<b>Planned date of change</b>	This field shows the date of the next planned change to the events contained in the current event flow. For further information about the functionality of the field, please see the description of the field "Planned Change" in the island Statistics in the window Event Flow.
<b>Planned time of change</b>	This field shows the time of the next planned change to the events contained in the current event flow. For further information about the functionality of the field, please see the description of the field "Planned Change" in the island Statistics in the window Event Flow.
<b>Actual Time</b>	This field shows the total amount of time that has been spent working on the events assigned to the current event flow. For further information about the functionality of the field, please see the description of the field "Actual Time" in the island Statistics in the window Event Flow.
<b>Option List 1-5</b>	In these fields, you can select the option lists containing the values you wish to use for further specification of the current event flow and its outcome. For further information about the functionality of the field, please see the description of the corresponding fields in the card part of the window Event Flow.
<b>Selected Value 1-5</b>	In these fields, you can specify values available in the respective option lists specified in this island. For further information about the functionality of the field, please see the description of the corresponding fields in the card part of the window Event Flow.  Date 1-5 and Time 1-5 In these fields, you can specify certain key times regarding the current event flow. For further information about the functionality of the field, please see the description of the corresponding fields in the card part of the window Event Flow.
<b>Employee 1-5</b>	In these fields, you can specify a number of employees related to the event flow. For further information about the functionality of the field, please see the description of the corresponding fields in the card part of the window Event Flow.
<b>Employee 1-5, Name</b>	These fields show the names of the respective employees specified in the fields "Employee 1-5" on the current line. For further information about the functionality of the field, please see the description of the corresponding fields in the card part of the window Event Flow.
<b>Flow Text 1-20</b>	In these fields, you can specify a number of descriptive texts related to the event flow. For further information about the functionality of the field,

Field	Description
	please see the description of the corresponding fields in the card part of the window Event Flow.

## Actions

This section shows the Actions available in the Event Flow per Contact Company workspace.

### Top Tab

Field	Description
<b>Create Customer</b>	This action is used for creating a customer from the current contact company. For further information about the functionality of the action, please see the description of the action "Create Customer" in the window Contact Companies.

## Event Flow by Contact Person Single Dialog Workspace

Use this workspace to review the event flows that you assigned to the individual contact persons.

You can view and create contact persons here in the same way as you do in the Contact Persons workspace.

In the Event Flow by Contact Person tab, each line displays an event flow that you assigned to the current contact person; you can create event flows for the current contact person by adding lines in this tab.

The fields in this tab correspond to the fields in the Contact Persons workspace Contact Persons tab; changing the information here updates the Contact Persons workspace appropriately. Similarly, the information in the Event flows sub-tab derives from the Event Flow workspace Event flow tab; changing the information here updates the Event Flow workspace appropriately.

For more information about creating contact persons and event flows and the functionality of the individual fields and actions that are available in this workspace, see the description of the Contact Persons and Event Flow workspaces.

## Event Flow by Contact Person Tab

This section includes the fields and descriptions for the Event Flow by Contact Person tab.

### Contact Company Island

Field	Description
<b>Contact Person</b>	<p>In this field, you can enter the name and number of a contact person when creating a contact person.</p> <p>For information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.</p>

Field	Description
<b>Attn.</b>	In this field you can enter an attention person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Country</b>	Here you select the country in which the contact person is located. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Phone</b>	Here you can enter the phone number of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Phone 2</b>	Here you can enter a second phone number of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Mobile</b>	Here you can enter the mobile phone number of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Mobile 2</b>	Here you can enter a second phone number of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Fax</b>	Here you can enter the fax number of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Telex</b>	Here you can enter the telex number of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>E-mail</b>	Here you can enter the e-mail address of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Department</b>	In this field, you can select the department to which the contact person pertains. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Education</b>	Here you can enter the education of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.

Field	Description
<b>Position</b>	Here you can enter the current position of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Initials</b>	Here you can enter the initials of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Soc. Security No.</b>	Here you can enter the social security number of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Date of Birth</b>	Here you can enter the contact person's date of birth. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Age</b>	Here you can enter the education of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Gender</b>	Here you can enter the gender of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Blocked</b>	Here you can specify whether the contact person is blocked. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.

### Employee Information Island

Field	Description
<b>New Employee No.</b>	When you select the action "Create Employee," an employee is created on the basis of the current contact person, and in this field you can specify information about the employee number to be assigned to the new employee. If you have specified a number in this field before selecting the action, the new employee is assigned this number, and the contact person number of the current contact person is subsequently changed, becoming identical to the number of the new employee. If this field is blank when the action is selected, the employee is assigned the same number as the current contact person. See the description of the action "Create Employee" for further information on the effects of creating an employee from a contact person.
<b>Employee No.</b>	When creating a contact person, you can base the contact person on an existing employee by specifying a number in this field. If you do so, the new contact person will be assigned to the employee specified in this field, and information will flow from the employee to the contact person.

Field	Description
<b>Termination Date</b>	If the employee in the field "Employee No." above has been terminated, this field shows the date when the termination took place.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

**Employee Information Island**

Field	Description
<b>Responsible Employee</b>	In this field, you can specify the number of the employee responsible for the current contact person.
<b>Name</b>	This field shows the name of the employee specified in the above field "Responsible Employee No."

**Access Level Island**

Field	Description
<b>Name</b>	In this field, you can enter the name of an access level. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Description</b>	This field shows the description of the access level specified in the field above.

**Option List Fields**

Field	Description
<b>List</b>	In these fields, you can specify the option lists containing the values you wish to use for further specification of the contact person. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Value</b>	In these fields, you can specify values available in the respective option lists specified in this island. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Persons.

**Remarks Island**

In these fields, you can enter additional remarks about the current contact person.

**Company Island**

Field	Description
<b>Company No.</b>	In this field, you can enter the number of a company to which the contact person is assigned. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

**Contact Company Island**

Field	Description
<b>Contact Company</b>	If the contact person is related to a contact company, you can specify the name and number of the contact company in question in this field.  For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons
<b>Linking Rule</b>	In this field, you can specify the linking rule that you want to use for the creation of the current contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.

**Information Island**

Field	Description
<b>Popup 1-20</b>	In these fields, you can select information concerning the current contact company.  For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Persons.

**Personnel Requisition Island**

Field	Description
<b>Requisition No.</b>	If the current contact person is associated with a personnel requisition, for instance because he or she was created as a contact person as a result for applying for a position on a personnel requisition, you can specify the requisition number in this field. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Persons.

**Extra Fields Island**

Field	Description
<b>Date 1-5</b>	In these fields, you can enter dates relevant to the contact person. The fields are for information only.
<b>Amount 1-5</b>	In these fields, you can enter amounts relevant to the contact person. The fields are for information only.

**Selection Criteria Island**

Field	Description
<b>Show Closed</b>	Mark this field if you want the table part to show closed event flows as well as open ones. If you do not mark the field, only open event flows are included in the table part.
<b>Starting Date, Flow</b>	In these fields, you can specify a range of dates. The table part will only include event flows with starting dates within the specified range.  Latest date of change In these fields, you can specify a range of dates. The table part will only include event flows whose latest date of change is within the specified range.

**User Island**

See the chapter “Getting Started” for a description of the fields in the island User.

## Event flows Sub-Tab

This section includes the fields and descriptions for the Event flows sub-tab.

Field	Description
<b>Event Flow No.</b>	In this field, you can specify a number for the event flow when creating a flow. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Description</b>	In this field, you can enter a description of the current event flow.
<b>Event Flow Type</b>	When creating an event flow, you must specify in this field an event flow type created in the window Event Flow Types. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Flow Status Type</b>	This field shows the name of the option list containing the options available for specifying event flow statuses in the current event flow. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Closed</b>	In this field, you can specify that the event flow is closed, for instance because the objective of the flow has been reached. For further

Field	Description
	information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Blocked</b>	If you mark this field, you block the current event flow for changes. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Current Flow Status</b>	This field shows the current status of the event flow. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Customer No.</b>	In this field, you can specify the customer whom the event flow concerns. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Customer Name</b>	This field shows the name in the first of the address fields on the information card of the customer specified in the field above.
<b>Employee No.</b>	In this field, you can specify the employee who should be responsible for the current event flow. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Name</b>	This field shows the name of the employee specified in the field above.
<b>Event Plan No.</b>	In this field, you can specify the number of the event plan on which events automatically created in the current event flow should be based. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Create Secondary Events When Closing</b>	In this field, you can specify whether secondary events should automatically be created when an event in the current event flow is closed. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Include Only Closed Events</b>	In this field, you can specify whether the action "Create Secondary Events" should only be carried out on closed events in the current event flow when the action is selected either for the whole flow in the window Event Flow or for individual events in the window Events. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Job No.</b>	In this field, you can specify the number of a job if the event flow pertains to a job. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.

Field	Description
<b>Job Name</b>	This field shows the name of the job specified in the field "Job No." above.
<b>Activity No.</b>	If the event flow has been assigned to a job, you can specify the number of a time activity in this field. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Task</b>	If the event flow has been assigned to a job, you can specify the number of a task in this field. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Campaign No.</b>	If the event flow is part of a campaign, that is, it was created by selecting the action "Create Initial Events" in the window Campaigns, this field shows the number of the campaign in question.
<b>Campaign Name</b>	This field shows the name of the campaign shown in the field "Campaign No." above.
<b>Location</b>	In this field, you can enter a value for the dimension Location. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Company No.</b>	In this field, you can enter the number of the company responsible for the event flow. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Company Name</b>	This field shows the name of the company specified in the field "Company No." above.
<b>Base Currency</b>	This field shows the base currency of the company specified in the field "Company No." on the line.
<b>Access Level Name</b>	In this field, you can enter the name of an access level created in the window Access Levels. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.

Field	Description
<b>Name</b>	This field shows the description of the access level specified in the field above.
<b>Document Archive No.</b>	In this field, you can assign a document archive to the event flow. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Note No.</b>	In this field, you can specify the number of a note relating to the current event flow. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Expected Flow Status</b>	This field shows the status expected to be the next event flow status in the current flow. For further information about the functionality of the field, please see the description of the field "Event Status" in the island Expected Status Change in the window Event Flow.
<b>Expected Status Change, Event No.</b>	This field shows the number of the next status changing event in the current flow. For further information about the functionality of the field, please see the description of the field "Event No." in the island Expected Status Change in the window Event Flow.
<b>Expected Status Change, Event Description</b>	This field shows the description of the next status changing event in the current flow. For further information about the functionality of the field, please see the description of the field "Event Description" in the island Expected Status Change in the window Event Flow.
<b>Expected Status Change, Employee No.</b>	This field shows the number of the employee responsible for carrying out the event shown in the field "Expected Status Change, Event No." on the current line. For further information about the functionality of the field, please see the description of the field "Employee No." in the island Expected Status Change in the window Event Flow.
<b>Expected Status Change, Event Starting Date</b>	This field shows the starting date of the event shown in the field "Expected Status Change, Event No." on the current line.
<b>Expected Status Change, Event Starting Time</b>	This field shows the starting time of the event shown in the field "Expected Status Change, Event No." on the current line.
<b>Expected Status Change, Event Changing Date</b>	This field show the last date on which changes were made to the event shown in the field "Expected Status Change, Event No." on the current line.
<b>Expected Status Change, Event Changing Time</b>	This field shows the last time at which changes were made to the event shown in the field "Expected Status Change, Event No." on the current line.

Field	Description
<b>Number of Events</b>	This field shows how many events exist in the current event flow.
<b>Number of Open Events</b>	This field shows how many of the events in the current flow is open.
<b>Starting Date, Flow</b>	This field shows the starting time of the first event created in the current flow.
<b>Starting Time, Flow</b>	This field shows the starting date of the first event created in the current flow.
<b>Latest date of change</b>	This field shows the closing date of the closed event in the flow which has the latest closing date and time. For further information about the functionality of the field, please see the description of the field "Changed" in the island Statistics in the window Event Flow.
<b>Latest time of change</b>	This field shows the closing time of the closed event in the flow which has the latest closing date and time. For further information about the functionality of the field, please see the description of the field "Changed" in the island Statistics in the window Event Flow.
<b>Planned date of change</b>	This field shows the date of the next planned change to the events contained in the current event flow. For further information about the functionality of the field, please see the description of the field "Planned Change" in the island Statistics in the window Event Flow.
<b>Planned time of change</b>	This field shows the time of the next planned change to the events contained in the current event flow. For further information about the functionality of the field, please see the description of the field "Planned Change" in the island Statistics in the window Event Flow.
<b>Actual Time</b>	This field shows the total amount of time that has been spent working on the events assigned to the current event flow.  For further information about the functionality of the field, please see the description of the field "Actual Time" in the island Statistics in the window Event Flow.
<b>Option List 1-5</b>	In these fields, you can select the option lists containing the values you wish to use for further specification of the current event flow and its outcome. For further information about the functionality of the field, please see the description of the corresponding fields in the card part of the window Event Flow.
<b>Selected Value 1-5</b>	In these fields, you can specify values available in the respective option lists specified in this island. For further information about the functionality of the field, please see the description of the corresponding fields in the card part of the window Event Flow.

Field	Description
<b>Date 1-5 and Time 1-5</b>	In these fields, you can specify certain key times regarding the current event flow. For further information about the functionality of the field, please see the description of the corresponding fields in the card part of the window Event Flow.
<b>Employee 1-5</b>	In these fields, you can specify a number of employees related to the event flow. For further information about the functionality of the field, please see the description of the corresponding fields in the card part of the window Event Flow.
<b>Employee 1-5, Name</b>	These fields show the names of the respective employees specified in the fields "Employee 1-5" on the current line. For further information about the functionality of the field, please see the description of the corresponding fields in the card part of the window Event Flow.
<b>Flow Text 1-20</b>	In these fields, you can specify a number of descriptive texts related to the event flow. For further information about the functionality of the field, please see the description of the corresponding fields in the card part of the window Event Flow.

## Actions

This section shows the Actions available in the Event Flow by Contact Person workspace.

### Top Tab

Field	Description
<b>Create Employee</b>	The functionality of this action is similar to that of the action "Create Employee" in the window Contact Persons.

## Events per Contact Company Single Dialog Workspace

Use this workspace to review completed events or events that are to be performed in connection with a specific contact company.

You can choose to include only events that match certain criteria. You can create, update, and delete the events in the Events sub-tab.

### Events Per Contact Company Tab

This section includes the fields and descriptions for the Events per Contact Company tab.

### Contact Company Island

Field	Description
<b>Contact Company</b>	This field shows the name and number of the current contact company. The table part thus shows the events which have been assigned to this contact

Field	Description
	company and match any selection criteria specified in the island Selection Criteria.
<b>Customer No.</b>	If the current contact company is assigned to a customer, the number of the customer in question is shown in this field.

### Selection Criteria Island

Field	Description
<b>Start Date</b>	In this field, you can specify a range of dates. The table part only shows those events concerning the current contact company which were started on a date within the specified range.
<b>Planned Starting Date</b>	In this field, you can specify a range of dates. The table part only shows those events concerning the current contact company which have a planned starting date within the specified range.
<b>Planned Ending Date</b>	In this field, you can specify a range of dates. The table part only shows those events concerning the current contact company which have a planned ending date within the specified range.
<b>Employee No.</b>	In this field, you can specify a range of employee numbers. The table part only shows those events concerning the current contact company which are to be carried out by an employee with a number within the specified range.
<b>Contact Mode</b>	In this field, you can select a contact mode. The table part only shows those events concerning the current contact company which have the selected contact mode.
<b>Event Type</b>	In this field, you can select an event type. The table part only shows those events concerning the current contact company which have the selected event type.
<b>Include Closed</b>	Mark this field if you want the table part to include events which have been closed, that is, events for which the field "Closed" has been marked.

### Events Sub-Tab

This section includes the fields and descriptions for the Events sub-tab.

Field	Description
<b>Event No.</b>	This field shows the number of the event.
<b>Event Type</b>	This field shows the contact type of the event.
<b>Description</b>	This field shows a description of the event, if a description has been entered.

Field	Description
<b>Contact Mode</b>	This field shows the contact mode of the event.
<b>Pl. Starting Date</b>	This field shows the planned starting date of the event in question.
<b>Pl. Starting Time</b>	This field shows the planned starting time of the event in question.
<b>Pl. Closing Date</b>	This field shows the planned closing date of the event in question.
<b>Pl. Closing Time</b>	This field shows the planned closing time of the event in question.
<b>Start Date</b>	This field shows the actual starting date of the event in question.
<b>Started</b>	This field shows the actual starting time of the event in question.
<b>New Job Processing Status</b>	This field shows the job processing status that will be applied to the job to which the event is assigned, if any. If the event has already been closed, this field shows the job processing status which was applied to the job when the event was closed.
<b>Closed</b>	This field shows whether the event has been closed.
<b>Result</b>	This field shows the result specified on the event, if any.
<b>Job No.</b>	This field shows the number of the job to which the event is assigned, if any.
<b>Job Name</b>	This field shows the name of the job shown in the field "Job No." on the line.
<b>Activity</b>	This field shows the number of the activity to which the event is assigned, if any.
<b>Task</b>	This field shows the number of the task to which the event is assigned, if any.
<b>Empl. No.</b>	This field shows the number of the employee who is to carry out the event.
<b>Name</b>	This field shows the name of the employee shown in the field "Employee No." on the line.
<b>Event Flow No.</b>	This field shows the number of the event flow assigned to the current opportunity.
<b>Event Flow Desc.</b>	This field shows the description of the event flow in the "Event Flow No." above.

Field	Description
<b>Opportunity No.</b>	In this field, you can specify a number for the opportunity when creating an opportunity. For further information about the functionality of the field, please see the description of the corresponding field in the window Opportunities.
<b>Opportunity Desc.</b>	In this field, you can enter a description of the current opportunity.

## Events per Employee Single Dialog Workspace

Use this workspace to review the events that an employee is expected to perform within a specific period.

You can choose to include only events that match certain criteria. All of the information in the tab derives from the Events workspace; you cannot change it here.

### Events Per Employee Tab

This section includes the fields and descriptions for the Events Per Employee tab.

#### Employee Information Island

Field	Description
<b>Employee No.</b>	This field shows the number of the current employee. The table part thus shows the events which are assigned to this employee and match any selection criteria specified in the island Selection Criteria.
<b>Name</b>	This field shows the name of the current employee.

#### Selection Criteria Island

Field	Description
<b>Start Date</b>	In this field, you can specify a range of dates. The table part only shows those events concerning the current employee which were started on a date within the specified range.
<b>Planned Starting Date</b>	In this field, you can specify a range of dates. The table part only shows those events concerning the current employee which have a planned starting date within the specified range.
<b>Planned Ending Date</b>	In this field, you can specify a range of dates. The table part only shows those events concerning the current employee which have a planned ending date within the specified range.
<b>Contact Company No.</b>	In this field, you can specify a range of employee numbers. The table part only shows those events concerning the current employee which are assigned to a contact company with a number within the specified range.

Field	Description
<b>Contact Mode</b>	In this field, you can select a contact mode. The table part only shows those events concerning the current employee which have the selected contact mode.
<b>Event Type</b>	In this field, you can select an event type. The table part only shows those events concerning the current employee which have the selected event type.
<b>Include Closed</b>	Mark this field if you want the table part to include events which have been closed, that is, events where the field "Closed" has been marked.

## Events Sub-Tab

This section includes the fields and descriptions for the Events sub-tab.

Field	Description
<b>Event No.</b>	This field shows the number of the event.
<b>Event Type</b>	This field shows the contact type of the event.
<b>Description</b>	This field shows a description of the event, if a description has been entered.
<b>Pl. Starting Date</b>	This field shows the planned starting date of the event in question.
<b>Pl. Starting Time</b>	This field shows the planned starting time of the event in question.
<b>Pl. Closing Date</b>	This field shows the planned closing date of the event in question.
<b>Pl. Closing Time</b>	This field shows the planned closing time of the event in question.
<b>Start Date</b>	This field shows the actual starting date of the event in question.
<b>Started</b>	This field shows the actual starting time of the event in question.
<b>New Job Processing Status</b>	This field shows the job processing status that will be applied to the job to which the event is assigned, if any. If the event has already been closed, this field shows the job processing status which was applied to the job when the event was closed.
<b>Closed</b>	This field shows whether the event has been closed.
<b>Result</b>	This field shows the result specified on the event, if any.

Field	Description
<b>Job No.</b>	This field shows the number of the job to which the event is assigned, if any.
<b>Job Name</b>	This field shows the name of the job shown in the field “Job No.” on the line.
<b>Activity</b>	This field shows the number of the activity to which the event is assigned, if any.
<b>Task</b>	This field shows the number of the task to which the event is assigned, if any.
<b>Company No.</b>	This field shows the number of the contact company which the event concerns.
<b>Customer No.</b>	If the contact company which the event concerns is assigned to a customer, the number of the customer in question is shown in this field.
<b>Customer Name</b>	This field shows the name of the customer shown in the field “Customer No.” on the line.
<b>Contact Mode</b>	This field shows the contact mode of the event.

## Opportunities by Contact Company Single Dialog Workspace

Use this workspace to review the opportunities that you assigned to individual contact companies.

You can view information about existing contact companies and create others in the same way as when you create contact companies in the Contact Companies workspace.

Each line in the Opportunities sub-tab displays an opportunity that you assigned to the current contact company. You can create opportunities for the current contact company by adding lines.

The fields in the Opportunities by Contact Company tab correspond to the fields in the Contact Companies tab in the Contact Companies workspace; changing the information here updates the Contact Companies workspace appropriately. Similarly, the information in the Opportunities sub-tab derives from the Opportunities workspace; changing the information here updates the Opportunities workspace appropriately

For more information about creating contact companies and opportunities and the functionality of the individual fields and actions that are available in this workspace, see the descriptions of the Contact Companies and Opportunities workspaces.

## Opportunities by Contact Company Tab

This section includes the fields and descriptions for the Opportunities by Contact Company tab.

### Contact Company Island

Field	Description
<b>Contact Company</b>	In this field, you can enter the name and number of a contact company when creating a contact company. For information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Attn.</b>	In this field you can enter an attention person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Country</b>	Here you select the country in which the contact company is located. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Phone</b>	Here you can enter the phone number of the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Fax</b>	Here you can enter the fax number of the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Telex</b>	Here you can enter the telex number of the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>E-mail</b>	Here you can enter the e-mail address of the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Department</b>	In this field, you can select the department to which the contact company pertains. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Sales Rep. No.</b>	Here you can enter the employee number of the sales representative in charge of the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Name</b>	This field shows the name of the sales representative.

**Customer Island**

Field	Description
<b>New Cust. No.</b>	If you want to register the current contact company as a customer, you can enter a new customer number here. For further information about the functionality of the field and the creation of customers from contact companies, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Customer No.</b>	If you want to register an existing customer as a contact company, you can enter the customer number in this field when you create a contact company. For further information about the functionality of the field and assigning customers to contact companies, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Termination Date</b>	If cooperation with the customer shown in the field "Customer No." above has been terminated, this field shows the date when the termination took place.

**Company Island**

Field	Description
<b>Company No.</b>	In this field, you can enter the number of a company to which the contact company is assigned. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

**Access Level Island**

Field	Description
<b>Access Level</b>	In this field, you can enter the name and description of an access level. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

**Selection Criteria Island**

Field	Description
<b>Show Open</b>	Mark this field if you want the table part to show open opportunities.
<b>Show Won</b>	Mark this field if you want the table part to show won opportunities.
<b>Show Lost</b>	Mark this field if you want the table part to show lost opportunities.
<b>Start Date</b>	In these fields, you can specify a range of dates. The table part will only include opportunities with starting dates within the specified range.
<b>Expected Closing Date</b>	In these fields, you can specify a range of dates. The table part will only include opportunities with expected closing dates within the specified range.
<b>Closing Date</b>	In these fields, you can specify a range of dates. The table part will only include opportunities with closing dates within the specified range.

**Print Control Island**

Field	Description
<b>Statistics 1-4 Value</b>	<p>In these fields, you can enter various statistic codes. The four codes can be used as selection criteria when selecting contact companies for printout in print windows. If a statistics list has been specified in a given statistics list field in this island, only values available in the list in question can be selected in the corresponding statistic value field. If a statistics list field has been left blank, any text can be entered in the corresponding value field.</p> <p>If the contact company is assigned to a customer, either by creating a customer on the basis of the contact company or by specifying a customer number in the field "Customer No." above while creating a contact company, any changes to the information in this island will cause the customer information card to be updated accordingly, and vice versa. Please note, however, that if you specify a customer number in the field "Customer No." above while creating a contact company, the information is copied to this window from the information card of the customer in question, and the statistics information must therefore be blank when creating the contact company.</p>
<b>Statistics 1-4 List</b>	In these fields, you can specify the option lists containing the values you wish to be available in the fields "Statistics 1-4 Value." In the fields "Statistics 1-4" in this island, you can then only select values from these lists. However, if you leave a given statistics list field blank, any text can be entered in the corresponding statistics value field.

### Extra Fields Island

Field	Description
<b>Date 1-5</b>	In these fields, you can enter a number of dates relevant to the contact company. The fields are for information only.

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

### Remarks Island

In these fields, you can enter additional remarks about the current contact company.

### Information Island

Field	Description
<b>Enterprise</b>	In this field, you can attach the contact company to an enterprise. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Segment</b>	In this field, you can select a segment. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Area</b>	In this field, you can select an area. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Industry Code</b>	Here you can enter an industry code for the current contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Popup 1-20</b>	In these fields, you can select a number of pop-up values with information concerning the current contact company. For further information about the functionality of the field, please see the description of the corresponding fields in the card part of the window Contact Companies.
<b>Information 1-5</b>	In these fields, you can enter general information concerning the current contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Origin</b>	In this field, you can register the place from which the current contact company originates. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.

**Option List Fields Island**

Field	Description
<b>List</b>	In these fields, you can specify the option lists containing the values you wish to use for further specification of the contact company. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Value</b>	In these fields, you can specify values available in the respective option lists specified in this island. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Companies.

**Opportunities Sub-Tab**

This section includes the fields and descriptions for the Opportunities sub-tab.

Field	Description
<b>Opportunity No.</b>	In this field, you can specify a number for the opportunity when creating an opportunity. For further information about the functionality of the field, please see the description of the corresponding field in the window Opportunities.
<b>Description</b>	In this field, you can enter a description of the current opportunity.
<b>Opportunity Type</b>	In this field, you can specify an opportunity type when creating an opportunity. For further information about the functionality of the field, please see the description of the corresponding field in the window Opportunities.
<b>Phase</b>	This field shows the current phase of the opportunity. For further information about the functionality of the field, please see the description of the corresponding field in the window Opportunities.
<b>Probability %</b>	In this field, you can specify the probability percentage indicating the chance that the opportunity will result in a sale. For further information about the functionality of the field, please see the description of the corresponding field in the window Opportunities.
<b>Currency</b>	In this field, you can specify the currency in which the estimated opportunity value in the field "Sales Estimate, Currency" is expressed.
<b>Sales Estimate, Currency</b>	In this field, you can specify the estimated value of the current opportunity, expressed in the currency specified in the field "Currency" above. For further information about the functionality of the field, please see the description of the corresponding field in the window Opportunities.
<b>Weighted Sales Estimate, Currency</b>	This field shows the weighted value of the current opportunity in the currency specified in the field "Currency" above. For further information about the functionality of the field, please see the description of the corresponding field in the window Opportunities.

Field	Description
<b>Sales Estimate, Base</b>	This field shows the value of the field "Sales Estimate, Currency," converted into the base currency of the company to which the current opportunity is assigned.
<b>Weighted Sales Estimate, Base</b>	This field shows the value of the field "Weighted Sales Estimate, Currency," converted into the base currency of the company to which the current opportunity is assigned.
<b>Sales Estimate, Enterprise</b>	This field shows the value of the field "Sales Estimate, Currency," converted into the enterprise currency of the Maconomy system.
<b>Weighted Sales Estimate, Enterprise</b>	This field shows the value of the field "Weighted Sales Estimate, Currency," converted into the enterprise currency of the Maconomy system.
<b>Start Date</b>	In this field, you can specify the starting date of the current opportunity, for example, the date when the first contact with the prospective customer was made.
<b>Expected Closing Date</b>	In this field, you can specify an expected closing date for the current opportunity. For further information about the functionality of the field, please see the description of the corresponding field in the window Opportunities.
<b>Closing Date</b>	In this field, you can specify the actual closing date of the current opportunity.
<b>Campaign No.</b>	In this field, you can specify the number of a campaign when creating an opportunity, thus assigning the opportunity to the campaign in question.
<b>Campaign Name</b>	This field shows the name of the campaign specified in the field "Campaign No." above.
<b>Sales Rep. No.</b>	In this field, you can specify the number of the employee acting as sales representative in connection with the current opportunity.
<b>Name</b>	This field shows the name of the employee specified in the field "Sales Rep.No." above.
<b>Contact Person 1-3</b>	In each of these fields, you can specify the number of a contact person relating to the current opportunity. The fields are for information only.
<b>Name 1-3</b>	These fields show the names of the contact persons specified in the fields "Contact Person 1-3" above.
<b>Company No.</b>	When creating an opportunity, you can specify in this field the number of the company responsible for the new opportunity. For further information about the functionality of the field, please see the description of the corresponding field in the window Opportunities.
<b>Company Name</b>	This field shows the name of the company specified in the field "Company No." above.

Field	Description
<b>Base Currency</b>	This field shows the name of the base currency used in the company specified in the field "Company No." above.
<b>Event Flow Type</b>	This field shows the name of the event flow type of the event flow assigned to the current opportunity. For further information about the functionality of the field, please see the description of the corresponding field in the window Opportunities.
<b>Event Flow No.</b>	This field shows the number of the event flow assigned to the current opportunity.
<b>Job No.</b>	In this field, you can specify the job on which the time spent on the current opportunity should be posted. For further information about the functionality of the field, please see the description of the corresponding field in the window Opportunities.
<b>Job Name</b>	This field shows the name of the job specified in the field "Job No." above.
<b>Activity No.</b>	In this field, you can specify the activity on which the time spent on the current opportunity should be posted. For further information about the functionality of the field, please see the description of the corresponding field in the window Opportunities.
<b>Task</b>	In this field, you can specify the task on which the time spent on the current opportunity should be posted. For further information about the functionality of the field, please see the description of the field "Event Status" in the island Expected Status Change in the window Opportunities.
<b>Access Level</b>	In this field, you can enter the name of an access level created in the window Access Levels. For further information about the functionality of the field, please see the description of the field "Event Status" in the island Expected Status Change in the window Opportunities.
<b>Description</b>	This field shows the description of the access level specified in the field above.
<b>Location</b>	In this field, you can enter a value for the dimension Location. For further information about the functionality of the field, please see the description of the corresponding field in the window Opportunities.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

Field	Description
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Option List 1-5</b>	In these fields, you can specify the option lists containing the values you wish to use for further specification of the opportunity. For further information about the functionality of the fields, please see the description of the corresponding fields in the window Opportunities.
<b>Selected Value 1-5</b>	In these fields, you can specify a number of values for further specification of the current opportunity. For further information about the functionality of the fields, please see the description of the corresponding fields in the window Opportunities.
<b>Remarks 1-5</b>	In these fields, you can enter additional remarks about the current opportunity.

## Actions

This section shows the Actions available in the Opportunities by Contact Company workspace.

### Top Tab

Field	Description
<b>Create Customer</b>	This action is used for creating a customer from the current contact company. For further information about the functionality of the action, please see the description of the action "Create Customer" in the window Contact Companies.

## Job Events Single Dialog Workspace

Use this workspace to review the course of a given job in the format of a list of the events that you assigned to the job.

Use the Job Events tab to browse through jobs.

This overview is helpful if you use events to document a job process, so that each event corresponds to a step in the job process, such as a new development in the job or passing the job to another employee in another department.

Maconomy displays information about the current job, including the job's processing status. The Events sub-tab displays information about the events that you assigned to the current job. You can create and assign events to the job in the Events workspace, or you can create them as lines in this workspace.

Maconomy automatically assigns an event that you create in this workspace to the job, company, and customer displayed in the Job Events tab. You can also view and change events that you create in this workspace in the Events workspace.

The information in the Events sub-tab focuses on the planned and actual time consumption, responsibility, and job processing status of each event. This lets you use this workspace to view the course of each event, while at the same time viewing the whole course of the job.

You can change some of the information in the Events sub-tab. Those changes are reflected in the Events workspace.

Use the **Closed** field to close an event.

## Job Events Tab

This section includes the fields and descriptions for the Job Events tab.

### Job Island

Field	Description
<b>Job</b>	This field shows the name and number of the current job. The table part thus shows the events assigned to this job.
<b>Job Proc. Status</b>	This field shows the job processing status currently assigned to the job. The job processing status can only be changed by closing an event assigned to the current job. For a description of this process, see the field "New Job Processing Status" in the table part of this window.
<b>Responsible</b>	This field shows the name of the user responsible for the current job. The value derives from the corresponding field in the window Jobs.
<b>Closed</b>	This field shows whether the current job is closed. Jobs are closed by using the action "Close Job" in the window Jobs.
<b>Date</b>	If the current job has been closed, this field shows the date on which the job was closed.

### Customer Island

Field	Description
<b>Customer</b>	This field shows the name and number of the customer to which the current job pertains.

### Company Island

Field	Description
<b>Company</b>	This field shows the name and number of the company responsible for the current job.

## Events Sub-Tab

This section includes the fields and descriptions for the Events sub-tab.

Field	Description
<b>Event No.</b>	In this field, you can enter the number of the event. The number can consist of both figures and letters. If you do not enter a number yourself, a number will be allocated automatically from the window Number Series.

Field	Description
<b>Event Type</b>	In this field, you can specify an event type which can be, for example, a lead, an analysis of customer satisfaction, support, and so on. If the event was created by means of the window Campaigns, the value is copied from the corresponding field in the event template on which the event was based.
<b>Description</b>	In this field, you can enter a short description of the event.
<b>Pl. Starting Date</b>	In this field, you can specify the date on which the event is to start according to plan.
<b>Pl. Starting Time</b>	In this field, you can specify the time at which the event is to start according to plan.
<b>Pl. Closing Date</b>	In this field, you can specify the date on which the event is to end according to plan.
<b>Pl. Closing Time</b>	In this field, you can specify the time at which the event is to end according to plan.
<b>Start Date</b>	In this field, you can specify the date on which the event was actually started. Maconomy suggests the date of the event's creation, but you can specify an earlier date.
<b>Started</b>	In this field, you can specify the time at which the event was actually started. Maconomy suggests the time of the event's creation, but you can specify an earlier time.
<b>New Job Processing Status</b>	<p>In this field, you can specify the job processing status to be assigned to the current job when the event is closed by marking the field "Closed." You can choose from the options in the option list specified in the job parameter assigned to the current job. However, the status is only updated on the job if the event is not assigned to an event flow. If the event is assigned to an event flow whose event flow status type is the same option list as the job processing status type of the job, the job's job processing status will instead be updated with the value in the field "New Event Flow Status" in the window Events, when the event is closed.</p> <p>The job processing status can, for example, be used for indicating the progress of the job or the person or function responsible for the next step. The field "Job Proc. Status" on each line in the table part shows the job processing status assigned to the job when the event in question was closed, allowing you to trace the course of the job processing.</p>
<b>Closed</b>	<p>In this field, you specify whether the event has been closed.</p> <p>When an event is closed, the event can no longer be changed in this window. However, the description of the event can be changed in the table part of the window Events. Closing an event also means that if the event is assigned to an event flow, any new event flow status in the field "New Event Flow Status"</p>

Field	Description
	<p>is transferred to the event flow to which the event is assigned. Similarly, if the event is not assigned to an event flow, any new job processing status in the field “New Job Processing Status” is transferred to the job to which the event is assigned.</p> <p>Furthermore, if the event is assigned to an event flow where the field “Create Secondary Events when Closing” has been marked, the closing of the event can cause the automatic creation of new events in the flow in question. For more information on this process, see the description of the field “Create Secondary Events when Closing” in the card part of the window Event Flows.</p> <p>A closed event cannot be reopened. When an event is closed, Maconomy automatically stops the timer if it is currently activated.</p>
<b>Result</b>	<p>This field shows the result of the current event. The result must be an option in the option list specified in the field “Result Type” for the event in question. The result can be specified in the window Events. If the event has been assigned to an event plan, the result can determine whether the current event will cause secondary events, as the event plan may contain templates where a given result is part of the condition for creating secondary events. For a further description of event plans, event templates and conditions for the creation of secondary events, please see the fields “Condition No.” and “Condition Result” in the window Event Plans, as well as the action “Create Secondary Events” in the window Events.</p>
<b>Activity</b>	<p>In this field, you must specify the number of an activity which the event concerns. When the action “Transfer to Time Sheet” is selected in the window Events, the registered time consumption is transferred to a time sheet line containing the activity in this field and the job number and task (if any) which the event concerns. If the event has been closed, the time consumption is transferred to the time sheet belonging to the employee of the event which covers the ending date of the event. If the event has not been closed, the time consumption is transferred to the time sheet covering today’s date.</p>
<b>Task</b>	<p>In this field, you can specify the number of a task which the event concerns. When the action “Transfer to Time Sheet” is selected in the window Events, the registered time consumption is transferred to a time sheet line containing the job number and activity which the event concerns, and any task specified in this field. If the event has been closed, the time consumption is transferred to the time sheet belonging to the employee of the event which covers the ending date of the event. If the event has not been closed, the time consumption is transferred to the time sheet covering today’s date.</p>
<b>Empl. No.</b>	<p>In this field, you can enter the number of the employee who should carry out the event. When using the action “Transfer to Time Sheet” in the window Events, the time consumed is transferred to a time sheet belonging to this employee. When you create an event, Maconomy suggests the employee number of the current user if this user is also registered as an employee.</p>
<b>Name</b>	<p>This field shows the name of the employee specified in the field “Employee No.” on the line.</p>

Field	Description
<b>Include Templates</b>	If you mark this field, the printout will show the templates assigned to each printed job.

## Set-Up Section

This section includes the fields and descriptions for the Set-Up workspaces.

### Contact Companies Single Dialog Workspace

Use this workspace to enter and maintain file information about contact companies.

You can enter potential customers as well as existing customers. You can also enter additional information about a contact company. You can use this information to limit the selection criteria of a campaign.

This workspace is integrated with the A/R module, enabling you to retrieve information about the name and address, and so on, from customer information that you entered in the A/R module.

You can also create a customer that is based a contact company and on a template customer that you specify in the System Information workspace in the Set-Up module. Changes that you make in the Contact Persons workspace cause Maconomy to update the information of a contact company and vice versa.

Each line in the Contact Persons sub-tab displays information about a contact person from the contact company. Add lines to identify additional contact people. The fields in this sub-tab correspond to the fields in the Contact Persons workspace; changing the information here updates the Contact Persons workspace appropriately.

For more information about creating contact persons, and for information about the functionality of the individual fields in the Contact Persons sub-tab, see the description of the Contact Persons workspace.

**Note:** When you delete a customer who is assigned to a contact company, Maconomy also deletes that contact company, unless you installed an add-on that grants access to the Contact Companies workspace. In that case, you must manually delete the relevant contact company if appropriate.

### Contact Companies Tab

This section includes the fields and descriptions for the Contact Companies tab.

#### Contact Company Island

Field	Description
<b>Contact Company</b>	<p>In this field, you can enter the name and number of a contact company. The number can consist of both figures and letters.</p> <p>The following procedure is used for finding contact company numbers when creating contact companies in this window.</p>

Field	Description
	<ol style="list-style-type: none"> <li>1. If you do not manually enter a number in this field, and if you have marked the system parameter "Use company specific contact companies," Maconomy automatically derives a company to the field "Company No." in the island Company and the contact company number in this field is hence derived from the company specific number series "Contact Company" belonging to the derived company. If you have manually specified a company number in the field "Company No.," the contact company number in this field will be derived from the company specific number series "Contact Company" belonging to the specified company.</li> <li>2. If the system parameter "Use company specific contact companies" is not marked, and you have not manually entered a company number in the field "Company No." in the island Company, the contact company number will be derived from the 'global' number series belonging to the first company created in the system.</li> </ol> <p>Please note that if the contact company was created as a result of creating a customer in the window Customer Information Card (because the field "Cust. as Contact Company" is marked) and the system parameter "Use the same numbers for contact companies as for customers" is marked, the contact company number will be the same as the number of the customer from which the contact company was created.</p> <p>The extra lines can be used for the name and address of the contact company. If the contact company is assigned to a customer, this information is, however copied from the information card of the customer in question, and the address information must therefore be blank when creating a contact company assigned to a customer.</p>
<b>Attn.</b>	In this field you can enter an attention person. When you create a contact company assigned to a customer number, this attention person is transferred from the information card of the customer in question.
<b>Country</b>	Here you select the country in which the contact company is located. Countries are defined in the window Popup Fields in the set-up module. When you create a new contact company assigned to a customer number, this country is transferred from the information card of the customer in question.
<b>Phone</b>	Here you can enter the phone number of the contact company. When you create a contact company assigned to a customer number, this phone number is transferred from the information card of the customer in question.
<b>Fax</b>	Here you can enter the fax number of the contact company. When you create a contact company assigned to a customer number, this fax number is transferred from the information card of the customer in question.
<b>Telex</b>	Here you can enter the telex number of the contact company.

Field	Description
	When you create a new contact company assigned to a customer number, this telex number is transferred from the information card of the customer in question.
<b>E-mail</b>	Here you can enter the e-mail address of the contact company. When you create a contact company assigned to a customer number, this e-mail address is transferred from the information card of the customer in question.
<b>Department</b>	In this field, you can select the department to which you want to connect the contact company. Departments can be defined in the window Posting References in the G/L module. When you create a new contact company assigned to a customer number, this department is transferred from the information card of the customer in question.
<b>Sales Person</b>	Here you can enter the employee name and number of the sales representative in charge of the event. When you create a contact company assigned to a customer number, this sales representative is transferred from the information card of the customer in question.
<b>Stock Symbol</b>	If the contact company is a public company you can enter the ticker symbol for its stock in this field.

### Customer Island

Field	Description
<b>New Cust. No.</b>	<p>If you want to register a contact company as customer, you can enter a new customer number. If you use the action "Create Customer," a customer will be created in the A/R module on the basis of the template customer specified in the window System Information in the Set-Up module, and the file information concerning the current contact company will be transferred to the customer information card.</p> <p>If you leave the field blank, and the system parameter "Use the same number for contact companies as for customers" has been marked, the new customer created when you select the action "Create Customer" is assigned a customer number corresponding to the number of the current contact company. If the parameter is not marked and you leave the field blank, the new customer is assigned the next available number in the Customer number series.</p>
<b>Customer No.</b>	If you want to register an existing customer as contact company, you can enter the customer number in this field when you create the contact company. Certain information will then automatically be transferred from the customer information card. When a contact company has been created as a customer, the customer number will be shown in this field.
<b>Termination Date</b>	If cooperation with the customer shown in the field "Customer No." above has been terminated, this field shows the date when the termination took place.

## Parent Contact Company Island

Field	Description
<b>Contact Company</b>	In this field, you can enter the name and number of a company to which the contact company is assigned.
<b>Linking Rule</b>	In this field, you can specify the linking rule that you want to use for the creation of the current contact company.

## Company Island

Field	Description
<b>Company</b>	<p>In this field, you can enter the name and number of a company to which the contact company is assigned. If you do not enter a value when creating a contact company, and the system parameter "Use company specific contact companies" has been marked, Maconomy will try to derive a value in accordance with the order of priority which is defined in the window Dimension Derivations in the G/L module. If no value can be derived from this window, the standard value is copied from the window System Parameters in the Set-Up module. If you do not enter a value when creating a contact company and the system parameter has not been marked, the field remains blank.</p> <p>When you create a contact company, the value in this field determines the number series to be used for deriving a contact company number. For further information on this, see the field "Contact Company No."</p> <p>The contents of this field also determine which users have access to see information about the contact company and refer to it in other windows. In the window Company Information in the G/L module it is possible to assign each company to an access level. A user only has access to see information about a given contact company if he has been granted access to the access level in the window Access Levels in the Set-Up module that the company is assigned to or a superordinate level. In addition, the user must have access to the access level specified in the island Access Level to have access to the contact company. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to contact customers may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.</p>

## Access Level Island

Field	Description
<b>Access Level</b>	Here you can enter the name and description of the access level. Users only have access to seeing information about the current contact company and referring to it in other windows if they have been assigned to this or a higher access level in the window User Access Levels in the Set-Up module. In addition, the user must have access to the access level specified for the company to which the contact company is assigned order to have access to the contact company. Please note that this access control model only applies if the standard access control configuration has

Field	Description
	<p>not been changed in your Maconomy system. If it has, the access to contact companies may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If you do not specify an access level, all users will have access to see information about the current contact company, provided that they have access to the company to which the contact company is assigned.</p>

### Document Archive Island

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the contact company. By assigning a document archive to a contact company, you can keep track of the various documents related to the contact company. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

### Note Island

Field	Description
<b>Note No.</b>	In this field, you can assign a note to the contact company. The field is automatically completed if a note was created using the action "Create Note."

### Print Control Island

Field	Description
<b>Statistic 1-4 Value</b>	<p>In these fields, you can enter various statistic codes. The four codes can be used as selection criteria when selecting contact companies for printout in print windows. If a statistics list has been specified in a given statistics list field in this island, only values available in the list in question can be selected in the corresponding statistic value field. If a statistics list field has been left blank, any text can be entered in the corresponding value field.</p> <p>If the contact company is assigned to a customer, either by creating a customer on the basis of the contact company or by specifying a customer number in the field "Customer No." above while creating a contact company, any changes to the information in this island will cause the customer information card to be updated accordingly, and vice versa. Please note, however, that if you specify a customer number in the field "Customer No." above while creating a contact company, the information is copied to this window from the information card of the customer in question, and the statistics information must therefore be blank when creating the contact company.</p>

Field	Description
<b>Statistics 1-4 List</b>	In these fields, you can specify the option lists containing the values you wish to be available in the fields “Statistics 1-4 Value.” In the fields “Statistics 1-4” in this island, you can then only select values from these lists. However, if you leave a given statistics list field blank, any text can be entered in the corresponding statistics value field.

### Extra Fields Island

Field	Description
<b>Date 1-5</b>	In these fields, you can enter dates relevant to the contact company. The fields are for information only.

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

### Remarks Island

In these fields, you can enter additional remarks about a contact company.

### Information Island

Field	Description
<b>Enterprise</b>	In this field, you can attach the company to an enterprise. You can define enterprises in the window Popup Fields in the set-up module. When you create a contact company assigned to a customer number, this enterprise is transferred from the information card of the customer in question.
<b>Segment</b>	In this field, you can select a segment. You can define segments in the window Popup Fields in the Set-Up module. When you create a contact company assigned to a customer number, this segment is transferred from the information card of the customer in question.
<b>Area</b>	In this field, you can select an area. You can define areas in the window Popup Fields in the Set-Up module. You can, for example, use this field for registration of the geographic area in which a contact company is located. When you create a contact company assigned to a customer number, this area is transferred from the information card of the customer in question.
<b>Industry Code</b>	Here you can enter an industry code for the contact company. This can, for example, be a NACE number (“Nomenclature generale des Activités économiques dans les Communautés Européennes”), which is a general classification of trade areas.
<b>Popup 1-20</b>	In these fields, you can select information concerning contact companies. These fields are pop-up fields, which means that you can choose between the options which have been created in the fields “Contact Company Popup 1-20” in the window Popup Fields in the Set-Up module.

Field	Description
	If you have Maconomy's layout editing tools, it is furthermore possible to rearrange the position of the fields in this window or add relevant headings. It is also possible to arrange the pop-up fields on printouts of relevance to the current contact company.
<b>Information 1-5</b>	<p>In these fields, you can enter information concerning contact companies. These fields are text fields which mean that you can enter as much information as you wish.</p> <p>If you have Maconomy's layout editing tools, it is furthermore possible to rearrange the position of the fields in this window or add relevant headings. It is also possible to arrange the pop-up fields on printouts of relevance to the current contact company.</p>
<b>Origin</b>	In this field, you can register the place from which the contact company originates. This can, for example, be input from a CD, and so on.

### Option List Fields Island

Field	Description
<b>List</b>	<p>Enter the names and values for default options in these fields to provide additional information about a contact company.</p> <p>In the Option List column, enter names of option lists. In the corresponding Value column, enter values that are available in the respective option lists.</p> <p>When you create a contact company these fields are initialized to the values that you entered during setup. However, you can change those values when you create a contact person.</p>
<b>Value</b>	In these fields, you can specify values available in the respective option lists specified in this island. The fields can, for example, be used for further specification of the contact company. If a given option list field in this island has been left blank, any text can be entered in the corresponding value field.

### Hierarchy Island

Field	Description
<b>Customer Level No.</b>	This field shows the Customer Level number for the contact company in question.
<b>Level 1-5 Contact Company No.</b>	These fields show the contact companies in the hierarchy above the contact company in question. These fields are only available if Customer Levels are set up using the designated System Parameters.
<b>Level 1-5 Name</b>	These fields show the names of contact companies in the hierarchy above the contact company in question. These fields are only available if Customer Levels are set up using the designated System Parameters.

Field	Description
<b>Level 1-5 Customer No.</b>	If the contact companies in the hierarchy above the contact company in question are created as customers, these fields will show their customer numbers. These fields are only available if Customer Levels are set up using the designated System Parameters.

## Contact Persons Sub-Tab

This section includes the fields and descriptions for the Contact Persons sub-tab.

Field	Description
<b>Contact Person No.</b>	<p>In this field, you can specify the contact person's number. The number can consist of both figures and letters. For further information about the functionality of the field, see the description of the corresponding field in the window Contact Persons.</p> <p>The island also contains a number of extra lines used for the name and address of the contact person. The fourth one of the extra lines contains two fields, one for zip code and the other for postal district. If you enter a zip code and leave the postal district field blank, the postal district field is automatically completed, provided that the zip code in question has been entered for the relevant country in the window Postal Districts in the Set-Up module. For further information, see the description of the window Postal Districts.</p>
<b>Name 1-3</b>	In these fields, you can specify the name and address of the current contact person.
<b>Zip Code</b>	In this field, you can specify the zip code of the current contact person. If you enter a zip code and leave the field "Postal District" blank, the field "Postal District" is automatically completed, provided that the zip code in question has been entered in the window Postal Districts in the Set-Up module. For further information, see the description of the window Postal Districts.
<b>Postal District</b>	In this field, you can specify the name of the postal district in which the current contact person resides.
<b>Name 4-5</b>	In these fields, you can specify the name and address of the current contact person.
<b>Attention.</b>	In this field, you can specify an attention person.
<b>Country</b>	In this field, you can specify the country of the contact person. Countries are defined in the window Popup Fields in the set-up module.
<b>Phone</b>	In this field, you can specify the phone number of the contact person.
<b>Mobile</b>	In this field, you can specify the mobile phone number of the contact person.

Field	Description
<b>Fax</b>	In this field, you can specify the fax number of the contact person.
<b>Telex</b>	In this field, you can specify the telex number of the contact person.
<b>E-mail</b>	In this field, you can specify the e-mail number of the contact person.
<b>Department</b>	In this field, you can select the department to which the contact person belongs. Departments can be defined in window Posting References in the G/L module.
<b>Education</b>	In this field, you can specify the contact person's education.
<b>Position</b>	In this field, you can specify the contact person's position.
<b>Date of Birth</b>	In this field, you can specify the contact person's date of birth.
<b>Age</b>	This field shows the age of the current contact person, calculated on the basis of the date of birth specified above.
<b>Gender</b>	In this field, you can specify the gender of the contact person.
<b>Blocked</b>	If you mark this field, the current contact person is blocked. For further information about the effects of blocking a contact person, see the description of the corresponding field in the window Contact Persons.
<b>Linking Rule</b>	In this field, you can specify the linking rule that you want to use for the creation of the current contact person. For further information about the effects of the linking rule, see the description of the corresponding field in the window Contact Persons.
<b>Popup 1-5</b>	In each of these five fields you can select different information pertaining to the contact person. For further information about the functionality of the fields, see the description of the corresponding field in the window Contact Persons.
<b>Document Archive No.</b>	In this field, you can assign a document archive to the contact person. For further information about the functionality of the field, see the description of the corresponding field in the window Contact Persons.
<b>Date 1-5</b>	In these fields, you can enter a number of dates relevant to the contact person. The fields are for information only.
<b>Responsible Employee</b>	In this field, you can specify the number of the employee responsible for the current contact person.

Field	Description
<b>Access Level Name</b>	Here you can enter the name of an access level created in the window Access Levels. For further information about the functionality of the fields, see the description of the corresponding field in the window Contact Persons.
<b>Created by</b>	This field shows the name of the user who created the information on the current line.
<b>Created on</b>	This field shows the date on which the information on the current line was created.
<b>Changed by</b>	This field shows the name of the last user who changed the information on the current line. Changes to the contact person information in the window Contact Persons, also causes this field to be updated.
<b>Correction Date</b>	This field shows the last date on which the information on the current line was changed. Changes to the contact person information in the window Contact Persons, also causes this field to be updated.
<b>Version</b>	This field shows the version number of the current line, indicating how many times information has been changed on the line. Maconomy automatically increases the version number by one every time the information is changed. Changes to the contact person information in the window Contact Persons, also causes this field to be updated. It is not possible to retrieve previous versions.

## Actions

This section shows the Actions available in the Contact Companies workspace.

### Top Tab

Field	Description
<b>Create Customer</b>	<p>Select this action if you want to create a new contact company as customer. The customer will then automatically be created as a customer in the A/R module. As Maconomy transfers certain information from the standard customer of the system, you can only select this action if a standard customer has been specified in the window System Information in the Set-Up module.</p> <p>If you have entered a number in the field "New Customer No.," the customer will be assigned this number. If this is not the case, the customer number will be taken from the number series Customer in the window Number Series provided that this has been created.</p> <p>When a customer has been created as contact company, the file information of the customer and the contact company will be concomitant. This means that changes in the file information of the customer information card also will be transferred to the customer's file information in the window Contact Company.</p>

Field	Description
<b>Attach Document to Contact Company</b>	This action allows you to attach a document to the contact company in the card part.
<b>Create Note</b>	Use this action to create a note. Maconomy derives the note type for the note from the contact management setup. Maconomy uses the company number, matched to the user's company number, to derive the right setup to use.

**Bottom Tab**

Field	Description
<b>Attach Document to Contact Person</b>	This action allows you to attach a document to the contact person in the card part.

## Contact Company Employees Single Dialog Workspace

Use this workspace to associate employees with a contact company.

Maconomy automatically includes the employee whom you identified as the sales representative in the contact company card in the list. You can only change or delete the sales representative via the contact company card and not via the list in this workspace.

### Contact Company Tab

This section includes the fields and descriptions for the Contact Company tab.

**Contact Company Island**

Field	Description
<b>Contact Company</b>	This field shows the contact company name and number.

### Employees Sub-Tab

This section includes the fields and descriptions for the Employees sub-tab.

Field	Description
<b>Employee No.</b>	This field shows the number of the employee associated with the contact company.
<b>Name</b>	This field shows the name of the employee associated with the contact company.

Field	Description
<b>Position</b>	This field shows the employee's position in the company.
<b>Phone</b>	This field shows the employee's phone number.
<b>Mobile</b>	This field shows the employee's mobile number.
<b>Email</b>	This field shows the employee's email address.
<b>Role</b>	Use this field to enter the employee's role with the contact company.
<b>Sales Rep.</b>	This field indicates if the employee is the sales rep. for the contact company. The employee registered as sales rep. on the contact company card will automatically be included in the list. You can only change or delete the sales rep. via the contact company card and not via the list.
<b>Company No.</b>	This field shows the employee's company number.
<b>Company Name</b>	This field shows the employee's company name.
<b>Account</b>	This field shows the value for the dimension Account.
<b>Location</b>	This field shows the employee's location as set up for the employee in the Employees window.
<b>Entity</b>	This field shows the value for the Entity dimension as set up for the employee in the Employees window. You can use the Entity dimension in any way you like – to distinguish between employees in the company, between departments, or something completely different.
<b>Project</b>	This field shows the value for the Project dimension as set up for the employee in the Employees window. You can use the Project dimension in any way you like – to describe sales projects or development projects, or something completely different.
<b>Purpose</b>	This field shows the value for the Purpose dimension as set up for the employee in the Employees window. You can use the Purpose dimension in any way you like – to describe the purpose of projects or development projects, or something completely different.
<b>Spec. 1-3</b>	This field shows the value for the Specification 1-3 dimension as set up for the employee in the Employees window. You can use the Specification 1 dimension in any way you like – to further specify a G/L entry or something completely different.

Field	Description
<b>Local Spec. 1-3</b>	<p>This field shows the value for the Local Specification 1-3 dimension as set up for the employee in the Employees window.</p> <p>You can use the Local Specification 1 dimension in any way you like to further specify a G/L entry or something completely different.</p> <p>You can use local dimensions as dimensions that are valid only within the individual company or Institution, such as a local chart of accounts, as opposed to the other dimensions, which are common to all companies.</p>

## Contact Company Addresses Single Dialog Workspace

Use this workspace to enter an unlimited number of addresses for a contact company.

You select one address as the primary address; that address is available directly on the contact company card. If you change the primary address, Maconomy also changes the contact company and vice-versa. If you select another address as the default, Maconomy updates the contact company card appropriately.

### Contact Company Tab

This section includes the fields and descriptions for the Contact Company tab.

#### Contact Company Island

Field	Description
<b>Contact Company</b>	This field shows the contact company number.

### Addresses Sub-Tab

This section includes the fields and descriptions for the Addresses sub-tab.

Field	Description
<b>Description</b>	Enter a description for the address. You must provide a value for this field.
<b>Name 2-3</b>	Enter lines 1-2 of the contact company address.
<b>Zip Code</b>	Enter the contact company address ZIP code.
<b>Postal District</b>	Enter the contact company address Postal District code.
<b>Name 4-5</b>	Enter lines 3-4 of the contact company address.

Field	Description
<b>Attn.</b>	Enter the contact company address attention person.
<b>Country</b>	Enter the country in which the contact company address is located.
<b>Phone</b>	Enter the contact company address telephone number.
<b>Fax</b>	Enter the contact company address fax number.
<b>Telex</b>	Enter the contact company address Telex number. You can enter the contact company's home page address if there is no Telex number.
<b>E-mail</b>	Enter the contact company e-mail address.
<b>Primary</b>	Select this check box to keep the primary address synchronized with the contact company card.

## Contact Company Targeting Codes Single Dialog Workspace

Use this workspace to assign targeting codes to a contact company.

### Contact Company Tab

This section includes the fields and descriptions for the Contact Company tab.

#### Contact Company Island

Field	Description
<b>Contact Company</b>	This field shows the contact company number. You cannot change the value.

### Targeting Codes Sub-Tab

This section includes the fields and descriptions for the Targeting Codes sub-tab.

Field	Description
<b>Targeting Code</b>	Enter a name for the targeting code. This field must contain a value.
<b>Description</b>	This field shows a description of the targeting code. You cannot change the value.
<b>Remark</b>	Enter any remarks about the targeting code assignment.

## Contact Persons Single Dialog Workspace

Use this workspace to enter and maintain information about contact persons.

A contact person can be a specific person within a company that you entered in the Contact Companies workspace; however, Maconomy does not require a contact person to be related to a contact company. In addition to the contact person name, you can also enter this person's working or private address, information about the person's education, and supplementary remarks.

You can create contact persons by using linking rules if they are assigned to a contact company. If you used the Linking Rules workspace in the Set-Up module to create a linking rule between the **ContactCompany** and **ContactPerson** database tables, you can copy certain information from a contact company to a contact person when you create the contact person. The setup of the relevant linking rule determines the information that a contact person inherits from a contact company. You can also identify what information users can change in this workspace.

For example, if you create a linking rule from the **ContactCompany** table to the **ContactPerson** table that specifies that all contact company information, except for a few fields such as **Attn.** and **E-mail**, should be inherited by contact persons with the standard linking method **Full**, Maconomy copies the relevant information to the contact persons using this linking rule. The selected linking rule determines which fields are can be changed the Contact Persons workspace.

The setup of the linking rule that you assign to the contact person, if any, determines whether or not you can enter, change, or only review a value in each field.

See the description of the Contact Company island in this workspace and the introduction to the Linking Rules workspace in the Set-Up module for more information about the use of linking rules when creating contact persons.

You can also create employees based on contact persons using the **Create Employee** action. This functionality is useful if you want to use the Contact Management module's event flow functionality to enter historical employee information or keep track of information such as the projects in which employees are involved or courses that they have taken. For more information about creating employees from contact persons, see the description of the **Create Employee** action.

### Contact Persons Tab

This section includes the fields and descriptions for the Contact Persons tab.

#### Contact Person Island

Field	Description
<b>Contact Person</b>	In this field, you can specify the name and number of a contact person. The number can consist of both figures and letters. If you do not enter a number, a number will be allocated automatically from the number series Contact Person in the window Number Series, provided that this series has been created. The company specific number series used depends on whether the contact company specified in the field "Contact Comp. No." (if any) has been assigned to a company, that is, that the field "Company No." has been completed for the contact company in question in the window Contact Companies. If it has, the number series of this company is used. If it has

Field	Description
	<p>not, or if no contact company has been specified for the contact person, the contact person number is derived from the standard company specified in the window System Information.</p> <p>It is possible to change the number of a contact person upon creation. If you do so, Maconomy will update all references made to the current contact person in other windows accordingly. If the contact person is, for example, assigned to a customer, the contact person number on the customer information card in question is changed to match the updated contact person number.</p> <p>The island also contains a number of extra lines used for the name and address of the contact person. The fourth one of the extra lines contains two fields, one for zip code and the other for postal district. If you enter a zip code and leave the postal district field blank, the postal district field is automatically completed, provided that the zip code in question has been entered for the relevant country in the window Postal Districts in the Set-Up module. For further information, see the description of the window Postal Districts.</p>
<b>Attn.</b>	In this field, you can specify an attention person.
<b>Country</b>	In this field, you select the country of the contact person. Countries are defined in the window Popup Fields in the set-up module.
<b>Phone</b>	In this field, you can specify the phone number of the contact person.
<b>Phone 2</b>	In this field, you can specify a second phone number to the contact person.
<b>Mobile</b>	In this field, you can specify the mobile phone number of the contact person.
<b>Mobile 2</b>	In this field, you can specify a second mobile phone number to the contact person.
<b>Fax</b>	In this field, you can specify the fax number of the contact person.
<b>Telex</b>	In this field, you can specify the telex number of the contact person.
<b>E-mail</b>	In this field, you can specify the e-mail number of the contact person.
<b>Department</b>	In this field, you can select which department you want to connect the contact person to. Departments can be defined in window Posting References in the G/L module.
<b>Education</b>	In this field, you specify the contact person's education.

Field	Description
<b>Position</b>	Enter a position for the contact person, or press CTRL+G to search for a possible position value. The CTRL+G search option is available if a position option list is specified for contact persons in the Contact Management Setup window.
<b>Initials</b>	In this field, you can specify the initials of the contact person.
<b>Soc. Security No.</b>	In this field, you can specify the social security number of the contact person.
<b>Date of Birth</b>	In this field, you can specify the contact person's date of birth.
<b>Age</b>	This field shows the age of the current contact person, calculated on the basis of the date of birth specified above.
<b>Gender</b>	In this field, you can specify the gender of the employee. You can select any of the following values: <ul style="list-style-type: none"> <li>Male</li> <li>Female</li> <li>Diverse</li> <li>Prefer not to classify</li> </ul>
<b>Blocked</b>	If you mark this field, the current contact person is blocked. It is not possible to assign a blocked contact person to events, contact groups, contact companies, and so on. However, you can unblock the contact person again by unmarking this field.

### Employee Information Island

Field	Description
<b>New Employee No.</b>	When you select the action "Create Employee," an employee is created on the basis of the current contact person, and in this field you can specify information about the employee number to be assigned to the new employee. If you have specified a number in this field before selecting the action, the new employee is assigned this number, and the contact person number of the current contact person is subsequently changed, becoming identical to the number of the new employee. If this field is blank when the action is selected, the employee is assigned the same number as the current contact person. See the description of the action "Create Employee" for further information on the effects of creating an employee from a contact person.
<b>Employee No.</b>	When creating a contact person, you can base the contact person on an existing employee by specifying a number in this field. If you do so, the new contact person will be assigned to the employee specified in this field, and information will flow from the employee to the contact person.

Field	Description
<b>Termination Date</b>	If the employee in the field "Employee No." above has been terminated, this field shows the date when the termination took place.

### Document Archive Island

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the contact person. By assigning a document archive to a contact person, you can keep track of the various documents related to the contact person. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

### Note Island

Field	Description
<b>Note No.</b>	In this field, you can assign a note to the contact person. The field is automatically completed if a note was created using the action "Create Note."

### Employee Information Island

Field	Description
<b>Employee</b>	Use this field to enter the name and number of the employee responsible for the contact person. The employee name automatically shows in the Name field. When you update the responsible employee on a contact person in this field, Maconomy also shows that employee in the table part as the employee responsible for that contact person.

### Access Level Island

Field	Description
<b>Access Level</b>	Here you can enter the name and description of an access level created in the window Access Levels. Users only have access to information about the current contact person if they have been assigned to this or a higher access level in the window User Access Levels in the Set-Up module. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to contact persons may depend on other factors. For further information about the standard access control configuration and access control in a multi-company

Field	Description
	<p>model, please see the section “Introduction to the Access Control System” in the Set-Up module.</p> <p>If you do not specify an access level, all users will have access to see information about the current contact person.</p>
<b>Description</b>	This field shows the description of the access level specified in the field above.

### Option List Fields Island

Field	Description
<b>List</b>	<p>Enter the names and values for default options in these fields to provide additional information about a contact person.</p> <p>In the Option List column, enter names of option lists. In the corresponding Value column, enter values that are available in the respective option lists.</p> <p>When you create a contact person these fields are initialized to the values that you entered during setup. However, you can change those values when you create a contact person.</p>
<b>Value</b>	In these fields, you can specify values available in the respective option lists specified in this island. The fields can, for example, be used for further specification of the contact person. If a given option list field in this island has been left blank, any text can be entered in the corresponding value field.

### Remarks Island

In this field, you can enter additional remarks concerning a contact company.

### Company Island

Field	Description
<b>Company</b>	<p>In this field, you can specify a company name and number if the current contact person pertains to a given company in the G/L module. It is possible to leave the field blank, but if the contact person is assigned to an employee or a contact company, any company number specified in this field must match the number of the company to which the employee or contact company in question is assigned. If the contact person is neither assigned to an employee nor a contact company, you can enter the number of any company in the G/L system.</p> <p>The contents of this field also determine which users have access to see information about the contact person and refer to it in other windows. In the window Company Information in the G/L module it is possible to assign each company to an access level. A user only has access to see information about a given contact person if he has been granted access to the access level in the window Access Levels in the Set-Up module that the company in question is assigned to or a superordinate level. In addition, the user must have access to the access level specified in the island Access Level to have access to the contact person. Please note that this access control model only applies if the standard access control configuration has not been</p>

Field	Description
	changed in your Maconomy system. If it has, the access to contact persons may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.

### Contact Company Island

Field	Description
<b>Contact Company</b>	<p>If the contact person is related to a contact company, you can specify the name and number of the contact company in question in this field.</p> <p>If you want to create a contact person on the basis of a linking rule, you can enter a contact company number here and specify the name of the relevant linking rule in the field "Linking Rule" below. Once you press Return, the contact person in question will be created on the basis of the contact company specified in this field and the linking rule specified in the field "Linking Rule." If you do not specify a linking rule, Maconomy will use a standard linking rule, if one has been created between the tables "ContactCompany" and "ContactPerson" in the window Linking Rules in the Set-Up module. The information copied to the contact person will depend on the set-up of the specified linking rule.</p>
<b>Linking Rule</b>	<p>In this field, you can specify the linking rule that you want to use for the creation of the current contact person. If you have specified a contact company in the field "Contact Company" above and you do not specify a linking rule in this field, Maconomy will use a standard linking rule, if one has been created between the tables "ContactCompany" and "ContactPerson" in the window Linking Rules in the Set-Up module. If no standard linking rule has been created, Maconomy will display an error message. Linking rules contain information about what information should be copied from a contact company to a contact person. Linking rules are maintained in the window Linking Rules in the Set-Up module. For further information about linking rule creation and usage and rules concerning the copying of field information from contact companies, please see the description of the window Linking Rules in the Set-Up module.</p>

### Information Island

Field	Description
<b>Popup 1-20</b>	In each of these fields you can select different information pertaining to the contact person. The fields are pop-up fields, that is, you can select one of the options created for each pop-up field. The "Contact Person Popup 1-20" fields can be defined in the Popup Fields window in the set-up module.

**Personnel Requisition Island**

Field	Description
<b>Requisition No.</b>	<p>If the current contact person is associated with a personnel requisition, for instance because he or she was created as a contact person as a result for applying for a position on a personnel requisition.</p> <p>If you create an employee on the basis of the current contact person and you have specified a requisition number in this field, certain information is transferred from the specified requisition to the new employee. This information includes the requisition number, supervisor and the information in the island Dimensions for Employee.</p>

**Extra Fields Island**

Field	Description
<b>Date 1-5</b>	In these fields, you can enter dates relevant to the contact person. The fields are for information only.
<b>Amount 1-5</b>	In these fields, you can enter amounts relevant to the contact person. The fields are for information only.

**User Island**

See the chapter “Getting Started” for a description of the fields in the island User.

**Employees Sub-Tab**

This section includes the fields and descriptions for the Employees sub-tab.

Field	Description
<b>Employee No.</b>	This field shows the number of the employee associated with the contact person.
<b>Name</b>	This field shows the name of the employee associated with the contact person.
<b>Position</b>	This field shows the employee's position.
<b>Phone</b>	This field shows the employee's phone number.
<b>Mobile</b>	This field shows the employee's mobile number.
<b>Email</b>	This field shows the employee's email address.
<b>Role</b>	Use this field to enter the role the employee has with regard to the contact person.

Field	Description
<b>Primary Responsible</b>	<p>This field shows whether the employee is the responsible employee on the contact person card.</p> <p>You can change or delete the primary responsible employee using the Responsible Employee field in the card part.</p>

## Actions

This section shows the Actions available in the Contact Persons workspace.

### Top Tab

Field	Description
<b>Create Employee</b>	<p>When you select this action, an employee is created in the window Employees on the basis of the current contact person. Information common to both contact persons and employees is copied to the new employee, and subsequent changes to this information on the contact person will cause the employee to be updated accordingly and vice versa.</p> <p>If you have specified a number in the island New Employee, the new employee is assigned the specified number. If you have not specified a new employee number, the new employee is assigned the same number as the contact person.</p> <p>You can only select this action if you have been granted access to creating employees from contact persons. Access is granted by marking the field "Create Employee from Contact Person" in the window Actions in the Set-Up module. The action cannot be selected if the current contact person is blocked or if the contact person is already assigned to an employee.</p>
<b>Attach Document to Contact Person</b>	<p>This action allows you to attach a document to the contact person.</p>
<b>Create Note</b>	<p>This action creates and assigns a note to the contact person. Maconomy derives the note type for the note from the contact management setup. Maconomy uses the company number, matched to the user's company number, to derive the right setup to use.</p>

## Contact Person Targeting Codes Single Dialog Workspace

Use this workspace to view information about contact person targeting codes.

## Contact Person Tab

This section includes the fields and descriptions for the Contact Person tab.

### Contact Person Island

Field	Description
<b>Contact Person No.</b>	This field shows the contact person number.
<b>Name</b>	This field shows the contact person's name.

## Targeting Codes Sub-Tab

This section includes the fields and descriptions for the Targeting Codes sub-tab.

Field	Description
<b>Targeting Code</b>	Enter a name for the targeting code you are assigning. This field must contain a value.
<b>Description</b>	This field shows a description of the targeting code. You cannot change the value.
<b>Remark</b>	Enter any remarks about the targeting code assignment.

## Contact Group Types Single Dialog Workspace

Use this workspace to create contact group types that contain template information for contact groups.

Each contact group that you create must be assigned to a contact group type, causing information from the contact group type in question to be copied to the new contact group. However, you can change the information for the individual contact groups.

## Contact Group Types Tab

This section includes the fields and descriptions for the Contact Group Types tab.

### Contact Group Type Island

Field	Description
<b>Contact Group Type</b>	In this field, you can enter the name of the contact group type when creating a contact group type. Once you have pressed Enter upon creating a contact group type, the field can no longer be changed.
<b>Description</b>	In this field, you can enter a description of the current contact group type.

## User Island

See the chapter “Getting Started” for a description of the fields in the island User.

## Option Lists On Contact Group Island

Field	Description
<b>Option List 1-30</b>	In these fields, you can select the option lists to be suggested in the respective option list fields on contact groups of the current type. However, the option lists can be changed for each contact group. The option lists can be used for further specification of the contact groups.

## Text Fields Island

Field	Description
<b>Text 1-10</b>	In these fields, you can enter a number of texts for further specification of the current contact group type. The fields are for information only.

## Access Level Island

Field	Description
<b>Access Level</b>	Here you can enter the name and description of an access level created in the window Access Levels. Users only have access to information about the current contact group type if they have been assigned to this or a higher access level in the window User Access Levels in the Set-Up module. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to contact group types may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section “Introduction to the Access Control System” in the Set-Up module.

## Option Lists On Contact Group Member Island

Field	Description
<b>Option List 1-5</b>	In these fields, you can select the option lists to be suggested in the respective option list fields on contact group member lines in the table part of the window Contact Groups for contact groups of the current type. However, the option lists can be changed for each contact group member. The option lists can be used for further specification of the contact group members.

## Contact Groups Single Dialog Workspace

Use this workspace to create and maintain contact groups.

A contact group is a group of contact companies and/or contact persons. You can use contact groups to bind together related contact persons.

For instance, if you have many contact persons within the same contact company, you can group these contact persons in this workspace, providing a better overview of your contact options in

that company. You can also group contact persons who work in similar functions within different companies or group contact companies according to their line of business.

In the Contact Groups tab, you can enter information about the current contact group, as well as a contact group type, based on the information that Maconomy suggests in the option list fields in this tab and the Contact Group Members sub-tab. You can create a line for each combination of contact company and contact person to be part of the group.

Contact groups are for information only and have no relation to campaign or event functionality.

## Contact Groups Tab

This section includes the fields and descriptions for the Contact Groups tab.

### Contact Group Island

Field	Description
<b>Contact Group No.</b>	In this field, you must enter the number of the contact group when creating a group. Once you have pressed Enter upon creating a group, the field can no longer be changed.  You cannot specify a combination of contact group number and contact group type which is already used on another contact group.
<b>Description</b>	In this field, you can enter a description of the current contact group type.
<b>Contact Group Type</b>	In this field, you must enter the number of a contact group type when creating a group. Template information from the contact group type is automatically suggested in the option list fields on the new contact group as well as on new contact group members.  You cannot specify a combination of contact group number and contact group type which is already used on another contact group.
<b>Description</b>	This field shows a description of the contact group type specified in the field "Contact Group Type" above.

### Company Island

Field	Description
<b>Company</b>	In this field, you can enter the name and number of the company to which the group belongs. The company number determines which users have access to seeing information about the group and referring to it in other windows, as described in the section "Central Concepts in the Access Control System" in the Set-Up module. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to contact groups may depend on other factors.  If you do not enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.

Field	Description
	See the section “Multiple Companies” in the chapter “Introduction to the G/L Module” and the window Dimension Derivations in the G/L module for a further description of the concept of dimension derivation.

### Document Archive Island

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the contact group. By assigning a document archive to a contact group, you can keep track of the various documents related to the contact group. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

### Job Island

Field	Description
<b>Job</b>	In this field, you can specify the name and number of a job if the current contact group pertains to a job.

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

### Option List Fields Island

Field	Description
<b>List</b>	In these fields, you can specify the option lists containing the values you wish to use for further specification of the contact group. In the fields “Value 1-30” in this island, you can then select values from these lists. When you create a contact group, Maconomy suggests the option lists from the corresponding fields in the selected contact group type, but you can change the option lists here.
<b>Value</b>	In these fields, you can specify values available in the respective option lists specified in this island. The fields can, for example, be used for further specification of the contact group. If a given option list field in this island has been left blank, any text can be entered in the corresponding value field.

**Text Fields Island**

Field	Description
<b>Text 1-5</b>	In these fields, you can enter a number of remarks about the current contact group.

**Database Relation Island**

Field	Description
<b>Database Relation</b>	In this field, you can specify the name of a relation in the Maconomy database, thus assigning the current contact group to the entry in question. In the remaining fields in this island, you can then specify the desired entry.
<b>Object Instance Key</b>	If instance key registration has been activated for the relation specified in the field "Database Relation" above, you can specify in this field the instance key value of the database entry to be assigned to the current contact group. If you enter key values in the fields "<Key 1-4>," this field is automatically completed with the instance key value of the database entry in question. Similarly, if you specify an instance key value, Maconomy automatically completes the key fields.
<b>&lt;Key 1-4&gt;</b>	<p>In these fields, you can enter the values in the primary, secondary, and so on, key fields that identify the entry in the relation above which the current contact group concerns. A key value is a value identifying, for example, a certain order, vendor invoice, and so on.</p> <p>In certain relations, a key consists of up to four key fields. In these relations, the combination of the key values constitutes the key to the individual entries in that relation. An example of this is order lines, where the first key value points to the sales order to which the line in question belongs, and the second key value is the line's line number in the table part of the sales order. So if the key to entries in a given relation consists of several key fields, it is possible for several entries to have the same value in the same key fields, but there can be no more than one entry with the same combination of values in the key fields in question.</p> <p>When you enter a database relation in the field "Database Relation" above, Maconomy shows the names of the individual key fields in this island instead of blank field names, allowing you to see which fields should be completed.</p> <p>If you specify an instance key in the field "Object, Instance Key" above, the key fields are automatically completed with the key values from the database entry to which the instance key value belongs. Similarly, if you enter key values in these fields and instance key registration has been activated for the database relation in question, Maconomy automatically completes the field "Object Instance Key."</p>

**Access Level Island**

Field	Description
<b>Access Level</b>	Here you can enter the name of an access level created in the window Access Levels. Users only have access to information about the current contact group if they have been assigned to this or a higher access level in the window User Access Levels in the Set-Up module. In addition, the user must have access to the access

Field	Description
	<p>level specified for the company to which the contact group is assigned order to have access to the contact company. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to contact groups may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section “Introduction to the Access Control System” in the Set-Up module.</p> <p>If you do not specify an access level, all users will have access to see information about the current contact group type.</p>

### Validity Period Island

Field	Description
<b>Validity Start</b>	In these fields, you can enter the starting date and time of the validity period of the current contact group. The field is for information only.
<b>Validity End</b>	In these fields, you can enter the ending date and time of the validity period of the current contact group. The field is for information only.

### Extra Date Fields Island

Field	Description
<b>Date and Time 1-5</b>	In these fields, you can enter a number of key dates and times related to the current contact group. The fields are for information only.

### Contact Group Members Sub-Tab

This section includes the fields and descriptions for the Contact Group Members sub-tab.

Field	Description
<b>Contact Comp. No.</b>	In this field, you must enter the number of a contact company which will then be assigned to the current contact group. It is possible for the same contact company to be part of multiple groups at the same time.
<b>Contact Person No.</b>	In this field, you can specify a contact person belonging to the contact company on the line. This contact person will then be assigned to the current group. It is possible for the same contact person to be part of multiple groups at the same time.
<b>Option List 1-5</b>	In these fields, you can specify the option lists containing the values you wish to use for further specification of the contact group member. In the fields “Selected Value 1-5,” you can then select values from the corresponding lists. When you create a line, Maconomy suggests the option lists from the contact group type of the current contact group. The suggested option lists are retrieved from the respective fields “Option List 1-5” in the island Option Lists

Field	Description
	on Contact Group Members in the window Contact Group Types. However, you can change the option lists here.
<b>Selected Value 1-5</b>	In this field, you can specify values available in the option lists specified in the fields "Option List 1-5" on the current line. The fields can, for example, be used for further specification of the contact group member.
<b>Text 1-10</b>	In these fields, you can enter a number of texts for further specification of the current contact group member. The fields are for information only.
<b>Date 1-5</b>	In these fields, you can enter a number of dates for further specification of the current contact group member. The fields are for information only.

## Event Flow Types Single Dialog Workspace

Use this workspace to create event flow types that contain template information for event flows.

You must assign each event flow that you create, either manually or automatically as part of a campaign, to an event flow type. When you create an event flow, Maconomy copies information from the event flow type in question to the event.

### Event Flow Types Tab

This section includes the fields and descriptions for the Event Flow Types tab.

#### Event Flow Type

Field	Description
<b>Event Flow Type</b>	In this field, you can enter the name of the event flow type when creating an event flow type. Once you have pressed Enter upon creating an event flow type, the field can no longer be changed.
<b>Description</b>	In this field, you can enter a description of the current event flow type.
<b>Blocked for New Flows</b>	Mark this field if it should no longer be possible to create event flows of the current type.
<b>Flow Status Type</b>	In this field, you can specify an option list created in the window Option Lists. The options in this option list will be available to be selected as event flow status on events assigned to event flows of the current type. For further information on the use of event flow statuses, please see the field "Flow Status Type" in the card part and the field "New Event Flow Status" in the table part of the window Event Flows. If you leave this field blank, it is not possible to enter event flow statuses on event flows of the current type.
<b>Initial Flow Status</b>	In this field, you can specify an event flow status to be transferred to the field "Current Event Flow Status" on new event flows of the current type. The value must be an option in the option list specified in the field "Flow Status

Field	Description
	Type" above. If no value is selected here, new event flows of the current type will have a blank event flow status upon creation.
<b>Aut. Status Update</b>	<p>In this field, you can specify whether it should be possible to enter a value in the field "New Event Flow Status" on events which are assigned to event flows of the current type and do not have the field "Status Changing Event" marked.</p> <p>If you do not mark the field, a given event in an event flow of the current type can only contain a value in the field "New Event Flow Status" if the field "Status Changing Event" is marked for the event in question. This ensures that only status changing events can have an event flow status. As a consequence of not marking this field, it will only be possible to close a status changing event in event flows of the current type if the closing date of the event is later than that of the other closed, status changing events in the flow (see the description of the field "Closed" in the table part of the window Event Flows).</p> <p>If you mark the field, a given event in an event flow of the current type can contain a value in the field "New Event Flow Status" regardless of whether the field "Status Changing Event" is marked for the event in question. This allows you to register a new event flow status for all events in a flow, to indicate their effects even if they do not affect the flow status. However, when closing a status changing event in a flow of the current type, Maconomy automatically unmarks the field "Status Changing Event" if the event being closed does not have a later closing date than that of the other closed, status changing events. This ensures that although you can specify new event flow statuses for multiple open events, the event flow status is not updated by previous events.</p>
<b>Application</b>	<p>In this field, specify how the current event flow type should be used. If you specify "History," it will be possible to specify an event starting date later than today's date on events in flows of the current type. In addition to this, when creating an event flow and specifying a given event flow type with the application "History," Maconomy rejects the creation of the new flow if the system already contains an event flow of the same type for the same contact person.</p> <p>If you specify "Standard," it will not be possible to specify a future event starting date on events in event flows of the current type, and the Selection Criteria island is not affected when browsing to an event flow of the current type.</p>
<b>Note Management</b>	<p>In this field, you can specify how Maconomy should handle any note assigned to a status changing event being closed in an event flow of the current type. If you select the value "Update Note at Status Change," closing a status changing event in a flow of the current type will cause the field "Note No." in the card part of the flow to be updated, so that any note assigned to the status changing event is assigned to the event flow. This allows you to, for example, run reports where information on the latest status changing</p>

Field	Description
	event in the individual flows includes the note information from the event in question.  If you select a blank value, the field "Note No." in the card part of event flows of the current type will not be updated automatically.

**Option Lists On Events Island**

Field	Description
<b>Option List 1-5</b>	In these fields, you can select the option lists to be suggested in the island Option List Fields on event flows of the current type. These option lists can be used for further specification of the event flows.

**Remarks Island**

In this field, you can enter additional remarks concerning the event flow type.

**Employees Island**

Field	Description
<b>Employee 1-5</b>	In these fields, you can specify the standard values to be suggested in the corresponding fields in the island Extra Employee Fields on event flows of the current type, for instance if certain employees should usually handle flows of this type.

**Flow Texts Island**

Field	Description
<b>Flow Text 1-20</b>	In these fields, you can specify the standard values to be suggested in the corresponding fields in the island Extra Fields on event flows of the current type. The fields are used for further specification of the individual event flows.

**Event Plan Island**

Field	Description
<b>Event Plan</b>	In this field, you can specify the name and number of the event plan to be suggested on event flows of the current type. For further information on the effect of event plans on event flows, see the description of the field "Event Plan No." in the window Event Flows and the section "Introduction to the Contact Management Module."
<b>Create Secondary Events When Closing</b>	In this field, you can specify the standard value to be suggested in the corresponding field on event flows of the current type. For further information on the functionality of the field, see the field "Create Secondary Events when Closing" in the window Event Flows.

Field	Description
<b>Include Only Closed Events</b>	In this field, you can specify the standard value to be suggested in the corresponding field on event flows of the current type. For further information on the functionality of the field, see the field “Include Only Closed Events” in the window Event Flows.

### Event Type Island

Field	Description
<b>Event Type</b>	In this field, you can specify the event type to be copied to events created from the current event template.

### Note Type Island

Field	Description
<b>Note Type</b>	Specify the note type whose heading options should be available as headings in the table part of the window Events.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>Here you can enter the description and name of an access level created in the window Access Levels. Users only have access to information about the current event flow type, and can only refer to it in other windows if they have been assigned to this or a higher access level in the window User Access Levels in the Set-Up module. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to event flow types may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section “Introduction to the Access Control System” in the Set-Up module.</p> <p>If you do not specify an access level, all users will have access to see information about the current event flow type.</p>

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

## Event Plans Single Dialog Workspace

Use this workspace to create the event plans that support the planned course of events in campaigns, based on different scenarios.

In the Event Plans tab you specify the name of each event plan; you create different event templates in the Event Templates sub-tab.

An event plan describes the events to be created as a result of the outcome of a previous event. In an event plan, you can, for example, specify that if the first call to a customer results in the

customer accepting the invitation to a meeting, Maconomy should automatically create an event with certain information, whereas no further events should be created if the customer declines.

An event plan should contain a number of templates for initial events and, if relevant, a number of templates for secondary events. When you initiate a campaign in the Campaigns workspace, Maconomy creates, for each contact company and person in the campaign, one event per initial event template in the event plan that you assigned to the campaign. The plan must contain at least one initial event template. Maconomy recognizes an initial event template by the fact that neither a condition result nor a condition template has been defined for the template.

### Secondary Events

If the outcome of an event in a campaign should cause the creation of additional events (for instance, if a potential customer wants you to send more information as a result of a phone call), the event plan should also contain a number of secondary event templates. A secondary event template is an event template for which you have defined a condition for the creation of events based on the template in question. In those cases where an event meets the conditions for a given template in the event plan, Maconomy can create an event with the information in the template in question. You do this by using the **Create Secondary Events** action in the Campaigns or Events workspaces.

In the following description, the term "basis event" refers to an existing event that you assigned to a given campaign, and for which no secondary events have been created yet.

The condition consists of:

- The number of the template on which a basis event must be based to cause the creation of secondary events based on the event template in question.
- The result of the basis event—for instance, whether the contact person answered yes or no to a given question in a phone conversation.

When you create secondary events for a campaign, Maconomy checks each basis event to see whether the event plan that you assigned to the campaign contains one or several event templates on which:

- The condition number matches the event template number on which the basis event was based.
- The condition result matches the result that you defined in the **Result** field on the basis event in question.

When these conditions are met, Maconomy creates a secondary event. Maconomy copies the contact person and/or contact company from the basis event to each secondary event and copies the contact mode, event type, employee number, starting date, and other information from the event template that, in combination with the basis event, resulted in the secondary event.

Maconomy performs a corresponding process for one event at a time when you use the **Create Secondary Events** action in the Events workspace.

**Note:** Initial event templates can also cause Maconomy to create events when you use the **Create Secondary Events** action in the Campaigns workspace. This happens when you add initial event templates to the event plan after the last time that you used that action for a given campaign. In that case, Maconomy creates secondary events from basis events as described previously, while at the same time creating events for all of the contact companies and persons that you included in the campaign, based on the initial event templates.

You can create several event templates that have exactly the same conditions. For example, this can be necessary if a given outcome of an event should cause the creation of several events for the same contact company or person.

### Event Plans Tab

This section includes the fields and descriptions for the Event Plans tab.

#### Plan Island

Field	Description
<b>Event Plan No.</b>	When creating an event plan, you can specify a number for the plan in this field.
<b>Description</b>	In this field, you can enter a short description of the current event plan.

#### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

### Event Templates Sub-Tab

This section includes the fields and descriptions for the Event Templates sub-tab.

Field	Description
<b>Event Template No.</b>	In this field, you can specify a number for the current event template. The number is used when referring to the current event template in the field “Condition No.” on other event templates.
<b>Contact Mode</b>	In this field, you can specify the contact mode to be copied to events created from the current event template.
<b>Event Type</b>	In this field, you can specify the event type to be copied to events created from the current event template.
<b>Status Changing Event</b>	In this field, you can specify whether events created from the current template should be marked as status changing events in their respective event flows. If an open event already in a given flow is already marked as the status changing event, any secondary event created in that flow based on the current event template will not be marked as a status changing event.
<b>Employee No.</b>	In this field, you can specify the employee number to be copied to events created from the current event template.
<b>Item No.</b>	In this field, you can specify the item number to be copied to events created from the current event template.
<b>Description</b>	In this field, you can specify the description to be copied to events created from the current event template.

Field	Description
<b>Result Type</b>	<p>In this field, you can specify the result type to be copied to events created from the current event template.</p> <p>The result type is an option list created in the window Option Lists, and thus contains the options representing possible outcomes of the created events.</p>
<b>Planned Starting Date</b>	<p>In this field, you can specify the planned starting date to be copied to events created from the current event template.</p>
<b>Planned Ending Date</b>	<p>In this field, you can specify the planned ending date to be copied to events created from the current event template.</p>
<b>Delay</b>	<p>In this field, you can specify the number of days which should pass from the creation of secondary events until the events created should be carried out. When creating secondary events from the current template, Maconomy will thus add the specified number of days to the ending date of the existing event, and transfer the calculated date to the field "Planned Starting Time" on the events created. If an existing event does not have an ending date, Maconomy adds the number of days to today's date instead of the closing date, when calculating the planned starting date of the secondary event.</p> <p>If you have both entered a date in this field and in the field "Planned Starting Date," Maconomy picks the earlier date.</p>
<b>Condition No.</b>	<p>In this field, you can specify the number of another event template in the current event plan. This number determines when to create secondary events from the current event template.</p> <p>In the description below, the term "basis event" is used about an existing event which is assigned to a given campaign and for which no secondary events have been created yet.</p> <p>When the action "Create Secondary Events" is selected for a campaign to which the current event plan is assigned, the current event template will cause the creation of secondary events for basis events on which:</p> <ul style="list-style-type: none"> <li>■ The number of the event template on which the basis event was based matches the event template number in this field, and</li> <li>■ The result specified in the field "Result" on the basis event in question matches the condition result specified in the field "Condition Result" for the current event template.</li> </ul> <p>For a further description of the concepts of condition results and condition numbers, please see the description of the fields "Condition Result" and "Condition No." in the table part of the window Event Plans.</p> <p>In those cases where the above conditions are met, a secondary event is created. Maconomy copies the contact person and/or contact company from the basis event to each secondary event, while other information is copied from the current event template.</p> <p>A similar process is carried out for one event at a time when selecting the action "Create Secondary Events" in the window Events.</p>

Field	Description
	<p>For an example illustrating how Maconomy finds out whether a given event should cause secondary events, please see the description of the action “Create Secondary Events” in the window Campaigns.</p> <p>It is possible to create several event templates with exactly the same condition template number and condition result. This can, for example, be necessary if a given outcome of an event should cause the creation of several new events for the same contact company or person.</p>
<b>Condition Result</b>	<p>In this field, you can specify a result which should determine when to create secondary events from the current event template. The condition result must be an option in the option list specified in the field “Result Type” on the event template specified in the field “Condition No.” on the current line.</p> <p>If you do not enter a result, the result of each event is ignored when Maconomy determines which events should cause secondary events based on the current template. This means that no matter what result including a “blank” result is specified on a given event, the event will cause the creation of secondary event, as long as the event itself was created from the event template specified as a condition in the field “Condition No.” on the current event template.</p> <p>For a detailed description of Maconomy’s method of finding out which events cause the creation of secondary events, please see the field “Condition No.”</p>
<b>Blocked</b>	<p>If you mark this field, the current event template is blocked, meaning that no events will be created from the template when the action “Create Secondary Events” is selected in the windows Campaigns and Events. However, you can unmark the field at any time, thus unblocking the event template.</p>

## Opportunity Types Single Dialog Workspace

Use this workspace to create opportunity types. An opportunity type is a template for opportunities that you create in the Opportunities workspace.

For each opportunity type, you can provide information that Maconomy transfers to new opportunities that you assign to the opportunity type in question. Each opportunity type also identifies an event flow type to be used on the event flows that you create and assign to opportunities of the type in question.

### Opportunity Types Tab

This section includes the fields and descriptions for the Opportunity Types tab.

#### Opportunity Type Island

Field	Description
<b>Opportunity Type</b>	<p>In this field, you can specify an opportunity type name when creating an opportunity type. Both letters and numbers can be used in the name. Once the opportunity type has been created, the name can no longer be changed.</p>

Field	Description
<b>Description</b>	In this field, you can enter a description of the current opportunity type.

### Event Flow Type Island

Field	Description
<b>Event Flow Type</b>	In this field, you must specify the name of the event flow type to be assigned to opportunities of the current type. This means that when you create an opportunity of the current type, the event flow automatically created and assigned to the new opportunity will be assigned this event flow type. For further information, see the field “Event Flow Type” in the description of the window Opportunities.
<b>Description</b>	This field shows a description of the event flow type specified in the field “Event Flow Type” above.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can enter the description and name of an access level created in the window Access Levels. Users only have access to information about the current opportunity type and to referring to the current opportunity types in other windows if they have been assigned to this or a higher access level in the window User Access Levels in the Set-Up module. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to opportunity types may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section “Introduction to the Access Control System” in the Set-Up module.</p> <p>If you do not specify an access level, this field has no influence on whether the user has access to information about the current opportunity type.</p>

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

### Remarks Island

In this island you can enter additional remarks about the current opportunity type.

