, you can enter an allocation code created in the Allocation Codes window in the G/L module. Allocation codes are used to ease the registration of standard entries.</p> <p>When you enter an allocation code in this field, Maconomy will automatically create the number of lines in the table part of the window specified in the code, and this field will be blanked. In this connection, it is recommended that you use allocation codes with positive percentages.</p> <p>If you do not enter an allocation code in this field, and a standard allocation code has been specified on the information card of the vendor for whom the invoice is created, the standard allocation code of the vendor is automatically transferred to the vendor invoice, and allocation lines are created in the same way as if you had manually specified an allocation code.</p> <p>Note that you cannot specify an allocation code in this field if one or more allocation lines have already been created in the table part of the window.</p>
<b>Allocation Account</b>	<p>In this field, you can enter a number of an account on which allocation entries should be posted. If you use an allocation code on which no account numbers have been specified, you can enter an account number in this field to be used for the allocation of the invoice. When you specify an allocation code in the field "Allocation Code" above and enter an allocation account number in this field, Maconomy will create the number of lines specified in the chosen allocation code, and these lines are hence allocated on the account number specified in this field.</p> <p>If you do not use an allocation code and specify an allocation account in this field, Maconomy will create one allocation line in the table part of the window with the account number specified in this field.</p>

Field	Description
<b>Disclosable</b>	<p>In this field, you can specify whether the current vendor invoice is disclosable. If this field has been marked for a vendor invoice, parts of the invoice amount may be tax-exempt for the vendor, for example, tax-exempt transportation. By checking the field "Tax Exempt" in the table part of this window, you specify that the individual invoice allocation line is tax-exempt. If a vendor has been marked as disclosable on the vendor information card, the mark will be transferred to this field when you make an invoice for the vendor in question.</p> <p>When reporting to tax authorities, you distinguish between disclosable and tax-exempt services for disclosable invoices. If you wish to mark a vendor as disclosable, the vendor's information card must contain a CNR or Corporate Registration Number. A vendor can be marked as disclosable in the Vendor Information Card window.</p>
<b>Purchase Transaction Type</b>	Use this field to select the type of the purchase transaction.
<b>Self Invoice</b>	Select this check box to indicate that the vendor invoice is a self-invoice.

### Company Island

Field	Description
<b>Company</b>	<p>This field displays the number and name of the company responsible for the invoice allocation. The value in this field is copied from either the field "Company No." in the card part of the window Vendor Invoices or in the current user depending on the order of priority specified in the window Dimension Derivations in the G/L module. If neither a value for derivation of the dimension Company on the vendor information card nor in the window Users in the Set-Up module has been specified, the standard value for the dimension Company is copied from the window System Parameters in the Set-Up module.</p> <p>Note that if you specify another company for a vendor invoice in the table part of this window which is different from the company specified in the card part of the window Vendor Invoices, this will result in intercompany entries between the responsible company on the vendor invoice and the specified intercompany company in this window in connection with posting. The intercompany entries will be of the type "Vendor Invoice."</p> <p>Should you wish to create a vendor invoice, the number of the company which should be the one responsible the invoice allocation is displayed in this field.</p>
<b>Base Currency</b>	This field shows the currency used as base currency in the company specified in the <b>Company No.</b> field. See the <b>Base Currency</b> field in the Company Information single dialog workspace in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

Field	Description
<b>Global Location No.</b>	<p>If a global location number has been specified on the vendor invoice, you can enter the global location number here. Global location numbers are used in electronic invoices, and therefore this field will typically be completed automatically on electronically read vendor invoices.</p> <p>Global location numbers are set up in the window Company Locations in the G/L module and indicate the company, department, warehouse or other entity to receive the invoice. For further information about the concept of global location numbers, see the introduction to the window Company Locations in the G/L module.</p> <p>If you specify both a global location number and a company, the location number must belong to the specified company. If you specify only a global location number, the invoice is automatically assigned to the company with which the location number is associated.</p> <p>When a global location number is specified, any registration code and allocation responsible specified for the global location number are transferred to the invoice as if entered manually.</p>

### Journal Island

Field	Description
<b>Journal No.</b>	<p>This field shows the journal number to which the current invoice belongs. If the invoice was created in the Vendor invoices window, this field shows the number of the journal in which the invoice was created. If you are creating a vendor invoice, the invoice must be assigned to a journal, and you can do this in the following ways:</p> <ul style="list-style-type: none"> <li>You can assign the current vendor invoice to an existing, unposted journal by manually entering the number of the journal in question.</li> <li>You can let Maconomy assign the vendor invoice to an existing journal by leaving the field blank and pressing Enter. If you do so, Maconomy checks if an open journal created by the current user exists. If so, the invoice is assigned to this journal. If no such journal exists, Maconomy automatically creates a vendor invoice journal and assigns the vendor invoice to this journal.</li> </ul>
<b>Line No.</b>	<p>This field shows the number of the line on which the current invoice occurs in the journal shown in the field "Journal No."</p>