### Status Update Island

Field	Description
<b>Won, Phase</b>	If the current opportunity can be considered won when entering a given phase, you can specify the phase in question in this field. When the opportunity enters the specified phase as a result of the event flow status of the event flow assigned to the opportunity being changed to the value in this field, Maconomy will automatically

Field	Description
	<p>close the opportunity as won by running the action "Close as Won." This, in turn, causes the event flow assigned to the opportunity to be closed.</p> <p>Using this functionality, you can cause the opportunity to be closed automatically when the event flow reaches a point indicating a closed sale.</p> <p>Please note that manually closing the opportunity as won will not cause the event flow status to be changed to the value in this field.</p>
<b>Lost, Phase</b>	<p>If the current opportunity can be considered lost when entering a given phase, you can specify the phase in question in this field. When the opportunity enters the specified phase as a result of the event flow status of the event flow assigned to the opportunity being changed to the value in this field, Maconomy will automatically close the opportunity as lost by running the action "Close as Lost." This, in turn, causes the event flow assigned to the opportunity to be closed.</p> <p>Using this functionality, you can cause the opportunity to be closed automatically when the event flow reaches a point indicating a lost sale.</p>

### Campaign Island

Field	Description
<b>Campaign</b>	<p>In this field, you can specify the name and number of a campaign to be assigned to opportunities of the current type. This means that when you create an opportunity of the current type, the event flow automatically created and assigned to the new opportunity will be assigned to this campaign. For further information, see the field "Campaign No." in the description of the window Opportunities.</p>

### Option List Fields Island

Field	Description
<b>List</b>	<p>In these fields, you can specify the option lists containing the values that should be available for further specification in the fields "Value 1-5" in this island and on opportunities of the current type. This means that the fields "Value 1-5" in this island can only be completed with options available in the corresponding option lists specified here. If you leave a given field empty, any value can be specified in the corresponding value field. Furthermore, when entering the current type on an opportunity created in the window Opportunities, these option lists are suggested in the corresponding island on the opportunity.</p>
<b>Value</b>	<p>In these fields, you can specify a number of values for further specification of the current compensation type and new opportunities of the type in question. You can only use values available in the respective option lists specified in this island. If a given option list field in the compensation type has been left blank, any text can be entered in the corresponding value field.</p> <p>When an opportunity of the current type is created, the values are also suggested in the corresponding fields on the new opportunity.</p>

## Targeting Codes Single Dialog Workspace

Use this workspace to create targeting codes and assign contacts to them. Contacts can be either contact persons or contact companies.

The list of contacts contains the same data that is displayed in the Targeting Codes sub-tab of the Contact Person Targeting Codes workspace and the Targeting Codes sub-tab of the Contact Company Targeting Codes workspace. Thus if you add or delete a row here, it is also added or deleted there and vice-versa.

### Targeting Code Tab

This section includes the fields and descriptions for the Targeting Code tab.

#### Targeting Code Island

Field	Description
<b>Name</b>	Use this field to enter a unique name for the targeting code that you are creating. This field must contain a value.
<b>Description</b>	Use this field to enter the description of the targeting code that you are creating.
<b>Show Blocked Contacts</b>	Here you can specify whether the contact person is blocked.

#### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

### Contacts Sub-Tab

This section includes the fields and descriptions for the Contacts sub-tab.

Field	Description
<b>Contact Type</b>	Enter the type of the contact person or company that you are assigning to the targeting code. This field must contain a value. Valid values are Person or Company.
<b>Contact No.</b>	Enter the number of the contact person or company (depending on the contact type) for the contact you are assigning. This field must contain a value.
<b>Name</b>	This field shows the name of the contact person or contact company.
<b>Remark</b>	Enter any remarks about the targeting code assignment. You can change the value of this field for existing assignments.

## Update Responsible Employee Single Dialog Workspace

Use this workspace to update the responsible employee on a group of CRM entries by entering selection criteria and a new responsible employee and then using the **Update** action.

This action updates the responsible employee on all entries in the selection criteria:

- For contact persons, it updates the **Responsible Employee No.** field.
- For opportunities and contact companies, it updates the **Sales Rep. No.** field.
- For events, it updates the **Employee No.** field.

The **Update** action only updates entries to which you have access.

### Update Responsible Employees Tab

This section includes the fields and descriptions for the Update Responsible Employee tab.

#### Selection Criteria Island

Field	Description
<b>Current Employee</b>	<p>Enter the employee name and number for the employee who is responsible. Maconomy only updates entries for which this employee is responsible. This field must contain a value.</p> <p>You use this window to change the responsible employee on Contact Companies, Contact Persons, and Opportunities. This employee is the one who is currently set as responsible. When you use the Update action, this responsible employee is replaced by the new responsible employee.</p> <p>After you enter the employee number, the associated employee name appears beside it.</p>
<b>Update Contact Persons</b>	<p>This check box is selected by default to indicate that the application should update contact persons information. Deselect this check box if you do not want to update contact persons information.</p>
<b>Contact Person No.</b>	<p>Enter the beginning and ending numbers in the range of numbers for the contact persons whose information is to be updated.</p> <p>You can only enter values in these fields if you selected Update Contact Persons.</p>
<b>Update Contact Companies</b>	<p>This check box is selected by default to indicate that the application should update contact companies. Deselect this check box if you do not want to update contact companies.</p>
<b>Contact Company No.</b>	<p>Enter the beginning and ending numbers in the range of numbers for the contact companies whose information is to be updated.</p> <p>You can only enter values in these fields if you selected Update Contact Companies.</p>

Field	Description
<b>Update Opportunities</b>	This check box is selected by default to indicate that the application should update opportunities. Deselect this check box if you do not want to update opportunities.
<b>Opportunity No.</b>	Enter the beginning and ending numbers in the range of numbers for the opportunities that are to be updated. You can only enter values in these fields if you selected Update Opportunities.
<b>Update Opportunity Events</b>	This check box is selected by default to indicate that the application should update opportunity events. Deselect this check box if you do not want to update opportunity events. You can only select this field if you selected Update Opportunities. The application only updates events that have the same responsible employee as the associated opportunity.

### New Responsible Island

Field	Description
<b>New Employee</b>	Enter the employee name and number for the employee who is to be responsible for the Contact Companies, Contact Persons, and Opportunities. When you use the Update action, this employee becomes the new responsible employee. This field must contain a value. After you enter the employee number, the associated employee name appears beside it.

### Actions

This section shows the Actions available in the Update Responsible Employee workspace.

### Top Tab

Field	Description
<b>Update</b>	Use this action to update the responsible employee information on all entries that match the selection criteria. <ul style="list-style-type: none"> <li>For contact persons, the application updates the field Responsible Employee No.</li> <li>For opportunities the application updates the field Sales Rep. No.</li> <li>For contact companies, the application updates the field Sales Rep. No.</li> <li>For events the application updates the field Employee No.</li> </ul> This action only updates entries to which you have access.

## Contact Management Setup Single Dialog Workspace

Use this workspace to set up default values to be used in the Contact Management module.

For each company, you can set the default values to be used when creating events, event flows, campaigns, and opportunities. You can define default option lists for contact persons and contact companies, and note types for contact persons and contact companies.

### Standard Document Archive Setup Tab

This section includes the fields and descriptions for the Standard Document Archive Setup tab.

#### Selection Criteria Island

Field	Description
<b>Company No.</b>	Enter a range of company numbers to select the lines to show in the table.

### Contact Management Setup Sub-Tab

This section includes the fields and descriptions for the Contact Management Setup sub-tab.

Field	Description
<b>Company No.</b>	This field shows the company number for which the contact management setup should be used. If this field is empty, the contact management setup can be used for all companies.
<b>Default Event Type</b>	Select a default event type. When you create an event that is not assigned to an event flow, the event type is initialized to the value that you enter in this field.
<b>Default Event Flow Type</b>	Enter a default event flow type. When you create an event flow, the event flow type is initialized to the value that you enter in this field.
<b>Default Opportunity Type</b>	Enter a default opportunity type. When you create an opportunity, the opportunity type is initialized to the value that you enter in this field.
<b>Default Campaign Event Flow Type</b>	Enter a default campaign event flow. When you create a campaign, the event flow type is initialized to the value that you enter in this field.
<b>Contact Person Note Type</b>	Enter a note type to be used when you create notes from a contact person.
<b>Contact Person Position List</b>	Enter the name of an option list of positions to use for the position field for contact persons. When you create a contact person, you can select a value for the position field from a drop-down list or you can enter a

Field	Description
	position manually. Those drop-down list values come from the list whose name you enter in this field.
<b>Contact Person Option List 1-10</b>	Enter the names of default option lists in these fields. When you create a contact person the Option List 1-10 fields for that contact person are initialized to the values that you enter in these fields.
<b>Contact Company Note Type</b>	Enter a note type to be used when you create notes from a contact company.
<b>Contact Company Option List 1-10</b>	Enter the names of default option lists in these fields. When you create a contact company, the Option List 1-10 fields for that contact company are initialized to the values that you enter in these fields.
<b>Relation Type List</b>	Enter the name of an option list of relation types to use when you create a contact relation. When you create a relation, you can select a value from a drop-down list or you can enter a value manually. Those drop-down list values come from the list whose name you enter in this field.
<b>Created by</b>	This field shows the user name of the person who created the content management setup.
<b>Created on</b>	This field shows the date on which the content management setup was created.
<b>Changed by</b>	This field shows the user name of the person who changed the content management setup.
<b>Changed on</b>	This field shows the date on which the content management setup was changed.
<b>Version</b>	This field shows the version number that corresponds to the update made to the content management setup.

## Delete Section

This section includes the fields and descriptions for the Delete workspaces.

### Delete Contact Data Single Dialog Workspace

Use this workspace to delete contact data. You can choose to delete contact companies with assigned contact entries and contact persons, or you can choose to delete events only.

You can choose one of the two delete functions. If you do not choose a delete function, Maconomy does not delete any data. You can specify that all contact companies or events created before a specified date must be deleted.

For contact companies, you can indicate that the deletion of contact companies is also to include the deletion of contact companies that were created as customers. When you delete a contact company that you created as a customer, the deletion only affects contact data; the information in the Contact Persons workspace is not affected.

For events, you can define a range of campaign numbers. If you do this, the deletion affects only those events that you created in connection with a campaign within that range.

## Delete Contact Data Tab

This section includes the fields and descriptions for the Delete Contact Data tab.

### Contact Companies Island

Field	Description
<b>Delete Companies</b>	If you wish to delete contact companies as well as the events and contact persons to whom the contact companies in question have been assigned, it is necessary to mark this field. If you do not mark the field, no data will be deleted.
<b>Last Contact Before</b>	It is necessary to specify a date in this field if you only wish to delete contact companies to which no contact entries have been assigned since the specified date. When you enter a date, a contact company will only be deleted if the event last created falls within the specified date.  Delete contact companies created as customers If you wish to delete a contact company even though it has been created as a customer, it is necessary to mark this field. If you do not mark the field, only contact companies, which have not been created as customers, will be deleted.

### Events Island

Field	Description
<b>Events</b>	If you only wish to delete contact entries but not the contact company to which the event has been assigned, it is necessary to mark this field. If you do not mark the field, no data will be deleted.
<b>Entered Before</b>	It is necessary to specify a date in this field if you only wish to delete events entered before the specified date. When you specify a date, an event will only be deleted if it has been entered before the specified date.
<b>Campaign No.</b>	If you only wish to delete events which have been assigned to a particular interval of campaigns, it is necessary to specify an interval in this field. If you do not specify an interval and no date has been entered in the field above, all events, which have been entered before the specified date, will be deleted in all campaigns.

## Actions

This section shows the Actions available in the Delete Contact Data workspace.

### Top Tab

Field	Description
OK	Use this action to execute deletion of contact data.

## EU Statistics Overview

This module lets you extract the EU trade figures, which are to be reported to tax authorities when your annual trade within the union reaches the EU thresholds.

### List System Section

This section includes the fields and descriptions for the List System workspaces.

#### Sales List System Reports Workspace

Use this workspace to enter the information that you report to the Sales List System each period.

The Sales List System Reports tab displays the total statistics for a company in a given period. The Sales List System Entries sub-tab displays an entry for every customer that has received items in the period.

You can make entries manually and/or automatically from the information in the Sales Orders module. The Sales List System Items workspace shows which invoices and credit memos the entries originate from.

You can print a report form by choosing **Print This** in the File menu. Similarly, you can create a report file by choosing **Create File** in the Action menu.

If you open the Sales List System Items workspace at the same time, you can see more information about the entries in the table.

#### Sales List System Reports Tab

This section includes the fields and descriptions for the Sales List System Reports tab.

#### Report Island

Field	Description
<b>Report No.</b>	This is the report's number, allocated automatically by Maconomy. The number cannot be changed here, but you can select a numbering series in the window System Numbers in the Set-Up module.
<b>Period</b>	Here you enter which quarter year the report is for by entering the first date of the quarter. You must complete the field. Once the report is created, you cannot change the dates.
<b>Remarks</b>	Here you can enter a comment about the report. It is not printed in the report.
<b>Auto. Entries</b>	This field is marked if the report contains entries created automatically using the action "Create File". It cannot be changed.

**Company Island**

Field	Description
<b>Company</b>	<p>In this field, you can specify the name and number of the company responsible for the report. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>When using the action "Create Entries", Maconomy only considers EU transactions for which the company in this field is responsible.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L Module" and the description of the window Dimension Derivations in the G/L module for further information about dimension derivation.</p>
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.
<b>EU Reporting Currency</b>	This field displays the EU reporting currency used in the company specified in the field "Company No." above. The EU reporting currency is selected for the current company in the window Company Information. In the files created for Intrastat and Sales List System all amounts are displayed in the individual company's EU reporting currency.

**Report Total Island**

Field	Description
<b>Entries</b>	This shows how many entries are in the report. It cannot be changed manually.
<b>Amount, Base</b>	This shows the sum of all the entry sales amounts, both for standard EU trades and triangulation. The amount is printed in the report section named "Period's Total Amount to EU". It cannot be changed manually.
<b>Amount, EU Reports</b>	This field displays the total sales amount of all entries in the company's EU reporting currency. The value cannot be changed manually.

**Show Island**

Field	Description
<b>Show Lines</b>	If you mark this field, the table will show the report entries. The window opens faster without the entries, which is why the field is not marked by default.
<b>Customer No.</b>	Here you can enter a range of customer numbers. If the "Show Lines" field is marked, the table will show entries for customers in this range.

## Sales List System Entries Sub-Tab

This section includes the fields and descriptions for the Sales List System Entries sub-tab.

Field	Description
<b>Customer No.</b>	<p>Here you enter the customer number. Maconomy checks that the customer exists and is from an EU country. If you cannot remember a number, you can use the search functions in the Find menu. Once the entry has been created, the number cannot be changed. Nor can you change the number of an automatically created entry.</p> <p>You cannot enter more than two entries with the same customer number, one with and one without a mark in the "Salary Prep." field.</p>
<b>Salary Prep.</b>	<p>You can mark this field if the items are sent to/returned from salary preparation. For automatically created entries, the value is taken from the "Salary Preparation" field in the item information card. For items which are sent for preparation in another EU country, the field should remain unmarked. For items that are being returned from salary preparation, the value of the work should be entered. Once the entry is created, the field cannot be changed. This is the name from the customer information card. It cannot be changed.</p>
<b>Name</b>	This is the name from the customer information card. It cannot be changed.
<b>Tax No.</b>	This is the value from the "Tax No." field in the customer information card. It cannot be changed.
<b>Country</b>	This is the value from the "Country" field in the customer information card. It cannot be changed.
<b>Sales Amount, Base</b>	<p>Here you enter the customer's total sales amount for the period in the company's base currency. The value is rounded off to the nearest whole currency unit. If you have created specification lines for the entry in the Sales List System Items window, the field cannot be changed. Similarly, if you enter the sales amount manually, you cannot create specification lines.</p>
<b>Sales Amount, EU Reports</b>	<p>In this field, you can enter the period's total sales amount for the customer in the company's EU reporting currency. The value is rounded to the nearest whole currency unit. If you have created specification lines for the entry in the Sales List System Items window, the field cannot be changed. Also, if you enter the sales amount manually, you cannot create specification lines.</p>
<b>Sales price, triang.tr., base</b>	<p>In this field, you can enter the customer's total triangulation sales amount for the period. The amount is entered in the company's base currency.</p>
<b>Sales price, triang.tr., EU Rep.</b>	<p>In this field, you can enter the period's total sales amount for triangulation trade for the customer in the company's EU reporting currency. Triangulation trade is registered on invoices or credit memos by changing the value in the field "EU Trade Type" from "Normal" to "Triangulation Trade".</p>

Field	Description
<b>Exchange Rate Date</b>	In this field, you can specify the date which should be used when converting amounts into the chosen reporting currency. When entering manually entries, Maconomy uses the valid exchange rates specified in the exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts. The field cannot be changed for entries generated automatically.
<b>Manual</b>	This field is marked if the entry is entered manually and unmarked if created automatically with the action "Create Entries". It cannot be changed.
<b>Internal Reference No.</b>	In this field, you can enter an internal reference number to identify the current sales list system entry.
<b>Remarks</b>	In this field, you can enter a comment about the report. It is not displayed in the printed report.

## Sales List System Items Workspace

Use this workspace to handle sales list system entries individually.

You must create entries in the Sales List System Reports workspace. The Sales List System Items tab displays which customer the entry is for and the amount that was sold. The Lines sub-tab displays which invoices and credit memos the entry originates from.

If you open the Sales List System Reports workspace at the same time, you can see more information about the report of which the entry is a part.

### Sales List System Items Tab

This section includes the fields and descriptions for the Sales List System Items tab.

#### Report Island

Field	Description
<b>Report No.</b>	This is the number of the report the entry is from. It cannot be changed.

#### Customer Island

Field	Description
<b>Customer</b>	This is the number of the customer the entry is for. It cannot be changed. The other lines in this field contain the first two lines of the customer's name and address.
<b>Country</b>	This is the value from the "Country" field in the customer information card. It cannot be changed.

Field	Description
<b>Tax No.</b>	This is the value from the "Tax No." field in the customer information card. It cannot be changed.

### Remarks Island

Here you can enter a comment about the report. It is not printed in the report.

### Entry Island

Field	Description
<b>Internal Reference No.</b>	This field displays the internal reference number of the current sales list system entry.
<b>Salary Preparation</b>	This field is marked if the items are sent to/returned from salary preparation. For automatically created entries, the value is taken from the salary preparation field in the item information card. It cannot be changed.
<b>Sales Amount, Base</b>	This field displays the period's total sales amount for the customer. The amount is displayed in the company's base currency.
<b>Sales Amount, EU Reports</b>	This field displays the period's total sales amount for the customer. The amount is displayed in the company's EU reporting currency.
<b>Sales price, triang.tr., base</b>	This field displays the period's total sales amount for triangulation trade with the customer. The amount is displayed in the company's base currency.
<b>Sales price, triang.tr., EU Rep.</b>	This field displays the period's total sales amount for triangulation trade with the customer. The amount is displayed in the company's EU reporting currency.
<b>Exchange Rate Date</b>	This field displays the date which should be used when converting amounts into the chosen reporting currency. Maconomy uses the valid exchange rates specified in the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts.

### Company Island

Field	Description
<b>Company</b>	This field shows the name and number of the company responsible for the sales list system report to which the entry is assigned.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

Field	Description
<b>EU Reporting Currency</b>	This field displays the EU reporting currency used in the company specified in the field "Company No." above. The EU reporting currency is selected for the current company in the window Company Information. In the files created for Intrastat and Sales List System all amounts are displayed in the individual company's EU reporting currency.

## Lines Sub-Tab

This section includes the fields and descriptions for the Lines sub-tab.

Field	Description
<b>Invoice/Credit Memo No.</b>	Here you can enter the number of the invoice or credit memo the entry is for. Maconomy checks that the number exists and alerts you if the customer number on the invoice or credit memo is different from the customer number here. Once created, the field cannot be changed. Nor can you change lines which have been created automatically.
<b>Sales Amount, Base</b>	This field displays the period's total sales amount for the customer. The amount is displayed in the company's base currency.
<b>Sales Amount, EU Reports</b>	This field displays the period's total sales amount for the customer. The amount is displayed in the company's EU reporting currency.
<b>Sales price, triang.tr., base</b>	This field displays the period's total sales amount for triangulation trade with the customer. The amount is displayed in the company's base currency.
<b>Sales price, triang.tr., EU Rep.</b>	This field displays the period's total sales amount for triangulation trade with the customer. The amount is displayed in the company's EU reporting currency.
<b>Remarks</b>	Here you can enter a comment about the line. It is not shown in the printed report.
<b>Aut.</b>	This field is marked if the line is created automatically. It cannot be changed.

## Intrastat Section

This section includes the fields and descriptions for the Intrastat workspaces.

### Intrastat Reports Workspace

Use this workspace to enter the declarations that you regularly report to Intrastat.

The Intrastat Reports tab displays the total statistics for a company in a given period. The Intrastat Declarations sub-tab displays a line for every declaration. Each declaration contains a number of item entries, and the declaration is printed on a separate form for the tax authorities.

There are two types of declaration, "Import" and "Export"; you can only create them if you specified them in the System Information workspace.

You can create declarations manually and/or automatically using the trade figures in the Sales Orders and Item Purchase modules. The Intrastat Declarations workspace shows which item entries have resulted in which declarations, and the Intrastat Items workspace shows which invoices or item purchase orders the item lines originate in. If you have one or both of these workspaces open at the same time, you can see that Maconomy updates all common information concurrently.

You can print official report forms for the report in this workspace by selecting **Print This** in the File menu. Similarly, you can create a file with the report by selecting **Create File** in the Action menu.

## Intrastat Reports Tab

This section includes the fields and descriptions for the Intrastat Reports tab.

### Report Island

Field	Description
<b>Report No.</b>	This is the report number, allocated automatically by Maconomy. The number cannot be changed automatically, but you can determine the number series in the window System Numbers.
<b>Period</b>	Here you enter the month of the report. The field must be completed, and it cannot be changed once the report is created.
<b>Remarks</b>	Here you can enter a comment about the report. It is not shown in the printed report.
<b>Auto. Entries</b>	This field is marked if the report has entries which have been created automatically using the action "Create Entries". It cannot be changed.

### Total Island

Field	Description
<b>Declarations</b>	This field displays how many declarations are contained in the report. It cannot be changed manually.
<b>Grand Total, Base</b>	This field displays the sum of all sales amounts of the entries. The amount is displayed in the company's base currency, and cannot be changed manually.
<b>Grand Total, EU Reports</b>	This field displays the sum of all the sales amounts of the entries. The amount is displayed in the company's EU reporting currency, and cannot be changed manually.

## Company Island

Field	Description
<b>Company</b>	<p>In this field, you can specify the name and number of the company responsible for the report. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>When using the action "Create Entries", Maconomy only considers Intrastat transactions for which the company in this field is responsible.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L Module" and the description of the window Dimension Derivations in the G/L module for further information about dimension derivation.</p>
<b>Base Currency</b>	<p>This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.</p>
<b>EU Reporting Currency</b>	<p>This field displays the EU reporting currency used in the company specified in the field "Company No." above. The EU reporting currency is selected for the current company in the window Company Information. In the files created for Intrastat and Sales List System all amounts appear in the individual company's EU reporting currency.</p>

## Intrastat Declarations Sub-Tab

This section includes the fields and descriptions for the Intrastat Declarations sub-tab.

Field	Description
<b>Decl.</b>	<p>This field displays your declarations in consecutive order. The value cannot be changed manually.</p>
<b>Type</b>	<p>In this field, you can enter "Import" or "Export". You can only create an import declaration if you have marked the "Intrastat Import Rep." field in the System Information window. Similarly, you can only create an export declaration if you have marked the "Intrastat Export Rep." field. Once the declaration is created, the type cannot be changed.</p>
<b>Entries</b>	<p>This field displays how many entries are contained in the declaration. It cannot be changed manually.</p>
<b>Stat. Value, Base</b>	<p>This field displays the sum of the sales amounts of the entries in the declaration. The amount is displayed in the company's base currency and cannot be changed manually.</p>
<b>Stat. Value, EU Rep.</b>	<p>This field displays the sum of the sales amounts of the entries in the declaration. The amount is displayed in the company's EU reporting currency and cannot be changed manually.</p>

Field	Description
<b>Form No.</b>	Here you can enter the number given to the form you are printing. The system numbers for the forms are given by the tax authorities for one year at a time. The field is only used if you are reporting on an official form. The number can also be changed in the "Form System No." field in the Intrastat Declarations window.
<b>Auto</b>	This field is marked if the declaration is created automatically using the action "Create Entries". It cannot be changed.
<b>Remarks</b>	Here you can enter a comment about the declaration. It is not shown in the printed report.

## Intrastat Declarations Workspace

Use this workspace to handle Intrastat declarations individually.

You create declarations in the Intrastat Reports workspace. The Intrastat Reports tab in that workspace displays the value and direction of the declaration, and the Intrastat Declarations sub-tab shows which entries it contains.

### Intrastat Declarations Tab

This section includes the fields and descriptions for the Intrastat Declarations tab.

#### Declaration Island

Field	Description
<b>Declaration No.</b>	This is the number of the declaration. The declarations are numbered in consecutive order within each report. The number cannot be changed.
<b>Declaration Type</b>	This shows which direction the declaration has, i.e. "Import" or "Export". It cannot be changed.
<b>No. Entries</b>	This shows the number of entries in the table.
<b>Stat. Value, Base</b>	This field displays the sum of the sales amounts of the entries in the declaration. The amount is displayed in the company's base currency and cannot be changed manually.
<b>Stat. Value, EU Rep.</b>	This field displays the sum of the sales amounts of the entries in the declaration. The amount is displayed in the company's EU reporting currency and cannot be changed manually.
<b>Form No.</b>	Here you enter the system number of the report form. Form numbers are issued by the tax authorities one year at a time. The field is only used when you send in the report on an official form. The number can be changed in the "Form No." field in the Intrastat Reports window.

**Status Island**

Field	Description
<b>Auto. Created</b>	This field is marked if the declaration is created automatically using the action "Create Entries". It cannot be changed.
<b>Remarks</b>	Here you can enter a comment about the declaration. It is not shown in the printed report.

**Selection Criteria Island**

Field	Description
<b>Show Lines</b>	In this field, you can mark if the table part of the window is to display the items of the expedition. If the field has been marked, the table part will display the items that are created on the expedition and that comply with the selection criteria information in this island. When opening this window, this field is not marked which is why no items are displayed in the table part.
<b>Item No.</b>	In this field, you can enter a range of item numbers. If the field "Show lines" has been marked, the table part of this window will display the items which are created on the expedition and which are placed within the specified range of item numbers. The items are sorted by item numbers.

**Report Island**

Field	Description
<b>Report No.</b>	This is the number of the report of which the declaration is part. It cannot be changed.

**Company Island**

Field	Description
<b>Company</b>	This field shows the name and number of the company responsible for the report of which the declaration is part.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.
<b>EU Reporting Currency</b>	This field displays the EU reporting currency used in the company specified in the field "Company No." above. The EU reporting currency is selected for the current company in the window Company Information. In the files created for Intrastat and Sales List System all amounts are displayed in the individual company's EU reporting currency.

## Intrastat Items Sub-Tab

This section includes the fields and descriptions for the Intrastat Items sub-tab.

Field	Description
<b>Zip Code</b>	This is the number of the item entry. It cannot be changed manually.
<b>Transact.</b>	Here you enter the transaction type of the trade. The transaction type is a two-digit code transferred from the field "EU Type". There are more than 20 such codes, of which code 11, "Regular Purchase and Sale" is the most frequently used. When item entries are extracted automatically, the code is transferred from the relevant invoice or item purchase order.
<b>Country</b>	Here you enter the three-digit country (member state) code of the company you are trading with. It is the same as the code in the "EU Country Code" popup field. When item entries are extracted automatically, the code is retrieved from the relevant invoice or item purchase order.
<b>Quantity</b>	Here you enter the total quantity in sales units. The quantity is not shown in the report file, but is used to calculate the net weight and, if applicable, the quantity in supplementary units. When item entries are extracted automatically, the field shows the sum for each item line.
<b>Unit</b>	This is the item's sales unit. It is retrieved from the item information card and cannot be changed manually.
<b>Weight</b>	Here you enter the net weight in kilos of the item entry. The weight will be rounded off to the nearest whole kilo, 1 kg being the smallest possible value. When you enter a new item entry, the net weight per unit is retrieved from the "Net Weight (kg.)" field in the item information card.
<b>Item No.</b>	<p>Here you enter the item number. Maconomy checks that the item exists and that you have entered a CN code in the item information card. The field must be completed. You cannot change the number once the entry is created.</p> <p>In the System Information window you can decide whether to create a separate Intrastat entry for every item number or whether to create one for every CN code.</p> <p>If you have chosen "By Item" in the "Intrastat Specification" field in the System Information window, Maconomy will create a new entry for every item number extracted using the action "Create Entries". If you have chosen "By CN Code" Maconomy will gather items with the same CN code in the same entry.</p>
<b>Description</b>	This is the item's name. It is retrieved from the "Description, Lang. 1" field in the item information card and cannot be changed here.
<b>Value, Base</b>	This is the total value of the trade made in the period, expressed for the combination of item, direction, transport mode, transaction type and country. The amount is displayed in the company's base currency. For automatic entries, the amount is retrieved from item movements and invoices/credit memos for imports and exports respectively.

Field	Description
	<p>Imports are calculated from the cost price registered for the item at the relevant warehouse, converted into the company's base currency, and are not necessarily the same as the amount given in the vendor invoice.</p> <p>Item purchases from other EU countries must be included in the tax settlement. Maconomy uses the invoice value, taken from the vendor invoices you have registered in the given period. If you have received items at a different price from the cost price registered at the warehouse in question, the amounts in the tax specification and Intrastat report will not be the same.</p>
<b>Value EU Reports</b>	<p>This is the total value of the trade made in the period, expressed for the combination of item, direction, transport mode, transaction type and country. The amount is displayed in the company's EU reporting currency. For automatic entries, the amount is retrieved from item movements and invoices/ credit memos for imports and exports respectively.</p> <p>Imports are calculated from the cost price registered for the item at the relevant warehouse, converted into the company's base currency, and are not necessarily the same as the amount given in the vendor invoice.</p> <p>Item purchases from other EU countries must be included in the tax settlement. Maconomy uses the invoice value, taken from the vendor invoices you have registered in the given period. If you have received items at a different price from the cost price registered at the warehouse, the amounts in the tax specification and Intrastat report will not be the same.</p>
<b>Exchange Rate Date</b>	<p>This field displays the date which should be used when converting amounts into the chosen reporting currency. Maconomy uses the valid exchange rates specified in the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts.</p>
<b>CN Code</b>	<p>This is the item's 8 or 10-digit CN code. It is retrieved from the "CN Code" field in the item information card and cannot be changed here.</p>
<b>CN Text</b>	<p>This is the item's name according to the combined nomenclature. It is retrieved from the "Item Descr." field in the item information card and cannot be changed here.</p>
<b>Suppl. Unit</b>	<p>This is the item quantity in supplementary units. For items with a conversion factor in the "Supplementary Unit" field in the item information card, the value is found by dividing the value in the "Quantity" field by the conversion factor. It cannot be changed manually.</p>
<b>Partial Shipment</b>	<p>This field should be marked if the item entry is part of a delivery of a main entry. The concept is used for machines and other plant material which are sent in several deliveries but registered as one sale. If the field is marked, Maconomy enters the value 9999999999 in the "Supplementary Units" field in the report form.</p>
<b>Auto</b>	<p>This field is marked if the entry is created automatically. It cannot be changed.</p>

Field	Description
<b>Internal Reference</b>	This field displays the internal reference number of the current Intrastat expedition.
<b>Remarks</b>	Here you can enter a comment about the entry. It is not included in the printed report.

## Intrastat Items Workspace

Use this workspace to handle Intrastat entries individually.

You create entries in the Intrastat Declarations workspace. The Intrastat Reports tab in that workspace displays the item, quantity, and sales amount for the entry. The specification lines in the Intrastat declarations sub-tab show which invoices, credit memos, and item purchase orders the entry is for. The information in the sub-tab is not displayed in the report to the tax authorities and is purely for reference.

### Intrastat Items Tab

This section includes the fields and descriptions for the Intrastat Items tab.

#### Item Island

Field	Description
<b>Zip Code</b>	This is the number given to the entry in the declaration. It is the same as the entry's line number in the table part of the Intrastat Declarations window. It cannot be changed.
<b>CN Code</b>	This is the CN code of the item. It cannot be changed.
<b>Item Description</b>	This is the item text according to the CN code. It cannot be changed.
<b>Item</b>	<p>This is the item number and description. It cannot be changed.</p> <p>If you have chosen "By Item" in the "Intrastat Specification" field in the System Information window, Maconomy will create a new entry for every item number when you choose "Create Entries". You can also create new specification lines for the same item number.</p> <p>If, instead, you choose "By CN Code", Maconomy gathers items with the same CN code in one entry. You can also create new specification lines for items with different item numbers but the same CN code. For automatically created entries, the field shows the item number of the first line created.</p>

**Information Island**

Field	Description
<b>Country</b>	This is the country (member state) of your trading partner. It cannot be changed manually.
<b>Nature</b>	This is the transaction type. It cannot be changed manually.
<b>Internal Reference</b>	In this field, you can enter an internal reference to identify the current Intrastat entry.

**Company Island**

Field	Description
<b>Company</b>	This field shows the name and number of the company registered for the current Intrastat entry.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.
<b>EU Reporting Currency</b>	This field displays the EU reporting currency used in the company specified in the field "Company No." above. The EU reporting currency is selected for the current company in the window Company Information. In the files created for Intrastat and Sales List System all amounts are displayed in the individual company's EU reporting currency.

**Status Island**

Field	Description
<b>Auto. Created</b>	This field is marked if the entry is created using the action "Create Entries". It cannot be changed.
<b>Remarks</b>	Here you can enter a comment about the entry. It is not shown in the official report.

**Item Total Island**

Field	Description
<b>Quantity</b>	This is the total number of sales units. It cannot be changed manually.
<b>Unit</b>	This is the item's sales unit. Maconomy alerts you if the try to create a specification line for an item with the same CN code and a different sales unit. It cannot be changed manually.
<b>Stat. Value, Base</b>	This field displays the entry's market value in the company's EU reporting currency rounded to a whole amount. If there are specification lines for the entry, the field will show the sum of the figures in the field "Value, Base" on

Field	Description
	every line in the table part. The contents of the field cannot be changed manually.
<b>Stat. Value, EU Rep.</b>	This field displays the entry's market value in the company's EU reporting currency rounded off to a whole amount. If there are specification lines for the entry, the field will show the sum of the figures in the field "Value, EU Rep." on every line in the table part. The contents of the field cannot be changed manually.
<b>Exchange Rate Date</b>	This field displays the date which should be used when converting amounts into the chosen reporting currency on manually created entries. Maconomy uses the valid exchange rates specified in the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts.
<b>Net Weight</b>	This is the total net weight of the item entry in kilos. In the official report, the weight is rounded off to the nearest whole kilo, the smallest possible value being one kilo. If there are specification lines for the entry, the value here is the sum of the "Net Weight" fields on the lines in the table. It cannot be changed manually.
<b>Suppl. units</b>	This is the entry's total quantity in supplementary units. If the item has a conversion factor in the item information card, the value is found by dividing the "Quantity" field by the conversion factor. It cannot be changed manually.
<b>Partial Shipment</b>	This shows whether the item is part of the delivery of a previous main entry. If the field is marked, Maconomy enters 999999999 in the "Supplementary Units" field in the official report. It cannot be changed manually.

### Report and Declaration Island

Field	Description
<b>Report No.</b>	This is the number of the report the entry is in. The value cannot be changed.
<b>Declaration No.</b>	This is the number of the declaration the entry is in. The value cannot be changed.
<b>Declaration Type</b>	This shows whether the declaration is for and import or an export. The value cannot be changed.

### Intrastat Item Lines Sub-Tab

This section includes the fields and descriptions for the Intrastat Item Lines sub-tab.

Field	Description
<b>Lin.</b>	This is the number of the report line definition. All line numbers are assigned by Maconomy and are numbered consecutively. When lines are inserted or

Field	Description
	deleted, any affected lines and references are renumbered to keep them in consecutive order.
<b>Item No.</b>	In this field, you enter the number of the item. If you have chosen "By Item" in the "Intrastat Specification" field in the System Information window, you can only enter the item number shown in the card part of the window. If you have chosen "By CN Code", you can only enter the number of an item which has the same CN code as the item in the card part. If you cannot remember the number, you can use the search functions in the Find menu.
<b>Quantity</b>	In this field, you can enter the quantity, divisible by the items sales unit.
<b>Net Weight</b>	In this field, you can enter the net weight for the item line.
<b>Description</b>	This is the item's name. It is retrieved from the "Description, Lang. 1" field in the item information card. It cannot be changed manually.
<b>Value, Base</b>	In this field, you can enter the total value of the item line in the company's base currency. For automatically created lines, the import value found from the cost price in the item purchase order. The export value is found from the sales price in the invoice/credit memo.
<b>Value, EU Reports</b>	In this field, you can enter the total value of the item line in the company's EU reporting currency. For automatically created lines, the import value found from the cost price in the item purchase order. The export value is found from the sales price in the invoice/credit memo.
<b>Invoice No.</b>	In this field, you can enter the number of an invoice or credit memo, if the declaration is for export. Maconomy checks that the invoice or credit memo exists. For automatic entries, Maconomy enters the number of the invoice or credit memo the item line is for.
<b>Item Purchase Order No.</b>	In this field, you can enter the number of an item purchase order, if the declaration is for import. Maconomy checks that the order exists. For automatically created entries, Maconomy enters the number of the item purchase order the item receipt is for.
<b>Customer/ Vendor Name</b>	If you have entered the number of an invoice, credit memo or item purchase order, Maconomy enters the name of the customer or vendor here. It cannot be changed manually.
<b>Remarks</b>	In this field, you can enter a comment about the line.

## Report Basis Section

This section includes the fields and descriptions for the Report Basis workspaces.

### Show EU Invoices Workspace

Use this workspace to show the invoices and credit memos that are flagged as "EU Sale".

Use the List of Invoices filter list to see which invoices and credit memos are reported or will be reported to Intrastat and the EU Sales List System.

The Invoice island displays information about the invoice or credit memo; you cannot change this information manually. The Statistics to Tax Authorities island displays the data that the EU Statistics module uses. You can change all of that information, but if you deselect the **EU Sale** field, the invoice or credit memo can no longer be displayed in this workspace, and it disappears from the EU Statistics system. Note that you can remove automatically created report entries before you print the official report.

### Show EU Invoices Tab

This section includes the fields and descriptions for the Show EU Invoices tab.

#### Invoice Island

Field	Description
<b>Invoice No.</b>	This is the number of the invoice or credit memo.
<b>Debit/Credit</b>	This shows "Debit" for invoices and "Credit" for credit memos.
<b>Invoice Date</b>	This is the date of the invoice or credit memo.
<b>Manual Invoice</b>	This shows whether the invoice/credit memo is created manually or automatically from a sales order in the Sales Orders module.
<b>Invoice on Account</b>	This is marked if the invoice is on account.
<b>Order No.</b>	This is the number of the sales order which the invoice/credit memo is for, if applicable.
<b>Job No.</b>	This is the number of the job in the Job Cost module the invoice/credit memo is for, if applicable.
<b>Version</b>	This is the version number of the invoice/credit memo.
<b>Information changed</b>	This field is retrieved from the invoice/credit memo and is purely for reference.

**Statistics to Tax Authorities Island**

Field	Description
<b>EU Sale</b>	The value here is retrieved from the invoice/credit memo. If you remove the mark, the invoice/credit memo cannot any longer be shown in this window.
<b>Intrastat Reg.</b>	The value here is retrieved from the invoice/credit memo. The field indicates whether the trade has to be reported to Intrastat.
<b>EU Trade Type</b>	The value here is retrieved from the invoice/credit memo.
<b>Nature</b>	The value here is retrieved from the invoice/credit memo.
<b>Reference Date</b>	The value here is retrieved from the invoice/credit memo.
<b>Delivery Mode</b>	The value here is retrieved from the invoice/credit memo.

**Company Island**

Field	Description
<b>Company</b>	This field shows the name and number of the company responsible for the current invoice/credit note.

## Show EU Item Receipts Workspace

Use this workspace to view item receipts from the item purchase orders selected in the **Intrastat Reg.** field.

Use the List of Item Receipts filter list to see which item receipts are reported or will be reported to Intrastat and the EU Sales List System.

The Item Receipt island displays information about the invoice or credit memo; you cannot change this information manually. The Statistics to Tax Authorities island displays the data that the EU Statistics module uses. You can change all of that information, but if you deselect the "EU Sale" field, the item receipt can no longer be displayed in this workspace, and it disappears from the EU Statistics system. Note that you can remove automatically created report entries before you print the official report.

## Show EU Item Receipts Tab

This section includes the fields and descriptions for the Show EU Item Receipts tab.

## Item Receipt Island

Field	Description
<b>Item Purchase Order No.</b>	This is the number of the item purchase order which the item receipt is for.
<b>Receipt No.</b>	This is the number of the item receipt. If the items in an item purchase order are received in more than one delivery, the deliveries are numbered in consecutively in the order in which they were received.
<b>Approved by</b>	This is the name of the user who approved the item receipt.
<b>Approval Date</b>	This is the date the item receipt was approved.
<b>Packing Slip No.</b>	This is the number of the packing slip entered in the Item Receipt window in the Item Purchase module.
<b>Trans. No.</b>	This is the number of the item transaction created when the item receipt was approved.
<b>Trans. Type</b>	This is the transaction type of the item transaction created when the item receipt was approved.

## Statistics to Tax Authorities Island

Field	Description
<b>Intrastat Reg.</b>	The value here is retrieved from the item purchase order. If you remove the mark, it cannot any longer be shown in this window.
<b>Reference Month</b>	The value here is retrieved from the item purchase order.
<b>Delivery Mode</b>	The value here is retrieved from the item purchase order.

## Company Island

Field	Description
<b>Company</b>	This field shows the name and number of the company responsible for the current item purchase order.

## Set Up Overview

Use the Set-Up module to enter and maintain general information common to all of Maconomy's modules, including system parameters, access control, and installation information.

You must enter this basic information before you can begin using other Maconomy modules.

### Access Control Section

This section includes the fields and descriptions for the Access Control section workspaces.

#### User Types Single Dialogs Workspace

Use this workspace to define user types, which serve as a starting point when you set up new users.

This workspace is available if you installed the Extended User Creation add-on.

A user type is essentially a template that you set up that includes the settings that you normally apply to new Maconomy users. You can create users manually, in which case the information from the template is copied directly to the new user's record. You can also create users from other Maconomy information (for example, turning a group of customers into a group of users), in which case you use user types to define how these users are created.

You use user types in connection with creating users, because the user type identifies template information to be applied to new users.

You can use user types either when manually creating users or when creating users from other information, such as a user for each customer within a specified range. When you create regular users, the user type merely identifies the template user whose information should be copied to new users who you assigned to the current user type. You create these template users in the Users workspace. When you create users from other types of information, the user type not only identifies the template user to be applied to the new users, but also determines the information from which users should be created and the access control to be applied to the users. You can use each user type only for one of these two purposes. If you leave the **Database Relation** field empty, you can only use the user type for manually creating users. Otherwise, you can only use the user type for automatically creating users.

You can create users from other Maconomy information. For example, this can be helpful if you are running a customer portal or web shop that is based on Maconomy information, and you want your customers to be able to access their own customer information and information about their own orders. In such cases, this workspace enables you to create the customers as users so that they can log in to your Maconomy system and access information that is relevant to them. The functionality of creating users based on other information applies to the predefined information for which you can set up selection criteria specifications in the Selection Criterion Specification workspace. For information about predefined information types in selection criterion specifications, see the **Type** field.

To create users based on another type of information, in the User Selection Criteria island, enter the type of information for which users should be created—for example, customers—and a selection criterion specification that identifies the relevant entries (customers) for which users should be created. When you use the **Create New Users** action, Maconomy creates a user for each

customer who matches the selection criteria and for whom no user has already been created, applying the access and template user information indicated by the current user type.

## User Types Tab

This section includes the fields and descriptions for the User Types tab.

### User Type Island

Field	Description
<b>User Type</b>	This field shows the name of the current user type. When creating a user type, you can specify the desired name for the user type here.
<b>Description</b>	In this field, you can specify a description of the current user type.

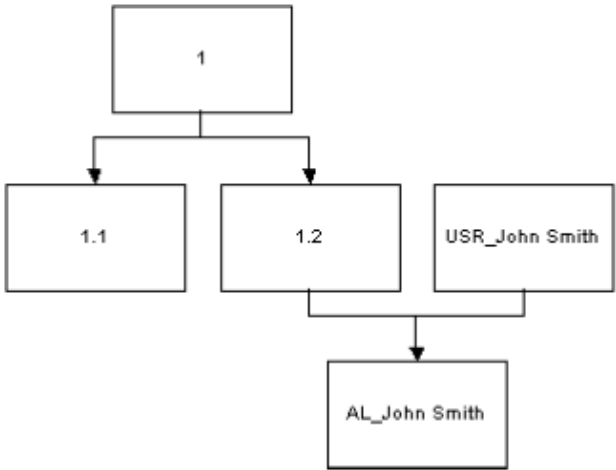

### User Creation Island

Field	Description
<b>User name in Field</b>	<p>In this field, you can specify the name of the field in the relation selected in the field “Database Relation” where Maconomy can find the names to apply as user names for the individual users created. When users of the current type are created, Maconomy retrieves the value in the specified field for each entry matching the selection criterion specification on the user type, and applies this value as the user name of the user created for the entry in question.</p> <p>If, for instance, you are setting up a user type to be used for creating users based on customers (that is, you have specified “Customer” in the field “Type”), and you want the customer number of the customer for which each user is created to also be the user name of the user created for the customer in question, specify the field “CustomerNumber” here.</p> <p>If you have specified a prefix and/or a suffix in the fields “Prefix, User Name” and “Suffix, User Name” in this island, the user name of each user created will consist of the retrieved user name, preceded by any prefix and followed by any suffix specified in this island.</p> <p>Please note that if a user of the current type is created in the workspace Users rather than by selecting the action “Create New Users” in this workspace, the user name is only retrieved in the above described manner if no user name has been specified manually on the new user.</p>
<b>Prefix, User Name</b>	In this field, you can specify a prefix to be added as the first part of the user name of users created when the action “Create New Users” is selected. For further information on how the user names of automatically created users are generated, see the field “User Name in Field” above.
<b>Suffix, User Name</b>	In this field, you can specify a suffix to be added as the last part of the user name of users created when the action “Create New Users” is selected. For further information on how the user names of automatically created users are generated, see the field “User Name in Field” above.

**Access List Island**

Field	Description
<b>New</b>	<p>This field can only be marked if the field “New” in the island User Specific Access Level has been marked.</p> <p>In this field, you can specify whether the users created when the action “Create New Users” is selected or when creating a user of the current type in the workspace Users should be granted access to the information on which they are based. This can, for example, be desirable if you are creating users based on customers because you are running a customer portal or Web shop based on Maconomy information, and you want your customers to be able to access their own customer information.</p> <p>If you mark the field, Maconomy runs the following procedure for each user created, either manually in the workspace Users or by selecting the action “Create New Users” in this workspace. In the description, the term “basis entry” is used about the entry (for example, the customer) on which a given new user is based.</p> <ol style="list-style-type: none"> <li>1. Maconomy creates a user specific access level as described in the field “New” in the island User Specific Access Level, and grants the new user access to this level in the workspace User Access Levels.</li> <li>2. Next, Maconomy creates an access level whose name is the user name of the user for which it is created, preceded by any prefix and followed by any suffix specified in this island. This access level is then assigned as a sublevel of the user specific access level.</li> <li>3. If an access level has been specified for the basis entry, the access level created in the previous step is also assigned as a sublevel of the access level of the basis entry, and the access level on the basis entry is changed to the new access level. If no access level has been specified for the basis entry, be it because the access level field is blank, or because it is simply not possible to specify an access level on the basis entry’s information type Maconomy issues a warning but does not undo the previous steps.</li> </ol> <p>In a diagram, the access level structure will now look as follows. In the illustration below, it is assumed that a user is created on the basis of the customer John Smith, who belonged to access level 1.2 before the action “Create New Users” was selected, and that the prefix “USR_” has been specified in the island User Specific Access Level, and the prefix “AL_” has been specified in this island.</p>

Field	Description
	 <p>On the information card of the customer, access level 1.2 is changed to AL_John Smith, and in the workspace User Access Levels, user John Smith is granted access to the level USR_John Smith, thereby also gaining access to AL_John Smith.</p> <p>This structure ensures that the new user gains access to his own customer information card but that he does not gain access to information about other customers. However, all users who had access to the customer before the action was selected will still have access to the customer, as he is assigned to a sublevel of the access level to which he was assigned before.</p> <p>If you do not mark the field, this field and the other fields in this island have no effect.</p> <p>Please note that this functionality does not grant the new users access to their own user information in the workspace Users, as this is determined by the company to which the individual user is assigned. When creating users, this access level is transferred from the information card of the template user assigned to the current user type.</p>
<b>Prefix</b>	If the field “New” in this island is marked, you can specify in this field a prefix to be added as the first part of the names of the access levels created when the action “Create New Users” is selected. For further information on how the access levels are generated, see the field “New” above.
<b>Suffix</b>	If the field “New” in this island is marked, you can specify in this field a suffix to be added as the last part of the names of the access levels created when the action “Create New Users” is selected. For further information on how the access levels are generated, see the field “New” above.

## User Island

See the Getting Started topic for a description of the fields in the island User.

**Remarks Island**

Field	Description
<b>Remarks</b>	In these fields, you can enter any remarks to the current user type. The fields are for reference only.

**User Selection Criteria Island**

Field	Description
<b>Database Relation</b>	<p>In this field, you can specify the database relation containing the type of information for which new users should be created when using the action "Create New Users." For instance, if you want to create users for a range of customers, you can select the relation Customer here. If you leave this field blank and specify a value in the field "Type," Maconomy automatically completes this field with the database relation used for storing information of the selected type. If the field is completed, the user type can only be used for automatic creation of users. If the field is left blank, the user type can only be used for manual creation of users.</p> <p>You can only specify a relation for which instance key registration has been activated in the workspace Database Relations. This is due to the fact that on automatically created users, the instance key is used for determining whether a user has already been created for the database entry on which the user was based. For further information on instance key registration, see the workspace Database Relations.</p> <p>Please note that the action "Create New Users" can only be used in this workspace if a value has been specified in the field "Type." If you specify a database relation but leave the field "Type" blank, users can only be created from the entries in the specified relation by means of the import program Import Users. For more information on this, see the manual on the import program Import Users.</p>
<b>External Relation Name</b>	This field shows the external name of the relation specified in the field "Database Relation" above.
<b>Type</b>	<p>In this field, you can specify the type of information for which users should be created when the action "Create New Users" is selected. For instance, if you want to create users for a range of customers, select the type Customer here.</p> <p>If you specify a type in this field and leave the field "Database Relation" blank, Maconomy automatically completes the fields "Database Relation" and "External Relation Name" with the internal and external names of the database relation used for storing information of the selected type.</p> <p>The action "Create New Users" can only be used in this workspace if a value has been specified in this field.</p>
<b>Selection Criterion</b>	In this field, you can specify the number of a selection criterion specification created in the workspace Selection Criterion Specification. If a type has been

Field	Description
<b>Specification No.</b>	<p>specified in the field "Type" above, the selection criterion specification must be of the specified type.</p> <p>When you select the action "Create New Users," Maconomy will create users for the entries in the above selected database relation that match the criteria in the selection criterion specification in question. However, a user is only created for a given entry if a user does not already exist for the entry in question.</p>
<b>Description</b>	This field shows a description of the selection criterion specification specified in the field above.

### User Specific Access Level Island

Field	Description
<b>New</b>	<p>In this field, you can specify whether Maconomy should automatically assign each new user of the current type to an access level automatically created by Maconomy.</p> <p>If you mark the field, selecting the action "Create New Users" will cause Maconomy to create an access level for each user created in the process. Similar functionality applies when creating a user of the current type in the workspace Users. The access level created for a given user is assigned the same name as the user for which it is created, preceded by any prefix and followed by any suffix specified in this island. Maconomy automatically assigns the user to the new access level in the workspace User Access Levels.</p> <p>Please note that this functionality does not grant the new users access to their own user information, as this is determined by the field "Access Level" in the information card of the individual users. When creating users, this access level is transferred from the information card of the template user assigned to the current user type.</p> <p>If you do not mark the field, no user specific access levels are created when the action "Create New Users" is selected, and the users created are only assigned to the access levels indicated by the template user assigned to the current user type.</p>
<b>Prefix</b>	If the field "New" is marked, you can specify in this field a prefix to be added as the first part of the names of the user specific access levels created when the action "Create New Users" is selected. For further information on how the access levels are generated, see the field "New" above.
<b>Suffix</b>	If the field "New" is marked, you can specify in this field a suffix to be added as the last part of the names of the user specific access levels created when the action "Create New Users" is selected. For further information on how the access levels users are generated, see the field "New" above.

### Access Level Island

Field	Description
<b>Access Level</b>	In this field, you can specify the name of an access level. You only have access to the current user type if you have been assigned to the same or a higher level in the workspace User Access Levels. This means that in other workspaces, you

Field	Description
	<p>can only specify user types (for example, on a template user) to which you have access. Furthermore, in this workspace, a given user can only see the user types to which he has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to user types may depend on other factors. For more information about this, please see the section “Introduction to the Access Control System.”</p> <p>If no access level is specified, all users have access to the current user type.</p>
<b>Description</b>	This field shows the description of the selected access level entered in the workspace Access Levels.

## Actions

This section shows the actions available in the User Types workspace.

### Top Tab

Field	Description
<b>Create New Users</b>	<p>This action only applies if the field “Selection Criterion Specification No.” has been completed. When you select this action, Maconomy will create users on the basis of entries in the database relation specified in the field “Database Relation” in this workspace. A user is created for each entry in the relation that matches the selection criteria specified in the field “Selection Criterion Specification No.” and for which Maconomy has not already created a user. The process described here is also run whenever a user of the current type is created in the workspace Users. In this case, however, instead of creating a user for each entry that matches the specified selection criteria, Maconomy only creates one user and assigns it to the entry specified on the new user (see the introduction to the workspace Users and the fields in the island “Object Reference” in that workspace).</p> <p>Maconomy transfers various information from the template user assigned to the current user type to the information cards of the users created. Furthermore, the users created are granted access to the same access levels, actions, and groups as the template user.</p> <p>If the field “New” is marked in the island User Specific Access Level, or in both the island User Specific Access Level and Access List, Maconomy will create a number of access levels and assign the individual new users to them. This procedure is described in detail in the sections on the fields “New” in the islands User Specific Access Level and Access List.</p> <p>If the workspace System Information indicates that passwords are required, each user created is assigned a password according to the rules set up in the workspaces System Information and Access Information, and Maconomy creates a file in the Maconomy folder, containing the user names and passwords assigned to each of the new users. However, such a file is only created if no standard password has been specified in the workspace Access Information, as the users are otherwise just assigned the standard password.</p>

## Groups Single Dialogs Workspace

Use this workspace to maintain access groups, which are collections of Maconomy users, often with similar jobs, who share the same access settings.

For example, you might have a group for salespeople, which gives access to the Maconomy areas that salespeople are likely to use.

A group's access settings determine which workspaces the group members can use and whether they have Read, New, Update, or Delete access to each of the windows.

A group consists of a number of lines, each of which defines the right to use four functions: Read, New, Update, and Delete in one window or potentially all windows.

You place Maconomy users into one or more groups, giving them automatic access to the windows that are relevant to their jobs. Use the Users window to assign users to groups.

The Window Layout Groups window also uses the groups that you create in this window because you can assign window layouts to each group. Each window layout contains information that defines the elements (fields, fixed texts, variables, and so on) that are to be displayed when a user opens a given window. Thus, the windows in Maconomy are only available to the user in the layouts that you define for the groups to which you assigned the user. You create the groups in this window, but you maintain the list of layouts that you assign to the group in the Window Layout Groups window. See the Window Layout Groups and Window Layouts windows for more information about the functionality of layouts.

If you have installed the Portal, groups are also linked to the role functionality in the Portal in that creating a group also causes a Portal role to be created and assigned to the new group. In the Portal island, you can define information that is specific to the role that you assign to the current group.

Maconomy's standard setup includes the Change Password and All Workspaces predefined groups. You cannot change these groups.

You select the windows to which a new group should have access in the **Window Name** or **Internal Window Name** field in the Windows sub-tab of this window, where you can find the relevant name and insert it by using the **Find** action in the Find menu. If you want the group to contain a line for each window, you can use the **Create lines for all workspaces** action. Using that action causes Maconomy to automatically insert all of the windows on the lines in this window. Next, you specify whether the users of the group should be able to open the windows in question and if so, whether they should have access to create entries, change existing entries, and delete entries in the windows in question.

If you do not define access rights for all of the lines that the Windows sub-tab displays, you can delete the lines for which you have not specified the **Read**, **Create**, **Change**, and **Delete** actions by using the **Delete lines without access permission** action.

You can also granted a group access to all windows if you leave the first field in a table line empty and you select the **Unspecified** pop-up type in the **Window Type** field. On such a line, you can then define the rights that the users of the group should have to all windows (a combination of the rights **Read**, **Create**, **Change**, and **Delete**). Even if you do this, you can still add lines for windows for which specific access rights should be given to the users who belong to the group. These lines then represent exceptions to the general rights on the line that has the value **Unspecified**.

You place users who have access to all Maconomy windows and functions in the **All Windows** group. If you want a more functional division of work routines, you can create several job-related

groups. For example, you might create a sales group, and give its member users access to the Sales Orders module, the Item Information window in the Inventory module, and perhaps to the customer ledger windows in the Accounts Receivable module.

Note that for some windows, read access implies full access (that is, to create, update, and delete information). These windows are typically windows from which you can print documents-where the printout represents an action. These windows include all of the Delete windows; the Interest Selection, Reminder Selection, Approve Interest Selection, and Approve Reminder Selection windows in the Accounts Receivable module; the Payment Selection and Change Payment Selection by Vendor windows in the Banking module; the Print Picking List and Print Returns List windows in the Sales Orders module; the Item Purchase Selection window in the Item Purchase module; and the Change Price Lists window in the Inventory module.

To prevent users in a group from having access to the full functionality of those workspaces, you must ensure that the group has no access at all to them.

By default, Maconomy contains one user, Administrator, who has access to all windows and all functions. This access category is defined in the "All workspaces" group, which is supplied by Maconomy. The Administrator user is automatically assigned to all groups created in this window.

Note that when you create a group, Maconomy creates an entry for that group in the View Groups and Layout Groups windows. For more information about views and view groups, see the description of the View Groups window.

For auditing purposes, it is strongly recommended that you print and file your group information every time that you change it in this window. You can use the **Print This** function in the File menu.

## Groups Tab

This section includes the fields and descriptions for the Groups tab.

### Group Island

Field	Description
<b>Name</b>	In this field, you specify the group name, for example, "Order Registration" from the above example. You must enter a name.
<b>Access with Expired Password</b>	If you mark this field, a user with access to the current group will be able to activate the workspaces in this group even if his password has expired. If you do not mark this field, a user with access to the current group will not be able to activate the workspaces in this group if his password has expired. In the group "Change Password," this field is automatically marked by Maconomy.

### Portal Island

This island and its fields only appear if the Portal has been installed. For further information, see the section "Groups and Portal Roles."

Field	Description
<b>Role No.</b>	This field shows the number of the role assigned to the current group. For all roles created as a result of creating a group in this workspace, the role number corresponds to the group name. The number may vary from the group

Field	Description
	name if the role was assigned to the group in an upgrade from a previous version.
<b>Role Name</b>	When creating a group, you can specify in this field the name of the Portal role to be automatically created and assigned to the group when the group is created. Once you press Return, the name can no longer be changed. Users assigned to the current group in the workspace Users are automatically also assigned to the Portal role assigned to the group.
<b>Standard Component</b>	In this field, you can specify the ID of a standard component for the role assigned to the current group. The standard component is shown in the Portal immediately after logon unless another standard component has been specified for the user in question, in which case the user specific standard component is shown. If a given user is assigned to several roles, the standard component is chosen at random among these.

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Windows Sub-Tab

This section includes the fields and descriptions for the Windows sub-tab.

Field	Description
<b>Window Name</b>	<p>In this field, you enter the name of the workspace to which the group should have access. The available workspace names can be found and inserted by using the action "Find Window" in the Find-menu. Please note that the Find-workspace only displays workspaces of the type specified in the field "Window Type."</p> <p>You can also specify the internal name of the relevant workspace in the field "Internal Window Name." This can be an advantage, as it is possible for several workspaces in Maconomy to have the same external name, but the internal name of each workspace must be unique. If you specify a name in this field and leave the field "Internal Window Name" blank, Maconomy automatically completes the field "Internal Window Name." However, if several workspaces have the specified external name, Maconomy displays an error message. If you specify an internal name, Maconomy automatically completes this field with the external name of the workspace in question.</p> <p>Moreover, you should note that if you want all available workspaces to be added in the sub-tab, you can use the action "Create lines for all workspaces,"</p> <p>If you want to give the group access to all workspaces, you can leave this field blank and select the pop-up type "Unspecified" in the field "Window Type." On such a line, you can then specify the rights which the users of the group should have in all workspaces in the system (a combination of the rights "Read," "Create," "Change," and "Delete"). Having done this, however, you can still add lines for workspaces for which specific access rights should be given to the users of the group. These lines will represent exceptions to the general rights on the line with</p>

Field	Description
	the value “Unspecified.” An example could be that all users of the groups are given access to read all workspaces, and that they are only given access to create, change and delete entries in certain other workspaces.
<b>Window Type</b>	<p>This field shows the workspace type that applies to the current line. There are six types of workspaces, described below:</p> <ul style="list-style-type: none"> <li>■ Dialog workspace— Windows of this type contain a tab and very often a sub-tab. Examples of such workspaces are the workspaces Time Sheets, Sales Orders, and Vendor Information Card.</li> <li>■ Parameter workspace— Windows in which you can specify parameters, for example a range of companies or order numbers. When the user accepts the specified parameters, Maconomy will carry out a given action. Examples of such workspaces are the workspaces Item Purchase Selection, Interest Charge Selection, and all print workspaces.</li> <li>■ Search workspaces— The workspace or search pane displayed when you select “Find” in Maconomy, for example, “Find Activity.”</li> <li>■ Report — The reports/report templates available under the menu Analyzer in the Windows client and the Reports menu in the Java™ client, respectively.</li> <li>■ Selection — Windows available in the menus Export, Programs, Graphics, and Reports in the menu.</li> <li>■ Unspecified — A token specifying all workspaces available in the system.</li> </ul>
<b>Internal Window Name</b>	In this field, you enter the internal name of the workspace to which the group should have access. The functionality of the field is similar to that of the field “Window Name” above.
<b>Read</b>	<p>Select this check box to enable read-only access to the window.</p> <p>Administrators can change read access for any window.</p> <p>If you have limited administrator rights and have read access to the window, you can also enable or disable this, as long as it does not change your total access.</p>
<b>Create</b>	<p>Select this check box to enable create access to a window group.</p> <p>Administrators can change create access for any window.</p> <p>If you have limited administrator rights and have create access to the window, you can also enable or disable this, as long as it does not change your total access.</p>
<b>Update</b>	<p>Select this check box to enable update access to a window group.</p> <p>In the Actions workspace, you can limit user access to the individual actions in the Action menus in various workspaces.</p> <p>Administrators can change update access for any window.</p> <p>If you have limited administrator rights and have update access to the window, you can also enable or disable this, as long as it does not change your total access.</p>

Field	Description
<b>Delete</b>	Select this check box to enable delete access to a window group. If you have limited administrator rights and have delete access to the window, you can also enable or disable this, as long as it does not change your total access.
<b>Access from</b>	Specify whether the access rights granted on the current line should apply when accessing the workspace in question through the Maconomy client program, through MScript functionality, or both. If you have limited administrator rights, you can modify this field, as long as the change does not change you own access, and you have both API and Client access to the window.

## Actions

This section shows the Actions available in the Groups workspace.

### Top Tab

Field	Description
<b>Create Lines For All Windows</b>	Use this action to create lines for all workspaces available in the system. The lines are displayed in the sub-tab of the workspace. Hereafter, you can specify whether the users of the group should be able to open the workspaces in question and if so, if they should have access to create entries, change existing entries, and delete entries in the workspaces in question.
<b>Delete Lines With No Access Permissions</b>	Use this action to delete the lines in the sub-tab for which it has neither been specified whether the users of the group can open the workspaces in question, create entries, change existing entries, nor delete entries.
<b>Create Lines For All Windows With Full Access</b>	Use this action to create lines for all workspaces with the highest access you can give them. Administrators can give full access to all workspaces. Users with limited administrator rights may only provide access to workspaces they have access to.

### Sub-Tab

Field	Description
<b>Add Window</b>	Use this action to add a window. You must have administrator rights, or the proper access, to add all rights to the window.
<b>Delete Window</b>	Use this action to delete a window. You must have administrator rights, or the proper access, to remove all rights to the window.

## Users Single Dialogs Workspace

Use this workspace to add and delete Maconomy users.

When you add a user, you create a user name, associate it with an employee number (if relevant), and enter settings that control the user's access to Maconomy windows, data, and actions.

To speed up the process of adding new users, you can create user types, which are templates that supply the settings that you normally apply to new Maconomy users. You set up user types in the User Types window.

You can also set up access groups, which are groups of Maconomy users, often with similar jobs, who share the same access settings. For example, you might have an access group for salespeople. You set up access groups in the Groups window.

Each user consists of a name with which the user can log in to Maconomy and the Portal and other information about the user, such as the period in which the user is valid and can log in, derived dimensions, and any connection to an employee number. In addition, you can assign access rights to each user, thus defining, for example, which windows the user can open, which data should be available to the user in those windows, and which actions the user should be allowed to use in the Action menu. You do this in the User Dialog Groups sub-tab of this window, and in the Groups, Actions, and User Access Levels windows.

When you create a user, you must specify a user type that identifies a template user whose information is copied to the new user. This means that the new user inherits both the static information in this window and the access rights defined for the template user. However, any employee number and validity period that you specify before you press Enter are not overwritten by the template information. If you select a user type to which no template user is assigned, Maconomy does not copy any information to the new user.

In addition to identifying a template user, the user type also determines whether or not a new user must be assigned to another type of Maconomy information, for instance a customer. For example, this can be useful if you are running a customer portal or web shop based on Maconomy information, and you want your customers to be able to access their own customer information and information about their own orders. In such cases, this window enables you to create each customer as a user so that the customer can log in to Maconomy and access information relevant to himself. You must assign new users to another type of information if you provide a value for the **Database Relation** field for the selected user type in the User Types window. If you specify a relation on the user type, the user is based on and assigned to an entry in the relation in question. You must define the appropriate entry by entering its key values in the **Key 1-4** fields. For example, if you specify the Customer relation for the user type, you must specify the number of the customer to which the user should be assigned. When you press Enter, the new user is automatically assigned to the specified database entry. In addition, depending on the setup of the user type, Maconomy may create a number of access levels to which the new user and the assigned database entry are automatically granted access. For more information about this, see introduction to the User Types window and the description of the User Specific Access Level and Access List islands in that window.

You can create template users in this window by selecting the **Template** field. For more information about creating template users and the information that Maconomy copies from template users to new users, see the description of the **Template** field.

In the User Dialog Groups sub-tab of this window, you can assign any number of groups to the user. Access groups determine the windows and functions that are available to the user. If you

installed the Portal, assigning a group to a user also causes that user to become member of the Portal role that belongs to the group in question, thus granting the user access to the menu items and components that you assigned to the relevant role.

The groups also determine which window layouts the user sees when opening windows. You maintain access groups in the Groups window. If you grant access to more than one group to a user, he or she has access to all of the combined functions and rights of the groups. If a user is not assigned to any groups, he or she cannot open any windows, although he or she can log in.

The order in which you specify the groups in the User Dialog Groups sub-tab is important if you use different window layouts. When a user opens a window, Maconomy checks whether a layout has been specified for the window in question in the group at the top of the sub-tab. If so, Maconomy uses the layout in question. If no layout has been specified in the top group, Maconomy checks whether a layout has been specified in the second group in the sub-tab, and so on. If no layouts have been specified in any of the groups, Maconomy uses the standard layout for the window.

Note that for some windows, read access implies full access (that is, to create, update, and delete information). These windows are typically windows from which you can print documents-where the printout represents an action. These windows include all Delete windows; the Interest Selection, Reminder Selection, Approve Interest Selection, and Approve Reminder Selection windows in the Accounts Receivable module; the Payment Selection and Change Payment Selection by Vendor windows in the Banking module; the Print Picking List and Print Returns List window in the Sales Orders module; the Item Purchase Selection window in the Purchase module; and the Change Price Lists window in the Inventory module. To prevent users in a group from having access to the full functionality of these windows, you must ensure that the group has no access at all to the windows.

If the System Information window specifies that a password is required to gain access, Maconomy automatically gives new users a password whose contents you define in the Access Information window. You can then change this password in the Change Password window. If a password is not required, users are not given a password here.

Maconomy is delivered with one user, Administrator, who has access to all windows and all functions. In addition, Maconomy automatically assigns the Administrator user to all of the groups that you created in the Groups window. You cannot delete the Administrator user, and you cannot remove or add groups in the sub-tab of the Administrator's information card. You can designate any user as an administrator by selecting the **Administrator** field. When you select this field, that user is granted the same rights as the special Administrator user. However, you can deselect the **Administrator** field at any time to make the user a "normal" user again.

For auditing purposes, it is strongly recommended that you print and file user information every time that you change it in this window. You can use the **Print This** function in the File menu.

## Users Tab

This section includes the fields and descriptions for the Users tab.

### User Island

Field	Description
<b>Name</b>	Enter a user name in this field when creating a user. If you create a user assigned to another type of Maconomy information (see the introduction to this

Field	Description
	workspace) and you leave this field blank, the user name is automatically generated by Maconomy. The user name is generated according to the rules specified for the selected user type in the island User Creation in the workspace User Types.
<b>Employee No.</b>	Here you can enter the number of a employee created in the workspace Employees. This information is used in the service module for assigning an employee to a service job, and in the workspace Time Sheets in the Job Cost module for managing access to changing, creating, approving, and printing time sheets. If you enter an employee number, the company specified on the employee's information card is transferred to the field "Company No." in the island Company. If the system parameter "Employee mandatory for user" has been marked, this field must be completed.
<b>Company</b>	Here you can enter a Company to which you associate the user. If the employee number has been entered, the user is automatically associated with the same company as the employee.
<b>Transfer to People Planner</b>	If this field is marked, the user will be included in the scheduled import to People Planner. Setting the Transfer To People Planner field will only have an effect if the field is included in the relevant queries in the .I files on the web server.

### User Type Island

Field	Description
<b>Type</b>	<p>This field shows the user type of the current user. When creating a user, specify the desired type of the user here.</p> <p>The user type points out the template user whose information should be copied to the new user. Maconomy copies the template user's information in this workspace to the new user, and the new user is granted access to the same actions in the workspace Actions and the same access levels in the workspace User Access Levels as the template user. For further information about template users, see the field "Template."</p> <p>In addition to pointing out a template user, the user type also determines whether or not a user being created must be assigned to another type of Maconomy information, for instance a customer. New users must be assigned to another type of information if the field "Database Relation" has been completed for the selected user type in the workspace User Types. If a relation has been specified on the user type, the user will be based on and assigned to an entry in the relation in question. You must specify the desired entry by entering its key values in the fields "Key 1-4." For instance, if the relation Customer has been specified for the user type, you must specify the number of the customer to which the user should be assigned. When you press Enter, the new user is automatically assigned to the specified database entry.</p> <p>Furthermore, if you leave the field "User Name" blank, the user name is automatically generated by Maconomy. The user name is generated according to the rules specified for the selected user type in the island User Creation in</p>

Field	Description
	<p>the workspace User Types. Depending on the setup of the user type, Maconomy may also create a number of access levels to which the new user and the assigned database entry are automatically granted access. For further information on this, see the introduction to the workspace User Types and the description of the islands User Specific Access Level and Access List in that workspace.</p> <p>If you have not installed the add-on “Extended User Administration,” only one user type is available.</p>
<b>Administrator</b>	<p>When you mark this field, the user in question is granted the same rights as the special Administrator user. However, this field can only be marked and unmarked by users who are already provided with the status Administrator. Furthermore, an Administrator cannot remove the mark specified for himself in this field. A user who has been granted the status Administrator in this field will get exactly the same rights as an Administrator is usually granted in Maconomy. By marking this field, it is thus possible to have several Administrators in one Maconomy system, only do these administrators have different names and can be assigned to different access levels.</p> <p>However, the field “Administrator” can be unmarked at any time to make the user a “normal” user again.</p>
<b>Template</b>	<p>Mark this field if the current user should be the template user of the user type specified in the field “Type” above.</p> <p>A template user is a user whose information is transferred to new users assigned to the user type to which the template user is assigned. This means that when a user is created and assigned to the user type in question, Maconomy copies the template user’s static information from this workspace to the new user. Furthermore, the new user is granted access to the same actions in the workspace Actions and the same access levels in the workspace User Access Levels as the template user.</p> <p>It is not possible to log on to Maconomy using a template user name, and hence a template user cannot make any registrations. However, in the workspaces Users, User Access Levels and Actions, you can set up the template user as desired.</p>

### Validity Island

Field	Description
<b>Period</b>	<p>In this field, you can specify the range of dates in which the current user is valid. It is not possible for a user whose period has expired to log on to Maconomy or the Portal. If you do not enter a validity period, Maconomy transfers the period from the template user of the specified user type.</p>
<b>Password Expiry Date</b>	<p>In this field, you can specify the last date on which the user’s access code is valid. Once the date has expired, the user will only have access to the workspace Change Password when logging on. However, the date can be changed here.</p>

Field	Description
<b>Password Blocked</b>	This field shows whether the user's access code has been blocked. The field is automatically marked when an incorrect access code has been entered three consecutive times when logging onto Maconomy. When this field has been marked, the user can no longer log on to Maconomy.

### Portal Island

This island and its fields only appears if the Portal has been installed. For further information, see the section "Groups and Portal Roles."

Field	Description
<b>Standard Component</b>	In this field, you can specify the ID of a default component for the current user. The standard component is shown in the Portal immediately after logon, and will overrule any standard components specified for the roles assigned to the user (by assigning the user to groups in the sub-tab).
<b>Client Type</b>	In the Portal, it is possible to open Maconomy workspaces using either Maconomy's Java™ client or the regular Maconomy Windows client, for instance when activating a Maconomy Window component or activating a tab which shows a Maconomy workspace. In this field, you can specify the type of client to be used for the current user.

### Database User Name Island

Field	Description
<b>Name</b>	If the current user is to have access to the Maconomy's underlying database, enter the name of a database user in this field. This name is assigned to the current user and must subsequently be used when requesting access to Maconomy's database. Please note that if your Maconomy system is running on a DB2 database, this field does not cause a database user to be created, as the field is only used for linking the current user to an existing database user. Therefore, the database user name must be created in the database before the name is entered in this field.
<b>Password</b>	When creating a database user, enter a password in this field. Note that the first character entered must be a letter and that the password cannot contain any space characters. This password must be supplied when logging on to the database using Maconomy's ODBC driver, along with the database user name specified in the field above. Following the creation of the current user and the entry of information in the fields in this island, the contents of the fields are automatically removed by Maconomy. Consequently, the field will appear empty when this workspace is reopened, even though a password has been entered. The password can then be changed by the current user in the workspace Change Database Password. Please note that if your Maconomy system is running on a DB2 database, you cannot enter a password here, as the password is assigned when the database user is created. As the database user must be created separately before being assigned to a user in this workspace, it is therefore not possible to enter a password here.

### Network Username Island

Field	Description
<b>Name</b>	<p>If the add-on “Single Sign On” (SSO) has been installed, you can access Maconomy using the Maconomy Portal immediately after logging on to a Microsoft network. If SSO uses the method “name mapping” to match the network name with a Maconomy user name, enter the network name of the user in this field, and the network domain name in the field “Domain Name” in the field below. When the user has logged on to the Microsoft network and launches the Maconomy Portal, the user will automatically log on to Maconomy. For more information, please see the special “Single Sign On” add-on reference documentation.</p> <p>Note that Microsoft automatically converts the network name to capital letters. Consequently, in order for the network name to match the name in this field, the name must be written in capitals in this field.</p>
<b>Domain Name</b>	<p>In this field, you can enter the name of the domain in the Microsoft network to which the current user belongs. For more information about the functionality of this field, please see the description of the field “Name” above.</p> <p>Note that Microsoft automatically converts the network domain name to capital letters. Consequently, in order for the name to match the domain name in this field, the name must be written in capitals in this field.</p>

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Dimension Combination Island

Field	Description
<b>Dim. Comb. No.</b>	<p>In this field, you can enter the number of a dimension combination of the type “Dimension Derivation” created in the workspace Dimension Combinations.</p> <p>If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the current user. However, any dimension derivation values specified in this island will be used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the user information card.</p>

### Derived Company Island

Field	Description
<b>Company No.</b>	<p>In this field, you can enter a value for the dimension Company if you want a value to be derived from the current user. If you also want the specified value to overwrite existing values for the dimension, complete the field “Overwrite.” If you do not choose overwriting, the dimension value will only be derived if the dimension field for which derivation is taking place has neither been completed manually nor by entering a registration code.</p>

Field	Description
	<p>Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used rather than the value (if any) found for this dimension in the dimension combination in question. This means that the dimension combination only applies to this dimension if you have not entered a value in this field.</p> <p>Please note that if a dimension combination has been specified in the field "Dim. Comb. No.," a mark in the field "Overwrite" will only have effect if you have also entered a dimension value. If you mark the field "Overwrite," but you do not enter a dimension value in this field, the "Overwrite" field is ignored, as dimension values and overwriting specification are always retrieved together from the same dimension derivation island, dimension combination or dimension combination line.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L Module" as well as the description of the workspaces Dimension Derivations and Dimension Combinations in the G/L module for further information about dimension derivation.</p>

#### Derived Account Island

Field	Description
<b>Account No.</b>	The functionality of this field is similar to that of the field "Company No." above.

#### Derived Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Account No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.

**Object Reference Island**

Field	Description
<b>Database Relation</b>	If the current user was created on the basis of another type of information, for example, a customer, this field shows the name of the database relation containing the type of information in question. For further information on creating users on the basis of other types of information, see the introduction to this workspace as well as the introduction to the workspace User Types and the action "Create New Users" in the same workspace.
<b>Relation Name</b>	This field shows the external name of the relation specified in the field "Database Relation" above.

## User Dialog Groups Sub-Tab

This section includes the fields and descriptions for the User Dialog Groups sub-tab.

Field	Description
<b>Groups</b>	<p>Here you assign groups to the user. You choose between existing groups created in the workspace Groups. Groups determine user access in Maconomy workspaces, and if the Portal has been installed, they also determine the roles to which the user is assigned in the Portal. For further information on this, see the introduction to this workspace.</p> <p>You can assign the user to more than one group. If a user is granted access to more than one group, he will have access to the combined functions and rights of the groups.</p> <p>You can only assign a user to a group to which you yourself have been assigned.</p> <p>The order in which the groups are specified in the sub-tab is important if different workspace layouts are used in the system.</p> <p>When the user opens a workspace, Maconomy checks if a layout has been specified for the workspace in question in the group at the top of the sub-tab. If so, that layout is used. If no layout has been specified in the top group, Maconomy checks if a layout has been specified in the second group in the table, and so on. If no layouts have been specified in any of the groups, the standard layout for the workspace in question is used.</p>

## User Roles Workspace

Use this workspace to create and maintain user roles.

## User Role Tab

This section includes the fields and descriptions for the User Role tab.

### User Role Island

Field	Description
<b>Username</b>	Enter the name of the user who owns the role. Once created, you cannot change the username.
<b>Role Name</b>	Enter the name of the role. The role name must be unique for the user. However, one or more users can have roles with the same name.
<b>Login Name</b>	Enter the login name for the role. The login name is used to log in to Maconomy or BPM as a specific role. Each role must have a unique login name. If you do not enter a login name, the system will generate a default name. The format for the first role's login name is <Username>. The format for additional roles is <Username>#< Role_Name>.
<b>Use for People Planner</b>	Select this check box to use the role when transferring the user setup to People Planner. Only one role can be selected for each user. If you select a different role, the previously chosen role will be replaced. You cannot deselect or delete a selected role. You must select a new role to replace the current role.
<b>Default for Background Tasks</b>	Select this check box to make this the default role when a background task run as the user. Only one role can be selected for each user. When a new role is selected, this field is automatically deselected on the previously selected role. You cannot deselect or delete the chosen role. You must select a new role to replace the current role.
<b>Blocked in Touch</b>	Copy to come.
<b>Main Access Level</b>	Specify a main access level to assign to a user role. If the user creates new access levels, the system automatically assigns them as sublevels of the main access level.  For users with limited administration rights, you can only select an access level that your user role has access to.

### Dimension Combination Island

Field	Description
<b>Dimension Combination Number</b>	Enter the number of a dimension combination of the Dimension Derivation type created in the Dimension Combinations workspace. Maconomy uses the values in this dimension combination when deriving dimensions from the current user role if you specify a dimension combination. However, any dimension derivation values specified in this island are used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the user information card.

**Derived Company Island**

Field	Description
<b>Derived Company</b>	<p>Enter a value for the company dimension to derive a value from the current user role. Select the <b>Overwrite</b> check box to use the specified value to overwrite existing values for the dimension. If you do not select the <b>Overwrite</b> check box, the dimension value is derived only if the dimension field for the derivation taking place has neither been completed manually or by entering a registration code.</p> <p>Even if you have specified a dimension combination in the <b>Dimension Combination Number</b> field, a value entered in this field is used rather than the value (if any) found for this dimension in the dimension combination in question. This means that the dimension combination only applies to this dimension if you have not entered a value in this field.</p> <div style="border: 1px solid blue; padding: 5px; margin: 10px 0;"> <p><b>Note:</b> If a dimension combination has been specified in the <b>Dimension Combination Number</b> field, selecting the <b>Overwrite</b> check box only takes effect if you have also entered a dimension value. If you select the <b>Overwrite</b> check box but do not enter a dimension value in this field, the <b>Overwrite</b> field is ignored, as dimension values and overwriting specification are always retrieved together from the same dimension derivation island, dimension combination, or dimension combination line.</p> </div> <p>For more information about dimension derivation, see the section on dimension derivation in the Introduction to the G/L Module chapter and the description of the Dimension Derivations and Dimension Combinations workspaces in the G/L module.</p>

**Derived Account Island**

Field	Description
<b>Account</b>	The functionality of this field is similar to that of the <b>Derived Company</b> field above.
<b>Local Account</b>	The functionality of this field is similar to that of the <b>Derived Company</b> field above.

**Remarks Island**

Field	Description
<b>Remarks</b>	Enter role types and information related to the user.

**Derived Dimensions Island**

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the <b>Derived Company</b> field above.

Field	Description
<b>Entity</b>	The functionality of this field is similar to that of the <b>Derived Company</b> field above.
<b>Project</b>	The functionality of this field is similar to that of the <b>Derived Company</b> field above.
<b>Purpose</b>	The functionality of this field is similar to that of the <b>Derived Company</b> field above.
<b>Spec. 2-3</b>	The functionality of this field is similar to that of the <b>Derived Company</b> field above.
<b>Local Spec. 1-3</b>	The functionality of this field is similar to that of the <b>Derived Company</b> field above.

### Network Username Island

Field	Description
<b>Name</b>	<p>If the Single Sign On (SSO) add-on has been installed, you can access Maconomy using the Maconomy Portal immediately after logging into a Microsoft network. If SSO uses the name mapping method to match the network name with a Maconomy login name, enter the user's network name in this field, and the network domain name in the <b>Domain Name</b> field. When the user has logged into the Microsoft network and launches the Maconomy Portal, the user will automatically log on to Maconomy. For more information, see the special Single Sign On add-on reference documentation.</p> <div> <p><b>Note:</b> Microsoft automatically converts the network name to capital letters. Consequently, in order for the network name to match the name in this field, the name must be entered in capital letters.</p> </div>
<b>Domain Name</b>	<p>Enter the name of the domain in the Microsoft network the current user belongs to. For more information about the functionality of this field, see the description of the <b>Name</b> field above.</p> <div> <p><b>Note:</b> Microsoft automatically converts the network domain name to capital letters. Consequently, in order for the name to match the domain name in this field, the name must be entered in capital letters.</p> </div>

### Database User Name Island

Field	Description
<b>Name</b>	Enter the name of a database user in this field if the current user role needs to have access to Maconomy's underlying database. This name is assigned to the current user role and must subsequently be used when requesting access to Maconomy's database.

Field	Description
	<p><b>Note:</b> If your Maconomy system is running on a DB2 database, this field does not cause a database user to be created, as the field is only used for linking the current user role to an existing database user. The database user name must be created in the database before the name is entered in this field.</p>
<b>Password</b>	<p>Enter a password in this field when creating a database user.</p> <p><b>Note:</b> The first character entered must be a letter. The password cannot contain any space characters. This password must be entered when logging on to the database using Maconomy's ODBC driver, along with the database user name specified in the field above. Following the creation of the current user and the entry of information in the fields in this island, the contents of the fields are automatically removed by Maconomy. Consequently, the field will appear empty when this workspace is reopened, even though a password has been entered. The password can then be changed by the current user in the Change Database Password workspace.</p> <p>If your Maconomy system is running on a DB2 database, you cannot enter a password here, as the password is assigned when the database user is created. The database user must be created separately before being assigned to a user in this workspace.</p>

### User Island

Field	Description
<b>Created</b>	This field shows the user who originally created this user role.
<b>Changed</b>	This field shows the user who made the last change on this user role. If the user role has not been modified since it was created, this field is blank.
<b>Version</b>	This field shows the current version of the user role based on modifications made to it.

### User Role Dialog Groups Sub-Tab

This section includes the fields and descriptions for the User Role Dialog Groups sub-tab.

Field	Description
<b>Groups</b>	<p>Select groups to be assigned to the user role. Choose between existing groups created in the Groups workspace. Groups determine user access in Maconomy workspaces. If the portal has been installed, groups also determine the roles to which the user is assigned to in the portal.</p> <p>You can assign multiple groups to one user role. If a user role is granted access to more than one group, access is provided for the combined functions and rights of the groups. You can only assign a user role to a group to which you yourself are assigned.</p>

Field	Description
	<p>The order in which the groups are specified in the sub-tab is important if different workspace layouts are used in the system.</p> <p>When the user opens a workspace, Maconomy checks if a layout has been specified for the workspace in the group at the top of the sub-tab. If so, that layout is used. If no layout has been specified in the top group, Maconomy checks if a layout has been specified in the second group in the table, and so on. If no layouts have been specified in any of the groups, the standard layout for the workspace is used.</p>

## Actions

This section shows the actions available in the User Roles workspace.

### User Role Tab

Field	Description
<b>New User Role</b>	Create a user role.
<b>Delete User Role</b>	Delete a user role. Roles that are used for network login or People Planner cannot be deleted.
<b>Add Group</b>	<p>Use this action to add a user role to a specific group.</p> <p>Administrator roles cannot be added to groups because they are already in all groups.</p> <p>If you have limited administrator rights, you can only add a group if its window access does not exceed your total window access.</p> <p>If you are adding a fixed standard group, you must first have access to the group itself.</p> <p>If the <b>Consider Portal Role Access When Assigning Window Groups</b> system parameter is enabled, users with limited administration rights can only assign a window group to another user if they have access to the group itself.</p>
<b>Delete Group</b>	<p>Use this action to remove a user role from a specific group.</p> <p>Groups cannot be removed from administrator roles because they must be in all groups.</p> <p>If you have limited administrator rights, you can only delete a group if you are allowed to add it again. You cannot remove a group from yourself if this changes your total rights.</p>

## Actions Single Dialogs Workspace

Use this workspace to control a user's access to individual functions in the Action menu of the workspaces to which the user has access.

For example, you may give a user access to enter information in the general ledger, but not allow the user to post the ledger. You can also control whether a user can change certain fields (for example, prices) and see certain information (for example, information about jobs that belong to other users).

You can also prevent a user from changing the prices and payment information transferred from the price list and customer information card when creating quotes, sales orders, and credit orders. You can also define whether the user is to have read and write access to jobs that are assigned to other users.

When you add a user in the Users workspace, none of the fields in this workspace are selected for that user.

For a user to use the actions listed in this workspace, You must also grant access to that user to changing information in the workspace in which the function in question can be selected. You grant access to changing information in the Groups workspace.

### Actions Tab

This section includes the fields and descriptions for the Actions tab.

#### User Island

Field	Description
<b>Username</b>	This field shows the username. If the action setup for a group is enabled, this field is blank.
<b>Role Name</b>	This field shows the role name. If the action group for a group is enabled, the role name is the same as the group name.

**Attention:** This sub-tab is available only when the **Update Rights from Groups** system parameter is enabled.

#### Permitted Job/Cost Actions Island

Field	Description
<b>Submit Draft Invoice</b>	Select this check box to enable invoice draft submission for all users in the selected group.
<b>Approve Draft Invoice</b>	Select this check box to enable invoice draft approval for all users in the selected group.

Field	Description
<b>Reopen Draft Invoice</b>	Select this check box to allow all users in the selected group to reopen invoice drafts.
<b>Print Invoices/ Credit Memos</b>	<p>Select this check box to allow all users in the selected group to use the <b>Print Invoice</b> action in the Sales Orders and Packing Lists workspaces to invoice and credit customers. Selecting this check box also enables the group members to use the <b>Print Credit Memo</b> action in the Credit Orders workspace. This also applies to the following workspaces:</p> <ul style="list-style-type: none"> <li>Invoice Selection</li> <li>Invoice Editing</li> <li>Invoice Editing Lawyer</li> </ul> <p><b>Note:</b> This does not affect the group members' access to creating and printing invoices and credit memos in the Invoices and Credit Memos workspaces. The <b>Print Invoice</b> and <b>Print Credit Memo</b> actions can also be used if the group has access to these workspaces.</p>
<b>Approve Job Invoice Allocation</b>	Select this check box to allow all users in the selected group to approve job invoice allocations.
<b>Approve Employee Revenue Distribution</b>	Select this check box to allow all users in the selected group to approve employee revenue distribution.
<b>Change Job Budgets</b>	Select this check box to allow all users in the selected group to change the information in all fields located in the Job Budgets workspace in the Job Cost module. If the group members cannot change job budgets, only the information can be modified. The group can use the actions needed to create purchase orders and plan jobs, such as planned start and ending date, first and last possible starting date, actual start and ending date, and remarks on job budget lines.
<b>Submit Job Budgets</b>	Select this check box to allow users in the selected group to submit job budgets.
<b>Approve Job Budgets</b>	Select this check box to allow all users in the selected group to use the <b>Approve Job Budget</b> action in the Job Budgets and Approve Job Budgets workspaces.
<b>Reopen Job Budgets</b>	Select this check box to allow all users in the selected group to use the <b>Reopen Job Budget</b> action in the Job Budgets and Approve Job Budgets workspaces.

Field	Description
<b>Transfer to Quote</b>	<p>Select this check box to give all users in the selected group access to the <b>Transfer to Quote</b> action in the Job Budgets workspace in the Job Cost module.</p> <div> <b>Note:</b> Only users with the ability to change job budgets can use this action. </div>
<b>Change Quotes</b>	Select this check box to allow all users in the selected group to change all information in the fields located in the Quote Editing workspace in the Job Cost module. If the group members do not have the ability to change quotes, the information in this workspace is read-only.
<b>Approve Quote</b>	Select this check box to allow all users in the selected group to use the <b>Approve Quote</b> action in the Quote Editing workspace in the Job Cost module.
<b>Reopen Quote</b>	Select this check box to allow all users in the selected group to use the <b>Reopen Quote</b> action in the Quote Editing workspace in the Job Cost module.
<b>Change Job No. on Job</b>	Select this check box to allow all users in the selected group to change the job number of a job in the Jobs workspace in the Job Cost module. The job number is changed only if no registrations have been made on the job in any workspace.
<b>Reopen jobs</b>	Select this check box to allow all users in the selected group to use the <b>Reopen Job</b> action in the Jobs workspace in the Job Cost module.
<b>See Time Cost</b>	Select this check box to allow all users in the selected group to view cost prices for time activities in the Job Budgets and Periodic Job Budgets workspaces in the Job Cost module. If you do not select this check box, cost prices are not shown on printouts made by the users in the group in the Print Job Budget and Print Job Report workspaces.
<b>Change Costs for Time</b>	Select this check box to allow all users in the selected group to view and change cost prices for time activities in the Job Budgets and Periodic Job Budgets workspaces in the Job Cost module.
<b>See All Time Sheets</b>	Select this check box to allow all users in the selected group to view time sheets for all employees in the Time Sheets workspace in the Job Cost module.
<b>Change All Time Sheets</b>	Select this check box to allow all users in the selected group to create, change, approve, and print out time sheets for all employees in the Time Sheets workspace in the Job Cost module.
<b>Release Time Sheets</b>	Select this check box to allow all users in the selected group to use the <b>Release Time Sheet</b> action in the Time Sheets workspace in the Job Cost module.

Field	Description
	<p><b>Note:</b> The <b>Change All Time Sheets</b> check box must also be selected to allow the user to use this action.</p>
<b>Reopen Time Sheets</b>	Select this check box to allow all users in the selected group to use the <b>Reopen Time Sheet</b> action in the Job Cost module.
<b>See All Expense Sheets</b>	Select this check box to allow all users in the selected group to view expense sheets for all employees in the Expense Sheets workspace in the Job cost module.
<b>Change All Expense Sheets</b>	Select this check box to allow all users in the selected group to create, change, approve, and print out expense sheets for all employees in the Expense Sheets workspace in the Job Cost module.
<b>Release Expense Sheets</b>	Select this check box to allow all users in the selected group to use the <b>Release Expense Sheet</b> action in the Expense Sheets workspace in the Job Cost module.
<b>Reopen Expense Sheets</b>	Select this check box to allow all users in the selected group to use the <b>Reopen Expense Sheet</b> action in the Expense Sheets workspace in the Job Cost module.
<b>Convert Job to Order</b>	Select this check box to allow all users in the selected group to use the <b>Convert to Order</b> action in the Jobs workspace in the Job Cost module.
<b>See All Employee Plans</b>	<p>Select this check box to allow all users in the selected group to view all planning lines in the Detailed Planning workspace in the Resource Planning module. If the users in the group cannot view all planning lines, only jobs assigned to each user with a project manager role can be viewed. Planning lines that have not been assigned to an employee are also viewable.</p> <p>For more information, refer to the field description for the <b>Plan All Jobs</b> field.</p>
<b>Plan All Jobs</b>	<p>Select this check box to allow all users in the selected group to create and change planning lines for all jobs in the Detailed Planning workspace in the Resource Planning module. If the users in the group do not have access to planning lines for all jobs, planning lines can only be created or changed when a user is the job's project manager.</p> <p>This field's function is connected to the <b>See All Employee Plans</b> field. If a user has access to plan all jobs but cannot view all employee plans, allocating hours to a planning line is done only for the employee assigned to the user. However, the user can also allocate hours to employees assigned to a job where the user's role is project manager.</p> <p>If you have defined that a user cannot plan all jobs and cannot view all employee plans, the user only has access to planning lines for jobs where</p>

Field	Description
	the user's role is project manager. Lines for the employee assigned to the user are also viewable.
<b>Submit Absence</b>	Select this check box to allow all users in the selected group to use the <b>Submit Absence</b> action to submit absences for all employees in the Employee Absence Calendars, Absence Calendar Lines, and Employee Calendars workspaces in the Resource Planning module.
<b>Approve and Reject Absence</b>	Select this check box to allow all users in the selected group to use the <b>Approve Absence</b> and <b>Reject Absence</b> actions to approve and reject absences for employees in the Employee Absence Calendars, Absence Calendar Lines, and Employee Calendars workspaces in the Resource Planning module.
<b>Reopen Absence</b>	Select this check box to allow all users in the selected group to use the <b>Reopen Absence</b> action to reopen absences for all employees in the Employee Absence Calendars, Absence Calendar Lines, and Employee Calendars workspaces in the Resource Planning module. If you do not select this field, absences can only be reopened if a user is the supervisor or absence approver of an employee.
<b>Change Amount Activity Tasks</b>	Select this check box to allow all users in the selected group to change tasks that derive amount activities in the Job Cost module. For more information, refer to the Approve Tasks Workspace section in the Job Cost module.
<b>Change Time Activity Tasks</b>	Select this check box to allow all users in the selected group to change tasks that derive time activities in the Job Cost module. For more information, refer to the Approve Tasks Workspace section in the Job Cost module.
<b>Can Approve Tasks</b>	Select this check box to allow all users in the selected group to approve tasks created in the Job Cost module. For more information, refer to the Approve Tasks Workspace section in the Job Cost module.
<b>Submit Jobs</b>	Select this check box to enable the user role to submit jobs.
<b>Approve Jobs</b>	Select this check box to enable the user role to approve jobs.

#### Permitted G/L Actions Island

Field	Description
<b>Use Post-Entry Periods</b>	Select this check box to allow all users in the selected group to post in prior-periods by selecting a prior-period in the General Journal and Vendor Invoices workspaces.
<b>Submit Journals</b>	Select this check box to allow all users in the selected group to use the <b>Submit</b> action to submit customer payment journals and job journals in the Customer Payments and Job Journal workspaces.

Field	Description
<b>Post Own Journals</b>	<p>Select this check box to allow all users in the selected group to post general journals, customer payment journals, and job journals they have submitted.</p> <p><b>Note:</b> If the <b>Allow Posting of Own Journals</b> system parameter has been enabled, all users can post their submitted journals, even when this check box is not selected.</p>
<b>Post</b>	Select this check box to allow all users in the selected group to use the <b>Post</b> action in the Posting, General Journal, Vendor Invoices, and Job Journal workspaces. This does not affect the users' ability to post in the Print Posting Journal workspace.
<b>Submit General Journals</b>	Select this check box to allow all users in the selected group to submit general journals.
<b>Approve General Journals</b>	Select this check box to allow all users in the selected group to approve general journals.

#### Permitted A/R Actions Island

Field	Description
<b>Release Customer Payments</b>	Select this check box to allow all users in the selected group to release customer payments for posting. If you do not select this check box, the users within this group cannot manually mark the <b>Released</b> field on lines in the Customer Payments workspace.
<b>Submit Customers</b>	Select this check box to allow all users in the selected group to submit customers.
<b>Approve Customers</b>	Select this check box to allow all users in the selected group to approve customers.

#### Permitted A/P Actions Island

Field	Description
<b>Submit Purchase Orders</b>	Select this check box to allow users in the selected group to use the <b>Submit Purchase Order</b> action in the Purchase Orders workspace.
<b>Approve purchase order</b>	Select this check box to allow all users in the selected group to use the <b>Approve Purchase Order</b> action in the Purchase Orders workspace.
<b>Reopen purchase order</b>	Select this check box to allow all users in the selected group to use the <b>Reopen Purchase Order</b> action in the Purchase Orders workspace.

Field	Description
<b>Approve request for quote</b>	Select this check box to allow all users in the selected group to use the <b>Approve Request for Quote</b> action in the Requests for Quote workspace.
<b>Reopen request for quote</b>	Select this check box to allow all users in the selected group to use the <b>Reopen Request for Quote</b> action in the Requests for Quote workspace.
<b>Approve requisition</b>	Select this check box to allow all users in the selected group use the <b>Approve Requisition</b> action in the Requisitions workspace.
<b>Reopen requisition</b>	Select this check box to allow all users in the selected group to use the <b>Reopen Requisition</b> action in the Requisitions workspace.
<b>Submit Vendor Invoices</b>	Select this check box to allow all users in the selected group to release vendor invoices. It gives users the ability to submit invoices for approval in the Vendor Invoices and Invoice Allocation workspaces.
<b>Approve Vendor Invoices</b>	Select this check box to allow all users in the selected group to approve vendor invoices for posting in the Vendor Invoices and Invoice Allocation workspaces.
<b>Pre Post Invoices</b>	Select this check box to allows all users in the selected group to pre-post vendor invoices in the Reallocate Invoices workspace.
<b>Submit Vendors</b>	Select this check box to allow all users in the selected group to submit vendors.
<b>Approve Vendors</b>	Select this check box to allow all users in the selected group to approve vendors.

#### Permitted Trade Actions Island

Field	Description
<b>Change Prices</b>	<p>Select this check box to allow all users in the selected group to change information on price and payment terms on the Quotes, Sales Orders, Credit Orders, and Order Lines workspaces.</p> <p>If you do not select this check box, all users in the selected group cannot change the values in the following fields located in the tabs in the Quotes, Sales Orders, and Credit Orders workspaces:</p> <ul style="list-style-type: none"> <li>▪ Partial Delivery</li> <li>▪ Payment Terms</li> <li>▪ Tax</li> <li>▪ Price List</li> <li>▪ Price Step</li> <li>▪ Invoices Discount %</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Charge 1-4</li> </ul> <p>Maconomy auto-populates values in these fields using the data in the customer's information card.</p> <p>If you do not select this check box, all users in the selected group also cannot change the values in the following fields located in the sub-tabs of the workspaces:</p> <ul style="list-style-type: none"> <li>Unit Price</li> <li>Discount %</li> <li>Discount</li> </ul> <p>Maconomy auto-populates values in these fields using the data from price lists and discount agreements.</p>
<b>Approve Sales Orders</b>	Select this check box to allow all users in the selected group to use the <b>Approve Order</b> action in the Sales Orders workspace.
<b>Print Order Confirmations</b>	Select this check box to allow all users in the selected group to use the <b>Print Order Confirmation</b> action in the Sales Orders workspace. This does not affect the users' ability to print order confirmations in the Print Order Confirmation workspace.
<b>Print Picking and Packing Lists</b>	Select this check box to allow all users in the selected group to use the <b>Print Packing List</b> action in the Sales Orders module. Selecting this check box also allows all users in the selected group to use the <b>Create Warehouse Transaction</b> and <b>Create Picking List</b> actions in the Sales Orders and Inventory modules. This does not affect the users' ability to print packing lists in the Print Packing List workspace.
<b>Print Packing Slips</b>	<p>Select this check box to enable all users in the selected group to use the following:</p> <ul style="list-style-type: none"> <li><b>Print Packing Slip</b> and <b>Release for Invoicing</b> actions to ship items in the Sales Orders workspace</li> <li><b>Approve Packing List</b> and <b>Print Packing Slip</b> actions in the Picking Lists workspace</li> <li><b>Create Warehouse Transaction</b> action in several workspaces</li> </ul> <p><b>Note:</b> Selecting this check box does not apply to access control in the Print Picking Lists and Print Packing Slip workspaces. all users in the selected group can create and print warehouse transactions, picking lists, and packing slips in these workspaces if assigned to a group that provides access to the Print Packing Slip workspace.</p>

Field	Description
<b>Change orders being picked and packed</b>	<p>Select this check box to allow all users in the selected group to add, change, and delete order lines on a sales order with existing open lists or warehouse transactions.</p> <p>If you do not select this check box, all users in the selected group cannot change order lines on orders with existing open packing lists or warehouse transactions.</p> <p>If back order allocation is used, receiving items in the Item Receipt and Inventory Change workspaces also cause changes to existing picking lists. Maconomy checks if each user receiving the items has access to changing orders being picked and packed. If a user does not have access, the back order allocation does not allocate items to orders with a printed packing list.</p> <div> <p><b>Note:</b> The packing list is not automatically reprinted when changes are made to an order after a packing list is printed. You must locate the order in the Order Status workspace and deselect the <b>Printed</b> check box in the Packing List island to print an updated packing list.</p> </div>
<b>Approve item purchase orders</b>	Select this check box to allow all users in the selected group to use the <b>Approve Item Purchase Order</b> action in the Item Purchase Orders workspace.
<b>Print item purchase orders</b>	Select this check box to allow all users in the selected group to use the <b>Print Item Purchase Order</b> action in the Item Purchase Orders workspace. This does not affect the users' ability to print item purchase orders in the Print Item Purchase Order workspace.
<b>Close Item Purchase Orders</b>	Select this check box to allow all users in the selected group to use the <b>Close Item Purchase Order</b> action in the Item Purchase Orders workspace and the <b>Close Purchase Order</b> action in the Purchase Orders workspace.

#### Permitted Misc. Actions Island

Field	Description
<b>Create Employee from Contact Person</b>	Select this check box to allow all users in the selected group to use the <b>Create Employee</b> action to create employees from contact persons in the Contact Persons workspace.
<b>Delete Closed Document Revisions</b>	Select this check box to allow all users in the selected group to delete closed document revisions in the Document Revision History workspace. For further information about the functionality of document revisions, see the description of the <b>Revision Control</b> field in the Document Archives workspace.
<b>Unconditionally Unlock Documents</b>	Select this check box to allow all users in the selected group to unlock documents locked by any user in the Document Archives workspace. For further information about the functionality of locking

Field	Description
	documents in document archives, see the description of the <b>Edit Control</b> field in the Document Archives workspace.
<b>Approve Monitors</b>	Select this check box to allow all users in the selected group to approve monitors in the Monitors workspace.
<b>Change Shared Selection Criterion Specifications</b>	Select this check box to allow all users in the selected group to change selection criterion specifications marked as Public in the Selection Criterion Specification workspace.
<b>Submit Employees</b>	Select this check box to allow all users in the selected group to submit employees in the Employees workspace.
<b>Approve Employees</b>	Select this check box to allow all users in the selected group to approve employees in the Employees workspace.
<b>Submit Users</b>	Select this check box to allow all users in the selected group to submit users in the Users workspace.
<b>Approve Users</b>	Select this check box to allow all users in the selected group to submit users in the users workspace.
<b>Synchronize Talent-Management Users with Employees</b>	Select this check box to allow all users in the selected group to synchronize Talent-Management users with employees in the Employees workspace

### Company Specific Actions Sub-Tab

This section includes the fields and descriptions for the Company Specific User Actions sub-tab.

Field	Description
<b>Company No.</b>	In this field you can select the company for which the actions selection are valid.
<b>User Action Group</b>	In this field you can specify a user action group. When an action group is specified, all action fields receive the value from the action group and cannot be modified individually.
<b>Use Post-Entry Periods</b>	If this field is marked, the user can post in prior-periods by selecting a prior-period in the windows General Journal and Vendor Invoices.
<b>Submit Journals</b>	If this field is marked, the user can submit general journals, customer payment journals and job journals using the action "Submit" in the window General Journals, Customer Payments and Job Journal.
<b>Post Own Journals</b>	If this field is marked, the user can post general journals, customer payment journals and job journals submitted by himself or herself. The field is only relevant if the system parameter "Allow Posting of Own

Field	Description
	Journals" has not been marked, as all users will otherwise be able to post journals submitted by themselves.
<b>Post</b>	If this field is marked, the user can use the action "Post" in the windows Posting, General Journal, Vendor Invoices and Job Journal. This does not affect the user's access to post in the window Print Posting Journal.
<b>Release Customer Payments</b>	In this field, you can specify whether or not the user should be able to release customer payments for posting. If you do not mark this field, the user cannot manually mark the field "Released" on lines in the window Customer Payments.
<b>Submit Purchase Orders</b>	Select this check box to enable the user role to submit purchase orders.
<b>Approve purchase order</b>	If this field is marked, the user can access the action "Approve Purchase Order" in the window Purchase Orders.
<b>Reopen purchase order</b>	If this field is marked, the user can access the action "Reopen Purchase Order" in the window Purchase Orders.
<b>Approve request for quote</b>	If this field is marked, the user can access the action "Approve Request for Quote" in the window Requests for Quote.
<b>Reopen request for quote</b>	If this field is marked, the user can access the action "Reopen Request for Quote" in the window Purchase Orders.
<b>Approve requisition</b>	If this field is marked, the user can access the action "Approve Requisition" in the window Requisitions.
<b>Reopen requisition</b>	If this field is marked, the user can access the action "Approve Requisition" in the window Requisitions.
<b>Submit Vendor Invoices</b>	Select this check box to allow all users in the selected group to release vendor invoices. It gives users the ability to submit invoices for approval in the Vendor Invoices and Invoice Allocation workspaces.
<b>Approve Vendor Invoices</b>	Select this check box to enable the user role to approve vendor invoices.
<b>Pre Post Vendor Invoices</b>	If this field is marked, the user can pre-post vendor invoices in the Reallocate Invoices window.
<b>Submit Jobs</b>	Select this check box to enable the user role to submit jobs.

Field	Description
<b>Approve Jobs</b>	Select this check box to enable the user role to approve jobs.
<b>Submit Draft Invoice</b>	Select this check box to enable the user role to submit draft invoices.
<b>Approve Draft Invoice</b>	Select this check box to enable the user role to approve draft invoices.
<b>Submit Job Budgets</b>	<p>Select this check box to enable the user role to submit job budgets. Only users with access rights can select this field.</p> <p><b>Note:</b> If a user without access rights tries to select the <b>Submit Job Budgets</b> field, Maconomy displays an error message.</p>
<b>Approve Job Budgets</b>	<p>Select this check box to enable the user role to approve job budgets. Only users with access rights can select this field.</p> <p><b>Note:</b> If a user without access rights tries to select the <b>Approve Job Budgets</b> field, Maconomy displays an error message.</p>
<b>Submit General Journals</b>	Select this check box to enable the user role to submit general journals in the company specified on the line.
<b>Approve General Journals</b>	Select this check box to enable the user role to approve general journals in the company specified on the line.

## Actions

This section shows the actions available in the Actions workspace.

### Top Tab

Field	Description
<b>Update Rights</b>	This action is not used in the current version of Maconomy.

## User Action Groups Single Dialogs Workspace

Use this workspace to set up user action groups, which are collections of Maconomy users, often with similar jobs, who have access to the same actions.

For example, you might have a group for people who are permitted to approve purchase orders.

## User Action Group Tab

This section includes the fields and descriptions for the User Action Group tab.

### User Action Group Island

Field	Description
<b>Name</b>	Enter the name of a user action group.

### Permitted Job/Cost Actions Island

Field	Description
<b>Submit Job Budgets</b>	Select this check box to allow users in the selected group to submit job budgets.

### Permitted G/L Actions Island

Field	Description
<b>Use Post-Entry Periods</b>	If this field is marked, the users within this action group can post in prior-periods by selecting a prior-period in the windows General Journal and Vendor Invoices.
<b>Submit Journals</b>	If this field is marked, the users within this action group can submit general journals, customer payment journals and job journals using the action "Submit" in the window General Journals, Customer Payments and Job Journal.
<b>Post Own Journals</b>	If this field is marked, the users within this action group can post general journals, customer payment journals and job journals submitted by himself or herself. The field is only relevant if the system parameter "Allow Posting of Own Journals" has not been marked, as all users will otherwise be able to post journals submitted by themselves.
<b>Post</b>	If this field is marked, the users within this action group can use the action "Post" in the windows Posting, General Journal, Vendor Invoices and Job Journal. This does not affect the user's access to post in the window Print Posting Journal.

### Permitted A/R Actions Island

Field	Description
<b>Release Customer Payments</b>	In this field, you can specify whether or not the users within this action group should be able to release customer payments for posting. If you do not mark this field, the user cannot manually mark the field "Released" on lines in the window Customer Payments.

**Permitted A/P Actions Island**

Field	Description
<b>Submit Purchase Orders</b>	Select this check box to allow users in the selected group to use the <b>Submit Purchase Order</b> action in the Purchase Orders workspace.
<b>Approve purchase order</b>	If this field is marked, the users within this action group can access the action "Approve Purchase Order" in the window Purchase Orders.
<b>Reopen purchase order</b>	If this field is marked, the users within this action group can access the action "Reopen Purchase Order" in the window Purchase Orders.
<b>Approve request for quote</b>	If this field is marked, the users within this action group can access the action "Approve Request for Quote" in the window Requests for Quote.
<b>Reopen request for quote</b>	If this field is marked, the users within this action group can access the action "Reopen Request for Quote" in the window Purchase Orders.
<b>Approve requisition</b>	If this field is marked, the users within this action group can access the action "Approve Requisition" in the window Requisitions.
<b>Reopen requisition</b>	If this field is marked, the users within this action group can access the action "Approve Requisition" in the window Requisitions.
<b>Submit Vendor Invoices</b>	Select this check box to allow all users in the selected group to release vendor invoices. It gives users the ability to submit invoices for approval in the Vendor Invoices and Invoice Allocation workspaces.
<b>Approve Vendor Invoices</b>	Select this check box to allow all users in the selected group to approve vendor invoices for posting in the Vendor Invoices and Invoice Allocation workspaces.
<b>Pre Post Vendor Invoices</b>	If this field is marked, the users within this action group can pre-post vendor invoices in the Reallocate Invoices window.

## View Groups Single Dialogs Workspace

Use this workspace to set up groups of users and specify which views are available to the members of each group.

Some users use third-party products to access the Maconomy database, communicating with the database via the Maconomy ODBC driver. You can set up views, or collections of fields, that control the information that these users can access.

A view is a group of a number of fields in one of more joined relations in Maconomy's database. You use views to control the information that you make accessible to users who read information in Maconomy's database via third-party products. Each view contains the names of the relations and associated fields from which users can read information when using the view in question.

This means that when you use a view, you can only retrieve information that pertains to the fields that are defined in the view.

Maconomy comes with one view per relation, where each view contains all of the fields in the relation. An individual user's membership in groups determines which views he or she can use, as described in the following.

When a user accesses the database using the Maconomy ODBC driver, the same access control tools that are normally used in Maconomy apply, that is, groups, users, and access levels.

When you create a user as a database user, you specify a name that the user must use to log in to the database using the ODBC driver. In addition to this, each database user has a password. You define the database user name and password in the Users workspace.

In this workspace, you specify the views that are available to the members of each group. The View Groups tab displays the name of a group, and the Views sub-tab displays the views that you have defined. For each view, you can specify whether members of the current group should have access to that view.

Note that you cannot change the settings in the fields in the Views sub-tab for the "Change Password" and "All Windows" groups.

As a database user, you are a member of the same groups as in Maconomy, that is, the groups listed in the User Dialog Groups sub-tab of the Users workspace. When you log in to the database, you thus gain access to use the views that are assigned to the groups of which you are a member.

The access control that determines which entries each user can see functions in the same way as elsewhere in Maconomy. This means that a database user can, for example, only view information about companies that are assigned to an access level to which the database user has access. Because a database user is directly associated with a "regular" user card in Maconomy, the database user has access to the same access levels as when using the Maconomy client.

## View Groups Tab

This section includes the fields and descriptions for the View Groups tab.

### Group Island

Field	Description
<b>Group Name</b>	This field shows the name of a group. You cannot create groups in this workspace, only browse between the groups already created. Groups are created in the workspace Groups.

### User Island

See the Getting Started topic for a description of the fields in the island User.

## Views Sub-Tab

This section includes the fields and descriptions for the Views sub-tab.

Field	Description
<b>View Name</b>	This field shows the name of the view, to which the current group can give access. Views are predefined in the system, and cannot be changed here.
<b>Access</b>	In this field, you can specify if the group should give access to using the current view. If the field is marked, members of the group have access to using the current view. Consequently, users assigned to the group can read information in the database tables using the ODBC driver.

## Group User Roles Single Dialog Workspace

Use this workspace to add users to a group.

The Group tab displays the name of the group and the associated portal. You can add users to the list in the Users sub-tab.

## Group Tab

This section includes the fields and descriptions for the Group tab.

### Group Island

Field	Description
<b>Name</b>	This field shows the group name.
<b>Access with Expired Password</b>	If this field is selected, a user with access to the current group will be able to activate the windows in this group even if his password has expired. If this field is not selected, a user with access to the current group will not be able to activate the windows in this group if his password has expired. In the group "Change Password," this field is automatically marked by Maconomy.

### Portal Island

This island and its fields only appear if the Portal has been installed. For further information, see the section "Groups and Portal Roles."

Field	Description
<b>Role No.</b>	This field shows the number of the role assigned to the current group. For all roles created as a result of creating a group in this window, the role number corresponds to the group name. The number may vary from the group name if the role was assigned to the group in an upgrade from a previous version.
<b>Role Name</b>	This field shows the name of the Portal role to be automatically created and assigned to the group when the group is created.

Field	Description
<b>Standard Component</b>	This field shows the ID of a standard component for the role assigned to the current group. The standard component is shown in the Portal immediately after logon unless another standard component has been specified for the user in question, in which case the user specific standard component is shown. If a given user is assigned to several roles, the standard component is chosen at random among these.

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Users Roles Sub-Tab

This section includes the fields and descriptions for the User Roles sub-tab.

Field	Description
<b>Username</b>	In this field you can specify a user name for a user that should be added to the group.
<b>Role Name</b>	This field displays the name for user roles assigned to the group.

## Access Information Single Dialogs Workspace

Use this workspace to set up rules that govern the format of user passwords (for example, the number of characters and the minimum number of digits).

These rules apply to all Maconomy users, assuming that you require users to enter passwords to log in to Maconomy.

However, the information in this workspace is only relevant if you select the **Password Required** field in the System Information workspace.

### Access Information Tab

This section includes the fields and descriptions for the Access Information tab.

### Password Island

Field	Description
<b>Minimum Length</b>	In this field, you can specify the minimum number of characters to be used in an access code.
<b>Minimum Number of Letters</b>	In this field, you can specify the minimum number of letters to be used in an access code. The letters do not have to be placed next to each other as they can be separated by digits or special characters.

Field	Description
<b>Minimum Number of Digits</b>	In this field, you can specify the minimum number of digits to be used in an access code. The digits do not have to be placed next to each other as they can be separated by letters or special characters.
<b>Minimum Number of Special Characters</b>	In this field, you can specify the minimum number of special characters (% , & , #, and so on) to be used in an access code. The special characters do not have to be placed next to each other as they can be separated by digits or letters.
<b>Max. Number of Character Repeats</b>	In this field, you can specify how many times in a row the same character can be repeated.
<b>Number of passwords between reuse</b>	In this field, you can specify the minimum number of times an access code must be changed before it can be changed to the same access code again.
<b>Validation Period in Number of Days</b>	In this field, you can enter the maximum number of days allowed between each user's change of access code. The number is used for calculating the expiry date of the user's access code in the workspace Users. The expiry date is recalculated each time the password of the user is changed. If the expiry date is exceeded as a result of the user not changing his password, the user will only have access to the workspace Change Password the next time he logs on to Maconomy.
<b>Standard Password</b>	<p>In this field, you can enter an access code to be used as the standard access code. The standard access code must comply with the rules set up for access codes in this workspace.</p> <p>If you enter a standard access code, users created in the workspace Users will automatically be assigned this access code. The standard access code is also assigned to users whose access code is reset in the workspace Reset Password.</p> <p>If you do not enter a standard access code, new users and users whose access code is reset are assigned a pseudo-random access code generated by Maconomy.</p>

### User Island

See the Getting Started topic for a description of the fields in the island User.

## Reset Password Single Dialogs Workspace

Use this workspace to reset the password for a user if, for example, he or she forgot the password.

Depending on your settings Maconomy issues a standard password (such as Password1) or a random code to the user.

Every time that you delete or change a password, it is recorded in Maconomy's security log. The passwords are not recorded.

If you selected the **Password Required** field in the System Information workspace, Maconomy assigns to the user in question the standard access code, if you specified one in the Access Information workspace. Otherwise, Maconomy assigns to the user a pseudo-random access code that it generates; the user can then change the access code in the Change Password workspace. If you do not require a password, using this function causes Maconomy to delete the access code.

## Reset Password Tab

This section includes the fields and descriptions for the Reset Password tab.

### User Island

Field	Description
<b>Name</b>	This is the name of the user whose password is being reset. To retrieve user names, you can use the search functions in the Find menu.

### Actions

This section shows the actions available in the Reset Password workspace.

### Top Tab

Field	Description
<b>Reset</b>	Select this function to reset the password.

## Change Password Single Dialogs Workspace

Use this workspace to change user passwords.

Passwords are normally required to access Maconomy. Maconomy verifies that users enter the correct combination of user name and password.

Passwords are mandatory if you selected the **Password Required** option in the System Information workspace. If you selected this option, Maconomy automatically assigns a password to each new user that you add in the Users workspace. A user should change this first password immediately.

Use the Access Information workspace to set up the rules that govern the format of user passwords (for example, the number of characters and the minimum number of digits).

It is recommended that after you create a user, he or she should immediately change the password that Maconomy assigned to him or her. In the Access Information workspace, you can specify the rules for the contents of access codes, as well as rules about how often users must change their passwords.

If a password is required, Maconomy checks that the password complies with the rules set up in the Access Information workspace.

Each time that you delete or change a password, the action is recorded in Maconomy's security log. The passwords are not recorded.

## Change Password Tab

This section includes the fields and descriptions for the Change Password tab.

### Password Island

Field	Description
<b>Username</b>	This is the name of the user whose password is being changed. To retrieve user names, use the search functions in the Find menu.
<b>Old Password</b>	<p>In this field, you enter the current password. If the current user does not have a password, leave the field blank.</p> <p>If the user is new in the system, and therefore has not been assigned an access code, leave this field blank. However, if the field "Access Code Required" has been marked in the workspace System Information, new users are always assigned an access code when created.</p> <p>For passwords, Maconomy reads upper and lower cases as different characters, that is, SMITH is not the same as Smith.</p>
<b>New Password</b>	<p>In this field, you enter the new password. You are asked to enter it twice to verify that the text is entered correctly. Maconomy alerts you, if you re-enter the password differently in the field "Confirm New Password" below.</p> <p>If passwords are required by Maconomy, you must enter an access code which complies with the rules set up for passwords in the workspace Access Information. You can only use characters with an ASCII value of less than or equal to 126.</p>
<b>Confirm new Password</b>	In this field, you must repeat the new password to verify that the text is entered correctly. Maconomy alerts you if the passwords entered in the field "New Password" and in this field are not identical.

## Change Database Password Single Dialogs Workspace

Use this workspace to maintain users' database user passwords.

Some users use third-party products to access the Maconomy database, communicating with the database via the Maconomy ODBC driver. These users need both a regular password and a database password.

You enter the original database password in the Users database; you can change the database password in the Change Database Password workspace. A user should change this first password immediately, then continue to change passwords on a regular basis.

Use the Access Information workspace to set up the rules that govern the format of user passwords (for example, the number of characters and the minimum number of digits).

Each time that you delete or change a password, the action is recorded in Maconomy's security log. The passwords are not recorded.

## Change Database Password Tab

This section includes the fields and descriptions for the Change Database Password tab.

### Password Island

Field	Description
<b>Username</b>	This field shows the name of the current user. A user can only change his or her own password.
<b>Database User Name</b>	This field shows the database user name of the current user. The name is transferred from the island Database User Name in the workspace Users and cannot be changed here.
<b>New Password</b>	In this field, you can enter the user's new database password. When the password is entered, a message shows the database user name used and the new password. The entered password is then removed from this field. Passwords are restricted to characters with an ASCII value less than or equal to 126.

## Access Levels Single Dialogs Workspace

Use this workspace to set up and maintain the access levels that you use to control your users' access to specific records.

For each user, you can grant access to the jobs, customers, companies, invoice entries, and so on that are relevant to that user's role. You can control access to static information, such as customer and job information, and transactions, such as G/L entries and orders.

In this workspace you set up a hierarchy of access levels, with top levels, sub-levels, and sub-sub-levels. If a user has access to a level, that user has access to all of the levels below it in the hierarchy.

You create the access hierarchy by assigning a list of sub-levels to each access level. You must create each sub-level as an individual access level, which can then have a list of sub-levels itself.

For a list of the areas of Maconomy that are subject to direct access control, see the listing of relations with direct access control in the Maconomy Database Description.

For each user name that you create, you can enter a list of access levels to which that user has access. This means that the user is granted access to the jobs, customers, companies, and so on assigned to these access levels or their sublevels. As a result, the user can, for example, view and enter information about a given company in the Company Information workspace, and create jobs with that company as the settling company. Note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to companies may depend on other factors. By means of indirect access control, a user is also indirectly granted access to entries in Maconomy's database that refer to entries to which the user has access. For more information about the standard access control configuration and direct and indirect access control, see "Introduction to the Access Control System."

You grant users access to the individual access levels in the User Access Levels workspace. When you assign a user to a given level, that user has access to referring to all jobs, customers,

and vendors assigned to the selected access levels or any underlying levels. An underlying level can, for example, be the sublevel of a sublevel.

In the Company Information workspace, you can also assign an access level to a company. If you specify an access level for a company, a user can only see information assigned to that company if you have granted access to the access level in question to that user. This functionality is described in more detail in the "Introduction to the Access Control System."

For auditing reasons, you should print out and file the access levels each time that you make changes in this workspace.

## Access Levels Tab

This section includes the fields and descriptions for the Access Levels tab.

### Level Island

Field	Description
<b>Name</b>	Here, you can enter a name of the current level in connection with its creation. Maconomy checks that the name has not already been used. It is not possible to change the name of already existing access level information.
<b>Description</b>	Here, you can enter a description of the access level. The field is used for reference purposes only.
<b>Access Level Type</b>	<p>This field shows whether the current access level is a standard access level, an access list or a user specific access level.</p> <p>Access levels can be created manually in this workspace (or through import programs), resulting in an access level of the type Standard.</p> <p>However, access levels can also be created automatically as part of the creation of users. This is relevant if you want to grant your customers access to their own orders, for example, if you are running a Web shop on your Maconomy system and you have therefore set up an automated user creation which is run when a customer is created, automatically creating a user for the new customer based on a user type set up for this purpose. To ensure that the new customer can only see his/her own information, the user type can be set up to automatically create a branch in the access level tree, specific to the user representing the customer, and grant the user access to this branch. Access levels created using this functionality are of the type Access List or User Specific. For detailed information about the concepts of access lists and user specific access levels, please see the description of the islands "User Specific Access Level" and "Access List" in the section on the workspace User Types.</p> <p>Access levels feature the same functionality in terms of access restriction, regardless of the type. The access type therefore merely indicates how the access level was created. However, access levels of the types Access List and User Specific cannot be created manually, and you cannot manually create any lines in the sub-tab for access lists.</p>

### User Island

See the Getting Started topic for a description of the fields in the island User.

## Sublevels Sub-Tab

This section includes the fields and descriptions for the Sublevels sub-tab.

Field	Description
<b>Sublevel</b>	<p>In this field, you can select the sublevel to be assigned to the level. The sublevel must be created as an individual level, and it cannot be part of a level higher up in the level hierarchy.</p> <p>If an access level of the type “Access List” is shown in the tab, it is not possible to create any lines in the sub-tab.</p> <p>It is not possible to create lines with access levels of the type “User Specific.”</p> <p>For information about the concepts of access lists and user specific access levels, please see the description of the islands “User Specific Access Level” and “Access List” in the section on the workspace User Types.</p>
<b>Description</b>	This field shows a description of the sublevel. The contents of this field cannot be changed.

## Actions

This section shows the Actions available in the Access Levels workspace.

### Top Tab

Field	Description
<b>New Access Level</b>	<p>Use this action to create an access level.</p> <p>If you have limited administrator rights, created access levels are directly assigned to you, or are assigned as sub-levels to your Main Access Level.</p>
<b>Delete Access Level</b>	<p>Use this action to delete an access level.</p> <p>If the access level is assigned to users, Maconomy displays a warning message.</p> <p>If you are not an administrator, you can only delete access levels you have access to.</p>

## Access Lists Single Dialogs Workspace

Use this workspace to review access sublevels and their immediate parent levels and to add and change access levels.

The functionality is similar to that of the Access Levels workspace. However, the Access Lists tab in this workspace displays an access level, and the Parent Levels sub-tab displays the parent access levels of the access level in the tab. The sub-tab only displays access levels that are one step up in the access level hierarchy. This means that the sub-tab does not display any parent levels that are above the parent levels of the access level displayed in the Access Lists tab.

You can add lines in the Parent Levels sub-tab to make the access level in the Access Lists tab a sub-level of further access levels. Similarly, you can create access levels in the tab.

The functionality of access levels in general is described in the introduction to the Access Levels workspace and in "Extended Access Control."

For auditing reasons, you should print out and file the access levels each time that you make changes in this workspace.

## Access Lists Tab

This section includes the fields and descriptions for the Access Lists tab.

### Level Island

Field	Description
<b>Name</b>	This field shows the name of the current access level. When creating an access level, you can enter the desired name here.
<b>Description</b>	Here, you can enter a description of the access level. The field is used for reference purposes only.
<b>Access Level Type</b>	<p>This field shows whether the current access level is a standard access level, an access list or a user specific access level.</p> <p>Access levels can be created manually in this workspace (or through import programs), resulting in an access level of the type Standard.</p> <p>However, access levels can also be created automatically as part of the creation of users. This is relevant if you want to grant your customers access to their own orders, for example, if you are running a web shop on your Maconomy system and you have therefore set up an automated user creation which is run when a customer is created, automatically creating a user for the new customer based on a user type set up for this purpose. To ensure that the new customer can only see his/her own information, the user type can be set up to automatically create a branch in the access level tree, specific to the user representing the customer, and grant the user access to this branch. Access levels created using this functionality are of the type Access List or User Specific. For detailed information about the concepts of access lists and user specific access levels, please see the description of the islands "User Specific Access Level" and "Access List" in the section on the workspace User Types.</p> <p>Access levels feature the same functionality in terms of access restriction, regardless of the type. The access type therefore merely indicates how the access level was created. However, access levels of the types Access List and User Specific cannot be created manually, and you cannot manually create any lines in the sub-tab for user specific access levels.</p>

### User Island

See the Getting Started topic for a description of the fields in the island User.

## Parent Levels Sub-Tab

This section includes the fields and descriptions for the Parent Levels sub-tab.

Field	Description
<b>Parent Level</b>	<p>In this field, you can select an access level to be assigned as parent to the level shown in the tab. You cannot specify an access level which is assigned, and its position in the access level structure cannot be below the level in the tab.</p> <p>If an access level of the type "User Specific" is shown in the tab, it is not possible to create any lines in the sub-tab.</p> <p>It is not possible to create lines with access levels of the type "Access List."</p> <p>For information about the concepts of access lists and user specific access levels, please see the description of the islands User Specific Access Level and Access List in the section on the workspace User Types.</p>
<b>Description</b>	This field shows a description of the parent level.

## User Access Levels Single Dialogs Workspace

Use this workspace to assign access levels to individual user names.

For each user, you can grant access to the jobs, customers, companies, invoice entries, and so on that are relevant to that user's role. You can control access to static information, such as customer and job information, and transactions, such as G/L entries and orders.

Access levels are hierarchical, with top levels, sub-levels, and sub-sub-levels. If a user has access to a level, that user has access to all of the levels below it in the hierarchy.

If you assigned a particular level to a user, that user has access to all of this level and any sub-levels of this level in the access level hierarchy. In database relations that use direct access control, the user is granted access to database entries assigned to the access level in question or one of its sub-levels. This means that this user can, for example, view and specify information about a given company in the Company Information workspace and create jobs with the company in question as the settling company. Note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to companies may depend on other factors. Using indirect access control, a user is also indirectly granted access to entries in Maconomy's database that refer to entries to which the user has access. For more information about the standard access control configuration, access control in a multi-company model, and direct and indirect access control on database entries, see the "Introduction to the Access Control System."

You create the access level hierarchy in the Access Levels workspace.

For auditing reasons, you should print out and file user access levels each time that you make changes to this workspace. You print this information using the **Print** button.

## User Role Access Levels Tab

This section includes the fields and descriptions for the User Access Levels tab.

### User Role Island

Field	Description
<b>Username</b>	Enter the name of the user who owns the role. Once created, you cannot change the username.
<b>Role Name</b>	Enter the name of the role. The role name must be unique for the user. However, one or more users can have roles with the same name.

### User Island

Field	Description
<b>Created</b>	This field shows the user who originally created this user role.
<b>Changed</b>	This field shows the user who made the last change on this user role. If the user role has not been modified since it was created, this field is blank.
<b>Version</b>	This field shows the current version of the user role based on modifications made to it.

## User Access Levels Sub-Tab

This section includes the fields and descriptions for the User Access Levels sub-tab.

Field	Description
<b>Access Level</b>	<p>In this field, you can enter the name of the user access level to which the user is to have access. Access levels are created in the workspace Access Levels.</p> <p>The user will gain access to all information (companies, customers, vendors, price lists, jobs and so on) assigned to the selected access level or any other level below this level in the access level hierarchy. The user also gains access to referring to this information, meaning that not only can the user see information about, for example, a given customer in the workspace Customer Information Card, but the user can also specify the customer on a sales order.</p> <p>In some cases, you need direct or indirect access to several pieces of information to see a given piece of information in a workspace. This functionality is described in further detail in the section "Introduction to the Access Control System" in the beginning of this chapter.</p> <p>You can only grant a user access to an access level to which you have access yourself. However, the user Administrator can grant users access to any access level.</p> <p>Furthermore, you cannot specify an access level of the type "User Specific," as these access levels can only be assigned automatically as a result of selecting the action "Create New Users."</p>

Field	Description
	Nor is it possible to assign a user directly to a level of the type "Access List." If you want a user to have access to a level of this type, you must assign the user to a parent level of the access list in question.
<b>Description</b>	This field shows the description of the access level. The field is transferred from the workspace Access Levels, and the field cannot be changed here.

## Show Itemized User Access Level Single Dialogs Workspace

Use this workspace to review user access levels and the users who have access to each level.

### List of Itemized User Access Levels Tab

This section includes the fields and descriptions for the List of Itemized User Access Levels tab.

#### Level Island

Field	Description
<b>Access Level</b>	This is the name of the access level the user is assigned to.
<b>User Name</b>	This is the name of the user assigned to the access level.

## Show Security Log Single Dialogs Workspace

Use this workspace to review or print a log of all of the user actions that have affected Maconomy's security for a period that you specify.

Maconomy records the action, the date and time of the action, and the user who is responsible for the action.

Maconomy records the following events:

- Changes to Maconomy's internal date (for example, if a user has backdated the computer's system date)
- Entry of an unknown user name at Maconomy start-up
- Entry of an incorrect password at Maconomy start-up
- Password changed from the Change Password workspace
- Password reset from the Reset Password workspace
- Login attempted using a user name whose validity period has not yet begun
- Login attempted using a user name whose validity period has expired
- Login attempted using a user name whose password has been blocked

## Show Security Log Tab

This section includes the fields and descriptions for the Show Security Log tab.

### Selection Criteria Island

Field	Description
<b>Date</b>	Here you specify a range of dates. Maconomy only shows actions recorded within this range. You must enter a range of dates.
<b>User</b>	Here you enter a range of users. Maconomy only shows actions by users within this range. Note that unknown user names also must be within this range. If you leave the field blank, Maconomy shows all user actions recorded within the given date range.
<b>Control Type</b>	Select which type of action to see in the sub-tab.

## Security Logs Sub-Tab

This section includes the fields and descriptions for the Security Logs sub-tab.

Field	Description
<b>Date</b>	This is the date the action was recorded in the security log. The actions are sorted by date and time.
<b>Time</b>	This is the time of day the action was recorded in the security log. The actions are sorted by date and time.
<b>Control Type</b>	This is the type of action recorded. You can select among five types in the pop-up field in the tab. The actions are described below: <ul style="list-style-type: none"><li>■ System Date Changed — This indicates that a user has backdated the computer's system date and then worked in Maconomy. The change is recorded regardless of whether Maconomy was operating when the date was changed.</li><li>■ Unknown User — This indicates that a user entered an unknown user name at Maconomy start-up. An unknown user name is a name that has not been created in the workspace Users. Maconomy does not record the "Unknown User" name.</li><li>■ Wrong Password — This indicates that a user has not entered the correct password at Maconomy start-up. Passwords are assigned to user names in the workspace Change Password. Maconomy records the user name.</li><li>■ Password Reset — This indicates that a password has been reset in the workspace Reset Password. Maconomy records the name of the user</li></ul>

Field	Description
	<p>whose password has been reset and the name of the user who reset the password.</p> <ul style="list-style-type: none"> <li>■ Password Changed — This indicates that a password has been changed in the workspace Change Password. Maconomy records the name of the user whose password has been changed.</li> <li>■ User Name Not Activated — This indicates that a user has attempted to log on using a user name whose validity period has not yet begun. The validity period of a user is specified in the workspace Users. Maconomy records the user name.</li> <li>■ User Name Expired — This indicates that a user has attempted to log on using a user name whose validity period has expired. The validity period of a user is specified in the workspace Users. Maconomy records the user name.</li> <li>■ User Name Blocked — This indicates that a user has attempted to log on using a user name whose access code has been blocked. Access codes are blocked and unblocked in the workspace Users. Maconomy records the user name.</li> </ul>
<b>Username</b>	This is the name of the user.
<b>Description</b>	This is a description of the control type.

## Approval Section

Use this section to learn about Approval workspaces.

### Introduction to Approval Hierarchies

In a company, you often need to be able to manage the approval of vendor invoices or expense sheets before making payments.

An example could be that if an employee wants to purchase a service, the employee's supervisor must approve the purchase order before it can be assigned to a vendor invoice by the bookkeeping department.

In certain cases, it might also be necessary for more than one person to approve an expense sheet, a purchase order, or the allocation lines of a vendor invoice. An example could be that you want expenses that exceed a certain amount to be approved by the supervisor of the employee who enters the expense, as well as by the department manager. Another example could be that expenses that are related to a certain job are always to be approved by the job's project manager and by the supervisor of the employee who entered the expense.

Approval is of crucial importance to the processing of expense sheets, purchase orders, and vendor invoices. You can only print and assign a purchase order to a vendor invoice when the purchase order has been fully approved. In addition, only approved purchase orders are included in the financial commitment accounts.

For expense sheets that use approval by approval hierarchies, this approval overrules the approval of a supervisor. This means that if you specify for a job that the supervisor must approve expense sheets, you can only post an expense (and settle it) when it has been fully approved by all of the people in the relevant approval hierarchy. If approval by the project manager for a given job is also required, the project manager must also approve the current line of an expense sheet before you can post it. The project manager's approval is performed without the use of approval hierarchies.

The approval principles are described in more detail in the Jobs workspace in the Job Cost module.

In Maconomy, the need for a specific approval procedure is handled by approval hierarchies. An approval hierarchy is a set of rules that determine who can approve the following, based on assigned allocation lines that match certain conditions: expense sheet, purchase order, vendor invoice, draft invoice, job budget, time sheet, vendor, company vendor, customer, company customer, employee, and user information.

### Setting up an Approval Hierarchy

An approval hierarchy applies to allocation lines of the items listed above. Because the functionality is identical for these types of approval hierarchies, the term "expense sheet" is used for the types of entries in the following description.

An approval hierarchy is a number of lines in the Approval Hierarchies workspace. For each line you specify a selection criterion and a person. This means that the person who is specified on the line in question must approve an expense sheet that matches the selection criterion specification on a given line. An expense sheet can match several selection criterion specifications in the same approval hierarchy. If that is the case, all respective persons must approve the expense sheet before it is considered to be fully approved.

The selection criterion specification on an approval hierarchy line is a predefined selection criterion specification that you create in the Selection Criterion Specification workspace. The person who is to approve expense sheets that match the current selection criterion specification is either a specific employee or a reference to an employee who is assigned a certain function. The reference might be, for example, the supervisor of the person who submits the expense sheet or the project manager on the job to which the current expense sheet is assigned.

The following example illustrates a simple approval hierarchy. The selection criterion specifications in the example are named according to the expense sheets that they contain. See the description of the Selection Criterion Specification workspace for more information about how to set up selection criterion specifications:

Selection Criterion Specification	Approver	Approver Reference
Amount <= 1,000		Submitter
Amount > 1,000		Submitter's supervisor
Amount > 10,000	1044	

When an expense sheet amounts to USD 1,000 or less, only the person who submits it must approve it. The submitter's supervisor must approve any expense sheets that amount to more than USD 1,000. Employee no. 1044 and the submitter's supervisor must always approve

amounts of more than USD 10,000 (no matter who submitted the expense sheet), because the expense sheet also matches the selection criterion specification on line 2.

For each approval hierarchy you can specify whether the approval of expense sheets that are to be approved by several persons (that is, the expense sheet matches more than one line in an approval hierarchy) is to be made in a certain order or if the approval is to be performed in any order. By specifying that approval is to be performed in a certain order, for example, you ensure that approval is always begun at the lower level in the organization before escalating to the higher levels in the organization.

If you use approval hierarchies, all expense sheets must be approved by means of an approval hierarchy; thus, an approval hierarchy line that consists of the submitted expense sheets must always be found. Expense sheets that do not match any of the selection criterion specifications in an approval hierarchy cannot be submitted because Maconomy issues an error message when submission is attempted.

### **Several Approval Hierarchies**

The approval procedure can often vary among the companies in a multi-company model. For example, there might be a more restrictive need for approvals in one company than in another, or some companies might have different approval functions to be supported by the approval hierarchies.

An example could be that one company in the organization wants expense sheets to be approved by several persons, depending on the size of the amount, whereas another company always wants the manager of the company to approve expense sheets regardless of the size of the amount.

In Maconomy, you can handle this in the Approval Hierarchies workspace by creating separate approval hierarchies for the different approval procedures to be used.

In the Approval Hierarchy Selection workspace you can specify a range of conditions that determine when an approval hierarchy is to be used. In the Approval Hierarchy Selection workspace you can then specify a specific set of rules to be applied to approval hierarchies for purchase orders, a specific set of rules to be applied to approval hierarchies for expense sheets, and a specific set of rules to be applied to approval hierarchies for vendor invoices and assigned allocation lines. If you create one or more lines in the Approval Hierarchy Selection Lines sub-tab for each of these hierarchy selection types, all purchase orders, expense sheets, and vendor invoices must be approved via an approval hierarchy. If you do not define any hierarchy selection lines, no approval hierarchies are used for the current type of transaction, and the approval must be performed based on a procedure that is specific to purchase orders, expense sheets, or vendor invoices. For more information about approvals without using approval hierarchies see "Other Approval Procedures."

A set of rules consists of a number of lines in the Approval Hierarchy Selection Lines sub-tab of the Approval Hierarchy Selection workspace. For each line, you provide a selection criterion specification and an approval hierarchy; this means that an expense sheet that matches the selection criterion specification on a given line must be approved through the approval hierarchy that is specified on the current line. The selection criterion specification here is also a selection criterion specification that you created in the Selection Criterion Specification workspace. The approval hierarchy is a hierarchy that you created in the Approval Hierarchies workspace.

When you submit an expense sheet, Maconomy first checks which selection criterion specification in the Approval Hierarchy Selection workspace the current expense sheet matches.

Next, Maconomy determines the holders of approval in the approval hierarchy specified for the selection criterion specification in question.

If an expense sheet matches several selection criterion specifications in the Approval Hierarchy Selection workspace, Maconomy uses the hierarchy that you defined for the selection criterion specification in the upper line of the sub-tab. If the approval hierarchy selection consists of several selection criterion specifications that can include the same expense sheets, you should put the most specific selection criterion specifications in the upper lines of the sub-tab, followed by selection criterion specifications that have more broad criteria. This enables you set up a process where an expense sheet flows through the most narrow selection criterion specifications until it reaches a selection criterion specification that it matches.

Using approval hierarchies requires that all expense sheets are approved by means of an approval hierarchy; as a result, Maconomy must always find an approval hierarchy selection line that consists of the submitted expense sheet. Expense sheets that you do not put within any of the selection criterion specifications in an approval hierarchy cannot be submitted because Maconomy issues an error message when expense sheet users try to submit them.

One way to ensure that all expense sheets can be submitted is to put a line that contains a selection criterion specification that covers all expense sheets in the lower part of the Approval Hierarchy Selection Lines sub-tab, and select an approval hierarchy for expense sheets that do not match the conditions of any of the selection criterion specifications that you entered in the upper part of the sub-tab.

The following example illustrates how Maconomy selects the relevant approval hierarchy via the Approval Hierarchy Selection workspace. As in the previous example, the selection criterion specifications are named according to the expense sheets that they contain. See the description of the Selection Criterion Specification workspace for more information about the setup of selection criterion specifications.

In the Approval Hierarchy Selection workspace, you create the following lines in the set of rules for expense sheets:

Line No.	Selection Criterion Specification	Approval Hierarchy
1	Expense sheets assigned to company no. 1 and job no. 1050	AH3
2	Expense sheets assigned to company no. 1	AH2
3	Expense sheets assigned to company no. 2	AH1

Employees create and submit the following expense sheets:

Expense sheet No.	Company No.	Job No.
2100	2	2486
1100	1	1050
1101	1	1091

Because it applies from expense sheet no. 2100, this expense sheet matches the selection criterion specification on line 3 in the approval hierarchy selection. This means that this expense sheet is approved by means of approval hierarchy AH1.

Due to its company and job specification, expense sheet no. 1100 matches the selection criterion specification on line 1; however, because the selection criterion specification on line 2 only contains the condition that the expense sheet must be assigned to company no. 1, this expense sheet also matches that selection criterion specification. Maconomy thus selects the upper of these lines, which means that expense sheet no. 1100 is to be approved by means of approval hierarchy AH3.

Finally, expense sheet no. 1101 matches the selection criterion specification on line 2 in the approval hierarchy selection and is therefore to be approved by means of approval hierarchy AH2.

### Approval Procedure

When someone submits an expense sheet, Maconomy checks which approval hierarchy is to be used to determine the persons who must approve that expense sheet. In this hierarchy, Maconomy then finds the lines whose selection criterion specification is matched by the expense sheet and creates an approval line.

Maconomy then transfers the number of the employee who is specified as the approver on the hierarchy line that resulted in the approval line to each approval line. You can identify the approver by either a specific employee number or a given reference. Thus, Maconomy can, for example, use the employee number of the project manager of the job to which the expense sheet is assigned.

An approval line thus corresponds to a person (or personal function) who is to decide on the approval of the expense sheet. If approval is to be performed in a certain order in the current approval hierarchy, Maconomy ensures that if one or more persons (or functions) must approve an expense sheet before you are supposed to, you cannot make your decision on the expense sheet until the persons (or functions) who precede you in the approval order have completed their approval/denial task.

The Approval sub-tab of the Approvals workspace displays a listing of a number of approval lines that you should make a decision on. You can choose whether Maconomy displays only the approval lines that you should approve. You can then select each of these lines as approved, released, or rejected.

If you reject an approval line for an expense sheet, Maconomy rejects the entire expense sheet, regardless of whether other employees approved other approval lines for the same expense sheet. The release of a line corresponds to neither approving nor rejecting the expense sheet, but letting approval be made by another approver in the hierarchy. This means that Maconomy only sees the line as approved if another employee approved any other approval line that is related to the same expense sheet. Among other things, the rejection of a purchase order means that you cannot print it or assign it to a vendor invoice. The consequences of rejecting a vendor invoice or an expense sheet can be that the invoice or the sheet cannot be posted, depending on the approval principle selected for supervisors' and project managers' approval of the job in question in the Jobs workspace. See the description of the fields in the Approval island for more information about the consequences of the approval principles.

When you have appropriately identified all of the approval lines in the Approval Hierarchy Selection Lines sub-tab, you use the **Carry out Approval** action. Maconomy then changes the approval status of those lines.

When all approval lines for an expense sheet have been approved, or when at least one line has been approved and the remaining lines have been released, the expense sheet is fully approved. At least one person is always to either approve or reject the current expense sheet, which means that if all other approval lines for an expense sheet have been released, the last line must be approved or rejected.

In the Approvals workspace you can also see approval lines that are to be approved by other employees (to the extent that you have been granted access in Maconomy's Access Control System). However, you cannot approve, release, or reject these lines because only the employee who is responsible for the approval of the respective lines can do that. A listing of the approval lines to be approved by other employees does, however, enable you to see how far an expense sheet has gone in the approval procedure.

You can approve expense sheets one by one using the Action menu in the Expense Sheets workspace. Approving, releasing, or rejecting an expense sheet in the Expense Sheets workspace corresponds to approving, releasing, or rejecting an approval line on which you are specified as an approver in the Approvals workspace. In the Expense Sheets workspace, Maconomy also checks that the order in which the approval is performed complies with the rules of the hierarchy in question.

You can approve vendor invoices and invoice allocation lines using the Action menu in the Vendor Invoices, Invoice Allocation, and Reallocate Invoices workspaces, based on the functionality that corresponds to that of expense sheets. This functionality also applies to purchase orders, which you can approve in the Purchase Orders workspace in the A/P module.

### Other Approval Procedures

You can choose whether or not you want to use the approval hierarchy functionality. You can choose to use approval hierarchies for only purchase orders, or expense sheets, or vendor invoices; both purchase orders, expense sheets; and vendor invoices; or none of these.

Even if you do not use approval hierarchies, each purchase order, expense sheet, and vendor invoice must go through an approval procedure that is specific to purchase orders, expense sheets, vendor invoices, and allocation lines, respectively.

When someone submits a purchase order, an employee must approve it in the Purchase Orders workspace. Any employee can perform this approval can be performed, because the only condition for approving purchase orders (when you do not use approval hierarchies) is that the current user has been granted access to approving purchase orders. You grant this access in the Actions workspace.

When someone submits a vendor invoice, an employee must approve it in the Vendor Invoices workspace. Any employee can perform this approval, because the only condition for approving vendor invoices that does not have allocation lines (when you do not use approval hierarchies) is that the current user has been granted access to approving purchase orders. You grant this access in the Actions workspace. If you create allocation lines for a vendor invoice, you must also submit and get approval for the allocation, a procedure that also applies to the reallocation of vendor invoices. You can submit and get approval for allocations and reallocations in the Invoice Allocation and Reallocate Invoices workspaces, respectively.

When you do not use approval hierarchies for expense sheets, the approval by supervisor must be performed by means of the **Approve** action in the Expense Sheets workspace. The setup of a job determines whether approval by supervisor is necessary or allowed, just as the setup of the job determines whether expense sheet lines are to be approved in the Approve Expense Sheet

Lines workspace. See the description of the Approval island in the Jobs workspace for more information about the approval of expense sheets when you do not use approval hierarchies.

## Approval Groups Single Dialogs Workspace

Use this workspace to enter information about the approval group in the Approval Group tab and related approval tasks that are currently valid in the Approval Line sub-tab.

For example, perhaps you set up an approval so that both lines and the header must be approved. The approval group in this case would be the grouping of all approval tasks that belong to the approval.

### Approval Group Tab

This section includes the fields and descriptions for the Approval Group tab.

#### Approval status Island

This island shows the status of the approval.

#### Approval Object Island

Field	Description
<b>Job No.</b>	This field shows the number of the job that is associated with the approval object.
<b>Job Budget Type</b>	This field shows the budget type of the job that is associated with the approval object.
<b>Job No.</b>	copy to come
<b>Job Budget Type</b>	copy to come
<b>Revision Remark 1-2</b>	This field displays any revision remarks assigned to the latest revision of the approval object.
<b>Amount Excl. Tax</b>	This field shows the value excluding tax of the approval object.
<b>Amount Incl. Tax</b>	This field shows the value including tax of the approval object.

### Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Approval Object</b>	This field shows the approval object of the line. As standard this can be either Header or Line.

Field	Description
<b>Level</b>	This field shows the level of the approval hierarchy that the approval object lines relate to, and thus the order in which they are to be approved. The field only applies, if the field "Level Prioritized" has been marked in the tab of the related approval hierarchy.
<b>Effective</b>	The actual approvals are the ones that are marked as effective. In-effective approval headers and lines show the history.
<b>Active</b>	This field shows whether or not the approval object is currently active.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.
<b>Approver</b>	This field shows the Employee number of the Approver of the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, please see the description for "Approver Reference" in the workspace "Approval Hierarchies."
<b>Substitute</b>	This field will show the employee number of a substitute approver if one has been specified on the approval object. For more information on this field, please see the description of the field "Substitute" for the workspace "Approval Hierarchies."
<b>Substitute Reference</b>	This field will show the reference type of a substitute approver if one has been specified on the approval object.
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the field 'New Approval Status' is transferred to this field when you select the action 'Execute Approval'. This field cannot be changed manually.
<b>New Approval Status</b>	In this field you can enter the status you wish to assign to the current approval object line when you select the action "Execute Approval." The available statuses are "Approved," "Rejected," and "Released."
<b>Remarks</b>	This field shows any remarks concerning the current approval object line entered by the employee when approving or rejecting the current line.
<b>Approved or Rejected by</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field shows the time that the current line was approved.
<b>Selected by</b>	This field show the user who changed the field "New approval status" until the new approval status is approved (by selecting the action "Execute Approvals").

Field	Description
<b>Approval No.</b>	This field displays the related approval number for the current approval object line. The number is increased every time the approval group is submitted.
<b>Approver (Employee No.)</b>	This field displays the employee number of the approver of the approval object.
<b>Approver Name</b>	If an employee number has been specified in the “Approver” field, this field shows the name of the employee in question.
<b>Substitute (Employee No.)</b>	This field will show the employee number of a substitute approver if one has been specified on the approval object. For more information on this field, please see the description of the field “Substitute” for the “Approval Hierarchies” window.
<b>Substitute Name</b>	This field will show the employee name of a substitute approver if one has been specified on the approval object.

## Actions

This section shows the Actions available in the Approval Groups workspace.

### Top Tab

Field	Description
<b>Mark all for approval</b>	When you select this action, all approval object lines in the sub-tab are marked for approval. This means that the value in the field “New Approval Status” is set to the value “Approved” on all lines.
<b>Mark all for release</b>	When you select this action, all approval object lines in the sub-tab are marked for release. This means that the value in the field “New Approval Status” is set to the value “Released” on all lines.  This action can only be used if the field “Trans. Non-Appr. Time Sheets” has been marked in the workspace System Information, and the current user has access to transferring expense sheets as specified in the workspace Actions. The employee specified as the project manager for the current job, however, always has the right to release time sheets for the employee in question.
<b>Mark all for rejection</b>	When you select this action, all approval object lines in the sub-tab are marked for rejection. This means that the value in the field “New Approval Status” is set to the value “Rejected” on all lines.
<b>Unmark all</b>	When you select this action, all approval object lines covered by the selection criteria are unmarked for approval. This means that the check mark in the field “Approve” is removed for all entries in the sub-tab.
<b>Execute approval</b>	When you select this action, all lines with status indications in the field “New Approval Status” are put into effect. If any approval object lines are thus fully approved or released (for example, the expense sheet from which the approval object line originates was already approved or released by the supervisor), the

Field	Description
	lines in question are transferred to a registration journal which can then be posted. The field "Approval Status" is updated with the value of the field "New Approval Status." Please see the description of the field "New Approval Status" for more information about the effect of the different status indications.
<b>Approve all</b>	Use this action to select all approval lines (applicable for change by the current user) and carry out the approval for all these lines.
<b>Reject all</b>	Use this action to reject all approval lines (applicable for change by the current user) and carry out the rejection for all these lines.
<b>Reset all</b>	Use this action to reset all approval lines (applicable for change by the current user) and carry out the reset for all these lines.

## Approval Objects Single Dialogs Workspace

Use this workspace to see information about the approval object in the Approval Object tab and related approval tasks in the Approval Line sub-tab.

For example, if you set up the approval so that both lines and the header must be approved, there is an approval object for each of the lines and an approval object for the header.

### Approval Object Tab

This section includes the fields and descriptions for the Approval Object tab.

#### Approval Type Island

Field	Description
<b>Approval Type</b>	This field shows the type of approval that the approval object relates to ; Purchase Orders, Expense Sheets, or Vendor Invoices.
<b>Approval Relation</b>	This field shows the relation used in connection with the type of registration. The available values as standard are Purchase Order, Purchase Order Line, Expense Sheet, Expense Sheet Line, Vendor Invoice, and Invoice Allocation Line.
<b>Approval No.</b>	This field displays the approval number for the current approval object. This number is system generated and depending on system setup, is based on the company number that the registrations are associated with.
<b>Approved For Level</b>	This shows the next approval level.
<b>Effective</b>	The actual approvals are the ones that are marked as effective. Ineffective approval headers and lines show the history.
<b>Approval Status</b>	This field shows the approval status of the current approval object: "Approved," "Rejected," or "Released."

Field	Description
<b>Approval Status, Reason</b>	If the Approval Status has been marked as "Rejected," any comment entered as a reason for rejection will be displayed in this field.
<b>Submitted</b>	This field shows the name of the employee who submitted the current approval object.
<b>Reopened</b>	If the approval object has been reopened, this field shows the name of the employee that completed the action.

### Approval Hierarchy Island

Field	Description
<b>Approval Hierarchy No.</b>	This field shows the approval hierarchy number that the approval object is governed by.
<b>Level Prioritized</b>	This field, if marked, indicates that the relating approval hierarchy is level prioritized. For more information, see the description of "Level Prioritized" for the workspace "Approval Hierarchies."
<b>May be approved by supervisor</b>	This field, if marked, indicates that the relating approval hierarchy allows the current approval object to be approved by a supervisor, as determined on the approver's Employee card.
<b>Company No.</b>	This field shows the company number that the related approval hierarchy applies to.

### Approval Object Island

Field	Description
<b>Amount Excl. Tax</b>	This field shows the value excluding tax of the approval object.
<b>Amount Incl. Tax</b>	This field shows the value including tax of the approval object.

### Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Level</b>	This field shows the level of the approval hierarchy that the approval object lines relate to, and thus the order in which they are to be approved. The field only applies if the field "Level Prioritized" has been marked in the tab of the related approval hierarchy.
<b>Effective</b>	The actual approvals are the ones that are marked as effective. Ineffective approval headers and lines show the history.

Field	Description
<b>Active</b>	This field shows whether or not the approval object is currently active.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.
<b>Approver</b>	This field shows the employee number of the Approver of the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, please see the description for "Approver Reference" in the workspace "Approval Hierarchies."
<b>Substitute</b>	This field will show the employee number of a substitute approver if one has been specified on the approval object. For more information on this field, please see the description of the field "Substitute" for the workspace "Approval Hierarchies."
<b>Substitute Reference</b>	This field will show the reference type of a substitute approver if one has been specified on the approval object.
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the field "New Approval Status" is transferred to this field when you select the action "Carry Out Approval." This field cannot be changed manually.
<b>New Approval Status</b>	In this field you can enter the status you wish to assign to the current approval object line when you select the action "Execute Approval." The available statuses are "Approved," "Rejected," and "Released."
<b>Remarks</b>	This field shows any remarks concerning the current approval object line entered by the employee when approving or rejecting the current line.
<b>Approved or Rejected by</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field shows the time when the current line was approved.
<b>Selected by</b>	This field shows the user who changed the field "New approval status" until the new approval status is approved (by selecting the action "Execute Approvals").
<b>Approver (Employee No.)</b>	This field displays the employee number of the approver of the approval object.
<b>Approver Name</b>	If an employee number has been specified in the "Approver" field, this field shows the name of the employee in question.

Field	Description
<b>Substitute (Employee No.)</b>	This field will show the employee number of a substitute approver if one has been specified on the approval object. For more information on this field, please see the description of the field “Substitute” for the “Approval Hierarchies” window.
<b>Substitute Name</b>	This field will show the employee name of a substitute approver if one has been specified on the approval object.

## Approvals Single Dialogs Workspace

Use this workspace to approve, line by line, purchase orders, expense sheets, vendor invoices, and other entries.

You can approve, release, or reject a line. If you reject a line, the entire entry is rejected. If you release a line, it moves on to the next person in the approval hierarchy. An entry is not fully approved until all lines are approved, or until at least one line has been approved, and the remaining lines have been released.

When someone submits an object for approval, Maconomy creates an approval line for each line in the relevant approval hierarchy that defines a selection criterion specification that the current object for approval matches. In this way, an approval line corresponds to a person (or personal function) who must make a decision about the current object for approval.

You can reject, release, or approve an approval line.

If you reject an approval line for an object for approval, the entire object is rejected, regardless of whether other employees have approved other approval lines for the same object. If you release a line the object for approval is neither approved nor rejected; it is sent on to another approver in the hierarchy. As a result, Maconomy sees the line is as approved only if another employee approved any other approval lines that are related to the same object for approval. Among other things, rejecting an object means that it cannot be printed or assigned to a vendor, and that it is not included in the financial commitment accounts. The consequences of rejecting an object can cause that object to be unpostable.

An object for approval is not fully approved until all lines have been approved, or until at least one line has been approved, and the remaining lines have been released. At least one person must always either approve or reject the object for approval, which means that if all other approval lines for an object have been released, the last line must be approved or rejected.

For this workspace, the Approval Groups workspace, and the Approval Objects workspace, you can specify a range of approval lines; in the Approval Groups and the Approval Objects workspaces, the sub-tabs display the approval lines that match the specified selection criterion specification.

In the sub-tab, you can then select lines for rejection, release, or approval. After selecting all of the lines in the sub-tab, you use the **Carry Out Approval** action and Maconomy changes the approval status of those lines.

You can see approval lines to be approved by employees other than you. However, you cannot approve, release, or reject these lines as this action is only to be carried out by the employee responsible for the approval of the current line (or a substitute, if any). A listing of the approval lines to be approved by other employees does, however, offer you the possibility of seeing how far an object for approval is in the approval procedure.

See "Introduction to Approval Hierarchies" for further information about creation of approval lines and approval hierarchies.

## Approval Tab

This section includes the fields and descriptions for the Approval tab.

### Approval Type Island

Field	Description
<b>Approval Type</b>	This field shows the type of approval that the approval task relates to ; Purchase Orders, Expense Sheets, or Vendor Invoices.
<b>Approval Relation</b>	This field shows the relation used in connection with the type of registration. The available values as standard are Purchase Order, Purchase Order Line, Expense Sheet, Expense Sheet Line, Vendor Invoice, and Invoice Allocation Line.

### Approval Object Island

Field	Description
<b>Amount Excl. Tax</b>	This field shows the value excluding tax of the approval object.
<b>Amount Incl. Tax</b>	This field shows the value including tax of the approval object.

### Approval Hierarchy Island

Field	Description
<b>Approval Hierarchy No.</b>	This field shows the approval hierarchy number that the approval object is governed by.
<b>Approval Hierarchy Line</b>	This field shows the approval hierarchy line number that the approval object is governed by.
<b>Approval No.</b>	This field displays the approval number for the current approval task.
<b>Line No.</b>	This field shows the line number of the approval hierarchy that the current approval task relates to.
<b>Level</b>	This field shows the level of the approval hierarchy that the approval task relates to, and thus the order in which they are to be approved. The field only applies if the field "Level Prioritized" has been marked in the tab of the related approval hierarchy.

**Approval Status Island**

Field	Description
<b>Approver</b>	This field shows the employee number of the approver of the approval task.
<b>Substitute</b>	This field will show the employee number of a substitute approver if one has been specified on the approval object. For more information on this field, please see the description of the field "Substitute" for the workspace "Approval Hierarchies."
<b>New Approval Status</b>	In this field you can enter the status you wish to assign to the current approval task. Pressing enter updates the current task with the new approval status.
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the field "New Approval Status" is transferred to this field when you update the workspace. This field cannot be changed manually.
<b>Remarks</b>	This field shows any remarks concerning the current approval object line entered by the employee when approving or rejecting the current line.
<b>Approved or Rejected by</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field shows the time when the current line was approved.
<b>Selected by</b>	This field show the user who changed the field "New approval status" until the new approval status is approved (by selecting the action "Execute Approvals").
<b>Effective</b>	The actual approvals are the ones that are marked as effective. Ineffective approval headers and lines show the history.
<b>Active</b>	This field shows whether or not the approval task is currently active.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.

## Approval Change Header Tab

This section includes the fields and descriptions for the Approval Change Header tab.

### Approval Type Island

Field	Description
<b>Approval Type</b>	This field shows the Type of approval object that has been changed.
<b>Approval Relation</b>	This field shows the relation used in connection with the type of registration. The available values as standard are Purchase Order, Purchase Order Line, Expense Sheet, Expense Sheet Line, Vendor Invoice, and Invoice Allocation Line.
<b>Changed by</b>	<p>This field shows the name of the user who made the change to the approval object.</p> <p>Changed on, date This field shows the date when the change to the approval object was made.</p> <p>Changed on, time This field shows the time when the change to the approval object was made.</p>
<b>Changed Before First Submission</b>	This field shows whether the change to the approval object was made before or after any registrations covered by the Approval Hierarchy were made. If the change was made before, this checkbox will be marked. If the change was made after, this checkbox will be blank.

### Selection Criteria Island

Field	Description
<b>Show derived changes</b>	This checkbox, if marked, will show any information lines in the sub-tab that are derived from changes to other approval objects.
<b>Show changes not requiring re-approval</b>	This checkbox, if marked, will show any information lines in the sub-tab that have been made to approval hierarchy lines that do not require reapproval.

### Approval Object Island

Field	Description
<b>Amount Excl. Tax</b>	This field shows the value excluding tax of the approval object.
<b>Amount Incl. Tax</b>	This field shows the value including tax of the approval object.

## Approval Change Line Sub-Tab

This section includes the fields and descriptions for the Approval Change Line sub-tab.

Field	Description
<b>Relation Name</b>	This field shows the relation name of the line that has been changed.
<b>Field Name</b>	This field shows the field name that has been changed.
<b>Old value</b>	This field shows the value of the field before the change was made.
<b>New value</b>	This field shows the new value to which the field has been changed.
<b>Derived Change</b>	This checkbox is selected if the change is a result of changes to a related hierarchy.
<b>Approval Mandatory</b>	This checkbox is selected if the change made requires mandatory approval.

## Employee Approvals Single Dialogs Workspace

Use this workspace to review, by employee, all outstanding approvals that are needed for objects for approval.

### Employee Tab

This section includes the fields and descriptions for the Employee tab.

#### Employee Information Island

Field	Description
<b>Employee</b>	This field shows the name and number of the employee to whom the approval tasks in the sub-tab are assigned.
<b>Phone</b>	This field shows the primary phone number of the current employee. The field is for reference only.
<b>Mobile</b>	This field shows the primary mobile phone number of the current employee. The field is for reference only.
<b>E-mail</b>	This field shows the e-mail address of the employee. The field is for reference only.
<b>Position</b>	This field shows the employee's position. The field is for reference only.
<b>Employee Type</b>	This field shows the employee's type. The field is for reference only.

**Related Contacts Island**

Field	Description
<b>Supervisor</b>	This field shows the employee number of the current employee's supervisor. The field is for reference only.
<b>Absence Approver</b>	This field shows the employee number of the employee who is responsible for approving absence for the current employee. The field is for reference only.

**Legend Island**

## Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Level</b>	This field shows the level of the approval hierarchy that the approval task relates to, and thus the order in which they are to be approved. The field only applies if the field "Level Prioritized" has been marked in the tab of the related approval hierarchy.
<b>Effective</b>	The actual approvals are the ones that are marked as effective. Ineffective approval headers and lines show the history.
<b>Active</b>	This field shows whether or not the approval task is currently active.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.
<b>Approver</b>	This field shows the employee number of the approver of the approval task.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, please see the description for "Approver Reference" in the workspace "Approval Hierarchies."
<b>Substitute</b>	This field will show the employee number of a substitute approver if one has been specified on the approval object. For more information on this field, please see the description of the field "Substitute" for the workspace "Approval Hierarchies."
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the field "New Approval Status" is transferred to this field when you update the workspace. This field cannot be changed manually.
<b>New Approval Status</b>	In this field you can enter the status you wish to assign to the current approval task. Pressing enter updates the current task with the new approval status.

Field	Description
<b>Remarks</b>	This field shows any remarks concerning the current approval object line entered by the employee when approving or rejecting the current line.
<b>Approved or Rejected by</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field shows the time when the current line was approved.
<b>Selected by</b>	This field show the user who changed the field “New approval status” until the new approval status is approved (by selecting the action “Execute Approvals”).
<b>Approval No.</b>	This field displays the related approval number for the current approval object line. The number is increased every time that the approval group is submitted.
<b>Approver (Employee No.)</b>	This field displays the employee number of the approver of the approval object.
<b>Approver Name</b>	If an employee number has been specified in the “Approver” field, this field shows the name of the employee in question.
<b>Substitute (Employee No.)</b>	This field will show the employee number of a substitute approver if one has been specified on the approval object. For more information on this field, please see the description of the field “Substitute” for the “Approval Hierarchies” window.
<b>Substitute Name</b>	This field will show the employee name of a substitute approver if one has been specified on the approval object.
<b>Amount Excl. Tax</b>	This field shows the value excluding Tax of the approval object.
<b>Amount Incl. Tax</b>	This field shows the value including Tax of the approval object.

## Approve Job Budgets by Employee

Use this single dialog to approve or reject job budgets.

This workspace supports approvals for project managers and other employee types responsible for approvals (for example, resource managers), and is available on the menu.

## Approve Job Quotes by Employee Single Dialog Workspace

Copy to come.

Approve Job Quotes by Employee Tab

This section includes the fields and descriptions for the Approve Job Quotes by Employees tab.

### Employee Information island

Field	Description
<b>Current Employee No.</b>	This field displays the employee number for the currently logged in user.
<b>Employee No.</b>	Enter or select an employee number to view the approval lines for that employee. By default, this field displays the same value as the <b>Current Employee No.</b> field.
<b>Employee Type</b>	This field displays the selected employee's employee type.
<b>Job No.</b>	Enter or select a job number to show only lines relevant to the specified job in the sub-tab.
<b>Show Lines For Approval</b>	Select this check box to show items available for approval. This is enabled by default.
<b>Show Non-Active Lines</b>	Select this check box to show approval items that are not yet active.
<b>Show Rejected Lines</b>	Select this check box to show rejected approval items.
<b>Show Substitute Lines</b>	Select this check box to show the approval items for which you are a substitute approver.
<b>Show Super Approver Lines</b>	Select this check box to show approval items for which you are a super approver.
<b>Show Approvable by All Approval Lines</b>	Select this check box to view all approval items that can be approved by any user.
<b>Overwrite existing</b>	If existing information is already available in the <b>Approval Status</b> or <b>Remark</b> fields in the sub-tab, select one or both of the following check boxes to enable the system to overwrite it: <ul style="list-style-type: none"> <li>Approval Status</li> <li>Remark</li> </ul>

Field	Description
<b>Remark</b>	Enter a remark regarding the specified approval object line.

### Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Job No.</b>	This field displays the job number to which the current line is associated.
<b>Level</b>	This field displays the level of the approval hierarchy that the approval object lines relate to, and thus the order in which they are to be approved. This field only applies if the <b>Level Prioritized</b> check box is selected in the tab of the related approval hierarchy.
<b>Effective</b>	This field displays whether or not the actual approvals are marked as effective. In-effective approval headers and lines show the history.
<b>Active</b>	This field displays whether or not the approval object is currently active.
<b>Approval Status</b>	This field displays the approval status of the current line. The value in the <b>New Approval Status</b> field is transferred to this field when you use the <b>Execute Approval</b> action. This field cannot be changed manually.
<b>New Approval Status</b>	Select the status you wish to assign to the current approval object line when you use the <b>Execute Approval</b> action. The following statuses are available: <ul style="list-style-type: none"> <li>Blank</li> <li>Approved</li> <li>Rejected</li> <li>Released</li> </ul>
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Deadline</b>	This field displays the deadline by which the approval must be completed.
<b>Approved or Rejected by</b>	If the approval object has been approved or rejected, this field displays the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field displays the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field displays the time that the current line was approved.

Field	Description
<b>Approver</b>	This field displays the employee name and number of the designated approver who approved the approval object.
<b>Substitute</b>	This field displays the employee name and number of the designated substitute approver who approved the approval object.
<b>Super Approver</b>	This field displays the employee name and number of the designated super approver who approved the approval object.
<b>Approver Name</b>	Enter or select the name of the designated approver who can approve the approval object.
<b>Approver Reference</b>	This field displays the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Name</b>	Enter or select the name of the designated substitute approver who can approve the approval object.
<b>Substitute Reference</b>	This field displays the reference type of a substitute approver if one has been specified on the approval object.
<b>Super Approver Name</b>	Enter or select the name of the designated super approver who can approve the approval object.
<b>Super Approver Reference</b>	This field displays the reference type of a super approver if one has been specified on the approval object.
<b>Approver</b>	This field displays the employee number of the employee who approved the current approval object.
<b>Approver Employee Type</b>	This field displays the designated employee type that can approve approval objects. Any approval object, such as time sheet lines, falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute</b>	This field displays the name of the designated substitute approver who approved the approval object.
<b>Approver Reference</b>	This field displays the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Employee Type</b>	This field displays the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute Reference</b>	This field displays the reference type of a substitute approver if one has been specified on the approval object.

Field	Description
<b>Approver Reference, Field</b>	This field displays the internal field name that the Approver Reference relates to.
<b>Approver Reference, Employee</b>	This field displays the employee reference of the Approver.
<b>Substitute Reference, Relation</b>	This field displays the relation of a substitute approver reference if one has been specified on the approval task.
<b>Substitute Reference, Field</b>	This field displays the field reference of a substitute approver if one has been specified on the approval task.
<b>Substitute Reference, Employee</b>	This field displays the employee reference of the substitute approver if one has been specified on the approval task.
<b>Super Approver Reference</b>	This field displays the reference type of a super approver if one has been specified on the approval object.
<b>Super Approver</b>	This field displays the name of the designated super approver who approved the approval object.
<b>Super Approver Employee Type</b>	This field displays the designated employee type that can act as super approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Super Approver Reference, Relation</b>	This field displays the relation of a super approver reference if one has been specified on the approval task.
<b>Super Approver Reference, Field</b>	This field displays the field reference of a super approver if one has been specified on the approval task.
<b>Super Approver Reference, Employee</b>	This field displays the employee reference of a super approver if one has been specified on the approval task.
<b>Current Approval Status Details</b>	This field displays details regarding the latest approval status of the current line.
<b>Current Approval Status</b>	This field displays the latest approval status of the current line.

Field	Description
<b>Last Approved Or Rejected By</b>	If the approval object has been approved or rejected, this field displays the name of the last user who completed the action for the associated approval object.
<b>Last Approval Or Rejection Date</b>	If the approval object has been approved, this field displays the latest date on which the current line was approved.
<b>Last Approval Or Rejection Time</b>	If the approval object has been approved, this field displays the latest time when the current line was approved.
<b>Last Approval Or Rejection Comment</b>	If the approval object has been approved or rejected, this field displays the latest comment for the associated approval object.
<b>Line Can Be Approved By Current User</b>	This field displays whether or not the current line can be approved by the current user.
<b>Current Status</b>	This field displays the latest status of the current line.
<b>Submitted By</b>	This field displays the name of the user who submitted the current line.
<b>Date Submitted</b>	This field displays the date the current line was submitted.
<b>Time Submitted</b>	This field displays the time the current line was submitted.
<b>Submitter</b>	This field displays the employee number of the user who submitted the current line.
<b>Submitter Name</b>	This field displays the name of the user who submitted the current line.
<b>Submitter Position</b>	This field displays the position of the user who submitted the current line.
<b>Submitter E-mail</b>	This field displays the e-mail address of the user who submitted the current line.
<b>Submitter Phone</b>	This field displays the phone number of the user who submitted the current line.
<b>Submitter Mobile</b>	This field displays the mobile number of the user who submitted the current line.
<b>Submitter Company No.</b>	This field displays the company number of the user who submitted the current line.

Field	Description
<b>Submitter Company</b>	This field displays the name of the company to which the user who submitted the current line belongs.
<b>Quotation, New Quote Price</b>	<p>This field displays the total price of the quote or order confirmation specified on the current line. The amount is converted into the relevant job's currency, and is printed as the line total on the quote or order confirmation.</p> <p>This field derives its value from the <b>New Quote Price</b> field under the Quote island of the Quote Editing single dialog workspace.</p>
<b>Quotation Invoice Discount %</b>	<p>This field displays the invoice discount percentage given for the job for which you are generating the quote or order confirmation specified on the current line.</p> <p>This field derives its value from the <b>Invoice Disc.</b> field under the Quote island of the Quote Editing single dialog workspace.</p>
<b>Quotation Invoice Discount, Currency</b>	<p>This field displays the invoice discount given for the job for which you are generating the quote or order confirmation specified on the current line. This amount is displayed in the job's currency.</p> <p>This field derives its value from the <b>Invoice Disc.</b> field under the Quote island of the Quote Editing single dialog workspace.</p>
<b>Quotation Total to Pay, Currency</b>	<p>This field displays the total quote or order confirmation price, in the job's currency. This amount is printed as the grand total on the quote or order confirmation.</p> <p>This field derives its value from the <b>Balance Due</b> field under the Quote island of the Quote Editing single dialog workspace.</p>
<b>Quotation Budget Type</b>	<p>This field displays the budget type of the relevant job budget.</p> <p>This field derives its value from the <b>Budget Type</b> field under the Budget Island of the Quote Editing single dialog workspace.</p>
<b>Quotation Budget Revision No.</b>	<p>This field displays the revision number of the latest approved revision of the relevant job budget.</p> <p>This field derives its value from the <b>Revision No.</b> field under the Budget island of the Quote Editing single dialog workspace.</p>
<b>Quotation Budget Billing Price, Currency</b>	<p>This field displays the budgeted billing price for the relevant job. This amount is displayed in the job's currency, and is the sum of all the amounts on the budget lines of the latest revision of the relevant job budget.</p> <p>This field derives its value from the <b>Billing Price, Budget</b> field under the Budget island of the Quote Editing single dialog workspace.</p>
<b>Quotation Deviation From Budget</b>	<p>If the <b>Check Budget Against Quote</b> job parameter attribute is set to <b>yes</b>, this field displays any deviation between the total budgeted billing price and the quote price.</p> <p>If there is a difference between the two amounts, Maconomy issues an alert when you try to approve the quote.</p>

Field	Description
	This field derives its value from the <b>Deviation</b> field under the Budget island of the Quote Editing single dialog workspace.
<b>Quotation Budget Property 1-3</b>	These fields display the job budget type properties used by companies that handle a large number of job budget types.
<b>Quotation Tax, Currency</b>	<p>This field displays the total tax amount for the quote or order confirmation specified on the current line, in the currency of the relevant job.</p> <p>This field derives its value from the <b>Tax</b> field under the Quote island of the Quote Editing single dialog workspace.</p>
<b>Quotation Tax 1, Currency</b>	If multiple tax codes are enabled for the quote, this field displays the same value as the <b>Tax 1</b> field under the Quote island of the Quote Editing single dialog workspaces.
<b>Quotation Tax 2, Currency</b>	If multiple tax codes are enabled for the quote, this field displays the same value as the <b>Tax 2</b> field under the Quote island of the Quote Editing single dialog workspaces.
<b>Quotation Tax 3, Currency</b>	If multiple tax codes are enabled for the quote, this field displays the same value as the <b>Tax 3</b> field under the Quote island of the Quote Editing single dialog workspaces.
<b>Quotation Revision No.</b>	<p>This field displays the current revision number of the quote specified on the current line.</p> <p>This field derives its value from the <b>Revision No.</b> field under the Revision island of the Quote Editing single dialog workspace.</p>
<b>Quotation Latest Revision</b>	This check box is selected to indicate that you are looking at the latest revision of a job quote.
<b>Quotation Revision Remark 1-10</b>	<p>These fields display any additional information or remarks provided regarding the current revision of the quote.</p> <p>These fields derive their value from the <b>Remarks</b> field/s under the Revision island of the Quote Editing single dialog workspace.</p>
<b>Quotation Instance Key</b>	This field displays the unique identity in the Maconomy database of the current revision of the quote.
<b>Quotation Transaction Timestamp</b>	This field displays the time of creation of the quote. If the quote has been updated, this field displays the time of the latest revision.
<b>Quotation Time Unit</b>	This field displays the time unit used for the job specified on the quote.

Field	Description
<b>Quotation Time Unit Factor</b>	This field displays the factor between the time registration unit for the job and the hours per man day on the job.
<b>Quotation Submitted</b>	This field indicates whether the quote specified on the current line has been submitted.
<b>Quotation Submitted by</b>	This field displays the name of the user who submitted the quote specified on the current line.
<b>Quotation, Date Submitted</b>	This field displays the date the quote specified on the current line was submitted.
<b>Quotation Approved</b>	This field indicates whether the quote specified on the current line has been approved.
<b>Quotation Approved by</b>	This field displays the name of the user who approved the quote specified on the current line.
<b>Quotation, Date Approved</b>	This field displays the date the quote specified on the current line was approved.
<b>Quotation Reopened</b>	This field indicates whether the quote specified on the current line has been reopened.
<b>Quotation Reopened by</b>	This field displays the name of the user who reopened the quote specified on the current line.
<b>Quotation, Date Reopened</b>	This field displays the date the quote specified on the current line was reopened.
<b>Project Manager No.</b>	This field displays the project manager number of the project manager assigned to the job specified on the quote.
<b>Project Manager</b>	This field displays the name of the project manager assigned to the job specified on the quote.
<b>Project Manager Position</b>	This field displays the position of the project manager assigned to the job specified on the quote.
<b>Project Manager E-mail</b>	This field displays the e-mail address of the project manager assigned to the job specified on the quote.
<b>Project Manager Phone</b>	This field displays the phone number of the project manager assigned to the job specified on the quote.

Field	Description
<b>Project Manager Mobile</b>	This field displays the mobile number of the project manager assigned to the job specified on the quote.
<b>Project Manager Company No.</b>	This field displays the company number of the project manager assigned to the job specified on the quote.
<b>Project Manager Company</b>	This field displays the name of the company to which the project manager assigned to the job specified on the quote.
<b>Sales Rep. No.</b>	This field displays the sales rep. number of the sales employee assigned to the job specified on the quote.
<b>Sales Rep.</b>	This field displays the name of the sales employee assigned to the job specified on the quote.
<b>Sales Rep. Position</b>	This field displays the position of the sales employee assigned to the job specified on the quote.
<b>Sales Rep. E-mail</b>	This field displays the e-mail address of the sales employee assigned to the job specified on the quote.
<b>Sales Rep. Phone</b>	This field displays the phone number of the sales employee assigned to the job specified on the quote.
<b>Sales Rep. Mobile</b>	This field displays the mobile number of the sales employee assigned to the job specified on the quote.
<b>Sales Rep. Company No.</b>	This field displays the company number of the sales employee assigned to the job specified on the quote.
<b>Sales Rep. Company</b>	This field displays the name of the company to which the sales employee assigned to the job specified on the quote.
<b>Account Manager No.</b>	This field displays the account manager number of the account manager assigned to the job specified on the quote.
<b>Account Manager</b>	This field displays the name of the account manager assigned to the job specified on the quote.
<b>Account Manager Position</b>	This field displays the position of the account manager assigned to the job specified on the quote.
<b>Account Manager E-mail</b>	This field displays the e-mail address of the account manager assigned to the job specified on the quote.
<b>Account Manager Phone</b>	This field displays the phone number of the account manager assigned to the job specified on the quote.

Field	Description
<b>Account Manager Mobile</b>	This field displays the mobile number of the account manager assigned to the job specified on the quote.
<b>Account Manager Company No.</b>	This field displays the company number of the account manager assigned to the job specified on the quote.
<b>Account Manager Company</b>	This field displays the name of the company to which the account manager assigned to the job specified on the quote.
<b>Job No.</b>	This field displays the job number to which the current line is associated.
<b>Job Name</b>	This field displays the name of the job to which the current line is associated.
<b>Job State</b>	This field displays the state of the job in the approval process. Possible values are user-created.
<b>Currency</b>	This field displays the currency specified on the job to which the current line is associated.
<b>Company No.</b>	This field displays the number of the company responsible for the job on which the work will be performed.
<b>Company</b>	This field displays the name of the company responsible for the job on which the work will be performed.
<b>Base Currency</b>	This field displays the base currency used by the company responsible for the job on which the work will be performed.
<b>Settling Company No.</b>	This field displays the number of the settling company for the job on which the work will be performed.
<b>Settling Company</b>	This field displays the name of the settling company for the job on which the work will be performed.
<b>Current Budget</b>	This field displays the budget type currently specified for the job on which the work will be performed.
<b>Forecast Budget</b>	This field displays the budget type specified for the job's forecast budget.
<b>Planning Budget</b>	This field displays the budget type specified for the job's planning budget.
<b>Invoice From Quote</b>	This field is unused.
<b>Main Job No.</b>	If the job on which the work will be performed is a subjob, this field displays the number of the relevant main job.

Field	Description
<b>Main Job</b>	If the job on which the work will be performed is a subjob, this field displays the name of the relevant main job.
<b>Customer Level</b>	This field displays the customer level number for the customer to which the current line is associated.
<b>Level 1-5 Customer No.</b>	If the contact companies in the hierarchy above the relevant contact company are created as customers, these fields display their customer numbers.
<b>Level 1-5 Customer</b>	If the contact companies in the hierarchy above the relevant contact company are created as customers, these fields display their customer names.
<b>Bill to Customer</b>	This field displays the customer number of the customer who will pay for the invoice.
<b>Bill to Customer</b>	This field displays the name of the customer who will pay for the invoice.
<b>Customer No.</b>	This field displays the number of the bill-to customer assigned to the job on the current line.
<b>Customer</b>	This field displays the name of the bill-to customer assigned to the job on the current line.
<b>Customer Name 2-5</b>	These fields display the address of the bill-to customer assigned to the job on the current line.
<b>Customer Zip Code</b>	This field displays the zip code of the bill-to customer assigned to the job on the current line.
<b>Customer Postal District</b>	This field displays the postal district of the bill-to customer assigned to the job on the current line.
<b>Customer Country</b>	This field displays the country of the bill-to customer assigned to the job on the current line.
<b>Customer Attn.</b>	This field displays the name of the employee responsible / the point person specified in the customer's shipping information.
<b>Customer E-mail</b>	This field displays the e-mail address of the customer assigned to the job on the current line.
<b>Customer Phone</b>	This field displays the phone number of the customer assigned to the job on the current line.

## Actions

This section shows the Actions available in the Approve Job Quotes by Employee single dialog workspace.

### Card Part

Field	Description
<b>Approve all</b>	Use this action to approve all the lines pending approval that are listed in the sub-tab.
<b>Reject all</b>	Use this action to reject all the lines pending approval that are listed in the sub-tab.
<b>Reset all</b>	Use this action to reset all the lines pending approval that are listed in the sub-tab.
<b>Execute approval</b>	Use this action to put into effect all statuses indicated in the <b>New Approval Status</b> field for all lines. If any approval object lines are thus fully approved or released (for example, the expense sheet from which the approval object line originates was already approved or released by the supervisor), the lines in question are transferred to a registration journal which can then be posted. The <b>Approval Status</b> field is automatically updated with the value shown in the <b>New Approval Status</b> field.

### Table Part

Field	Description
<b>Approve Line</b>	Use this action to approve the selected line.
<b>Reject Line</b>	Use this action to reject the selected line.
<b>Reset Line</b>	Use this action to reset the selected line.

## Approval Hierarchy Selection Single Dialog Workspace

Use this workspace to review, by employee, all outstanding approvals that are needed for objects for approval.

For example, you might want to have a more restrictive approach to purchase order approvals, with more or higher-level approvers, in one office than you do in another. Or you might want to use more restrictive approvals for higher-value purchase orders.

You can set up a separate set of rules for purchase orders, expense sheets, vendor invoices, and other types of entries.

In the Approval Hierarchy Selection workspace, you can specify a set of rules that select the approval hierarchy to be used in each individual case. For example, this might be useful if the approval procedure varies between companies in a multi-company model. There might be a need

for more restrictive approvals in one company than in another, or some companies might have different approval functions to be supported by the approval hierarchies.

Another example could be that one organization wants expense sheets or vendor invoice allocation lines to be approved by several persons depending on the size of the amount, whereas another organization always wants the manager of the company to approve expense sheets or vendor invoices, regardless of the amount size.

You define the set of rules using a selection criterion specification and an approval hierarchy number. When an object for approval matches the selection criterion specification on a line, it must be approved through the approval hierarchy specified on the current line.

You can define a specific set of hierarchy selection rules to be applied to each type of object for approval. For each of these hierarchy selection types, if you create one or more lines in the Approval Hierarchy Selection Lines sub-tab, all purchase orders, expense sheets, vendor invoices, or other types of objects for approval must be approved through an approval hierarchy, and therefore you can only submit an object for approval if Maconomy finds a selection criterion specification that includes the current object in the Approval Hierarchy Selection Lines sub-tab.

If you do not define any hierarchy selection lines, the type of transaction in question must go through another approval procedure as described in "Other Approval Procedures" in "Introduction to Approval Hierarchies."

## Approval Hierarchy Selection Tab

This section includes the fields and descriptions for the Approval Hierarchy Selection tab.

### Approval Type Island

Field	Description
<b>Type</b>	In the tab of this workspace, you can choose to see approval hierarchy selection rules for either purchase orders, expense sheets or vendor invoices. This field displays the type whose transaction approval hierarchy selection rules are currently shown.
<b>Approval Relation</b>	This field shows the relation used in connection with the type of registration.
<b>Description</b>	In this field, you can enter a description about the approval hierarchy selection set of rules currently shown in the workspace.

### User Island

See the Getting Started topic for a description of the island User.

## Approval Hierarchy Selection Lines Sub-Tab

This section includes the fields and descriptions for the Approval Hierarchy Selection Lines sub-tab.