### Tax Island

Field	Description
<b>Tax Code</b>	<p>In this field, you specify a G/L tax code if the invoice is subject to tax. Maconomy suggests a G/L tax code for tax receivable if the vendor is marked in the field "Tax" in the Payment Control window. You can select another code or leave the field blank if no tax applies to the invoice.</p> <p>Maconomy suggests a tax code on the basis of the following procedure:</p>

Field	Description
	<p>If a standard tax code for vendor invoices that is specified in the field “Standard Vendor Tax Code” in the Company Information window has been selected for the company responsible for the current journal, Maconomy will suggest the specified G/L tax code.</p> <p>If no standard tax code has been specified for vendor invoices, the tax code will be found as follows:</p> <ul style="list-style-type: none"> <li>■ If a G/L tax table has been specified in the Company Information window, a G/L tax code will be transferred from the G/L tax table on the basis of the information registered on the current invoice. When searching for a line in the G/L tax table, Maconomy searches for a match between the value of the tax table line in the field “Account No.” and the A/P Control Account, as well as the information on the line. If no line is found in the G/L tax table that corresponds to the current line’s registrations and the A/P Control Account, or if no G/L tax table has been specified for the current company, Maconomy will suggest the G/L tax code specified for the A/P Control Account in question in the Account Information Card window.</li> </ul> <p>If you have referred to a purchase order number when receiving the vendor invoice in the Vendor Invoices window, Maconomy automatically creates allocation lines in the table part of the window that correspond to the lines on the purchase order, and the value in the field “Tax” on the corresponding line on the purchase order will be transferred to this field.</p> <p>You can change the value suggested by Maconomy, and you can enter a “blank” value.</p> <p>Maconomy adds tax automatically if you specify a tax code in this field. The amount is displayed in the field “Tax Amount.” The tax is posted in debit or credit to the tax account, depending on the value selected in the field “D/C.”</p> <p>You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters “Show Three Tax Levels” and/or “Show Two Tax Levels” must be marked in the System Parameters window. When multiple tax codes are enabled, the “Tax Code” field will be replaced by the following fields: “Tax Code 1,” “Tax Code 2,” and, if enabled, “Tax Code 3.” For further information on multiple tax codes, please see the description in “Tax Codes.”</p>
<b>Tax Amount, Currency</b>	<p>This field shows the tax amount if you specify a tax code in the field “Tax Code.” The amount is calculated from the tax code, but it can be changed.</p> <p>See the description of the field “Tax Code” above.</p> <p>If multiple tax codes are enabled, the “Tax Amount, Currency” field will be replaced by the following fields: “Tax Amount Total, Currency,” “Tax Amount 1, currency,” “Tax Amount 2, Currency,” and, if enabled, “Tax Amount 3, Currency.” For further information on multiple tax codes, please see the description in “Tax Codes.”</p>
<b>Company Tax Code</b>	<p>In this field, you can specify a company tax code created in the Popup Fields window. This field is used by Maconomy for determining the tax code to be used in the calculation of tax for the individual allocation lines, as the reporting code is</p>

Field	Description
	<p>part of the criteria for the selection of a G/L tax code in the G/L Tax Tables window if such a table has been specified for the company responsible for the current invoice. When selecting a G/L tax table, Maconomy uses the tax table specified as the responsible company for the vendor invoice in the Company Information window. However, the tax code is only selected from a tax table if the company that is responsible for the current invoice is assigned to a tax table in the System Information window.</p> <p>If no G/L tax table has been specified for the company, or if the G/L tax table does not contain any lines that correspond to the current registration, Maconomy uses the G/L tax code specified for the account in question. If an activity has been specified, Maconomy uses the tax code specified for the P&amp;L account of the activity.</p> <p>When posting entries, the reporting code is used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports that show the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be done if extended tax reporting has been selected in the System Information window.</p> <p>If a purchase order has been specified for the vendor invoice, Maconomy retrieves the reporting code from the card part of the purchase order in question, and if no purchase order has been specified, the reporting code is transferred from the vendor's information card. However, you can select another reporting code here.</p>

### Pay to Vendor Island

Field	Description
<b>Vendor No.</b>	<p>In this field, you can specify the number of the vendor who is to receive payment for the vendor invoice. Maconomy suggests the pay to vendor from the information card of the vendor specified in the island Vendor, but you can change the pay to vendor here.</p> <p>The other lines in this island show the name and address of the pay to vendor. This information cannot be changed here.</p>
<b>Giro No.</b>	This field shows the giro number assigned to the pay to vendor displayed in this island.
<b>Reg. No.</b>	This field shows the registration number assigned to the pay to vendor displayed in this island.
<b>Bank Acct. No.</b>	This field shows the bank account number assigned to the pay to vendor displayed in this island.