Field	Description
<b>From Company No.</b>	Select a Company No. as a starting number for lines to include when an approval object is submitted.
<b>To Company No.</b>	Enter an interval of companies. If you use these fields, Maconomy will only look at lines for the actual company when an approval object is submitted.
<b>Selection Criterion Specification No.</b>	<p>In this field, you can specify a selection criterion specification created in the workspace Selection Criterion Specification. When a purchase order, an expense sheet or a vendor invoice containing allocation lines has been submitted, Maconomy will search the approval hierarchy selection lines for the current type of transaction (purchase order, expense sheet or vendor invoice) to find a line containing a selection criterion specification comprising the current purchase order/expense sheet/vendor invoice. Thus, the purchase order, the expense sheet or the allocation lines of the vendor invoice are to be approved through the approval hierarchy specified on the current line.</p> <p>If a purchase order/an expense sheet/a vendor invoice matches more than one of the selection criterion specifications in the sub-tab, Maconomy will use the hierarchy specified for the upper selection criterion specifications. If the approval hierarchy selection contains several selection criterion specifications, which can contain the same purchase orders/expense sheets/vendor invoices, you should therefore place the most specific selection criterion specifications in the upper part of the table followed by selection criterion specifications with more broad criteria. In this way, you can reach an effect where a purchase order/an expense sheet/a vendor invoice “seeps” through the most narrow selection criterion specifications until it reaches a selection criterion specification that it fulfills.</p> <p>As Maconomy uses the first approval hierarchy select line that matches the current approval object, It is therefore very important to have the correct order of lines. You can easily change the order of lines using the ‘Move Approval Hierarchy Selection Line Up / Down’ icons on the taskbar of the sub-tab.</p>
<b>Approval Hierarchy No.</b>	In this field, you can enter the number of the approval hierarchy to be used for approval of purchase order/expense sheets/vendor invoices matching the selection criterion specification specified on the current line. However, if a submitted purchase order/expense sheet/vendor invoice matches several selection criterion specifications in the sub-tab, Maconomy will use the hierarchy specified for the upper selection criterion specification.

Field	Description
<b>Approval Hierarchy Description</b>	This field shows a description of the approval hierarchy from the Approval Hierarchy No. field above.

## Actions

This section shows the Actions available in the Approval Hierarchy Selection workspace.

### Top Tab

Field	Description
<b>Create Line</b>	This action allows you can to create an approval hierarchy selection line by using an existing entry or creating an entry for both the target group and approval hierarchy. You are also able to create an approval hierarchy selection line by selecting an existing target group and approval hierarchy.

### Bottom Tab

Field	Description
<b>Create Line</b>	This action allows you can to create an approval hierarchy selection line by using an existing entry or creating an entry for both the target group and approval hierarchy. You are also able to create an approval hierarchy selection line by selecting an existing target group and approval hierarchy.

## Approval Hierarchies Single Dialogs Workspace

Use this workspace to set up approval hierarchies for objects for approval such as expense sheets, general journals, purchase orders, vendor invoices, and other entries, including the employees or employee positions who are responsible for approvals, the order in which they must perform approvals, and any substitute approvers who can step in if an approver is unavailable.

You can set up separate hierarchies for purchase orders, expense sheets, vendor invoices, and other entry types.

See "Introduction to Approval Hierarchies" for a more detailed description of the creation and use of approval hierarchies.

In the Approval Hierarchies tab of this workspace, you enter general information about the current approval hierarchy, for example, whether approval through the hierarchy must be performed in a certain order, or if the persons who are to approve an object for approval through the hierarchy can approve the entry in an arbitrary order. You can also specify a "Super Approver" who can perform all of the approvals through this hierarchy. This ensures that the approval procedure is never blocked.

In the Approvers sub-tab, you can list the persons (or personal functions) who must approve the purchase orders, expense sheets, or vendor invoices when using this approval hierarchy. These are persons who are responsible for approval of the purchase orders, expense sheets, or vendor invoices, and other types of entries that meet a number of specific criteria. This person can be

either a specific employee, employees of a given type, or a reference to an employee, such as the project manager of a job to which a given expense sheet is assigned. In addition, you can also specify a substitute who can approve the vendor invoice, expense sheet, or purchase order instead of the holder of approval.

You define the conditions that determine which person or personal function must approve a given object for approval using selection criterion specifications that you create in the Selection Criterion Specification workspace. A purchase order, an expense sheet, a vendor invoice, or other types of entries that match the selection criterion specification on a line must be approved by the person who is identified on the line in question (or by a specified substitute, if any). Because an expense sheet can fall within more than one selection criterion specification in the same approval hierarchy, it must be approved by all respective persons before it can be fully approved.

If you want objects for approval that are approved through a specific hierarchy to be approved in a certain order, you must select the **Level Prioritized** field in the Approval Hierarchies tab for that hierarchy. After you select this field, you can enter a level number on each line in the Approvers sub-tab and define the order in which certain persons are to approve the individual vendor invoices, expense sheets, or purchase orders.

### Approval Hierarchies Tab

This section includes the fields and descriptions for the Approval Hierarchies tab.

#### Approval Hierarchy Island

Field	Description
<b>Approval Hierarchy No.</b>	In this field, you can enter the number of the current approval hierarchy.
<b>Description</b>	In this field, you can enter a description of the current approval hierarchy.
<b>Approval Type</b>	In this field, you can specify whether the current approval hierarchy is to be used in connection with purchase orders, expense sheets, general journals, or vendor invoices. Each approval hierarchy can only be used in connection with one of these registrations.
<b>Approval Relation</b>	This field shows the relation used in connection with the type of registration.
<b>Level Prioritized</b>	<p>In this field, you can specify whether the approval of purchase orders, general journals, expense sheets and vendor invoices, which are approved through the current hierarchy, is to be carried out in a certain order.</p> <p>If you do not mark this field, the employees who are to approve purchase orders, general journals, expense sheets, and vendor invoices through the current hierarchy can carry out approval in an arbitrary order.</p> <p>If you mark the field, the level number on each line in the sub-tab determines the order in which approval must be carried out. As mentioned in the section "Introduction to Approval Hierarchies," an approval line is created for each</p>

Field	Description
	<p>line in the approval hierarchy whose selection criterion specification is matched by the vendor invoice, purchase order or expense sheet in question. This is done at submission of a vendor invoice, an expense sheet or a purchase order. For each approval line created, Maconomy transfers the number of the holder of approval and the level number from the hierarchy line that gave rise to each individual approval line.</p> <p>When a hierarchy is level prioritized, the approval lines with the lowest level must be approved before you can approve lines on the next level and so on. An example of the use of this functionality is that the supervisor of the person submitting an expense sheet must approve the expense sheet before it can be approved by the department manager.</p> <p>Level zero is the lowest possible level, and must therefore be approved first followed by level 1, 2, and so on. It is possible to have several lines carrying the same level number, and when several approval lines are created with identical level numbers for the same purchase order/expense sheet/vendor invoice, the lines in question can be approved in any order when all other approval lines with a lower level number have been approved.</p> <p>When a purchase order, journal, expense sheet, or vendor invoice is approved in one of the Purchase Orders, General Journals, Expense Sheets, Vendor Invoices, Invoice Allocation, or Reallocate Invoices workspaces, it corresponds to the employee who makes the approval, approves an approval line concerning the purchase order/expense sheet/vendor invoice in question and on which the employee himself is specified as holder of approval or substitute. Therefore approval in these workspaces is only allowed in the order dictated by the level order of priority.</p>
<b>Super Approver</b>	<p>In this field, you can enter the number of the employee who should be the super approver on the current approval hierarchy. The super approver can approve any approval line created on the basis of the current hierarchy.</p> <p>Note that the super approver can change the approval status of all approval lines created on the basis of the current approval hierarchy. If the super approver is changed, the new super approver cannot only change the approval status of approval lines created after the change, but also all previously created approval lines.</p>
<b>May be approved by supervisor</b>	<p>If you mark this field, you allow the approval line created on the basis of the current approval hierarchy to be not only approved by the employee or substitute responsible for approval of the line but also to be approved by the supervisor of the holder of approval. However, the supervisor of a specified substitute, if any, does not gain the right to approve on behalf of the substitute, if this field is marked.</p>
<b>Automatic approval if no approvers specified</b>	<p>Select this check box for an approval hierarchy with no specified approvers if you want Maconomy to perform automatic approval whenever that hierarchy is triggered.</p> <p>If this check box is not selected and an approval hierarchy with no specified approver is triggered, Maconomy displays an error message and stops the approval process.</p>

Field	Description
<b>Submitter Can Approve (Default)</b>	Select this check box to set the default setting for self-approval when new approval hierarchy lines are created. If this check box is selected, a submitter can approve their own approval line.

### Message Control Island

Field	Description
<b>Show Message</b>	Select this check box if you want Maconomy to display a custom message whenever a user selects a specific approval hierarchy.
<b>Message</b>	In this field, enter the text for the custom message. By default, there is a 255-character limit for this field.
<b>Message Type</b>	Select a message type from the drop-down list. You can choose between Error, Warning, or Remarks.

### User Island

See the Getting Started topic for a description of the User island.

### Approvers Sub-Tab

This section includes the fields and descriptions for the Approval Hierarchy Lines sub-tab.

Field	Description
<b>Level</b>	<p>In this field, you can specify the level on which approval lines created on the basis of the current hierarchy line are to be approved.</p> <p>The field only applies, if the field “Level Prioritized” has been marked in the tab of the current hierarchy, as approval lines created on the basis of the current hierarchy are then to be approved in a certain order.</p> <p>As mentioned in the section “Introduction to Approval Hierarchies,” Maconomy creates an approval line for each line in the approval hierarchy whose selection criterion specification is met by the current purchase order, expense sheet, or vendor invoice. This is done at the submission of an expense sheet, purchase order, or vendor invoice. For each approval line created, Maconomy transfers the number of the holder of approval and the level number from the hierarchy line that gave rise to the approval line in question.</p> <p>In this way, the level number is the deciding factor for the order in which the approval is to be carried out.</p> <p>When a hierarchy is level prioritized, the approval lines with the lowest level must be approved before you can approve lines on the next level and so on. An example of the use of this functionality is that the supervisor of the person submitting an expense sheet must approve the expense sheet before it can be approved by the department manager.</p>

Field	Description
	<p>Level zero is the lowest possible level, and must therefore be approved first followed by level 1, 2, and so on. It is possible to have several lines carrying the same level number, and when several approval lines are created with identical level numbers for the same purchase order, expense sheet, or vendor invoice, the lines in question can be approved in any order when all other approval lines with a lower level number, have been approved.</p> <p>When a purchase order, an expense sheet, or a vendor invoice is approved in one of the workspaces Purchase Orders, Expense Sheets, Vendor Invoices, Invoice Allocation, or Reallocate Invoices, it corresponds to that the employee who makes the approval, approves an approval line concerning the purchase order, expense sheet, or vendor invoice in question and on which the employee himself is specified as holder of approval or substitute. Therefore approval in these workspaces is only allowed in the order dictated by the level order of priority.</p>
<b>Submitter Can Approve</b>	Select this check box to allow self-approval on the approval lines created from this approval hierarchy line. If the check box is selected, a submitter can approve their own approval lines if they are set as approver by the approval hierarchy line. Deselect this check box to not allow a submitter to approve approval lines created from the approval hierarchy, even if they are set as the approver.
<b>Selection Criterion Specification</b>	<p>In this field, you can enter a selection criterion specification of the same type as selected in the field "Type" in the tab, for example, either a selection criterion specification of the type "Expense sheet," if the approval hierarchy concerns expense sheets, a selection criterion specification of the type "Requisition," if the approval hierarchy concerns purchase orders or a selection criterion specification of the type "Vendor Invoice," if the approval hierarchy concerns vendor invoice allocation lines.</p> <p>The selection criterion specification determines when an approver specified on the current line is to approve expense sheets, purchase orders, or vendor invoices. When the current hierarchy is used (that is when it is selected by a line in the workspace Approval Hierarchy Selection), Maconomy creates an approval line for each line in the hierarchy whose selection criterion specification contains the expense sheet, purchase order, or vendor invoice in question. In this way, the approver on the current line (or a substitute, if any) is to approve purchase orders/expense sheets/invoices falling within the specified selection criterion specification. Selection criterion specifications are created in the workspace Selection Criterion Specifications.</p>
<b>Approver</b>	If you want the holder of approval to be a specific employee, you can enter in this field the number of the employee who should approve purchase orders, expense sheets, or vendor invoices falling within the selection criterion specification on the current line.
<b>Approver Name</b>	If an employee number has been specified in the field "Approver" above, this field displays the name of the employee in question.

Field	Description
<b>Approver Reference</b>	<p>If you want the holder of approval to depend on the information on the current purchase order/expense sheet/vendor invoice, you can enter a reference in this field to the place from which the employee number should be transferred. Maconomy will then transfer the referenced employee number when a purchase order/expense sheet/vendor invoice falls within the selection criterion specification on the current line, and apply the employee as holder of approval on the created approval line.</p> <p>If no employee number is found by means of the reference at the submission of a purchase order/an expense sheet/a vendor invoice - for example, if the reference concerns the project manager of a job, and the purchase order submitted is not assigned to a job - Maconomy shows an error message, and the approval cannot be carried out.</p> <p>The following options can be selected:</p> <ul style="list-style-type: none"> <li>■ All — Approval lines created on the basis of the current hierarchy line can be approved by anybody with access to the current purchase order/expense sheet/vendor invoice.</li> <li>■ Submitter — Approval lines created on the basis of the current hierarchy line must be approved by the person submitting the current purchase order/expense sheet/vendor invoice.</li> <li>■ Employee — Select a named employee. If this is entered you must also select 'Employee' as the approval reference type. Approval lines created on the basis of the current hierarchy line must be approved by the employee specified in the field 'Approver'.</li> <li>■ Employee type — Select an employee type. If this is entered you must also select 'Employee Type' as the approval reference type. Approval lines created on the basis of the current hierarchy line can be approved by anybody with the employee type specified in this field and with access to the current purchase order/expense sheet/vendor invoice.</li> <li>■ Reference — Select a reference to an employee associated with the approval object. If this is entered you must also select a reference and a field in the fields 'Approver Reference, Relation' and 'Approver Reference, Field'. This, for example, could be the project manager from the job or Employee 1 from the company. There are a number of default references and fields that are available depending upon the approval type chosen.</li> <li>■ Previous level — The previous level is an approval hierarchy line on a previous level with a lower line number.</li> <li>■ Approver — This is for use in conjunction with substitutes only. For further information, please see the description of the field 'Substitute.'</li> </ul>
<b>Approver Employee Type</b>	Specify an employee type to assign any users of this type to view and approve the record. Any approval record falling within the selection criterion

Field	Description
	<p>specification on the current line must be approved by an employee of this type.</p> <div> <p><b>Note:</b> Specify an employee type to assign any users of this type to view and approve the record. Any approval record falling within the selection criterion specification on the current line must be approved by an employee of this type. If you do not want to give approvers the right to view all of the specified record types, you must directly specify the approver in the <b>Approver</b> field, or grant indirect access using the <b>Approver, Reference</b> field.</p> </div>
<b>Approver Reference, Relation</b>	This field shows the relation of the Approver Reference for the current approval task.
<b>Approver Reference, Field</b>	This field shows the internal field name that the Approver Reference relates to.
<b>Approver Reference, Employee</b>	This field shows the employee reference of the Approver.
<b>Substitute</b>	If you want a specific employee – in addition to the holder of approval – to be able to approve approval lines created on the basis of the current hierarchy line, you can enter the number of the employee in this field. This employee is then granted the possibility of approving purchase orders/expense sheets/ vendor invoices falling within the selection criterion specification on the current line. The substitute can also be derived from the approver. The approver can, for example, be specified as the supervisor for the submitter, and the substitute can then be the substitute for that approver (the substitute for the supervisor for the submitter).
<b>Substitute Name</b>	If an employee number has been specified in the field “Substitute” above, this field will display the name of the current employee.
<b>Substitute Reference</b>	<p>If you want a specific employee - in addition to the holder of approval - to be able to approve approval lines created on the basis of the current hierarchy line, and that this person is to depend on the information on the current purchase order/expense sheet/vendor invoice, you can enter a reference in this field referring to the place from which the substitute should be transferred. Maconomy will then transfer the referenced employee number when a purchase order/expense sheet/vendor invoice falls within the selection criterion specification on the current line, and apply the substitute as holder of approval on the created approval line.</p> <p>You can choose between the options described under the field 'Approver Reference'. The functionality of these options are identical to those described</p>

Field	Description
	under the field 'Approver Reference', with the addition of 'Approver' as a substitute-only reference.
<b>Substitute Employee Type</b>	<p>Specify an employee type to assign any users of this type as substitute approvers who can view and approve the record. Any approval record falling within the selection criterion specification on the current line must be approved by an employee of this type.</p> <div> <p><b>Note:</b> If you have set up approval hierarchies or time, expense, or mileage sheets, then specify a substitute approver by employee type, these employees only have access to the records for approval if they are granted access to see all of the specified records. This is done in the Actions sub-tab under the User Roles single dialog workspace. If you do not want to give approvers the right to view all of the specified record types, you must directly specify the approver in the <b>Approver</b> field, or grant indirect access using the <b>Approver, Reference</b> field.</p> </div>
<b>Substitute Reference, Relation</b>	This field will show the relation of a substitute approver reference if one has been specified on the approval task.
<b>Substitute Reference, Field</b>	This field will show the field reference of a substitute approver if one has been specified on the approval task.
<b>Substitute Reference, Employee</b>	This field will show the employee reference of the substitute approver if one has been specified on the approval task.
Field	Description
<b>Super Approver Employee Type</b>	<p>Specify an employee type to assign any users of this type as super approvers who can view and approve the record. Any approval record falling within the selection criterion specification on the current line must be approved by an employee of this type.</p> <div> <p><b>Note:</b> If you have set up approval hierarchies or time, expense, or mileage sheets, then specify a super approver by employee type, these employees only have access to the records for approval if they are granted access to see all of the specified records. This is done in the Actions sub-tab under the User Roles single dialog workspace. If you do not want to give approvers the right to view all of the specified record types, you must directly specify the approver in the <b>Approver</b> field, or grant indirect access using the <b>Approver, Reference</b> field.</p> </div>

## Actions

This section shows the Actions available in the Approval Hierarchies workspace.

### Bottom Tab

Field	Description
<b>Add New Selection Criteria Specification</b>	This action allows you to automatically create a selection criteria specification or target group and assign this target group to the existing approval hierarchy line.

## Changes on Approve Single Dialogs Workspace

Use this workspace to specify whether some fields should have specific values assigned when the associated entry is fully approved.

The Approval Hierarchy tab displays approval hierarchy entries with all open fields. The Changes on Approve sub-tab displays all changes that could be applied when an entry is fully approved. Each line in this sub-tab has a reference to the field that should be changed, and another field for the value to assign to that field. You can also specify whether the field should be changed regardless of what the previous value was, or if the field should only be changed if it is equal to or different from an explicit value.

## Approval Hierarchy Tab

This section includes the fields and descriptions for the Approval Hierarchy tab.

### Approval Hierarchy Island

Field	Description
<b>Appr. Hierarchy No.</b>	Enter an approval hierarchy number by which the approval object is governed.

Field	Description
<b>Description</b>	Use this field to add a description for the current approval hierarchy.

Field	Description
<b>Type</b>	Enter the type of registration to which the current approval hierarchy will apply.

Field	Description
<b>Approval Relation</b>	Enter the relation used in connection with the type of registration.

Field	Description
<b>Level Prioritized</b>	<p>Use this field to specify whether the approval that uses the current hierarchy is to be carried out in a certain order</p> <p>If you do not select this field, the approval can be done in any order.</p> <p>If you select the field, the level number on each line in the table part determines the order in which approval must be carried out. An approval line is created for each line in the approval hierarchy whose selection criterion specification is matched by the item in question. This is done when an item is submitted. For each approval line created, Maconomy transfers the number of the holder of approval and the level number from the hierarchy line that gave rise to each individual approval line.</p> <p>When a hierarchy is level prioritized, the approval lines with the lowest level must be approved before you can approve lines on the next level, and so on. For example, the supervisor of the person submitting an expense sheet must approve the expense sheet before it can be approved by the department manager.</p> <p>Level zero is the lowest possible level, and must therefore be approved first, followed by level 1, 2, and so on. You can have several lines carrying the same level number. When several approval lines are created with identical level numbers for the same item, the lines in question can be approved in any order when all other approval lines with a lower level number have been approved.</p> <p>When an item is approved, it corresponds to the employee who makes the approval, approves an approval line concerning the item in question and on which the employee himself is specified as holder of approval or substitute. Therefore approval is only allowed in the order dictated by the level order of priority.</p>
<b>Super Approver</b>	<p>Use this field to enter the number of the employee who should be the super approver on the current approval hierarchy. The super approver can approve any approval line, or change the approval status of all approval lines, created on the basis of the current hierarchy.</p> <p>If the super approver is changed, the new super approver can change the approval status of approval lines created after the change as well as all previously created approval lines.</p>
<b>May be approved by supervisor</b>	<p>Select this field to allow the approval line, created on the basis of the current approval hierarchy, to be approved by the supervisor of the holder of approval as well as the employee or substitute responsible for approval of the line. This option is not applicable to the supervisor of a substitute (if specified) who may not approve on behalf of the substitute.</p>

### User Island

See the Introduction to Maconomy topic for a description of the User Island.

### Changes on Approve Sub-Tab

This section includes the fields and descriptions for the Changes on Approve sub-tab.

Field	Description
<b>Field Name</b>	Select a field whose value you want to change when the last person has approved the current step. For example, you could set the <b>Vendor State</b> field to change, or you could set an Allow field to change to <b>Yes</b> so that you can use the vendor in that area at this stage of the approval process.
<b>Change when Current Value is</b>	Enter the expression to use to stipulate when the selected field value should change. Possible options are: <ul style="list-style-type: none"> <li>Any</li> <li>Equal to</li> <li>Different From</li> </ul>
<b>Compare Value</b>	Enter the current field value if you select <b>Equal to</b> or <b>Different From</b> in the <b>Change when Current Value is</b> field, otherwise leave blank.
<b>New Value</b>	Enter the new value to which you want the selected field to change.

### Changes on Change Single Dialogs Workspace

Use this workspace to define what happens when a field from an approved item is changed and saved.

#### Approval Hierarchy Rule Tab

This section includes the fields and descriptions for the Approval Hierarchy Rule tab.

##### Approval Type Island

Field	Description
<b>Approval Type</b>	This field shows the type of approval hierarchy. The type cannot be changed here. Use the search function to select a different Type.
<b>Description</b>	Use this field to add a description of the approval hierarchy type

##### Deadline Island

Field	Description
<b>No. of days for approval</b>	Use this field to specify the number of days available for approval to be completed. The number of days can be negative.

Field	Description
<b>Monthly approval day</b>	Use this field to specify the number of the day later in the current month or in the next month which represents the approval deadline. If the day is after the last day in the current month, the deadline is set to the last day in the month. For example, if the approval is set for the 30th of each month, then for February it will be set to February 28.
<b>Weekly approval day</b>	Use this field to specify the day of the week which represents the approval deadline. The day will be the next week day.

### User Island

See the Introduction to Maconomy topic for a description of the User Island.

### Approval Principles Island

Field	Description
<b>Approval Required</b>	Select this field to use approval hierarchy. For vendors and customers, if this field is not selected, you should set the <i>Allow Users to Manually Set Allow Fields on &lt;Vendors or Customers&gt; to Yes</i> system parameter so that users can manually change the Allow fields to <b>Yes</b> .
<b>Approve at Submission</b>	If you select this field, the item will be approved automatically wherever the setup of the approval hierarchy allows for a user to submit and approve the item when they submit.
<b>Approve at Submission, Remark</b>	Select this field to automatically populate the Approval Remarks field wherever Approve at Submission has been applied.
<b>Log Changes Before First Submission</b>	If you select this field, changes made to an item prior to its first submission will be logged and will be available to be viewed in the Approval Changes window. If this field is not selected, changes made prior to first submission are not logged.

### Changes on Change Sub-Tab

This section includes the fields and descriptions for the Changes on Change sub-tab.

Field	Description
<b>Relation</b>	Select the group to which the change field belongs.
<b>Field</b>	Select the change field.

Field	Description
<b>Type of Change</b>	<p>Select the change parameter. For example, you could select <b>Greater Than</b> and enter a value in the <b>Value 1</b> field to specify that the approval hierarchy will only start for this field if the value in the selected field is greater than the value in the <b>Value 1</b> field. The available values are:</p> <ul style="list-style-type: none"> <li>Changed</li> <li>Increased</li> <li>Decreased</li> <li>Between</li> <li>Greater Than</li> <li>Greater Than or Equal to</li> <li>Equal to</li> <li>Less Than or Equal to</li> <li>Less Than</li> <li>Different From</li> </ul>
<b>Value 1</b>	Enter a value that relates to your selection in the <b>Type of Change</b> field. See <b>Type of Change</b> above for more information.
<b>Value 2</b>	Enter a value that relates to your selection in the <b>Type of Change</b> field. See <b>Type of Change</b> above for more information.
<b>Field to Update</b>	Select the field that must be updated. For example, you could select an Allow field that should change to <b>Requested</b> until this change has been approved.
<b>Change when Current Value is</b>	<p>Select a parameter to use when comparing the <b>Field to Update</b> and <b>Compare Values</b> fields. The available values are:</p> <ul style="list-style-type: none"> <li>Any</li> <li>Equal To</li> <li>Different From</li> </ul>
<b>Compare Value</b>	If the <b>Change when Current Value is</b> field is set to <b>Equal To</b> or <b>Different From</b> , then the system will use that parameter to compare the value you enter in this field with the value in the <b>Field to Update</b> field.
<b>New Value</b>	Enter the value to which the selected field will change if the parameters listed in the selected line are true.

## Changes on Reject Single Dialogs Workspace

Use this workspace to specify whether some fields should have specific values assigned when the associated entry is rejected.

The Approval Hierarchy tab displays approval hierarchy entries with all open fields. The Changes on Reject sub-tab displays all changes that could be applied if an entry is rejected. Each line in

this sub-tab has a reference to the field that should be changed and another field for the value to assign to that field. You can also specify whether the field should be changed regardless of what the previous value was, or if the field should only be changed if it is equal to or different from an explicit value.

### Approval Hierarchy Tab

This section includes the fields and descriptions for the Approval Hierarchy tab.

#### Approval Hierarchy Island

Field	Description
<b>Appr. Hierarchy No.</b>	Enter an approval hierarchy number by which the approval object is governed.

Field	Description
<b>Description</b>	Use this field to add a description for the current approval hierarchy.

Field	Description
<b>Type</b>	Enter the type of registration to which the current approval hierarchy will apply.

Field	Description
<b>Approval Relation</b>	Enter the relation used in connection with the type of registration.

Field	Description
<b>Level Prioritized</b>	<p>Use this field to specify whether the approval that uses the current hierarchy is to be carried out in a certain order</p> <p>If you do not select this field, the approval can be done in any order.</p> <p>If you select the field, the level number on each line in the table part determines the order in which approval must be carried out. An approval line is created for each line in the approval hierarchy whose selection criterion specification is matched by the item in question. This is done when an item is submitted. For each approval line created, Maconomy transfers the number of the holder of approval and the level number from the hierarchy line that gave rise to each individual approval line.</p> <p>When a hierarchy is level prioritized, the approval lines with the lowest level must be approved before you can approve lines on the next level, and so on. For example, the supervisor of the person submitting an expense sheet must approve the expense sheet before it can be approved by the department manager.</p> <p>Level zero is the lowest possible level, and must therefore be approved first, followed by level 1, 2, and so on. You can have several lines carrying the same level number. When several approval lines are created with identical level</p>

Field	Description
	<p>numbers for the same item, the lines in question can be approved in any order when all other approval lines with a lower level number have been approved.</p> <p>When an item is approved, it corresponds to the employee who makes the approval, approves an approval line concerning the item in question and on which the employee himself is specified as holder of approval or substitute. Therefore approval is only allowed in the order dictated by the level order of priority.</p>
<b>Super Approver</b>	<p>Use this field to enter the number of the employee who should be the super approver on the current approval hierarchy. The super approver can approve any approval line, or change the approval status of all approval lines, created on the basis of the current hierarchy.</p> <p>If the super approver is changed, the new super approver can change the approval status of approval lines created after the change as well as all previously created approval lines.</p>
<b>May be approved by supervisor</b>	<p>Select this field to allow the approval line, created on the basis of the current approval hierarchy, to be approved by the supervisor of the holder of approval as well as the employee or substitute responsible for approval of the line. This option is not applicable to the supervisor of a substitute (if specified) who may not approve on behalf of the substitute.</p>

### User Island

See the Introduction to Maconomy topic for a description of the User Island.

### Changes on Reject Sub-Tab

This section includes the fields and descriptions for the Changes on Reject sub-tab.

Field	Description
<b>Field Name</b>	Select a field whose value you want to change when the item is rejected. For example, you could set the <b>Vendor State</b> field to change.
<b>Change when Current Value is</b>	<p>Enter the expression to use to stipulate when the selected field value should change. Possible options are:</p> <ul style="list-style-type: none"> <li>■ Any</li> <li>■ Equal to</li> <li>■ Different From</li> </ul>
<b>Compare Value</b>	Enter the current field value if you select <b>Equal to</b> or <b>Different From</b> in the <b>Change when Current Value is</b> field, otherwise leave blank.
<b>New Value</b>	Enter the new value to which you want the selected field to change.

## Notifications after Approval Single Dialogs Workspace

When an item is created and all of the users on the Approvers tab have approved it, the users who are listed in the Notifications after Approval workspace receive notification that they must add information to the item and submit it. For example, users might have a task added to their To-Do lists when they need to add payment information for a vendor.

### Approval Hierarchy Tab

This section includes the fields and descriptions for the Approval Hierarchy tab.

#### Approval Hierarchy Island

Field	Description
<b>Appr. Hierarchy No.</b>	Enter an approval hierarchy number by which the approval object is governed.

Field	Description
<b>Description</b>	Use this field to add a description for the current approval hierarchy.

Field	Description
<b>Type</b>	Enter the type of registration to which the current approval hierarchy will apply.

Field	Description
<b>Approval Relation</b>	Enter the relation used in connection with the type of registration.

Field	Description
<b>Level Prioritized</b>	<p>Use this field to specify whether the approval that uses the current hierarchy is to be carried out in a certain order</p> <p>If you do not select this field, the approval can be done in any order.</p> <p>If you select the field, the level number on each line in the table part determines the order in which approval must be carried out. An approval line is created for each line in the approval hierarchy whose selection criterion specification is matched by the item in question. This is done when an item is submitted. For each approval line created, Maconomy transfers the number of the holder of approval and the level number from the hierarchy line that gave rise to each individual approval line.</p> <p>When a hierarchy is level prioritized, the approval lines with the lowest level must be approved before you can approve lines on the next level, and so on. For example, the supervisor of the person submitting an expense sheet must approve the expense sheet before it can be approved by the department manager.</p>

Field	Description
	<p>Level zero is the lowest possible level, and must therefore be approved first, followed by level 1, 2, and so on. You can have several lines carrying the same level number. When several approval lines are created with identical level numbers for the same item, the lines in question can be approved in any order when all other approval lines with a lower level number have been approved.</p> <p>When an item is approved, it corresponds to the employee who makes the approval, approves an approval line concerning the item in question and on which the employee himself is specified as holder of approval or substitute. Therefore approval is only allowed in the order dictated by the level order of priority.</p>
<b>Super Approver</b>	<p>Use this field to enter the number of the employee who should be the super approver on the current approval hierarchy. The super approver can approve any approval line, or change the approval status of all approval lines, created on the basis of the current hierarchy.</p> <p>If the super approver is changed, the new super approver can change the approval status of approval lines created after the change as well as all previously created approval lines.</p>
<b>May be approved by supervisor</b>	<p>Select this field to allow the approval line, created on the basis of the current approval hierarchy, to be approved by the supervisor of the holder of approval as well as the employee or substitute responsible for approval of the line. This option is not applicable to the supervisor of a substitute (if specified) who may not approve on behalf of the substitute.</p>

### User Island

See the Introduction to Maconomy topic for a description of the User Island.

### Notifications after Approval Sub-Tab

This section includes the fields and descriptions for the Notifications after Approval Sub-tab.

Field	Description
<b>Selection Criterion Specification</b>	<p>You can select a selection criterion specification so that the person should only be notified if the specification in this field is true. For example, only notify this user if payment information is needed.</p>
<b>Notification Reference</b>	<p>Enter a reference to the place from which the employee number should be transferred so that the user who adds the information is selected based on the information in the current item. Maconomy will then transfer the referenced employee number when an item falls within the selection criterion specification on the current line, and apply the employee as the person who needs to add information to the item.</p> <p>If, when an item is submitted, no employee number is found by means of the reference, Maconomy displays an error message, and name cannot be added to the line.</p> <p>The following are the available options:</p>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Submitter</b> — Select this option to notify the user who submitted the current item that they need to enter information.</li> <li>▪ <b>Employee</b> — Select a specific employee. If this is entered you must also select <b>Employee</b> in the <b>Reference, Employee</b> field.</li> <li>▪ <b>Reference</b> — Select a reference to an employee associated with the item. If this is entered, you must also make a selection in the <b>Reference Employee, Reference Relation, and Reference Field</b> fields.</li> </ul>
<b>Reference, Employee</b>	Select the employee reference, for example, supervisor. This field is mandatory if the Notification Reference is <b>Submitter</b> or <b>Reference</b> .
<b>Employee No.</b>	Select the number of the employee who should get the notification to add information to the selected item. This field is mandatory if the Notification Reference is <b>Employee</b> .
<b>Employee Name</b>	Select the name of the employee who should get the notification to add information to the selected item.
<b>Reference, Relation</b>	Select the relation of the reference for the current task. This field is mandatory if the Notification Reference is <b>Reference</b> .
<b>Reference, Field</b>	Select the internal field name to which the reference relates. This field is mandatory if the Notification Reference is <b>Reference</b> .

## Approval Hierarchy Rules Single Dialogs Workspace

U Use this workspace to set up approval hierarchy rules.

Normally, any changes to a purchase order, expense sheet, vendor invoice, or other entry would trigger the need for the entry to be reapproved, even if the change were trivial or cosmetic. This workspace lets you identify certain fields that can be changed and employees who have certain access levels who can make these changes without triggering reapproval.

It is, however, often the case that certain changes are acceptable, and it would only be annoying to have such changes trigger reapproval. You can set up rules in this workspace to list the changes that should not trigger reapproval.

In the Approval Change Line tab, you can select an approval hierarchy type.

In the sub-tab, you can select fields from the vendor invoice and invoice allocation, and for each of these fields you can set:

- Whether the field can be changed without reapproval (by selecting the **Allow change without re-approval** field).
- An access level, such that only users with this access level can change without reapproval.

## Approval Hierarchy Rules Tab

This section includes the fields and descriptions for the Approval Hierarchy Rules tab.

## Approval Type Island

Field	Description
<b>Approval Type</b>	This field shows the Type of approval hierarchy: Purchase Order, Expense Sheet or Vendor Invoice. The Type cannot be changed here; to select a different Type you should use the search function.
<b>Description</b>	In this field, you can add a description of the approval hierarchy type.

## Deadline Island

Field	Description
<b>Deadline based on preferred delivery date</b>	<p>If you mark this field, and the Type is Vendor Invoice, the deadline for the approval of the Vendor Invoice will be calculated based on the preferred delivery date. If the field is not marked, and the Type is Vendor Invoice, the deadline for the approval of the Vendor Invoice will be calculated based on the submission date.</p> <p>If you mark this field, and the Type is Purchase Order, the deadline for the approval of the purchase order will be calculated based on the due date. If the field is not marked, and the Type is Purchase Order, the deadline for the approval of the Purchase Order will be calculated based on the submission date.</p> <p>This field has no impact on deadline calculations for Expense Sheets.</p>
<b>No. of days for approval</b>	<p>In this field, you can specify a number of days available for approval to be completed. The number of days can be negative.</p> <p>The number of days is used in the approval deadline calculation as follows:</p> <ul style="list-style-type: none"> <li>For purchase orders, if the Deadline based on due date field has been marked this is the number of days that is added to the preferred delivery date, otherwise this is the number of days added to the date submitted.</li> <li>For expense sheets this is the number of days that is added to the date submitted.</li> <li>For vendor invoices, if the Deadline based on due date field has been marked this is the number of days added to the due date, otherwise this is the number of days added to the date submitted.</li> </ul>
<b>Monthly approval day</b>	In this field, you can specify the number of the day later in the current month or in the next month which represents the approval deadline. If the day is after the last day in the current month, the deadline is set to the last day in the month. For example, if the approval is set for the 30th of each month, then for February it will be set to 28th February.

Field	Description
<b>Weekly approval day</b>	In this field, you can specify the day of the week which represents the approval deadline. The day will be the next week day.

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Approval Principles Island

Field	Description
<b>Approve Header, Always</b>	If you mark this field, the approval hierarchy will always be based on the header of the purchase order/expense sheet/vendor invoice. This is regardless of whether there are any lines in the purchase order / expense sheet / vendor invoice. You should only select this option if the associated Approval Hierarchy uses the header based Approval Relation, that is, for a purchase order the approval relation would need to be Purchase Order Header.
<b>Approve Header, If no lines</b>	If you mark this field, the approval hierarchy will be based on the header of the purchase order/expense sheet/vendor invoice only where there are no lines in the purchase order/expense sheet/vendor invoice.
<b>Approve Line, Always</b>	If you mark this field, the approval hierarchy will always be based on the lines of the purchase order/expense sheet/vendor invoice. You should only select this option if the associated Approval Hierarchy uses the line based Approval Relation, that is, for a purchase order the approval relation would need to be Purchase Order Line.
<b>Reapprove header when adding a new line</b>	If you select this check box, Maconomy requires reapproval of any header resubmitted with added lines. You cannot select this check box if you already selected the <b>Reapprove all when adding a new line</b> check box, and vice versa.
<b>Reapprove header when changing a line</b>	If you select this check box, Maconomy requires reapproval of any header resubmitted with updated lines. You cannot select this check box if you already selected the <b>Reapprove all when changing a line</b> check box, and vice versa.
<b>Reapprove header when removing a line</b>	If you select this check box, Maconomy requires reapproval of any header resubmitted with deleted lines. You cannot select this check box if you already selected the <b>Reapprove all when removing a line</b> check box, and vice versa.
<b>Approve at Submission</b>	If you mark this field, wherever the setup of the approval hierarchy would allow for a user to submit and approve the same purchase order/expense sheet/vendor invoice, the purchase order/expense sheet/vendor invoice will be approved automatically when they submit.

Field	Description
	<p><b>Note:</b> In Approval Hierarchy Rules, if you select <b>Approve at Submission</b>, Maconomy automatically approves items submitted by users, such as time or expense sheets.</p> <p>However, you may prefer to disable these automatic approvals if the user is a Substitute, Supervisor, or Super Approver.</p> <p>So for example if "Approve at Submission" is marked, but "Automatic Substitute Approval" is unmarked, then Maconomy does not automatically approve if the user who submits is set as a substitute on the approval hierarchy. It works the same for "Automatic Supervisor Approval" and "Automatic Super Approver Approval."</p>
<b>Approve at Submission, Remark</b>	In this field, you can add a remark which will automatically populate the Approval Remarks field wherever Approve at Submission has been applied.
<b>Automatic Substitute Approval</b>	If "Approve at Submission" is selected, select this check box to enable automatic approval by substitute approvals, and deselect to facilitate manual approval.
<b>Automatic Supervisor Approval</b>	If "Approve at Submission" is selected, select this check box to enable automatic approval by supervisor approvals, and deselect to facilitate manual approval.
<b>Automatic Super Approver Approval</b>	If "Approve at Submission" is selected, select this check box to enable automatic approval by super approver approvals, and deselect to facilitate manual approval.
<b>Log Changes Before First Submission</b>	If you mark this field, changes made to a purchase order/expense sheet/ vendor invoice prior to its first submission will be logged and will be available to be viewed in the Approval Changes workspace. If this field is not marked, changes made prior to first submission will not be logged.

### Approver Access Tickets Island

Field	Description
<b>Approved Tickets Expire</b>	<p>Select this check box to enable deletion of access tickets after a specified number of days after approval. Maconomy runs a daily scheduled background task to delete expired tickets.</p> <p>If this check box is deselected, approver access tickets do not expire. Note that not deleting tickets may gradually impact system performance.</p> <p><b>Note:</b> This functionality does not apply to approval hierarchies used in jobs, job budgets, job quotes, and draft invoices.</p>

Field	Description
<b>Days from Approval to Expiration</b>	<p>Specify the number of days before an approved access ticket expires and is deleted.</p> <p>By default, the value in this field is <b>60</b>. Maconomy deletes the ticket 60 days after the objects in the ticket are approved.</p>
<b>Unapproved Tickets Expire</b>	<p>Select this check box to delete unapproved access tickets after a specified number of days. Maconomy runs a daily background task to delete expired tickets.</p> <p>If this check box is deselected, unapproved access tickets do not expire. Note that not deleting tickets may gradually impact system performance.</p> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> This functionality does not apply to approval hierarchies used in jobs, job budgets, job quotes and draft invoices.</p> </div>
<b>Days from Submission to Expiration</b>	<p>Specify the number of days before a submitted and unapproved access ticket expires and is deleted.</p> <p>By default, the value in this field is <b>120</b>. Maconomy deletes the ticket 120 days after the ticket is submitted and remains unapproved.</p>

### Approval Hierarchy Rule Lines Sub-Tab

This section includes the fields and descriptions for the Approval Hierarchy Rule Lines sub-tab.

Field	Description
<b>Internal Relation Name</b>	<p>This field shows the internal name of a Maconomy database relation. This is the relation to which a workflow is attached. Whenever an object is created in this relation, a workflow is initiated as defined in MWL. For instance: If JobHeader is specified as the relation, a workflow will be initialized for every job created in Maconomy.</p> <p>Note that instance keys must be created for the relation in this field for workflows to take effect. For more information, please see the description of the window Database Relations.</p>
<b>Internal Field Name</b>	This field shows the system's internal name of the database field on the current line.
<b>Relation Name</b>	This field shows the system's external name of the current relation. The external name is shown in the language currently selected in the Preferences window of your Maconomy client.
<b>Field Name</b>	This field shows the system's external name of the database field on the current line.
<b>Allowed Changes</b>	Select the level of change that is allowed from the values None, All, Decrease, and Increase.

Field	Description
<b>Only Derived Changes</b>	If you mark this field, only changes that are derived are allowed.
<b>Log Changes</b>	If you mark this field, changes made to a purchase order/expense sheet/vendor invoice prior to its first submission will be logged and will be available to be viewed in the Approval Changes window. If this field is not marked, changes made prior to first submission will not be logged.
<b>Access Level</b>	Enter the access level that is required to change an approval without triggering reapproval.
<b>Access Level Description</b>	This field displays the description of the access level specified in the "Access Level" field.

## Show Approval Change Lines Single Dialogs Workspace

Use this workspace to view logged changes to approval objects. Which changes that should be logged is selected in the Approval Hierarchy Rules Workspace.

### Approval Change Line Tab

This topic shows the fields and descriptions for the Approval Change Line tab.

#### Copy to Come

Field	Description

## Approve Time Sheets by Employee

Use up to 35 words to describe this conceptual topic. Write complete sentences.

Copy to come.

### Approve Time Sheets by Employee Tab

This section includes the fields and descriptions for the Approve Time Sheets by Employees tab.

#### Employee Information island

Field	Description
<b>Current Employee No.</b>	This field shows the employee number for the currently logged in user.

Field	Description
<b>Employee No.</b>	This field shows the number of the employee designated as approver of all lines submitted for approval. By default, this field displays the same value as the <b>Current Employee No.</b> field.
<b>Employee Type</b>	This field shows the selected employee's employee type.
<b>Job No.</b>	Enter or select a job number to show only lines relevant to the specified job in the sub-tab.
<b>Show Lines For Approval</b>	Select this check box to show items available for approval. This is enabled by default.
<b>Show Non-Active Lines</b>	Select this check box to show approval items that are not yet active.
<b>Show Rejected Lines</b>	Select this check box to show rejected approval items.
<b>Show Substitute Lines</b>	Select this check box to show the approval items for which you are a substitute approver.
<b>Show Super Approver Lines</b>	Select this check box to show approval items for which you are a super approver.
<b>Show Approvable by All Approval Lines</b>	Select this check box to view all approval items that can be approved by any user.
<b>Overwrite existing</b>	If existing information is already available in the <b>Approval Status</b> or <b>Remark</b> fields in the sub-tab, select one or both of the following check boxes to enable the system to overwrite it: <ul style="list-style-type: none"> <li>Approval Status</li> <li>Remark</li> </ul>
<b>Remark</b>	Enter a remark regarding the specified approval object line.

### Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number to which the current line is associated.
<b>Level</b>	This field shows the level of the approval hierarchy that the approval object lines relate to, and thus the order in which they are to be

Field	Description
	approved. This field only applies if the <b>Level Prioritized</b> check box is selected in the tab of the related approval hierarchy.
<b>Effective</b>	This field shows whether or not the actual approvals are marked as effective. In-effective approval headers and lines show the history.
<b>Active</b>	This field shows whether or not the approval object is currently active.
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the <b>New Approval Status</b> field is transferred to this field when you use the <b>Execute Approval</b> action. This field cannot be changed manually.
<b>New Approval Status</b>	<p>Select the status you wish to assign to the current approval object line when you use the <b>Execute Approval</b> action.</p> <p>The following statuses are available:</p> <ul style="list-style-type: none"> <li>Blank</li> <li>Approved</li> <li>Rejected</li> <li>Released</li> </ul>
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.
<b>Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field shows the time that the current line was approved.
<b>Approver</b>	This field show the employee name and number of the designated approver who approved the approval object.
<b>Substitute</b>	This field shows the employee name and number of the designated substitute approver who approved the approval object.
<b>Super Approver</b>	This field shows the employee name and number of the designated super approver who approved the approval object.
<b>Approver Name</b>	Enter or select the name of the designated approver who can approve the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.

Field	Description
<b>Substitute Name</b>	Enter or select the name of the designated substitute approver who can approve the approval object.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Super Approver Name</b>	Enter or select the name of the designated super approver who can approve the approval object.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Approver</b>	This field shows the employee number of the employee who approved the current approval object.
<b>Approver Employee Type</b>	This field shows the designated employee type that can approve approval objects. Any approval object, such as time sheet lines, falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute</b>	This field shows the name of the designated substitute approver who approved the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Approver Reference, Field</b>	This field shows the internal field name that the Approver Reference relates to.
<b>Approver Reference, Employee</b>	This field shows the employee reference of the Approver.
<b>Substitute Reference, Relation</b>	This field shows the relation of a substitute approver reference if one has been specified on the approval task.

Field	Description
<b>Substitute Reference, Field</b>	This field shows the field reference of a substitute approver if one has been specified on the approval task.
<b>Substitute Reference, Employee</b>	This field shows the employee reference of the substitute approver if one has been specified on the approval task.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Super Approver</b>	This field shows the name of the designated super approver who approved the approval object.
<b>Super Approver Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Super Approver Reference, Relation</b>	This field shows the relation of a super approver reference if one has been specified on the approval task.
<b>Super Approver Reference, Field</b>	This field shows the field reference of a super approver if one has been specified on the approval task.
<b>Super Approver Reference, Employee</b>	This field shows the employee reference of a super approver if one has been specified on the approval task.
<b>Current Approval Status Details</b>	This field shows details regarding the latest approval status of the current line.
<b>Current Approval Status</b>	This field shows the latest approval status of the current line.
<b>Last Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the last user who completed the action for the associated approval object.
<b>Last Approval or Rejection Date</b>	If the approval object has been approved, this field shows the latest date on which the current line was approved.
<b>Last Approval or Rejection Time</b>	If the approval object has been approved, this field shows the latest time when the current line was approved.

Field	Description
<b>Last Approval or Rejection Comment</b>	If the approval object has been approved or rejected, this field shows the latest comment for the associated approval object.
<b>Line Can Be Approved by Current User</b>	This field shows whether the current line can be approved by the current user.
<b>Current Status</b>	This field shows the latest status of the current line.
<b>Submitted By</b>	This field shows the name of the user who submitted the current line.
<b>Date Submitted</b>	This field shows the date the current line was submitted.
<b>Time Submitted</b>	This field shows the time the current line was submitted.
<b>Employee No.</b>	This field shows the number of the employee who entered the current line.
<b>Line No.</b>	This field shows the line number of the current time sheet line.
<b>Start Date</b>	This field displays the start date of the time sheet.
<b>Job No.</b>	This field shows the job number related to the current time sheet.
<b>Activity No.</b>	This field shows the activity number specified on the current time sheet line.
<b>Monday-Sunday</b>	<p>These fields show registered time in hours or days, depending on the time unit of the expense sheet. In these fields, enter the time used every day of the week on the specific job, dimension, task, and activity. You cannot register more hours in one day than the maximum number of hours entered for the employee in the employee revision applying to the date in question.</p> <p>Moreover, if a value has been entered in the <b>Time Sheets</b> field in the Activities workspace for the activity for which you wish to register hours or amounts, you cannot enter a larger quantity for the activity than specified in that field. If there are several time sheet lines for a given employee with the activity in question, the sum of the registrations on these lines cannot exceed the daily registration limit specified for the activity in question.</p> <p>You can enter a negative number of hours. If the <b>Minimum Hours</b> field is enabled on the employee revision applying on the date in question, Maconomy checks whether the employee has registered the minimum</p>

Field	Description
	<p>number of hours that the employee in question is supposed to register. If the number of hours registered is lower than this number, the time sheet cannot be submitted. It can be temporarily submitted, however. See the description of the Employees workspace in the Set-Up module for further information.</p> <p>If time sheet lines are automatically created from the detailed resource planning, these fields are automatically filled in with the quantity of hours planned for the employee on the task specified on the current line. In this way, you only need to enter hours in these fields if you need to make any changes to the pre-filled quantity of hours. However, the fields are only prefilled on time sheet lines referring to jobs where you entered a value in the <b>By Day</b> field in the <b>Pre-fill Time Sheet Lines</b> job parameter attribute.</p> <p>You cannot enter hours for days that are before the open posting period for the job specified on the current line. For further information, refer to the description of the Job Cost island in the Company Information workspace in the G/L module. If you enter hours for a date that comes after the open posting period, Maconomy issues a warning. In addition, it will only be possible to submit such time sheets, but not to perform any actions that will result in a posting. Whether it is the submission, release, or approval that determines when a time sheet is transferred for posting depends on the approval principle of each job. For further information about approval principles, refer to the description of the Approval island in the Jobs workspace.</p> <p>By changing the MDL layout of this window, you can insert variable day names in the sub-tab. For example, the column which is named <b>Monday</b> by default, can be changed to <b>Mon. &lt;date&gt;</b>. For more information, refer to the description of the Window Layouts workspace in the Set-Up module.</p>
<b>Description</b>	This field shows a description of the current entry.
<b>Activity Type</b>	This field shows the type of the current activity.
<b>Quantity Monday-Sunday, Transferred</b>	These fields show whether or not the quantities for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Job Description</b>	This field shows a description of the job specified in the <b>Job No.</b> field. If it is an internal job, the description contains the job name, whereas the description of an external job contains the name of the customer to whom the job has been assigned.
<b>Internal Job</b>	This field displays the total time registered on internal jobs for the week.

Field	Description
<b>Spec. 1-3</b>	These fields show the specifications assigned to the current line.
<b>Task</b>	This field shows the type of the current activity.
<b>Time Activity 1-3</b>	These fields show the total time for activities in hours or days, depending on the time unit. Time activity can be used to calculate overtime, among others. The activity references can be created in the Time Sheet References workspace.
<b>Time Activity 1-3, Transferred</b>	These fields show whether or not the time activities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Amount Activity 1-4</b>	These fields show the total number of hours for the amount activities specified in the window Time Sheet References. Amount activities can for instance be used to register transport costs, meals, and so on.
<b>Amount Activity 1-4, Transferred</b>	These fields show whether or not the amounts have been transferred to a time sheet journal or the time sheet journal queue.
<b>Location</b>	This field shows the location assigned to the current line.
<b>Entity</b>	This field shows the entity assigned to the current line.
<b>Project</b>	This field shows the project assigned to the current line.
<b>Purpose</b>	This field shows the purpose assigned to the current line.
<b>Local Spec. 1-3</b>	This field shows the local specifications assigned to the current line.
<b>Company No.</b>	This field shows the name of the company responsible for the job on which the work was performed.
<b>Quantity 1-2</b>	These fields show the quantities registered in the entry.
<b>Quantity 1-2, Transferred</b>	These fields show whether or not the quantites have been transferred to a time sheet journal or the time sheet journal queue.
<b>Transferred for Posting</b>	This field determines whether the current line has been transferred for posting.
<b>Total</b>	This field displays the total hours (or days) worked for the week for the job, dimension, task, and activity specified on the line.

Field	Description
<b>Cost Type</b>	This field shows the cost type of the current line.
<b>Submitted</b>	This field shows whether the current line has been submitted.
<b>New Approval Status, Project Manager</b>	<p>This field shows the status of the current line, as determined by the designated project manager of the job.</p> <p>When the time sheet is submitted, the project manager can approve, reject, or release each line if the approval principle of the job indicates that approval of time registrations by the project manager is mandatory or optional.</p> <p>If the status of the line is Approved or Released, and the line is changed, the status changes to blank. If the line is Rejected, then changed, the status does not change.</p>
<b>Approval, Project Manager</b>	This field shows the approval status of the current line, as determined by the designated project manager of the job. The value in the <b>New Approval Status, Project Manager</b> field is transferred to this field when you use the <b>Execute Approval</b> action.
<b>Approved by</b>	This field shows the name of the project manager who assigned the current approval status to the line.
<b>Approval Date</b>	This field shows the date on which the project manager who assigned the current approval status assigned the approval status to the line.
<b>Comment</b>	This field shows any comments entered by the project manager in connection with the approval, release, or rejection of the line.
<b>Approved by Superior</b>	This field shows if the current line has been approved by the user's superior.
<b>Released by Superior</b>	This field shows if the current line has been released by the user's superior.
<b>Keep Line</b>	<p>This field shows whether or not the current line is deemed permanent.</p> <p>If this check box is selected, the current line is automatically copied from the previous period at the creation of time sheets. New lines created inherit this status, which means that they will automatically be copied to all new time sheets until you deselect the check box on the selected line.</p>
<b>Planned This Period</b>	This field shows whether or not the current line has been transferred, in which case the transfer action does not apply.
<b>Est. Time to Compl.</b>	This field shows the estimated time to completion of the current line.
<b>Completed</b>	This field shows whether or not the work on the current line is completed.

Field	Description
<b>Estimate Date</b>	This field shows the estimate date of the current line's completion.
<b>Job Budget Type</b>	This field shows the budget type assigned to the current job.
<b>Job Budget Revision No.</b>	This field shows the revision number of the current job budget line.
<b>Overtime Spec.</b>	This field shows the overtime specification for the current line. Overtime specifications are defined in the Popup Fields tab in the System Setup workspace.
<b>Favorite</b>	This field shows a favorite, if it has been selected. Favorites are derived from the Favorites workspace.
<b>Note</b>	Enter a brief description of what you have been working on.
<b>Est. Time to Compl. Days</b>	Enter the number of days as an estimate to completion. If you enter a value in this field, Maconomy automatically converts it to hours, which is shown in the <b>Est. Time to Compl.</b> field. The number of hours is calculated by multiplying the number of days by the value in the <b>Hours per Man Day</b> field in the Jobs workspace.
<b>Description, Monday-Sunday</b>	Enter a daily description of the task specified on the current line. If daily descriptions are required for the task in question, Maconomy ensures that you enter a description for the task for the day in question before you can submit the time sheet.
<b>Transaction Timestamp</b>	This field shows the time of creation or the latest revision of the current line.
<b>Proposed Quantity</b>	This field shows the invoiceable quantity entered by the employee on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity, Monday-Sunday</b>	These fields show the invoiceable quantity entered by the employee for each day on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity Transferred, Monday-Sunday</b>	This field shows the proposed invoiceable quantity entered by the employee for each day that can be transferred on an expense sheet line.
<b>Proposed Billing Price, Total</b>	This field shows the total proposed billing price in job currency per hour or day, depending on the Time Unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.

Field	Description
<b>Proposed Billing Price, Unit</b>	This field shows the proposed billing price in job currency per hour or day, depending on the Time Unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Billing Price, Currency</b>	This field shows the standard billing price of the current line in the currency of the job.
<b>Use Invoice Proposal</b>	This field shows whether the quantity and billing price in the following fields are used for invoicing: <ul style="list-style-type: none"> <li>Proposed Quantity</li> <li>Proposed Billing Price, Unit</li> <li>Proposed Billing Price, Total</li> </ul>
<b>Transaction Type</b>	This field shows the current line's transaction type. Transaction types are set up in the Transaction Types workspace.
<b>Invoiceable</b>	This field shows whether or not the line is invoiceable.
<b>Billing Price, Base</b>	This field shows the budgeted billing price in base currency.
<b>Billing Price, Enterprise</b>	This field shows the budgeted billing price in enterprise currency.
<b>Employee Category No.</b>	This field shows the employee category number that comes from job budget lines or that you add manually in this sub-tab.
<b>Absence Type</b>	Select the reason for the absence.
<b>Time Unit</b>	This field displays the time unit used for filing time (either hours or days).
<b>Option List 1-5</b>	Specify the option lists containing the values that should be available for further specification in the <b>Selected Value 1-5</b> fields on the current line.
<b>Selected Value 1-5</b>	Specify a number of values for further specification of the current line. You can only use values available in the respective option lists specified in the <b>Option List 1-5</b> fields.
<b>Spec. 4-10</b>	These fields show the specifications assigned to the current line.
<b>Local Spec. 4-10</b>	This field shows the local specifications assigned to the current line.

Field	Description
<b>Purchase Order Number</b>	This field shows the purchase order number to which the current line is associated to.
<b>Purchase Order Line Number</b>	This field shows the purchase order line number assigned to the current line.
<b>Employee</b>	This field shows the name of the employee assigned to the current line.
<b>Employee Position</b>	This field shows the position number assigned to the employee.
<b>Employee E-mail</b>	This field shows the employee's email address.
<b>Employee Phone</b>	This field shows the employee's phone number.
<b>Employee Mobile</b>	This field shows the employee's mobile number.
<b>Employee Company No.</b>	This field shows the employee's company number.
<b>Employee Company</b>	This field shows the company the employee is associated with.
<b>Job Name</b>	This field shows the name of the job to which the current line is associated.
<b>Project Manager No.</b>	This field shows the project manager number of the project manager assigned to the current line.
<b>Project Manager</b>	This field shows the name of the project manager assigned to the current line.
<b>Activity Description</b>	This field displays the title or name of the activity for which the employee registered time.
<b>Task Description</b>	This field displays the title or name of the task for which the employee registered time.
<b>Task Path</b>	This field shows any task path of the task.
<b>Company</b>	This field shows the name of the bill-to-customer assigned to the job on the current line.
<b>Customer No.</b>	This field shows the number of the bill-to customer assigned to the job on the current line.
<b>Customer</b>	This field shows the name of the bill-to customer assigned to the job on the current line.

Field	Description
<b>Time Unit, Job</b>	This field displays the time unit used for filing time (hours or days) on the job.
<b>Week</b>	This field shows the week number of the current time sheet.
<b>Year</b>	This field shows the year in which the current time sheet line was entered. The field cannot be changed.
<b>Location Description</b>	This field shows a description regarding the location assigned to the current line.
<b>Entity Description</b>	This field shows a description regarding the entity assigned to the current line.
<b>Project Description</b>	This field shows a description regarding the project assigned to the current line.
<b>Purpose Description</b>	This field shows a description regarding the purposes assigned to the current line.
<b>Spec. 1-10 Description</b>	This field shows descriptions regarding the specifications assigned to the current line.
<b>Local Spec. 1-10 Description</b>	This field shows descriptions regarding the local specifications assigned to the current line.
<b>Customer Level</b>	This field shows the customer level number for the customer to which the current line is associated.
<b>Level 1-5 No.</b>	These fields show the companies in the hierarchy above the specified company associated with the current line. These fields are only available if Customer Levels are set up using the designated system parameters.
<b>Level 1-5 Name</b>	These fields show the names of the companies in the hierarchy above the specified company associated with the current line. These fields are only available if Customer Levels are set up using the designated system parameters.
<b>Time Activity 1-3</b>	In these fields, you can specify time registration for activities as set up in Time Sheet References. This field is in hours or days, depending on the time unit on the time sheet.
<b>Monday-Friday</b>	These fields show registered time in hours or days, depending on the time unit of the time sheet. In these fields you enter the time used every day of the week on the specific job, dimension, task, and activity. You cannot register more hours in one day than the maximum number of hours entered for the employee in the employee revision applying to the date in question.

Field	Description
	<p>Moreover, if a value has been entered in the <b>Time Sheets</b> field in the Activities workspace for the activity for which you wish to register hours or amounts, you cannot enter a larger quantity for the activity than specified in that field. If there are several time sheet lines for a given employee with the activity in question, the sum of the registrations on these lines cannot exceed the daily registration limit specified for the activity in question.</p> <p>It is possible to enter a negative number of hours. If the <b>Minimum Hours</b> field has been marked on the employee revision applying on the date in question, Maconomy checks whether the employee has registered the minimum number of hours that the employee in question is supposed to register. If the number of hours registered is lower than this number, the time sheet cannot be submitted. It can be temporarily submitted, however. See the description of the window Employees in the Set-Up module for further information.</p> <p>If time sheet lines are automatically created from the detailed resource planning, these fields will automatically be filled in with the quantity of hours planned for the employee on the task specified on the current line. In this way, you only need to enter hours in these fields if you need to make any changes to the pre-filled quantity of hours. However, the fields are only pre-filled on time sheet lines referring to jobs for which the <b>Pre-fill Time Sheet Lines</b> job parameter attribute has the <b>By Day</b> value.</p> <p>You cannot enter hours for days that are before the open posting period for the job specified on the current line. For further information, refer to the description of the Job Cost island in the Company Information workspace in the G/L module. If you enter hours for a date that comes after the open posting period, Maconomy issues a warning. In addition, it will only be possible to submit such time sheets, but not to perform any actions that will result in a posting. Whether it is the submission, release, or approval that determines when a time sheet is transferred for posting depends on the approval principle of each job. For further information about approval principles, refer to the description of the Approval island in the Jobs workspace.</p> <p>By changing the MDL layout of this window, you can insert variable day names in the sub-tab. For example, the column which is called <b>Monday</b> by default, can, be changed to <b>Mon. &lt;date&gt;</b>. For more information, refer to the description of the Window Layouts workspace in the Set-Up module.</p>
<b>Time Activity 1-3, Transferred</b>	These fields show whether or not the time activities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Quantity Monday-Friday, Transferred</b>	These fields show whether or not the quantites for each day have been transferred to a time sheet journal or the time sheet journal queue.

Field	Description
<b>Proposed Quantity Monday-Friday</b>	These fields show the invoiceable quantity entered by the employee for each day on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity Monday-Friday, Transferred</b>	These fields show whether or not the quantities for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Proposed Quantity</b>	This field shows the invoiceable quantity entered by the employee on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Billing Price, Unit</b>	This field shows the proposed billing price in job currency per hour or day, depending on the time unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Total</b>	This field displays the total hours (or days) worked for the week for the job, dimension, task, and activity specified on the line.
<b>Missed Meal Monday-Sunday</b>	This field specifies whether the employee utilized their daily break for the day. If the field value is <b>Yes</b> , the employee skipped their break.

## Actions

This section shows the Actions available in the Approve Time Sheets by Employee workspace.

### Table Part

Field	Description
<b>Mark All For Approval</b>	Use this action to mark all approval object lines in the sub-tab for approval. This means the status in the <b>New Approval Status</b> field is set to Approved on all lines.
<b>Mark All For Release</b>	Use this action to mark all approval object lines in the sub-tab for release. This means the status in the <b>New Approval Status</b> field is set to Released on all lines.  This action can only be used if the <b>Trans. Non-Appr. Time Sheets</b> field is enabled in the System Information workspace, and the current user has access to transferring expense sheets as specified in the Actions workspace. The employee specified as the project manager for the current job, however, always has the right to release time sheets for the employee in question.
<b>Mark All For Rejection</b>	Use this action to mark all approval object lines in the sub-tab for rejection. This means the status in the <b>New Approval Status</b> field is set to Rejected on all lines.

Field	Description
<b>Unmark All</b>	Use this action to unmark all approval object lines in the sub-tab for approval. This means the <b>Approve</b> check box is deselected for all entries in the sub-tab.
<b>Execute Approval</b>	Use this action to put into effect all statuses indicated in the <b>New Approval Status</b> field for all lines. If any approval object lines are thus fully approved or released (for example, the expense sheet from which the approval object line originates was already approved or released by the supervisor), the lines in question are transferred to a registration journal which can then be posted. The <b>Approval Status</b> field is automatically updated with the value shown in the <b>New Approval Status</b> field.
<b>Approve All</b>	Use this action to approve all the lines pending approval that are listed in the sub-tab.
<b>Reset All</b>	Use this action to reset all the lines pending approval that are listed in the sub-tab.

## Approve Time Sheet Lines by Employee Workspace

Use up to 35 words to describe this conceptual topic. Write complete sentences.

Copy to come.

### Approve Time Sheet Lines by Employee Tab

This section includes the fields and descriptions for the Approve Time Sheet Lines by Employee tab.

#### Employee Information island

Field	Description
<b>Current Employee No.</b>	This field shows the employee number for the currently logged in user.
<b>Employee No.</b>	This field shows the number of the employee designated as approver of all lines submitted for approval. By default, this field displays the same value as the <b>Current Employee No.</b> field.
<b>Employee Type</b>	This field shows the selected employee's employee type.
<b>Job No.</b>	Enter or select a job number to show only lines relevant to the specified job in the sub-tab.
<b>Show Lines For Approval</b>	Select this check box to show items available for approval. This is enabled by default.
<b>Show Non-Active Lines</b>	Select this check box to show approval items that are not yet active.

Field	Description
<b>Show Rejected Lines</b>	Select this check box to show rejected approval items.
<b>Show Substitute Lines</b>	Select this check box to show the approval items for which you are a substitute approver.
<b>Show Super Approver Lines</b>	Select this check box to show approval items for which you are a super approver.
<b>Show Approvable by All Approval Lines</b>	Select this check box to view all approval items that can be approved by any user.
<b>Overwrite existing</b>	<p>If existing information is already available in the <b>Approval Status</b> or <b>Remark</b> fields in the sub-tab, select one or both of the following check boxes to enable the system to overwrite it:</p> <ul style="list-style-type: none"> <li>Approval Status</li> <li>Remark</li> </ul>
<b>Remark</b>	Enter a remark regarding the specified approval object line.

### Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number to which the current line is associated.
<b>Level</b>	This field shows the level of the approval hierarchy that the approval object lines relate to, and thus the order in which they are to be approved. This field only applies if the <b>Level Prioritized</b> check box is selected in the tab of the related approval hierarchy.
<b>Effective</b>	This field shows whether or not the actual approvals are marked as effective. In-effective approval headers and lines show the history.
<b>Active</b>	This field shows whether or not the approval object is currently active.
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the <b>New Approval Status</b> field is transferred to this field when you use the <b>Execute Approval</b> action. This field cannot be changed manually.
<b>New Approval Status</b>	<p>Select the status you wish to assign to the current approval object line when you use the <b>Execute Approval</b> action.</p> <p>The following statuses are available:</p>

Field	Description
	<ul style="list-style-type: none"> <li>Blank</li> <li>Approved</li> <li>Rejected</li> <li>Released</li> </ul>
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.
<b>Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field shows the time that the current line was approved.
<b>Approver</b>	This field show the employee name and number of the designated approver who approved the approval object.
<b>Substitute</b>	This field shows the employee name and number of the designated substitute approver who approved the approval object.
<b>Super Approver</b>	This field shows the employee name and number of the designated super approver who approved the approval object.
<b>Approver Name</b>	Enter or select the name of the designated approver who can approve the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Name</b>	Enter or select the name of the designated substitute approver who can approve the approval object.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Super Approver Name</b>	Enter or select the name of the designated super approver who can approve the approval object.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Approver</b>	This field shows the employee number of the employee who approved the current approval object.

Field	Description
<b>Approver Employee Type</b>	This field shows the designated employee type that can approve approval objects. Any approval object, such as time sheet lines, falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute</b>	This field shows the name of the designated substitute approver who approved the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Approver Reference, Field</b>	This field shows the internal field name that the Approver Reference relates to.
<b>Approver Reference, Employee</b>	This field shows the employee reference of the Approver.
<b>Substitute Reference, Relation</b>	This field shows the relation of a substitute approver reference if one has been specified on the approval task.
<b>Substitute Reference, Field</b>	This field shows the field reference of a substitute approver if one has been specified on the approval task.
<b>Substitute Reference, Employee</b>	This field shows the employee reference of the substitute approver if one has been specified on the approval task.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Super Approver</b>	This field shows the name of the designated super approver who approved the approval object.
<b>Super Approver Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects.

Field	Description
	Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Super Approver Reference, Relation</b>	This field shows the relation of a super approver reference if one has been specified on the approval task.
<b>Super Approver Reference, Field</b>	This field shows the field reference of a super approver if one has been specified on the approval task.
<b>Super Approver Reference, Employee</b>	This field shows the employee reference of a super approver if one has been specified on the approval task.
<b>Current Approval Status Details</b>	This field shows details regarding the latest approval status of the current line.
<b>Current Approval Status</b>	This field shows the latest approval status of the current line.
<b>Last Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the last user who completed the action for the associated approval object.
<b>Last Approval or Rejection Date</b>	If the approval object has been approved, this field shows the latest date on which the current line was approved.
<b>Last Approval or Rejection Time</b>	If the approval object has been approved, this field shows the latest time when the current line was approved.
<b>Last Approval or Rejection Comment</b>	If the approval object has been approved or rejected, this field shows the latest comment for the associated approval object.
<b>Line Can Be Approved by Current User</b>	This field shows whether the current line can be approved by the current user.
<b>Current Status</b>	This field shows the latest status of the current line.
<b>Submitted By</b>	This field shows the name of the user who submitted the current line.
<b>Date Submitted</b>	This field shows the date the current line was submitted.

Field	Description
<b>Time Submitted</b>	This field shows the time the current line was submitted.
<b>Employee No.</b>	This field shows the number of the employee who entered the current line.
<b>Line No.</b>	This field shows the line number of the current expense sheet line.
<b>Start Date</b>	This field displays the start date of the expense sheet.
<b>Job No.</b>	This field shows the job number related to the current expense sheet line.
<b>Activity No.</b>	This field shows the activity number specified on the current expense sheet line.
<b>Monday-Sunday</b>	<p>These fields show registered time in hours or days, depending on the time unit of the expense sheet. In these fields, enter the time used every day of the week on the specific job, dimension, task, and activity. You cannot register more hours in one day than the maximum number of hours entered for the employee in the employee revision applying to the date in question.</p> <p>Moreover, if a value has been entered in the <b>Time Sheets</b> field in the Activities workspace for the activity for which you wish to register hours or amounts, you cannot enter a larger quantity for the activity than specified in that field. If there are several time sheet lines for a given employee with the activity in question, the sum of the registrations on these lines cannot exceed the daily registration limit specified for the activity in question.</p> <p>You can enter a negative number of hours. If the <b>Minimum Hours</b> field is enabled on the employee revision applying on the date in question, Maconomy checks whether the employee has registered the minimum number of hours that the employee in question is supposed to register. If the number of hours registered is lower than this number, the time sheet cannot be submitted. It can be temporarily submitted, however. See the description of the Employees workspace in the Set-Up module for further information.</p> <p>If time sheet lines are automatically created from the detailed resource planning, these fields are automatically filled in with the quantity of hours planned for the employee on the task specified on the current line. In this way, you only need to enter hours in these fields if you need to make any changes to the pre-filled quantity of hours. However, the fields are only prefilled on time sheet lines referring to jobs where you entered a value in the <b>By Day</b> field in the <b>Pre-fill Time Sheet Lines</b> job parameter attribute.</p> <p>You cannot enter hours for days that are before the open posting period for the job specified on the current line. For further information, refer to the description of the Job Cost island in the Company Information</p>

Field	Description
	<p>workspace in the G/L module. If you enter hours for a date that comes after the open posting period, Maconomy issues a warning. In addition, it will only be possible to submit such time sheets, but not to perform any actions that will result in a posting. Whether it is the submission, release, or approval that determines when a time sheet is transferred for posting depends on the approval principle of each job. For further information about approval principles, refer to the description of the Approval island in the Jobs workspace.</p> <p>By changing the MDL layout of this window, you can insert variable day names in the sub-tab. For example, the column which is named <b>Monday</b> by default, can be changed to <b>Mon. &lt;date&gt;</b>. For more information, refer to the description of the Window Layouts workspace in the Set-Up module.</p>
<b>Description</b>	This field shows a description of the current entry.
<b>Activity Type</b>	This field shows the type of the current activity.
<b>Quantity Monday-Sunday, Transferred</b>	These fields show whether or not the quantities for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Job Description</b>	This field shows a description of the job specified in the <b>Job No.</b> field. If it is an internal job, the description contains the job name, whereas the description of an external job contains the name of the customer to whom the job has been assigned.
<b>Internal Job</b>	This field displays the total time registered on internal jobs for the week.
<b>Spec. 1-3</b>	These fields show the specifications assigned to the current line.
<b>Task</b>	This field shows the type of the current activity.
<b>Time Activity 1-3</b>	These fields show the total time for activities in hours or days, depending on the time unit. Time activity can be used to calculate overtime, among others. The activity references can be created in the Time Sheet References workspace.
<b>Time Activity 1-3, Transferred</b>	These fields show whether or not the time activities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Amount Activity 1-4</b>	These fields show the total number of hours for the amount activities specified in the window Time Sheet References. Amount activities can for instance be used to register transport costs, meals, and so on.

Field	Description
<b>Amount Activity 1-4, Transferred</b>	These fields show whether or not the amounts have been transferred to a time sheet journal or the time sheet journal queue.
<b>Location</b>	This field shows the location assigned to the current line.
<b>Entity</b>	This field shows the entity assigned to the current line.
<b>Project</b>	This field shows the project assigned to the current line.
<b>Purpose</b>	This field shows the purpose assigned to the current line.
<b>Local Spec. 1-3</b>	This field shows the local specifications assigned to the current line.
<b>Company No.</b>	This field shows the name of the company responsible for the job on which the work was performed.
<b>Quantity 1-2</b>	These fields show the quantities registered in the entry.
<b>Quantity 1-2, Transferred</b>	These fields show whether or not the quantites have been transferred to a time sheet journal or the time sheet journal queue.
<b>Transferred for Posting</b>	This field determines whether the current line has been transferred for posting.
<b>Total</b>	This field displays the total hours (or days) worked for the week for the job, dimension, task, and activity specified on the line.
<b>Cost Type</b>	This field shows the cost type of the current line.
<b>Submitted</b>	This field shows whether the current line has been submitted.
<b>New Approval Status, Project Manager</b>	<p>This field shows the status of the current line, as determined by the designated project manager of the job.</p> <p>When the time sheet is submitted, the project manager can approve, reject, or release each line if the approval principle of the job indicates that approval of time registrations by the project manager is mandatory or optional.</p> <p>If the status of the line is Approved or Released, and the line is changed, the status changes to blank. If the line is Rejected, then changed, the status does not change.</p>

Field	Description
<b>Approval, Project Manager</b>	This field shows the approval status of the current line, as determined by the designated project manager of the job. The value in the <b>New Approval Status, Project Manager</b> field is transferred to this field when you use the <b>Execute Approval</b> action.
<b>Approved by</b>	This field shows the name of the project manager who assigned the current approval status to the line.
<b>Approval Date</b>	This field shows the date on which the project manager who assigned the current approval status assigned the approval status to the line.
<b>Comment</b>	This field shows any comments entered by the project manager in connection with the approval, release, or rejection of the line.
<b>Approved by Superior</b>	This field shows if the current line has been approved by the user's superior.
<b>Released by Superior</b>	This field shows if the current line has been released by the user's superior.
<b>Keep Line</b>	This field shows whether or not the current line is deemed permanent. If this check box is selected, the current line is automatically copied from the previous period at the creation of time sheets. New lines created inherit this status, which means that they will automatically be copied to all new time sheets until you deselect the check box on the selected line.
<b>Planned This Period</b>	This field shows whether or not the current line has been transferred, in which case the transfer action does not apply.
<b>Est. Time to Compl.</b>	This field shows the estimated time to completion of the current line.
<b>Completed</b>	This field shows whether or not the work on the current line is completed.
<b>Estimate Date</b>	This field shows the estimate date of the current line's completion.
<b>Job Budget Type</b>	This field shows the budget type assigned to the current job.
<b>Job Budget Revision No.</b>	This field shows the revision number of the current job budget line.
<b>Overtime Spec.</b>	This field shows the overtime specification for the current line. Overtime specifications are defined in the Popup Fields tab in the System Setup workspace.
<b>Favorite</b>	This field shows a favorite, if it has been selected. Favorites are derived from the Favorites workspace.

Field	Description
<b>Note</b>	Enter a brief description of what you have been working on.
<b>Est. Time to Compl. Days</b>	Enter the number of days as an estimate to completion. If you enter a value in this field, Maconomy automatically converts it to hours, which is shown in the <b>Est. Time to Compl.</b> field. The number of hours is calculated by multiplying the number of days by the value in the <b>Hours per Man Day</b> field in the Jobs workspace.
<b>Description, Monday-Sunday</b>	Enter a daily description of the task specified on the current line. If daily descriptions are required for the task in question, Maconomy ensures that you enter a description for the task for the day in question before you can submit the time sheet.
<b>Transaction Timestamp</b>	This field shows the time of creation or the latest revision of the current line.
<b>Proposed Quantity</b>	This field shows the invoiceable quantity entered by the employee on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity, Monday-Sunday</b>	These fields show the invoiceable quantity entered by the employee for each day on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity Transferred, Monday-Sunday</b>	This field shows the proposed invoiceable quantity entered by the employee for each day that can be transferred on an expense sheet line.
<b>Proposed Billing Price, Total</b>	This field shows the total proposed billing price in job currency per hour or day, depending on the Time Unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Proposed Billing Price, Unit</b>	This field shows the proposed billing price in job currency per hour or day, depending on the Time Unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Biling Price, Currency</b>	This field shows the standard billing price of the current line in the currency of the job.
<b>Use Invoice Proposal</b>	This field shows whether the quantity and billing price in the following fields are used for invoicing: <ul style="list-style-type: none"> <li>Proposed Quantity</li> <li>Proposed Billing Price, Unit</li> <li>Proposed Billing Price, Total</li> </ul>

Field	Description
<b>Transaction Type</b>	This field shows the current line's transaction type. Transaction types are set up in the Transaction Types workspace.
<b>Invoiceable</b>	This field shows whether or not the line is invoiceable.
<b>Billing Price, Base</b>	This field shows the budgeted billing price in base currency.
<b>Billing Price, Enterprise</b>	This field shows the budgeted billing price in enterprise currency.
<b>Employee Category No.</b>	This field shows the employee category number that comes from job budget lines or that you add manually in this sub-tab.
<b>Absence Type</b>	Select the reason for the absence.
<b>Time Unit</b>	This field displays the time unit used for filing time (either hours or days).
<b>Option List 1-5</b>	Specify the option lists containing the values that should be available for further specification in the <b>Selected Value 1-5</b> fields on the current line.
<b>Selected Value 1-5</b>	Specify a number of values for further specification of the current line. You can only use values available in the respective option lists specified in the <b>Option List 1-5</b> fields.
<b>Spec. 4-10</b>	These fields show the specifications assigned to the current line.
<b>Local Spec. 4-10</b>	This field shows the local specifications assigned to the current line.
<b>Purchase Order Number</b>	This field shows the purchase order number to which the current line is associated to.
<b>Purchase Order Line Number</b>	This field shows the purchase order line number assigned to the current line.
<b>Employee</b>	This field shows the name of the employee assigned to the current line.
<b>Employee Position</b>	This field shows the position number assigned to the employee.
<b>Employee E-mail</b>	This field shows the employee's email address.

Field	Description
<b>Employee Phone</b>	This field shows the employee's phone number.
<b>Employee Mobile</b>	This field shows the employee's mobile number.
<b>Employee Company No.</b>	This field shows the employee's company number.
<b>Employee Company</b>	This field shows the company the employee is associated with.
<b>Job Name</b>	This field shows the name of the job to which the current line is associated.
<b>Project Manager No.</b>	This field shows the project manager number of the project manager assigned to the current line.
<b>Project Manager</b>	This field shows the name of the project manager assigned to the current line.
<b>Activity Description</b>	This field displays the title or name of the activity for which the employee registered time.
<b>Task Description</b>	This field displays the title or name of the task for which the employee registered time.
<b>Task Path</b>	This field shows any task path of the task.
<b>Company</b>	This field shows the name of the bill-to-customer assigned to the job on the current line.
<b>Customer No.</b>	This field shows the number of the bill-to customer assigned to the job on the current line.
<b>Customer</b>	This field shows the name of the bill-to customer assigned to the job on the current line.
<b>Time Unit, Job</b>	This field displays the time unit used for filing time (hours or days) on the job.
<b>Week</b>	This field shows the week number of the current time sheet.
<b>Year</b>	This field shows the year in which the current time sheet line was entered. The field cannot be changed.
<b>Location Description</b>	This field shows a description regarding the location assigned to the current line.
<b>Entity Description</b>	This field shows a description regarding the entity assigned to the current line.

Field	Description
<b>Project Description</b>	This field shows a description regarding the project assigned to the current line.
<b>Purpose Description</b>	This field shows a description regarding the purposes assigned to the current line.
<b>Spec. 1-10 Description</b>	This field shows descriptions regarding the specifications assigned to the current line.
<b>Local Spec. 1-10 Description</b>	This field shows descriptions regarding the local specifications assigned to the current line.
<b>Customer Level</b>	This field shows the customer level number for the customer to which the current line is associated.
<b>Level 1-5 No.</b>	These fields show the companies in the hierarchy above the specified company associated with the current line. These fields are only available if Customer Levels are set up using the designated system parameters.
<b>Level 1-5 Name</b>	These fields show the names of the companies in the hierarchy above the specified company associated with the current line. These fields are only available if Customer Levels are set up using the designated system parameters.
<b>Time Activity 1-3</b>	In these fields, you can specify time registration for activities as set up in Time Sheet References. This field is in hours or days, depending on the time unit on the time sheet.
<b>Monday-Friday</b>	<p>These fields show registered time in hours or days, depending on the time unit of the time sheet. In these fields you enter the time used every day of the week on the specific job, dimension, task, and activity. You cannot register more hours in one day than the maximum number of hours entered for the employee in the employee revision applying to the date in question.</p> <p>Moreover, if a value has been entered in the <b>Time Sheets</b> field in the Activities workspace for the activity for which you wish to register hours or amounts, you cannot enter a larger quantity for the activity than specified in that field. If there are several time sheet lines for a given employee with the activity in question, the sum of the registrations on these lines cannot exceed the daily registration limit specified for the activity in question.</p> <p>It is possible to enter a negative number of hours. If the <b>Minimum Hours</b> field has been marked on the employee revision applying on the date in question, Maconomy checks whether the employee has registered the minimum number of hours that the employee in question is supposed to register. If the number of hours registered is lower than this number, the time sheet cannot be submitted. It can be temporarily</p>

Field	Description
	<p>submitted, however. See the description of the window Employees in the Set-Up module for further information.</p> <p>If time sheet lines are automatically created from the detailed resource planning, these fields will automatically be filled in with the quantity of hours planned for the employee on the task specified on the current line. In this way, you only need to enter hours in these fields if you need to make any changes to the pre-filled quantity of hours. However, the fields are only pre-filled on time sheet lines referring to jobs for which the <b>Pre-fill Time Sheet Lines</b> job parameter attribute has the <b>By Day</b> value.</p> <p>You cannot enter hours for days that are before the open posting period for the job specified on the current line. For further information, refer to the description of the Job Cost island in the Company Information workspace in the G/L module. If you enter hours for a date that comes after the open posting period, Maconomy issues a warning. In addition, it will only be possible to submit such time sheets, but not to perform any actions that will result in a posting. Whether it is the submission, release, or approval that determines when a time sheet is transferred for posting depends on the approval principle of each job. For further information about approval principles, refer to the description of the Approval island in the Jobs workspace.</p> <p>By changing the MDL layout of this window, you can insert variable day names in the sub-tab. For example, the column which is called <b>Monday</b> by default, can, be changed to <b>Mon. &lt;date&gt;</b>. For more information, refer to the description of the Window Layouts workspace in the Set-Up module.</p>
<b>Time Activity 1-3, Transferred</b>	These fields show whether or not the time activities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Quantity Monday-Friday, Transferred</b>	These fields show whether or not the quantites for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Proposed Quantity Monday-Friday</b>	These fields show the invoiceable quantity entered by the employee for each day on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity Monday-Friday, Transferred</b>	These fields show whether or not the quantites for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Proposed Quantity</b>	This field shows the invoiceable quantity entered by the employee on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.

Field	Description
<b>Proposed Billing Price, Unit</b>	This field shows the proposed billing price in job currency per hour or day, depending on the time unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Total</b>	This field displays the total hours (or days) worked for the week for the job, dimension, task, and activity specified on the line.

## Actions

This section shows the Actions available in the Approve Time Sheet Lines by Employee workspace.

### Table Part

Field	Description
<b>Mark All For Approval</b>	Use this action to mark all approval object lines in the sub-tab for approval. This means the status in the <b>New Approval Status</b> field is set to Approved on all lines.
<b>Mark All For Release</b>	Use this action to mark all approval object lines in the sub-tab for release. This means the status in the <b>New Approval Status</b> field is set to Released on all lines.  This action can only be used if the <b>Trans. Non-Appr. Time Sheets</b> field is enabled in the System Information workspace, and the current user has access to transferring expense sheets as specified in the Actions workspace. The employee specified as the project manager for the current job, however, always has the right to release time sheets for the employee in question.
<b>Mark All For Rejection</b>	Use this action to mark all approval object lines in the sub-tab for rejection. This means the status in the <b>New Approval Status</b> field is set to Rejected on all lines.
<b>Unmark All</b>	Use this action to unmark all approval object lines in the sub-tab for approval. This means the <b>Approve</b> check box is deselected for all entries in the sub-tab.
<b>Execute Approval</b>	Use this action to put into effect all statuses indicated in the <b>New Approval Status</b> field for all lines. If any approval object lines are thus fully approved or released (for example, the expense sheet from which the approval object line originates was already approved or released by the supervisor), the lines in question are transferred to a registration journal which can then be posted. The <b>Approval Status</b> field is automatically updated with the value shown in the <b>New Approval Status</b> field.
<b>Approve All</b>	Use this action to approve all the lines pending approval that are listed in the sub-tab.
<b>Reset All</b>	Use this action to reset all the lines pending approval that are listed in the sub-tab.

## Approve Expense Sheets by Employee Workspace

Use up to 35 words to describe this conceptual topic. Write complete sentences.

This is the start of your concept.

### Approve Expense Sheets by Employee Tab

This section includes the fields and descriptions for the Approve Expense Sheets by Employee tab.

#### Employee Information island

Field	Description
<b>Current Employee No.</b>	This field shows the employee number for the currently logged in user.
<b>Employee No.</b>	This field shows the number of the employee designated as approver of all lines submitted for approval. By default, this field displays the same value as the <b>Current Employee No.</b> field.
<b>Employee Type</b>	This field shows the selected employee's employee type.
<b>Job No.</b>	Enter or select a job number to show only lines relevant to the specified job in the sub-tab.
<b>Show Lines For Approval</b>	Select this check box to show items available for approval. This is enabled by default.
<b>Show Non-Active Lines</b>	Select this check box to show approval items that are not yet active.
<b>Show Rejected Lines</b>	Select this check box to show rejected approval items.
<b>Show Substitute Lines</b>	Select this check box to show the approval items for which you are a substitute approver.
<b>Show Super Approver Lines</b>	Select this check box to show approval items for which you are a super approver.
<b>Show Approvable by All Approval Lines</b>	Select this check box to view all approval items that can be approved by any user.
<b>Overwrite existing</b>	<p>If existing information is already available in the <b>Approval Status</b> or <b>Remark</b> fields in the sub-tab, select one or both of the following check boxes to enable the system to overwrite it:</p> <ul style="list-style-type: none"> <li>Approval Status</li> <li>Remark</li> </ul>

Field	Description
<b>Remark</b>	Enter a remark regarding the specified approval object line.

### Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number to which the current line is associated.
<b>Level</b>	This field shows the level of the approval hierarchy that the approval object lines relate to, and thus the order in which they are to be approved. This field only applies if the <b>Level Prioritized</b> check box is selected in the tab of the related approval hierarchy.
<b>Effective</b>	This field shows whether or not the actual approvals are marked as effective. In-effective approval headers and lines show the history.
<b>Active</b>	This field shows whether or not the approval object is currently active.
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the <b>New Approval Status</b> field is transferred to this field when you use the <b>Execute Approval</b> action. This field cannot be changed manually.
<b>New Approval Status</b>	Select the status you wish to assign to the current approval object line when you use the <b>Execute Approval</b> action. The following statuses are available: <ul style="list-style-type: none"> <li>Blank</li> <li>Approved</li> <li>Rejected</li> <li>Released</li> </ul>
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.
<b>Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field shows the time that the current line was approved.

Field	Description
<b>Approver</b>	This field show the employee name and number of the designated approver who approved the approval object.
<b>Substitute</b>	This field shows the employee name and number of the designated substitute approver who approved the approval object.
<b>Super Approver</b>	This field shows the employee name and number of the designated super approver who approved the approval object.
<b>Approver Name</b>	Enter or select the name of the designated approver who can approve the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Name</b>	Enter or select the name of the designated substitute approver who can approve the approval object.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Super Approver Name</b>	Enter or select the name of the designated super approver who can approve the approval object.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Approver</b>	This field shows the employee number of the employee who approved the current approval object.
<b>Approver Employee Type</b>	This field shows the designated employee type that can approve approval objects. Any approval object, such as time sheet lines, falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute</b>	This field shows the name of the designated substitute approver who approved the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.

Field	Description
<b>Approver Reference, Field</b>	This field shows the internal field name that the Approver Reference relates to.
<b>Approver Reference, Employee</b>	This field shows the employee reference of the Approver.
<b>Substitute Reference, Relation</b>	This field shows the relation of a substitute approver reference if one has been specified on the approval task.
<b>Substitute Reference, Field</b>	This field shows the field reference of a substitute approver if one has been specified on the approval task.
<b>Substitute Reference, Employee</b>	This field shows the employee reference of the substitute approver if one has been specified on the approval task.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Super Approver</b>	This field shows the name of the designated super approver who approved the approval object.
<b>Super Approver Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Super Approver Reference, Relation</b>	This field shows the relation of a super approver reference if one has been specified on the approval task.
<b>Super Approver Reference, Field</b>	This field shows the field reference of a super approver if one has been specified on the approval task.
<b>Super Approver Reference, Employee</b>	This field shows the employee reference of a super approver if one has been specified on the approval task.
<b>Current Approval Status Details</b>	This field shows details regarding the latest approval status of the current line.
<b>Current Approval Status</b>	This field shows the latest approval status of the current line.

Field	Description
<b>Last Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the last user who completed the action for the associated approval object.
<b>Last Approval or Rejection Date</b>	If the approval object has been approved, this field shows the latest date on which the current line was approved.
<b>Last Approval or Rejection Time</b>	If the approval object has been approved, this field shows the latest time when the current line was approved.
<b>Last Approval or Rejection Comment</b>	If the approval object has been approved or rejected, this field shows the latest comment for the associated approval object.
<b>Line Can Be Approved by Current User</b>	This field shows whether the current line can be approved by the current user.
<b>Current Status</b>	This field shows the latest status of the current line.
<b>Submitted By</b>	This field shows the name of the user who submitted the current line.
<b>Date Submitted</b>	This field shows the date the current line was submitted.
<b>Time Submitted</b>	This field shows the time the current line was submitted.
<b>Employee No.</b>	This field shows the number of the employee who entered the current line.
<b>Line No.</b>	This field shows the line number of the current expense sheet line.
<b>Start Date</b>	This field displays the start date of the expense sheet.
<b>Job No.</b>	This field shows the job number related to the current expense sheet line.
<b>Activity No.</b>	This field shows the activity number specified on the current expense sheet line.
<b>Monday-Sunday</b>	These fields show registered time in hours or days, depending on the time unit of the expense sheet. In these fields, enter the time used every day of the week on the specific job, dimension, task, and activity. You cannot register more hours in one day than the maximum number of hours entered for the employee in the employee revision applying to the date in question.

Field	Description
	<p>Moreover, if a value has been entered in the <b>Time Sheets</b> field in the Activities workspace for the activity for which you wish to register hours or amounts, you cannot enter a larger quantity for the activity than specified in that field. If there are several time sheet lines for a given employee with the activity in question, the sum of the registrations on these lines cannot exceed the daily registration limit specified for the activity in question.</p> <p>You can enter a negative number of hours. If the <b>Minimum Hours</b> field is enabled on the employee revision applying on the date in question, Maconomy checks whether the employee has registered the minimum number of hours that the employee in question is supposed to register. If the number of hours registered is lower than this number, the time sheet cannot be submitted. It can be temporarily submitted, however. See the description of the Employees workspace in the Set-Up module for further information.</p> <p>If time sheet lines are automatically created from the detailed resource planning, these fields are automatically filled in with the quantity of hours planned for the employee on the task specified on the current line. In this way, you only need to enter hours in these fields if you need to make any changes to the pre-filled quantity of hours. However, the fields are only prefilled on time sheet lines referring to jobs where you entered a value in the <b>By Day</b> field in the <b>Pre-fill Time Sheet Lines</b> job parameter attribute.</p> <p>You cannot enter hours for days that are before the open posting period for the job specified on the current line. For further information, refer to the description of the Job Cost island in the Company Information workspace in the G/L module. If you enter hours for a date that comes after the open posting period, Maconomy issues a warning. In addition, it will only be possible to submit such time sheets, but not to perform any actions that will result in a posting. Whether it is the submission, release, or approval that determines when a time sheet is transferred for posting depends on the approval principle of each job. For further information about approval principles, refer to the description of the Approval island in the Jobs workspace.</p> <p>By changing the MDL layout of this window, you can insert variable day names in the sub-tab. For example, the column which is named <b>Monday</b> by default, can be changed to <b>Mon. &lt;date&gt;</b>. For more information, refer to the description of the Window Layouts workspace in the Set-Up module.</p>
<b>Description</b>	This field shows a description of the current entry.
<b>Activity Type</b>	This field shows the type of the current activity.

Field	Description
<b>Quantity Monday-Sunday, Transferred</b>	These fields show whether or not the quantities for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Job Description</b>	This field shows a description of the job specified in the <b>Job No.</b> field. If it is an internal job, the description contains the job name, whereas the description of an external job contains the name of the customer to whom the job has been assigned.
<b>Internal Job</b>	This field displays the total time registered on internal jobs for the week.
<b>Spec. 1-3</b>	These fields show the specifications assigned to the current line.
<b>Task</b>	This field shows the type of the current activity.
<b>Time Activity 1-3</b>	These fields show the total time for activities in hours or days, depending on the time unit. Time activity can be used to calculate overtime, among others. The activity references can be created in the Time Sheet References workspace.
<b>Time Activity 1-3, Transferred</b>	These fields show whether or not the time activities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Amount Activity 1-4</b>	These fields show the total number of hours for the amount activities specified in the window Time Sheet References. Amount activities can for instance be used to register transport costs, meals, and so on.
<b>Amount Activity 1-4, Transferred</b>	These fields show whether or not the amounts have been transferred to a time sheet journal or the time sheet journal queue.
<b>Location</b>	This field shows the location assigned to the current line.
<b>Entity</b>	This field shows the entity assigned to the current line.
<b>Project</b>	This field shows the project assigned to the current line.
<b>Purpose</b>	This field shows the purpose assigned to the current line.
<b>Local Spec. 1-3</b>	This field shows the local specifications assigned to the current line.
<b>Company No.</b>	This field shows the name of the company responsible for the job on which the work was performed.

Field	Description
<b>Quantity 1-2</b>	These fields show the quantities registered in the entry.
<b>Quantity 1-2, Transferred</b>	These fields show whether or not the quantities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Transferred for Posting</b>	This field determines whether the current line has been transferred for posting.
<b>Total</b>	This field displays the total hours (or days) worked for the week for the job, dimension, task, and activity specified on the line.
<b>Cost Type</b>	This field shows the cost type of the current line.
<b>Submitted</b>	This field shows whether the current line has been submitted.
<b>New Approval Status, Project Manager</b>	<p>This field shows the status of the current line, as determined by the designated project manager of the job.</p> <p>When the time sheet is submitted, the project manager can approve, reject, or release each line if the approval principle of the job indicates that approval of time registrations by the project manager is mandatory or optional.</p> <p>If the status of the line is Approved or Released, and the line is changed, the status changes to blank. If the line is Rejected, then changed, the status does not change.</p>
<b>Approval, Project Manager</b>	This field shows the approval status of the current line, as determined by the designated project manager of the job. The value in the <b>New Approval Status, Project Manager</b> field is transferred to this field when you use the <b>Execute Approval</b> action.
<b>Approved by</b>	This field shows the name of the project manager who assigned the current approval status to the line.
<b>Approval Date</b>	This field shows the date on which the project manager who assigned the current approval status assigned the approval status to the line.
<b>Comment</b>	This field shows any comments entered by the project manager in connection with the approval, release, or rejection of the line.
<b>Approved by Superior</b>	This field shows if the current line has been approved by the user's superior.
<b>Released by Superior</b>	This field shows if the current line has been released by the user's superior.

Field	Description
<b>Keep Line</b>	This field shows whether or not the current line is deemed permanent. If this check box is selected, the current line is automatically copied from the previous period at the creation of time sheets. New lines created inherit this status, which means that they will automatically be copied to all new time sheets until you deselect the check box on the selected line.
<b>Planned This Period</b>	This field shows whether or not the current line has been transferred, in which case the transfer action does not apply.
<b>Est. Time to Compl.</b>	This field shows the estimated time to completion of the current line.
<b>Completed</b>	This field shows whether or not the work on the current line is completed.
<b>Estimate Date</b>	This field shows the estimate date of the current line's completion.
<b>Job Budget Type</b>	This field shows the budget type assigned to the current job.
<b>Job Budget Revision No.</b>	This field shows the revision number of the current job budget line.
<b>Overtime Spec.</b>	This field shows the overtime specification for the current line. Overtime specifications are defined in the Popup Fields tab in the System Setup workspace.
<b>Favorite</b>	This field shows a favorite, if it has been selected. Favorites are derived from the Favorites workspace.
<b>Note</b>	Enter a brief description of what you have been working on.
<b>Est. Time to Compl. Days</b>	Enter the number of days as an estimate to completion. If you enter a value in this field, Maconomy automatically converts it to hours, which is shown in the <b>Est. Time to Compl.</b> field. The number of hours is calculated by multiplying the number of days by the value in the <b>Hours per Man Day</b> field in the Jobs workspace.
<b>Description, Monday-Sunday</b>	Enter a daily description of the task specified on the current line. If daily descriptions are required for the task in question, Maconomy ensures that you enter a description for the task for the day in question before you can submit the time sheet.
<b>Transaction Timestamp</b>	This field shows the time of creation or the latest revision of the current line.
<b>Proposed Quantity</b>	This field shows the invoiceable quantity entered by the employee on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.

Field	Description
<b>Proposed Quantity, Monday-Sunday</b>	These fields show the invoiceable quantity entered by the employee for each day on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity Transferred, Monday-Sunday</b>	This field shows the proposed invoiceable quantity entered by the employee for each day that can be transferred on an expense sheet line.
<b>Proposed Billing Price, Total</b>	This field shows the total proposed billing price in job currency per hour or day, depending on the Time Unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Proposed Billing Price, Unit</b>	This field shows the proposed billing price in job currency per hour or day, depending on the Time Unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Billing Price, Currency</b>	This field shows the standard billing price of the current line in the currency of the job.
<b>Use Invoice Proposal</b>	This field shows whether the quantity and billing price in the following fields are used for invoicing: <ul style="list-style-type: none"> <li>Proposed Quantity</li> <li>Proposed Billing Price, Unit</li> <li>Proposed Billing Price, Total</li> </ul>
<b>Transaction Type</b>	This field shows the current line's transaction type. Transaction types are set up in the Transaction Types workspace.
<b>Invoiceable</b>	This field shows whether or not the line is invoiceable.
<b>Billing Price, Base</b>	This field shows the budgeted billing price in base currency.
<b>Billing Price, Enterprise</b>	This field shows the budgeted billing price in enterprise currency.
<b>Employee Category No.</b>	This field shows the employee category number that comes from job budget lines or that you add manually in this sub-tab.
<b>Absence Type</b>	Select the reason for the absence.
<b>Time Unit</b>	This field displays the time unit used for filing time (either hours or days).

Field	Description
<b>Option List 1-5</b>	Specify the option lists containing the values that should be available for further specification in the <b>Selected Value 1-5</b> fields on the current line.
<b>Selected Value 1-5</b>	Specify a number of values for further specification of the current line. You can only use values available in the respective option lists specified in the <b>Option List 1-5</b> fields.
<b>Spec. 4-10</b>	These fields show the specifications assigned to the current line.
<b>Local Spec. 4-10</b>	This field shows the local specifications assigned to the current line.
<b>Purchase Order Number</b>	This field shows the purchase order number to which the current line is associated to.
<b>Purchase Order Line Number</b>	This field shows the purchase order line number assigned to the current line.
<b>Employee</b>	This field shows the name of the employee assigned to the current line.
<b>Employee Position</b>	This field shows the position number assigned to the employee.
<b>Employee E-mail</b>	This field shows the employee's email address.
<b>Employee Phone</b>	This field shows the employee's phone number.
<b>Employee Mobile</b>	This field shows the employee's mobile number.
<b>Employee Company No.</b>	This field shows the employee's company number.
<b>Employee Company</b>	This field shows the company the employee is associated with.
<b>Job Name</b>	This field shows the name of the job to which the current line is associated.
<b>Project Manager No.</b>	This field shows the project manager number of the project manager assigned to the current line.
<b>Project Manager</b>	This field shows the name of the project manager assigned to the current line.
<b>Activity Description</b>	This field displays the title or name of the activity for which the employee registered time.

Field	Description
<b>Task Description</b>	This field displays the title or name of the task for which the employee registered time.
<b>Task Path</b>	This field shows any task path of the task.
<b>Company</b>	This field shows the name of the bill-to-customer assigned to the job on the current line.
<b>Customer No.</b>	This field shows the number of the bill-to customer assigned to the job on the current line.
<b>Customer</b>	This field shows the name of the bill-to customer assigned to the job on the current line.
<b>Time Unit, Job</b>	This field displays the time unit used for filing time (hours or days) on the job.
<b>Week</b>	This field shows the week number of the current time sheet.
<b>Year</b>	This field shows the year in which the current time sheet line was entered. The field cannot be changed.
<b>Location Description</b>	This field shows a description regarding the location assigned to the current line.
<b>Entity Description</b>	This field shows a description regarding the entity assigned to the current line.
<b>Project Description</b>	This field shows a description regarding the project assigned to the current line.
<b>Purpose Description</b>	This field shows a description regarding the purposes assigned to the current line.
<b>Spec. 1-10 Description</b>	This field shows descriptions regarding the specifications assigned to the current line.
<b>Local Spec. 1-10 Description</b>	This field shows descriptions regarding the local specifications assigned to the current line.
<b>Customer Level</b>	This field shows the customer level number for the customer to which the current line is associated.
<b>Level 1-5 No.</b>	These fields show the companies in the hierarchy above the specified company associated with the current line. These fields are only available if Customer Levels are set up using the designated system parameters.
<b>Level 1-5 Name</b>	These fields show the names of the companies in the hierarchy above the specified company associated with the current line. These fields are

Field	Description
	only available if Customer Levels are set up using the designated system parameters.
<b>Time Activity 1-3</b>	In these fields, you can specify time registration for activities as set up in Time Sheet References. This field is in hours or days, depending on the time unit on the time sheet.
<b>Monday-Friday</b>	<p>These fields show registered time in hours or days, depending on the time unit of the time sheet. In these fields you enter the time used every day of the week on the specific job, dimension, task, and activity. You cannot register more hours in one day than the maximum number of hours entered for the employee in the employee revision applying to the date in question.</p> <p>Moreover, if a value has been entered in the <b>Time Sheets</b> field in the Activities workspace for the activity for which you wish to register hours or amounts, you cannot enter a larger quantity for the activity than specified in that field. If there are several time sheet lines for a given employee with the activity in question, the sum of the registrations on these lines cannot exceed the daily registration limit specified for the activity in question.</p> <p>It is possible to enter a negative number of hours. If the <b>Minimum Hours</b> field has been marked on the employee revision applying on the date in question, Maconomy checks whether the employee has registered the minimum number of hours that the employee in question is supposed to register. If the number of hours registered is lower than this number, the time sheet cannot be submitted. It can be temporarily submitted, however. See the description of the window Employees in the Set-Up module for further information.</p> <p>If time sheet lines are automatically created from the detailed resource planning, these fields will automatically be filled in with the quantity of hours planned for the employee on the task specified on the current line. In this way, you only need to enter hours in these fields if you need to make any changes to the pre-filled quantity of hours. However, the fields are only pre-filled on time sheet lines referring to jobs for which the <b>Pre-fill Time Sheet Lines</b> job parameter attribute has the <b>By Day</b> value.</p> <p>You cannot enter hours for days that are before the open posting period for the job specified on the current line. For further information, refer to the description of the Job Cost island in the Company Information workspace in the G/L module. If you enter hours for a date that comes after the open posting period, Maconomy issues a warning. In addition, it will only be possible to submit such time sheets, but not to perform any actions that will result in a posting. Whether it is the submission, release, or approval that determines when a time sheet is transferred for posting depends on the approval principle of each job. For further information about approval principles, refer to the description of the Approval island in the Jobs workspace.</p>

Field	Description
	By changing the MDL layout of this window, you can insert variable day names in the sub-tab. For example, the column which is called <b>Monday</b> by default, can, be changed to <b>Mon. &lt;date&gt;</b> . For more information, refer to the description of the Window Layouts workspace in the Set-Up module.
<b>Time Activity 1-3, Transferred</b>	These fields show whether or not the time activities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Quantity Monday-Friday, Transferred</b>	These fields show whether or not the quantites for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Proposed Quantity Monday-Friday</b>	These fields show the invoiceable quantity entered by the employee for each day on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity Monday-Friday, Transferred</b>	These fields show whether or not the quantites for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Proposed Quantity</b>	This field shows the invoiceable quantity entered by the employee on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Billing Price, Unit</b>	This field shows the proposed billing price in job currency per hour or day, depending on the time unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Total</b>	This field displays the total hours (or days) worked for the week for the job, dimension, task, and activity specified on the line.

## Actions

This section shows the Actions available in the Approve Expense Sheets by Employee workspace.

### Table Part

Field	Description
<b>Mark All For Approval</b>	Use this action to mark all approval object lines in the sub-tab for approval. This means the status in the <b>New Approval Status</b> field is set to Approved on all lines.
<b>Mark All For Release</b>	Use this action to mark all approval object lines in the sub-tab for release. This means the status in the <b>New Approval Status</b> field is set to Released on all lines.

Field	Description
	This action can only be used if the <b>Trans. Non-Appr. Time Sheets</b> field is enabled in the System Information workspace, and the current user has access to transferring expense sheets as specified in the Actions workspace. The employee specified as the project manager for the current job, however, always has the right to release time sheets for the employee in question.
<b>Mark All For Rejection</b>	Use this action to mark all approval object lines in the sub-tab for rejection. This means the status in the <b>New Approval Status</b> field is set to Rejected on all lines.
<b>Unmark All</b>	Use this action to unmark all approval object lines in the sub-tab for approval. This means the <b>Approve</b> check box is deselected for all entries in the sub-tab.
<b>Execute Approval</b>	Use this action to put into effect all statuses indicated in the <b>New Approval Status</b> field for all lines. If any approval object lines are thus fully approved or released (for example, the expense sheet from which the approval object line originates was already approved or released by the supervisor), the lines in question are transferred to a registration journal which can then be posted. The <b>Approval Status</b> field is automatically updated with the value shown in the <b>New Approval Status</b> field.
<b>Approve All</b>	Use this action to approve all the lines pending approval that are listed in the sub-tab.
<b>Reset All</b>	Use this action to reset all the lines pending approval that are listed in the sub-tab.

## Approve Expense Sheet Lines Workspace

Use up to 35 words to describe this conceptual topic. Write complete sentences.

Copy to come.

### Approve Expense Sheet Lines by Employee Tab

This section includes the fields and descriptions for the Approve Expense Sheet Lines by Employees tab.

#### Employee Information island

Field	Description
<b>Current Employee No.</b>	This field shows the employee number for the currently logged in user.
<b>Employee No.</b>	This field shows the number of the employee designated as approver of all lines submitted for approval. By default, this field displays the same value as the <b>Current Employee No.</b> field.

Field	Description
<b>Employee Type</b>	This field shows the selected employee's employee type.
<b>Job No.</b>	Enter or select a job number to show only lines relevant to the specified job in the sub-tab.
<b>Show Lines For Approval</b>	Select this check box to show items available for approval. This is enabled by default.
<b>Show Non-Active Lines</b>	Select this check box to show approval items that are not yet active.
<b>Show Rejected Lines</b>	Select this check box to show rejected approval items.
<b>Show Substitute Lines</b>	Select this check box to show the approval items for which you are a substitute approver.
<b>Show Super Approver Lines</b>	Select this check box to show approval items for which you are a super approver.
<b>Show Approvable by All Approval Lines</b>	Select this check box to view all approval items that can be approved by any user.
<b>Overwrite existing</b>	If existing information is already available in the <b>Approval Status</b> or <b>Remark</b> fields in the sub-tab, select one or both of the following check boxes to enable the system to overwrite it: <ul style="list-style-type: none"> <li>Approval Status</li> <li>Remark</li> </ul>
<b>Remark</b>	Enter a remark regarding the specified approval object line.

### Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number to which the current line is associated.
<b>Level</b>	This field shows the level of the approval hierarchy that the approval object lines relate to, and thus the order in which they are to be approved. This field only applies if the <b>Level Prioritized</b> check box is selected in the tab of the related approval hierarchy.
<b>Effective</b>	This field shows whether or not the actual approvals are marked as effective. In-effective approval headers and lines show the history.

Field	Description
<b>Active</b>	This field shows whether or not the approval object is currently active.
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the <b>New Approval Status</b> field is transferred to this field when you use the <b>Execute Approval</b> action. This field cannot be changed manually.
<b>New Approval Status</b>	<p>Select the status you wish to assign to the current approval object line when you use the <b>Execute Approval</b> action.</p> <p>The following statuses are available:</p> <ul style="list-style-type: none"> <li>Blank</li> <li>Approved</li> <li>Rejected</li> <li>Released</li> </ul>
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.
<b>Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field shows the time that the current line was approved.
<b>Approver</b>	This field show the employee name and number of the designated approver who approved the approval object.
<b>Substitute</b>	This field shows the employee name and number of the designated substitute approver who approved the approval object.
<b>Super Approver</b>	This field shows the employee name and number of the designated super approver who approved the approval object.
<b>Approver Name</b>	Enter or select the name of the designated approver who can approve the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Name</b>	Enter or select the name of the designated substitute approver who can approve the approval object.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.

Field	Description
<b>Super Approver Name</b>	Enter or select the name of the designated super approver who can approve the approval object.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Approver</b>	This field shows the employee number of the employee who approved the current approval object.
<b>Approver Employee Type</b>	This field shows the designated employee type that can approve approval objects. Any approval object, such as time sheet lines, falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute</b>	This field shows the name of the designated substitute approver who approved the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Approver Reference, Field</b>	This field shows the internal field name that the Approver Reference relates to.
<b>Approver Reference, Employee</b>	This field shows the employee reference of the Approver.
<b>Substitute Reference, Relation</b>	This field shows the relation of a substitute approver reference if one has been specified on the approval task.
<b>Substitute Reference, Field</b>	This field shows the field reference of a substitute approver if one has been specified on the approval task.
<b>Substitute Reference, Employee</b>	This field shows the employee reference of the substitute approver if one has been specified on the approval task.

Field	Description
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Super Approver</b>	This field shows the name of the designated super approver who approved the approval object.
<b>Super Approver Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Super Approver Reference, Relation</b>	This field shows the relation of a super approver reference if one has been specified on the approval task.
<b>Super Approver Reference, Field</b>	This field shows the field reference of a super approver if one has been specified on the approval task.
<b>Super Approver Reference, Employee</b>	This field shows the employee reference of a super approver if one has been specified on the approval task.
<b>Current Approval Status Details</b>	This field shows details regarding the latest approval status of the current line.
<b>Current Approval Status</b>	This field shows the latest approval status of the current line.
<b>Last Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the last user who completed the action for the associated approval object.
<b>Last Approval or Rejection Date</b>	If the approval object has been approved, this field shows the latest date on which the current line was approved.
<b>Last Approval or Rejection Time</b>	If the approval object has been approved, this field shows the latest time when the current line was approved.
<b>Last Approval or Rejection Comment</b>	If the approval object has been approved or rejected, this field shows the latest comment for the associated approval object.
<b>Line Can Be Approved by Current User</b>	This field shows whether the current line can be approved by the current user.

Field	Description
<b>Current Status</b>	This field shows the latest status of the current line.
<b>Submitted By</b>	This field shows the name of the user who submitted the current line.
<b>Date Submitted</b>	This field shows the date the current line was submitted.
<b>Time Submitted</b>	This field shows the time the current line was submitted.
<b>Employee No.</b>	This field shows the number of the employee who entered the current line.
<b>Line No.</b>	This field shows the line number of the current expense sheet line.
<b>Start Date</b>	This field displays the start date of the expense sheet.
<b>Job No.</b>	This field shows the job number related to the current expense sheet line.
<b>Activity No.</b>	This field shows the activity number specified on the current expense sheet line.
<b>Monday-Sunday</b>	<p>These fields show registered time in hours or days, depending on the time unit of the expense sheet. In these fields, enter the time used every day of the week on the specific job, dimension, task, and activity. You cannot register more hours in one day than the maximum number of hours entered for the employee in the employee revision applying to the date in question.</p> <p>Moreover, if a value has been entered in the <b>Time Sheets</b> field in the Activities workspace for the activity for which you wish to register hours or amounts, you cannot enter a larger quantity for the activity than specified in that field. If there are several time sheet lines for a given employee with the activity in question, the sum of the registrations on these lines cannot exceed the daily registration limit specified for the activity in question.</p> <p>You can enter a negative number of hours. If the <b>Minimum Hours</b> field is enabled on the employee revision applying on the date in question, Maconomy checks whether the employee has registered the minimum number of hours that the employee in question is supposed to register. If the number of hours registered is lower than this number, the time sheet cannot be submitted. It can be temporarily submitted, however. See the description of the Employees workspace in the Set-Up module for further information.</p> <p>If time sheet lines are automatically created from the detailed resource planning, these fields are automatically filled in with the quantity of hours planned for the employee on the task specified on the current</p>

Field	Description
	<p>line. In this way, you only need to enter hours in these fields if you need to make any changes to the pre-filled quantity of hours. However, the fields are only prefilled on time sheet lines referring to jobs where you entered a value in the <b>By Day</b> field in the <b>Pre-fill Time Sheet Lines</b> job parameter attribute.</p> <p>You cannot enter hours for days that are before the open posting period for the job specified on the current line. For further information, refer to the description of the Job Cost island in the Company Information workspace in the G/L module. If you enter hours for a date that comes after the open posting period, Maconomy issues a warning. In addition, it will only be possible to submit such time sheets, but not to perform any actions that will result in a posting. Whether it is the submission, release, or approval that determines when a time sheet is transferred for posting depends on the approval principle of each job. For further information about approval principles, refer to the description of the Approval island in the Jobs workspace.</p> <p>By changing the MDL layout of this window, you can insert variable day names in the sub-tab. For example, the column which is named <b>Monday</b> by default, can be changed to <b>Mon. &lt;date&gt;</b>. For more information, refer to the description of the Window Layouts workspace in the Set-Up module.</p>
<b>Description</b>	This field shows a description of the current entry.
<b>Activity Type</b>	This field shows the type of the current activity.
<b>Quantity Monday-Sunday, Transferred</b>	These fields show whether or not the quantites for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Job Description</b>	This field shows a description of the job specified in the <b>Job No.</b> field. If it is an internal job, the description contains the job name, whereas the description of an external job contains the name of the customer to whom the job has been assigned.
<b>Internal Job</b>	This field displays the total time registered on internal jobs for the week.
<b>Spec. 1-3</b>	These fields show the specifications assigned to the current line.
<b>Task</b>	This field shows the type of the current activity.
<b>Time Activity 1-3</b>	These fields show the total time for activities in hours or days, depending on the time unit. Time activity can be used to calculate

Field	Description
	overtime, among others. The activity references can be created in the Time Sheet References workspace.
<b>Time Activity 1-3, Transferred</b>	These fields show whether or not the time activities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Amount Activity 1-4</b>	These fields show the total number of hours for the amount activities specified in the window Time Sheet References. Amount activities can for instance be used to register transport costs, meals, and so on.
<b>Amount Activity 1-4, Transferred</b>	These fields show whether or not the amounts have been transferred to a time sheet journal or the time sheet journal queue.
<b>Location</b>	This field shows the location assigned to the current line.
<b>Entity</b>	This field shows the entity assigned to the current line.
<b>Project</b>	This field shows the project assigned to the current line.
<b>Purpose</b>	This field shows the purpose assigned to the current line.
<b>Local Spec. 1-3</b>	This field shows the local specifications assigned to the current line.
<b>Company No.</b>	This field shows the name of the company responsible for the job on which the work was performed.
<b>Quantity 1-2</b>	These fields show the quantities registered in the entry.
<b>Quantity 1-2, Transferred</b>	These fields show whether or not the quantities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Transferred for Posting</b>	This field determines whether the current line has been transferred for posting.
<b>Total</b>	This field displays the total hours (or days) worked for the week for the job, dimension, task, and activity specified on the line.
<b>Cost Type</b>	This field shows the cost type of the current line.
<b>Submitted</b>	This field shows whether the current line has been submitted.

Field	Description
<b>New Approval Status, Project Manager</b>	<p>This field shows the status of the current line, as determined by the designated project manager of the job.</p> <p>When the time sheet is submitted, the project manager can approve, reject, or release each line if the approval principle of the job indicates that approval of time registrations by the project manager is mandatory or optional.</p> <p>If the status of the line is Approved or Released, and the line is changed, the status changes to blank. If the line is Rejected, then changed, the status does not change.</p>
<b>Approval, Project Manager</b>	<p>This field shows the approval status of the current line, as determined by the designated project manager of the job. The value in the <b>New Approval Status, Project Manager</b> field is transferred to this field when you use the <b>Execute Approval</b> action.</p>
<b>Approved by</b>	<p>This field shows the name of the project manager who assigned the current approval status to the line.</p>
<b>Approval Date</b>	<p>This field shows the date on which the project manager who assigned the current approval status assigned the approval status to the line.</p>
<b>Comment</b>	<p>This field shows any comments entered by the project manager in connection with the approval, release, or rejection of the line.</p>
<b>Approved by Superior</b>	<p>This field shows if the current line has been approved by the user's superior.</p>
<b>Released by Superior</b>	<p>This field shows if the current line has been released by the user's superior.</p>
<b>Keep Line</b>	<p>This field shows whether or not the current line is deemed permanent. If this check box is selected, the current line is automatically copied from the previous period at the creation of time sheets. New lines created inherit this status, which means that they will automatically be copied to all new time sheets until you deselect the check box on the selected line.</p>
<b>Planned This Period</b>	<p>This field shows whether or not the current line has been transferred, in which case the transfer action does not apply.</p>
<b>Est. Time to Compl.</b>	<p>This field shows the estimated time to completion of the current line.</p>
<b>Completed</b>	<p>This field shows whether or not the work on the current line is completed.</p>
<b>Estimate Date</b>	<p>This field shows the estimate date of the current line's completion.</p>
<b>Job Budget Type</b>	<p>This field shows the budget type assigned to the current job.</p>

Field	Description
<b>Job Budget Revision No.</b>	This field shows the revision number of the current job budget line.
<b>Overtime Spec.</b>	This field shows the overtime specification for the current line. Overtime specifications are defined in the Popup Fields tab in the System Setup workspace.
<b>Favorite</b>	This field shows a favorite, if it has been selected. Favorites are derived from the Favorites workspace.
<b>Note</b>	Enter a brief description of what you have been working on.
<b>Est. Time to Compl. Days</b>	Enter the number of days as an estimate to completion. If you enter a value in this field, Maconomy automatically converts it to hours, which is shown in the <b>Est. Time to Compl.</b> field. The number of hours is calculated by multiplying the number of days by the value in the <b>Hours per Man Day</b> field in the Jobs workspace.
<b>Description, Monday-Sunday</b>	Enter a daily description of the task specified on the current line. If daily descriptions are required for the task in question, Maconomy ensures that you enter a description for the task for the day in question before you can submit the time sheet.
<b>Transaction Timestamp</b>	This field shows the time of creation or the latest revision of the current line.
<b>Proposed Quantity</b>	This field shows the invoiceable quantity entered by the employee on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity, Monday-Sunday</b>	These fields show the invoiceable quantity entered by the employee for each day on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity Transferred, Monday-Sunday</b>	This field shows the proposed invoiceable quantity entered by the employee for each day that can be transferred on an expense sheet line.
<b>Proposed Billing Price, Total</b>	This field shows the total proposed billing price in job currency per hour or day, depending on the Time Unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Proposed Billing Price, Unit</b>	This field shows the proposed billing price in job currency per hour or day, depending on the Time Unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.

Field	Description
<b>Billing Price, Currency</b>	This field shows the standard billing price of the current line in the currency of the job.
<b>Use Invoice Proposal</b>	This field shows whether the quantity and billing price in the following fields are used for invoicing: <ul style="list-style-type: none"> <li>Proposed Quantity</li> <li>Proposed Billing Price, Unit</li> <li>Proposed Billing Price, Total</li> </ul>
<b>Transaction Type</b>	This field shows the current line's transaction type. Transaction types are set up in the Transaction Types workspace.
<b>Invoiceable</b>	This field shows whether or not the line is invoiceable.
<b>Billing Price, Base</b>	This field shows the budgeted billing price in base currency.
<b>Billing Price, Enterprise</b>	This field shows the budgeted billing price in enterprise currency.
<b>Employee Category No.</b>	This field shows the employee category number that comes from job budget lines or that you add manually in this sub-tab.
<b>Absence Type</b>	Select the reason for the absence.
<b>Time Unit</b>	This field displays the time unit used for filing time (either hours or days).
<b>Option List 1-5</b>	Specify the option lists containing the values that should be available for further specification in the <b>Selected Value 1-5</b> fields on the current line.
<b>Selected Value 1-5</b>	Specify a number of values for further specification of the current line. You can only use values available in the respective option lists specified in the <b>Option List 1-5</b> fields.
<b>Spec. 4-10</b>	These fields show the specifications assigned to the current line.
<b>Local Spec. 4-10</b>	This field shows the local specifications assigned to the current line.
<b>Purchase Order Number</b>	This field shows the purchase order number to which the current line is associated to.

Field	Description
<b>Purchase Order Line Number</b>	This field shows the purchase order line number assigned to the current line.
<b>Employee</b>	This field shows the name of the employee assigned to the current line.
<b>Employee Position</b>	This field shows the position number assigned to the employee.
<b>Employee E-mail</b>	This field shows the employee's email address.
<b>Employee Phone</b>	This field shows the employee's phone number.
<b>Employee Mobile</b>	This field shows the employee's mobile number.
<b>Employee Company No.</b>	This field shows the employee's company number.
<b>Employee Company</b>	This field shows the company the employee is associated with.
<b>Job Name</b>	This field shows the name of the job to which the current line is associated.
<b>Project Manager No.</b>	This field shows the project manager number of the project manager assigned to the current line.
<b>Project Manager</b>	This field shows the name of the project manager assigned to the current line.
<b>Activity Description</b>	This field displays the title or name of the activity for which the employee registered time.
<b>Task Description</b>	This field displays the title or name of the task for which the employee registered time.
<b>Task Path</b>	This field shows any task path of the task.
<b>Company</b>	This field shows the name of the bill-to-customer assigned to the job on the current line.
<b>Customer No.</b>	This field shows the number of the bill-to customer assigned to the job on the current line.
<b>Customer</b>	This field shows the name of the bill-to customer assigned to the job on the current line.
<b>Time Unit, Job</b>	This field displays the time unit used for filing time (hours or days) on the job.

Field	Description
<b>Week</b>	This field shows the week number of the current time sheet.
<b>Year</b>	This field shows the year in which the current time sheet line was entered. The field cannot be changed.
<b>Location Description</b>	This field shows a description regarding the location assigned to the current line.
<b>Entity Description</b>	This field shows a description regarding the entity assigned to the current line.
<b>Project Description</b>	This field shows a description regarding the project assigned to the current line.
<b>Purpose Description</b>	This field shows a description regarding the purposes assigned to the current line.
<b>Spec. 1-10 Description</b>	This field shows descriptions regarding the specifications assigned to the current line.
<b>Local Spec. 1-10 Description</b>	This field shows descriptions regarding the local specifications assigned to the current line.
<b>Customer Level</b>	This field shows the customer level number for the customer to which the current line is associated.
<b>Level 1-5 No.</b>	These fields show the companies in the hierarchy above the specified company associated with the current line. These fields are only available if Customer Levels are set up using the designated system parameters.
<b>Level 1-5 Name</b>	These fields show the names of the companies in the hierarchy above the specified company associated with the current line. These fields are only available if Customer Levels are set up using the designated system parameters.
<b>Time Activity 1-3</b>	In these fields, you can specify time registration for activities as set up in Time Sheet References. This field is in hours or days, depending on the time unit on the time sheet.
<b>Monday-Friday</b>	These fields show registered time in hours or days, depending on the time unit of the time sheet. In these fields you enter the time used every day of the week on the specific job, dimension, task, and activity. You cannot register more hours in one day than the maximum number of hours entered for the employee in the employee revision applying to the date in question.  Moreover, if a value has been entered in the <b>Time Sheets</b> field in the Activities workspace for the activity for which you wish to register hours or amounts, you cannot enter a larger quantity for the activity than

Field	Description
	<p>specified in that field. If there are several time sheet lines for a given employee with the activity in question, the sum of the registrations on these lines cannot exceed the daily registration limit specified for the activity in question.</p> <p>It is possible to enter a negative number of hours. If the <b>Minimum Hours</b> field has been marked on the employee revision applying on the date in question, Maconomy checks whether the employee has registered the minimum number of hours that the employee in question is supposed to register. If the number of hours registered is lower than this number, the time sheet cannot be submitted. It can be temporarily submitted, however. See the description of the window Employees in the Set-Up module for further information.</p> <p>If time sheet lines are automatically created from the detailed resource planning, these fields will automatically be filled in with the quantity of hours planned for the employee on the task specified on the current line. In this way, you only need to enter hours in these fields if you need to make any changes to the pre-filled quantity of hours. However, the fields are only pre-filled on time sheet lines referring to jobs for which the <b>Pre-fill Time Sheet Lines</b> job parameter attribute has the <b>By Day</b> value.</p> <p>You cannot enter hours for days that are before the open posting period for the job specified on the current line. For further information, refer to the description of the Job Cost island in the Company Information workspace in the G/L module. If you enter hours for a date that comes after the open posting period, Maconomy issues a warning. In addition, it will only be possible to submit such time sheets, but not to perform any actions that will result in a posting. Whether it is the submission, release, or approval that determines when a time sheet is transferred for posting depends on the approval principle of each job. For further information about approval principles, refer to the description of the Approval island in the Jobs workspace.</p> <p>By changing the MDL layout of this window, you can insert variable day names in the sub-tab. For example, the column which is called <b>Monday</b> by default, can, be changed to <b>Mon. &lt;date&gt;</b>. For more information, refer to the description of the Window Layouts workspace in the Set-Up module.</p>
<b>Time Activity 1-3, Transferred</b>	These fields show whether or not the time activities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Quantity Monday-Friday, Transferred</b>	These fields show whether or not the quantites for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Proposed Quantity Monday-Friday</b>	These fields show the invoiceable quantity entered by the employee for each day on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.

Field	Description
<b>Proposed Quantity Monday-Friday, Transferred</b>	These fields show whether or not the quantities for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Proposed Quantity</b>	This field shows the invoiceable quantity entered by the employee on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Billing Price, Unit</b>	This field shows the proposed billing price in job currency per hour or day, depending on the time unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Total</b>	This field displays the total hours (or days) worked for the week for the job, dimension, task, and activity specified on the line.

## Actions

This section shows the Actions available in the Approve Expense Sheet Lines by Employee workspace.

### Table Part

Field	Description
<b>Mark All For Approval</b>	Use this action to mark all approval object lines in the sub-tab for approval. This means the status in the <b>New Approval Status</b> field is set to Approved on all lines.
<b>Mark All For Release</b>	Use this action to mark all approval object lines in the sub-tab for release. This means the status in the <b>New Approval Status</b> field is set to Released on all lines.  This action can only be used if the <b>Trans. Non-Appr. Time Sheets</b> field is enabled in the System Information workspace, and the current user has access to transferring expense sheets as specified in the Actions workspace. The employee specified as the project manager for the current job, however, always has the right to release time sheets for the employee in question.
<b>Mark All For Rejection</b>	Use this action to mark all approval object lines in the sub-tab for rejection. This means the status in the <b>New Approval Status</b> field is set to Rejected on all lines.
<b>Unmark All</b>	Use this action to unmark all approval object lines in the sub-tab for approval. This means the <b>Approve</b> check box is deselected for all entries in the sub-tab.
<b>Execute Approval</b>	Use this action to put into effect all statuses indicated in the <b>New Approval Status</b> field for all lines. If any approval object lines are thus fully approved or released (for example, the expense sheet from which the approval object line

Field	Description
	originates was already approved or released by the supervisor), the lines in question are transferred to a registration journal which can then be posted. The <b>Approval Status</b> field is automatically updated with the value shown in the <b>New Approval Status</b> field.
<b>Approve All</b>	Use this action to approve all the lines pending approval that are listed in the sub-tab.
<b>Reset All</b>	Use this action to reset all the lines pending approval that are listed in the sub-tab.

## Approve Purchase Order Lines by Employee Workspace

Use this workspace to view information on all relevant approval lines for purchase order lines.

This workspace enables you to view information on all relevant approval lines for purchase order lines. This enables you to use iAccess to access purchase order lines that were created in the Workspace Client. You can now approve or reject transactions for which approval hierarchies are set up from within iAccess.

### Approve Purchase Order Lines by Employee Tab

This section includes the fields and descriptions for the Approve Purchase Order Lines by Employees tab.

#### Employee Information island

Field	Description
<b>Current Employee No.</b>	This field shows the employee number for the currently logged in user.
<b>Employee No.</b>	This field shows the number of the employee designated as approver of all lines submitted for approval. By default, this field displays the same value as the <b>Current Employee No.</b> field.
<b>Employee Type</b>	This field shows the selected employee's employee type.
<b>Job No.</b>	Enter or select a job number to show only lines relevant to the specified job in the sub-tab.
<b>Show Lines For Approval</b>	Select this check box to show items available for approval. This is enabled by default.
<b>Show Non-Active Lines</b>	Select this check box to show approval items that are not yet active.
<b>Show Rejected Lines</b>	Select this check box to show rejected approval items.

Field	Description
<b>Show Substitute Lines</b>	Select this check box to show the approval items for which you are a substitute approver.
<b>Show Super Approver Lines</b>	Select this check box to show approval items for which you are a super approver.
<b>Show Approvable by All Approval Lines</b>	Select this check box to view all approval items that can be approved by any user.
<b>Overwrite existing</b>	<p>If existing information is already available in the <b>Approval Status</b> or <b>Remark</b> fields in the sub-tab, select one or both of the following check boxes to enable the system to overwrite it:</p> <ul style="list-style-type: none"> <li>Approval Status</li> <li>Remark</li> </ul>
<b>Remark</b>	Enter a remark regarding the specified approval object line.

### Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number to which the current line is associated.
<b>Level</b>	This field shows the level of the approval hierarchy that the approval object lines relate to, and thus the order in which they are to be approved. This field only applies if the <b>Level Prioritized</b> check box is selected in the tab of the related approval hierarchy.
<b>Effective</b>	This field shows whether or not the actual approvals are marked as effective. In-effective approval headers and lines show the history.
<b>Active</b>	This field shows whether or not the approval object is currently active.
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the <b>New Approval Status</b> field is transferred to this field when you use the <b>Execute Approval</b> action. This field cannot be changed manually.
<b>New Approval Status</b>	<p>Select the status you wish to assign to the current approval object line when you use the <b>Execute Approval</b> action.</p> <p>The following statuses are available:</p> <ul style="list-style-type: none"> <li>Blank</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Approved</li> <li>Rejected</li> <li>Released</li> </ul>
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.
<b>Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field shows the time that the current line was approved.
<b>Approver</b>	This field show the employee name and number of the designated approver who approved the approval object.
<b>Substitute</b>	This field shows the employee name and number of the designated substitute approver who approved the approval object.
<b>Super Approver</b>	This field shows the employee name and number of the designated super approver who approved the approval object.
<b>Approver Name</b>	Enter or select the name of the designated approver who can approve the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Name</b>	Enter or select the name of the designated substitute approver who can approve the approval object.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Super Approver Name</b>	Enter or select the name of the designated super approver who can approve the approval object.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Approver</b>	This field shows the employee number of the employee who approved the current approval object.

Field	Description
<b>Approver Employee Type</b>	This field shows the designated employee type that can approve approval objects. Any approval object, such as time sheet lines, falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute</b>	This field shows the name of the designated substitute approver who approved the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Approver Reference, Field</b>	This field shows the internal field name that the Approver Reference relates to.
<b>Approver Reference, Employee</b>	This field shows the employee reference of the Approver.
<b>Substitute Reference, Relation</b>	This field shows the relation of a substitute approver reference if one has been specified on the approval task.
<b>Substitute Reference, Field</b>	This field shows the field reference of a substitute approver if one has been specified on the approval task.
<b>Substitute Reference, Employee</b>	This field shows the employee reference of the substitute approver if one has been specified on the approval task.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Super Approver</b>	This field shows the name of the designated super approver who approved the approval object.
<b>Super Approver Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects.

Field	Description
	Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Super Approver Reference, Relation</b>	This field shows the relation of a super approver reference if one has been specified on the approval task.
<b>Super Approver Reference, Field</b>	This field shows the field reference of a super approver if one has been specified on the approval task.
<b>Super Approver Reference, Employee</b>	This field shows the employee reference of a super approver if one has been specified on the approval task.
<b>Current Approval Status Details</b>	This field shows details regarding the latest approval status of the current line.
<b>Current Approval Status</b>	This field shows the latest approval status of the current line.
<b>Last Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the last user who completed the action for the associated approval object.
<b>Last Approval or Rejection Date</b>	If the approval object has been approved, this field shows the latest date on which the current line was approved.
<b>Last Approval or Rejection Time</b>	If the approval object has been approved, this field shows the latest time when the current line was approved.
<b>Last Approval or Rejection Comment</b>	If the approval object has been approved or rejected, this field shows the latest comment for the associated approval object.
<b>Line Can Be Approved by Current User</b>	This field shows whether the current line can be approved by the current user.
<b>Current Status</b>	This field shows the latest status of the current line.
<b>Submitted By</b>	This field shows the name of the user who submitted the current line.
<b>Date Submitted</b>	This field shows the date the current line was submitted.

Field	Description
<b>Time Submitted</b>	This field shows the time the current line was submitted.
<b>Employee No.</b>	This field shows the number of the employee who entered the current line.
<b>Line No.</b>	This field shows the line number of the current expense sheet line.
<b>Start Date</b>	This field displays the start date of the expense sheet.
<b>Job No.</b>	This field shows the job number related to the current expense sheet line.
<b>Activity No.</b>	This field shows the activity number specified on the current expense sheet line.
<b>Monday-Sunday</b>	<p>These fields show registered time in hours or days, depending on the time unit of the expense sheet. In these fields, enter the time used every day of the week on the specific job, dimension, task, and activity. You cannot register more hours in one day than the maximum number of hours entered for the employee in the employee revision applying to the date in question.</p> <p>Moreover, if a value has been entered in the <b>Time Sheets</b> field in the Activities workspace for the activity for which you wish to register hours or amounts, you cannot enter a larger quantity for the activity than specified in that field. If there are several time sheet lines for a given employee with the activity in question, the sum of the registrations on these lines cannot exceed the daily registration limit specified for the activity in question.</p> <p>You can enter a negative number of hours. If the <b>Minimum Hours</b> field is enabled on the employee revision applying on the date in question, Maconomy checks whether the employee has registered the minimum number of hours that the employee in question is supposed to register. If the number of hours registered is lower than this number, the time sheet cannot be submitted. It can be temporarily submitted, however. See the description of the Employees workspace in the Set-Up module for further information.</p> <p>If time sheet lines are automatically created from the detailed resource planning, these fields are automatically filled in with the quantity of hours planned for the employee on the task specified on the current line. In this way, you only need to enter hours in these fields if you need to make any changes to the pre-filled quantity of hours. However, the fields are only prefilled on time sheet lines referring to jobs where you entered a value in the <b>By Day</b> field in the <b>Pre-fill Time Sheet Lines</b> job parameter attribute.</p> <p>You cannot enter hours for days that are before the open posting period for the job specified on the current line. For further information, refer to the description of the Job Cost island in the Company Information</p>

Field	Description
	<p>workspace in the G/L module. If you enter hours for a date that comes after the open posting period, Maconomy issues a warning. In addition, it will only be possible to submit such time sheets, but not to perform any actions that will result in a posting. <b>Description</b>	This field shows a description of the current entry.
<b>Activity Type</b>	This field shows the type of the current activity.
<b>Quantity Monday-Sunday, Transferred</b>	These fields show whether or not the quantities for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Job Description</b>	This field shows a description of the job specified in the <b>Job No.</b> field. If it is an internal job, the description contains the job name, whereas the description of an external job contains the name of the customer to whom the job has been assigned.
<b>Internal Job</b>	This field displays the total time registered on internal jobs for the week.
<b>Spec. 1-3</b>	These fields show the specifications assigned to the current line.
<b>Task</b>	This field shows the type of the current activity.
<b>Time Activity 1-3</b>	These fields show the total time for activities in hours or days, depending on the time unit. Time activity can be used to calculate overtime, among others. The activity references can be created in the Time Sheet References workspace.
<b>Time Activity 1-3, Transferred</b>	These fields show whether or not the time activities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Amount Activity 1-4</b>	These fields show the total number of hours for the amount activities specified in the window Time Sheet References. Amount activities can for instance be used to register transport costs, meals, and so on.

Field	Description
<b>Amount Activity 1-4, Transferred</b>	These fields show whether or not the amounts have been transferred to a time sheet journal or the time sheet journal queue.
<b>Location</b>	This field shows the location assigned to the current line.
<b>Entity</b>	This field shows the entity assigned to the current line.
<b>Project</b>	This field shows the project assigned to the current line.
<b>Purpose</b>	This field shows the purpose assigned to the current line.
<b>Local Spec. 1-3</b>	This field shows the local specifications assigned to the current line.
<b>Company No.</b>	This field shows the name of the company responsible for the job on which the work was performed.
<b>Quantity 1-2</b>	These fields show the quantities registered in the entry.
<b>Quantity 1-2, Transferred</b>	These fields show whether or not the quantites have been transferred to a time sheet journal or the time sheet journal queue.
<b>Transferred for Posting</b>	This field determines whether the current line has been transferred for posting.
<b>Total</b>	This field displays the total hours (or days) worked for the week for the job, dimension, task, and activity specified on the line.
<b>Cost Type</b>	This field shows the cost type of the current line.
<b>Submitted</b>	This field shows whether the current line has been submitted.
<b>New Approval Status, Project Manager</b>	<p>This field shows the status of the current line, as determined by the designated project manager of the job.</p> <p>When the time sheet is submitted, the project manager can approve, reject, or release each line if the approval principle of the job indicates that approval of time registrations by the project manager is mandatory or optional.</p> <p>If the status of the line is Approved or Released, and the line is changed, the status changes to blank. If the line is Rejected, then changed, the status does not change.</p>

Field	Description
<b>Approval, Project Manager</b>	This field shows the approval status of the current line, as determined by the designated project manager of the job. The value in the <b>New Approval Status, Project Manager</b> field is transferred to this field when you use the <b>Execute Approval</b> action.
<b>Approved by</b>	This field shows the name of the project manager who assigned the current approval status to the line.
<b>Approval Date</b>	This field shows the date on which the project manager who assigned the current approval status assigned the approval status to the line.
<b>Comment</b>	This field shows any comments entered by the project manager in connection with the approval, release, or rejection of the line.
<b>Approved by Superior</b>	This field shows if the current line has been approved by the user's superior.
<b>Released by Superior</b>	This field shows if the current line has been released by the user's superior.
<b>Keep Line</b>	This field shows whether or not the current line is deemed permanent. If this check box is selected, the current line is automatically copied from the previous period at the creation of time sheets. New lines created inherit this status, which means that they will automatically be copied to all new time sheets until you deselect the check box on the selected line.
<b>Planned This Period</b>	This field shows whether or not the current line has been transferred, in which case the transfer action does not apply.
<b>Est. Time to Compl.</b>	This field shows the estimated time to completion of the current line.
<b>Completed</b>	This field shows whether or not the work on the current line is completed.
<b>Estimate Date</b>	This field shows the estimate date of the current line's completion.
<b>Job Budget Type</b>	This field shows the budget type assigned to the current job.
<b>Job Budget Revision No.</b>	This field shows the revision number of the current job budget line.
<b>Overtime Spec.</b>	This field shows the overtime specification for the current line. Overtime specifications are defined in the Popup Fields tab in the System Setup workspace.
<b>Favorite</b>	This field shows a favorite, if it has been selected. Favorites are derived from the Favorites workspace.

Field	Description
<b>Note</b>	Enter a brief description of what you have been working on.
<b>Est. Time to Compl. Days</b>	Enter the number of days as an estimate to completion. If you enter a value in this field, Maconomy automatically converts it to hours, which is shown in the <b>Est. Time to Compl.</b> field. The number of hours is calculated by multiplying the number of days by the value in the <b>Hours per Man Day</b> field in the Jobs workspace.
<b>Description, Monday-Sunday</b>	Enter a daily description of the task specified on the current line. If daily descriptions are required for the task in question, Maconomy ensures that you enter a description for the task for the day in question before you can submit the time sheet.
<b>Transaction Timestamp</b>	This field shows the time of creation or the latest revision of the current line.
<b>Proposed Quantity</b>	This field shows the invoiceable quantity entered by the employee on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity, Monday-Sunday</b>	These fields show the invoiceable quantity entered by the employee for each day on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity Transferred, Monday-Sunday</b>	This field shows the proposed invoiceable quantity entered by the employee for each day that can be transferred on an expense sheet line.
<b>Proposed Billing Price, Total</b>	This field shows the total proposed billing price in job currency per hour or day, depending on the Time Unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Proposed Billing Price, Unit</b>	This field shows the proposed billing price in job currency per hour or day, depending on the Time Unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Biling Price, Currency</b>	This field shows the standard billing price of the current line in the currency of the job.
<b>Use Invoice Proposal</b>	This field shows whether the quantity and billing price in the following fields are used for invoicing: <ul style="list-style-type: none"> <li>Proposed Quantity</li> <li>Proposed Billing Price, Unit</li> <li>Proposed Billing Price, Total</li> </ul>

Field	Description
<b>Transaction Type</b>	This field shows the current line's transaction type. Transaction types are set up in the Transaction Types workspace.
<b>Invoiceable</b>	This field shows whether or not the line is invoiceable.
<b>Billing Price, Base</b>	This field shows the budgeted billing price in base currency.
<b>Billing Price, Enterprise</b>	This field shows the budgeted billing price in enterprise currency.
<b>Employee Category No.</b>	This field shows the employee category number that comes from job budget lines or that you add manually in this sub-tab.
<b>Absence Type</b>	Select the reason for the absence.
<b>Time Unit</b>	This field displays the time unit used for filing time (either hours or days).
<b>Option List 1-5</b>	Specify the option lists containing the values that should be available for further specification in the <b>Selected Value 1-5</b> fields on the current line.
<b>Selected Value 1-5</b>	Specify a number of values for further specification of the current line. You can only use values available in the respective option lists specified in the <b>Option List 1-5</b> fields.
<b>Spec. 4-10</b>	These fields show the specifications assigned to the current line.
<b>Local Spec. 4-10</b>	This field shows the local specifications assigned to the current line.
<b>Purchase Order Number</b>	This field shows the purchase order number to which the current line is associated to.
<b>Purchase Order Line Number</b>	This field shows the purchase order line number assigned to the current line.
<b>Employee</b>	This field shows the name of the employee assigned to the current line.
<b>Employee Position</b>	This field shows the position number assigned to the employee.
<b>Employee E-mail</b>	This field shows the employee's email address.

Field	Description
<b>Employee Phone</b>	This field shows the employee's phone number.
<b>Employee Mobile</b>	This field shows the employee's mobile number.
<b>Employee Company No.</b>	This field shows the employee's company number.
<b>Employee Company</b>	This field shows the company the employee is associated with.
<b>Job Name</b>	This field shows the name of the job to which the current line is associated.
<b>Project Manager No.</b>	This field shows the project manager number of the project manager assigned to the current line.
<b>Project Manager</b>	This field shows the name of the project manager assigned to the current line.
<b>Activity Description</b>	This field displays the title or name of the activity for which the employee registered time.
<b>Task Description</b>	This field displays the title or name of the task for which the employee registered time.
<b>Task Path</b>	This field shows any task path of the task.
<b>Company</b>	This field shows the name of the bill-to-customer assigned to the job on the current line.
<b>Customer No.</b>	This field shows the number of the bill-to customer assigned to the job on the current line.
<b>Customer</b>	This field shows the name of the bill-to customer assigned to the job on the current line.
<b>Time Unit, Job</b>	This field displays the time unit used for filing time (hours or days) on the job.
<b>Week</b>	This field shows the week number of the current time sheet.
<b>Year</b>	This field shows the year in which the current time sheet line was entered. The field cannot be changed.
<b>Location Description</b>	This field shows a description regarding the location assigned to the current line.
<b>Entity Description</b>	This field shows a description regarding the entity assigned to the current line.

Field	Description
<b>Project Description</b>	This field shows a description regarding the project assigned to the current line.
<b>Purpose Description</b>	This field shows a description regarding the purposes assigned to the current line.
<b>Spec. 1-10 Description</b>	This field shows descriptions regarding the specifications assigned to the current line.
<b>Local Spec. 1-10 Description</b>	This field shows descriptions regarding the local specifications assigned to the current line.
<b>Customer Level</b>	This field shows the customer level number for the customer to which the current line is associated.
<b>Level 1-5 No.</b>	These fields show the companies in the hierarchy above the specified company associated with the current line. These fields are only available if Customer Levels are set up using the designated system parameters.
<b>Level 1-5 Name</b>	These fields show the names of the companies in the hierarchy above the specified company associated with the current line. These fields are only available if Customer Levels are set up using the designated system parameters.
<b>Time Activity 1-3</b>	In these fields, you can specify time registration for activities as set up in Time Sheet References. This field is in hours or days, depending on the time unit on the time sheet.
<b>Monday-Friday</b>	<p>These fields show registered time in hours or days, depending on the time unit of the time sheet. In these fields you enter the time used every day of the week on the specific job, dimension, task, and activity. You cannot register more hours in one day than the maximum number of hours entered for the employee in the employee revision applying to the date in question.</p> <p>Moreover, if a value has been entered in the <b>Time Sheets</b> field in the Activities workspace for the activity for which you wish to register hours or amounts, you cannot enter a larger quantity for the activity than specified in that field. If there are several time sheet lines for a given employee with the activity in question, the sum of the registrations on these lines cannot exceed the daily registration limit specified for the activity in question.</p> <p>It is possible to enter a negative number of hours. If the <b>Minimum Hours</b> field has been marked on the employee revision applying on the date in question, Maconomy checks whether the employee has registered the minimum number of hours that the employee in question is supposed to register. If the number of hours registered is lower than this number, the time sheet cannot be submitted. It can be temporarily</p>

Field	Description
	<p>submitted, however. See the description of the window Employees in the Set-Up module for further information.</p> <p>If time sheet lines are automatically created from the detailed resource planning, these fields will automatically be filled in with the quantity of hours planned for the employee on the task specified on the current line. In this way, you only need to enter hours in these fields if you need to make any changes to the pre-filled quantity of hours. However, the fields are only pre-filled on time sheet lines referring to jobs for which the <b>Pre-fill Time Sheet Lines</b> job parameter attribute has the <b>By Day</b> value.</p> <p>You cannot enter hours for days that are before the open posting period for the job specified on the current line. For further information, refer to the description of the Job Cost island in the Company Information workspace in the G/L module. If you enter hours for a date that comes after the open posting period, Maconomy issues a warning. In addition, it will only be possible to submit such time sheets, but not to perform any actions that will result in a posting. Whether it is the submission, release, or approval that determines when a time sheet is transferred for posting depends on the approval principle of each job. For further information about approval principles, refer to the description of the Approval island in the Jobs workspace.</p> <p>By changing the MDL layout of this window, you can insert variable day names in the sub-tab. For example, the column which is called <b>Monday</b> by default, can, be changed to <b>Mon. &lt;date&gt;</b>. For more information, refer to the description of the Window Layouts workspace in the Set-Up module.</p>
<b>Time Activity 1-3, Transferred</b>	These fields show whether or not the time activities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Quantity Monday-Friday, Transferred</b>	These fields show whether or not the quantites for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Proposed Quantity Monday-Friday</b>	These fields show the invoiceable quantity entered by the employee for each day on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity Monday-Friday, Transferred</b>	These fields show whether or not the quantites for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Proposed Quantity</b>	This field shows the invoiceable quantity entered by the employee on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.

Field	Description
<b>Proposed Billing Price, Unit</b>	This field shows the proposed billing price in job currency per hour or day, depending on the time unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Total</b>	This field displays the total hours (or days) worked for the week for the job, dimension, task, and activity specified on the line.

## Actions

This section shows the Actions available in the Approve Purchase Order Lines by Employee workspace.

### Table Part

Field	Description
<b>Mark All For Approval</b>	Use this action to mark all approval object lines in the sub-tab for approval. This means the status in the <b>New Approval Status</b> field is set to Approved on all lines.
<b>Mark All For Release</b>	Use this action to mark all approval object lines in the sub-tab for release. This means the status in the <b>New Approval Status</b> field is set to Released on all lines.  This action can only be used if the <b>Trans. Non-Appr. Time Sheets</b> field is enabled in the System Information workspace, and the current user has access to transferring expense sheets as specified in the Actions workspace. The employee specified as the project manager for the current job, however, always has the right to release time sheets for the employee in question.
<b>Mark All For Rejection</b>	Use this action to mark all approval object lines in the sub-tab for rejection. This means the status in the <b>New Approval Status</b> field is set to Rejected on all lines.
<b>Unmark All</b>	Use this action to unmark all approval object lines in the sub-tab for approval. This means the <b>Approve</b> check box is deselected for all entries in the sub-tab.
<b>Execute Approval</b>	Use this action to put into effect all statuses indicated in the <b>New Approval Status</b> field for all lines. If any approval object lines are thus fully approved or released (for example, the expense sheet from which the approval object line originates was already approved or released by the supervisor), the lines in question are transferred to a registration journal which can then be posted. The <b>Approval Status</b> field is automatically updated with the value shown in the <b>New Approval Status</b> field.
<b>Approve All</b>	Use this action to approve all the lines pending approval that are listed in the sub-tab.
<b>Reset All</b>	Use this action to reset all the lines pending approval that are listed in the sub-tab.

## SD\_SU\_Approve Vendor Invoice Allocation Lines by Employee Workspace

Use up to 35 words to describe this conceptual topic. Write complete sentences.

This is the start of your concept.

### Approve Vendor Invoice Allocation Lines by Employee Tab

This section includes the fields and descriptions for the Approve Vendor Invoice Allocation Lines by Employee tab.

#### Employee Information island

Field	Description
<b>Current Employee No.</b>	This field shows the employee number for the currently logged in user.
<b>Employee No.</b>	This field shows the number of the employee designated as approver of all lines submitted for approval. By default, this field displays the same value as the <b>Current Employee No.</b> field.
<b>Employee Type</b>	This field shows the selected employee's employee type.
<b>Job No.</b>	Enter or select a job number to show only lines relevant to the specified job in the sub-tab.
<b>Show Lines For Approval</b>	Select this check box to show items available for approval. This is enabled by default.
<b>Show Non-Active Lines</b>	Select this check box to show approval items that are not yet active.
<b>Show Rejected Lines</b>	Select this check box to show rejected approval items.
<b>Show Substitute Lines</b>	Select this check box to show the approval items for which you are a substitute approver.
<b>Show Super Approver Lines</b>	Select this check box to show approval items for which you are a super approver.
<b>Show Approvable by All Approval Lines</b>	Select this check box to view all approval items that can be approved by any user.
<b>Overwrite existing</b>	If existing information is already available in the <b>Approval Status</b> or <b>Remark</b> fields in the sub-tab, select one or both of the following check boxes to enable the system to overwrite it:

Field	Description
	<ul style="list-style-type: none"> <li>Approval Status</li> <li>Remark</li> </ul>
<b>Remark</b>	Enter a remark regarding the specified approval object line.

## Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number to which the current line is associated.
<b>Level</b>	This field shows the level of the approval hierarchy that the approval object lines relate to, and thus the order in which they are to be approved. This field only applies if the <b>Level Prioritized</b> check box is selected in the tab of the related approval hierarchy.
<b>Effective</b>	This field shows whether or not the actual approvals are marked as effective. In-effective approval headers and lines show the history.
<b>Active</b>	This field shows whether or not the approval object is currently active.
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the <b>New Approval Status</b> field is transferred to this field when you use the <b>Execute Approval</b> action. This field cannot be changed manually.
<b>New Approval Status</b>	<p>Select the status you wish to assign to the current approval object line when you use the <b>Execute Approval</b> action.</p> <p>The following statuses are available:</p> <ul style="list-style-type: none"> <li>Blank</li> <li>Approved</li> <li>Rejected</li> <li>Released</li> </ul>
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.
<b>Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.

Field	Description
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field shows the time that the current line was approved.
<b>Approver</b>	This field show the employee name and number of the designated approver who approved the approval object.
<b>Substitute</b>	This field shows the employee name and number of the designated substitute approver who approved the approval object.
<b>Super Approver</b>	This field shows the employee name and number of the designated super approver who approved the approval object.
<b>Approver Name</b>	Enter or select the name of the designated approver who can approve the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Name</b>	Enter or select the name of the designated substitute approver who can approve the approval object.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Super Approver Name</b>	Enter or select the name of the designated super approver who can approve the approval object.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Approver</b>	This field shows the employee number of the employee who approved the current approval object.
<b>Approver Employee Type</b>	This field shows the designated employee type that can approve approval objects. Any approval object, such as time sheet lines, falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute</b>	This field shows the name of the designated substitute approver who approved the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects.

Field	Description
	Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Approver Reference, Field</b>	This field shows the internal field name that the Approver Reference relates to.
<b>Approver Reference, Employee</b>	This field shows the employee reference of the Approver.
<b>Substitute Reference, Relation</b>	This field shows the relation of a substitute approver reference if one has been specified on the approval task.
<b>Substitute Reference, Field</b>	This field shows the field reference of a substitute approver if one has been specified on the approval task.
<b>Substitute Reference, Employee</b>	This field shows the employee reference of the substitute approver if one has been specified on the approval task.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Super Approver</b>	This field shows the name of the designated super approver who approved the approval object.
<b>Super Approver Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Super Approver Reference, Relation</b>	This field shows the relation of a super approver reference if one has been specified on the approval task.
<b>Super Approver Reference, Field</b>	This field shows the field reference of a super approver if one has been specified on the approval task.
<b>Super Approver Reference, Employee</b>	This field shows the employee reference of a super approver if one has been specified on the approval task.

Field	Description
<b>Current Approval Status Details</b>	This field shows details regarding the latest approval status of the current line.
<b>Current Approval Status</b>	This field shows the latest approval status of the current line.
<b>Last Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the last user who completed the action for the associated approval object.
<b>Last Approval or Rejection Date</b>	If the approval object has been approved, this field shows the latest date on which the current line was approved.
<b>Last Approval or Rejection Time</b>	If the approval object has been approved, this field shows the latest time when the current line was approved.
<b>Last Approval or Rejection Comment</b>	If the approval object has been approved or rejected, this field shows the latest comment for the associated approval object.
<b>Line Can Be Approved by Current User</b>	This field shows whether the current line can be approved by the current user.
<b>Current Status</b>	This field shows the latest status of the current line.
<b>Submitted By</b>	This field shows the name of the user who submitted the current line.
<b>Date Submitted</b>	This field shows the date the current line was submitted.
<b>Time Submitted</b>	This field shows the time the current line was submitted.
<b>Employee No.</b>	This field shows the number of the employee who entered the current line.
<b>Line No.</b>	This field shows the line number of the current expense sheet line.
<b>Start Date</b>	This field displays the start date of the expense sheet.
<b>Job No.</b>	This field shows the job number related to the current expense sheet line.
<b>Activity No.</b>	This field shows the activity number specified on the current expense sheet line.

Field	Description
<b>Monday-Sunday</b>	<p>These fields show registered time in hours or days, depending on the time unit of the expense sheet. In these fields, enter the time used every day of the week on the specific job, dimension, task, and activity. You cannot register more hours in one day than the maximum number of hours entered for the employee in the employee revision applying to the date in question.</p> <p>Moreover, if a value has been entered in the <b>Time Sheets</b> field in the Activities workspace for the activity for which you wish to register hours or amounts, you cannot enter a larger quantity for the activity than specified in that field. If there are several time sheet lines for a given employee with the activity in question, the sum of the registrations on these lines cannot exceed the daily registration limit specified for the activity in question.</p> <p>You can enter a negative number of hours. If the <b>Minimum Hours</b> field is enabled on the employee revision applying on the date in question, Maconomy checks whether the employee has registered the minimum number of hours that the employee in question is supposed to register. If the number of hours registered is lower than this number, the time sheet cannot be submitted. It can be temporarily submitted, however. See the description of the Employees workspace in the Set-Up module for further information.</p> <p>If time sheet lines are automatically created from the detailed resource planning, these fields are automatically filled in with the quantity of hours planned for the employee on the task specified on the current line. In this way, you only need to enter hours in these fields if you need to make any changes to the pre-filled quantity of hours. However, the fields are only prefilled on time sheet lines referring to jobs where you entered a value in the <b>By Day</b> field in the <b>Pre-fill Time Sheet Lines</b> job parameter attribute.</p> <p>You cannot enter hours for days that are before the open posting period for the job specified on the current line. For further information, refer to the description of the Job Cost island in the Company Information workspace in the G/L module. If you enter hours for a date that comes after the open posting period, Maconomy issues a warning. In addition, it will only be possible to submit such time sheets, but not to perform any actions that will result in a posting. Whether it is the submission, release, or approval that determines when a time sheet is transferred for posting depends on the approval principle of each job. For further information about approval principles, refer to the description of the Approval island in the Jobs workspace.</p> <p>By changing the MDL layout of this window, you can insert variable day names in the sub-tab. For example, the column which is named <b>Monday</b> by default, can be changed to <b>Mon. &lt;date&gt;</b>. For more information, refer to the description of the Window Layouts workspace in the Set-Up module.</p>

Field	Description
<b>Description</b>	This field shows a description of the current entry.
<b>Activity Type</b>	This field shows the type of the current activity.
<b>Quantity Monday-Sunday, Transferred</b>	These fields show whether or not the quantities for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Job Description</b>	This field shows a description of the job specified in the <b>Job No.</b> field. If it is an internal job, the description contains the job name, whereas the description of an external job contains the name of the customer to whom the job has been assigned.
<b>Internal Job</b>	This field displays the total time registered on internal jobs for the week.
<b>Spec. 1-3</b>	These fields show the specifications assigned to the current line.
<b>Task</b>	This field shows the type of the current activity.
<b>Time Activity 1-3</b>	These fields show the total time for activities in hours or days, depending on the time unit. Time activity can be used to calculate overtime, among others. The activity references can be created in the Time Sheet References workspace.
<b>Time Activity 1-3, Transferred</b>	These fields show whether or not the time activities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Amount Activity 1-4</b>	These fields show the total number of hours for the amount activities specified in the window Time Sheet References. Amount activities can for instance be used to register transport costs, meals, and so on.
<b>Amount Activity 1-4, Transferred</b>	These fields show whether or not the amounts have been transferred to a time sheet journal or the time sheet journal queue.
<b>Location</b>	This field shows the location assigned to the current line.
<b>Entity</b>	This field shows the entity assigned to the current line.
<b>Project</b>	This field shows the project assigned to the current line.
<b>Purpose</b>	This field shows the purpose assigned to the current line.

Field	Description
<b>Local Spec. 1-3</b>	This field shows the local specifications assigned to the current line.
<b>Company No.</b>	This field shows the name of the company responsible for the job on which the work was performed.
<b>Quantity 1-2</b>	These fields show the quantities registered in the entry.
<b>Quantity 1-2, Transferred</b>	These fields show whether or not the quantities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Transferred for Posting</b>	This field determines whether the current line has been transferred for posting.
<b>Total</b>	This field displays the total hours (or days) worked for the week for the job, dimension, task, and activity specified on the line.
<b>Cost Type</b>	This field shows the cost type of the current line.
<b>Submitted</b>	This field shows whether the current line has been submitted.
<b>New Approval Status, Project Manager</b>	<p>This field shows the status of the current line, as determined by the designated project manager of the job.</p> <p>When the time sheet is submitted, the project manager can approve, reject, or release each line if the approval principle of the job indicates that approval of time registrations by the project manager is mandatory or optional.</p> <p>If the status of the line is Approved or Released, and the line is changed, the status changes to blank. If the line is Rejected, then changed, the status does not change.</p>
<b>Approval, Project Manager</b>	This field shows the approval status of the current line, as determined by the designated project manager of the job. The value in the <b>New Approval Status, Project Manager</b> field is transferred to this field when you use the <b>Execute Approval</b> action.
<b>Approved by</b>	This field shows the name of the project manager who assigned the current approval status to the line.
<b>Approval Date</b>	This field shows the date on which the project manager who assigned the current approval status assigned the approval status to the line.
<b>Comment</b>	This field shows any comments entered by the project manager in connection with the approval, release, or rejection of the line.
<b>Approved by Superior</b>	This field shows if the current line has been approved by the user's superior.

Field	Description
<b>Released by Superior</b>	This field shows if the current line has been released by the user's superior.
<b>Keep Line</b>	This field shows whether or not the current line is deemed permanent. If this check box is selected, the current line is automatically copied from the previous period at the creation of time sheets. New lines created inherit this status, which means that they will automatically be copied to all new time sheets until you deselect the check box on the selected line.
<b>Planned This Period</b>	This field shows whether or not the current line has been transferred, in which case the transfer action does not apply.
<b>Est. Time to Compl.</b>	This field shows the estimated time to completion of the current line.
<b>Completed</b>	This field shows whether or not the work on the current line is completed.
<b>Estimate Date</b>	This field shows the estimate date of the current line's completion.
<b>Job Budget Type</b>	This field shows the budget type assigned to the current job.
<b>Job Budget Revision No.</b>	This field shows the revision number of the current job budget line.
<b>Overtime Spec.</b>	This field shows the overtime specification for the current line. Overtime specifications are defined in the Popup Fields tab in the System Setup workspace.
<b>Favorite</b>	This field shows a favorite, if it has been selected. Favorites are derived from the Favorites workspace.
<b>Note</b>	Enter a brief description of what you have been working on.
<b>Est. Time to Compl. Days</b>	Enter the number of days as an estimate to completion. If you enter a value in this field, Maconomy automatically converts it to hours, which is shown in the <b>Est. Time to Compl.</b> field. The number of hours is calculated by multiplying the number of days by the value in the <b>Hours per Man Day</b> field in the Jobs workspace.
<b>Description, Monday-Sunday</b>	Enter a daily description of the task specified on the current line. If daily descriptions are required for the task in question, Maconomy ensures that you enter a description for the task for the day in question before you can submit the time sheet.
<b>Transaction Timestamp</b>	This field shows the time of creation or the latest revision of the current line.

Field	Description
<b>Proposed Quantity</b>	This field shows the invoiceable quantity entered by the employee on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity, Monday-Sunday</b>	These fields show the invoiceable quantity entered by the employee for each day on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity Transferred, Monday-Sunday</b>	This field shows the proposed invoiceable quantity entered by the employee for each day that can be transferred on an expense sheet line.
<b>Proposed Billing Price, Total</b>	This field shows the total proposed billing price in job currency per hour or day, depending on the Time Unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Proposed Billing Price, Unit</b>	This field shows the proposed billing price in job currency per hour or day, depending on the Time Unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Billing Price, Currency</b>	This field shows the standard billing price of the current line in the currency of the job.
<b>Use Invoice Proposal</b>	This field shows whether the quantity and billing price in the following fields are used for invoicing: <ul style="list-style-type: none"> <li>Proposed Quantity</li> <li>Proposed Billing Price, Unit</li> <li>Proposed Billing Price, Total</li> </ul>
<b>Transaction Type</b>	This field shows the current line's transaction type. Transaction types are set up in the Transaction Types workspace.
<b>Invoiceable</b>	This field shows whether or not the line is invoiceable.
<b>Billing Price, Base</b>	This field shows the budgeted billing price in base currency.
<b>Billing Price, Enterprise</b>	This field shows the budgeted billing price in enterprise currency.
<b>Employee Category No.</b>	This field shows the employee category number that comes from job budget lines or that you add manually in this sub-tab.
<b>Absence Type</b>	Select the reason for the absence.

Field	Description
<b>Time Unit</b>	This field displays the time unit used for filing time (either hours or days).
<b>Option List 1-5</b>	Specify the option lists containing the values that should be available for further specification in the <b>Selected Value 1-5</b> fields on the current line.
<b>Selected Value 1-5</b>	Specify a number of values for further specification of the current line. You can only use values available in the respective option lists specified in the <b>Option List 1-5</b> fields.
<b>Spec. 4-10</b>	These fields show the specifications assigned to the current line.
<b>Local Spec. 4-10</b>	This field shows the local specifications assigned to the current line.
<b>Purchase Order Number</b>	This field shows the purchase order number to which the current line is associated to.
<b>Purchase Order Line Number</b>	This field shows the purchase order line number assigned to the current line.
<b>Employee</b>	This field shows the name of the employee assigned to the current line.
<b>Employee Position</b>	This field shows the position number assigned to the employee.
<b>Employee E-mail</b>	This field shows the employee's email address.
<b>Employee Phone</b>	This field shows the employee's phone number.
<b>Employee Mobile</b>	This field shows the employee's mobile number.
<b>Employee Company No.</b>	This field shows the employee's company number.
<b>Employee Company</b>	This field shows the company the employee is associated with.
<b>Job Name</b>	This field shows the name of the job to which the current line is associated.
<b>Project Manager No.</b>	This field shows the project manager number of the project manager assigned to the current line.
<b>Project Manager</b>	This field shows the name of the project manager assigned to the current line.

Field	Description
<b>Activity Description</b>	This field displays the title or name of the activity for which the employee registered time.
<b>Task Description</b>	This field displays the title or name of the task for which the employee registered time.
<b>Task Path</b>	This field shows any task path of the task.
<b>Company</b>	This field shows the name of the bill-to-customer assigned to the job on the current line.
<b>Customer No.</b>	This field shows the number of the bill-to customer assigned to the job on the current line.
<b>Customer</b>	This field shows the name of the bill-to customer assigned to the job on the current line.
<b>Time Unit, Job</b>	This field displays the time unit used for filing time (hours or days) on the job.
<b>Week</b>	This field shows the week number of the current time sheet.
<b>Year</b>	This field shows the year in which the current time sheet line was entered. The field cannot be changed.
<b>Location Description</b>	This field shows a description regarding the location assigned to the current line.
<b>Entity Description</b>	This field shows a description regarding the entity assigned to the current line.
<b>Project Description</b>	This field shows a description regarding the project assigned to the current line.
<b>Purpose Description</b>	This field shows a description regarding the purposes assigned to the current line.
<b>Spec. 1-10 Description</b>	This field shows descriptions regarding the specifications assigned to the current line.
<b>Local Spec. 1-10 Description</b>	This field shows descriptions regarding the local specifications assigned to the current line.
<b>Customer Level</b>	This field shows the customer level number for the customer to which the current line is associated.
<b>Level 1-5 No.</b>	These fields show the companies in the hierarchy above the specified company associated with the current line. These fields are only available if Customer Levels are set up using the designated system parameters.

Field	Description
<b>Level 1-5 Name</b>	These fields show the names of the companies in the hierarchy above the specified company associated with the current line. These fields are only available if Customer Levels are set up using the designated system parameters.
<b>Time Activity 1-3</b>	In these fields, you can specify time registration for activities as set up in Time Sheet References. This field is in hours or days, depending on the time unit on the time sheet.
<b>Monday-Friday</b>	<p>These fields show registered time in hours or days, depending on the time unit of the time sheet. In these fields you enter the time used every day of the week on the specific job, dimension, task, and activity. You cannot register more hours in one day than the maximum number of hours entered for the employee in the employee revision applying to the date in question.</p> <p>Moreover, if a value has been entered in the <b>Time Sheets</b> field in the Activities workspace for the activity for which you wish to register hours or amounts, you cannot enter a larger quantity for the activity than specified in that field. If there are several time sheet lines for a given employee with the activity in question, the sum of the registrations on these lines cannot exceed the daily registration limit specified for the activity in question.</p> <p>It is possible to enter a negative number of hours. If the <b>Minimum Hours</b> field has been marked on the employee revision applying on the date in question, Maconomy checks whether the employee has registered the minimum number of hours that the employee in question is supposed to register. If the number of hours registered is lower than this number, the time sheet cannot be submitted. It can be temporarily submitted, however. See the description of the window Employees in the Set-Up module for further information.</p> <p>If time sheet lines are automatically created from the detailed resource planning, these fields will automatically be filled in with the quantity of hours planned for the employee on the task specified on the current line. In this way, you only need to enter hours in these fields if you need to make any changes to the pre-filled quantity of hours. However, the fields are only pre-filled on time sheet lines referring to jobs for which the <b>Pre-fill Time Sheet Lines</b> job parameter attribute has the <b>By Day</b> value.</p> <p>You cannot enter hours for days that are before the open posting period for the job specified on the current line. For further information, refer to the description of the Job Cost island in the Company Information workspace in the G/L module. If you enter hours for a date that comes after the open posting period, Maconomy issues a warning. In addition, it will only be possible to submit such time sheets, but not to perform any actions that will result in a posting. Whether it is the submission, release, or approval that determines when a time sheet is transferred for posting depends on the approval principle of each job. For further</p>

Field	Description
	<p>information about approval principles, refer to the description of the Approval island in the Jobs workspace.</p> <p>By changing the MDL layout of this window, you can insert variable day names in the sub-tab. For example, the column which is called <b>Monday</b> by default, can, be changed to <b>Mon. &lt;date&gt;</b>. For more information, refer to the description of the Window Layouts workspace in the Set-Up module.</p>
<b>Time Activity 1-3, Transferred</b>	These fields show whether or not the time activities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Quantity Monday-Friday, Transferred</b>	These fields show whether or not the quantites for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Proposed Quantity Monday-Friday</b>	These fields show the invoiceable quantity entered by the employee for each day on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity Monday-Friday, Transferred</b>	These fields show whether or not the quantites for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Proposed Quantity</b>	This field shows the invoiceable quantity entered by the employee on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Billing Price, Unit</b>	This field shows the proposed billing price in job currency per hour or day, depending on the time unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Total</b>	This field displays the total hours (or days) worked for the week for the job, dimension, task, and activity specified on the line.

## Actions

This section shows the Actions available in the Approve Vendor Invoice Allocation Lines by Employee workspace.

### Table Part

Field	Description
<b>Mark All For Approval</b>	Use this action to mark all approval object lines in the sub-tab for approval. This means the status in the <b>New Approval Status</b> field is set to Approved on all lines.

Field	Description
<b>Mark All For Release</b>	<p>Use this action to mark all approval object lines in the sub-tab for release. This means the status in the <b>New Approval Status</b> field is set to Released on all lines.</p> <p>This action can only be used if the <b>Trans. Non-Appr. Time Sheets</b> field is enabled in the System Information workspace, and the current user has access to transferring expense sheets as specified in the Actions workspace.</p> <p>The employee specified as the project manager for the current job, however, always has the right to release time sheets for the employee in question.</p>
<b>Mark All For Rejection</b>	<p>Use this action to mark all approval object lines in the sub-tab for rejection. This means the status in the <b>New Approval Status</b> field is set to Rejected on all lines.</p>
<b>Unmark All</b>	<p>Use this action to unmark all approval object lines in the sub-tab for approval. This means the <b>Approve</b> check box is deselected for all entries in the sub-tab.</p>
<b>Execute Approval</b>	<p>Use this action to put into effect all statuses indicated in the <b>New Approval Status</b> field for all lines. If any approval object lines are thus fully approved or released (for example, the expense sheet from which the approval object line originates was already approved or released by the supervisor), the lines in question are transferred to a registration journal which can then be posted.</p> <p>The <b>Approval Status</b> field is automatically updated with the value shown in the <b>New Approval Status</b> field.</p>
<b>Approve All</b>	<p>Use this action to approve all the lines pending approval that are listed in the sub-tab.</p>
<b>Reset All</b>	<p>Use this action to reset all the lines pending approval that are listed in the sub-tab.</p>

## Approve Vendor Invoices by Employee Workspace

Use the Approve Vendor Invoices by Employee workspace to view information on all relevant approval lines for vendor invoices.

Use this workspace to view information on all relevant approval lines for vendor invoices. This allows you to use iAccess to access vendor invoices that were created in the Workspace Client. You can also approve or reject transactions for which approval hierarchies are set up, from within iAccess.

## Approve Vendor Invoices by Employee Tab

This section includes the fields and descriptions for the Approve Vendor Invoices by Employee tab.

### Employee Information Island

Field	Description
<b>Current Employee No.</b>	This field shows the employee number for the currently logged in user.
<b>Employee No.</b>	This field shows the number of the employee designated as approver of all lines submitted for approval. By default, this field displays the same value as the <b>Current Employee No.</b> field.
<b>Employee Type</b>	This field shows the selected employee's employee type.
<b>Job No.</b>	Enter or select a job number to show only lines relevant to the specified job in the sub-tab.
<b>Show Lines For Approval</b>	Select this check box to show items available for approval. This is enabled by default.
<b>Show Non-Active Lines</b>	Select this check box to show approval items that are not yet active.
<b>Show Rejected Lines</b>	Select this check box to show rejected approval items.
<b>Show Substitute Lines</b>	Select this check box to show the approval items for which you are a substitute approver.
<b>Show Super Approver Lines</b>	Select this check box to show approval items for which you are a super approver.
<b>Show Approvable by All Approval Lines</b>	Select this check box to view all approval items that can be approved by any user.
<b>Overwrite existing</b>	If existing information is already available in the <b>Approval Status</b> or <b>Remark</b> fields in the sub-tab, select one or both of the following check boxes to enable the system to overwrite it: <ul style="list-style-type: none"> <li>Approval Status</li> <li>Remark</li> </ul>
<b>Remark</b>	Enter a remark regarding the specified approval object line.

## Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number to which the current line is associated.
<b>Level</b>	This field shows the level of the approval hierarchy that the approval object lines relate to, and thus the order in which they are to be approved. This field only applies if the <b>Level Prioritized</b> check box is selected in the tab of the related approval hierarchy.
<b>Effective</b>	This field shows whether or not the actual approvals are marked as effective. In-effective approval headers and lines show the history.
<b>Active</b>	This field shows whether or not the approval object is currently active.
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the <b>New Approval Status</b> field is transferred to this field when you use the <b>Execute Approval</b> action. This field cannot be changed manually.
<b>New Approval Status</b>	Select the status you wish to assign to the current approval object line when you use the <b>Execute Approval</b> action. The following statuses are available: <ul style="list-style-type: none"> <li>Blank</li> <li>Approved</li> <li>Rejected</li> <li>Released</li> </ul>
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.
<b>Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field shows the time that the current line was approved.
<b>Approver</b>	This field show the employee name and number of the designated approver who approved the approval object.

Field	Description
<b>Substitute</b>	This field shows the employee name and number of the designated substitute approver who approved the approval object.
<b>Super Approver</b>	This field shows the employee name and number of the designated super approver who approved the approval object.
<b>Approver Name</b>	Enter or select the name of the designated approver who can approve the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Name</b>	Enter or select the name of the designated substitute approver who can approve the approval object.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Super Approver Name</b>	Enter or select the name of the designated super approver who can approve the approval object.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Approver</b>	This field shows the employee number of the employee who approved the current approval object.
<b>Approver Employee Type</b>	This field shows the designated employee type that can approve approval objects. Any approval object, such as time sheet lines, falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute</b>	This field shows the name of the designated substitute approver who approved the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Approver Reference, Field</b>	This field shows the internal field name that the Approver Reference relates to.

Field	Description
<b>Approver Reference, Employee</b>	This field shows the employee reference of the Approver.
<b>Substitute Reference, Relation</b>	This field shows the relation of a substitute approver reference if one has been specified on the approval task.
<b>Substitute Reference, Field</b>	This field shows the field reference of a substitute approver if one has been specified on the approval task.
<b>Substitute Reference, Employee</b>	This field shows the employee reference of the substitute approver if one has been specified on the approval task.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Super Approver</b>	This field shows the name of the designated super approver who approved the approval object.
<b>Super Approver Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Super Approver Reference, Relation</b>	This field shows the relation of a super approver reference if one has been specified on the approval task.
<b>Super Approver Reference, Field</b>	This field shows the field reference of a super approver if one has been specified on the approval task.
<b>Super Approver Reference, Employee</b>	This field shows the employee reference of a super approver if one has been specified on the approval task.
<b>Current Approval Status Details</b>	This field shows details regarding the latest approval status of the current line.
<b>Current Approval Status</b>	This field shows the latest approval status of the current line.
<b>Last Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the last user who completed the action for the associated approval object.

Field	Description
<b>Last Approval or Rejection Date</b>	If the approval object has been approved, this field shows the latest date on which the current line was approved.
<b>Last Approval or Rejection Time</b>	If the approval object has been approved, this field shows the latest time when the current line was approved.
<b>Last Approval or Rejection Comment</b>	If the approval object has been approved or rejected, this field shows the latest comment for the associated approval object.
<b>Line Can Be Approved by Current User</b>	This field shows whether the current line can be approved by the current user.
<b>Current Status</b>	This field shows the latest status of the current line.
<b>Submitted By</b>	This field shows the name of the user who submitted the current line.
<b>Date Submitted</b>	This field shows the date the current line was submitted.
<b>Time Submitted</b>	This field shows the time the current line was submitted.
<b>Journal Type</b>	The journal type. You cannot delete or rename this.
<b>Journal No.</b>	The number of the journal to which the entry was posted.
<b>Line No.</b>	The number of the allocation line in the current invoice.
<b>Type</b>	This field shows whether the information in the window is for an invoice ("Credit") or a credit memo ("Debit").
<b>Vendor No.</b>	This field shows the number of the vendor to which the employee is associated.
<b>Pay to Vendor No.</b>	The number of the vendor who is to receive payment for the vendor invoice.
<b>Entry Date</b>	This is the entry date registered on the invoice.
<b>Invoice Date</b>	The entry's invoice date from the vendor.
<b>Due Date</b>	The due date of the invoice.

Field	Description
<b>Trans. No.</b>	The transaction number of the invoice.
<b>Invoice No.</b>	The invoice number of the vendor invoice
<b>Std. Description</b>	This field shows the standard text.
<b>Description</b>	The description of the entry that is manually added when registration of the entry takes place.
<b>Amount Incl. Tax Base</b>	This is the base amount inclusive tax registered on the vendor invoice.
<b>Currency</b>	The currency of the invoice.
<b>Amount Incl. Tax, Currency</b>	This is the invoice amount in the currency of the invoice. If the invoice is subject to tax, you must enter the full amount, including tax, and also specify the relevant G/L tax code in the Tax Code field.
<b>Tax Amount, Currency</b>	This field shows the tax amount.
<b>Tax Code 1</b>	This field shows the G/L tax code, if any, used on the entry.
<b>Responsible</b>	This field shows the name of the person responsible for the job.
<b>Location</b>	This field shows the location dimension value which is assigned to the approval line.
<b>Entity</b>	This field shows the entity dimension value which is assigned to the approval line.
<b>Project</b>	This field shows the project dimension value which is assigned to the approval line.
<b>Allocation Started</b>	This field indicates whether Allocation lines have been created, but have not yet been submitted or fully allocated.
<b>Released for Posting</b>	This field shows whether the invoice allocation has been approved for posting. If this field is marked, the invoice journal has been approved for posting.
<b>Tax Amount, Base</b>	This is the tax amount on the amount in the "Price, Base," expressed into the base currency. The amount cannot be changed here.
<b>Purch. Order No.</b>	This field shows the purchase order number.
<b>Payment Mode</b>	The method used to pay the vendor.

Field	Description
<b>Payer Identification</b>	The vendor invoice's payer identification. It is used by Maconomy to create payment files for electronic payment of vendors.
<b>For Inventory Purch.</b>	When creating a vendor invoice, you can mark this field if you want Maconomy to make a purchase transaction when the invoice is posted. If the field "For Inventory Purch." in the window System Information is marked, Maconomy will automatically mark this field. If this field is marked, Maconomy automatically creates an allocation line in the table part of the window Invoice Allocation for the full invoice amount. This means that when the invoice is posted, a purchase transaction is created for the amount in the field "Inventory Amount." Purchase transactions are shown in the Invoice Reconciliation window and are used for balancing item receipts from the Item Purchase Orders and A/P modules against vendor invoices. You must thus create a purchase transaction if the invoice is for items to your warehouse and are received in the Item Receipt or Purchase Receipt window.
<b>Packing Slip No.</b>	This field shows the number of the delivery note which accompanied the delivery. You must enter a value for reference.  If the receipt includes any items, the delivery note number is printed on the item transaction created when you use the <b>Approve Receipt</b> action.
<b>Name</b>	This field shows the name of the vendor entered in the above Vendor No. field.
<b>Allocation Code</b>	In this field, you can enter an allocation code. You can use the allocation codes created in the Allocation Codes window in the G/L module. Allocation codes are used for easing registration of standard entries.  When you enter an allocation code and press Return, Maconomy will automatically create the number of allocation lines that the code specifies, and this field is subsequently blanked. In this way, specifying an allocation code in this field corresponds to creating an invoice allocation line in the Invoice Allocation window. However, the allocation lines that are created are not shown in this window, but can be inspected and edited in the table part of the Invoice Allocation window. In this connection, you should use allocation codes with positive percentages.  If you do not enter an allocation code in this field, and a standard allocation code has been specified in the information card of the vendor for whom the invoice is created, the standard allocation code of the vendor is automatically transferred to the vendor invoice, and allocation lines are created in the same way as if you had manually specified an allocation code.
<b>Exchange Rate</b>	The exchange rate used when the invoice was posted.

Field	Description
<b>Fixed Exchange Rate at Payment</b>	If this field is marked, the exchange rate in which the entry is posted will be fixed when the payment is posted, even though the exchange rate may have changed according to the current exchange rate table.
<b>Allocated by</b>	Copy to come.
<b>Payment Description</b>	This field shows the code for the goods or services covered by the vendor invoice if the vendor invoice concerns import.
<b>Card Type Code</b>	The vendor invoice card type code used by Maconomy to create payment files for the electronic payment of vendors.
<b>Import Date</b>	The date on which the goods or services covered by the vendor invoice were imported. Maconomy uses the import date in the creation of payment files for electronic payment of vendors. These payment files are created in the window Payment Files in the Banking module.
<b>Company Tax Code</b>	This field shows the company's tax code.
<b>Registration Code</b>	This field shows a registration code from the window Registration Codes in the G/L module.
<b>Purpose</b>	This is the purpose entered for the invoice or credit memo.
<b>Spec.1-3</b>	The specification 1-3 entered for the invoice or credit memo.
<b>Local Spec. 1-3</b>	The specification 1-3 entered for the invoice or credit memo.
<b>Company No</b>	This field shows the number of the company responsible for the current job.
<b>Disclosable</b>	This field shows whether the vendor registered on the invoice has been marked as disclosable.
<b>Cash Discount Date</b>	This field displays a cash discount date, if any, assigned to the current vendor entry. The date displayed in this field is thus the latest date on which payment should take place if cash discount is to be granted for the current vendor invoice.
<b>Job No.</b>	If a job number was specified on the original vendor invoice, this field shows the job number in question. It also shows the name of the specified job.
<b>Allocation Account</b>	This field shows the number of the account on which allocation entries should be posted.
<b>Date Posted</b>	The date the entry was posted to the accounts payable and general ledger.

Field	Description
<b>Posted</b>	This field shows whether or not the journal is posted.
<b>Entry Line No.</b>	Copy to come.
<b>Reallocation Date</b>	This is the reallocation date registered on the invoice.
<b>Amt. for Realloc., Currency</b>	Copy to come.
<b>Tax for Realloc., Currency</b>	Copy to come.
<b>Amt. for Realloc., Base</b>	Copy to come.
<b>Tax for Realloc., Base</b>	Copy to come.
<b>Amt. for Realloc., Enterprise</b>	Copy to come.
<b>Tax for Realloc., Enterprise</b>	Copy to come.
<b>Journal No., Reallocation</b>	Copy to come.
<b>Journal Line No., Reallocation</b>	Copy to come.
<b>Copy from vendor no.</b>	<p>In this field, you can enter a vendor number to be used for identifying a vendor invoice to be copied to the new vendor invoice. If you fill in this field, you must also enter an invoice number in the field "Copy From Invoice No." on the line.</p> <p>If you want to copy the information from one invoice to a new invoice, you enter a new transaction number and a new invoice number on the line, fill in this field and the field "Copy From Invoice No," and press Return, and Maconomy copies the vendor invoice specified including any assigned allocation lines. However, these lines cannot be inspected in this window, but are displayed in the Invoice Allocation window. Fields filled in by the user on the new invoice are not affected by the copying.</p>

Field	Description
	Entering a vendor number in this field can also be used for reversing the effect of an already posted invoice. See the description of the field "Reverse At Copying" for further information on the functionality of copying and reversing vendor entries.
<b>Copy from invoice no.</b>	In this field, you can enter an invoice number to be used for identifying a vendor invoice to be copied to the new vendor invoice. If you fill in this field, you must also enter a vendor number in the field "Copy From Vendor No." on the line. As the functionality of this field is similar to that of the field "Copy From Vendor No.," you should see the description of that field for further information.
<b>Copy from journal no.</b>	In this field, you can enter a journal number to be used for identifying a vendor invoice to be copied to the new vendor invoice. You can fill in this field, if you do not know either the vendor number or the invoice number of the invoice that you want to copy. If you fill in this field, you must also enter a journal line number in the field "Copy From Journal Line No." on the line. As the functionality of this field is similar to that of the field "Copy From Vendor No.," you should see the description of that field for further information.
<b>Copy from journal line no.</b>	In this field, you can enter a journal line number to be used for identifying a vendor invoice to be copied to the new vendor invoice. You can fill in this field if you do not know either the vendor number or the invoice number of the invoice that you want to copy. If you fill in this field, you must also enter a journal number in the field "Copy From Journal No." on the line. As the functionality of this field is similar to that of the field "Copy from vendor No.," you should see the description of that field for further information.
<b>Reverse at Copying</b>	In this field, you can choose whether the new vendor invoice should reverse an existing invoice at copying. If you mark this field, the new entry is assigned the opposite value in the field "Debit/Credit" as the existing entry; that is, if the original entry is a credit entry (a vendor invoice), the new entry will be a debit entry (a credit memo). In this way, the new entry reverses the effect of the existing entry. If the invoice or credit memo being copied has not already been reconciled, it is automatically reconciled against the new invoice or credit memo. To avoid exchange rate differences when copying, mark the field "Use Original Exchange Rate" below.
<b>Document Archive No.</b>	This field shows the document archive number assigned to the job.
<b>File Name</b>	Copy to come.
<b>Responsible for Allocation</b>	In this field, you can enter the name of the person to be responsible for the allocation of the invoice. The field is for information only.

Field	Description
<b>Attn.</b>	This field shows the customer's attention person.
<b>Remarks 1-5</b>	These fields show any notes or comments regarding the employee.
<b>Non-allocated Excl. Tax, Currency</b>	Copy to come.
<b>Non-allocated Tax, Currency</b>	Copy to come.
<b>Non-allocated Excl. Tax, Base</b>	Copy to come.
<b>Non-allocated Tax, Base</b>	Copy to come.
<b>Status</b>	This field shows the job's current status.
<b>Reference Date</b>	This field shows the entry reference date.
<b>Instance Key</b>	This field shows the current employee's unique identity in the Maconomy database.
<b>Amount Rounding, Base</b>	This is the rounding amount, in base currency. If currency rounding is used (in the Currency Rounding window), then the total interest amount should be rounded up, based on the currency rounding.
<b>Submitted by</b>	This field shows the name of the user who submitted the current line.
<b>Date Submitted</b>	This field shows the date the current line was submitted.
<b>Possible Cash Discount, Currency</b>	In this field, you can view the cash discount which can be gained by paying the vendor invoice by the cash discount date specified above.
<b>Possible Cash Discount %</b>	In this field, you can view the cash discount percentage which can be gained by paying the vendor invoice by the cash discount date specified above.
<b>Intercompany Invoice</b>	This field shows the intercompany invoice.
<b>Name 1-5, Vendor</b>	This is the name and address of the vendor.