### Payment Island

Field	Description
<b>Payment Mode</b>	In this field, you can select the payment mode to be used for the current vendor invoice. Maconomy suggests the value in the field "Payment Mode"

Field	Description
	in the window Payment Control, but you can change the payment mode for the current invoice.
<b>Pay when Paid</b>	<p>In this field, you can specify whether payment when paid functionality should apply to the current vendor invoice. Maconomy suggests the value from the corresponding field on the payment terms selected for the current invoice. The field can only be marked if the system parameter “Enable Payment when Paid” has been marked.</p> <p>Payment when paid functionality is used in the Banking module to ensure that vendor invoices are not paid until they are allocated, and that vendor invoices allocated to jobs are not paid until you have received payment from the customer of the job in question.</p> <p>The value in this field does not have any effect on the vendor invoice itself, but the value here is suggested in the corresponding field on the vendor entries created as a result of posting the invoice. This means that in the window Change Payment Selection by Vendor, you can change the value for the individual vendor invoices resulting from the allocation of the invoice. Therefore, the effects of the field are described in the section about the field “Pay when Paid” in the window Payment Selection by Vendor.</p>
<b>Payer Identification</b>	In this field, you can enter the vendor invoice’s payer identification. The payer identification is used by Maconomy to create payment files for the electronic payment of vendors. These payment files are created in the window Payment Files in the Banking module. If you enter neither a card type code nor a payer identification, the vendor’s standard payer identification is copied to the vendor entry when the invoice is posted. This payer identification is entered in the field “Payer Identification” in the window Payment Control. Maconomy checks that the value entered is a correct payer identification.
<b>Payment Description</b>	In this field, you can enter a code for the goods or services covered by the vendor invoice if the vendor invoice concerns import. Maconomy uses the payment description in the creation of payment files for electronic payment of vendors.
<b>Card Type Code</b>	In this field, you can enter the vendor invoice card type code. It is used by Maconomy to create payment files for the electronic payment of vendors. These payment files are created in the window Payment Files in the Banking module. If you enter neither a card type code nor a payer identification, the vendor’s standard card type code is copied to the vendor entry when the invoice is posted. This card type code is entered in the field “Card Type Code” in the window Payment Control.
<b>Import Date</b>	In this field, you can enter the date on which the goods or services covered by the vendor invoice were imported. Maconomy uses the import date in the creation of payment files for electronic payment of vendors. These payment files are created in the window Payment Files in the Banking module.
<b>Giro</b>	In this field, you can enter the giro number to be used for the vendor invoice.

Field	Description
<b>Bank Acct. No.</b>	In this field, you can enter the bank account number to be used for the vendor invoice.
<b>Reg. No.</b>	In this field, you can enter the registration number to be used for the vendor invoice.
<b>Credit Card No.</b>	In this field, you can enter the credit card number to be used for the vendor invoice.
<b>CPC No.</b>	In this field, you can enter the CPC number to be used for the vendor invoice.

### Approval Hierarchy Status Island

Field	Description
<b>Approval Relation</b>	This field shows the relation used in connection with the type of registration.
<b>Approval No.</b>	This field shows the approval number of the vendor invoice or credit memo. The number is incremented by one each time you submit the vendor invoice or credit memo for approval.
<b>Approval line No.</b>	This field shows the approval line number, which indicates the current approval level of the vendor invoice or credit memo based on the order in the current approval hierarchy.
<b>Approval Status</b>	<p>This field shows the approval status of the current vendor invoice or credit memo. The possible statuses are:</p> <ul style="list-style-type: none"> <li>▪ <b>Approved</b></li> <li>▪ <b>Rejected</b></li> <li>▪ <b>Released</b></li> </ul>
<b>Approval Status Details</b>	This field shows details regarding the latest approval status of the current vendor invoice or credit memo.
<b>Header Can Be Approved By Current User</b>	This field indicates if the current user can approve the header of the vendor invoice or credit memo.
<b>Header Approved Or Rejected By</b>	This field shows the user who approved or rejected the header of the vendor invoice or credit memo.
<b>Header Approval Or Rejection Date</b>	This field shows the date when the user approved or rejected the header of the vendor invoice or credit memo.

Field	Description
<b>Header Approval Or Rejection Time</b>	This field shows the time when the user approved or rejected the header of the vendor invoice or credit memo.
<b>Header Approval Or Rejection Comment</b>	This field shows any comments entered by the user related to the approval, release, or rejection of the vendor invoice or credit memo.
<b>Workflow Status</b>	<p>This field shows the status of the vendor invoice or credit memo within a workflow. The possible workflow statuses are:</p> <ul style="list-style-type: none"> <li>▪ <b>Open</b></li> <li>▪ <b>Closed</b></li> <li>▪ <b>Submitted</b></li> <li>▪ <b>Approved</b></li> <li>▪ <b>Rejected Header</b></li> <li>▪ <b>Rejected Lines</b></li> </ul>

### Vendor Island

Field	Description
<b>Vendor No.</b>	In this field, you can specify the number of the vendor who sent the vendor invoice. The other lines in the island show the name and address of the vendor who sent the vendor invoice. The information is retrieved from the vendor's information card and cannot be changed here.

### Purchase Order Island

Field	Description