Field	Description
<b>Zip Code, Vendor</b>	This is the zip code of the vendor.
<b>Postal District, Vendor</b>	This is the postal district of the vendor.
<b>Attention, Vendor</b>	This is the name of the vendor's attention person.
<b>Country, Vendor</b>	This is the vendor's country.
<b>Telephone, Vendor</b>	This is the vendor's telephone number.
<b>Telefax, Vendor</b>	This is the fax number of the vendor.
<b>Telex, Vendor</b>	This is the telex number of the vendor.
<b>Giro, Vendor</b>	This field shows the giro number entered on the vendor invoice. The information is for reference.
<b>E-mail, Vendor</b>	This field shows the vendor's email address.
<b>Global Location No.</b>	<p>If a global location number has been specified on the vendor invoice, you can enter the global location number here. Global location numbers are used in electronic invoices, and there this field will typically be completed automatically on electronically read vendor invoices.</p> <p>Global location numbers are set up in the Company Locations window in the G/L module and indicate the company, department, warehouse, or other entity to receive the invoice. For further information about the concept of global location numbers, see the introduction to the Company Locations window in the G/L module.</p> <p>When a global location number is specified, any registration code and allocation responsible specified for the global location number are transferred to the invoice as if they were entered manually.</p>
<b>Settling Company No.</b>	This field shows the name of the settling company that applies to the current job.
<b>Use Original Exchange Rate</b>	<p>If you are reversing an existing vendor invoice, you can mark this field to use the same exchange rate as was used for the original vendor invoice. If you do this, there will be no exchange rate differences when you reverse the vendor invoice, unless the original currency has moved in relation to the enterprise currency. If this is the case, the difference must be handled at the time of posting.</p> <p>The vendor invoices can be inspected in the Show Vendor Invoices window.</p>

Field	Description
<b>Pay when Paid</b>	<p>This field shows whether payment when paid functionality applies to the current vendor invoice. Maconomy suggests the value from the corresponding field on the payment term selected for the current invoice. The field can only be marked if the system parameter "Enable Payment when Paid" has been marked.</p> <p>Payment when paid functionality is used in the Banking module to ensure that vendor invoices are not paid until they are allocated, and that vendor invoices allocated to jobs are not paid until you have received payment from the customer of the job in question.</p> <p>The value in this field does not have any effect on the vendor invoice itself, but the value here is suggested in the corresponding field on the vendor entries created as a result of posting the invoice. This means that in the window Change Payment Selection by Vendor, you can change the value for the individual vendor invoices resulting from the allocation of the invoice. Therefore, the effects of the field are described in the section about the field "Pay when Paid" in the window Payment Selection by Vendor.</p>
<b>Amount Rounding, Enterprise</b>	This shows the rounding amount, in enterprise currency if currency rounding is used (in the Currency Rounding window).
<b>Job Exchange Rate Variance, Base</b>	Copy to come.
<b>Job Exchange Rate Variance, Enterprise</b>	Copy to come.
<b>Open Job Exchange Rate Variance, Base</b>	Copy to come.
<b>Tax For Realloc., Spec. Entry Key</b>	Copy to come.
<b>Non-allocation Tax, Spec. Entry Key</b>	Copy to come.
<b>Tax Code 1-3</b>	This field displays the tax code for the expense registered on the line.
<b>Tax Amount 1-3, Currency</b>	This field shows the tax amount for the current request for quote line.
<b>Tax Amount 1-3, Base</b>	This field shows the tax amount for the current request for quote line.

Field	Description
<b>Transaction Type</b>	This field shows the transaction type of the entry.
<b>Amount Excl. Tax, Currency</b>	This field shows the price less tax of the allocation line in the currency of the vendor invoice
<b>Amount Incl. Tax, Enterprise</b>	Copy to come.
<b>Tax Amount, Enterprise</b>	Copy to come.
<b>Tax Spec. Entry Key</b>	Copy to come.
<b>Non-allocated Excl. Tax, Enterprise</b>	Copy to come.
<b>Non-allocated Tax, Enterprise</b>	Copy to come.
<b>Giro</b>	This field shows the giro number assigned to the pay-to vendor.
<b>Bank Acct. No.</b>	This field shows the bank account number assigned to the pay-to vendor.
<b>Reg. No.</b>	This field shows the registration number assigned to the pay-to vendor.
<b>Credit Card No.</b>	This field shows the credit card number assigned to the pay-to vendor.
<b>CPC No.</b>	This field shows the CPC number assigned to the pay-to vendor.
<b>Amount Excl. Tax, Base</b>	This field displays the base amount excluding tax.
<b>Amount Excl. Tax, Enterprise</b>	This field displays the enterprise amount excluding tax.
<b>Reopened</b>	This field shows whether the job was reopened.

Field	Description
<b>Job Balancing Exchange Rate Variance, Enterprise</b>	Copy to come.
<b>Open Job Balancing Exchange Rate Variance, Enterprise</b>	Copy to come.
<b>Credit Memo Reference</b>	This field is the invoice number of the invoice to reconcile a credit memo against.
<b>Journal No. Reference</b>	This field is the journal number of the invoice to reconcile a credit memo against.
<b>Journal Line No. Reference</b>	This field is the line number of the entry in the journal of the invoice to reconcile a credit memo against.
<b>Approval Group, Instance Key</b>	This field shows the current approval group's unique identity in the Maconomy database.
<b>Submitted</b>	A check mark in this field shows if the invoice allocation on the job has been submitted.
<b>Approved by</b>	This field shows the name of the project manager who assigned the current approval status (shown in the Approval, Project Manager field) to the current expense sheet line.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Purchase Transaction Type</b>	This field indicates the type of purchase the line represents. The available values are: <ul style="list-style-type: none"> <li>Fixed Asset</li> <li>Inventory</li> <li>Job Cost</li> <li>G/L</li> <li>Text Line</li> <li>Subcontractor Reconciliation</li> </ul>
<b>Enterprise</b>	This field specifies an enterprise for the purchase order.
<b>Segment</b>	This field specifies a segment for the purchase order.

Field	Description
<b>Area</b>	This field specifies an area for the purchase order.
<b>Self Invoice</b>	This field specifies whether the purchase order is a self-invoice.
<b>Spec. 4-10</b>	These fields show the specifications assigned to the current line.
<b>Local Spec. 4-10</b>	These fields show the local specifications assigned to the current line.
<b>Time Unit</b>	This field displays the time unit used for filing time (either hours or days).
<b>Job Name</b>	This field shows the job name.
<b>Project Manager Number</b>	This field shows the employee number of the project manager who can approve and reject lines on the current job.
<b>Project Manager</b>	This field shows the name and number of the project manager.
<b>Customer Number</b>	This field displays the customer number.
<b>Customer</b>	This field shows the customer selected on the job.

## Actions

This section shows the Actions available in the Approve Vendor Invoices by Employee workspace.

### Table Part

Field	Description
<b>Mark All For Approval</b>	Use this action to mark all approval object lines in the sub-tab for approval. This means the status in the <b>New Approval Status</b> field is set to Approved on all lines.
<b>Mark All For Release</b>	<p>Use this action to mark all approval object lines in the sub-tab for release. This means the status in the <b>New Approval Status</b> field is set to Released on all lines.</p> <p>This action can only be used if the <b>Trans. Non-Appr. Time Sheets</b> field is enabled in the System Information workspace, and the current user has access to transferring expense sheets as specified in the Actions workspace. The employee specified as the project manager for the current job, however, always has the right to release time sheets for the employee in question.</p>

Field	Description
<b>Mark All For Rejection</b>	Use this action to mark all approval object lines in the sub-tab for rejection. This means the status in the <b>New Approval Status</b> field is set to Rejected on all lines.
<b>Unmark All</b>	Use this action to unmark all approval object lines in the sub-tab for approval. This means the <b>Approve</b> check box is deselected for all entries in the sub-tab.
<b>Execute Approval</b>	Use this action to put into effect all statuses indicated in the <b>New Approval Status</b> field for all lines. If any approval object lines are thus fully approved or released (for example, the expense sheet from which the approval object line originates was already approved or released by the supervisor), the lines in question are transferred to a registration journal which can then be posted. The <b>Approval Status</b> field is automatically updated with the value shown in the <b>New Approval Status</b> field.
<b>Approve All</b>	Use this action to approve all the lines pending approval that are listed in the sub-tab.
<b>Reset All</b>	Use this action to reset all the lines pending approval that are listed in the sub-tab.

## Approve Employees by Employee Workspace

Use up to 35 words to describe this conceptual topic. Write complete sentences.

### Approve Employees by Employee Tab

This section includes the fields and descriptions for the Approve Employees by Employee tab.

#### Employee Information island

Field	Description
<b>Current Employee No.</b>	This field shows the employee number for the currently logged in user.
<b>Employee No.</b>	This field shows the number of the employee designated as approver of all lines submitted for approval. By default, this field displays the same value as the <b>Current Employee No.</b> field.
<b>Employee Type</b>	This field shows the selected employee's employee type.
<b>Show Lines For Approval</b>	Select this check box to show items available for approval. This is enabled by default.
<b>Show Non-Active Lines</b>	Select this check box to show approval items that are not yet active.

Field	Description
<b>Show Rejected Lines</b>	Select this check box to show rejected approval items.
<b>Show Substitute Lines</b>	Select this check box to show the approval items for which you are a substitute approver.
<b>Show Super Approver Lines</b>	Select this check box to show approval items for which you are a super approver.
<b>Show Approvable by All Approval Lines</b>	Select this check box to view all approval items that can be approved by any user.
<b>Overwrite existing</b>	<p>If existing information is already available in the <b>Approval Status</b> or <b>Remark</b> fields in the sub-tab, select one or both of the following check boxes to enable the system to overwrite it:</p> <ul style="list-style-type: none"> <li>Approval Status</li> <li>Remark</li> </ul>
<b>Remark</b>	Enter a remark regarding the specified approval object line.

### Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number to which the current line is associated.
<b>Level</b>	This field shows the level of the approval hierarchy that the approval object lines relate to, and thus the order in which they are to be approved. This field only applies if the <b>Level Prioritized</b> check box is selected in the tab of the related approval hierarchy.
<b>Effective</b>	This field shows whether or not the actual approvals are marked as effective. In-effective approval headers and lines show the history.
<b>Active</b>	This field shows whether or not the approval object is currently active.
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the <b>New Approval Status</b> field is transferred to this field when you use the <b>Execute Approval</b> action. This field cannot be changed manually.
<b>New Approval Status</b>	<p>Select the status you wish to assign to the current approval object line when you use the <b>Execute Approval</b> action.</p> <p>The following statuses are available:</p>

Field	Description
	<ul style="list-style-type: none"> <li>Blank</li> <li>Approved</li> <li>Rejected</li> <li>Released</li> </ul>
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.
<b>Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field shows the time that the current line was approved.
<b>Approver</b>	This field show the employee name and number of the designated approver who approved the approval object.
<b>Substitute</b>	This field shows the employee name and number of the designated substitute approver who approved the approval object.
<b>Super Approver</b>	This field shows the employee name and number of the designated super approver who approved the approval object.
<b>Approver Name</b>	Enter or select the name of the designated approver who can approve the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Name</b>	Enter or select the name of the designated substitute approver who can approve the approval object.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Super Approver Name</b>	Enter or select the name of the designated super approver who can approve the approval object.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Approver</b>	This field shows the employee number of the employee who approved the current approval object.

Field	Description
<b>Approver Employee Type</b>	This field shows the designated employee type that can approve approval objects. Any approval object, such as time sheet lines, falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute</b>	This field shows the name of the designated substitute approver who approved the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Approver Reference, Field</b>	This field shows the internal field name that the Approver Reference relates to.
<b>Approver Reference, Employee</b>	This field shows the employee reference of the Approver.
<b>Substitute Reference, Relation</b>	This field shows the relation of a substitute approver reference if one has been specified on the approval task.
<b>Substitute Reference, Field</b>	This field shows the field reference of a substitute approver if one has been specified on the approval task.
<b>Substitute Reference, Employee</b>	This field shows the employee reference of the substitute approver if one has been specified on the approval task.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Super Approver</b>	This field shows the name of the designated super approver who approved the approval object.
<b>Super Approver Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects.

Field	Description
	Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Super Approver Reference, Relation</b>	This field shows the relation of a super approver reference if one has been specified on the approval task.
<b>Super Approver Reference, Field</b>	This field shows the field reference of a super approver if one has been specified on the approval task.
<b>Super Approver Reference, Employee</b>	This field shows the employee reference of a super approver if one has been specified on the approval task.
<b>Current Approval Status Details</b>	This field shows details regarding the latest approval status of the current line.
<b>Current Approval Status</b>	This field shows the latest approval status of the current line.
<b>Last Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the last user who completed the action for the associated approval object.
<b>Last Approval or Rejection Date</b>	If the approval object has been approved, this field shows the latest date on which the current line was approved.
<b>Last Approval or Rejection Time</b>	If the approval object has been approved, this field shows the latest time when the current line was approved.
<b>Last Approval or Rejection Comment</b>	If the approval object has been approved or rejected, this field shows the latest comment for the associated approval object.
<b>Line Can Be Approved by Current User</b>	This field shows whether the current line can be approved by the current user.
<b>Current Status</b>	This field shows the latest status of the current line.
<b>Submitted By</b>	This field shows the name of the user who submitted the current line.
<b>Date Submitted</b>	This field shows the date the current line was submitted.

Field	Description
<b>Time Submitted</b>	This field shows the time the current line was submitted.
<b>Journal Type</b>	The journal type. You cannot delete or rename this.
<b>Journal No.</b>	The number of the journal to which the entry was posted.
<b>Line No.</b>	The number of the allocation line in the current invoice.
<b>Type</b>	This field shows whether the information in the window is for an invoice ("Credit") or a credit memo ("Debit").
<b>Vendor No.</b>	This field shows the number of the vendor to which the employee is associated.
<b>Pay to Vendor No.</b>	The number of the vendor who is to receive payment for the vendor invoice.
<b>Entry Date</b>	This is the entry date registered on the invoice.
<b>Invoice Date</b>	The entry's invoice date from the vendor.
<b>Due Date</b>	The due date of the invoice.
<b>Trans. No.</b>	The transaction number of the invoice.
<b>Invoice No.</b>	The invoice number of the vendor invoice
<b>Std. Description</b>	This field shows the standard text.
<b>Description</b>	The description of the entry that is manually added when registration of the entry takes place.
<b>Amount Incl. Tax Base</b>	This is the base amount inclusive tax registered on the vendor invoice.
<b>Currency</b>	The currency of the invoice.
<b>Amount Incl. Tax, Currency</b>	This is the invoice amount in the currency of the invoice. If the invoice is subject to tax, you must enter the full amount, including tax, and also specify the relevant G/L tax code in the Tax Code field.
<b>Tax Amount, Currency</b>	This field shows the tax amount.

Field	Description
<b>Tax Code 1</b>	This field shows the G/L tax code, if any, used on the entry.
<b>Responsible</b>	This field shows the name of the person responsible for the job.
<b>Location</b>	This field shows the location dimension value which is assigned to the approval line.
<b>Entity</b>	This field shows the entity dimension value which is assigned to the approval line.
<b>Project</b>	This field shows the project dimension value which is assigned to the approval line.
<b>Allocation Started</b>	This field indicates whether Allocation lines have been created, but have not yet been submitted or fully allocated.
<b>Released for Posting</b>	This field shows whether the invoice allocation has been approved for posting. If this field is marked, the invoice journal has been approved for posting.
<b>Tax Amount, Base</b>	This is the tax amount on the amount in the "Price, Base," expressed into the base currency. The amount cannot be changed here.
<b>Purch. Order No.</b>	This field shows the purchase order number.
<b>Payment Mode</b>	The method used to pay the vendor.
<b>Payer Identification</b>	The vendor invoice's payer identification. It is used by Maconomy to create payment files for electronic payment of vendors.
<b>For Inventory Purch.</b>	When creating a vendor invoice, you can mark this field if you want Maconomy to make a purchase transaction when the invoice is posted. If the field "For Inventory Purch." in the window System Information is marked, Maconomy will automatically mark this field. If this field is marked, Maconomy automatically creates an allocation line in the table part of the window Invoice Allocation for the full invoice amount. This means that when the invoice is posted, a purchase transaction is created for the amount in the field "Inventory Amount." Purchase transactions are shown in the Invoice Reconciliation window and are used for balancing item receipts from the Item Purchase Orders and A/P modules against vendor invoices. You must thus create a purchase transaction if the invoice is for items to your warehouse and are received in the Item Receipt or Purchase Receipt window.
<b>Packing Slip No.</b>	This field shows the number of the delivery note which accompanied the delivery. You must enter a value for reference.

Field	Description
	If the receipt includes any items, the delivery note number is printed on the item transaction created when you use the <b>Approve Receipt</b> action.
<b>Name</b>	This field shows the name of the vendor entered in the above Vendor No. field.
<b>Allocation Code</b>	<p>In this field, you can enter an allocation code. You can use the allocation codes created in the Allocation Codes window in the G/L module. Allocation codes are used for easing registration of standard entries.</p> <p>When you enter an allocation code and press Return, Maconomy will automatically create the number of allocation lines that the code specifies, and this field is subsequently blanked. In this way, specifying an allocation code in this field corresponds to creating an invoice allocation line in the Invoice Allocation window. However, the allocation lines that are created are not shown in this window, but can be inspected and edited in the table part of the Invoice Allocation window. In this connection, you should use allocation codes with positive percentages.</p> <p>If you do not enter an allocation code in this field, and a standard allocation code has been specified in the information card of the vendor for whom the invoice is created, the standard allocation code of the vendor is automatically transferred to the vendor invoice, and allocation lines are created in the same way as if you had manually specified an allocation code.</p>
<b>Exchange Rate</b>	The exchange rate used when the invoice was posted.
<b>Fixed Exchange Rate at Payment</b>	If this field is marked, the exchange rate in which the entry is posted will be fixed when the payment is posted, even though the exchange rate may have changed according to the current exchange rate table.
<b>Allocated by</b>	Copy to come.
<b>Payment Description</b>	This field shows the code for the goods or services covered by the vendor invoice if the vendor invoice concerns import.
<b>Card Type Code</b>	The vendor invoice card type code used by Maconomy to create payment files for the electronic payment of vendors.
<b>Import Date</b>	The date on which the goods or services covered by the vendor invoice were imported. Maconomy uses the import date in the creation of payment files for electronic payment of vendors. These payment files are created in the window Payment Files in the Banking module.
<b>Company Tax Code</b>	This field shows the company's tax code.

Field	Description
<b>Registration Code</b>	This field shows a registration code from the window Registration Codes in the G/L module.
<b>Purpose</b>	This is the purpose entered for the invoice or credit memo.
<b>Spec.1-3</b>	The specification 1-3 entered for the invoice or credit memo.
<b>Local Spec. 1-3</b>	The specification 1-3 entered for the invoice or credit memo.
<b>Company No</b>	This field shows the number of the company responsible for the current job.
<b>Disclosable</b>	This field shows whether the vendor registered on the invoice has been marked as disclosable.
<b>Cash Discount Date</b>	This field displays a cash discount date, if any, assigned to the current vendor entry. The date displayed in this field is thus the latest date on which payment should take place if cash discount is to be granted for the current vendor invoice.
<b>Job No.</b>	If a job number was specified on the original vendor invoice, this field shows the job number in question. It also shows the name of the specified job.
<b>Allocation Account</b>	This field shows the number of the account on which allocation entries should be posted.
<b>Date Posted</b>	The date the entry was posted to the accounts payable and general ledger.
<b>Posted</b>	This field shows whether or not the journal is posted.
<b>Entry Line No.</b>	Copy to come.
<b>Reallocation Date</b>	This is the reallocation date registered on the invoice.
<b>Amt. for Realloc., Currency</b>	Copy to come.
<b>Tax for Realloc., Currency</b>	Copy to come.
<b>Amt. for Realloc., Base</b>	Copy to come.

Field	Description
<b>Tax for Realloc., Base</b>	Copy to come.
<b>Amt. for Realloc., Enterprise</b>	Copy to come.
<b>Tax for Realloc., Enterprise</b>	Copy to come.
<b>Journal No., Reallocation</b>	Copy to come.
<b>Journal Line No., Reallocation</b>	Copy to come.
<b>Copy from vendor no.</b>	<p>In this field, you can enter a vendor number to be used for identifying a vendor invoice to be copied to the new vendor invoice. If you fill in this field, you must also enter an invoice number in the field "Copy From Invoice No." on the line.</p> <p>If you want to copy the information from one invoice to a new invoice, you enter a new transaction number and a new invoice number on the line, fill in this field and the field "Copy From Invoice No," and press Return, and Maconomy copies the vendor invoice specified including any assigned allocation lines. However, these lines cannot be inspected in this window, but are displayed in the Invoice Allocation window. Fields filled in by the user on the new invoice are not affected by the copying.</p> <p>Entering a vendor number in this field can also be used for reversing the effect of an already posted invoice. See the description of the field "Reverse At Copying" for further information on the functionality of copying and reversing vendor entries.</p>
<b>Copy from invoice no.</b>	<p>In this field, you can enter an invoice number to be used for identifying a vendor invoice to be copied to the new vendor invoice. If you fill in this field, you must also enter a vendor number in the field "Copy From Vendor No." on the line. As the functionality of this field is similar to that of the field "Copy From Vendor No.," you should see the description of that field for further information.</p>
<b>Copy from journal no.</b>	<p>In this field, you can enter a journal number to be used for identifying a vendor invoice to be copied to the new vendor invoice. You can fill in this field, if you do not know either the vendor number or the invoice number of the invoice that you want to copy. If you fill in this field, you must also enter a journal line number in the field "Copy From Journal Line No." on the line. As the functionality of this field is similar to that of the field "Copy From Vendor No.," you should see the description of that field for further information.</p>

Field	Description
<b>Copy from journal line no.</b>	In this field, you can enter a journal line number to be used for identifying a vendor invoice to be copied to the new vendor invoice. You can fill in this field if you do not know either the vendor number or the invoice number of the invoice that you want to copy. If you fill in this field, you must also enter a journal number in the field "Copy From Journal No." on the line. As the functionality of this field is similar to that of the field "Copy from vendor No.," you should see the description of that field for further information.
<b>Reverse at Copying</b>	In this field, you can choose whether the new vendor invoice should reverse an existing invoice at copying. If you mark this field, the new entry is assigned the opposite value in the field "Debit/Credit" as the existing entry; that is, if the original entry is a credit entry (a vendor invoice), the new entry will be a debit entry (a credit memo). In this way, the new entry reverses the effect of the existing entry. If the invoice or credit memo being copied has not already been reconciled, it is automatically reconciled against the new invoice or credit memo. To avoid exchange rate differences when copying, mark the field "Use Original Exchange Rate" below.
<b>Document Archive No.</b>	This field shows the document archive number assigned to the job.
<b>File Name</b>	Copy to come.
<b>Responsible for Allocation</b>	In this field, you can enter the name of the person to be responsible for the allocation of the invoice. The field is for information only.
<b>Attn.</b>	This field shows the customer's attention person.
<b>Remarks 1-5</b>	These fields show any notes or comments regarding the employee.
<b>Non-allocated Excl. Tax, Currency</b>	Copy to come.
<b>Non-allocated Tax, Currency</b>	Copy to come.
<b>Non-allocated Excl. Tax, Base</b>	Copy to come.
<b>Non-allocated Tax, Base</b>	Copy to come.

Field	Description
<b>Status</b>	This field shows the job's current status.
<b>Reference Date</b>	This field shows the entry reference date.
<b>Instance Key</b>	This field shows the current employee's unique identity in the Maconomy database.
<b>Amount Rounding, Base</b>	This is the rounding amount, in base currency. If currency rounding is used (in the Currency Rounding window), then the total interest amount should be rounded up, based on the currency rounding.
<b>Submitted by</b>	This field shows the name of the user who submitted the current line.
<b>Date Submitted</b>	This field shows the date the current line was submitted.
<b>Possible Cash Discount, Currency</b>	In this field, you can view the cash discount which can be gained by paying the vendor invoice by the cash discount date specified above.
<b>Possible Cash Discount %</b>	In this field, you can view the cash discount percentage which can be gained by paying the vendor invoice by the cash discount date specified above.
<b>Intercompany Invoice</b>	This field shows the intercompany invoice.
<b>Name 1-5, Vendor</b>	This is the name and address of the vendor.
<b>Zip Code, Vendor</b>	This is the zip code of the vendor.
<b>Postal District, Vendor</b>	This is the postal district of the vendor.
<b>Attention, Vendor</b>	This is the name of the vendor's attention person.
<b>Country, Vendor</b>	This is the vendor's country.
<b>Telephone, Vendor</b>	This is the vendor's telephone number.
<b>Telefax, Vendor</b>	This is the fax number of the vendor.
<b>Telex, Vendor</b>	This is the telex number of the vendor.
<b>Giro, Vendor</b>	This field shows the giro number entered on the vendor invoice. The information is for reference.

Field	Description
<b>E-mail, Vendor</b>	This field shows the vendor's email address.
<b>Global Location No.</b>	<p>If a global location number has been specified on the vendor invoice, you can enter the global location number here. Global location numbers are used in electronic invoices, and there this field will typically be completed automatically on electronically read vendor invoices.</p> <p>Global location numbers are set up in the Company Locations window in the G/L module and indicate the company, department, warehouse, or other entity to receive the invoice. For further information about the concept of global location numbers, see the introduction to the Company Locations window in the G/L module.</p> <p>When a global location number is specified, any registration code and allocation responsible specified for the global location number are transferred to the invoice as if they were entered manually.</p>
<b>Settling Company No.</b>	This field shows the name of the settling company that applies to the current job.
<b>Use Original Exchange Rate</b>	<p>If you are reversing an existing vendor invoice, you can mark this field to use the same exchange rate as was used for the original vendor invoice. If you do this, there will be no exchange rate differences when you reverse the vendor invoice, unless the original currency has moved in relation to the enterprise currency. If this is the case, the difference must be handled at the time of posting.</p> <p>The vendor invoices can be inspected in the Show Vendor Invoices window.</p>
<b>Pay when Paid</b>	<p>This field shows whether payment when paid functionality applies to the current vendor invoice. Maconomy suggests the value from the corresponding field on the payment term selected for the current invoice. The field can only be marked if the system parameter "Enable Payment when Paid" has been marked.</p> <p>Payment when paid functionality is used in the Banking module to ensure that vendor invoices are not paid until they are allocated, and that vendor invoices allocated to jobs are not paid until you have received payment from the customer of the job in question.</p> <p>The value in this field does not have any effect on the vendor invoice itself, but the value here is suggested in the corresponding field on the vendor entries created as a result of posting the invoice. This means that in the window Change Payment Selection by Vendor, you can change the value for the individual vendor invoices resulting from the allocation of the invoice. Therefore, the effects of the field are described in the section about the field "Pay when Paid" in the window Payment Selection by Vendor.</p>

Field	Description
<b>Amount Rounding, Enterprise</b>	This shows the rounding amount, in enterprise currency if currency rounding is used (in the Currency Rounding window).
<b>Job Exchange Rate Variance, Base</b>	Copy to come.
<b>Job Exchange Rate Variance, Enterprise</b>	Copy to come.
<b>Open Job Exchange Rate Variance, Base</b>	Copy to come.
<b>Tax For Realloc., Spec. Entry Key</b>	Copy to come.
<b>Non-allocation Tax, Spec. Entry Key</b>	Copy to come.
<b>Tax Code 1-3</b>	This field displays the tax code for the expense registered on the line.
<b>Tax Amount 1-3, Currency</b>	This field shows the tax amount for the current request for quote line.
<b>Tax Amount 1-3, Base</b>	This field shows the tax amount for the current request for quote line.
<b>Transaction Type</b>	This field shows the transaction type of the entry.
<b>Amount Excl. Tax, Currency</b>	This field shows the price less tax of the allocation line in the currency of the vendor invoice
<b>Amount Incl. Tax, Enterprise</b>	Copy to come.
<b>Tax Amount, Enterprise</b>	Copy to come.
<b>Tax Spec. Entry Key</b>	Copy to come.

Field	Description
<b>Non-allocated Excl. Tax, Enterprise</b>	Copy to come.
<b>Non-allocated Tax, Enterprise</b>	Copy to come.
<b>Giro</b>	This field shows the giro number assigned to the pay-to vendor.
<b>Bank Acct. No.</b>	This field shows the bank account number assigned to the pay-to vendor.
<b>Reg. No.</b>	This field shows the registration number assigned to the pay-to vendor.
<b>Credit Card No.</b>	This field shows the credit card number assigned to the pay-to vendor.
<b>CPC No.</b>	This field shows the CPC number assigned to the pay-to vendor.
<b>Amount Excl. Tax, Base</b>	This field displays the base amount excluding tax.
<b>Amount Excl. Tax, Enterprise</b>	This field displays the enterprise amount excluding tax.
<b>Reopened</b>	This field shows whether the job was reopened.
<b>Job Balancing Exchange Rate Variance, Enterprise</b>	Copy to come.
<b>Open Job Balancing Exchange Rate Variance, Enterprise</b>	Copy to come.
<b>Credit Memo Reference</b>	This field is the invoice number of the invoice to reconcile a credit memo against.
<b>Journal No. Reference</b>	This field is the journal number of the invoice to reconcile a credit memo against.
<b>Journal Line No. Reference</b>	This field is the line number of the entry in the journal of the invoice to reconcile a credit memo against.

Field	Description
<b>Approval Group, Instance Key</b>	This field shows the current approval group's unique identity in the Maconomy database.
<b>Submitted</b>	A check mark in this field shows if the invoice allocation on the job has been submitted.
<b>Approved by</b>	This field shows the name of the project manager who assigned the current approval status (shown in the Approval, Project Manager field) to the current expense sheet line.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Purchase Transaction Type</b>	<p>This field indicates the type of purchase the line represents. The available values are:</p> <ul style="list-style-type: none"> <li>■ Fixed Asset</li> <li>■ Inventory</li> <li>■ Job Cost</li> <li>■ G/L</li> <li>■ Text Line</li> <li>■ Subcontractor Reconciliation</li> </ul>
<b>Enterprise</b>	This field specifies an enterprise for the purchase order.
<b>Segment</b>	This field specifies a segment for the purchase order.
<b>Area</b>	This field specifies an area for the purchase order.
<b>Self Invoice</b>	This field specifies whether the purchase order is a self-invoice.
<b>Spec. 4-10</b>	These fields show the specifications assigned to the current line.
<b>Local Spec. 4-10</b>	These fields show the local specifications assigned to the current line.
<b>Time Unit</b>	This field displays the time unit used for filing time (either hours or days).
<b>Job Name</b>	This field shows the job name.
<b>Project Manager Number</b>	This field shows the employee number of the project manager who can approve and reject lines on the current job.

Field	Description
<b>Project Manager</b>	This field shows the name and number of the project manager.
<b>Customer Number</b>	This field displays the customer number.
<b>Customer</b>	This field shows the customer selected on the job.

## Actions

This section shows the Actions available in the Approve Employees by Employee workspace.

### Table Part

Field	Description
<b>Mark All For Approval</b>	Use this action to mark all approval object lines in the sub-tab for approval. This means the status in the <b>New Approval Status</b> field is set to Approved on all lines.
<b>Mark All For Release</b>	Use this action to mark all approval object lines in the sub-tab for release. This means the status in the <b>New Approval Status</b> field is set to Released on all lines.  This action can only be used if the <b>Trans. Non-Appr. Time Sheets</b> field is enabled in the System Information workspace, and the current user has access to transferring expense sheets as specified in the Actions workspace. The employee specified as the project manager for the current job, however, always has the right to release time sheets for the employee in question.
<b>Mark All For Rejection</b>	Use this action to mark all approval object lines in the sub-tab for rejection. This means the status in the <b>New Approval Status</b> field is set to Rejected on all lines.
<b>Unmark All</b>	Use this action to unmark all approval object lines in the sub-tab for approval. This means the <b>Approve</b> check box is deselected for all entries in the sub-tab.
<b>Execute Approval</b>	Use this action to put into effect all statuses indicated in the <b>New Approval Status</b> field for all lines. If any approval object lines are thus fully approved or released (for example, the expense sheet from which the approval object line originates was already approved or released by the supervisor), the lines in question are transferred to a registration journal which can then be posted. The <b>Approval Status</b> field is automatically updated with the value shown in the <b>New Approval Status</b> field.
<b>Approve All</b>	Use this action to approve all the lines pending approval that are listed in the sub-tab.
<b>Reset All</b>	Use this action to reset all the lines pending approval that are listed in the sub-tab.

## Approve Jobs by Employee Workspace

Use up to 35 words to describe this conceptual topic. Write complete sentences.

Copy to come.

Approve Jobs by Employee Tab

This section includes the fields and descriptions for the Approve Jobs by Employee tab.

### Employee Information island

Field	Description
<b>Current Employee No.</b>	This field shows the employee number for the currently logged in user.
<b>Employee No.</b>	This field shows the number of the employee designated as approver of all lines submitted for approval. By default, this field displays the same value as the <b>Current Employee No.</b> field.
<b>Employee Type</b>	This field shows the selected employee's employee type.
<b>Job No.</b>	Enter or select a job number to show only lines relevant to the specified job in the sub-tab.
<b>Show Lines For Approval</b>	Select this check box to show items available for approval. This is enabled by default.
<b>Show Non-Active Lines</b>	Select this check box to show approval items that are not yet active.
<b>Show Rejected Lines</b>	Select this check box to show rejected approval items.
<b>Show Substitute Lines</b>	Select this check box to show the approval items for which you are a substitute approver.
<b>Show Super Approver Lines</b>	Select this check box to show approval items for which you are a super approver.
<b>Show Approvable by All Approval Lines</b>	Select this check box to view all approval items that can be approved by any user.
<b>Overwrite existing</b>	<p>If existing information is already available in the <b>Approval Status</b> or <b>Remark</b> fields in the sub-tab, select one or both of the following check boxes to enable the system to overwrite it:</p> <ul style="list-style-type: none"> <li>Approval Status</li> <li>Remark</li> </ul>

Field	Description
<b>Remark</b>	Enter a remark regarding the specified approval object line.

### Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number to which the current line is associated.
<b>Level</b>	This field shows the level of the approval hierarchy that the approval object lines relate to, and thus the order in which they are to be approved. This field only applies if the <b>Level Prioritized</b> check box is selected in the tab of the related approval hierarchy.
<b>Effective</b>	This field shows whether or not the actual approvals are marked as effective. In-effective approval headers and lines show the history.
<b>Active</b>	This field shows whether or not the approval object is currently active.
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the <b>New Approval Status</b> field is transferred to this field when you use the <b>Execute Approval</b> action. This field cannot be changed manually.
<b>New Approval Status</b>	Select the status you wish to assign to the current approval object line when you use the <b>Execute Approval</b> action. The following statuses are available: <ul style="list-style-type: none"> <li>Blank</li> <li>Approved</li> <li>Rejected</li> <li>Released</li> </ul>
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.
<b>Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.

Field	Description
<b>Approval Time</b>	If the approval object has been approved, this field shows the time that the current line was approved.
<b>Approver</b>	This field show the employee name and number of the designated approver who approved the approval object.
<b>Substitute</b>	This field shows the employee name and number of the designated substitute approver who approved the approval object.
<b>Super Approver</b>	This field shows the employee name and number of the designated super approver who approved the approval object.
<b>Approver Name</b>	Enter or select the name of the designated approver who can approve the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Name</b>	Enter or select the name of the designated substitute approver who can approve the approval object.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Super Approver Name</b>	Enter or select the name of the designated super approver who can approve the approval object.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Approver</b>	This field shows the employee number of the employee who approved the current approval object.
<b>Approver Employee Type</b>	This field shows the designated employee type that can approve approval objects. Any approval object, such as time sheet lines, falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute</b>	This field shows the name of the designated substitute approver who approved the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.

Field	Description
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Approver Reference, Field</b>	This field shows the internal field name that the Approver Reference relates to.
<b>Approver Reference, Employee</b>	This field shows the employee reference of the Approver.
<b>Substitute Reference, Relation</b>	This field shows the relation of a substitute approver reference if one has been specified on the approval task.
<b>Substitute Reference, Field</b>	This field shows the field reference of a substitute approver if one has been specified on the approval task.
<b>Substitute Reference, Employee</b>	This field shows the employee reference of the substitute approver if one has been specified on the approval task.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Super Approver</b>	This field shows the name of the designated super approver who approved the approval object.
<b>Super Approver Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Super Approver Reference, Relation</b>	This field shows the relation of a super approver reference if one has been specified on the approval task.
<b>Super Approver Reference, Field</b>	This field shows the field reference of a super approver if one has been specified on the approval task.
<b>Super Approver Reference, Employee</b>	This field shows the employee reference of a super approver if one has been specified on the approval task.
<b>Current Approval Status Details</b>	This field shows details regarding the latest approval status of the current line.

Field	Description
<b>Current Approval Status</b>	This field shows the latest approval status of the current line.
<b>Last Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the last user who completed the action for the associated approval object.
<b>Last Approval or Rejection Date</b>	If the approval object has been approved, this field shows the latest date on which the current line was approved.
<b>Last Approval or Rejection Time</b>	If the approval object has been approved, this field shows the latest time when the current line was approved.
<b>Last Approval or Rejection Comment</b>	If the approval object has been approved or rejected, this field shows the latest comment for the associated approval object.
<b>Line Can Be Approved by Current User</b>	This field shows whether the current line can be approved by the current user.
<b>Current Status</b>	This field shows the latest status of the current line.
<b>Submitted By</b>	This field shows the name of the user who submitted the current line.
<b>Date Submitted</b>	This field shows the date the current line was submitted.
<b>Time Submitted</b>	This field shows the time the current line was submitted.
<b>Job No.</b>	This field shows the job number, which is the unique identification of the job.
<b>Job Group</b>	This field shows the job group to which the job is assigned.
<b>Status</b>	This field shows the job's current status.
<b>Responsible</b>	This field shows the name of the person responsible for the job.
<b>Blocked for Time Registrations</b>	This field shows whether the job is blocked for registration.
<b>Description 1-3</b>	These fields show descriptions related to the job.

Field	Description
<b>Customer No.</b>	This field shows the number of the customer associated with the job.
<b>Name 1-5</b>	These fields show the customer's name and address.
<b>Attn.</b>	This field shows the customer's attention person.
<b>Reference</b>	This field shows the name of the customer representative dealing with the order.
<b>Phone</b>	This field shows the customer's phone number.
<b>Fax</b>	This field shows the customer's fax number.
<b>Telex</b>	This field shows the customer's telex number.
<b>Currency</b>	The currency of the invoice.
<b>Amount Incl. Tax, Currency</b>	This is the invoice amount in the currency of the invoice. If the invoice is subject to tax, you must enter the full amount, including tax, and also specify the relevant G/L tax code in the Tax Code field.
<b>Tax Amount, Currency</b>	This field shows the tax amount.
<b>Tax Code 1</b>	This field shows the G/L tax code, if any, used on the entry.
<b>Responsible</b>	This field shows the name of the person responsible for the job.
<b>Location</b>	This field shows the location dimension value which is assigned to the approval line.
<b>Entity</b>	This field shows the entity dimension value which is assigned to the approval line.
<b>Project</b>	This field shows the project dimension value which is assigned to the approval line.
<b>Allocation Started</b>	This field indicates whether Allocation lines have been created, but have not yet been submitted or fully allocated.
<b>Released for Posting</b>	This field shows whether the invoice allocation has been approved for posting. If this field is marked, the invoice journal has been approved for posting.
<b>Tax Amount, Base</b>	This is the tax amount on the amount in the "Price, Base," expressed into the base currency. The amount cannot be changed here.

Field	Description
<b>Purch. Order No.</b>	This field shows the purchase order number.
<b>Payment Mode</b>	The method used to pay the vendor.
<b>Payer Identification</b>	The vendor invoice's payer identification. It is used by Maconomy to create payment files for electronic payment of vendors.
<b>For Inventory Purch.</b>	When creating a vendor invoice, you can mark this field if you want Maconomy to make a purchase transaction when the invoice is posted. If the field "For Inventory Purch." in the window System Information is marked, Maconomy will automatically mark this field. If this field is marked, Maconomy automatically creates an allocation line in the table part of the window Invoice Allocation for the full invoice amount. This means that when the invoice is posted, a purchase transaction is created for the amount in the field "Inventory Amount." Purchase transactions are shown in the Invoice Reconciliation window and are used for balancing item receipts from the Item Purchase Orders and A/P modules against vendor invoices. You must thus create a purchase transaction if the invoice is for items to your warehouse and are received in the Item Receipt or Purchase Receipt window.
<b>Packing Slip No.</b>	This field shows the number of the delivery note which accompanied the delivery. You must enter a value for reference.  If the receipt includes any items, the delivery note number is printed on the item transaction created when you use the <b>Approve Receipt</b> action.
<b>Name</b>	This field shows the name of the vendor entered in the above Vendor No. field.
<b>Allocation Code</b>	In this field, you can enter an allocation code. You can use the allocation codes created in the Allocation Codes window in the G/L module. Allocation codes are used for easing registration of standard entries.  When you enter an allocation code and press Return, Maconomy will automatically create the number of allocation lines that the code specifies, and this field is subsequently blanked. In this way, specifying an allocation code in this field corresponds to creating an invoice allocation line in the Invoice Allocation window. However, the allocation lines that are created are not shown in this window, but can be inspected and edited in the table part of the Invoice Allocation window. In this connection, you should use allocation codes with positive percentages.  If you do not enter an allocation code in this field, and a standard allocation code has been specified in the information card of the vendor for whom the invoice is created, the standard allocation code of the vendor is automatically transferred to the vendor invoice, and

Field	Description
	allocation lines are created in the same way as if you had manually specified an allocation code.
<b>Exchange Rate</b>	The exchange rate used when the invoice was posted.
<b>Fixed Exchange Rate at Payment</b>	If this field is marked, the exchange rate in which the entry is posted will be fixed when the payment is posted, even though the exchange rate may have changed according to the current exchange rate table.
<b>Allocated by</b>	Copy to come.
<b>Payment Description</b>	This field shows the code for the goods or services covered by the vendor invoice if the vendor invoice concerns import.
<b>Card Type Code</b>	The vendor invoice card type code used by Maconomy to create payment files for the electronic payment of vendors.
<b>Import Date</b>	The date on which the goods or services covered by the vendor invoice were imported. Maconomy uses the import date in the creation of payment files for electronic payment of vendors. These payment files are created in the window Payment Files in the Banking module.
<b>Company Tax Code</b>	This field shows the company's tax code.
<b>Registration Code</b>	This field shows a registration code from the window Registration Codes in the G/L module.
<b>Purpose</b>	This is the purpose entered for the invoice or credit memo.
<b>Spec.1-3</b>	The specification 1-3 entered for the invoice or credit memo.
<b>Local Spec. 1-3</b>	The specification 1-3 entered for the invoice or credit memo.
<b>Company No</b>	This field shows the number of the company responsible for the current job.
<b>Disclosable</b>	This field shows whether the vendor registered on the invoice has been marked as disclosable.
<b>Cash Discount Date</b>	This field displays a cash discount date, if any, assigned to the current vendor entry. The date displayed in this field is thus the latest date on which payment should take place if cash discount is to be granted for the current vendor invoice.
<b>Job No.</b>	If a job number was specified on the original vendor invoice, this field shows the job number in question. It also shows the name of the specified job.

Field	Description
<b>Allocation Account</b>	This field shows the number of the account on which allocation entries should be posted.
<b>Date Posted</b>	The date the entry was posted to the accounts payable and general ledger.
<b>Posted</b>	This field shows whether or not the journal is posted.
<b>Entry Line No.</b>	Copy to come.
<b>Reallocation Date</b>	This is the reallocation date registered on the invoice.
<b>Amt. for Realloc., Currency</b>	Copy to come.
<b>Tax for Realloc., Currency</b>	Copy to come.
<b>Amt. for Realloc., Base</b>	Copy to come.
<b>Tax for Realloc., Base</b>	Copy to come.
<b>Amt. for Realloc., Enterprise</b>	Copy to come.
<b>Tax for Realloc., Enterprise</b>	Copy to come.
<b>Journal No., Reallocation</b>	Copy to come.
<b>Journal Line No., Reallocation</b>	Copy to come.
<b>Copy from vendor no.</b>	<p>In this field, you can enter a vendor number to be used for identifying a vendor invoice to be copied to the new vendor invoice. If you fill in this field, you must also enter an invoice number in the field "Copy From Invoice No." on the line.</p> <p>If you want to copy the information from one invoice to a new invoice, you enter a new transaction number and a new invoice number on the line, fill in this field and the field "Copy From Invoice No," and press Return, and Maconomy copies the vendor invoice specified including</p>

Field	Description
	<p>any assigned allocation lines. However, these lines cannot be inspected in this window, but are displayed in the Invoice Allocation window. Fields filled in by the user on the new invoice are not affected by the copying.</p> <p>Entering a vendor number in this field can also be used for reversing the effect of an already posted invoice. See the description of the field "Reverse At Copying" for further information on the functionality of copying and reversing vendor entries.</p>
<b>Copy from invoice no.</b>	In this field, you can enter an invoice number to be used for identifying a vendor invoice to be copied to the new vendor invoice. If you fill in this field, you must also enter a vendor number in the field "Copy From Vendor No." on the line. As the functionality of this field is similar to that of the field "Copy From Vendor No.," you should see the description of that field for further information.
<b>Copy from journal no.</b>	In this field, you can enter a journal number to be used for identifying a vendor invoice to be copied to the new vendor invoice. You can fill in this field, if you do not know either the vendor number or the invoice number of the invoice that you want to copy. If you fill in this field, you must also enter a journal line number in the field "Copy From Journal Line No." on the line. As the functionality of this field is similar to that of the field "Copy From Vendor No.," you should see the description of that field for further information.
<b>Copy from journal line no.</b>	In this field, you can enter a journal line number to be used for identifying a vendor invoice to be copied to the new vendor invoice. You can fill in this field if you do not know either the vendor number or the invoice number of the invoice that you want to copy. If you fill in this field, you must also enter a journal number in the field "Copy From Journal No." on the line. As the functionality of this field is similar to that of the field "Copy from vendor No.," you should see the description of that field for further information.
<b>Reverse at Copying</b>	In this field, you can choose whether the new vendor invoice should reverse an existing invoice at copying. If you mark this field, the new entry is assigned the opposite value in the field "Debit/Credit" as the existing entry; that is, if the original entry is a credit entry (a vendor invoice), the new entry will be a debit entry (a credit memo). In this way, the new entry reverses the effect of the existing entry. If the invoice or credit memo being copied has not already been reconciled, it is automatically reconciled against the new invoice or credit memo. To avoid exchange rate differences when copying, mark the field "Use Original Exchange Rate" below.
<b>Document Archive No.</b>	This field shows the document archive number assigned to the job.
<b>File Name</b>	Copy to come.

Field	Description
<b>Responsible for Allocation</b>	In this field, you can enter the name of the person to be responsible for the allocation of the invoice. The field is for information only.
<b>Attn.</b>	This field shows the customer's attention person.
<b>Remarks 1-5</b>	These fields show any notes or comments regarding the employee.
<b>Non-allocated Excl. Tax, Currency</b>	Copy to come.
<b>Non-allocated Tax, Currency</b>	Copy to come.
<b>Non-allocated Excl. Tax, Base</b>	Copy to come.
<b>Non-allocated Tax, Base</b>	Copy to come.
<b>Status</b>	This field shows the job's current status.
<b>Reference Date</b>	This field shows the entry reference date.
<b>Instance Key</b>	This field shows the current employee's unique identity in the Maconomy database.
<b>Amount Rounding, Base</b>	This is the rounding amount, in base currency. If currency rounding is used (in the Currency Rounding window), then the total interest amount should be rounded up, based on the currency rounding.
<b>Submitted by</b>	This field shows the name of the user who submitted the current line.
<b>Date Submitted</b>	This field shows the date the current line was submitted.
<b>Possible Cash Discount, Currency</b>	In this field, you can view the cash discount which can be gained by paying the vendor invoice by the cash discount date specified above.
<b>Possible Cash Discount %</b>	In this field, you can view the cash discount percentage which can be gained by paying the vendor invoice by the cash discount date specified above.
<b>Intercompany Invoice</b>	This field shows the intercompany invoice.

Field	Description
<b>Name 1-5, Vendor</b>	This is the name and address of the vendor.
<b>Zip Code, Vendor</b>	This is the zip code of the vendor.
<b>Postal District, Vendor</b>	This is the postal district of the vendor.
<b>Attention, Vendor</b>	This is the name of the vendor's attention person.
<b>Country, Vendor</b>	This is the vendor's country.
<b>Telephone, Vendor</b>	This is the vendor's telephone number.
<b>Telefax, Vendor</b>	This is the fax number of the vendor.
<b>Telex, Vendor</b>	This is the telex number of the vendor.
<b>Giro, Vendor</b>	This field shows the giro number entered on the vendor invoice. The information is for reference.
<b>E-mail, Vendor</b>	This field shows the vendor's email address.
<b>Global Location No.</b>	<p>If a global location number has been specified on the vendor invoice, you can enter the global location number here. Global location numbers are used in electronic invoices, and there this field will typically be completed automatically on electronically read vendor invoices.</p> <p>Global location numbers are set up in the Company Locations window in the G/L module and indicate the company, department, warehouse, or other entity to receive the invoice. For further information about the concept of global location numbers, see the introduction to the Company Locations window in the G/L module.</p> <p>When a global location number is specified, any registration code and allocation responsible specified for the global location number are transferred to the invoice as if they were entered manually.</p>
<b>Settling Company No.</b>	This field shows the name of the settling company that applies to the current job.
<b>Use Original Exchange Rate</b>	If you are reversing an existing vendor invoice, you can mark this field to use the same exchange rate as was used for the original vendor invoice. If you do this, there will be no exchange rate differences when you reverse the vendor invoice, unless the original currency has moved in relation to the enterprise currency. If this is the case, the difference must be handled at the time of posting.

Field	Description
	The vendor invoices can be inspected in the Show Vendor Invoices window.
<b>Pay when Paid</b>	<p>This field shows whether payment when paid functionality applies to the current vendor invoice. Maconomy suggests the value from the corresponding field on the payment term selected for the current invoice. The field can only be marked if the system parameter "Enable Payment when Paid" has been marked.</p> <p>Payment when paid functionality is used in the Banking module to ensure that vendor invoices are not paid until they are allocated, and that vendor invoices allocated to jobs are not paid until you have received payment from the customer of the job in question.</p> <p>The value in this field does not have any effect on the vendor invoice itself, but the value here is suggested in the corresponding field on the vendor entries created as a result of posting the invoice. This means that in the window Change Payment Selection by Vendor, you can change the value for the individual vendor invoices resulting from the allocation of the invoice. Therefore, the effects of the field are described in the section about the field "Pay when Paid" in the window Payment Selection by Vendor.</p>
<b>Amount Rounding, Enterprise</b>	This shows the rounding amount, in enterprise currency if currency rounding is used (in the Currency Rounding window).
<b>Job Exchange Rate Variance, Base</b>	Copy to come.
<b>Job Exchange Rate Variance, Enterprise</b>	Copy to come.
<b>Open Job Exchange Rate Variance, Base</b>	Copy to come.
<b>Tax For Realloc., Spec. Entry Key</b>	Copy to come.
<b>Non-allocation Tax, Spec. Entry Key</b>	Copy to come.
<b>Tax Code 1-3</b>	This field displays the tax code for the expense registered on the line.
<b>Tax Amount 1-3, Currency</b>	This field shows the tax amount for the current request for quote line.

Field	Description
<b>Tax Amount 1-3, Base</b>	This field shows the tax amount for the current request for quote line.
<b>Transaction Type</b>	This field shows the transaction type of the entry.
<b>Amount Excl. Tax, Currency</b>	This field shows the price less tax of the allocation line in the currency of the vendor invoice
<b>Amount Incl. Tax, Enterprise</b>	Copy to come.
<b>Tax Amount, Enterprise</b>	Copy to come.
<b>Tax Spec. Entry Key</b>	Copy to come.
<b>Non-allocated Excl. Tax, Enterprise</b>	Copy to come.
<b>Non-allocated Tax, Enterprise</b>	Copy to come.
<b>Giro</b>	This field shows the giro number assigned to the pay-to vendor.
<b>Bank Acct. No.</b>	This field shows the bank account number assigned to the pay-to vendor.
<b>Reg. No.</b>	This field shows the registration number assigned to the pay-to vendor.
<b>Credit Card No.</b>	This field shows the credit card number assigned to the pay-to vendor.
<b>CPC No.</b>	This field shows the CPC number assigned to the pay-to vendor.
<b>Amount Excl. Tax, Base</b>	This field displays the base amount excluding tax.
<b>Amount Excl. Tax, Enterprise</b>	This field displays the enterprise amount excluding tax.
<b>Reopened</b>	This field shows whether the job was reopened.

Field	Description
<b>Job Balancing Exchange Rate Variance, Enterprise</b>	Copy to come.
<b>Open Job Balancing Exchange Rate Variance, Enterprise</b>	Copy to come.
<b>Credit Memo Reference</b>	This field is the invoice number of the invoice to reconcile a credit memo against.
<b>Journal No. Reference</b>	This field is the journal number of the invoice to reconcile a credit memo against.
<b>Journal Line No. Reference</b>	This field is the line number of the entry in the journal of the invoice to reconcile a credit memo against.
<b>Approval Group, Instance Key</b>	This field shows the current approval group's unique identity in the Maconomy database.
<b>Submitted</b>	A check mark in this field shows if the invoice allocation on the job has been submitted.
<b>Approved by</b>	This field shows the name of the project manager who assigned the current approval status (shown in the Approval, Project Manager field) to the current expense sheet line.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Purchase Transaction Type</b>	This field indicates the type of purchase the line represents. The available values are: <ul style="list-style-type: none"> <li>Fixed Asset</li> <li>Inventory</li> <li>Job Cost</li> <li>G/L</li> <li>Text Line</li> <li>Subcontractor Reconciliation</li> </ul>
<b>Enterprise</b>	This field specifies an enterprise for the purchase order.
<b>Segment</b>	This field specifies a segment for the purchase order.

Field	Description
<b>Area</b>	This field specifies an area for the purchase order.
<b>Self Invoice</b>	This field specifies whether the purchase order is a self-invoice.
<b>Spec. 4-10</b>	These fields show the specifications assigned to the current line.
<b>Local Spec. 4-10</b>	These fields show the local specifications assigned to the current line.
<b>Time Unit</b>	This field displays the time unit used for filing time (either hours or days).
<b>Job Name</b>	This field shows the job name.
<b>Project Manager Number</b>	This field shows the employee number of the project manager who can approve and reject lines on the current job.
<b>Project Manager</b>	This field shows the name and number of the project manager.
<b>Customer Number</b>	This field displays the customer number.
<b>Customer</b>	This field shows the customer selected on the job.

## Actions

Use up to 35 words to describe the screen, tab, or dialog box. Write complete sentences.

## Contents

Field	Description

## Approve Customers by Employee Workspace

Use the Approve Customers by Employee workspace to view information on all relevant approval lines for customers.

This workspace enables you to view information on all relevant approval lines for customers. This enables you to use iAccess to access customer lines that were created in the Workspace Client. You can now approve or reject transactions for which approval hierarchies are set up from within iAccess.

## Approve Customers by Employee Tab

This section includes the fields and descriptions for the Approve Customers by Employee tab.

### Employee Information island

Field	Description
<b>Current Employee No.</b>	This field shows the employee number for the currently logged in user.
<b>Employee No.</b>	This field shows the number of the employee designated as approver of all lines submitted for approval. By default, this field displays the same value as the <b>Current Employee No.</b> field.
<b>Employee Type</b>	This field shows the selected employee's employee type.
<b>Show Lines For Approval</b>	Select this check box to show items available for approval. This is enabled by default.
<b>Show Non-Active Lines</b>	Select this check box to show approval items that are not yet active.
<b>Show Rejected Lines</b>	Select this check box to show rejected approval items.
<b>Show Substitute Lines</b>	Select this check box to show the approval items for which you are a substitute approver.
<b>Show Super Approver Lines</b>	Select this check box to show approval items for which you are a super approver.
<b>Show Approvable by All Approval Lines</b>	Select this check box to view all approval items that can be approved by any user.
<b>Overwrite existing</b>	If existing information is already available in the <b>Approval Status</b> or <b>Remark</b> fields in the sub-tab, select one or both of the following check boxes to enable the system to overwrite it: <ul style="list-style-type: none"><li>■ Approval Status</li><li>■ Remark</li></ul>
<b>Remark</b>	Enter a remark regarding the specified approval object line.

## SD\_SU\_ApproveCustomersbyEmployeeWS\_Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Level</b>	This field shows the level of the approval hierarchy that the approval object lines relate to, and thus the order in which they are to be approved. This field only applies if the <b>Level Prioritized</b> check box is selected in the tab of the related approval hierarchy.
<b>Effective</b>	This field shows whether or not the actual approvals are marked as effective. In-effective approval headers and lines show the history.
<b>Active</b>	This field shows whether or not the approval object is currently active.
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the <b>New Approval Status</b> field is transferred to this field when you use the <b>Execute Approval</b> action. This field cannot be changed manually.
<b>New Approval Status</b>	Select the status you wish to assign to the current approval object line when you use the <b>Execute Approval</b> action. The following statuses are available: <ul style="list-style-type: none"> <li>Blank</li> <li>Approved</li> <li>Rejected</li> <li>Released</li> </ul>
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.
<b>Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field shows the time that the current line was approved.
<b>Approver</b>	This field show the employee name and number of the approver of the approval task.
<b>Substitute</b>	This field shows the employee name and number of the designated substitute approver who approved the approval object.

Field	Description
<b>Super Approver</b>	This field shows the employee name and number of the designated super approver who approved the approval object.
<b>Approver Name</b>	Enter or select the name of the designated approver who can approve the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Name</b>	Enter or select the name of the designated substitute approver who can approve the approval object.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Super Approver Name</b>	Enter or select the name of the designated super approver who can approve the approval object.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Approver</b>	Enter the employee number of the approver of the approval task.
<b>Approver Employee Type</b>	This field shows the designated employee type that can approve approval objects. Any approval object, such as time sheet lines, falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute</b>	This field shows the employee number of the designated substitute approver who approved the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Approver Reference, Field</b>	This field shows the internal field name that the Approver Reference relates to.

Field	Description
<b>Approver Reference, Employee</b>	This field shows the employee reference of the Approver.
<b>Substitute Reference, Relation</b>	This field shows the relation of a substitute approver reference if one has been specified on the approval task.
<b>Substitute Reference, Field</b>	This field shows the field reference of a substitute approver if one has been specified on the approval task.
<b>Substitute Reference, Employee</b>	This field shows the employee reference of the substitute approver if one has been specified on the approval task.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Super Approver</b>	This field shows the name of the designated super approver who approved the approval object.
<b>Super Approver Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Super Approver Reference, Relation</b>	This field shows the relation of a super approver reference if one has been specified on the approval task.
<b>Super Approver Reference, Field</b>	This field shows the field reference of a super approver if one has been specified on the approval task.
<b>Super Approver Reference, Employee</b>	This field shows the employee reference of a super approver if one has been specified on the approval task.
<b>Current Approval Status Details</b>	This field shows details regarding the latest approval status of the current line.
<b>Current Approval Status</b>	This field shows the latest approval status of the current line.
<b>Last Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the last user who completed the action for the associated approval object.

Field	Description
<b>Last Approval or Rejection Date</b>	If the approval object has been approved, this field shows the latest date on which the current line was approved.
<b>Last Approval or Rejection Time</b>	If the approval object has been approved, this field shows the latest time when the current line was approved.
<b>Last Approval or Rejection Comment</b>	If the approval object has been approved or rejected, this field shows the latest comment for the associated approval object.
<b>Line Can Be Approved by Current User</b>	This field shows whether the current line can be approved by the current user.
<b>Current Status</b>	This field shows the latest status of the current line.
<b>Submitted By</b>	This field shows the name of the user who submitted the current line.
<b>Date Submitted</b>	This field shows the date the current line was submitted.
<b>Time Submitted</b>	This field shows the time the current line was submitted.
<b>Rebating %</b>	Copy to come.
<b>Credit Limit, Enterprise Level</b>	This field shows the credit limit amount in the enterprise currency of the system.
<b>Transfer to People Planner</b>	If this field is marked, the user will be included in the scheduled import to People Planner. Setting the Transfer To People Planner field will only have an effect if the field is included in the relevant queries in the .I files on the web server.
<b>Level 1-5 Customer No.</b>	If the contact companies in the hierarchy above the contact company in question are created as customers, these fields will show their customer numbers. These fields are only available if Customer Levels are set up using the designated System Parameters.
<b>Customer Level No.</b>	This field shows the Customer Level number for the contact company in question.
<b>Insert Below Parent in Hierarchy</b>	This field determines whether or not the customer should be inserted in a hierarchy. This field is only available if Customer Levels are set up using the designated System Parameters.  If the field is not selected, then the customer will be on the top level in the hierarchy and the parent customer will only be used as a template.

Field	Description
	If the field is selected, the customer will be inserted into the hierarchy. This means its level will be set to its parent's level + 1 and the hierarchy structure from top parent to the customer will be saved on the customer card.
<b>Fiscal Year End Month</b>	This field shows the month that the customer's fiscal year ends. The month is used for calculating due date and extension date on customer tax returns.
<b>Customer State</b>	This field is used to specify the state of the customer in the approval process. The options are user-created.
<b>Allow Company Customer Creation</b>	This field shows whether you can create a new company specific customer based on this customer. A company specific customer can either be created manually or automatic when a user makes a registration on a customer in a new company. This is only validated at the time of creation.
<b>CRM Customer Key</b>	If the customer has CRM integration, this field shows the Customer Key.
<b>CRM Customer ID</b>	If the customer has CRM integration, this field shows the Customer ID.
<b>Statement No.</b>	This field shows the number of the current account statement. If the reconciliation has a wrong number, it can be changed here.
<b>Date of Last Statement</b>	This is the date on which the customer's last historical statement was created. The field is automatically updated by Maconomy.
<b>Last Statement</b>	This is the number of the latest historical account statement printed out for the customer.
<b>Selected for Reminder</b>	Copy to come.
<b>Total Orders</b>	Copy to come.
<b>Payer Identification</b>	The vendor invoice's payer identification. It is used by Maconomy to create payment files for electronic payment of vendors.
<b>Reminder Assessment Date</b>	Copy to come.
<b>Customer Specific Linking Rule</b>	Copy to come.
<b>Last Reminder Letter</b>	Copy to come.

Field	Description
<b>Company Customer State</b>	This field shows the state of the company customer when it is in the approval process.
<b>Use Fixed Exchange Rates From Job</b>	Select this check box when specifying fixed exchange rates for a company customer. Each time you create a job for the company customer, Maconomy automatically copies the value of this check box to the check box with the same name in the Jobs workspace.
<b>Fixed Exchange Rate Date</b>	This is the date for selecting exchange rate table entries from the system tables.
<b>Customer No.</b>	This field shows the number a direct customer who sells your items to the end customer.
<b>Name 1-5</b>	This is the name and address of the customer who sells to the end customer.
<b>Attn.</b>	This field shows the name of an attention person - the person to whom you want shipping information directed. The information is used on printouts.
<b>Phone</b>	This field shows the customer's telephone number. The information is used for reference.
<b>Fax</b>	This field shows the customer's telephone number. The information is used for reference.
<b>Telex</b>	This field shows the customer's telex number. The information is used for reference.
<b>Giro</b>	This field shows the customer's giro account number.
<b>Carrier</b>	This field shows the means of transport you use to deliver items to the customer. The field is used when you handle orders.
<b>Delivery Mode</b>	This field shows the delivery mode that normally applies to the customer. The field is used when you handle orders.
<b>Delivery Terms</b>	This field shows the delivery terms that normally apply to the customer. The field is used when you handle orders. Delivery Terms are maintained in the pop-up field "Delivery Terms" in the window Popup Fields in the Set-Up module.
<b>Payment Terms</b>	This field shows the payment terms that apply to the invoices for this job.
<b>Blanket Invoice</b>	A check mark in this field indicates that the invoices or credit memos created for the job are ready for blanket invoicing.

Field	Description
<b>Tax</b>	This field shows whether to charge the customer tax on a normal basis. If the field is marked, Maconomy adds tax. The value can be changed on individual orders.
<b>Cash Discount Code</b>	This field shows how much discount should be granted when a customer pays an invoice within a certain period. The codes apply to invoices reconciled in the workspace Customer Open Entry Reconciliation in the Accounts Receivable module.
<b>Invoice Discount %</b>	This field shows the applicable invoice discount percentage on the job. If no discount applies, the value will be zero.
<b>Department</b>	<p>This field shows the department that the customer usually deals with. The department specified here determines which G/L accounts are used when you invoice customer transactions. The department is a reference to item sales accounts, charge accounts, discount accounts, and so on. The posting references are also used when posting interest and reminder charges, as well as when posting cash discounts and exchange rate differences occurring from open item reconciling.</p> <p>G/L posting references are specified by means of dimension combinations in the window Posting References in the G/L module. If the window System Information in the Set-Up module specifies that entries are posted by item group or by activity, the posting references for item sales and cost of sales are retrieved from the Item Group Information Card in the Inventory module and from the window Activities in the Job Cost module respectively.</p>
<b>Customer Group</b>	This field shows the group to which the customer belongs. This field is used to classify customers - primarily for statistics.
<b>Country</b>	This is the customer's country. The information is used for reference, and it can be used to make statistics.
<b>Sales Rep. No.</b>	This is the number of the sales representative responsible for the customer.
<b>Currency</b>	<p>This is the customer's standard currency. All customer transactions are converted into the customer's standard currency. This means you can print and send account statements in the customer's own currency. All customer transactions are registered in three currencies:</p> <ul style="list-style-type: none"> <li>Standard Currency - the currency in which the customer has requested you hold their account. For example DEM if the customer is from Germany.</li> <li>Base Currency - the currency used in your country (USD in the United States) and in which your books are kept.</li> <li>Original Currency - the currency of a given transaction.</li> </ul> <p>For example FFR, if a German customer pays in French Francs.</p>

Field	Description
	To prevent inconsistencies, you cannot change the customer's currency if entries have been posted or are ready to be posted on the customer. Currencies are maintained in the pop-up field "Currencies" in the window Popup Fields in the Set-Up module.
<b>Language</b>	<p>This is the language of the customer. The selected language is used, for example, on printouts of item descriptions on sales order documents and in connection with language texts. For further information about this window, see the description of the window Language Texts in the Set-Up module.</p> <p>Languages are maintained in the pop-up field "Language" in the window Popup Fields in the Set-Up module.</p>
<b>Warehouse</b>	This field shows the warehouse in which the re-location of items is to take place. When creating a transaction, specify the relevant warehouse in this field. Once the transaction has been created, this field can no longer be changed.
<b>Price List</b>	This is the name of the price list the item is priced by, if applicable. If the price is not from a price list, or if the item is a BOM without price control, the field is blank.
<b>Price Step</b>	This is the price list step the item is priced by.
<b>Charge 1-4</b>	These fields show charge codes normally added to an order to the customer. The customer might, for example, pay a handling charge or a delivery charge.
<b>Bill to Customer</b>	This field shows the bill-to customer on the job to be invoiced with the amount on the line.
<b>Control Account</b>	The control account is a reference to two G/L accounts - a Vendor control account and an account for un-reconciled entries.
<b>Credit Limit, Company Level</b>	Copy to come.
<b>Auto. Reconciliation</b>	Copy to come.
<b>Remarks</b>	Enter remarks about the current line.
<b>Reminder Level</b>	This field displays the reminder level of the reminder letter. The reminder level of the letter is the highest level of one of the reminder letter lines.
<b>Reminder Date</b>	The date the reminder letter was created and sent to the customer.

Field	Description
<b>Previous Interest Charge Notice</b>	This field shows the previous interest charge notice.
<b>Statistics 1-4</b>	The four codes can be selected/not selected in the selection criteria islands in windows where statistics are printed. If a statistics list has been specified in a given statistics list field in this island, only values available in the list in question can be selected in the corresponding statistic value field. If a statistics list field has been left blank, any text can be entered in the corresponding value field.
<b>Created by</b>	This field shows the user name of the person who created the line.
<b>Created on</b>	This field shows the date on which the line was created.
<b>Changed by</b>	This field shows the name of the user who made the last change to this line.
<b>Changed on</b>	This field shows the version number of the line.
<b>Version</b>	This field shows the version number of the line.
<b>Location</b>	This field shows the location of the customer.
<b>Entity</b>	This field shows the name of the entity associated with the customer.
<b>Project</b>	This field shows the customer's project.
<b>Contact Person</b>	This field shows the contact person's name and number.
<b>Agreement</b>	This is the agreement with the customer that has significance for sales orders to the customer. The information is not used anywhere else in the system.
<b>Zip Code</b>	This is the zip code of the contact person.
<b>Postal District</b>	This is the name of the postal district in which the current contact person resides.
<b>Tax No.</b>	This is the customer's tax number.
<b>Remark 1-3</b>	This field shows the remarks pertaining to the current customer.

Field	Description
<b>EU Trade Type</b>	This value is either "Normal" or "Triangulation" to indicate the EU trade type. Triangulation means you act as agent for a vendor in another EU country and a customer in a third EU country. Triangulation sales are not included in the EU sales part of the tax specification. The trade type can be changed during order processing.
<b>Enterprise</b>	This field shows the enterprise to which the tax code on the tax table line should apply.
<b>Segment</b>	This field shows the segment to which the tax code on the tax table line should apply.
<b>Show Price Mark</b>	<p>This field is only used if you have Maconomy's layout editing tools. Using Maconomy's layout editing tools, you can add fields to invoice and packing slip layouts, which, with a plus or minus sign, indicate if the item is sold at a higher or lower price than in the previous sale to the same customer. The unit price in the previous sale can be seen in the window Item Assortment in the Inventory module.</p> <p>If the field is marked, higher and lower prices will highlighted. It indicates to the customer, that the price calculation should be adjusted if the items are being sold to others.</p>
<b>Price on Packing Slip</b>	This field shows the price of individual items on the packing slip.
<b>Combined Picking List</b>	Copy to come.
<b>Company Tax Code</b>	This is the company tax code for the customer on the current line.
<b>Back Order Handling</b>	This field shows which method is normally used for handling back orders to the customer. It is retrieved from the Customer Information Card window and cannot be changed here.
<b>Cust. Payment Mode</b>	This field displays a customer payment mode.
<b>E-mail</b>	This field shows the e-mail address of the customer. The field is for reference only.
<b>Contact Comp. No.</b>	If the customer has been created as a contact company, the contact company number in question is shown in this field.
<b>Customer Type</b>	This field shows the customer type of the current customer. The field is used for organizing customers.
<b>Account Stm. Cust.</b>	Copy to come.
<b>Our Contact</b>	This is the number of the employee who is in charge of the customer in question. The employee must exist in Maconomy.

Field	Description
<b>Area</b>	This is the area assigned to the customer. Areas are maintained in the pop-up field "Segments" in the window Popup Fields in the Set-Up module. The field is used for statistics.
<b>Markup %</b>	This field shows the markup percentage for amount activities. If the field is completed, the specified value will be transferred when you create a new job on the current customer in the Job Cost module.
<b>Job Price List, Sales</b>	This field shows a job price list for the calculation of sales prices.
<b>Charge Table</b>	This field shows the charge table to be used in the calculation of charges on transactions regarding the current customer. When quotes, sales orders, and credit orders are created for the current customer, the charge table is transferred to the transaction in question.
<b>Charge Discount %</b>	This field shows the charge discount percentage to be applied to charges on transactions regarding the current customer.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Overwrite Location</b>	In this field, you can specify if the location shown in the field "Location" should overwrite any manually entered location.
<b>Overwrite Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Overwrite Project</b>	The functionality of this field is similar to that of the field "Overwrite Location" above.
<b>Overwrite Spec. 1-3</b>	The functionality of this field is similar to that of the field "Overwrite Location" above.
<b>Overwrite Purpose</b>	The functionality of this field is similar to that of the field "Overwrite Location" above.
<b>Settling Company</b>	This field displays the name and number of the settling company of the customer.
<b>Overwrite Company</b>	If you want the value in the field "Company No." on the line to overwrite any manually entered values for the company dimension, you can indicate this by marking this field. If you do not select to overwrite, the company number on the line will only be derived if the dimension field to which the derivation is performed is blank.
<b>Company No.</b>	This field shows the number of the company that the approval line refers to.

Field	Description
<b>Collection Agreement</b>	This field shows the agreement number that the current customer has been assigned at the payment agent who is connected to the selected customer payment mode. The field is only used for electronic customer payment modes.
<b>Overwrite Local Spec. 1-3</b>	The functionality of this field is similar to the functionality of the field "Overwrite Company".
<b>Access Level</b>	This field shows the access level for this line.
<b>Soc. Security No.</b>	This is the social security number of the customer.
<b>Company Reg. No.</b>	This is the registration number of the current company.
<b>Job Surcharge Rule</b>	The rule specified in this field is copied to the window Job Information when you create a new job on the current customer. The rule must be created in the window Job Surcharge Rules and can be changed in the windows Job Information or Job Budgets in the Job Cost module. See the description of the window Job Surcharge Rules for a detailed description.
<b>Popup 1-5</b>	This field includes further information regarding the current customer. You might, for example, specify a "hold" code or information about substitution items. The pop-up options are maintained in the pop-up fields "Customer Popup 1-5" in the window Popup Fields in the Set-Up module.
<b>Remark 5-10</b>	These fields show remarks about this line.
<b>Invoice Layout</b>	This field shows the invoice layout rule.
<b>Credit Card No.</b>	This field shows the credit card number assigned to the pay-to vendor.
<b>Expiry Date</b>	This field shows the expiry date of the credit card specified in the field "Credit Card No." above.
<b>Catalog No.</b>	This field shows the catalog assigned to the customer. This field is only used if you have installed the add-on module Maconomy Web Shop.
<b>Destination No.</b>	In this field, you can enter a destination number if items to the current customer are usually delivered to a given destination.
<b>Consignment Type</b>	In this field, select the consignment type normally used when delivering goods to the current customer.

Field	Description
<b>Job Price List, Intercomp.</b>	In this field, you can select a job price list for the calculation of intercompany prices. In the Job Cost module, this job price list will be transferred to the new job when you create a job with the current customer.
<b>Job Price List, Cost</b>	In this field, you can select a job price list for the calculation of cost prices. In the Job Cost module, this job price list will be transferred to the new job when you create a job with the current customer.
<b>Collection Group No.</b>	This field shows the collection group number to which the current customer belongs. The collection group number is supplied by the payment agent. If the payment mode of the customer is electronic, you must specify a collection group number in this field.
<b>Reminder Text Group</b>	This field displays the reminder text group assigned to the current customer. The reminder text group is copied from the window Company Specific Payment Information and cannot be changed in this window.
<b>Parent Customer</b>	This field shows the name of the parent customer.
<b>Linking Rule</b>	In this field, you can specify the linking rule that you want to use between the parent customer and the new customer. If you have specified a parent customer in the field "Customer No." above and you do not specify a linking rule in this field, Maconomy will use the standard linking rule created between the tables "Customer" and "Customer" in the window Linking Rules in the Set-Up module, if any. If no standard linking rule has been created, Maconomy will display a message. Linking rules contain information about what information should be copied from a parent customer to the current customer. Linking rules are maintained in the window Linking Rules in the Set-Up module. For further information about linking rule creation and usage and rules concerning the copying of field information from parent customers, see the description of the window Linking Rules in the Set-Up module.
<b>Interest Charge/Reminder Principle</b>	This is the interest charge/reminder principle to be used for the current customer. Interest charge/reminder principles are maintained in the window Interest Charge/Reminder Principles. For further information about interest charge/reminder principles, see the description of this window.
<b>Campaign No.</b>	This field shows the number of a marketing campaign that has resulted in the creation of the current customer. Note, however, that the campaign number is not transferred to quotes, sales orders, and so on, which are created for the customer.
<b>Dimension Comb. No.</b>	In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the window Dimension Combinations.

Field	Description
	If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the current customer. However, any dimension derivation values specified in this island will be used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the customer information card.
<b>Document Archive No.</b>	In this field, you can assign a document archive to the event. By assigning a document archive to an event, you can keep track of the various documents related to the event. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.
<b>Blanket Order</b>	In this field, you can specify whether quotes and orders for the current customer should be created as blanket orders. If you mark this field, quotes and orders created for the customer will be created as blanket orders, that is, with the corresponding field marked. See the description of the field "Blanket Order" in the window Sales Orders in the Sales Orders module for further information on the functionality of blanket orders.
<b>Instance Key</b>	This field shows the instance key of the budget line.
<b>Job Price List, Standard Sales</b>	In this field, you can choose a job price list to be used for calculating the standard billing prices of the activities used for the job. The functionality of this field is similar to that of the "Job Price List, Sales" field. This field also shows the description of the specified job price list. The description derives from the Job Price Lists workspace.
<b>Statistics 1-3, List</b>	Copy to come.
<b>Remark 11-20</b>	This field shows comments about the customer.
<b>Keep Price</b>	This field shows whether the unit price and discount percentage on the current line should be recalculated when changing the quantity. If this field is marked, a change in quantity will not cause the current unit price or discount percentage to be recalculated, even if the new quantity results in, for example, a different price step.
<b>Price Adjustment Principle</b>	In this field, you can specify a price adjustment principle to be suggested on subscriptions created for the current customer. For further information about price adjustment principles, see the window Price Adjustment Principles in the Subscription module.
<b>Team 1-6</b>	In these fields, you can specify the name and number of a team of employees to be assigned to the customer, for instance because the customer prefers to work with a given team. Teams are created in the

Field	Description
	window Teams in the Set-Up module. When you create a new job for the current customer, the teams specified for the customer are automatically copied to the job, unless another team is specified in the corresponding field on the job.
<b>Termination Date</b>	If co-operation with the current customer has ceased, you can specify in this field the date on which co-operation was terminated.
<b>Option List 1-10</b>	If co-operation with the current customer has ceased, you can specify in this field the date on which co-operation was terminated.
<b>Selected Value 1-10</b>	This field shows a number of values for further specification of the current personnel requisition.
<b>Global Location No.</b>	<p>If the customer on the current line has requested that you use a specific global location number on invoices pertaining to the current job, you can specify the location number in question here. The number specified here will be transferred to invoices created for the customer in connection with the current job. Maconomy suggests the global location number specified in the window Company Specific Payment Information for the customer in question, but you can change it here if the location number to be used in connection with the current job is not the same as the standard location number of the customer.</p> <p>For further information about the concept of global location numbers, see the introduction to the window Company Locations in the G/L module.</p>
<b>Transaction Timestamp</b>	This field shows the time of creation or the latest revision of the current line.
<b>Holiday Calendar Name</b>	Name of a holiday calendar used by the customer.
<b>Expected Days to Payment</b>	<p>This field shows the expected number of days to payment (the expected number of days from the invoice date to the date of payment).</p> <p>If the expected days to payment is set to zero days, then the expected payment date will be the same as the due date.</p> <p>The expected days to payment is currently used only for calculating expected payment date on job invoicing plans.</p>
<b>Employee 1-10</b>	These fields show up to 10 employees assigned to the current job.
<b>Remark 21-30</b>	Copy to come.
<b>Customer Job Option List 1-3</b>	Copy to come.

Field	Description
<b>Selected Customer Job Value 1-3</b>	Copy to come.
<b>Post Vendor Exch. Rate Variances on Job</b>	<p>Use this field to specify how to post exchange rate variances that occur when you register vendor payments.</p> <p>If this check box is selected, the exchange rate variances are posted to the jobs to which the paid vendor invoices were allocated.</p> <p>If this check box is not selected, the exchange rate variances are posted to the Vendor Exchange Rate Gain or Vendor Exchange Rate Loss account.</p> <p>The default value is that the check box is not selected.</p> <p>Maconomy uses the value of this field as the default value for the Post Vendor Exch. Rate Variances on Job field for newly created company-specific customers for this customer.</p>
<b>Show Customer Balances on Invoice</b>	<p>Select this field to indicate that you want to see the customer's prior and new balance on the job invoice printout.</p> <p>The default value is inherited from the customer / company-specific customer; however, you can override it in the Invoice Selection, On Account Invoice Selection, and Blanket Invoice Selection windows.</p>
<b>Show Customer Statement On Invoice</b>	Select this field to indicate that you want to see the customer statement on the job invoice printout. You can override this selection in the Company Customer Information Card and in Invoice Selection.
<b>Show Customer Aging On Invoice</b>	This field indicates whether to show the A/R aging on the job invoice printout.
<b>Detailed Invoice Specification</b>	This field shows the detailed invoice specification.
<b>Account Manager No.</b>	This field displays the account manager employee number.
<b>Stock Symbol</b>	<p>This field allows for specifying the stock symbol if the customer refers to a listed company. If contact customers are used, the stock symbol on both customer and contact company will always be synchronized.</p> <p>When a stock symbol is set, the customer home, company customer home, and contact company home sections in the Workspace Client will have integrations to Google Finance, showing information about the stock.</p>
<b>Approval Group, Instance Key</b>	Copy to come.
<b>Submitted</b>	This field shows whether the customer line has been submitted.

Field	Description
<b>Approved</b>	This field shows whether the customer line has been approved.
<b>Allow for use as inter Company Customer</b>	Use this field to specify whether the customer can be used as an intercompany customer. This is validated when the customer is selected or changed on the company information card or on an outlay account. It is also validated when the intercompany invoice is created.
<b>Allow Budgets</b>	Use this field to specify whether this customer can be used in a G/L or job budget. Maconomy validates when the job budget is created, a G/L budget line is created or changed, and when the G/L budget is approved.
<b>Allow Registrations</b>	Use this field to specify whether this customer can be used in a general journal or in bank reconciliation. Maconomy validates when the line is created or changed, and when the journal is posted or the bank reconciliation is approved.
<b>Allow Payments</b>	Use this field to specify whether this customer can be used for payments. Maconomy will validate at the time of registration if the system parameter "Allow Payments on blocked customers" is not marked, and when the payment is approved. Maconomy will only validate customer payments created in the customer payment window. The validation in the G/L journal and bank reconciliation windows is based on the field "Allow Registrations."
<b>Allow Reporting</b>	<p>Use this field to specify whether this customer can be used in standard customer reports. For the following reports, Maconomy ignores customers who are not allowed to be included for reporting where the user has selected Customer as dimension.</p> <ul style="list-style-type: none"> <li>■ A/R aging</li> <li>■ A/R balance list</li> <li>■ A/R Historical Statement</li> <li>■ Open Entry Statement</li> <li>■ Periodic Statement</li> <li>■ A/R Statistics</li> <li>■ Customer Group Statistics</li> <li>■ Customer budgets</li> <li>■ Customer information</li> <li>■ G/L report lines</li> </ul>
<b>Allow for use as Template/Parent Customer</b>	Use this field to specify whether this customer may be used as a template or parent customer. A template customer can be entered into system information or company information. Maconomy will suggest

Field	Description
	the template customer as parent customer when a new customer is created. Maconomy validates when the new customer is created.
<b>Allow Interests and Reminders</b>	Use this field to specify whether this customer can be used when creating interests and reminders. Maconomy validates when the interest or reminder is created, and when the interest or reminder is approved.
<b>Allow for use on Jobs and Orders</b>	Use this field to specify whether this customer may be used on a job, sales order, or subscription order. Maconomy validates when the sales order or subscription order is created or changed, and when the invoice is approved/printed. Maconomy will also validate when the job is created. You can still use a customer on a template job even if they are not allowed for use on jobs.
<b>Allow Delivery</b>	Use this field to specify whether deliveries on either sales or subscription orders in which the current customer acts as payment or delivery customer can be made to this customer.
<b>Status</b>	Copy to come.
<b>First Activation Date</b>	When the Status field is set to Active, this field name is First Activation Date and it displays the date that the customer was first made active. When the Status field is set to Inactive, this field name is Active Period and it displays the date interval that the customer was active.
<b>Last Inactivation Date</b>	Copy to come.
<b>Spec. 4-10</b>	These fields show the specifications assigned to the current line.
<b>Local Spec. 4-10</b>	These fields shows the local specifications assigned to the current line.
<b>Overwrite Spec.4-10</b>	The functionality of these fields is similar to that of the Spec. 4-10 field.
<b>Overwrite Local Spec. 4-10</b>	The functionality of these fields is similar to that of the Local Spec. 4-10 field.
<b>Sales Person Name</b>	Copy to come.
<b>Our Contact Name</b>	Copy to come.
<b>Company Name</b>	This field displays the name of the company to which the budget hierarchy line pertains.

Field	Description
<b>Parent Customer Name</b>	This field shows the name of the parent customer.
<b>Employee 1-10 Name</b>	If you have already selected an employee number in the Employee 1-10 fields, these fields automatically show the employee name associated with the employee numbers. If you use Ctrl + G to search for employee name, you can manually add an employee.
<b>Payment Customer Name</b>	This field shows the name of the customer who must pay the invoice.
<b>Statement Customer Name</b>	Copy to come.
<b>Level Name</b>	Copy to come.
<b>Level 1-5 Customer Name</b>	Copy to come.
<b>Settling Co. Name</b>	Copy to come.
<b>Settling Co. Info. Line</b>	Copy to come.
<b>Submitter</b>	Approval lines created on the basis of the current hierarchy line must be approved by the person submitting the approval line.
<b>Submitter Name</b>	This is the name of the person submitting the approval line.
<b>Submitter Position</b>	This is the position of the person submitting the approval line.
<b>Submitter E-mail</b>	This is the e-mail address of the person submitting the approval line.
<b>Submitter Phone</b>	This is the phone number of the person submitting the approval line.
<b>Submitter Mobile</b>	This is the mobile number of the person submitting the approval line.
<b>Submitter Company No.</b>	This is the company number of the person submitting the approval line.
<b>Submitter Company</b>	This is the company of the person submitting the approval line.

Field	Description
<b>Account Manager</b>	This is the account manager of the customer.
<b>Account Manager Position</b>	This is the position of the customer's account manager.
<b>Account Manager E-mail</b>	This is the e-mail address of the customer's account manager.
<b>Account Manager Phone</b>	This is the contact number of the customer's account manager.
<b>Account Manager Mobile</b>	This is the mobile number of the customer's account manager.
<b>Account Manager Company No.</b>	This is the company number of the customer's account manager.
<b>Account Manager Company</b>	This is the company name of the customer's account manager.
<b>Customer State</b>	This field shows the state of the customer during the approval process.
<b>Company Specific</b>	Copy to come.

## Actions

This section shows the Actions available in the Approve Customers by Employee workspace.

### Table Part

Field	Description
<b>Mark All For Approval</b>	Use this action to mark all approval object lines in the sub-tab for approval. This means the status in the <b>New Approval Status</b> field is set to Approved on all lines.
<b>Mark All For Release</b>	Use this action to mark all approval object lines in the sub-tab for release. This means the status in the <b>New Approval Status</b> field is set to Released on all lines.  This action can only be used if the <b>Trans. Non-Appr. Time Sheets</b> field is enabled in the System Information workspace, and the current user has access to transferring expense sheets as specified in the Actions workspace.

Field	Description
	The employee specified as the project manager for the current job, however, always has the right to release time sheets for the employee in question.
<b>Mark All For Rejection</b>	Use this action to mark all approval object lines in the sub-tab for rejection. This means the status in the <b>New Approval Status</b> field is set to Rejected on all lines.
<b>Unmark All</b>	Use this action to unmark all approval object lines in the sub-tab for approval. This means the <b>Approve</b> check box is deselected for all entries in the sub-tab.
<b>Execute Approval</b>	Use this action to put into effect all statuses indicated in the <b>New Approval Status</b> field for all lines. If any approval object lines are thus fully approved or released (for example, the expense sheet from which the approval object line originates was already approved or released by the supervisor), the lines in question are transferred to a registration journal which can then be posted. The <b>Approval Status</b> field is automatically updated with the value shown in the <b>New Approval Status</b> field.
<b>Approve All</b>	Use this action to approve all the lines pending approval that are listed in the sub-tab.
<b>Reset All</b>	Use this action to reset all the lines pending approval that are listed in the sub-tab.

## Approve Draft Invoices by Employee Workspace

Use this workspace to view information on all relevant approval lines for draft invoices.

This workspace enables you to view information on all relevant approval lines for draft invoices. This allows you to use iAccess to access draft invoices that were created in the Workspace Client. You can now approve or reject transactions for which approval hierarchies are set up from within iAccess.

### Approve Draft Invoices by Employee Tab

This section includes the fields and descriptions for the Approve Draft Invoices by Employee tab.

#### Employee Information island

Field	Description
<b>Current Employee No.</b>	This field shows the employee number for the currently logged in user.
<b>Employee No.</b>	This field shows the number of the employee designated as approver of all lines submitted for approval. By default, this field displays the same value as the <b>Current Employee No.</b> field.
<b>Employee Type</b>	This field shows the selected employee's employee type.

Field	Description
<b>Job No.</b>	Enter or select a job number to show only lines relevant to the specified job in the sub-tab.
<b>Show Lines For Approval</b>	Select this check box to show items available for approval. This is enabled by default.
<b>Show Non-Active Lines</b>	Select this check box to show approval items that are not yet active.
<b>Show Rejected Lines</b>	Select this check box to show rejected approval items.
<b>Show Substitute Lines</b>	Select this check box to show the approval items for which you are a substitute approver.
<b>Show Super Approver Lines</b>	Select this check box to show approval items for which you are a super approver.
<b>Show Approvable by All Approval Lines</b>	Select this check box to view all approval items that can be approved by any user.
<b>Overwrite existing</b>	<p>If existing information is already available in the <b>Approval Status</b> or <b>Remark</b> fields in the sub-tab, select one or both of the following check boxes to enable the system to overwrite it:</p> <ul style="list-style-type: none"> <li>Approval Status</li> <li>Remark</li> </ul>
<b>Remark</b>	Enter a remark regarding the specified approval object line.

### Approval Line Sub-Tab

This section includes the fields and descriptions for the Approval Line sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number to which the current line is associated.
<b>Level</b>	This field shows the level of the approval hierarchy that the approval object lines relate to, and thus the order in which they are to be approved. This field only applies if the <b>Level Prioritized</b> check box is selected in the tab of the related approval hierarchy.
<b>Effective</b>	This field shows whether or not the actual approvals are marked as effective. In-effective approval headers and lines show the history.
<b>Active</b>	This field shows whether or not the approval object is currently active.

Field	Description
<b>Approval Status</b>	This field shows the approval status of the current line. The value in the <b>New Approval Status</b> field is transferred to this field when you use the <b>Execute Approval</b> action. This field cannot be changed manually.
<b>New Approval Status</b>	<p>Select the status you wish to assign to the current approval object line when you use the <b>Execute Approval</b> action.</p> <p>The following statuses are available:</p> <ul style="list-style-type: none"> <li>Blank</li> <li>Approved</li> <li>Rejected</li> <li>Released</li> </ul>
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Deadline</b>	This field shows the deadline by which the approval must be completed.
<b>Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the user who completed the action for the associated approval object.
<b>Approval Date</b>	If the approval object has been approved, this field shows the date on which the current line was approved.
<b>Approval Time</b>	If the approval object has been approved, this field shows the time that the current line was approved.
<b>Approver</b>	This field show the employee name and number of the designated approver who approved the approval object.
<b>Substitute</b>	This field shows the employee name and number of the designated substitute approver who approved the approval object.
<b>Super Approver</b>	This field shows the employee name and number of the designated super approver who approved the approval object.
<b>Approver Name</b>	Enter or select the name of the designated approver who can approve the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Name</b>	Enter or select the name of the designated substitute approver who can approve the approval object.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.

Field	Description
<b>Super Approver Name</b>	Enter or select the name of the designated super approver who can approve the approval object.
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Approver</b>	This field shows the employee number of the employee who approved the current approval object.
<b>Approver Employee Type</b>	This field shows the designated employee type that can approve approval objects. Any approval object, such as time sheet lines, falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute</b>	This field shows the name of the designated substitute approver who approved the approval object.
<b>Approver Reference</b>	This field shows the reference type of the approval object approver. For more information on this field, refer to the description for the Approver Reference in the Approval Hierarchies workspace.
<b>Substitute Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Substitute Reference</b>	This field shows the reference type of a substitute approver if one has been specified on the approval object.
<b>Approver Reference, Field</b>	This field shows the internal field name that the Approver Reference relates to.
<b>Approver Reference, Employee</b>	This field shows the employee reference of the Approver.
<b>Substitute Reference, Relation</b>	This field shows the relation of a substitute approver reference if one has been specified on the approval task.
<b>Substitute Reference, Field</b>	This field shows the field reference of a substitute approver if one has been specified on the approval task.
<b>Substitute Reference, Employee</b>	This field shows the employee reference of the substitute approver if one has been specified on the approval task.

Field	Description
<b>Super Approver Reference</b>	This field shows the reference type of a super approver if one has been specified on the approval object.
<b>Super Approver</b>	This field shows the name of the designated super approver who approved the approval object.
<b>Super Approver Employee Type</b>	This field shows the designated employee type that can act as substitute approver on approval objects. Purchase orders, expense sheets, and vendor invoices falling within the selection criterion specification on the current line need to be approved by an employee of this type.
<b>Super Approver Reference, Relation</b>	This field shows the relation of a super approver reference if one has been specified on the approval task.
<b>Super Approver Reference, Field</b>	This field shows the field reference of a super approver if one has been specified on the approval task.
<b>Super Approver Reference, Employee</b>	This field shows the employee reference of a super approver if one has been specified on the approval task.
<b>Current Approval Status Details</b>	This field shows details regarding the latest approval status of the current line.
<b>Current Approval Status</b>	This field shows the latest approval status of the current line.
<b>Last Approved or Rejected By</b>	If the approval object has been approved or rejected, this field shows the name of the last user who completed the action for the associated approval object.
<b>Last Approval or Rejection Date</b>	If the approval object has been approved, this field shows the latest date on which the current line was approved.
<b>Last Approval or Rejection Time</b>	If the approval object has been approved, this field shows the latest time when the current line was approved.
<b>Last Approval or Rejection Comment</b>	If the approval object has been approved or rejected, this field shows the latest comment for the associated approval object.
<b>Line Can Be Approved by Current User</b>	This field shows whether the current line can be approved by the current user.

Field	Description
<b>Current Status</b>	This field shows the latest status of the current line.
<b>Submitted By</b>	This field shows the name of the user who submitted the current line.
<b>Date Submitted</b>	This field shows the date the current line was submitted.
<b>Time Submitted</b>	This field shows the time the current line was submitted.
<b>Employee No.</b>	This field shows the number of the employee who entered the current line.
<b>Line No.</b>	This field shows the line number of the current expense sheet line.
<b>Start Date</b>	This field displays the start date of the expense sheet.
<b>Job No.</b>	This field shows the job number related to the current expense sheet line.
<b>Activity No.</b>	This field shows the activity number specified on the current expense sheet line.
<b>Monday-Sunday</b>	<p>These fields show registered time in hours or days, depending on the time unit of the expense sheet. In these fields, enter the time used every day of the week on the specific job, dimension, task, and activity. You cannot register more hours in one day than the maximum number of hours entered for the employee in the employee revision applying to the date in question.</p> <p>Moreover, if a value has been entered in the <b>Time Sheets</b> field in the Activities workspace for the activity for which you wish to register hours or amounts, you cannot enter a larger quantity for the activity than specified in that field. If there are several time sheet lines for a given employee with the activity in question, the sum of the registrations on these lines cannot exceed the daily registration limit specified for the activity in question.</p> <p>You can enter a negative number of hours. If the <b>Minimum Hours</b> field is enabled on the employee revision applying on the date in question, Maconomy checks whether the employee has registered the minimum number of hours that the employee in question is supposed to register. If the number of hours registered is lower than this number, the time sheet cannot be submitted. It can be temporarily submitted, however. See the description of the Employees workspace in the Set-Up module for further information.</p> <p>If time sheet lines are automatically created from the detailed resource planning, these fields are automatically filled in with the quantity of hours planned for the employee on the task specified on the current</p>

Field	Description
	<p>line. In this way, you only need to enter hours in these fields if you need to make any changes to the pre-filled quantity of hours. However, the fields are only prefilled on time sheet lines referring to jobs where you entered a value in the <b>By Day</b> field in the <b>Pre-fill Time Sheet Lines</b> job parameter attribute.</p> <p>You cannot enter hours for days that are before the open posting period for the job specified on the current line. For further information, refer to the description of the Job Cost island in the Company Information workspace in the G/L module. If you enter hours for a date that comes after the open posting period, Maconomy issues a warning. In addition, it will only be possible to submit such time sheets, but not to perform any actions that will result in a posting. Whether it is the submission, release, or approval that determines when a time sheet is transferred for posting depends on the approval principle of each job. For further information about approval principles, refer to the description of the Approval island in the Jobs workspace.</p> <p>By changing the MDL layout of this window, you can insert variable day names in the sub-tab. For example, the column which is named <b>Monday</b> by default, can be changed to <b>Mon. &lt;date&gt;</b>. For more information, refer to the description of the Window Layouts workspace in the Set-Up module.</p>
<b>Description</b>	This field shows a description of the current entry.
<b>Activity Type</b>	This field shows the type of the current activity.
<b>Quantity Monday-Sunday, Transferred</b>	These fields show whether or not the quantities for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Remarks</b>	Enter remarks relating to the current line.
<b>Job Description</b>	This field shows a description of the job specified in the <b>Job No.</b> field. If it is an internal job, the description contains the job name, whereas the description of an external job contains the name of the customer to whom the job has been assigned.
<b>Internal Job</b>	This field displays the total time registered on internal jobs for the week.
<b>Spec. 1-3</b>	These fields show the specifications assigned to the current line.
<b>Task</b>	This field shows the type of the current activity.
<b>Time Activity 1-3</b>	These fields show the total time for activities in hours or days, depending on the time unit. Time activity can be used to calculate

Field	Description
	overtime, among others. The activity references can be created in the Time Sheet References workspace.
<b>Time Activity 1-3, Transferred</b>	These fields show whether or not the time activities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Amount Activity 1-4</b>	These fields show the total number of hours for the amount activities specified in the window Time Sheet References. Amount activities can for instance be used to register transport costs, meals, and so on.
<b>Amount Activity 1-4, Transferred</b>	These fields show whether or not the amounts have been transferred to a time sheet journal or the time sheet journal queue.
<b>Location</b>	This field shows the location assigned to the current line.
<b>Entity</b>	This field shows the entity assigned to the current line.
<b>Project</b>	This field shows the project assigned to the current line.
<b>Purpose</b>	This field shows the purpose assigned to the current line.
<b>Local Spec. 1-3</b>	This field shows the local specifications assigned to the current line.
<b>Company No.</b>	This field shows the name of the company responsible for the job on which the work was performed.
<b>Quantity 1-2</b>	These fields show the quantities registered in the entry.
<b>Quantity 1-2, Transferred</b>	These fields show whether or not the quantities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Transferred for Posting</b>	This field determines whether the current line has been transferred for posting.
<b>Total</b>	This field displays the total hours (or days) worked for the week for the job, dimension, task, and activity specified on the line.
<b>Cost Type</b>	This field shows the cost type of the current line.
<b>Submitted</b>	This field shows whether the current line has been submitted.

Field	Description
<b>New Approval Status, Project Manager</b>	<p>This field shows the status of the current line, as determined by the designated project manager of the job.</p> <p>When the time sheet is submitted, the project manager can approve, reject, or release each line if the approval principle of the job indicates that approval of time registrations by the project manager is mandatory or optional.</p> <p>If the status of the line is Approved or Released, and the line is changed, the status changes to blank. If the line is Rejected, then changed, the status does not change.</p>
<b>Approval, Project Manager</b>	<p>This field shows the approval status of the current line, as determined by the designated project manager of the job. The value in the <b>New Approval Status, Project Manager</b> field is transferred to this field when you use the <b>Execute Approval</b> action.</p>
<b>Approved by</b>	<p>This field shows the name of the project manager who assigned the current approval status to the line.</p>
<b>Approval Date</b>	<p>This field shows the date on which the project manager who assigned the current approval status assigned the approval status to the line.</p>
<b>Comment</b>	<p>This field shows any comments entered by the project manager in connection with the approval, release, or rejection of the line.</p>
<b>Approved by Superior</b>	<p>This field shows if the current line has been approved by the user's superior.</p>
<b>Released by Superior</b>	<p>This field shows if the current line has been released by the user's superior.</p>
<b>Keep Line</b>	<p>This field shows whether or not the current line is deemed permanent. If this check box is selected, the current line is automatically copied from the previous period at the creation of time sheets. New lines created inherit this status, which means that they will automatically be copied to all new time sheets until you deselect the check box on the selected line.</p>
<b>Planned This Period</b>	<p>This field shows whether or not the current line has been transferred, in which case the transfer action does not apply.</p>
<b>Est. Time to Compl.</b>	<p>This field shows the estimated time to completion of the current line.</p>
<b>Completed</b>	<p>This field shows whether or not the work on the current line is completed.</p>
<b>Estimate Date</b>	<p>This field shows the estimate date of the current line's completion.</p>
<b>Job Budget Type</b>	<p>This field shows the budget type assigned to the current job.</p>

Field	Description
<b>Job Budget Revision No.</b>	This field shows the revision number of the current job budget line.
<b>Overtime Spec.</b>	This field shows the overtime specification for the current line. Overtime specifications are defined in the Popup Fields tab in the System Setup workspace.
<b>Favorite</b>	This field shows a favorite, if it has been selected. Favorites are derived from the Favorites workspace.
<b>Note</b>	Enter a brief description of what you have been working on.
<b>Est. Time to Compl. Days</b>	Enter the number of days as an estimate to completion. If you enter a value in this field, Maconomy automatically converts it to hours, which is shown in the <b>Est. Time to Compl.</b> field. The number of hours is calculated by multiplying the number of days by the value in the <b>Hours per Man Day</b> field in the Jobs workspace.
<b>Description, Monday-Sunday</b>	Enter a daily description of the task specified on the current line. If daily descriptions are required for the task in question, Maconomy ensures that you enter a description for the task for the day in question before you can submit the time sheet.
<b>Transaction Timestamp</b>	This field shows the time of creation or the latest revision of the current line.
<b>Proposed Quantity</b>	This field shows the invoiceable quantity entered by the employee on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity, Monday-Sunday</b>	These fields show the invoiceable quantity entered by the employee for each day on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Quantity Transferred, Monday-Sunday</b>	This field shows the proposed invoiceable quantity entered by the employee for each day that can be transferred on an expense sheet line.
<b>Proposed Billing Price, Total</b>	This field shows the total proposed billing price in job currency per hour or day, depending on the Time Unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Proposed Billing Price, Unit</b>	This field shows the proposed billing price in job currency per hour or day, depending on the Time Unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.

Field	Description
<b>Billing Price, Currency</b>	This field shows the standard billing price of the current line in the currency of the job.
<b>Use Invoice Proposal</b>	This field shows whether the quantity and billing price in the following fields are used for invoicing: <ul style="list-style-type: none"> <li>Proposed Quantity</li> <li>Proposed Billing Price, Unit</li> <li>Proposed Billing Price, Total</li> </ul>
<b>Transaction Type</b>	This field shows the current line's transaction type. Transaction types are set up in the Transaction Types workspace.
<b>Invoiceable</b>	This field shows whether or not the line is invoiceable.
<b>Billing Price, Base</b>	This field shows the budgeted billing price in base currency.
<b>Billing Price, Enterprise</b>	This field shows the budgeted billing price in enterprise currency.
<b>Employee Category No.</b>	This field shows the employee category number that comes from job budget lines or that you add manually in this sub-tab.
<b>Absence Type</b>	Select the reason for the absence.
<b>Time Unit</b>	This field displays the time unit used for filing time (either hours or days).
<b>Option List 1-5</b>	Specify the option lists containing the values that should be available for further specification in the <b>Selected Value 1-5</b> fields on the current line.
<b>Selected Value 1-5</b>	Specify a number of values for further specification of the current line. You can only use values available in the respective option lists specified in the <b>Option List 1-5</b> fields.
<b>Spec. 4-10</b>	These fields show the specifications assigned to the current line.
<b>Local Spec. 4-10</b>	This field shows the local specifications assigned to the current line.
<b>Purchase Order Number</b>	This field shows the purchase order number to which the current line is associated to.

Field	Description
<b>Purchase Order Line Number</b>	This field shows the purchase order line number assigned to the current line.
<b>Employee</b>	This field shows the name of the employee assigned to the current line.
<b>Employee Position</b>	This field shows the position number assigned to the employee.
<b>Employee E-mail</b>	This field shows the employee's email address.
<b>Employee Phone</b>	This field shows the employee's phone number.
<b>Employee Mobile</b>	This field shows the employee's mobile number.
<b>Employee Company No.</b>	This field shows the employee's company number.
<b>Employee Company</b>	This field shows the company the employee is associated with.
<b>Job Name</b>	This field shows the name of the job to which the current line is associated.
<b>Project Manager No.</b>	This field shows the project manager number of the project manager assigned to the current line.
<b>Project Manager</b>	This field shows the name of the project manager assigned to the current line.
<b>Activity Description</b>	This field displays the title or name of the activity for which the employee registered time.
<b>Task Description</b>	This field displays the title or name of the task for which the employee registered time.
<b>Task Path</b>	This field shows any task path of the task.
<b>Company</b>	This field shows the name of the bill-to-customer assigned to the job on the current line.
<b>Customer No.</b>	This field shows the number of the bill-to customer assigned to the job on the current line.
<b>Customer</b>	This field shows the name of the bill-to customer assigned to the job on the current line.
<b>Time Unit, Job</b>	This field displays the time unit used for filing time (hours or days) on the job.

Field	Description
<b>Week</b>	This field shows the week number of the current time sheet.
<b>Year</b>	This field shows the year in which the current time sheet line was entered. The field cannot be changed.
<b>Location Description</b>	This field shows a description regarding the location assigned to the current line.
<b>Entity Description</b>	This field shows a description regarding the entity assigned to the current line.
<b>Project Description</b>	This field shows a description regarding the project assigned to the current line.
<b>Purpose Description</b>	This field shows a description regarding the purposes assigned to the current line.
<b>Spec. 1-10 Description</b>	This field shows descriptions regarding the specifications assigned to the current line.
<b>Local Spec. 1-10 Description</b>	This field shows descriptions regarding the local specifications assigned to the current line.
<b>Customer Level</b>	This field shows the customer level number for the customer to which the current line is associated.
<b>Level 1-5 No.</b>	These fields show the companies in the hierarchy above the specified company associated with the current line. These fields are only available if Customer Levels are set up using the designated system parameters.
<b>Level 1-5 Name</b>	These fields show the names of the companies in the hierarchy above the specified company associated with the current line. These fields are only available if Customer Levels are set up using the designated system parameters.
<b>Time Activity 1-3</b>	In these fields, you can specify time registration for activities as set up in Time Sheet References. This field is in hours or days, depending on the time unit on the time sheet.
<b>Monday-Friday</b>	These fields show registered time in hours or days, depending on the time unit of the time sheet. In these fields you enter the time used every day of the week on the specific job, dimension, task, and activity. You cannot register more hours in one day than the maximum number of hours entered for the employee in the employee revision applying to the date in question.  Moreover, if a value has been entered in the <b>Time Sheets</b> field in the Activities workspace for the activity for which you wish to register hours or amounts, you cannot enter a larger quantity for the activity than

Field	Description
	<p>specified in that field. If there are several time sheet lines for a given employee with the activity in question, the sum of the registrations on these lines cannot exceed the daily registration limit specified for the activity in question.</p> <p>It is possible to enter a negative number of hours. If the <b>Minimum Hours</b> field has been marked on the employee revision applying on the date in question, Maconomy checks whether the employee has registered the minimum number of hours that the employee in question is supposed to register. If the number of hours registered is lower than this number, the time sheet cannot be submitted. It can be temporarily submitted, however. See the description of the window Employees in the Set-Up module for further information.</p> <p>If time sheet lines are automatically created from the detailed resource planning, these fields will automatically be filled in with the quantity of hours planned for the employee on the task specified on the current line. In this way, you only need to enter hours in these fields if you need to make any changes to the pre-filled quantity of hours. However, the fields are only pre-filled on time sheet lines referring to jobs for which the <b>Pre-fill Time Sheet Lines</b> job parameter attribute has the <b>By Day</b> value.</p> <p>You cannot enter hours for days that are before the open posting period for the job specified on the current line. For further information, refer to the description of the Job Cost island in the Company Information workspace in the G/L module. If you enter hours for a date that comes after the open posting period, Maconomy issues a warning. In addition, it will only be possible to submit such time sheets, but not to perform any actions that will result in a posting. Whether it is the submission, release, or approval that determines when a time sheet is transferred for posting depends on the approval principle of each job. For further information about approval principles, refer to the description of the Approval island in the Jobs workspace.</p> <p>By changing the MDL layout of this window, you can insert variable day names in the sub-tab. For example, the column which is called <b>Monday</b> by default, can, be changed to <b>Mon. &lt;date&gt;</b>. For more information, refer to the description of the Window Layouts workspace in the Set-Up module.</p>
<b>Time Activity 1-3, Transferred</b>	These fields show whether or not the time activities have been transferred to a time sheet journal or the time sheet journal queue.
<b>Quantity Monday-Friday, Transferred</b>	These fields show whether or not the quantites for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Proposed Quantity Monday-Friday</b>	These fields show the invoiceable quantity entered by the employee for each day on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.

Field	Description
<b>Proposed Quantity Monday-Friday, Transferred</b>	These fields show whether or not the quantities for each day have been transferred to a time sheet journal or the time sheet journal queue.
<b>Proposed Quantity</b>	This field shows the invoiceable quantity entered by the employee on an expense sheet line. By default, the proposed quantity is equal to the quantity entered by the employee.
<b>Proposed Billing Price, Unit</b>	This field shows the proposed billing price in job currency per hour or day, depending on the time unit on the time sheet. Note that this field cannot be changed in the time sheet, but may be changed by the project manager.
<b>Total</b>	This field displays the total hours (or days) worked for the week for the job, dimension, task, and activity specified on the line.

## Actions

This section shows the Actions available in the Approve Draft Invoices by Employee workspace.

### Table Part

Field	Description
<b>Mark All For Approval</b>	Use this action to mark all approval object lines in the sub-tab for approval. This means the status in the <b>New Approval Status</b> field is set to Approved on all lines.
<b>Mark All For Release</b>	Use this action to mark all approval object lines in the sub-tab for release. This means the status in the <b>New Approval Status</b> field is set to Released on all lines.  This action can only be used if the <b>Trans. Non-Appr. Time Sheets</b> field is enabled in the System Information workspace, and the current user has access to transferring expense sheets as specified in the Actions workspace. The employee specified as the project manager for the current job, however, always has the right to release time sheets for the employee in question.
<b>Mark All For Rejection</b>	Use this action to mark all approval object lines in the sub-tab for rejection. This means the status in the <b>New Approval Status</b> field is set to Rejected on all lines.
<b>Unmark All</b>	Use this action to unmark all approval object lines in the sub-tab for approval. This means the <b>Approve</b> check box is deselected for all entries in the sub-tab.
<b>Execute Approval</b>	Use this action to put into effect all statuses indicated in the <b>New Approval Status</b> field for all lines. If any approval object lines are thus fully approved or released (for example, the expense sheet from which the approval object line originates was already approved or released by the supervisor), the lines in question are transferred to a registration journal which can then be posted.

Field	Description
	The <b>Approval Status</b> field is automatically updated with the value shown in the <b>New Approval Status</b> field.
<b>Approve All</b>	Use this action to approve all the lines pending approval that are listed in the sub-tab.
<b>Reset All</b>	Use this action to reset all the lines pending approval that are listed in the sub-tab.

## Current Employee Approvals Workspace

Use this workspace to view all available lines that require your approval.

This workspace provides information about the following approval objects:

- Time Sheets
- Time Sheet Lines
- Expense Sheets
- Expense Sheet Lines
- Purchase Orders
- Purchase Order Lines
- Vendor Invoices
- Vendor Invoice Allocation Lines
- Draft Invoices
- Job Budgets
- Employees
- Jobs
- Customers
- Company Customers
- Customers and Company Customers

The Approval Counters, No. of Approvals island shows how many lines per approval object is available for approval.

Selection criteria is available to enable you to filter what approvals to view. You can choose to view approvals by employee or job. You can also choose to view rejected lines, non-active lines, or only lines for which you are the substitute approver or super approver.

## Current Employee Approvals Tab

This section includes the fields and descriptions for the Current Employee Approvals tab.

### Current Employee Info island

Field	Description
<b>Current Employee No.</b>	This field shows the employee number for the currently logged in user
<b>Employee</b>	Enter or select an employee number to view the approval lines for that employee. By default, this field displays the same value as the <b>Current Employee No.</b> field.
<b>Employee Type</b>	This field shows the selected employee's employee type.

### Selection Criteria island

Field	Description
<b>Show Lines For Approval</b>	Select this check box to show items available for approval.
<b>Job</b>	Select or enter a job to view only the lines related to it in the sub-tab.
<b>Show Non-Active Lines</b>	Select whether to show approval items that are not yet active.
<b>Show Rejected Lines</b>	Select whether to show rejected approval items.
<b>Show Substitute Lines</b>	Select whether to show the approval items for which you are a substitute approver.
<b>Show Super Approver Lines</b>	Select whether to show approval items for which you are a super approver.
<b>Show Approvable by All Approval Lines</b>	Select whether to show all approval items that can be approved by any user.

### Approval Counters, No. of Approvals island

Field	Description
<b>Time Sheets</b>	This field shows the number of active approvals for time sheets for the current employee logged in. This also depends on the job number entered in the selection criteria.
<b>Time Sheet Lines</b>	This field shows the number of active approvals for time sheet lines for the current employee logged in. This also depends on the job number entered in the selection criteria.

Field	Description
<b>Expense Sheets</b>	This field shows the number of active approvals for expense sheets for the current employee logged in. This also depends on the job number entered in the selection criteria.
<b>Expense Sheet Lines</b>	This field shows the number of active approvals for expense sheet lines for the current employee logged in. This also depends on the job number entered in the selection criteria.
<b>Purchase Orders</b>	This field shows the number of active approvals for purchase orders for the current employee logged in. This also depends on the job number entered in the selection criteria.
<b>Purchase Order Lines</b>	This field shows the number of active approvals for purchase order lines for the current employee logged in. This also depends on the job number entered in the selection criteria.
<b>Vendor Invoices</b>	This field shows the number of active approvals for vendor invoice allocations for the current employee logged in. This also depends on the job number entered in the selection criteria.
<b>Vendor Invoice Allocation Lines</b>	This field shows the number of active approvals for vendor invoice allocation lines for the current employee logged in. This also depends on the job number entered in the selection criteria.
<b>Draft Invoices</b>	This field shows the number of active approvals for invoice drafts for the current employee logged in. This also depends on the job number entered in the selection criteria.
<b>Job Budgets</b>	This field shows the number of active approvals for job budgets for the current employee logged in. This also depends on the job number entered in the selection criteria.
<b>Employees</b>	Copy to come.
<b>Jobs</b>	Copy to come.
<b>Customers</b>	Copy to come.
<b>Company Customers</b>	Copy to come.
<b>Customers and Company Customers</b>	Copy to come.

## Approver Access Ticket Expiration Workspace

Use this workspace for scheduled background tasks related to deleting approver tickets.

This workspace provides support for creating scheduled background tasks to delete approver access tickets.

## Approver Access Ticket Expiration Actions

This section shows the actions available in the Approver Access Ticket Expiration workspace.

### Top Tab

Field	Description
<b>Delete Expired Tickets</b>	This action is run by a scheduled background task to delete all expired approver excess tickets.

## Archiving Section

Use this section to learn about Archiving workspaces.

### Archiving Single Dialog Workspace

Use this workspace to select the finance entries you want to archive, and to view logs that show archived information.

After you select finance entries for archiving, you can safely delete them or move them to another database. After you archive them, the finance entries are no longer available from within Maconomy.

When you select finance entries for archiving, Maconomy creates an Archiving Log entry for each combination of company and fiscal year of the included finance entries. Each log entry contains information about who selected the entries, when they were selected, and how many finance entries were selected for this combination of company and fiscal year.

Use the Archiving island to define the cut-off date and the range of companies when you use the **Mark for Archiving** action. You can use the Selection Criteria island to indicate which Archiving Log entries should be displayed in the Archiving Logs sub-tab.

### Archiving Tab

This section includes the fields and descriptions for the Archiving tab.

### Archiving Island

Field	Description
<b>Archive Entries Before Date</b>	In this field, enter the date on which you want to stop including finance entries to be archived. Note that the value for this field can be overruled by the value set for the <b>Prevent Archiving of Previous Fiscal Years</b> system parameter.
<b>Company No.</b>	In these fields, enter a range of company numbers for those companies whose finance entries you want to archive.

**Selection Criteria Island**

Field	Description
<b>Show Archiving Logs</b>	Select this check box if you want the archiving logs to display in the Archiving Logs sub-tab.
<b>Date</b>	In these fields, enter a date range to identify the archiving logs to display in the Archiving Logs sub-tab.
<b>Company No.</b>	In these fields, enter a range of company numbers for those companies for which you want to display archiving logs in the Archiving Logs sub-tab.

## Archiving Logs Sub-Tab

This section includes the fields and descriptions for the Archiving Logs sub-tab.

Field	Description
<b>Company No.</b>	In this field, enter the company number of the company whose finance entries are selected for archiving.
<b>Company Name</b>	In this field, enter the name of the company whose finance entries are selected for archiving.
<b>Period Start</b>	In this field, enter the start date of the fiscal year for which finance entries are selected.
<b>Period End</b>	In this field, enter the end date of the fiscal year for which finance entries are selected.
<b>Archived By</b>	This field displays the name of the user who selected the finance entries for archiving.
<b>Archived Date</b>	This field displays the date when the finance entries were selected for archiving.
<b>Archived Entries</b>	This field displays the number of finance entries selected for archiving.

## Actions

This section shows the Actions available in the Archiving workspace.

**Top Tab**

Field	Description
<b>Mark for Archiving</b>	Use this action to select finance entries for archiving. Enter a range of companies and a cut-off date for age of entries to include.

## Database Schema Section

Use this section to learn about Database Schema workspaces.

### Database Relations Single Dialogs Workspace

Use this workspace to review information about the tables and fields in the Maconomy database.

You cannot change any information in this workspace, but you can use the **Initialize Instance Keys** action to activate instance key registration on the current table, if it is not already active.

In the Database Relations tab, you can browse through the relations in the database. The Database Fields sub-tab lists the fields identified by the current relation, showing various information on the individual fields.

When instance key registration is active for a relation, Maconomy assigns an instance key value to each existing entry in the relation, and whenever entries are created, Maconomy also assigns instance key values to them.

An instance key value is a number that is assigned to a given database entry and is unique within the whole Maconomy database. This means that no two database entries, regardless of the relations to which they belong, can have the same instance key value. This allows you to identify entries by means of one number, whereas in the case of regular database relation keys, multiple entries that belong to different relations can have identical key values, and the identification is made through fields with different names and types, sometimes using several fields. Instance keys thus make it easier to refer directly to a given entry in any relation without having to specify a relation name and several key values. Note that the functionality of regular database key fields is unaffected by the activation of instance keys, because instance keys simply function as an optional way of identifying entries across relations, instead of just within individual relations.

For example, instance keys are used in the Users workspace. As described in the User Types workspace, users can be based on information in other Maconomy workspaces, and an instance key is therefore used to refer to the database entry on which an individual the user was based.

However, to avoid unnecessary processing and system workload, instance key registration is by default only used on certain relations. For each relation for which you want to be able to refer to instance keys, you must initiate the registration in this workspace.

#### Database Relations Tab

This section includes the fields and descriptions for the Database Relations tab.

#### Database Relation Island

Field	Description
<b>Internal Relation Name</b>	This field shows the system's internal name of the current relation. The internal name is shown in the kernel language of your Maconomy system.
<b>Relation Name</b>	This field shows the system's external name of the current relation. The external name is shown in the language currently selected in the Preferences workspace of your Maconomy client.

Field	Description
<b>Class Type</b>	This field shows whether the current relation is a database relation or a parameter set. However, as this workspace only shows relations, the value in this field will always be "Relation."
<b>Instance Keys Applied</b>	This field shows whether instance key registration is active for the current database relation. If instance keys are not currently used, but you wish to start using instance key registration on the current relation, select the action "Initialize Instance Keys." For further information on instance key registration, see the introduction to this workspace and the description of the action "Initialize Instance Keys."

### Database Fields Sub-Tab

This section includes the fields and descriptions for the Database Fields sub-tab.

Field	Description
<b>Internal Field Name</b>	This field shows the system's internal name of the database field on the current line.
<b>Field Name</b>	This field shows the system's external name of the database field on the current line.
<b>Type</b>	This field shows the field type of the database field on the current line. The type determines the kind of information which is allowed to be entered into the field in question, for instance amounts, dates, integers or text strings. For detailed information on the field types available and their functionality, see the manual "Maconomy Database Description."
<b>Popup Type</b>	If the field on the current line is of the type "PopupValue," this field shows the pop-up type to which the field belongs. The pop-up types are fixed in Maconomy, and are used for determining which options are available in the pop-up field.
<b>Field No.</b>	This field shows the current field's internal sorting order in the relation. The sorting order has no functionality as such, and the field is therefore only for information.
<b>Key Field</b>	This field shows whether the field on the current line is part of the key in the current database relation. Key fields are used for uniquely identifying each entry in the database relation as no two entries can have the same values in the key fields. If the key consists of several fields, no two entries in the relation can have the same combination of values in the key fields.
<b>Mandatory Field</b>	If the field is marked, the database field is mandatory.
<b>New Field</b>	If the field is marked, the database field is open in Create state.

Field	Description
<b>Update Field</b>	If the field is marked, the database field is open in Change state.

## Actions

This section shows the Actions available in the Database Relations workspace.

### Top Tab

Field	Description
<b>Initialize Instance Keys</b>	When you select this action, Maconomy assigns an instance key value to each existing entry in the relation currently shown in the workspace. Once this is done, entries created in the relation are also assigned an instance key value. For further information on instance key registration, see the introduction to this workspace.

## Delete Section

This section includes the fields and descriptions for the Delete section workspaces.

### Delete Security Log Single Dialogs Workspace

Use this workspace to delete outdated entries in the security log.

Maconomy automatically records sensitive user actions—such as attempts by unknown users to log in—in the security log.

This workspace lets you delete all entries that were created prior to the beginning of the previous calendar year. For example, if today's date is January 17, 2015, it deletes log entries up to and including December 31, 2013.

It is recommended that you make a backup copy before you delete the security log. Maconomy prints a list of the deleted entries.

### Delete Security Log Tab

This section includes the fields and descriptions for the Delete Security Log tab.

Copy to come

## Actions

This section shows the Actions available in the Delete Security Log workspace.

### Top Tab

Field	Description
<b>Delete Security Log</b>	Use this action to delete the security log.

## Documents and Notes Section

This section includes the fields and descriptions for the Document and Notes section workspaces.

### Document Archives Single Dialogs Workspace

Use this workspace to create document archives in which you can store non-Maconomy files, including correspondence, presentations, spreadsheets, and so on.

The files can be of any format, such as Microsoft Word, Excel, PowerPoint, and others.

You can assign an archive to an employee, customer, job, sales order, or other entity, or to an event flow. For example, you can create a document archive for each employee that contains the employee's CV or resume and employment contract.

When you create an archive, you can assign it to employees, customers, jobs, event flows, quotes, sales orders, and assets.

For example, by assigning an archive to an event flow, you can keep track of the documents that are relevant for the entire flow. Another example could be to assign a document archive to each employee in the company that contains files like the employee's CV and employment contract. For each document archive you can assign an access level to restrict the use of the archive. You can also print the archives.

In the Document Archives tab of this workspace you specify the number and name of the archive in question. In the Documents sub-tab, you specify the documents to be assigned the current archive. When you create a line and press **Return**, Maconomy displays a dialog box in which you can choose the file you want to assign to a line in the document archive.

### Document Archives Tab

This section includes the fields and descriptions for the Document Archives tab.

#### Archive Island

Field	Description
<b>Archive No.</b>	In this field, you can enter a number or a name to apply to the document archive. If you do not specify a value in this field, Maconomy will attempt to assign the new document archive a number from the number series specified for the company to which the document archive is assigned.

Field	Description
<b>Description</b>	In this field, you can enter a description of the document archive in question.
<b>Revision Control</b>	<p>In this field, you can specify whether to use revision control on the current document archive. If you mark the field, Maconomy will apply revision control to the documents in the archive, meaning that you will be able to store previous versions of each document when importing a new version. This allows you to view previous versions using the workspace Document Revision History.</p> <p>When revision control is used, the sub-tab shows the latest revision of each line in the current archive. The latest revision can be either open or closed, and the current status is indicated in the field "Latest Revision is Closed" on each line. As long as the latest revision of a given line is open, importing a new file to the line in question will cause the file stored in the latest revision to be overwritten and thereby lost. However, if the latest revision is closed before importing a new file, an open revision is automatically created, and the new file will be stored in that revision. This way, you will be able to look up and retrieve previous versions of the document stored on the document archive line using the workspace Document Revision History. A revision is closed by placing the cursor on the line in question and selecting the action "Close Latest Revision." However, by marking the field "Close on Import," you can ensure that when importing a new file to an existing line, the latest revision of that line is automatically closed before the import is carried out, thus causing a revision to automatically always be created when importing a new file to a given line.</p> <p>If you do not mark the field, revision control is not applied, and importing a new file to an existing line will always cause the document previously stored on the line in question to be overwritten.</p>
<b>New Revision on Update</b>	<p>In this field, you can specify that each time a new file is imported to a given line using the action "Import Document," any existing, open revision of the line in question is automatically closed (corresponding to selecting the action "Close Latest Revision"), causing the imported file to be stored in a new revision instead of overwriting the file in the revision that was open when the action was selected.</p> <p>If you do not mark the field, the user must manually close the latest revision if he or she does not want to overwrite the current file.</p>
<b>Enable Locking</b>	In this field, you can specify whether to use edit control on the current document archive. Without edit control, any user can export a given document, make changes, and re-import it, either resulting in a new revision of the document archive line in question or simply overwriting the existing version of the file assigned to the archive line (see the field "Revision Control" above). However, if multiple users are able to export, edit, and re-import the same document, there is a risk that the individually imported versions of the document overwrite each other or are stored in separate revisions instead of all changes being merged into the same version of the document. With edit control, a user can lock a given document archive line to ensure that only he or she can import new files to the line in question. This is done by placing the cursor on the desired line and selecting the action "Lock." If a line has been locked, other users will still be able

Field	Description
	<p>to export the file stored on the line in question, and make changes to the exported file, but only the user who locked the line can reimport it. This way you ensure that changes made by different users are reviewed and merged by the user who locked the line. Please note that the edit control does not prevent users from editing locked documents that they have exported it merely prevents them from re-importing the documents.</p> <p>A line which has been locked by a given user can only be unlocked again by the same user using the action "Unlock." However, using the field "Unconditional Document Unlocking" in the workspace Actions, individual users can be granted the right to unlock document archive lines locked by any other user.</p> <p>If you do not mark the field, edit control is not applied, and the document archive lines cannot be locked.</p>

### Company Island

Field	Description
<b>Company</b>	<p>In this field, you can enter the number of the company to which the document archive should be assigned.</p> <p>This field also shows the name of the specified company.</p>

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can specify the name of an access level. You only have access to the current document archive if you have been assigned to the same or a higher level in the workspace User Access Levels. This means that you can only specify document archives (for example, on a job or a customer) to which you have access. Furthermore, a given user can only see the document archive to which he or she has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to document archives may depend on other factors. For more information about this, please see the section "Introduction to the Access Control System."</p> <p>If no access level is specified, this field has no influence on user access to the current document archive.</p> <p>This field also shows a description of the specified access level.</p>

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Remarks Island

In these fields, you can enter a number of remarks to apply to the document archive in question.

## Documents Sub-Tab

This section includes the fields and descriptions for the Documents sub-tab.

Field	Description
<b>Document Name</b>	This field shows the name of the file assigned to the document archive. The field is automatically filled in by Maconomy and cannot be changed manually.
<b>Document Type</b>	This field shows the type of the file assigned to the document archive. The files to be stored in a given document archive can be of any format, for example, MS Word, Excel, PowerPoint, and so on. The field is automatically filled in by Maconomy and cannot be changed manually.
<b>Document Size (Bytes)</b>	This field shows the size of the file assigned to the document archive. The size is displayed in bytes.
<b>Locked</b>	This field shows whether the current line has been locked. Lines are locked using the action "Lock." For further information about the effects of locking a document, and how to unlock a locked line, see the description of the field "Edit Control."
<b>Locked By</b>	If the field "Locked" above is marked, this field shows the name of the user who locked the current line. A locked line can only be unlocked by the user who locked it or by a user granted access to unconditionally unlock document archive lines. This permission is granted in the workspace Actions.
<b>Revision No.</b>	This field shows the number of the latest revision of the document archive line. If revision control is not used in the current document archive, the number is always 1.
<b>Revision Text</b>	In this field, you can enter a description of the latest revision of the document archive line. The description is stored when the latest revision is closed, thus appearing in the workspace Document Revision History.
<b>Changed on</b>	This field shows the date on which the file was last modified. If the file has not been modified, the field shows the date on which the file was placed in the archive.
<b>Time of change</b>	This field shows the time at which the file was last modified. If the file has not been modified, the field shows the time at which the file was placed in the archive.
<b>Changed by</b>	This field shows the name of the last user to import a file to the current line.
<b>Latest Revision is Closed</b>	This field shows whether the latest revision of the document archive line is closed. If the revision is closed, importing a file to the line will result in a revision being created, causing the file to be imported to the new revision. If the revision is not closed, importing a file to the line will cause the file stored in the latest revision to be overwritten and lost. Please note, however, that if the field "Close Revision on Import" has been marked in the tab, the latest

Field	Description
	<p>revision is automatically closed when a file is imported, ensuring that a file being imported is always stored in a new, separate revision.</p> <p>You can close the latest revision by selecting the action “Close Latest Revision.” This action can only be selected if the field “Revision Control” is marked in the tab. For further information, see the description of the field “Revision Control.”</p>
<b>Closed, Date</b>	If the latest revision has been closed (see the field “Latest Revision Closed” above), this field shows the date on which the revision was closed.
<b>Closed, Time</b>	If the latest revision has been closed (see the field “Latest Revision Closed” above), this field shows the time when the revision was closed.
<b>Closed By</b>	If the latest revision has been closed (see the field “Latest Revision Closed” above), this field shows the name of the user who closed the revision.
<b>Access Level</b>	<p>In this field, you can specify the name of an access level. You only have access to the current document archive line if you have been assigned to the same or a higher level in the workspace User Access Levels. This means that in other workspaces, you can only refer to document archive lines to which you have access. Furthermore, a given user can only see the document archive line to which he or she has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to document archive lines may depend on other factors. For more information about this, please see the section “Introduction to the Access Control System.”</p> <p>If no access level is specified, this field has no influence on user access to the current document archive.</p>
<b>Remarks 1-10</b>	In these fields, you can enter remarks to the file assigned to the line in question. If a revision of the current line is created, the values in these fields are automatically copied to the new revision.

## Actions

This section shows the Actions available in the Document Archives workspace.

### Bottom Tab

Field	Description
<b>Update Document</b>	<p>This action is only available if the currently active line has not been locked by another user (see the field “Locked”). When you select this action, Maconomy displays a file selection dialog in which you can choose the file to be imported to the current line. The name of the file chosen must be identical to the name of the file in the document archive on which you have placed the cursor.</p> <p>If the latest revision of the line has been closed, a revision is automatically created, and the selected file is imported to the new revision. The previous revision will appear in the workspace Document Revision History.</p>

Field	Description
	If the latest revision of the line is open, the file imported will overwrite the file currently stored in the latest revision. However, if the field "Close on Import" has been marked, the latest revision of the line is automatically closed when this action is selected, thus ensuring that the file imported is stored in a separate, new revision.
<b>Export Document</b>	When you select this action, Maconomy displays a file selection dialog in which you can choose a destination for the file to be exported. By means of this action you can, for example, export a document in the archive to your own desktop, if you need to read or make changes to the document in question or you can export the document to any other relevant folder. Note that when you export a file, the file is not removed from the document archive in question.
<b>View Document</b>	When you select this action, the file assigned to the archive line on which you have placed the cursor is displayed in a third party program, such as, for example, Acrobat Reader, a word processing application or a browser.
<b>Lock Document</b>	This action is only available if the field "Edit Control" has been marked for the current document archive. When you select this action, the document on the line on which you have placed the cursor is locked. For further information about the effects of locking a document, see the description of the fields "Edit Control" and "Locked."
<b>Unlock Document</b>	This action is only available if the field "Edit Control" has been marked for the current document archive and the currently active line has been locked. When you select this action, the document on the line on which you have placed the cursor is unlocked. A locked line can only be unlocked by the user who locked it or a user who has been granted access to unconditionally unlock document archive lines. This access is granted in the workspace Actions. For further information about locked documents, see the description of the fields "Edit Control" and "Locked."
<b>Close Latest Revision</b>	This action is only available if the field "Revision Control" has been marked for the current document archive. When you select this action, the latest revision of the line on which you have placed the cursor is closed. For further information about the effects of closing a revision, please see the description of the fields "Revision Control" and "Latest Revision Closed."
<b>Delete Document Archive</b>	Use this action to delete a document archive. An error displays if you delete a document archive that is used in an invoice edit, previous edit, or an invoice.

## Document Revision History Single Dialogs Workspace

Use this workspace to review revisions made to the documents that are stored in your document archives.

You can see which documents have been changed and open or export the documents for further review.

In the Document Revision History tab, you can select the document archive line whose revisions you want to see by browsing to the relevant combination of document archive number and line number, corresponding to the position of the line in the Documents sub-tab of the Document Archives workspace. The Document Revisions sub-tab of the Document Revision History workspace then displays a line for each revision that has been created for the document archive line that you selected in the document Revision History tab. The latest revision is also displayed, even though it might still be open. The lines are sorted by revision number, with the latest revision appearing on the top line. For more information about the concept of multiple revisions of archive lines, see the description of the **Revision Control** field in the Document Archives workspace.

Each line in the Document Revisions sub-tab displays information that is similar to the information that appears in lines in the Document Archives workspace, and you can perform similar actions. By placing the cursor on the appropriate revision line and using the **Show Document** or **Export Document** action, you can view or export the document that is stored in a given revision, for instance if you want to compare it to the latest revision. You can also lock, unlock, and close the latest revision using actions in this workspace.

## Document Revision History Tab

This section includes the fields and descriptions for the Document Revision History tab.

### Document Island

Field	Description
<b>Document Name</b>	This field shows the name of the document stored on the document archive line selected in the tab.
<b>Locked</b>	This field shows whether the latest revision of the current document archive line has been locked. For further information on the concept of locking documents, see the description of the field "Edit Control" in the tab of the workspace Document Archives.
<b>Locked By</b>	If the field "Locked" above is marked, this field shows the name of the user who locked the current document archive line. A locked document archive line can only be unlocked by the user who locked it or by a user granted access to unconditionally unlock document archive lines. This access is granted in the workspace Actions.
<b>Latest revision is closed</b>	<p>This field shows whether the latest revision of the current document archive line is closed. If the revision is closed, importing a file to the line will result in a revision being created, causing the file to be imported to the new revision. If the revision is not closed, importing a file to the line will cause the file stored in the latest revision to be overwritten and lost. Please note, however, that if the field "Close Revision on Import" has been marked for the document archive to which the document archive line pertains, the latest revision is automatically closed when a file is imported, ensuring that a file being imported is always stored in a new, separate revision.</p> <p>You can close the latest revision by selecting the action "Close Latest Revision." This action can only be selected if the field "Revision Control" is</p>

Field	Description
	marked in the tab. For further information, see the description of the field "Revision Control."

### Document Archive Island

Field	Description
<b>Document Archive</b>	This field shows the number and description of the document archive to which the archive line selected in the tab pertains.

### Access Level Island

Field	Description
<b>Access Level</b>	This field shows the name and description of the access level assigned to the document archive to which the archive line selected in the tab pertains.

### Document Revisions Sub-Tab

This section includes the fields and descriptions for the Document Revisions sub-tab.

Field	Description
<b>Revision No.</b>	This field shows the number of the revision presented on the current line in the sub-tab.
<b>Revision Text</b>	This field shows the description of the revision, as entered before the revision was closed. For the latest revision, the text can be entered as long as the revision has not been closed.
<b>Document Type</b>	This field shows the type of the file assigned to the revision.
<b>Document Size (Bytes)</b>	This field shows the size of the file assigned to the revision. The size is displayed in bytes.
<b>Changed on</b>	This field shows the date on which the file was last modified. If the file has not been modified, the field shows the date on which the file was assigned the document archive.
<b>Time of change</b>	This field shows the time when the file was last modified. If the file has not been modified, the field shows the time at which the file was assigned the document archive.
<b>Changed by</b>	This field shows the name of the last user to import a file to the current line.
<b>Closed</b>	This field shows whether the revision on the current line is closed. Only the latest revision of a given document archive line can be open.

Field	Description
<b>Closed, Date</b>	If the revision has been closed (see the field “Closed” above), this field shows the date on which the revision was closed.
<b>Closed, Time</b>	If the revision has been closed (see the field “Closed” above), this field shows the time when the revision was closed.
<b>Closed By</b>	If the revision has been closed (see the field “Closed” above), this field shows the name of the user who closed the revision.
<b>Remarks 1-10</b>	These fields show the description of the revision, as entered before the revision was closed. For the latest revision, the remarks can be entered as long as the revision has not been closed.

## Actions

This section shows the Actions available in the Document Revision History workspace.

### Top Tab

Field	Description
<b>Update Document</b>	This action is used for importing a new document to the archive line selected in the tab. The functionality of the action is similar to that of the corresponding action in the workspace Document Archives. Therefore, for further information about the action, see the description of the action “Import Document” in the section on the workspace Document Archives.
<b>Lock Document</b>	This action is only available if the field “Edit Control” has been marked for the current document archive.  When you select this action, the latest revision of the document line selected in the tab is locked. For further information about the effects of locking a document, see the description of the fields “Edit Control” and “Locked.”
<b>Unlock Document</b>	This action is only available if the field “Edit Control” has been marked for the current document archive and the current document archive line has been locked.  When you select this action, the latest revision of the document line selected in the tab is unlocked. A locked document can only be unlocked by the user who locked it or a user who has been granted access to unconditionally unlock document archive lines. This access is granted in the workspace Actions. For further information about locked documents, see the description of the fields “Edit Control” and “Locked.”
<b>Close Latest Revision</b>	This action is only available if the field “Revision Control” has been marked for the current document archive. When you select this action, the latest revision of the document archive selected in the tab (that is, the revision on the top line of the sub-tab) is closed. For further information about the effects of closing a revision, please see the description of the fields “Revision Control” and “Latest Revision Closed.”

## Bottom Tab

Field	Description
<b>Export Revision</b>	<p>This action is used for exporting the file assigned to a given revision, allowing you to view, edit, and re-import it if desired. The document exported is the one on the line on which you have placed the cursor.</p> <p>When you select this action, Maconomy displays a file selection dialog in which you can choose a destination for the file to be exported. By means of this action you can, for example, export a document in the archive to your own desktop if you need to read or make changes to the document in question, or you can export the document to any other relevant folder. Note that when you export a file, the file is not removed from the document archive in question.</p>
<b>Show Revision</b>	<p>When you select this action, the file assigned to the revision line on which you have placed the cursor is displayed in a third-party program, such as Acrobat Reader, a word processing application, or a browser.</p>

## Document Archive Setup Single Dialogs Workspace

Use this workspace to define the setup of standard document archives, which are the archives that Maconomy creates automatically when you attach the first document to an employee, job, or other entity.

You can set up different standard document archives for different companies and document archive types.

### Standard Document Archive Setup Tab

This section includes the fields and descriptions for the Standard Document Archive Setup tab.

#### Selection Criterion Island

Field	Description
<b>Company No.</b>	<p>This field allows you to enter a restriction on the company number for the lines shows in the table. The field can be left blank which then removes such a restriction.</p>
<b>Standard Archive Type</b>	<p>This field allows you to enter a restriction on which lines to show in the sub-tab. The field can be left blank which then removes such a restriction.</p>

## Document Archive Setup Sub-Tab

This section includes the fields and descriptions for the Standard Document Archive Setup sub-tab.

Field	Description
<b>Company No.</b>	The setup on this line applies to standard document archives created for records in the company specified in this field. The field can be left blank, which then removes such a restriction.
<b>Standard Archive Type</b>	The setup on this line applies to standard document archives of the type specified in this field. The field can be left blank, which then removes such a restriction.
<b>Revision Control</b>	If the line applies to a new standard document archive, then this archive will be created with revision control if this field is selected.
<b>New Revision on Update</b>	If the line applies to a new standard document archive, this archive will be created with "New Revision On Update" enabled if this field is selected.
<b>Enable Locking</b>	If the line applies to a new standard document archive, this archive will be created with locking enabled if this field is selected.
<b>Access Level Prefix</b>	New document archives created when you attach a document to an entity of the given standard archive type is given an access level. For example, if the field Standard Archive Type is "Expense Sheet" then the new document archive that is created when you attach the first document to an expense sheet is given an access level with the prefix specified in this field, such as EXP. Note that you can specify the same access level prefix for multiple archive types or note types. If they then also have the same setting in the field <b>Access Level Employee Specific</b> , then the same access levels can be used across those different document and note types.
<b>Access Level Employee Specific</b>	<p>This field controls the format which indicates the access level assigned to new document archives if the field Access Level Prefix is filled in. If this field is selected, then the access level name has the format:</p> <p>&lt;prefix&gt; &lt;company number&gt; &lt;employee number&gt;</p> <p>where the <i>prefix</i> is specified in the field <b>Access Level Prefix</b>, the <i>company number</i> comes from the document archive, and the <i>employee number</i> comes from the current user. If this field is not selected, the access level name will instead has the format and access level:</p> <p>&lt;prefix&gt; &lt;company number&gt; (excluding the employee number)</p> <p><b>Note</b></p> <p>: The field is enabled when the access level prefix is not blank. If it is blank, this field has no effect.</p>
<b>Access Level Employee Specific</b>	Copy

Field	Description
<b>Grant Access Level to Supervisor</b>	<p>When you attach the first document to an entity the new document archive will be given an access level if the field Access Level Prefix is filled in. This access level will be granted to yourself (as user). Moreover, if this field is ticked, the access level will also be granted to your supervisor.</p> <p><b>Note</b></p> <p>: The field is enabled when the access level prefix is not blank. If it is blank, this field has no effect.</p>
<b>Created by</b>	This field shows the name of the user who created this line.
<b>Created on</b>	This field shows the date of creation.
<b>Changed by</b>	This field shows the name of the user who made the last change to this line.
<b>Changed on</b>	This field shows the date of the last change to this line.
<b>Version</b>	This field shows the version number of the line.

## Layout Section

This section includes the fields and descriptions for the Layout section workspaces.

### Window Layouts Single Dialogs Workspace

Use this workspace to maintain a list of the layouts that are available for each window in Maconomy.

A layout defines which elements (fields, labels, variables, and so on) are displayed when a user opens a window. You can design different layouts and assign them to different user groups. You can also specify that a window should be translated into different languages.

You define layouts in text files, using the MDL programming language. You can edit these text files to create multiple layouts for a single workspace.

Using layouts, you can define several versions of the same window. For example, you can use this feature to implement familiar terminology in Maconomy. In the Window Layout Groups workspace you can associate each layout with a user group, thus ensuring that specific user types only see the necessary fields for their workflows. If you do not associate user groups with the layouts, the users see the default layout that you specify in this workspace.

The Window Layouts tab displays the name of a window in Maconomy. In the Layouts sub-tab you can assign layouts to the window in question.

### Editing Layouts

When you assign a layout to a window, Maconomy imports the associated text file to the server and stores it centrally. You assign a layout to a window by pressing **Return** in the Layouts sub-tab and selecting the text document that contains the appropriate layout description.

In this workspace, you can export layouts from the server to your own computer. You can then edit a layout locally and reimport it to the server using this workspace. Maconomy imports the layout into the Custom layer.

## Layers

The layouts are divided into layers: Standard, Solution, and Custom. Maconomy displays the window layout in a certain order of priority: Custom, Solution, Standard. When a user opens a window, Maconomy takes the layout of the window from the Custom layer, if it exists. If the window layout does not exist in the Custom layer, Maconomy takes it from the Solution layer or from the Standard layer (which always exists). Note that you can change the order of priority by assigning layouts to user groups. That kind of change is not taken into account in the following description of the layers:

- **Standard** — The layouts in this layer are the ultimate fallback layouts. That is, this layout is displayed if no layouts exist in any other layer. Maconomy provides the layouts in this layer; they are called the original layout. You cannot delete the original layout, but you can export an original layout, change it, and reimport it into the Custom layer under another name.
- **Solution** — Deltak designs the layouts in this layer to support a Maconomy solution such as the Maconomy Consulting Solution (MCS) or the Maconomy Agency Solution (MAS). Deltak provides the layouts in this layer.
- **Custom** — You can customize the layouts in this layer if you have the correct access privileges. Consultants typically create customized layouts. For example, if you are a consultant, you can make small adjustments to a layout to support local terminology or to add a company logo, or you can heavily modify a layout to support different users in their workflows.

Only one Standard and Solution layout typically exists. In some cases, a Maconomy developer or consultant might add more layouts in some cases, but this must be done before the system is installed.

Each window has a default layout. The default layout is the layout that is displayed to the user if no other layout has been defined for the window in question in any of the groups to which the user is assigned. If you delete the layout that is identified as the default layout, Maconomy automatically uses the "Original" layout in the standard layer as the new default layout for the current window.

## Localization

If you select the **Localize Custom Layout** field on a line in the Layouts sub-tab, the layout in the custom layer is localized via dynamic translation.

If you installed the "Dynamic Translation" add-on on the server, you can choose a client language in the Language Selection workspace on the Settings menu (in the Maconomy client for the Java™ platform, this is defined elsewhere). Follow these steps to have Maconomy dynamically translate the current window layout:

1. Make sure that you export the layout file using the **Export Standard/Solution/Custom Layout** action—not the **Export Localized Standard/Solution/Custom Layout** action. This exports the layout in nonlocalized (US English) form. See also the **Export Standard Layout** action.

2. Edit the resulting text file in a text editor, as described in the "Window Design using MDL" guide. Note that you cannot enter new items in the layout; you can only edit existing items.
3. Import the edited text file as described in the following section "Import Custom Layout."
4. Verify that the **Localize Custom Layout** field is selected for the imported window layout.

The imported layout is now localized as any other layout in the system.

### Actions in this Workspace

The workspace provides actions for exporting the layout on the current line in the Layouts sub-tab on all layers. In addition, you can import and delete layouts in the Custom layer.

### Window Layouts Tab

This section includes the fields and descriptions for the Window Layouts tab.

### Window Island

Field	Description
<b>Module Name</b>	This field shows the name of the module to which the current workspace belongs.
<b>Window Name</b>	This field shows the name of the current Maconomy workspace. The sub-tab only shows layouts assigned to the workspace in this field, and by adding lines to the sub-tab, you can assign additional layouts to the workspace.
<b>Internal Window Type</b>	<p>This field shows the dialog type of the current workspace. There are six types of dialogs in Maconomy, which are described briefly below:</p> <ul style="list-style-type: none"> <li>■ <b>Dialog Window</b> — Windows of this type contain a tab and very often a sub-tab. These workspaces are used for registering and viewing information. Examples of dialog workspaces are the workspaces Time Sheets, General Journal, and Vendor Information Card.</li> <li>■ <b>Parameter Window</b> — Parameter workspaces are workspaces in which you can specify a number of parameters, for instance a range of sales order numbers, and execute a function by accepting the parameters. Examples of parameter workspaces are the workspaces Item Purchase Selection, Interest Selection, and all printout workspaces.</li> <li>■ <b>Search Window</b> — The search panes in Maconomy, which define the fields you can search by.</li> <li>■ <b>Report</b> — Does not apply in this workspace.</li> <li>■ <b>Selection</b> — Does not apply in this workspace.</li> <li>■ <b>Unspecified</b> — Does not apply in this workspace.</li> </ul>

Field	Description
<b>Internal Window Name</b>	This field shows the internal name of the workspace. In contrast to the external name shown in the field “Window Name” above, this name cannot be changed in a layout.
<b>Default Layout Name</b>	In this field you can enter the internal name of the default layout. The default layout is the layout shown to the user if no other layout has been defined for the workspace in question in any of the groups to which the user is assigned.

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Layouts Sub-Tab

This section includes the fields and descriptions for the Layouts sub-tab.

Field	Description
<b>Internal Layout Name</b>	This field shows the internal name of the current layout. The internal name is defined in the <layout> tag of the layout itself it is not the name of the file containing the layout.
<b>Layout Name</b>	This field shows the external name of the current layout. By default, this field shows the internal name defined in the <layout> tag of the layout itself, but you can change the name in this workspace.
<b>Standard Layout</b>	This field shows if a layout for the workspace exists on the server for the Standard layer as described in the section “Layers” above. A layout with the internal name “Original” always exists on the Standard layer.
<b>Solution Layout</b>	The functionality of this field is similar to that of the field “Standard Layout” above, but concerns the Solution layer. A layout with the internal name “Original” always exists on the Solution layer in a Maconomy solution (for example MCS or MAS).
<b>Custom Layout</b>	The functionality of this field is similar to that of the field “Standard Layout” above, but concerns the Custom layer. You can only modify layouts on this layer.
<b>Localize Custom</b>	Layout In this field, you can specify that the layout on the Custom layer on the current line should be localized by means of dynamic translation. For more information, see the section “Localization” in the introduction to this workspace.

## Actions

This section shows the Actions available in the Window Layouts workspace.

### Bottom Tab

Field	Description
<b>Export Standard Layout</b>	<p>Using this function, you can export a layout from the server to your own computer. When you select this function, the layout for the Standard layer on the current line is converted to a text file, and a dialog appears, asking you to enter a name and location for the exported file. After exporting the layout, you can edit it and re-import it as a layout on the Custom layer using the function "Import Custom Layout."</p> <p>The exported layout is not localized into the client language. If you want to localize the layout on export, use the action "Export Localized Standard Layout." In a multi-language installation, you will typically export the layout without localization, as Maconomy will localize the layouts to the applicable languages when you import the modified layout. However, if you only use one language, it will be more efficient to export the layout using the "Export Localized..." actions. This will make it easier for you to edit the layout.</p> <p>Note that the layout is not deleted from the server after being exported.</p>
<b>Export Solution Layout</b>	The functionality of this action is similar to that of the action "Export Standard Layout" above, but concerns the layout on the Solution layer.
<b>Export Custom Layout</b>	The functionality of this action is similar to that of the action "Export Standard Layout" above, but concerns the layout on the Custom layer.
<b>Export Localized Standard Layout</b>	The functionality of this action is similar to that of the action "Export Standard Layout" above, with the exception that when exported, the layout is localized into the client language selected in the workspace Language Selection in the Settings menu in the Windows client (or otherwise in the Java client). If you want the modified layout to be localized upon import, you must use the action "Export Standard Layout" instead. For more information, see the action "Export Standard Layout" above and the section "Localization" in the introduction to this workspace.
<b>Export Localized Solution Layout</b>	The functionality of this action is similar to that of the action "Export Localized Standard Layout" above, but concerns the layout on the Solution layer.
<b>Export Localized</b>	The functionality of this action is similar to that of the action "Export Localized Standard Layout" above, but concerns the layout on the Custom layer.

Field	Description
<b>Custom Layout</b>	
<b>Import Custom Layout</b>	<p>Using this function, you can update the layout on the Custom layer on a given line in the sub-tab or add a new one. When you select the function with a line selected in the sub-tab, a dialog appears, asking you to select the text file containing the desired layout description. When you have selected the file, it is automatically imported to the server, replacing the layout which was previously assigned to the line in question, or adding a new layout in the Custom layer. When updating a layout, the update affects all of the groups to which the layout has been assigned. The layout name in the imported layout description file must match the name of the layout being updated. You cannot update layouts on other layers than the Custom layer.</p> <p>Note that Maconomy validates the layout before importing it. Any errors in the validation will be displayed if you are not able to import the layout.</p>
<b>Delete Custom Layout</b>	If you select this action, you remove the layout on the Custom layer on the current line. The layout is deleted from the server also. See also the section “Layers” in the introduction to this workspace.
<b>Export to Excel</b>	Use this action to export the layout to Excel.

## Print Layout Single Dialogs Workspace

Use this workspace to maintain a list of the layouts that are available for printing.

You define layouts in text files, using the MDL programming language. You can edit these text files to create multiple layouts for a single report. You can also specify that a report should be translated into different languages.

When you have finished editing a layout, you can import that layout into Maconomy in this workspace. You can then use the layout for the printout to which the layout is assigned.

Using this workspace, you can export layouts from the server to your own computer so that you can edit the layout. After you edit a layout, you can save the text file again and update the layout on the server by importing it. When it imports the layout, Maconomy checks whether the layout complies with the required structure, and whether all of the elements are within the margins of the paper format.

If you select the **Localization Desired** field on the line in the Print Layouts sub-tab, Maconomy localizes the edited layout via dynamic translation. See the description of the **Localization Desired** field in the sub-tab for information about working with localization of print layouts.

For every layout you can assign an access level to restrict the use of that layout.

In the Print Layouts tab, the workspace displays the name of a Maconomy printout. In the Print Layouts sub-tab, you can assign various layouts to the current printout. Print layouts is an add-on product for Maconomy.

## Print Layouts Tab

This section includes the fields and descriptions for the Print Layouts tab.

### Window Island

Field	Description
<b>Module Name</b>	This field shows the name of the module of which the current workspace is part.
<b>Window Name</b>	This field shows the name of the current Maconomy workspace. The sub-tab only shows layouts assigned to the workspace in this field, and by adding lines to the sub-tab, you can assign additional print layouts to the workspace.
<b>Internal Window Name</b>	This field shows the internal name of the workspace. The internal workspace name is the name of the workspace in Maconomy's database.

## Print Layouts Sub-Tab

This section includes the fields and descriptions for the Print Layouts sub-tab.

Field	Description
<b>Internal Layout Name</b>	This field shows the internal name of the current layout. The name in this field is used when making references to layouts in the workspaces Print Layout Selection and Printer Selection.
<b>External Layout Name</b>	This field shows the external name of the current layout. This name can be seen when selecting the layout in various pop-up menus in print workspaces, and in, for example, Find workspaces. The external name can be changed in this field.
<b>Paper Format</b>	This field shows the name of the paper format used for the current layout.
<b>Paper Orientation</b>	This field shows whether the current layout is printed "Landscape" or "Portrait."
<b>Priority</b>	<p>In this field, you can specify the priority of the current print layout in relation to other print layouts when Maconomy is using a print selection rule to determine which layout to use for printing an item. For instance, when printing several invoices, Maconomy can choose the correct layout for each invoice.</p> <p>In the workspace Print Layout Selection, you can create several print layout selection rules for the same combination of printout and table. In this way, you can, for example, create a print layout rule for each layout created for the printout in question. The print layout rules created for the same combination of printout and table may have overlapping criteria in the sub-</p>

Field	Description
	<p>tab of the workspace Print Layout Selection, and therefore you can assign a priority to each layout. When printing an item, Maconomy checks if the item fulfills the criteria of more than one print layout rule with the same combination of printout and table, and picks the layout with the lowest priority number if there is a match. Priority "0" is the highest priority.</p> <p>If an item to be printed does not fulfill the criteria of any of the created print layout rules, Maconomy will use the layout selected before the printout was initiated.</p> <p>For more information about automatic selection of print layouts using print layout rules, please see the description of the workspace Print Layout Selection.</p>
<b>Original</b>	This field shows whether the current layout is an original layout for the current printout. Maconomy comes with an original layout for every printout, which contains a standard appearance of the printout. This layout cannot be deleted, but you can export it, edit it, and re-import it, to make the imported layout a "shadow" of the original. The layout created on the basis of an original layout is thus a "shadow layout."
<b>Customized</b>	This field shows whether the current layout has been customized by the user. If an original layout has been customized and reimported, thus acting as a "shadow layout," this field will be marked.
<b>Validated</b>	This field shows whether the current layout has been validated. Validation takes place when the layout is translated, and this field is marked if the translation of the current layout was successful. If the field is not marked, the current layout has not been validated. This means that the translation produced an error.
<b>Original Layout</b>	This field shows the name of the layout used as the basis of the current layout.
<b>Access Level</b>	In this field, you can enter an access level for the current layout. A user will only have access to the layout if he or she has access to the specified access level.
<b>Created by</b>	This field shows the name of the employee who created the current information about the layout.
<b>Created on</b>	This field shows the date on which the current information about the layout was created.
<b>Changed by</b>	This field shows the name of the employee who last changed information about the layout.
<b>Changed on</b>	This field shows the date on which the information about the layout was last changed.
<b>Version</b>	This field shows a version number. The version number is increased by one every time the current information is changed.

Field	Description
<b>Name in Layout Designer</b>	If the current layout was created using the Maconomy Layout Designer, this field contains the name assigned to the current layout in the Layout Designer.
<b>Localization Desired</b>	<p>In this field, you can specify that the layout on the current line should be localized by means of dynamic translation. If the “Dynamic Translation” add-on is installed on the server, the users can choose a client language in the workspace Preferences in the Edit menu. In order for the current print layout to be translated dynamically, please follow these steps:</p> <ol style="list-style-type: none"> <li>1. The exported layout file will contain strings in the selected client language, and localization is always based on US English. Therefore, make sure that your client uses Maconomy standard English terminology. To verify this, open the workspace Language Selection in the Settings menu in the Windows client). If “US” is selected here, you can be sure that your client uses Maconomy standard English terminology.</li> <li>2. Export the layout as described below under the action “Export Layout” or “Export Original Layout,” depending on whether the layout in question is the original layout.</li> <li>3. Edit the resultant text file in a text editor as described in the manual “Printout Design using MPL.” Note that you cannot enter new items in the layout, only edit existing ones.</li> <li>4. Import the edited text file as described below under “Import Custom Layout.”</li> <li>5. Verify that the field “Localization Desired” is marked for the imported print layout.</li> </ol> <p>The imported layout will now be localized as any other layout in the system.</p>

## Actions

This section shows the Actions available in the Print Layout workspace.

### Top Tab

Field	Description
<b>Compile All Non-validated Layouts</b>	This action can only be selected on Windows clients. Using this action, you can compile all non-validated layouts. When you select the action, Maconomy displays messages stating how many print layouts will be validated, and how many cannot be validated. The translation can take a considerable amount of time. After the translation, a status report is generated regarding the compiled layouts.

**Bottom Tab**

Field	Description
<b>Export Layout</b>	<p>Using this action, you can export a layout from the server to your own computer, allowing you to edit the layout in a text editor and re-import it using the action "Import Layout." When you select this action, the layout on the current line is converted to a text file, and a dialog will appear, asking you to enter a name and location for the exported file. When exported, the layout is localized into the client language selected in the workspace Language Selection in the Settings menu in the Windows client. Therefore, if you want the finished, re-imported layout to be localized after importing it, you must set the user language to "US" before running this action. For further information, see the field "Localization Desired."</p> <p>Note that the layout is not deleted from the server after being exported, and that this action cannot be used for an original layout which has not been customized.</p>
<b>Export Original Layout</b>	<p>Using this action, you can export an original layout from the server to your own computer, allowing you to edit the original layout in a text editor and re-import it using the action "Import Layout." When you select this action, the layout on the current line is converted to a text file, and a dialog will appear, asking you to enter a name and location for the exported file. When exported, the layout is localized into the client language selected in the workspace Language Selection in the Settings menu in the Windows client. Therefore, if you want the finished, re-imported layout to be localized after importing it, you must set the user language to "US" before running this action. For further information, see the field "Localization Desired."</p> <p>Note that the layout is not deleted from the server after being exported.</p>
<b>Export Original Structure Layout</b>	<p>Using this action, you can export a structure layout from the server to your own computer, allowing you to edit the structure layout in a text editor and re-import it using the action "Import Layout." A structure layout is an "empty" layout which only contains the structure which applies to the printout. The structure is used as the basis of new print layouts.</p>
<b>Import Layout</b>	<p>This action can only be selected on Windows clients. Using this action, you can update the layout on a given line in the sub-tab. When you select the action, a dialog appears, asking you to select the text file containing the desired layout description. When you have selected the file, it is automatically imported to the server, replacing the layout which was previously assigned to the line in question. Please note that Maconomy will automatically attempt to validate the layout during import. In order to be able to import the layout, the user must have access to both the current layout and the associated original layout. The layout name in the imported print layout description must match the name of the layout being updated.</p>
<b>Delete Layout</b>	<p>When you select this action, you can delete a layout. Please note, however, that it is only possible to delete customized layouts. If you attempt to delete a layout which acts as a "shadow layout" of an original layout, the "shadow" is deleted when you select this action, but you can still use the original layout. If rules are set up involving the current layout in the workspace Print Layout Selection, the layout cannot be deleted.</p>

Field	Description
<b>Compile Layout</b>	This action can only be selected on Windows clients. When you select this action, you can compile the layout on the current line in the sub-tab in this workspace, unless the layout is an original layout.

## Window Layout Groups Single Dialogs Workspace

Use this workspace to assign window layouts to user groups.

A layout defines which elements (fields, labels, variables, and so on) are displayed when a user opens a window. You can design different layouts and assign them to different user groups.

Windows in Maconomy are only available to the users in the layouts that you define for the groups to which you assigned those users.

The Window Layout Groups tab displays the name of a group that you create in the Groups workspace. In the Layouts sub-tab, you can assign window layouts to that group. Thus, users whom you assign to the current group see the layouts that you define in the sub-tab when they open windows.

If you assign a user to more than one group, Maconomy uses the following list of priorities to determine which layout to display when the user opens a given window:

1. Maconomy checks whether a layout for the window in question has been defined for the group on the top line in the sub-tab of the user's information card. If so, Maconomy uses that layout.
2. If no layout is specified for that window in the top group, Maconomy checks whether a layout has been defined in the second group in the sub-tab of the user's information card, and so on. If no layouts have been defined in any of the groups, Maconomy uses the standard layout for the window.

### Window Layout Groups Tab

This section includes the fields and descriptions for the Window Layout Groups tab.

#### Group Island

Field	Description
<b>Group Name</b>	This field shows the name of the current group. Groups are created in the workspace Group.

#### User Island

See the Getting Started topic for a description of the fields in the island User.

## Layouts Sub-Tab

This section includes the fields and descriptions for the Layouts sub-tab.

Field	Description
<b>Module Name</b>	In this field, you can specify the name of the module of which the workspace in the field "Window Name" is part. Note in some cases, a workspace can be opened from other modules than the one that it is actually part of.
<b>Window Name</b>	In this field, you can specify the name of the workspace to which you wish to assign a layout for the current group.
<b>Layout</b>	In this field, you can enter the name of the layout you wish to assign to the workspace on the current line. The layout must be assigned to the workspace in question in the Window Layouts workspace.
<b>Layout</b>	This field shows the name of the layout used as the basis of the current layout.
<b>Internal Window Type</b>	<p>In this field, you can specify the dialog type of the current workspace. It is only necessary to specify the workspace type manually if you have specified an internal workspace name which is shared by several workspaces. For example, the workspaces Purpose and Find Purpose both have the internal workspace name Purpose, but their internal workspace types are "Dialog Window" and "Search Window," respectively.</p> <p>There are three types of dialogs in Maconomy: "Dialog Window," "Search Window," and "Parameter Window." The three types are described briefly below:</p> <ul style="list-style-type: none"> <li>■ Dialog Window — Windows of this type contain a tab and, in some cases, a sub-tab. These workspaces are used for registering and viewing information. Examples of dialog workspaces are the workspaces Sales Orders, General Journal, and Vendor Information Card.</li> <li>■ Search Window — The find workspaces in Maconomy.</li> <li>■ Parameter Window — Parameter workspaces are workspaces in which you can specify a number of parameters, for example, a range of sales order numbers, and execute a function by accepting the parameters. Examples of parameter workspaces are the workspaces Item Purchase Selection, Interest Selection, and all printout workspaces.</li> </ul>
<b>Internal Window Name</b>	<p>In this field, you can specify the internal workspace name of the current workspace. It is only necessary to specify the internal workspace name in those cases where the same "normal" workspace name is shared by several workspaces. If you complete this field, Maconomy will automatically complete the fields "Module Name" and "Window Name."</p> <p>Note that some internal workspace names are shared by several workspaces. For example, the workspaces Purpose and Find Purpose both have the internal workspace name Purpose. This problem is solved by specifying both an internal workspace name and an internal workspace type.</p>

## SD\_SU\_Printers Single Dialogs Workspace

Use this workspace only for Maconomy systems that run on a server with server printers.

Use it to maintain information, such as the spool queue and driver, for each printer used to print Maconomy reports. This information is used solely for batch printing.

The printers must be connected to and defined on the server, and the information in this workspace is only used when printing on the server, also called batch printing. This means that you must turn the **Print on Server** option in the File menu on and turn the **Print to Screen** option off.

Maconomy uses the information in this workspace each time that you print information on the server. In addition, in the Printer Selection workspace, you can set up a number of rules that define when to use each printer so that, for example, the printer at the warehouse is always used to print picking lists.

## Paper Formats Single Dialogs Workspace

Use this workspace to set up the paper formats that Maconomy uses to print information.

You use these formats when you create report layouts using the MPL language.

The A4 and US Letter paper formats are predefined; you cannot change or delete them.

You can define the size of a paper format using the following units of measure: "pt," "mm," "cm," and "in."

If you change a paper format and recompile print layouts (using the **Recompile Print Layout** action), you can view the status of the affected print layouts in the Print Layouts sub-tab of the Print Layout workspace.

### Paper Formats Tab

This section includes the fields and descriptions for the Paper Formats tab.

#### Paper Format Island

Field	Description
<b>Paper Format Name</b>	In this field, you enter a name for the paper format. Once you have created the paper format, the name cannot be changed.

#### Size Island

Field	Description
<b>Height</b>	In this field, you specify the height of the paper format. You must specify a value greater than 0. In the pop-up field to the right, you can select the unit of measure for the height specification. Please note that the paper format height must be greater than or equal to the width of the paper format.
<b>Width</b>	In this field, you specify the width of the paper format. You must specify a value greater than 0. In the pop-up field to the right, you can select the unit of measure for the width specification.

**Margin Island**

Field	Description
<b>Top Margin</b>	In this field, you specify the top margin of the paper format. You must specify a value greater than 0. In the pop-up field to the right, you can select the unit of measure for the margin specification.
<b>Bottom Margin</b>	In this field, you specify the bottom margin of the paper format. You must specify a value greater than 0. In the pop-up field to the right, you can select the unit of measure for the margin specification.
<b>Left Margin</b>	In this field, you specify the left margin of the paper format. You must specify a value greater than 0. In the pop-up field to the right, you can select the unit of measure for the margin specification.
<b>Right Margin</b>	In this field, you specify the right margin of the paper format. You must specify a value greater than 0. In the pop-up field to the right, you can select the unit of measure for the margin specification.

**User Island**

See the Getting Started topic for a description of the fields in the island User.

**Actions**

This section shows the Actions available in the Paper Formats workspace.

**Top Tab**

Field	Description
<b>Recompile Print Layout</b>	When you select this function, all layouts created using the current paper format are recompiled. After translation, the file "PrintLayoutErrors.txt" contains an overview of successful and unsuccessful re-translations and explanations why the unsuccessful translations failed. Furthermore, status of such a retranslation of print layouts can be seen in the sub-tab of the workspace Print Layout.

## SD\_SU\_Printer Selection Single Dialogs Workspace

Use this workspace to set up rules that determine which printers Maconomy uses for which reports.

For example, you might want to use a printer that you loaded with special paper stock to print certain reports. This workspace is part of the Print Control add-on module and is used solely for Maconomy systems that run on a server with server printers.

In the Printer Selection Rules sub-tab you can set up rules that, for example, define that Maconomy should use a certain printer whenever you print packing lists, or whenever users in a certain group print information. Each time that someone prints a printout on the server, Maconomy checks whether there is a printer selection line that matches the circumstances of the printout. If such a line exists, Maconomy suggests the printer that is listed on the selection line in

question in the printing dialog before starting the printout. If several printer selection lines match the circumstances of the printout, Maconomy uses the top line that matches the circumstances.

If Maconomy does not find a printer selection line, it suggests the printer that has the lowest printer number.

You use printer selections both in printouts from parameter workspaces such as Print Picking List and in printouts that are triggered when you select a function in the File and Action menus. For each printer selection line, you can specify whether users can change the printer selection in the printing dialog.

Note that you can only create printer selection rules if the Printer Selection Rules sub-tab displays all of the lines, that is, the **Show Lines** field is selected, and none of the selection criteria fields in the Printer Selection tab contain values.

## Print Layout Selection Single Dialogs Workspace

Use this workspace to set up rules that determine which layouts Maconomy uses for which reports, depending on specific circumstances.

For example, you can designate one layout for invoices for domestic customers and another layout for international customers. Each rule can include multiple selection criteria.

In this workspace, you can create a number of layout selection rules, each of which is related to a database table and a printout. In a layout selection rule, you also specify the layout to be used when the printout of an item in the selected table matches the criteria for the layout selection rule in question.

You define the criteria for the use of a given layout selection rule on one or more lines in the Layout Selection Rules sub-tab. On each line, you can specify a field from the table that is displayed in the Print Layout Selection tab and a criterion for the value in this field. This means that for each item printed, Maconomy checks the value in the field in question. If the value is within the range specified on the layout selection line, it matches the criterion. You can also specify a layout as a criterion. If you do that, the criterion on the line is a match if a user selects the specified layout before starting the printout. A layout selection line can also consist of a combination of field values and a layout.

You can set up any number of lines, and the lines can either contain criteria for the same field or several different fields. However, if the same print layout selection rule contains several lines that have criteria that relate to the same field, an entry that is being printed only has to match one of the lines for the print layout selection rule in the tab to be activated. If there are several criteria lines that relate to different fields, an entry that is being printed must match at least one criterion line for each field for the print layout selection rule in the tab to be activated.

This functionality can be illustrated using an example where the following criteria lines have been set up for a print layout selection rule:

<b>Language</b>	English
<b>Language</b>	French
<b>Currency</b>	GBP
<b>Currency</b>	USD
<b>Currency</b>	CHF

In this example, the print layout selection rule is activated for entries where the language is either English or French and where the currency is USD, GBP, or CHF. For example, the print layout selection rule is thus activated by an entry with English language and the currency USD, or an entry with English language and the currency GBP, but not by an entry with English language and the currency DEM.

You can set up any number of print layout selection rules for the same combination of printout and datagase table, allowing you to create a print layout selection rule for each layout that you created for the printout in question. The print layout selection rules that have the same combination of printout and table can have overlapping criteria in the Layout Selection Rules sub-tab. You can therefore enter a priority for each print layout selection rule. When you print an item, Maconomy checks whether the item matches the criteria of several print layout selection rules that have the relevant combination of printout and table. If it does, Maconomy uses the print layout selection rule that has the lowest priority number.

If the item does not match the criteria for any of the print layout selection rules, Maconomy uses the layout that you selected before you started the printout.

It is important to note that you cannot mix MPL 2 (or MPL 1) and MPL 3 layouts when you create layout selection rules. If the first layout that you select is an MPL 2 (or 1) layout, and at any later point you select an MPL 3 layout, the server will crash with a PPU Debug string with the message "OpenPrintsDefs: PrintsDefsVersion 'xxxxxxx' too new." If the first layout that you select is an MPL 3 layout, and at any later point you select an MPL 2 (or 1) layout, the Maconomy client will show an error message that explains that you cannot mix MPL 1/2 and MPL 3 layouts. It is therefore quite important to verify that this cannot happen when you set up the layout selection rules. Also, when you update a single layout that participates in layout selection rules you must update all of the layouts that participate in the same rules.

In addition, note that although the Printer Selection workspace allows you to specify that Maconomy is to use a given printer if you select a certain layout, the print layout selections in this workspace have no influence on the printer used in that printout. This is because the printer selection is done from the layout that you select before you start the printout (or the layout that Maconomy uses automatically in the case of printouts from functions), and not the layout that is ultimately used for the individual item.

## Print Layout Selection Tab

This section includes the fields and descriptions for the Print Layout Selection tab.

### Printout Island

Field	Description
<b>Printout</b>	This field shows the name of a printout in Maconomy, for example, Print Invoice or Print Employee. The print layout selection rule created in the workspace is thus only relevant in printouts of that particular type. You cannot manually create printouts in this workspace, but you can browse through all printouts by using the toolbar arrows.
<b>Internal Layout Name</b>	This field shows the internal name of the layout to be used when printing items matching the criteria defined in the sub-tab of the workspace. Furthermore, this name is used in references to layouts in the workspaces Print Layout Selection and Printer Selection.

Field	Description
<b>External Layout Name</b>	This field shows the external name of the current layout. The name can be changed manually. The layout name can be seen when selecting the layout in various pop-up menus in print workspaces, and in, for example, Find workspaces. The external name can be changed in this field.
<b>Name in Layout Designer</b>	If the current layout was created using the Maconomy Layout Designer, this field contains the name assigned to the current layout in the Layout Designer.
<b>Table</b>	This field shows the name of the table on the basis of which the printout displayed in the workspace is based. For instance, the Standard layout for packing slips shows entries in the table PackingSlip as each of the entries in this table represents a packing slip. In the sub-tab of the workspace, you can set up criteria for the contents of the fields in this table.
<b>Priority</b>	<p>In this field, you can specify the priority of the current print layout rule in relation to other print layout rules.</p> <p>You can create several print layout selection rules for the same combination of printout and table. In this way, you can, for example, create a print layout rule for each layout created for the printout in question. The print layout rules created for the same combination of printout and table may have overlapping criteria in the sub-tab of the workspace, and therefore you can assign a priority to each layout. When printing an item, Maconomy checks if the item fulfills the criteria of more than one print layout rule with the same combination of printout and table, picking the layout with the lowest priority number if there is a match. Priority "0" is the highest priority.</p> <p>If an item to be printed does not fulfill the criteria of any of the created print layout rules, Maconomy will use the layout selected before the printout was initiated.</p>

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Layout Selection Rules Sub-Tab

This section includes the fields and descriptions for the Layout Selection Rules sub-tab.

Field	Description
<b>Internal Field Name</b>	In this field, you can specify the name of the field whose contents you wish to use as a criterion for using the current print layout selection rule. Only fields being part of the table displayed in the tab can be selected. Thus, the fields "From" and "To" are used for setting up a range of values to apply to this field. You can use the function "Find Database Field" in the Find menu to search for the relevant fields.
<b>From</b>	Along with the field "To," this field forms a range of values. An entry will thus only match the criterion on the current line if the entry contains a value within this

Field	Description
	range in the internal field specified on the line. If the field "Internal Field Name" contains the name of a pop-up field, you cannot specify a range of values. Instead, you specify a value in this field and leave the field "To" blank. Only entries with the selected pop-up value will match the criterion. Similarly, check boxes should only contain a value in this field. The field should contain a 0 or a 1, 0 meaning unmarked and 1 meaning marked.
<b>To</b>	See the description of the field "From" above.
<b>Type</b>	This field shows the field type of the field specified in the field "Internal Field Name."
<b>Popup Type</b>	This field shows the pop-up type in question if the field "Internal Field Name" contains the name of a pop-up field.
<b>External Field Name</b>	This field shows the external name of the field specified in the field "Internal Field Name" on the current line. The external field name is the name shown in the Find workspace for the table in question unless the name has been changed using the Maconomy Layout Designer or user dependent layouts (see the workspaces Window Layout Groups and Layouts).
<b>User Selected Layout</b>	If you specify a value in this field, the layout selection in the printout of a given entry depends on whether the printout is made from a parameter workspace or by selecting a function in the Action or File menu. If the printout was started in a parameter workspace, for example, the workspace Print Picking List, the criterion on the line will only be a match if the user selected this layout manually. If the printout was caused by the selection of a function, the criterion will only be a match if the layout in this field is the layout automatically used by Maconomy when the function is selected.

## Note Section

This section includes the fields and descriptions for the Note section workspaces.

### Notes Single Dialogs Workspace

Use this workspace to create and edit notes or brief messages.

Notes can either stand alone or they can be attached to events, jobs, or other entities. Some notes are created automatically when you perform an action; others are created and assigned to entities manually.

You can view and edit any note in this workspace. Notes also appear in relevant workspaces, and you can edit them there. For example, notes that are attached to an event appear in the Events workspace, and you can edit them there.

Notes can either be completely independent, simply functioning as note pads, or you can assign them to certain data in Maconomy such as events or jobs, thus acting as a means of storing detailed descriptions about the data in question. In some workspaces, the text of notes that are assigned to data appears in the sub-tab of the workspace in which you enter that type of data. For instance, if you assign a note to an event in the Events workspace, the sub-tab of that

workspace displays the text of that note. In other cases, you must view or edit the notes in this workspace.

Notes that you assign to various data types are in some cases created using an action in the workspace in question, causing Maconomy to automatically assign the new note to the current data. However, you can also create notes manually in this workspace and assign them to data later on. You can view and edit any note in this workspace, regardless of whether it is assigned to data. If you use this workspace to edit a note that you assigned to an event, for example, the change also appears in the Events workspace, and vice versa.

You can assign each note to a note type which that determines the contents of the Note Lines sub-tab of the note. For instance, the note type can cause a number of lines with headings to be created automatically, and the setup of these headings in the note type determines whether or not you can delete the individual lines. For more information about the note type's effects on the sub-tab, see the description of the fields in the Note Type Specifications sub-tab of the Note Types workspace.

When you create a note, you can create the note as a copy of an existing note by specifying the number of the note to be copied in the Copy Note island. For more information, see the **Copy From Note No.** field.

## Notes Tab

This section includes the fields and descriptions for the Notes tab.

### Note Island

Field	Description
<b>Note No.</b>	In this field, you can enter a number or a name to apply to the note. If you do not specify a value in this field, Maconomy will attempt to assign the new note a number from the number series specified for the company to which the note is assigned.
<b>Description</b>	In this field, you can enter a description of the current note. If you do not enter a description but you enter a note type in the field "Note Type," the description from the field "Note Description" on the specified note type is suggested.
<b>Note Type</b>	<p>In this field, you can specify a note type. The note type determines a number of things about the data in the sub-tab of the note. For instance, the note type indicates the options to be available as headers in the field "Heading" in the sub-tab, and the types of values (numbers, text, dates, and so on) allowed in the field "Value" under the individual headings. The note type can also cause lines to be created automatically in the sub-tab. For further information, see the fields in the sub-tab of the workspace Note Types.</p> <p>Once a note has been created, you cannot change the note type by manually entering a new value in this field. Instead, you can change the note type using the fields in the island Change Note Type and the action "Change Note Type."</p>
<b>Closed</b>	This field shows whether the current note has been closed. When a note is closed, it is not possible to change the information in the card and sub-tabs of the notes, but the note can be reopened using the action "Reopen Note."

Field	Description
	In this workspace, notes can be closed manually using the action "Close Note," but notes can also be closed automatically in other workspaces. For instance, closing an event to which a note is assigned will also cause the note in question to be closed.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can specify the name of an access level. You only have access to the current note if you have been assigned to the same or a higher level in the workspace User Access Levels. This means that you can only specify notes (for example, on a job or an event) to which you have access. Furthermore, a given user can only see the notes to which he or she has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to notes may depend on other factors. For more information about this, please see the section "Introduction to the Access Control System."</p> <p>If no access level is specified, this field has no influence on the access to the current note.</p> <p>This field also shows a description of the specified access level.</p>

### Note Access Level Island

Field	Description
<b>Prefix</b>	Similar to "Access Level Prefix" in Document Archive Setup. In this field you can specify a prefix for access levels to be given to new notes of the given note type.
<b>Access Level Employee Specific</b>	Similar to "Access Level Employee Specific" in Document Archive Setup.
<b>Grant Access to Supervisor</b>	Similar to "Grant Access Level to Supervisor" in Document Archive Setup.

### Text Wrapping Island

Field	Description
<b>Do Not Wrap Text</b>	In this field, you can specify if Maconomy should wrap text automatically when you enter information in the sub-tab. If you do not mark the field, Maconomy automatically wraps the text entered in the sub-tab. If you mark the field, notes are not wrapped unless you use the action "Wrap Lines."

**Copy Note Island**

Field	Description
<b>Copy from Note No.</b>	When creating a note, you can specify a note number in this field to copy information from an existing note to the new note. Both card and sub-tab information is copied to the new note, overwriting any values specified before pressing Return. However, if you have manually specified a note number, this number will be applied to the new note.

**Database Relation Island**

Field	Description
<b>Database Relation</b>	<p>In this field, you can specify the name of a relation in the Maconomy database if the current note relates to an entry in a given relation. In the remaining fields in this island, you can then specify the entry in question.</p> <p>Please note that the note can be assigned to any type of information, regardless of any relation name entered here. This means that although you specify a relation here, the note can still be assigned to sales orders in the workspace Sales Orders, events in the workspace Events, and so on.</p>
<b>Object Instance Key</b>	<p>If instance key registration has been activated for the relation specified in the field "Database Relation" above, you can specify in this field the instance key value of the database entry to be assigned to the current note. If you enter key values in the fields "&lt;Key 1-4&gt;," this field is automatically completed with the instance key value of the database entry in question. Similarly, if you specify an instance key value, Maconomy automatically completes the key fields.</p>
<b>&lt;Key 1-4&gt;</b>	<p>In these fields, you can enter the values in the primary, secondary, and so on, key fields that identify the entry in the relation above which the current note concerns. A key value is a value identifying, for example, a certain order, vendor invoice, and so on.</p> <p>In certain relations, a key consists of up to four key fields. In these relations, the combination of the key values constitute the key to the individual entries in that relation. An example of this is order lines, where the first key value points to the sales order to which the line in question belongs, and the second key value is the line's line number in the sub-tab of the sales order. So if the key to entries in a given relation consists of several key fields, it is possible for several entries to have the same value in the same key fields, but there can be no more than one entry with the same combination of values in the key fields in question.</p> <p>When you enter a database relation in the field "Database Relation" above, Maconomy shows the names of the individual key fields in this island instead of blank field names, allowing you to see which fields should be completed.</p> <p>If you specify an instance key in the field "Object, Instance Key" above, the key fields are automatically completed with the key values from the database entry to which the instance key value belongs. Similarly, if you enter key values in these fields and instance key registration has been activated for the database relation in question, Maconomy automatically completes the field "Object Instance Key."</p>

Field	Description
	Please note that the note can be assigned to any type of information, regardless of any information entered here. This means that although you specify key values here, the note can still be assigned to sales orders in the workspace Sales Orders, events in the workspace Events, and so on.

**Company Island**

Field	Description
<b>Company</b>	In this field, you can enter the number of the company to which the note should be assigned.  This field also shows the name of the specified company.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the note in question. Document archives are created in the workspace Document Archives in the Set-Up module. See the description of that workspace for further information on the use of document archives.  This field also shows a description of the specified document archive.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

**Option List Fields Island**

Field	Description
<b>List</b>	In these fields, you can specify the option lists containing the values you wish to use for further specification of the note. In the fields "Value" in this island, you can then select values from these lists.
<b>Value</b>	In these fields, you can specify values available in the respective option lists specified in this island. The fields can, for example, be used for further specification of the note. If a given option list field in this island has been left blank, any text can be entered in the corresponding value field.

**User Island**

See the Getting Started topic for a description of the fields in the island User.

**Remarks Island**

In this island, you can enter a number of remarks about the current note.

## Note Lines Sub-Tab

This section includes the fields and descriptions for the Note Lines sub-tab.

Field	Description
<b>Heading</b>	<p>In this field, you can enter a heading for the text on the current line. A heading can only be specified if a note type has been specified in the field “Note Type” in the tab of the workspace, and must be one of the options in the note type in question. You can see the available options by using the Find functionality.</p> <p>A heading can only appear once in the sub-tab. Assigned to the heading is a section of text fields in the column “Value” from the row containing the heading to the row containing the next heading.</p>
<b>Value</b>	<p>In this field, you can enter the note text. If the note is assigned to a data type whose sub-tab allows you to view or edit notes, for example, an event or a job text changes made in this workspace will also be reflected in sub-tab of the workspace in which you can normally write notes about the data type in question and vice versa. This is, for example, the case in the sub-tab of the workspace Events. When you press Enter, Maconomy automatically wraps the text, so that text exceeding the standard width of the field is automatically moved down to the necessary number of lines.</p> <p>The text can be divided into paragraphs by inserting one or several blank lines between the paragraphs. Please note that the Enter key cannot be used for dividing the text into paragraphs, as this key is used for executing the changes made on a line, just like in any other Maconomy workspace.</p> <p>If a heading is specified on the current line or a line above it, the value in this field must comply with the format specified for the heading on the current line or, if no heading is specified on the current line, the nearest above line where a heading has been specified. Similarly, if an option list has been specified for the heading in question in the note type, you can only select an option within the option list in question. For further information on the use of heading formats, see the fields “Format” and “Option List” in the workspace Note Types.</p>
<b>Format</b>	<p>In this field, you can specify a format for the contents of the information on note lines under the current heading, for instance that only a date may be specified. If you specify a format, Maconomy will only accept information entered on note lines under the current heading if it complies with the selected format. If you do not enter a format, any type of information may be entered on note lines under the current heading.</p>

## Actions

This section shows the Actions available in the Notes workspace.

### Top Tab

Field	Description
<b>Close Note</b>	When you select this action, the current note is closed, causing the field “Closed” to be marked and causing all of the fields in the card and sub-tabs to

Field	Description
	be closed for the current note. However, the note can be reopened using the action "Reopen Note."
<b>Reopen Note</b>	This action is only available when the current note has been closed. When you select the action, the current note is reopened for editing.
<b>Wrap lines</b>	When you select this action, Maconomy wraps the text entered in the sub-tab as described in the field "Value." When you enter information in the workspace, Maconomy automatically wraps the text entered, but lines created using the import program Import Notes are not wrapped unless you use this action. It is therefore possible to wrap these types of text lines by means of this action.
<b>Attach Document</b>	This action allows you to attach a document to the note.
<b>Change Note Type</b>	<p>When you select this action, Maconomy changes the note type of the current note in accordance with the information entered in the island Change Note Type. When the note type is changed, all information in the sub-tab is deleted and replaced by any template lines specified for the new note type in the sub-tab of the workspace Note Types.</p> <p>For further information about how the new note type is found, see the description of the fields in the island Change Note Type.</p>

### Bottom Tab

Field	Description
<b>Import Text</b>	When you select this action, you can import a text file to the sub-tab of the workspace. Maconomy will show a dialog prompting you for the location of the file. The text in the file will be wrapped automatically, meaning that text exceeding the width of the text field in the sub-tab will be wrapped and placed on separate lines. A line break in the file will result in a blank line in the table.
<b>Export Text</b>	When you select this action, Maconomy exports the text in the sub-tab to a text file in which the wrapped text is reformatted so that consecutive table lines are concatenated into one text string, and blank table lines are converted to line breaks. Maconomy will show a dialog prompting you for a target location for the file.

## Note Types Single Dialogs Workspace

Use this workspace to create and maintain note types, which are templates for notes.

When you create a note from a note type, Maconomy automatically supplies heading text.

Each note type consists of a number of rows in the Note Type Specifications sub-tab, each of which contains an option that becomes available in the **Heading** field in the Note Lines in the Notes workspace assigned to the note type in question.

The Note Types tab in this workspace displays a note type, including a number and a description. In the Note Type Specifications sub-tab, you can add the appropriate heading options for the note type.

### Note Types Tab

This section includes the fields and descriptions for the Note Types tab.

#### Note Type Island

Field	Description
<b>Note Type</b>	In this field, you enter the number of the current note type. The number cannot be changed on existing note types.
<b>Description</b>	In this field, you can enter a description of the note type.
<b>Note Description</b>	In this field, you can enter a description to be applied to new notes of the current type. The value in this field is automatically transferred to the field "Description" in the workspace Notes when creating a note of this type. However, any manually entered description on the new note is not overwritten.

#### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can assign an access level to the note type. A user only has access to the current note type (and thereby using the options in the note type) if he has been assigned to this level or a level above this in the workspace User Access Levels. This access control ensures that when entering notes regarding, for example, an event, you can only enter headings if you have access to the note type assigned to the event in question. Furthermore, in this workspace, you can only see and edit the note types to which you have access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to options and note types may depend on other factors. For further information about the standard access control configuration, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>You can only specify an access level to which you have access yourself.</p> <p>This field also shows a description of the specified access level.</p>

#### Remarks Island

In these fields, you can enter additional remarks regarding the current note type.

#### User Island

See the Getting Started topic for a description of the fields in the island User.

## Note Type Specifications Sub-Tab

This section includes the fields and descriptions for the Note Type Specifications sub-tab.

Field	Description															
Name	In this field, you enter a heading option that should be available in the current note type.															
Format	<p>In this field, you can specify a format for the contents of the information on note lines under the current heading, for instance that only a date may be specified. If you specify a format, Maconomy will only accept information entered on note lines under the current heading if it complies with the selected format. If you do not enter a format, any type of information may be entered on note lines under the current heading.</p> <p>By using this functionality combined with assigning notes of certain types to different information in Maconomy, for example, sales orders you can create any number of extra information fields to those types of information. This is done by creating a note type where the headings represent field names, and the format of each heading indicates what type of information may be entered in the field in question. To each sales order, vendor invoice , and so on, you can then assign a new note of the type in question, and enter the relevant information under the headings representing the individual field names. In the table below, you can see the available options and the values allowed in note fields under headings of each format:</p> <table><tr><th>Type</th><th>Example</th><th>Description</th></tr><tr><td>TextValue</td><td>Leather Couch</td><td>Fields under headings of this format can contain any number of characters, and both letters, figures, and special characters can be used. Under headings of this format, Maconomy wraps the text as described in the field “Value” in the sub-tab of the workspace Notes.</td></tr><tr><td>String-Value</td><td>Leather Couch</td><td>This format is used for text strings. The field can contain a maximum of 255 characters, and both letters, figures, and special characters can be used. Contrary to headings of the type TextValue, the text in fields under headings of this type is not wrapped.</td></tr><tr><td>IntegerValue</td><td>999</td><td>This format can only contain figures. No decimals are allowed. A blank value imported will result in the number 0.</td></tr><tr><td>RealValue</td><td>999,999</td><td>This format can only contain figures. The format allows decimals, and the comma is used as the separator, for example,</td></tr></table>	Type	Example	Description	TextValue	Leather Couch	Fields under headings of this format can contain any number of characters, and both letters, figures, and special characters can be used. Under headings of this format, Maconomy wraps the text as described in the field “Value” in the sub-tab of the workspace Notes.	String-Value	Leather Couch	This format is used for text strings. The field can contain a maximum of 255 characters, and both letters, figures, and special characters can be used. Contrary to headings of the type TextValue, the text in fields under headings of this type is not wrapped.	IntegerValue	999	This format can only contain figures. No decimals are allowed. A blank value imported will result in the number 0.	RealValue	999,999	This format can only contain figures. The format allows decimals, and the comma is used as the separator, for example,
Type	Example	Description														
TextValue	Leather Couch	Fields under headings of this format can contain any number of characters, and both letters, figures, and special characters can be used. Under headings of this format, Maconomy wraps the text as described in the field “Value” in the sub-tab of the workspace Notes.														
String-Value	Leather Couch	This format is used for text strings. The field can contain a maximum of 255 characters, and both letters, figures, and special characters can be used. Contrary to headings of the type TextValue, the text in fields under headings of this type is not wrapped.														
IntegerValue	999	This format can only contain figures. No decimals are allowed. A blank value imported will result in the number 0.														
RealValue	999,999	This format can only contain figures. The format allows decimals, and the comma is used as the separator, for example,														

Field	Description		
			372,1. The maximum number of decimals allowed is the same as the chosen number of decimals in the Preferences workspace (in the Edit menu) in Maconomy. If you import a real figure with fewer decimals than set up in the Preferences workspace (or none at all), Maconomy will add the remaining decimals automatically. A blank value imported will result in the number 0,00 (and the relevant number of decimals).
	AmountValue	99,99	This format is used for amounts. The comma is used as the separator between the main monetary unit and the secondary monetary unit. A maximum of two decimals is allowed, for example, 125,00. A blank value imported will result in the amount of 0,00.
	DateValue	07.01.02	This format is used for dates, and follows the format day, month, year. A dot is used as the separator between date, month, and year, for example, 07.01.99.
	TimeValue	13:45:00	This format is used for time. The colon is used as the separator, for example, 13:45:00. No blanks are allowed before or after the value.
	BooleanValue	Yes/No	This format represents check boxes in Maconomy. The values allowed are "Yes," representing a marked check box, and "No" (or a blank value), representing an unmarked check box.
	PopupValue		This option cannot be selected in the current version of Maconomy.
	RealAmountValue		This option cannot be selected in the current version of Maconomy.
<b>Description</b>	In this field, you enter a description to elaborate on the meaning of the current heading option.		
<b>Option List</b>	In this field, you can specify an option list created in the workspace Option Lists. If you specify an option list, Maconomy will only accept values from the option list in question on note lines under the current heading. Please note, however, that you can only specify an option list if the field "Format" contains the value "StringValue."		

Field	Description
<b>Create Automatically</b>	If you mark this field, a line with the heading on the current line is automatically created when creating notes of the current type.
<b>Required</b>	If you mark this field, it is not possible to remove lines with this heading from notes of the current type.
<b>Remarks 1-3</b>	In these fields, you can enter additional remarks regarding the current heading option.

## Actions

This section shows the Actions available in the Note Types workspace.

### Top Tab

Field	Description
<b>Update Notes</b>	This action is used for ensuring that all notes of the current type contain all of the mandatory headings in the note type. When you select this action, Maconomy checks the sub-tab of all notes of the current type to see if they contain all of the headings marked as mandatory in the sub-tab of the note type. If there are mandatory headings missing, they are automatically created in the notes.

## E-Forms

Use this workspace to create e-form types.

E-forms are introduced in Maconomy to enable you to create questionnaires and save them in the project register. A Maconomy e-form is a questionnaire requiring answers using a customized layout. You can create different e-form types to accommodate the different kind of surveys or forms you want to use. You can also create various e-forms with different field types.

E-form types are created in the Documents and Notes workspace. You can also create custom fields for your e-form types, such as popup items or option lists, in the Job Cost Setup workspace. Choosing a specific e-form type when you create an e-form displays a custom layout showing the appropriate questionnaire fields and titles for that e-form type.

You can use several field types when creating an e-form. When creating an e-form, you can add a maximum of 40 fields for the **Option List** and **Option List Value** fields and 50 fields for each of the following other field types:

- Boolean
- Yes/No/Blank
- Date
- Employee No.
- Integer
- Reals

- Amount value and currency
- Popup value

### Submission and Approval of E-Forms

You can also set up e-forms for submission and approval. An e-form must be submitted before it can be approved. If you modify a field in the e-form, it is automatically unsubmitted and subject for approval again.

**Note:** Maconomy does not restrict which users may submit or approve e-forms. The **Submitted** and **Approved** fields within the selected e-form provide information regarding the users who submitted or approved the e-form and the date of submission or approval.

### Job Registers

To use e-forms, it is recommended to create a custom Job Register sub-tab, which replaces the Registers sub-tab in the Jobs workspace. All e-forms are created and saved in this workspace. Maconomy provides an example workspace named "Job Registers with E-Forms" as a guide for creating your own customized workspace. The example workspace functions best when the "Health, Safety and Security Risk Assessment" e-form type exists with titles on the following fields:

- Remarks 1-4
- Popup 1
- Date 1-4
- Employee 1-4

In your customized Job registers workspace, you can sort e-forms into separate registers to easily view e-forms for each category. Aside from the current registers, Risks and Changes, you can add two new registers when you create custom Job Register for the e-form functionality:

- Review Register
- Control Register

Each line in these registers can contain an e-form. When you create a new risk or change in their respective registers, an appropriate e-form type is automatically associated to them. For example, when you create a risk, a risk e-form type is automatically associated to it to enable you to easily create a risk e-form, if needed.

The **New E-Form** action is provided in the Review and Control registers to enable you to create e-forms that are automatically associated to the selected register.

**Note:** The Review and Control registers are not included in any Maconomy standard workspaces, but they may be included in a customized workspace. These registers are created solely for the e-form functionality.

## E-Forms Tab

This section includes the fields and descriptions for the E-Forms tab.

### E-Form Island

Field	Description
<b>E-Form Type</b>	Specify the e-form type. You cannot change the e-form type once the form is created.
<b>Job No.</b>	Enter or select a job number if you wish to associate the e-form to a job.

### Document Archive Island

Field	Description
<b>Archive No.</b>	This field shows the archive number of the attached document.
<b>Description</b>	This field shows the description of the attached document.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

### Approval Island

Field	Description
<b>Submitted</b>	<p>This field indicates whether the e-form has been submitted.</p> <p>If the e-form has been submitted, it shows the username of the person who submitted the form and the date of submission.</p> <p>If you modify any field in the e-form, it is automatically unsubmitted and is subject for reapproval.</p>
<b>Approved</b>	<p>This field indicates whether the e-form has been approved.</p> <p>If the e-form has been approved, it shows the username of the person who approved the form and the date of approval.</p> <p>If you modify any field in the e-form, it is automatically unsubmitted and unapproved.</p>

### User Island

See the Getting Started topic for a description of the fields in the User island.

### Revision Island

Field	Description
<b>Revision No.</b>	This field shows the revision number. The latest revision number is always the highest one.
<b>Current Revision</b>	This field indicates whether the current e-form is the latest revision.

### Remarks Island

Field	Description
<b>Remarks 1-50</b>	Enter text in these fields.

### Option Lists Island

Field	Description
<b>Option List 1-40</b>	Enter or select an option list. If the option list selection is changed, then the option list value is cleared.
<b>Option List 1-40 Value</b>	Enter or select an option list value as allowed by the selected option list 1-40.

### Dates Island

Field	Description
<b>Date 1-50</b>	Choose a date.

### Yes/No Island

Field	Description
<b>Yes/No 1-10</b>	Select an option from the drop-down list. You can also leave this field blank.

### Popup Values Island

Field	Description
<b>Popup 1-50</b>	Select a popup value. The drop-down list shows popup values derived from the appropriate E-Form Popup Type 1-50.

### Booleans Island

Field	Description
<b>Boolean 1-50</b>	Select a check box.

### Reals Island

Field	Description
<b>Reals 1-50</b>	Enter a number value.

### Amounts Island

Field	Description
<b>Amount 1-50</b>	Enter an amount value.
<b>Amount 1-50 Currency</b>	Choose a currency for the amount.

### Employees Island

Field	Description
<b>Employee 1-50</b>	Enter or select an existing employee number. If you use Ctrl + G to search for employee numbers, you can manually add a blocked employee number.
<b>Employee 1-10 Name</b>	Enter or select an existing employee name. If you have already selected an employee number in the <b>Employee 1-50</b> fields, these fields automatically show the employee name associated with the employee numbers. If you use Ctrl + G to search for employee name, you can manually add an employee.

### Integers Island

Field	Description
<b>Integer 1-50</b>	Enter an integer value.

## Actions

This section includes the actions available in the E-Forms tab.

### E-Forms Tab

Field	Description
<b>New E-Form</b>	Use this action to create an e-form. You must choose an e-form type.
<b>Delete E-Form</b>	<p>Use this action to delete an e-form.</p> <p>You cannot delete an e-form in any of the following circumstances:</p> <ul style="list-style-type: none"> <li>▪ The e-form is associated with a closed job. To delete the e-form, reopen the job first.</li> <li>▪ The e-form is associated with a Job Risk or Job Change. Delete it from the Job Risk or Job Change Details sliding panel.</li> <li>▪ The e-form is a Job Review or Job Control entry. Delete it directly from the Job Review or Job Control register.</li> <li>▪ The e-form contains documents. You must first remove all attached documents to delete the e-form.</li> </ul> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> A warning message appears if the e-form is approved.</p> </div>
<b>Print E-Form</b>	Use this action to print the current e-form.
<b>Print...</b>	Use this action to open a wizard, which enables you to choose what information to print from the current e-form.
<b>Submit</b>	Use this action to submit an e-form. This action is only available if the e-form is not already submitted.
<b>Approve</b>	Use this action to approve an e-form. This action is only available if the e-form is submitted and not yet approved.

Field	Description
<b>Attach Document</b>	Use this action to attach a document to the e-form.

Field	Description
<b>Copy</b>	<p>Use this action to create a copy of the selected e-form. If you copy an e-form , all fields in the created e-form are an exact copy of the selected e-form except the following:</p> <ul style="list-style-type: none"> <li>▪ No document archives are copied.</li> <li>▪ All items, including blocked items, are copied.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Information in the Approvals island on the original e-form is not copied.</li> <li><b>CopyToNewInstanceKeyVar</b> - This field generates a new instance key for the copied e-form revision.</li> <li><b>Revision No.</b> - This field's value is set to 1.</li> <li>Information in the User island is updated to show the username of the person who copied the e-form and the date it was copied. Information regarding changes on the original e-form is not copied.</li> </ul>
<b>New Revision</b>	<p>Use this action to create a new e-form revision. All fields in the created revision are an exact copy of the original e-form except the following:</p> <ul style="list-style-type: none"> <li><b>Instance Key</b> - A new instance key is generated each time a revision is created.</li> <li><b>Timestamp</b> - A new timestamp is generated each time a revision is created.</li> <li><b>Revision No.</b> - A new revision number is generated each time a revision is created.</li> <li><b>Current Revision</b> - This check box is deselected. It is only selected on the latest revision of the e-form.</li> <li><b>Current Revision Instance Key</b> - This field shows the latest revision's instance key.</li> <li><b>CopyToNewInstanceKeyVar</b> - Because a copy is made of the current revision, it always maintains its instance key. A new instance key is generated for the new revision that was copied from the latest revision.</li> </ul>

## Print E-Forms Workspace

Use this workspace to print e-forms.

Use this workspace to customize what information should be included when you print an e-form. Selection criteria is provided to enable you to choose to print e-forms for certain jobs, e-form types, or only approved e-forms. You can also select a print layout.

### Print E-Form Tab

This section includes the fields and descriptions for the Print E-Form tab.

#### Selection Criteria island

Field	Description
<b>Job No.</b>	Enter a job number to limit the printout to only e-forms assigned to a certain job range.
<b>E-Form Type Name</b>	Select an e-form type to limit the printout to only e-forms of a certain type.

Field	Description
<b>Only Approved</b>	Select this check box to limit the printout to only approved e-forms assigned to a certain job range.

#### Print Control island

Field	Description
<b>Layout</b>	<p>Select one of the following layouts:</p> <ul style="list-style-type: none"> <li>▪ <b>Standard</b> - The standard layout prints all fields in a very condensed manner with one e-form per page. Field values may be cut short.</li> <li>▪ <b>Condensed</b> - The condensed layout prints many e-forms per page. The layout includes a few fields and values may be cut short.</li> </ul>

## E-Form Types Workspace

Use this workspace to set up e-form types.

Copy to come.

### E-Form Types Tab

This section includes the fields and descriptions for the E-Form Types tab.

#### E-Form Type island

Field	Description
<b>Name</b>	Enter the name for a new e-form type. The name cannot be changed.
<b>Description</b>	Enter a description for the e-form type.

#### Remarks island

Field	Description
<b>Remark 1-40 Title</b>	<p>Enter field titles for <b>Remarks</b> fields that are available in e-forms created using this e-form type.</p> <p>If a title is changed, all existing e-forms created using this e-form type get updated titles.</p>

**Option Lists island**

Field	Description
<b>Option List 1-40 Title</b>	Specify option lists and option list titles that are available for e-forms created using this e-form type. Once an e-form is created using this e-form type, it retains these option lists. If the e-form type is changed to select other option lists, only new e-forms will follow the updated selection.

**Popups island**

Field	Description
<b>Popup 1-10 Title</b>	Specify field titles for popups for e-forms created using this e-form type. If a title is changed, all existing e-forms created from the type get updated titles.

**Dates island**

Field	Description
<b>Date 1-10 Title</b>	Specify the field titles for <b>Date</b> fields for e-forms created using this e-form type. If a title is changed, all existing e-forms created from the type get updated titles.

**Reals island**

Field	Description
<b>Real 1-10 Title</b>	Specify field titles for <b>Real</b> fields that are available in e-forms created using this e-form type. If a title is changed, all existing e-forms created from the type get updated titles.

**Integers island**

Field	Description
<b>Integer 1-10 Title</b>	Specify field titles for <b>Integer</b> fields that are available in e-forms created using this e-form type. If a title is changed, all existing e-forms created from the type get updated titles.

**Amounts island**

Field	Description
<b>Amount 1-10 Title</b>	Specify field titles for <b>Amount</b> fields that are available in e-forms created using this e-form type. If a title is changed, all existing e-forms created from the type get updated titles.

**Employees island**

Field	Description
<b>Employee 1-10 Title</b>	Specify field titles for <b>Employee</b> fields that are available in e-forms created using this e-form type. If a title is changed, all existing e-forms created from the type get updated titles.

**Booleans island**

Field	Description
<b>Boolean 1-10 Title</b>	Specify field titles for <b>Boolean</b> fields that are available in e-forms created using this e-form type. If a title is changed, all existing e-forms created from the type get updated titles.

**Yes/No island**

Field	Description
<b>Yes/No 1-10 Title</b>	Specify field titles for <b>Yes/No</b> fields that are available in e-forms created using this e-form type. If a title is changed, all existing e-forms created from the type get updated titles.

## Actions

This section includes the actions available in the E-Form Types workspace.

**E-Form Types Tab**

Field	Description
<b>New E-Form Type</b>	Use this action to create an e-form type.
<b>Delete E-Form Type</b>	Use this action to delete an e-form type. <div><b>Note:</b> An error message displays if you attempt to delete an e-form type that is currently being used by an e-form.</div>

## Popup Reminder Section

This section includes the fields and descriptions for the Popup Reminder section workspaces.

### Popup Reminders Single Dialogs Workspace

Use this workspace to create pop-up reminders.

You specify a recipient, a delivery time, and an unlimited number of lines of text. At delivery time, a pop-up note appears above the system tray on the recipient's desktop. The recipient can click the note to display the contents of the reminder.

Maconomy also displays a To Do note.

#### Popup Reminders Tab

This section includes the fields and descriptions for the Popup Reminders tab.

#### Popup Reminder Island

Field	Description
<b>From</b>	This field shows your user name when you have created a pop-up reminder. You cannot enter a value in this field, as the value will automatically match the user ID with which you are currently logged into Maconomy.
<b>To</b>	This field allows you to select the Maconomy user who should receive the pop-up reminder. You will not be able to create a note before you have selected a recipient in this field. Please note that the field only allows you to select one recipient.
<b>Effective from</b>	In this field, you can enter the date and time on which the pop-up reminder should alert the user specified in the "To" field.

#### Note Lines Sub-Tab

This section includes the fields and descriptions for the Note Lines sub-tab.

Field	Description
<b>Text</b>	This field allows you to enter text notes that will be shown to the recipient of the pop-up reminder when the recipient opens the pop-up reminder. You can enter an unlimited amount of text lines.

## Reporting Section

This section includes the fields and descriptions for the Reporting section workspaces.

### Reporting Hierarchies Single Dialogs Workspace

Use this workspace to define reporting hierarchies that are used to generate Universe reports.

You can create and name each hierarchy, specifying the type of information to which it pertains. For example, you can specify whether the current hierarchy is for accounts, locations, jobs, and so on.

A reporting hierarchy is made up of a number of trees. For example, a reporting hierarchy for a geographically organized enterprise that has offices in Europe and the USA could contain a single tree that sums up the figures from each of the geographical divisions in the organization.

The concept of reporting hierarchies and their use is described in "Introduction to Reporting Structures."

In the Reporting Hierarchies tab of this workspace, you can provide information about the current reporting hierarchy. The individual Maconomy Universe reports may use this information to determine which hierarchy to apply. This means that each report might contain a number of selection criteria used for picking or suggesting a hierarchy when you run the report. The documentation for each Maconomy Universe report contains information about the criteria used for selecting a hierarchy.

In the Reporting Hierarchy Nodes sub-tab, you can create the nodes that make up the hierarchy, and you can assign parent nodes. Before you can assign a parent node to a node, you must create the parent node on another line in the sub-tab.

On lines that represent leaves, you can specify the object (account, dimension value, job, and so on) whose figures should be summed in the leaf in question. The type of object that you can assign to the leaves is determined by the type that you specify in the Reporting Hierarchies tab. The headings in the columns where you assign the node to an information object reflect the hierarchy type. Three fields are used for specifying objects, but you only need to fill in the ones where the heading is not blank. For more information on specifying objects on leaves, see the description of the **<Key Value 1-3>** field in the Reporting Hierarchy Nodes sub-tab of this workspace.

### Reporting Hierarchies Tab

This section includes the fields and descriptions for the Reporting Hierarchies tab.

#### Reporting Hierarchy Island

Field	Description
<b>Reporting Hierarchy No.</b>	In this field, you can specify a reporting hierarchy number when creating a hierarchy.
<b>Description</b>	In this field, you can specify a description of the current hierarchy.

Field	Description
<b>Type</b>	<p>In this field, you can specify the type of the current hierarchy. The type determines the information type to which the hierarchy applies. This means that on lines representing leaves, you can assign the leaf to an object of the type in question. If, for instance, you have selected the type "Location," you can assign a value in the dimension Location to each leaf. For a description of the effects of assigning leaves to objects, see the fields "&lt;Key Value 1-3&gt;."</p> <p>When you select a type, the columns used for assigning objects to leaves are applied the relevant names. For instance, if you specify "Account," one of the columns is named "Account No.," and the remaining two columns are assigned a blank heading. If you select one of the local dimensions, two columns are assigned a name, as you must then specify both a local specification list and a value within the list in question.</p> <p>To assign an object to a leaf on a line, specify a value in the named column or columns only.</p>
<b>Standard</b>	<p>In this field, you can specify whether the current hierarchy is the standard hierarchy of the type specified in the field "Type." There can be no more than one standard hierarchy for each type.</p>

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can specify the name of an access level. You only have access to the current hierarchy if you have been assigned to the same or a higher level in the workspace User Access Levels. This means that you can only run Maconomy Universe reports using hierarchies to which you have access. Furthermore, in this workspace, a given user can only see the current hierarchy if he or she has access to this level. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to reporting hierarchies may depend on other factors. For more information about this, please see the section "Introduction to the Access Control System."</p> <p>If no access level is specified, all users have access to the current hierarchy.</p> <p>This field also shows the description of the selected access level, as entered in the workspace Access Levels.</p>

### Selection Criteria Island

Field	Description
<b>Node No.</b>	In these fields, you can specify a range of node numbers. Only nodes with numbers within the specified range are shown in the sub-tab.
<b>Description</b>	In these fields, you can specify a range of descriptions. Only nodes with descriptions within the specified range are shown in the sub-tab.
<b>Parent Node No.</b>	In these fields, you can specify a range of node numbers. Only nodes whose parent node number is within the specified range are shown in the sub-tab.

Field	Description
<b>Level</b>	In these fields, you can specify a range of level numbers. Only nodes placed at a level within the specified range are shown in the sub-tab.
<b>Sorting Key</b>	In these fields, you can specify a range of sorting key numbers. Only nodes with sorting key numbers within the specified range are shown in the sub-tab.

## User Island

See the Getting Started topic for a description of the fields in the island User.

## Reporting Hierarchy Nodes Sub-Tab

This section includes the fields and descriptions for the Reporting Hierarchy Nodes sub-tab.

Field	Description
<b>Node No.</b>	In this field, you can specify the desired number of the node when creating a node.
<b>Description</b>	In this field, you can enter a description of the current node. The description appears as the fixed line text when the node is printed in reports.
<b>Parent Node No.</b>	In this field, you can specify the number of another node which should be the parent node of the current node, thus hierarchically placing the current node beneath the parent node in the structure.  You cannot specify a node which results in a circular structure, and you cannot specify a leaf node to which a value has been assigned in the fields "<Key Value 1-3>."
<b>Parent, Description</b>	This field shows the name of the parent node specified in the field "Parent Node No." above.
<b>Level</b>	This field shows the level at which the current node is located. The node is placed one level below its parent node. If the node has no parent node, it is located at level one.
<b>Detail Level</b>	In this field, you can specify the detail level of the current node. In certain reports, the detail level is used for ensuring a balance in the amount of detail shown at the same time, so that very aggregated information in one branch of the reporting hierarchy is not shown at the same time as leaves in another branch of the hierarchy (which may be placed at the same level in the field "Level"). However, the functionality of the field fully relies on the report in question, as the detail level may be used in different ways from report to report. Therefore you should see the manual for your individual reports for information on their use of the detail level of each node.
<b>Sorting by</b>	In this field, you can specify a number to manage the position of the current node in relation to the other nodes placed beneath the same parent node as the current node. In reports, the nodes below a given node will be sorted

Field	Description
	according to their sorting keys, the node with the lowest sorting key number being shown first.
<b>Account No.</b>	This field shows the number of the account or dimension that the reporting node refers to. The title of this field depends on the type of the reporting hierarchies.

## Actions

This section shows the Actions available in the Reporting Hierarchies workspace.

### Top Tab

Field	Description
<b>Get from Structure</b>	<p>This action is only available for hierarchies of the types regarding G/L dimensions, that is, the types "Company," "Account," "Location," "Entity," "Project," "Purpose," "Spec. 1-3," and "Local Spec. 1-3." When you select this action, Maconomy automatically creates nodes in the current hierarchy to make the hierarchy match the structure specified for the dimension in question in the G/L module. In the G/L module, structures are created in the Structure submenu where there is a workspace for each dimension, in which you can define a structure. The functionality of the action is identical, regardless of the dimension in question. Therefore, while the description below is based on accounts, it applies to any dimension.</p> <p>When you select the action, Maconomy creates nodes for sum accounts and non-sum accounts and assigns each node to the relevant parent nodes to reflect the original structure. Each node created in this process is assigned a sorting key number corresponding to the structure line number multiplied by 10.</p> <p>If the original structure contains any heading lines, they are assigned as attributes to the relevant nodes. The attributes will be of the type "Heading." However, certain cases may cause incorrect creation of headings, for instance if you have two consecutive headings at the same sum level. Therefore it is recommended that you check the automatically generated headings.</p>
<b>Suggest Detail Level</b>	When you select this action, Maconomy assigns a detail level to each node in the hierarchy. The detail level assigned to each node is based on the position of the node in the hierarchy and the number of subordinate lines below it.

## Reporting Hierarchy Nodes Single Dialogs Workspace

Use this workspace to assign children to nodes in reporting hierarchies.

The components that make up each tree are called nodes; a node that is located directly below another node is called a child. You can build the entire hierarchical structure in the Reporting Hierarchies workspace, but the Reporting Hierarchy Nodes workspace provides a better view because you work with one parent node at a time.

In the Reporting Hierarchy Nodes tab of this workspace, you can browse through the nodes in the individual reporting hierarchies and specify information about the currently selected node. If your Find menu includes the **Automatic Find** function, you can use this workspace together with the Reporting Hierarchies workspace, because you can select a node in this workspace by selecting it in the Reporting Hierarchy Nodes sub-tab of in the Reporting Hierarchies workspace.

The Reporting Hierarchy Nodes sub-tab of the Reporting Hierarchy Nodes workspace displays the children of the node that you select in the Reporting Hierarchy Nodes tab. You can assign new child nodes by adding new lines. Creating a line in this workspace corresponds to creating a line in the Reporting Hierarchies workspace and assigning it to the parent node that you selected in the Reporting Hierarchies tab of the Reporting Hierarchies workspace. Therefore, lines that you create in this workspace also appear in the Reporting Hierarchy Nodes sub-tab of the Reporting Hierarchies workspace, and vice versa.

On lines that represent leaves, you can specify the object (account, dimension value, job, and so on) whose figures should be summed in the leaf in question. Maconomy determines the type of object that you can assign to the leaves by the type of hierarchy to which the node belongs. For information about assigning objects to nodes, see the description of the **Type** field in the tab of this workspace and the **<Key Value 1-3>** field in the sub-tab of this workspace.

## Reporting Hierarchy Nodes Tab

This section includes the fields and descriptions for the Reporting Hierarchy Nodes tab.

### Node Island

Field	Description
<b>Reporting Hierarchy No.</b>	This field shows the number of the reporting hierarchy of which the current node is part.
<b>Node No.</b>	This field shows the number of the current node.
<b>Description</b>	In this field, you can enter a description of the current node. The description appears as the fixed line text when the node is printed in reports.
<b>Level</b>	This field shows the level at which the current node is located. The node is placed one level below its parent node. If the node has no parent node, it is located at level one.
<b>Type</b>	This field shows the type of hierarchy to which the current node belongs. For information about the functionality of reporting hierarchy types, please see the description of the field "Type" in the workspace Reporting Hierarchies.
<b>Parent Node No.</b>	In this field, you can specify the number of another node which should be the parent node of the current node, thus hierarchically placing the current node beneath the parent node in the structure.  You cannot specify a node which results in a circular structure, and you cannot specify a leaf node to which a value has been assigned in the fields "<Key Value 1-3>."

Field	Description
<b>Sorting Key</b>	In this field, you can specify a number to manage the position of the current node in relation to the other nodes placed beneath the same parent node as the current node.  The order of the lines belonging to the same parent node applies to their order of appearance in reports where the nodes are itemized. For an example of this, see the description of the corresponding field in the sub-tab of the workspace Reporting Hierarchies.
<b>Account No.</b>	This field shows the number of the account or dimension that the reporting node refers to. The title of this field depend on the type of the reporting hierarchies.

### Reporting Hierarchy Nodes Sub-Tab

This section includes the fields and descriptions for the Reporting Hierarchy Nodes sub-tab.

Field	Description
<b>Node No.</b>	In this field, you can specify the desired number of the node when creating a node.
<b>Description</b>	In this field, you can enter a description of the current node. The description appears as the fixed line text when the node is printed in reports.
<b>Level</b>	This field shows the level at which the current node is located. The node is placed one level below its parent node.
<b>Sorting Key</b>	In this field, you can specify a number to manage the position of the current node in relation to the other nodes placed beneath the parent node selected in the tab.  The order of the lines belonging to the same parent node applies to their order of appearance in reports where the nodes are itemized. For an example of this, see the description of the corresponding field in the sub-tab of the workspace Reporting Hierarchies.
<b>Account No.</b>	This field shows the number of the account or dimension that the reporting node refers to. The title of this field depend on the type of the reporting hierarchies.

## Node Attributes Single Dialogs Workspace

Use this workspace to set up attributes for nodes in your reporting hierarchies.

The attributes provide extra information of any type about the nodes. Their use depends on the reports that use the reporting hierarchies. For example, a report might be set up to search each node for certain attributes and use the information that is provided by the attribute to perform certain actions.

Node attributes are lines that contain extra information about the node to which the lines are assigned. There is no specific functionality assigned to the attributes as such, which means that you can create as many attribute lines as you want for each node and enter any kind of information that you want to capture.

In the Node Attributes tab, you can browse through the nodes that you created in the individual reporting hierarchies and enter information about the currently selected node.

In the sub-tab of this workspace, you can create the attributes to be assigned to the node in the tab of this workspace.

## Node Attributes Tab

This section includes the fields and descriptions for the Node Attributes tab.

### Node Island

Field	Description
<b>Reporting Hierarchy No.</b>	This field shows the number of the current reporting hierarchy.
<b>Node No.</b>	This field shows the number of the current node in the hierarchy shown in the field "Reporting Hierarchy No." above.
<b>Description</b>	In this field, you can enter a description of the current node.
<b>Level</b>	This field shows the level at which the current node is located. The node is placed one level below its parent node. If the node has no parent node, it is located at level one.
<b>Type</b>	This field shows the type of hierarchy to which the current node belongs. For information about the functionality of reporting hierarchy types, please see the description of the field "Type" in the workspace Reporting Hierarchies.
<b>Parent Node No.</b>	In this field, you can specify the number of another node which should be the parent node of the current node, thus hierarchically placing the current node beneath the parent node in the structure.  You cannot specify a node which results in a circular structure, and you cannot specify a leaf node to which a value has been assigned in the fields "<Key Value 1-3>."
<b>Sorting Key</b>	In this field, you can specify a number to manage the position of the current node in relation to the other nodes placed beneath the same parent node as the current node.  The order of the lines belonging to the same parent node applies to their order of appearance in reports where the nodes are itemized. For an example of this, see the description of the corresponding field in the sub-tab of the workspace Reporting Hierarchies.
<b>Account No.</b>	This field shows the number of the account or dimension that the reporting node refers to. The title of this field depend on the type of the reporting hierarchies.

## Node Attributes Sub-Tab

This section includes the fields and descriptions for the Node Attributes sub-tab.

Field	Description
<b>Attribute Type</b>	<p>In this field, you can specify the type of the current attribute. By specifying a type, you can indicate the context in which the attribute should be used.</p> <p>For instance, you might have a report which searches each node for attributes of the type Heading and uses the value in the field "String Field 1" on such lines as a heading shown below the children of the node in question.</p> <p>While this is a common use of attributes of the type "Heading," the functionality of the attribute type is determined by the individual reports using the current reporting hierarchy. Therefore, you should see the manual for your individual reports for information on their use of node attributes.</p> <p>Note that the value "Node Collection" cannot be selected manually in this workspace, as it is applied to node collections created in the workspace Node Collections.</p>
<b>Remarks</b>	In these fields, you can enter a number of remarks to apply to the attribute in question.
<b>String Field 1-2</b>	<p>In these fields, you can specify a string value for the current attribute.</p> <p>The functionality of the fields is determined by the individual reports using the current reporting hierarchy. Therefore, you should see the manual for your individual reports for information on their use of node attributes.</p>
<b>Integer Field 1-2</b>	<p>In these fields, you can specify an integer value for the current attribute.</p> <p>The functionality of the fields is determined by the individual reports using the current reporting hierarchy. Therefore, you should see the manual for your individual reports for information on their use of node attributes.</p>
<b>Real Figure Field 1-2</b>	<p>In these fields, you can specify a real figure value for the current attribute.</p> <p>The functionality of the fields is determined by the individual reports using the current reporting hierarchy. Therefore, you should see the manual for your individual reports for information on their use of node attributes.</p>
<b>Amount Field 1-2</b>	<p>In these fields, you can specify an amount for the current attribute.</p> <p>The functionality of the fields is determined by the individual reports using the current reporting hierarchy. Therefore, you should see the manual for your individual reports for information on their use of node attributes.</p>
<b>Boolean Field 1-2</b>	<p>In these fields, you can specify a yes/no value for the current attribute.</p> <p>The functionality of the fields is determined by the individual reports using the current reporting hierarchy. Therefore, you should see the manual for your individual reports for information on their use of node attributes.</p>

## Node Collections Single Dialogs Workspace

Use this workspace to set up node collections for your reporting hierarchies.

A node collection is a number of lines, each of which provides extra information about the node in relation to the current node collection. Use of a node collection depends on the reports that use the reporting hierarchy. For example, in the P/L Key Figures report, you select a node collection in the selection criteria, and then each line in the node collection becomes a column in the report.

On each line of a node collection, you can enter additional information about the node in relation to the current node collection. There is no specific functionality assigned to the node collections and their lines as such, which means that you can create as many node collection lines as you want and enter any kind of information that you want to capture.

By creating a node collection, you list a number of nodes for which you can provide additional information; it is the definition of the reports in which the node collection is used that determines how the information in the node collection is to be applied. You should set up each node collection to match the specifications of the report or reports for which the node collection is intended.

In the Node Collections tab, you enter a node collection name and select the reporting hierarchy to which the node collection pertains. In the Node Attributes sub-tab, you can then create lines with nodes from the selected hierarchy. On each line, you specify a node as well as any relevant information in accordance with the set-up requirements of the reports for which the current node collection is intended.

### Node Collections Tab

This section includes the fields and descriptions for the Node Collections tab.

#### Node Collection Island

Field	Description
<b>Node Collection No.</b>	When creating a node collection, specify in this field the desired number of the node collection. Once the collection has been created, you can no longer change the value in this field.
<b>Description</b>	In this field, you can specify a description of the current node collection.
<b>Reporting Hierarchy No.</b>	When creating a node collection, specify in this field the reporting hierarchy to which the node collection pertains. In the sub-tab, only nodes from the reporting hierarchy in question can be specified.
<b>Standard</b>	In this field, you can specify whether the current node collection is the standard node collection for the reporting hierarchy specified in the field "Reporting Hierarchy No." above. The interpretation of the field depends on the individual reports, but in many reports, including P/L Key Figures, the field is used for suggesting a node collection in the selection criteria before the report is run.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can specify the name of an access level. You only have access to the current hierarchy if you have been assigned to the same or a higher level in the workspace User Access Levels. This means that you can only run Maconomy Universe reports using hierarchies to which you have access. Furthermore, in this workspace, a given user can only see the current hierarchy if he or she has access to this level. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to reporting hierarchies may depend on other factors. For more information about this, please see the section “Introduction to the Access Control System.”</p> <p>If no access level is specified, all users have access to the current hierarchy.</p> <p>This field also shows the description of the selected access level, as entered in the workspace Access Levels.</p>

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Node Attributes Sub-Tab

This section includes the fields and descriptions for the Node Attributes sub-tab.

Field	Description
<b>Node No.</b>	In this field, specify a node to be included in the node collection. The node must be part of the reporting hierarchy specified in the tab.
<b>Description</b>	In this field, you can enter a description of the current node. The description appears as the fixed line text when the node is printed in reports.
<b>Remarks</b>	In these fields, you can enter a number of remarks to apply to the node in question.
<b>String Field 1-2</b>	<p>In these fields, you can specify a string value for the current node collection line.</p> <p>The functionality of the fields is determined by the individual reports using the current node collection. Therefore, you should see the manual for your individual reports for information on their use of node collections.</p>
<b>Integer Field 1-2</b>	<p>In these fields, you can specify an integer value for the current node collection line.</p> <p>The functionality of the fields is determined by the individual reports using the current node collection. Therefore, you should see the manual for your individual reports for information on their use of node collections.</p>
<b>Real Figure Field 1-2</b>	In these fields, you can specify a real figure value for the current node collection line.

Field	Description
	The functionality of the fields is determined by the individual reports using the current node collection. Therefore, you should see the manual for your individual reports for information on their use of node collections.
<b>Amount Field 1-2</b>	<p>In these fields, you can specify an amount for the current node collection line.</p> <p>The functionality of the fields is determined by the individual reports using the current node collection. Therefore, you should see the manual for your individual reports for information on their use of node collections.</p>
<b>Boolean Field 1-2</b>	<p>In these fields, you can specify a yes/no value for the current node collection line.</p> <p>The functionality of the fields is determined by the individual reports using the current node collection. Therefore, you should see the manual for your individual reports for information on their use of node collections.</p>

## Dimension Groupings Single Dialogs Workspace

Use this workspace to set up dimension groupings by arranging your dimension values on up to 12 grouping levels.

This enables you to add additional structure to a dimension type such as the account, company, or location dimension. Dimension groupings are designed for use with business intelligence tools such as Maconomy AnalytiX and are not used in any Analyzer reports or universe reports.

To group a dimension on different levels for advanced reporting, create a dimension grouping header. For instance, you can group all of your company accounts on different grouping levels. If you use the **Get Suggested Grouping** action in the Action menu, Maconomy suggests grouping levels that are based on the relevant dimension structure that you entered in the Structure submenu of the G/L menu.

If you want to change the grouping levels that Maconomy suggests, manually change any value in the grouping level structure that the Dimension Grouping Lines sub-tab displays. You can also use the **Export** action in the Action menu to export the current grouping level structure to a tab-separated text file. If you open that file in a spreadsheet application such as Excel, you can easily edit the grouping level structure. After you edit the text file, save and close it. Finally, import the modified dimension grouping structure using the **Import** action in the Action menu in the Dimension Groupings workspace.

In the Dimension Groupings tab, you can select or create a dimension grouping header and specify a dimension type. You can also enter a reporting hierarchy number if you want to retrieve a dimension grouping structure from a specific reporting hierarchy.

The Dimension Grouping Lines sub-tab displays an overview of the dimension grouping structure. You can modify the value on any level of the dimension grouping structure and add dimension grouping lines as needed. Additionally, the dimension column in the sub-tab allows you to select each dimension value to view and modify the details for the value in question.

## Dimension Groupings Tab

This section includes the fields and descriptions for the Dimension Groupings tab.

### Dimension Grouping Island

Field	Description
<b>Grouping No.</b>	When you create a dimension grouping header, assign a number or a name to it for easy identification. Once the dimension grouping header has been created, you can no longer change the value in this field.  You can browse existing dimension grouping numbers by clicking on the toolbar arrow keys above the tab.
<b>Description</b>	In this field, you can enter a descriptive text for the selected dimension grouping number.
<b>Type</b>	In this field, select the dimension on which you want your dimension grouping structure to be based. Please note that to be able to retrieve grouping levels from a reporting hierarchy, a reporting hierarchy must have been created to include the dimension values associated with the selected dimension type.
<b>Option List</b>	In this field, you can specify an option list. The options from the option list can be entered in the Value field.
<b>Selected Value</b>	In this field, you can specify a value from the selected option list. The value is used to determine the dimension grouping to be used by the business intelligence tool.
<b>Standard</b>	In this field, you can specify whether the grouping structure specified in the "Grouping No." field above should be the standard structure in cases where multiple grouping structures have been created using the same dimension type and option. If a business intelligence tool attempts to extract a dimension grouping structure from Maconomy based on a specific dimension type, the tool may select the standard grouping structure if multiple grouping headers have been created based on the same dimension type and option.  Note that the standard structure will only be selected if your business intelligence tool supports this functionality.

### Access Level Island

Field	Description
<b>Access Level</b>	This field allows you to specify an access level that will be in effect for the selected dimension grouping header. Access levels can be created and maintained in the "Access Levels" workspace.  This field shows a description of the specified access level.

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

## Dimension Grouping Lines Sub-Tab

This section includes the fields and descriptions for the Dimension Grouping Lines sub-tab.

Field	Description
<b>Account No.</b>	This field shows the number of the account or dimension that the reporting node refers to. The title of this field depends on the type of the reporting hierarchies.
<b>Sorting Key</b>	In these fields, you can specify a range of sorting key numbers. Only nodes with sorting key numbers within the specified range are shown in the table part.
<b>Grouping 1-12</b>	<p>These columns show the 12 grouping levels by which you can structure your dimension values. The grouping levels make up a hierarchical structure that can be displayed in reports if you use Maconomy AnalytiX or another Business Intelligence tool that supports dimension groupings.</p> <p>Please note that the higher the grouping level number, the higher its position in the dimension grouping hierarchy. In a dimension grouping structure based on location, for instance, Grouping 1 could be All Locations, Grouping 2 could be Continent, Grouping 3 could be Country, and Grouping 4 could be Local Office. In reports, this would enable you to view your financial results sorted by any or all of these grouping levels.</p> <p>You can modify the grouping level structure by entering a new value in any grouping level field manually or by building a new grouping level structure from scratch using the Insert Dimension Grouping Line or Add Dimension Grouping Line feature in the top left corner of the sub-tab.</p>

## Actions

This section shows the Actions available in the Dimension Groupings workspace.

### Top Tab

Field	Description
<b>Get Suggested Grouping</b>	<p>This action is only available for grouping level structures involving G/L dimension types, that is, the "Company," "Account," "Location," "Entity," "Project," "Purpose," "Spec. 1-3," and "Local Spec. 1-3." When you select this action, Maconomy automatically retrieves a grouping level structure based on the relevant dimension structure specified in the Structure submenu of the G/L menu.</p> <p>Additionally, the Job Cost dimension "Activity" can be used for setting up a grouping level structure. When you select the Get Suggested Grouping action for this dimension, a grouping level structure is created. This structure shows all relevant activities.</p>
<b>Update Sort Order</b>	This action updates the sorting order based on the line number and the grouping fields.

Field	Description
<b>Export</b>	This action allows you to export your dimension grouping structure to a tab-separated text file. If you open the file in a spreadsheet application such as Excel, you can easily edit the grouping level structure for subsequent import back into the Dimension Groupings workspace.
<b>Import</b>	By selecting this action, you can import your previously exported tab-separated text file back into the Dimension Groupings workspace. The existing dimension grouping structure in the sub-tab will be fully replaced by the imported structure.
<b>Get Missing Dimensions</b>	If you select this action, missing dimension values (if any) will be retrieved into the Dimension Groupings workspace. The action is relevant if entries associated with the selected dimension type – for instance, one or more accounts – have been created in Maconomy after the initial retrieval of dimension values into the Dimension Groupings workspace.
<b>Get from Reporting Hierarchy</b>	This action allows you to retrieve a dimension grouping structure from a specific reporting hierarchy rather than letting Maconomy select the default structure based on the relevant dimension structure.  Please note that to perform this action, you must previously have selected the desired reporting hierarchy number in the “From Reporting Hierarchy No.” field in the tab. Additionally, to be able to retrieve grouping levels from a specific reporting hierarchy number, the selected reporting hierarchy number must include the dimension values associated with the selected dimension type for this dimension grouping header.

## Aging Principles Single Dialogs Workspace

Use this workspace to enter settings used to generate aging reports, including how Maconomy calculates aging and displays it on reports and invoices.

### Aging Principle Tab

This section includes the fields and descriptions for the Aging Principle tab.

#### Aging Principle Island

Field	Description
<b>Name</b>	Name of the aging principle. This is the key field.
<b>Based On Entry Date</b>	If marked, the aging report considers the entry date of the invoices. If not marked, the aging report considers due date of the invoices.
<b>Split Periods by Month End, When Run on Last Day of Month</b>	This can only be marked if the period unit is Month. If it is marked and the report is run on the last day of a month, then each period will be split by the last day of the respective months.

**Aging Periods Island**

Field	Description
<b>Period Unit</b>	This field specifies how the length value of each period should be understood, that is, whether the period lengths are specified in days or months.
<b>Start Date, Example</b>	This date is used as start date when calculating the start and end dates shown in the sub-tab. The date is only for example purposes to make it easier to set up the aging principles and thus not used in the reports.

**Option List Fields Island**

Field	Description
<b>List</b>	The option list for use when printing aging reports in BPM. Please consult the BPM manual for guides on how to set and use this field.
<b>Value</b>	An option from the Option List option list used when printing aging reports in BPM. Please consult the BPM manual for guides on how to set and use this field.

**Copy Aging Principle Island**

Field	Description
<b>Name</b>	In his field you can enter the name of the new aging principle that you will copy the current aging principle to using the action Copy Aging Principle.

**User Island**

See the Getting Started topic for a description of the fields in the island User.

**Aging Periods Sub-Tab**

This section includes the fields and descriptions for the Aging Periods sub-tab.

Field	Description
<b>Title</b>	The title of the period. This field is not used in the standard print layouts but can be used in customized print layouts.
<b>Entries to Include</b>	If Due is selected, then the period will include invoices due prior (in time) to the start date of the report. If Not Due is selected, then the period will include invoices due on or later (in time) than the start date of the report.
<b>Interval Start</b>	The field shows the first day/month included in this period relative to the start date of the report. The field Entries to Include determines whether this field specifies days/months before or after the start date of the report.
<b>Interval End</b>	The field shows the last day/month included in this period relative to the start date of the report. The field Entries to Include determines whether this field specifies days/months before or after the start date of the report. If the period is open ended (does not have an ending date), then this field will be 0.

Field	Description
<b>Open Ended</b>	If marked, the period will be open ended, meaning that the period will not have an interval end. If not marked, then the interval end must be equal to or larger than the interval start.
<b>First Date in Period, Example</b>	The field is closed and shows the first date of this period, based on the example start date specified in the card pane. If the period is open ended and includes due entries, then this field will be blank for the period. Note, that this date is only for setup purposes and thus not used in the report, where another start date is specified.
<b>Last Date in Period, Example</b>	The field is closed and shows the first date of this period, based on the example start date specified in the card pane. If the period is open ended and includes not due entries, then this field will be blank for the period. Note, that this date is only for setup purposes and thus not used in the report, where another start date is specified.

## Actions

This section shows the Actions available in the Aging Principles workspace.

### Top Tab

Field	Description
<b>Copy Aging Principle</b>	Copy an existing aging principle including the associated aging periods. Always enabled.

## Reporting Structures Workspace

Use the Reporting Structure tab to view the reporting structures in a directory-like table, outlining the hierarchical structure of the defined transaction types and their grouping.

Use this workspace to set up a reporting structure by arranging your dimension values on up to 12 grouping levels. This enables you to add additional structure to a dimension type such as the account, company, or location dimension. Reporting Structures are designed for use with BPM reports.

To structure a dimension on different levels for advanced reporting, create a tree structure in the sub-tab portion with needed fields / areas to establish hierarchy.

If you want to change the reporting structure hierarchy, use the arrows or actions to move lines or whole groups.

## Reporting Structure Header Tab

This section includes the fields and descriptions for the Reporting Structure Header tab.

### Reporting Structure Island

Field	Description
<b>Name</b>	Enter a name for the reporting structure.
<b>Description</b>	Enter a description for the reporting structure.
<b>Type</b>	Select the dimension to determine the basis of your reporting structure.
<b>List</b>	Select the list to determine the basis of your reporting structure.
<b>Option List</b>	Enter or choose an option list. The options from the option list are entered in the <b>Selected Value</b> field.
<b>Selected Value</b>	Enter or choose a value from the selected option list. The value determines which reporting structure BPM uses.
<b>Allow Duplicates</b>	Select this check box to indicate whether or not duplicate dimension entries are allowed in the reporting structure. For example, if you already added account 1110 in your structure under the <b>Sales</b> group, you cannot add the same account under a different group, unless <b>Allow Duplicates</b> is selected.

### Access Level Island

Field	Description
<b>Access Level</b>	Use this field to specify an access level for this reporting structure. Once this access level is selected, a related description displays. You can create and maintain access levels in the Access Levels workspace.
<b>User Island</b>	See the Getting Started section for a description of the fields in the User island.

## Reporting Structure Lines Sub-Tab

This section includes the fields and descriptions for the Reporting Structure Lines sub-tab.

Field	Description
<b>Classification</b>	This field shows the name of the grouping line or the dimension entry.
<b>Account No.</b>	This field shows the number of the account or dimension included in the reporting structure.

Field	Description
<b>Description</b>	This field shows a description of the reporting structure line.
<b>Debit/Credit</b>	Select whether the account in the reporting structure line is a debit or a credit balance.
<b>Invert Sign</b>	Select this field to toggle whether the amount on the report is shown as a positive or negative number ( + / -).
<b>Select for Moving</b>	Select this check box to move this line with a move action.
<b>Remark 1-5</b>	Enter a remark about this line.
<b>Access Level</b>	This field shows the access level for this reporting line.
<b>Access Level Description</b>	This field shows a description of the access level.

## Set-Up Section

This section includes the fields and descriptions for the Set-Up section workspaces.

### System Information Single Dialogs Workspace

Use this workspace to maintain the system information and accounting methods common to all Maconomy modules.

For auditing purposes, it is recommended that you print and file the System Information workspace every time that you change it. You can use the **Print System Information** button for this purpose.

#### System Information Tab

This section includes the fields and descriptions for the System Information tab.

#### General Ledger Island

Field	Description
<b>Retained Earnings Account</b>	In this field, enter a dimension combination containing the account to be used for year-end closing. The dimension combination can also contain other dimension values to be used in this connection. Note that you can only enter a dimension combination on which no account number has been specified on potential lines in the sub-tab. This is due to the fact that the same account is used by all companies in the multi-company structure. However, if you are using local charts of accounts and want to carry out year-end closings for these local charts of accounts, the dimension combination must be set up so that for each company,

Field	Description
	<p>Maconomy can find a valid value in the local dimension used for local charts of accounts.</p> <p>When you close the fiscal year, net income is posted to this account. You must enter an account number to be able to close a fiscal year. See the description of the workspace Year-End Closing in the G/L module.</p> <p>When you print a balance, this account will always reflect the retained earnings after running a year end close, regardless of whether or not the year has actually been closed.</p>
<b>Template Company</b>	<p>In this field, you can enter a company number. The company must exist in the workspace Company Information and the field "Separate System Numbers" must be marked for the company. The standard company is used as a template at the creation of companies in the workspace Company Information in the G/L module. If the field "Separate System Numbers" is marked on a new company, the standard company's next available numbers in the workspaces System Numbers, Number Series, and Trans. No. Series are transferred to the system numbers of the new company.</p>
<b>Template Account</b>	<p>Enter a G/L account number to be used as a template for creating accounts in the Account Information Card in the G/L module.</p>
<b>Local chart of accounts</b>	<p>In this field, you can specify which of the three local dimensions is used as a local chart of accounts. The field is used in connection with year-end closing in the G/L module. When carrying out year-end closing for local chart of accounts, the year-end closing is carried out for the dimension selected in this field. For further information on year-end closing using local chart of accounts, please see the introduction to the workspace Year-End Closing in the G/L module.</p>
<b>Summary Postings</b>	<p>Here you specify how you wish to summarize entries where the field "Summary Posting" has been marked in a general journal. You can choose between the following:</p> <ul style="list-style-type: none"> <li>■ By Journal — Entries in a journal with identical entry date, account number (G/L account, customer number or vendor number, job number, company, entry date, company, location, entity, project, purpose, spec. 1-3, local spec. 1-3, tax type, prior-period, reference date, external transaction number, and intercompany company are summarized in one G/L entry. Maconomy uses the journal number as the transaction number. Several of the fields mentioned above will often be empty as you, for example, do not have to enter an external transaction number.</li> <li>■ By Trans. No. — Entries with identical values in the fields mentioned above as well as the transaction number transaction number in a journal with the same account number (G/L account, customer number, or vendor number), entry date, company, location, entity, project, purpose, spec. 1-3, and local spec. 1-3 are summarized in one G/L entry which is assigned the transaction number in question.</li> </ul>

Field	Description
<b>Reuse Trans. No.</b>	You can mark this field if you wish to reuse a transaction number for posting to the workspace General Journal in the G/L module, for creating vendor invoices and credit memos in the workspace Vendor Invoices in the Accounts Payable module, and for creating a general journal in the workspace Commission Calculation in the Sales Orders module. If you do not mark the field, Maconomy checks that each transaction number entered in the mentioned workspaces is unique, meaning that it has not been used on a journal entry in a non-posted general or vendor invoice journal or on an already posted G/L entry.
<b>Carry Forward Inv. Sign</b>	In the sub-tab of the workspace G/L Report Set-Up, you can mark the field "Invert Sign." This field controls either the sign on printouts or the sign of the value used when referring to a line in calculation expressions in other lines.  If you mark the field "Carry Forward Inv. Sign," the calculated value on G/L report lines will be used with inverted sign in other calculations. If you do not mark the field, the original value will be used.

### Currency Island

Field	Description
<b>Exch. Rate Tbl., Sales</b>	In this field, you select the exchange rate table to be used for the sale of items/services and in connection with customers. This exchange rate table is often equivalent to the exchange rate at which the bank purchases currency. Exchange rate tables can be created in the workspace Exchange Rate Tables.
<b>Exch. Rate Tbl., Purch.</b>	In this field, you select the exchange rate table to be used for the purchasing of items/services and in connection with vendors. This exchange rate table is often equivalent to the exchange rate at which the bank purchases currency. Exchange rate tables can be created in the workspace Exchange Rate Tables.  If the enterprise currency is specified in the Euro exchange rate table, you can only enter an exchange rate table in which Euro appears as reference currency. This ensures a correct triangulation at conversion between amounts in enterprise currency and amounts in currencies outside of the EMU Cooperation.
<b>Exch. Rate Tbl., Duty</b>	In this field, you select the exchange rate table to be used for the calculation of duty on purchased items. Exchange rate tables can be edited in the workspace Exchange Rate Tables.  If the enterprise currency is specified in the Euro exchange rate table, you can only enter an exchange rate table in which Euro appears as reference currency. This ensures a correct triangulation at conversion between amounts in enterprise currency and amounts in currencies outside of the EMU Cooperation.
<b>Exch. Rate Tbl., Budg.</b>	In this field, you select the exchange rate table to be used for conversion of currencies in the Budget module. When converting currencies in the Budget module, Maconomy always uses the exchange rate that was valid at the starting date of the fiscal year for which the current budget model applies. This exchange rate table is only used in the Budget module.  If the enterprise currency is specified in the Euro exchange rate table, you can only enter an exchange rate table in which Euro appears as reference currency.

Field	Description
	This ensures a correct triangulation at conversion between amounts in enterprise currency and amounts in currencies outside of the EMU Cooperation.
<b>Exch. Rate Tbl., Enterpr.</b>	<p>In this field, you select the currency table to be used for conversion of currencies in cases where the conversion cannot be related directly to a sales or purchase situation. The enterprise exchange rate table is used, for example, at intercompany transactions between companies not using the same base currency and for currency conversions in G/L reports. Furthermore, the enterprise exchange rate table is used for conversion of amounts in enterprise currency in G/L entries.</p> <p>If the enterprise currency is specified in the Euro exchange rate table, you can only enter an exchange rate table in which Euro appears as reference currency. This ensures a correct triangulation at conversion between amounts in enterprise currency and amounts in currencies outside of the EMU Cooperation.</p>
<b>Enterprise Currency</b>	<p>The enterprise currency is the currency used throughout the General Ledger. Amounts on entries in the G/L module are all converted into the enterprise currency to enable comparisons of entered amounts concerning companies working with different base currencies.</p> <p>Furthermore, the enterprise currency is used in a number of setup workspaces in which amounts cannot be directly related to a specific company, for example, charge codes used across companies, as well as totals and credit limits for customers, as a total is based on registrations from several companies and as a credit limit has to be compared to this total. Grand totals comprising amounts from several companies will often appear in enterprise currency, in cases where it is not possible manually to enter the currency in which you want totals displayed.</p> <p>Note that when you have selected an enterprise currency and pressed Enter, the enterprise currency can no longer be changed.</p>
<b>Standard Unit</b>	Here you enter the unit of the exchange rate. In some countries, exchange rates are given in the base currency per 100 of the foreign currency. In this case, the unit should be 100. You must enter a value here.
<b>Exch. Rate in Ref. Currency</b>	<p>This field and the field "Standard Unit" are used for specifying the way in which Maconomy is to interpret the exchange rates you enter for the currencies used in the workspace Exchange Rate Tables.</p> <p>Mark this field if you wish to enter exchange rates as the price in the reference currency for a given number of foreign currency units. If, for instance, you mark the field and the reference currency of a given exchange rate table is USD, each line in the exchange rate table should contain the price paid in USD for 100 units of the currency on the line in question (provided that the standard unit specified in the field "Standard Unit" below is set to 100).</p> <p>Remove the mark if you want exchange rates to express the price in the foreign currency for a given number of units of the reference currency. If, for instance, you mark the field and the reference currency of a given exchange rate table is USD, each line in the exchange rate table should contain the price paid in the</p>

Field	Description
	<p>currency on the line in question for 100 USD (provided that the standard unit specified in the field "Standard Unit" below is set to 100).</p> <p>In the field "Standard Unit," you can enter the number of units for which the currency price is to be specified in exchange rate tables.</p>

**Invoice / Credit Memo Island**

Field	Description
<b>Show Tax Itemization</b>	Mark this field if you wish to itemize tax on invoices and credit memos. It is only relevant if you use several rates of tax.

**Tax Island**

Field	Description
<b>Standard Tax Code</b>	<p>Here you select a standard tax rate. This standard overrides the tax rate specified in the item information card unless you apply differentiated tax or the item has a blank tax code (that is, no tax is applied). The standard tax code is also used for registering vendor invoices and to calculate tax from charges. You must select a standard tax rate.</p> <p>Tax codes are maintained in the workspace Tax Codes in the G/L module.</p> <p>You can add up to three different standard tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters workspace. When multiple tax codes are enabled, the "Standard Tax Code" field will be replaced by the following fields: "Standard Tax Code 1," "Standard Tax Code 2," and, if enabled, "Standard Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>On Account Item Tax Code</b>	<p>This field is only used, if the field "Use Tax Tables" and the system parameter "Get on account tax code from tax table" have been marked. In this field, you can enter an item tax code created in the workspace Popup Fields.</p> <p>When invoicing on account, Maconomy will use the on account tax code to determine which tax code to use for calculation of tax for the invoice/credit memo on account, as the on account tax code along with the company tax code for the current sales order, credit order, job, and so on, is part of the selection criteria for a tax code in the workspace Tax Codes in the G/L module.</p> <p>If the field "Use Tax Tables" and the system parameter "Get on account tax code from tax table" have not been marked, Maconomy uses the tax code specified in the field "Standard Tax Code" when invoicing on account.</p>
<b>Vendor Discount Item Tax Code</b>	<p>In this field, you can specify a discount tax code for vendors to be used when adjusting for tax in connection with cash discounts granted. When rolling back cash discount tax, Maconomy will use this discount tax code for determining the G/L tax code (and consequently the G/L account) to be used for posting the cash discount, since the discount tax code for vendor along with the company tax code for the vendor in question is part of the selection criteria for a tax code in</p>

Field	Description
	the workspace Tax Codes in the G/L module. Please note that if no G/L tax code can be found, the G/L tax code of the discount account is applied.
<b>Standard Item Tax Code</b>	<p>In this field, you specify an item tax code created in the workspace Popup Fields. Reporting codes are used by Maconomy for determining the tax code to be used in the calculation of tax on items, accounts, and activities, as the reporting code is part of the criteria for the selection of a tax code in the workspace Tax Tables in the G/L module. The tax table selected for the responsible company in the workspace Company Information is used in the selection criteria. However, the tax code is only selected from a tax table if the field "Use Tax Tables" has been selected in this workspace, and only if the responsible company has a tax table assigned to it. If no tax table is assigned to the responsible company, or if you use differentiated tax, and you do not use tax tables, Maconomy uses the tax code specified for the account, item or activity, depending on the transaction in question. If you use neither tax tables nor differentiated tax, Maconomy uses the standard tax code specified in this workspace.</p> <p>If you use tax tables, and the system parameter "Get on account tax code from tax table" is marked, the tax code to be transferred to on account invoices is found in a tax table. But instead of using the item tax code specified on an activity, item or account, Maconomy uses the on account tax code in the field "On Account Tax Code" (along with various other information) to point out the relevant tax table line. If the system parameter "Get on account tax code from tax table" is not marked, the standard tax code specified in the workspace System Information is always used as the tax code on invoices on account. For further information about the information used to point out the correct tax code, please see the description of the workspace Tax Tables in the G/L module.</p> <p>When posting entries, the reporting code is used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if extended tax reporting has been selected in the workspace System Information.</p> <p>The value in this field is suggested in the field "Reporting Code" on individual lines in the workspaces Purchase Orders, Invoice Allocation, and Reallocate Invoices. See the aforementioned workspaces for a more detailed description.</p>
<b>Customer Payment Item Tax Code</b>	In this field, you can enter a default item tax code for customer payments created in the workspace Popup Fields. This item tax code is assigned to the customer payment when it is created. This makes it possible to derive different G/L tax codes for withholding tax on customer payments and withholding tax on the debit customer entries. If the field has not been marked, Maconomy uses the tax code specified in the field "Standard Tax Code."
<b>Extended Tax Reporting</b>	If you mark this field, you can print an extended tax report. The tax report specification is described in the workspaces Tax Report Fields and Tax Report Specification in the G/L module. The tax report is printed from the workspace Print Tax Report. See the workspaces mentioned for a more detailed description.

**Statistics to Tax Authorities Island**

Field	Description
<b>Max. File Size</b>	Enter the maximum size in Kilobytes of the report files Maconomy creates when you select "Create File" in the workspaces Sales List System Reports and Intrastat Reports. If the report is too big to be contained in a file of the given size, Maconomy divides it into smaller files. The highest value you can enter is 1400K, which is the capacity of a 3.5" HD diskette.
<b>Entries per Declaration</b>	Enter the maximum number of entries Maconomy is to include in a declaration when you select "Create Entries" in the workspace Intrastat Reports. The highest value you can enter is 999, since each entry in the report form must be identified by a 3-digit entry number.
<b>Intrastat Specification</b>	Here you choose whether Maconomy is to create item entries per item number or per CN Code, when you report to Intrastat. If you choose "By Item," Maconomy creates a separate item entry for every item number when you select "Create Entries" in the workspace Intrastat Reports. If you choose "By CN Code" Maconomy creates one item entry for every CN code (that is, gathers items with the same CN code in the same entry).
<b>Sales List System Rep.</b>	This field is to be marked if your company must report its EU trade to the EU Sales List System. You cannot make Sales List System Reports if this field is not marked.
<b>Intrastat Import Rep.</b>	This field is to be marked if you company must report its EU purchases to Intrastat. You cannot make Intrastat Reports if this field is not marked.
<b>Intrastat Export Rep.</b>	This field is to be marked if you company must report its EU sales to Intrastat. You cannot make Intrastat Reports if this field is not marked.

**Rounding Island**

Field	Description
<b>Round off Amount</b>	In this field, you specify if you want Maconomy to round off amounts at calculations, for example, at calculation of prices and discounts and currency conversions. If you mark this field, Maconomy will round off all amounts when performing calculations on the basis of the rules specified in the workspace Currency Rounding, and only for the currencies for which an internal rounding unit has been specified in the field "Round to" in the workspace Currency Rounding. Note, that this will produce various amount differences in the system.

**Job Cost Island**

Field	Description
<b>Created as Order</b>	If you mark this field, jobs will automatically have the status of being on order when you create them. If you leave it blank, jobs are created with the "Quote" status.

Field	Description
<b>Hourly Rate</b>	<p>Here you choose how to calculate the price of billed time spent by employees in the Job Cost module. You can choose between the following options:</p> <ul style="list-style-type: none"> <li>By Employee, by which Maconomy uses the billing prices entered for your employees in the workspace Employees.</li> <li>By Activity, by which Maconomy uses the billing prices entered for activities in the field "Billing Price" in the workspace Activities in the Job Cost module.</li> <li>Employee Priority, by which Maconomy uses the billing prices entered for each employee in the workspace Employees. If the billing price of a given employee is zero, Maconomy uses the billing price of the activity that is retrieved from the field "Billing Price" in the workspace Activities.</li> <li>Activity Priority, by which Maconomy uses the billing prices specified for each activity in the field "Billing Price" in the workspace Activities in the Job Cost module. If the billing price of a given activity is zero, Maconomy uses the billing price of the employee specified on the line in question.</li> </ul>
<b>Post Amount in Job Journal</b>	<p>You can indicate by marking this field that entries to amount activities in the workspace Job Journal are to produce G/L entries in the event that the activity or job is not invoiceable, or if the job is not being capitalized. In other words, the job is to be expensed directly.</p> <p>When marked, the cost in the above cases will be debited to the P&amp;L account and the offsetting entry will be a credit to the offset account. These accounts are entered in the fields "P&amp;L Account, amount" and "Offset Account, Cap." in the workspace Activities in the Job Cost module.</p>
<b>Post Hours in Job Journal</b>	<p>You can indicate by marking this field that entries to time activities in the workspace Job Journal are to produce G/L entries in the event that the activity or job is not invoiceable, or if the job is not being capitalized. In other words, the job is to be expensed directly.</p> <p>When marked, the cost in the above cases will be debited to the P&amp;L account and the offsetting entry will be a credit to the offset account. These accounts are entered in the fields "P&amp;L Account, amount" and "Offset Account, Cap." in the workspace Activities in the Job Cost module.</p>
<b>Department from Employee</b>	<p>This field allows you to select whether the offset account for posting of time activities should be derived from the job's or the employee's department. If you mark this field, the cost will be recorded to the job's department as usual, while the offset (income) will be posted to the employee's department.</p> <p>In combination with the system parameter "All Posting References from Employee Department" in the "System Parameters" workspace, this field can cause three possible scenarios:</p>

Field	Description
	<ol style="list-style-type: none"> <li>1. If this field and the system parameter are both marked, all account references specified in the Activities workspace are derived from the employee's department.</li> <li>2. If this field is marked and the system parameter is not marked, the P/L account will be derived from the employee's department while all other account references are derived from the department to which the relevant job belongs.</li> <li>3. If this field is not marked, the setting of the system parameter will be ignored as this field must be marked in order for the system parameter to take effect. In this case, all account references are derived from the department to which the relevant job belongs.</li> </ol>
<b>Fixed Markup (Amts.)</b>	<p>Mark this field if you wish to use a standard fixed gross margin when you create jobs. If you mark this field, the sales price of amount activity entries will be calculated as the cost plus a gross margin that is found using the GM % in the field "Markup %."</p> <p>The value here is suggested in the field "Fixed Markup (Amts.)" in the workspace Job Information in the Job Cost module when you create jobs. You can always change the value in the workspace Job Information.</p>
<b>Markup %</b>	<p>Here you enter a standard fixed gross margin percentage to be used when you create jobs. You can only enter a value here if you also mark the field "Fixed Markup (Amts.)" above. When you do, the sales price of amount activities will be the cost plus a gross margin that is calculated using this GM % taken from the cost.</p> <p>The value here is suggested in the field "Markup %" in the workspace Job Information in the Job Cost module when you create jobs, but you can change it there.</p>
<b>Text Lines for Purchase</b>	<p>Here you can mark that text lines in a job budget are to be transferred to the purchase orders which are created by the "Create Purchase Order" function in the workspace Job Budgets.</p>
<b>Allocation Method</b>	<p>Here you can choose how time sheets are to be transferred to time sheet journals. It is possible to choose between the following three options: "One Entry per Day," "One Entry per Week," and "One Entry per Month."</p> <ul style="list-style-type: none"> <li>■ With the allocation method "One Entry per Day," a job entry will be created for each day with registered hours. You should choose this method if you use daily descriptions and you want the descriptions to be available for printing on invoices.</li> <li>■ With the allocation method "One Entry per Week," a job entry, equivalent to the sum of the daily registrations for each time sheet line, will be created. The entry date is the one you have selected for the week in question in the field "Entry Date" in the workspace Week Calendars.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>The allocation method “One Entry per Month” is equivalent to “One Entry per Week.” However, in weeks which extend over two months, Maconomy creates an entry for each month with time sheet lines covering registrations in both months. You hereby make sure that all registrations are allocated to the correct month.</li> </ul>
<b>Duplicate Lines on Time Sheet</b>	If you mark this field, it is possible to have more than one line in a time sheet with the same combination of job number, activity, task, and dimension values. If the field is not marked, you cannot have more than one line in a time sheet with the same registration combination, unless either or both of the lines are incomplete. See also the description of the system parameter “Allow Incomplete Time Registrations.”
<b>Transf. Non-Appr. Time Sheets</b>	If you mark this field, it is allowed to transfer time sheets to a job journal before they have been approved.
<b>Appr. by Supervisor, Time</b>	In this field, you can specify the extent to which the approval of time sheet lines by a supervisor should be allowed. The following options are available: “None,” “Optional,” and “Mandatory.” The value selected in this field is transferred as the default value in the corresponding field in the island Approval in the workspace Jobs in the Job Cost module. For further information about the functionality of each of these options, please see the description of the corresponding field in the workspace Jobs in the Job Cost module.
<b>Appr. by Project Manager, Time</b>	In this field, you can specify the extent to which the approval of time sheet lines by a project manager should be allowed. The following options are available: “None,” “Optional,” and “Mandatory.” The value selected in this field is transferred as the default value in the corresponding field in the island Approval in the workspace Jobs in the Job Cost module. For further information about the functionality of each of these options, please see the description of the corresponding field in the workspace Jobs in the Job Cost module.
<b>Appr. by Supervisor, Exp.</b>	The functionality of this field is similar to that of the field “Appr. By Supervisor, Time” above, but concerns expense sheet lines.
<b>Appr. by Project Manager, Exp.</b>	The functionality of this field is similar to that of the field “Appr. by Project Manager, Time” above, but concerns expense sheet lines.
<b>Verify Overtime</b>	In this field, it is possible to specify that the calculation of overtime in connection with time sheets is to be equivalent to the sum of the three time activities, which you specify in the workspace Time Sheets in the Job Cost module. If you mark the field, it is only possible to approve a time sheet if the overtime and the sum of the three time activities correspond.

Field	Description
<b>Allocate Job Sales</b>	<p>In this field, you can specify that the creation of a job invoice automatically makes Maconomy redistribute the accumulated sales on the job entries invoiced up till now. If you mark the field, you can then distribute the accumulated revenue of a job between the employees/departments who have worked on the job in question.</p> <p>Note that if a job has been transferred to new dimensions in the workspace Job Transfer, the distribution will be carried out on the job entries with the new dimensions. This means that in the procedure of distributing the accumulated revenue of a job between the employees/departments who have worked on the job in question Maconomy will not consider entries with a posting date before the latest transfer date of the job in question.</p> <p>Note that it is not possible to mark the field "Allocate Job Sales" if the field "Extended Tax Reporting" has also been marked. If you mark the field "Do Not Adjust Amount Activities," this will furthermore be included in the job reallocation.</p>
<b>Do Not Adjust Amount Activities</b>	<p>In this field, you can specify that the billing price of amount activities is to remain unchanged in connection with the actions "Transfer Fixed Price" and "Transfer Desired Sales Price" in the workspace Invoice Selection, and the actions "Create Credit Memo Selection" and "Create New Invoice Selection" in the workspace Job Invoice Crediting in the Job Cost module.</p>
<b>New Ord. when Transf. to Sales</b>	<p>In this field, you can specify that the transfer of items automatically leads to the creation of a sales order. If you do not mark the field, new lines will be added to an existing sales order related to the job in question, if it exists.</p>
<b>Task Approval</b>	<p>In this pop-up field you can choose how tasks in the Job Cost module should be approved when they are created or edited. You can choose between the following options:</p> <ul style="list-style-type: none"> <li>None — Tasks created or edited in the Job Cost module are approved automatically and immediately.</li> <li>All — When created or edited, tasks deriving an activity of any type must be approved by a user authorized to do so in the workspace Actions. Tasks can be approved in the workspaces Job Tasks, Task Lists or Approve Tasks in the Job Cost module.</li> <li>With Time Activities — When created or edited, tasks deriving a time activity must be approved by a user authorized to do so in the workspace Actions.</li> <li>With Amount Activities — When created or edited, tasks deriving an amount activity must be approved by a user authorized to do so in the workspace Actions.</li> </ul>
<b>Message at Cancellation of Appr.</b>	<p>If a user edits a task which has been approved, the user should be notified in some way that the edit will revoke the approval of the edited task – the task will no longer be approved. In this pop-up field you can choose how the user should be notified.</p>

Field	Description
	<ul style="list-style-type: none"> <li>Blank — No notification is given to the user editing an approved task.</li> <li>Error — The user editing an approved task receives an error message, and the edit will not be saved. The task remains approved.</li> <li>Warning — The user editing an approved task receives a warning. The user has an option to either undo his or her edit or carry on with the edit. If the user continues, the task will no longer be approved.</li> <li>Remarks — The user editing an approved task receives a notice that the edited task is no longer approved.</li> </ul>

### Job Allocation Combinations Island

Field	Description
<b>Allow Dimension Intervals</b>	<p>If you mark this field, it is possible to specify intervals in the workspace Job Allocation Combinations. The field is marked by default.</p> <p>If you choose to unmark the field, none of the fields in the sub-tab of the workspace Job Allocation Combinations can be modified. However, none of the existing intervals will be affected if you unmark the field.</p>

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Sales Orders Island

Field	Description
<b>Gross Margin</b>	<p>Here you select how Maconomy calculates gross margins. The information is used in printouts involving GM calculations, such as statistics. Choose from the following two methods:</p> <ul style="list-style-type: none"> <li>From Costs Gross margin is calculated as a percentage of costs.</li> <li>From Sales Prices Gross margin is calculated as a percentage of sales prices.</li> </ul>
<b>Back Order Method</b>	<p>Here you select how Maconomy tracks back orders. The information is used for sales order entry. Select one the following two methods:</p> <ul style="list-style-type: none"> <li>By Reservation Maconomy creates a back order if the item is unavailable when you create the order line. Therefore, the available stock determines whether an item is put on back order.</li> <li>By Packing Maconomy creates a back order if the item is reported unavailable at the time the order lines are packed in the warehouse. Therefore, the number packed determines whether an item is put on back order.</li> </ul>

Field	Description
	Once Maconomy is in operation, you can only change back order method if the order and back order volumes are zero for all items at all warehouses. For information on how the order and back order volumes are calculated for a given item at a given warehouse, please see the description of the fields "Sales Orders" and "Back Orders" in the sub-tab of the workspace Item Information Card in the Inventory module.
<b>Round Off, Item No.</b>	<p>If you want to round off amounts on BOMs, you can enter an item number in this field. The specified item number will be used on the rounding line when itemizing.</p> <p>Rounding lines allocate prices on a BOM so that the line price corresponds to the quantity of items multiplied by the unit price minus discounts. The line price at a given level will thus be equal to the sum of line prices at lower levels.</p>
<b>Including Back Orders</b>	Here you specify whether to show on packing slips and invoices, back order items that have not been invoiced. When this field is marked, these items are included.
<b>Aut. Back-Order Allocation</b>	<p>Here you select automatic back-order allocation. The field can only be completed if the back-order principle "By Reservation" is used.</p> <p>If you mark the field, back-order items on an order line will be allocated at the time of item receipt. New items will thus be set for packing immediately and will not be included in the available stock.</p>
<b>Post by Item Group</b>	<p>Here you select whether to post item sales by item group. If marked, Maconomy uses the G/L accounts specified in the sub-tab of the workspace Item Group Information Card to book item sales and cost of sales, when you invoice a sales order. This applies to entries of the type "Sales, Taxable," "Sales, Nontaxable," "Export Sales," and "Cost of Sales."</p> <p>If this field is not marked, Maconomy uses the posting references in the workspace Posting References in the G/L module and the posting references in the workspace Item Group Information Card will be ignored.</p> <p>Please note that when you invoice on account, the cost of sales are posted to the cost of sales accounts specified in the workspace Posting References in the G/L module. When the customer is later invoiced for actual goods, the on-account amounts are offset against the entries to the accounts specified in the workspace Item Group Information Card such that the sales and cost of sales are apportioned according to item group.</p>
<b>Credit Block</b>	Mark this field if you wish to block credit to customers who have exceeded their credit limit. When a customer has exceeded a credit limit at the time when a sales order is approved, Maconomy will block the order by blocking all order documents except the order confirmation. The credit limit calculation adds up the customer's current balance and order volume and compares them with the credit limit as specified in the workspace Payment Information in the Accounts Receivable module. Sales and credit orders transferred to a job are not included in the calculation of the balance of a customer. Nor does the calculation of the order volume of a customer include amounts registered on the customer's jobs in the Job Cost module, as the order volume is the

Field	Description
	<p>expression of the sum of amounts on approved sales and credit orders for the customer.</p> <p>Once a sales order has been blocked because the credit limit has been exceeded, you must revoke it in the workspace Unblocking. This is true regardless of whether the customer has reduced his balance below the credit limit. The workspace Unblocking can be used for viewing all blocked sales orders and to unblock individual sales orders.</p>
<b>Partial Delivery</b>	<p>Mark this field if you wish to make partial deliveries of items sold in the Sales Orders module. When you create quotes and sales orders, Maconomy transfers the value here to the corresponding field in the workspaces Quotes and Sales Orders.</p> <p>If “Partial Delivery” is not marked in a sales order, you can only print packing lists, packing slips and invoices when all ordered items are selected to be packed from stock. Also, in the workspace Packing Lists, you will only be able to approve a packing list if all items are packed. Finally, when you print a packing list in the workspace Print Packing List, you can only include sales orders that are marked “Partial Delivery” or for which all items are selected to be packed.</p>
<b>Post Quantity</b>	<p>Mark this field if you wish to post quantities from invoices and credit memos to the quantity field for item sales entries in the G/L module. If you mark this field, Maconomy totals quantities from item lines and transfers them to the quantity field in the G/L entry when you post an invoice or credit order. The following methods are used:</p> <p>If you post by item group, or if you have entered various dimensions on the item lines, Maconomy will group the G/L entries by item group or by combination of location, entity and project. The sum of the quantities with the same item group or dimension combination will be transferred to the quantity field in the corresponding item sales entry.</p> <p>If you do not post by item group, and if all item lines have the same combination of dimensions, Maconomy sums up the quantities on all item lines and transfers them to the quantity field in the total item sales entry for the entire invoice or credit memo.</p>
<b>Dept. from Bill to Cust.</b>	<p>If you mark this field, Maconomy uses the department of the Bill to Customer in quotes, sales orders and credit orders.</p> <p>If you leave this field blank, Maconomy uses the department from the Ship to Customer’s information card.</p>
<b>Inv. Disc. from Bill to Cust.</b>	<p>If you mark this field, Maconomy uses the invoice discount of the Bill to Customer in quotes, sales orders and credit orders.</p> <p>If you leave this field blank, Maconomy uses the invoice discount from the Ship to Customer’s information card.</p>
<b>Fix Price Step</b>	<p>This field controls how the field “Price Step” in the workspaces Invoices, Credit Memos, Quotes, Sales Orders and Credit Orders is used.</p>

Field	Description
	<p>If you leave this field blank, Maconomy uses at least the price step chosen in the given workspace, but if the order quantity justifies a higher level, Maconomy uses the higher level.</p> <p>If you mark this field, Maconomy uses the price step you specify in the invoice, quote, and so on, regardless of whether the order quantity justifies a higher price step (that is, a lower price).</p>
<b>Check Price List</b>	If this field is marked, Maconomy will verify that any items you enter in the workspaces Quotes, Sales Orders, Credit Orders, Invoices and Credit Memos exist in the price list you use. If an item is not in the price list, Maconomy alerts you.
<b>Check Cost</b>	If this field is marked, Maconomy will verify if the cost of an item entered in the workspaces Quotes, Sales Orders, Credit Orders, Invoices and Credit Memos is zero. If it is, Maconomy issues a warning.
<b>Total Packing List</b>	<p>When you enter a new customer, the value of this field is transferred to the customer information card. If this field is marked in the information card of a delivery customer, and you select "Print Packing List" in the workspace Sales Orders, Warehouse Transactions or Picking Lists, Maconomy prints a packing list not only for the order in the workspace, but for all other non-delivered orders to the same customer. This field can be used for ensuring that old back orders are delivered with new orders.</p> <p>If this field is not marked on the customer's information card, Maconomy only prints a packing list for the current order.</p>
<b>Itemized Bar Code Entries</b>	<p>If this field is marked, and you import bar codes, Maconomy creates an entry for each delivery or return. Deliveries for different orders will thus result in more than one bar code entry.</p> <p>If the field is not marked, Maconomy creates a joint bar code entry for the whole import. This entry will therefore typically contain deliveries and returns for several orders.</p> <p>Bar code entries are imported and approved in the workspace Bar Code Entries in the sales orders module.</p>
<b>Sales by Ship to Customer</b>	If this field is marked, sales and gross margin will be reported for the ship-to customer instead of the bill-to customer.
<b>Due Date from Printing Date</b>	In this field, you can specify that the due date on invoices is to be calculated from the printing date instead of the invoice date.
<b>Deliv. Date from Pref. Inv. Date</b>	In this field, you can specify that it is possible to enter the delivery date on packing slips manually in the sense that you can specify a date in the field "Pref. Deliv. Date" in the workspace Sales Orders.

Field	Description
<b>Do Not Notify of Not Available</b>	In this field, you can specify that Maconomy does not give a warning if an item is not available when you create order lines.
<b>Get Inventory From Item</b>	In this field, you can specify that it is allowed to operate with more than one warehouse. If you mark the field, the warehouse that is specified in the workspace Item Information Card will be selected.

### Inventory Island

Field	Description
<b>Template Item</b>	Here you can specify an item number to be used as a template for items created in the workspace Item Information Card in the Inventory module.
<b>Allow Back Dating</b>	<p>Here you specify that it is allowed to backdate item movements. If you choose to do so, there are various reasons why you should consider it thoroughly:</p> <ul style="list-style-type: none"> <li>▪ A backdated item movement invalidates already completed inventory count listings with a later date than the date of the movement.</li> <li>▪ The result of carrying out a backdated item movement is often different from actually carrying out an item movement on the date in question. A backdated item movement will thus not include the registration of any cost changes for other costing methods than that of the item. Furthermore, backdated item movements of items with the FIFO costing method are carried out on the current item batch queue and not on the one which existed on the posting date.</li> <li>▪ Maconomy only allows backdating that does not make the information in the system inconsistent.</li> <li>▪ To all items regardless of costing method, it thus applies that backdating is not allowed if Maconomy as a result registers:</li> <li>▪ Item movements or cost adjustments earlier than the latest cost adjustment.</li> <li>▪ Cost adjustments earlier than the latest item movement.</li> <li>▪ Furthermore, for items with the “FIFO” costing method, there are three types of backdated item movements not allowed by Maconomy. These are: <ul style="list-style-type: none"> <li>▪ Item movements earlier than the latest receipt by a warehouse with a negative stock at the time of receipt.</li> <li>▪ Receipt by a warehouse with a negative current stock.</li> <li>▪ Shipments from a warehouse with a positive current stock when the shipment subsequently causes destocking below zero.</li> </ul> </li> </ul>

**Customer Island**

Field	Description
<b>Template Customer</b>	<p>In this field, you can specify a customer number. The customer specified will be used as a template when creating customers in the workspace Customer Information Card in the A/R module, if no template customer has been specified for a given company in the workspace Company Information in the G/L module.</p> <p>For information to be inherited from the standard customer to new customers, you must set up a linking rule in the workspace Linking Rules. By creating a linking rule between the relations Customer and Customer and marking this linking rule as a "Standard Linking Rule," the rule is automatically applied when creating customers, if you do not specify another linking rule when creating the customer.</p> <p>If you create a standard linking rule with the linking method "At Creation," information from the template customer's information card is only inherited at the creation of the customer and it is thus still possible to change the information on the new customer's information card. Such a rule is therefore very useful as default standard linking rule.</p> <p>Using a template customer and a standard linking rule thus ensures fast and safe creation of new customers. If you do not specify a template customer in this field, information on new customers must be entered manually unless you create other linking rules and specify these at the creation of customers. See the description of the workspace Linking Rules for further information on the functionality of linking rules.</p>
<b>Reminder Charge Tax Code</b>	<p>If you enter a G/L tax code here, Maconomy uses the reminder charge tax rate for this tax code.</p> <p>G/L tax codes are created in the Popup Fields workspace.</p> <p>If multiple tax codes are enabled, the "Reminder Charge Tax Code" field will be replaced by the following fields: "Reminder Charge Tax Code 1," "Reminder Charge Tax Code 2," and, if enabled, "Reminder Charge Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Cust. as Contact Company</b>	<p>You can mark this field if you also want Maconomy to automatically create customers as contact companies, when you create customers.</p>
<b>Aut. Cred. Memo Reconc.</b>	<p>Here you specify whether a credit memo is to be automatically reconciled with the matching invoice when it is posted. Automatic reconciliation requires that the credit memo is created from the invoice or that the number on the credit memo is manually stated on the credit memo.</p>

**Vendor Island**

Field	Description
<b>Template Vendor</b>	Here you can enter a vendor number. If no template vendor has been specified for a given company in the workspace Company Information in the G/L module, the vendor in this field will be used as a template when vendors are created and assigned to the company in question in the workspace Vendor Information Card in the A/P module.
<b>For Inventory Purch.</b>	<p>In this field you can specify if you normally want to create a purchase voucher when a vendor invoice or vendor credit memo is not allocated to G/L accounts or jobs in the workspace Invoice Allocation in the A/P module. The value of this field will be suggested in the field "Inventory Control" on each line of a vendor invoice journal in the workspace Invoice Allocation. You can change the value of the field "Inventory Control" on the individual vendor invoice or credit memo line.</p> <p>Purchase vouchers are displayed in the workspace Invoice Reconciliation in the A/P module and are used to align item receipts from the Item Purchase module with vendor invoices from the A/P module.</p> <p>You should mark this field if your company is using Maconomy's Item Purchase module, and you to reconcile item receipts from the Item Purchase module with vendor invoices and credit memos entered in the Accounts Payable module. Any deviations between these will automatically be allocated as cost price and quantity differences. When this occurs, a purchase voucher will be created for every un-allocated vendor invoice or vendor credit memo when the vendor invoice journal is posted. This purchase voucher can then be seen in the workspace Invoice Reconciliation in the A/P module, where it can be reconciled with the corresponding item receipt from the Item Purchase module.</p> <p>If the field is not marked, un-allocated vendor invoices and credit memos can be seen in the workspace Reallocate Invoices in the A/P module after posting. In this workspace, you can then allocate to G/L accounts or jobs. This allocation is independent of the payment of the vendor invoice. In other words, you can postpone allocation of a vendor invoice till after the entry has been posted in the A/P module, and until after payment has taken place if this is desired.</p>

**Access Control Island**

Field	Description
<b>Password Required</b>	<p>Select this check box to require all Maconomy users to use a password to gain access to the system. If selected, all users must use an access code which complies with the rules set up for access codes in the Access Information workspace. If you set up a new user, or delete an existing password, Maconomy automatically assigns a password to the user. You can then change this password in the Change Password single dialog workspace.</p> <p>If you deselect this check box, users do not need to enter a password to gain access to Maconomy, and new users are not assigned a password.</p> <p>You must have administrator rights to change this field.</p>

**Tax Office Island**

Field	Description
<b>Vendor No.</b>	<p>In this field, you can enter a vendor number to be used by the local tax office for tax settlement.</p> <p>You can create duty codes in the workspace Popup Fields. These codes can be specified on items. The duty code of an item will be transferred to item purchase order lines on which the item is specified. If the item is delivered from another country than the standard country in Maconomy, a duty is calculated from the rate specified in the item's duty code. The total duty affects the inventory value, and a purchase transaction regarding the vendor in this field is automatically created.</p>

**Advertisement Island**

Field	Description
<b>Insertions per Form</b>	<p>This field only has to be filled in if you have the Maconomy advertisement add-on module.</p> <p>You must specify the maximum number of insertions to be printed on one advertising order page, created in the workspace Advertising Order. It must be between 1 and 10.</p>

**Subscription Island**

Field	Description
<b>Show Subscription Sales and Credit Orders</b>	<p>If you mark this field, sales and credit orders from the subscription module can be viewed in the workspaces Sales Orders and Credit Orders in the Sales Orders module. Subscription orders which have been running for a long period, or subscriptions with many issues create sales orders with many lines. It is relatively time-consuming to show such orders and their credit orders in the workspaces Sales Orders and Credit Orders, and it is therefore recommended that you do not mark this field.</p>
<b>Separate Sales Order Numbers</b>	<p>If you mark this field, the number series "Subscription Sales Order" is automatically used when you create sales orders in the sales orders module from the subscription module. By marking the field, it is thus possible to divide your sales orders into sales orders created in the sales orders module and sales orders created in the subscription module.</p>

**Resource Planning Island**

Field	Description
<b>Overtime, Empl.</b>	<p>In this field, you can specify how Maconomy should react if hours have been planned for an employee and the planned number of hours exceeds the employee's planning time resulting in overtime for the employee in question. See also the description of the workspaces Employee Absence Calendars and Detailed Planning in the resource planning module. In this field, you can select the following methods:</p>

Field	Description
	<ul style="list-style-type: none"> <li>Ignore — If you select this method, Maconomy will not react if an employee is allocated more hours than the planning time registered for the employee in question. Maconomy will give a warning if planning slots are created for an employee on dates on which the employee in question is absent.</li> <li>Give warning — If you select this method, Maconomy will give a warning if an employee is allocated more hours than the planning time registered for the employee in question. Maconomy will give a warning if planning slots are created for an employee on dates on which the employee in question is absent.</li> <li>Give Error — If you select this method, Maconomy will give an error message, if an employee is allocated more hours than the planning time registered for the employee in question and the allocation will be cancelled.</li> </ul>
<b>Exceeding Task Alloc.</b>	<p>In this field, you can define how Maconomy should react if more hours have been planned on a task than budgeted in the resource planning module resulting in exceeding task allocation. The method selected in this field is only relevant if you have not selected a method in the field “Resolve Exceeding Task Alloc.,” or if a situation with exceeding task allocation cannot be resolved by means of one of the selected methods. You can select one of the following methods:</p> <ul style="list-style-type: none"> <li>Ignore — If you select this method, Maconomy will not react if exceeding task allocation appears.</li> <li>Give Warning — If you select this method, Maconomy will give a warning if exceeding task allocation appears.</li> <li>Give Error — If you select this method, Maconomy will give an error message if exceeding task allocation appears, and the allocation will be cancelled.</li> </ul>
<b>Resolve Exceeding Task Alloc.</b>	<p>In this field, you can define the method to be used by Maconomy if more hours have been planned on a task than budgeted in the resource planning module resulting in exceeding task allocation. The method selected in this field is only a default standard shown when the workspace Detailed Planning is opened, and you can select another method in the workspace Detailed Planning than the one defined in this workspace. If you leave this field blank, Maconomy will not try to resolve the situation with exceeding task allocation, but use the method specified in the field “Exceeding Task allocation.”</p> <p>If you select a method in this field, Maconomy will try to resolve the situation by removing the exceeding hours from one or more of those employees on whom hours on the task have been allocated in one of the following ways:</p> <ul style="list-style-type: none"> <li>Remove Smallest Allocations First — If you select this method, Maconomy will remove hours from the employee(s) who have been allocated the fewest number of hours on the task in a slot (if there are</li> </ul>

Field	Description						
	<p>allocations of hours which are not provided with a specification of an employee, these allocations will always be removed first).</p> <p>If, for example, employee A has been allocated a total of 100 hours on the task (with, for example, 0.5 hours on a Friday), and another employee has been allocated a total of 10 hours (2 days of 5 hours), Maconomy will remove half of the hours from employee A, as this is the smallest allocation.</p> <ul style="list-style-type: none"> <li>Remove Most Loaded First — If you select this method, Maconomy will reduce the number of hours for the employee(s) who have been allocated most hours compared to the defined planning time. Allocation of hours with a specification of an employee is removed before allocations without a specification of an employee. In situations where there are more allocations with the same value, Maconomy will select the employees who do not have the employee category specified for the task as their primary category.</li> </ul> <p>Please see the description of planning time in the section “Central Terms in The Resource Planning Module” in the introduction to this module for information on the calculation of planning time.</p> <ul style="list-style-type: none"> <li>Remove External First — If you select this method, Maconomy will reduce the number of hours for the employees who are not assigned to the company responsible for the job in question, and therefore are regarded as external. In situations where there are several external employees, Maconomy will select the employees who do not have the employee category specified for the task as their primary category.</li> </ul> <p>In those cases where all task allocations for these employees have been deducted, and if there are still exceeding task allocations, Maconomy will use the method “Remove Most Loaded First” as described above.</p> <p>If there is still exceeding task allocation, which cannot be solved by Maconomy, the user might be given a message according to the method selected in the field “Exceeding Task Allocation.” If “Show Error” is selected, Maconomy will cancel the attempts made to solve the task allocation and display a message.</p>						
<b>Detailed Plan Column Title Format</b>	<p>In this pop-up field, you can specify the format of the column headings in the sub-tab of the workspaces Detailed Planning and Detailed Employee Planning (including the associated Portal components). Changing the format only applies if the planning unit is “Day.” If the planning unit is “Week,” the table headings always display the format “&lt;week&gt;, &lt;short full date&gt;,” for example, “20, 05-10-2004.” If the planning unit is “Day,” you can choose from the options in the table below:</p> <table> <tr> <th>Option</th><th>Example</th></tr> <tr> <td>Ddd dd mm yyyy</td><td>Mon 05-10-2004</td></tr> <tr> <td>Ddd dd</td><td>Mon 10</td></tr> </table>	Option	Example	Ddd dd mm yyyy	Mon 05-10-2004	Ddd dd	Mon 10
Option	Example						
Ddd dd mm yyyy	Mon 05-10-2004						
Ddd dd	Mon 10						

Field	Description
	<div>dd10</div> <p>The format chosen in this field is used as the default value in the workspaces Detailed Planning and Detailed Employee Planning. Using Maconomy's layout editing tools, you can add a similar field to those workspaces, whereby each user can choose a preferred format.</p>

## System Parameters Single Dialogs Workspace

Use this workspace to maintain a number of system parameters that are related to certain modules in Maconomy.

### System Parameter Tab

This section includes the fields and descriptions for the System Parameter tab.

#### System Parameter Island

Field	Description
<b>Allow Users to Manually Set Allow Fields on &lt;Vendors / Customers&gt; to Yes</b>	<p>Setting this company specific parameter allows users to manually set the Allow fields to <b>Yes</b>.</p> <p>Since this is a company specific system parameter, you can specify, on a company level, which users can set the Allow fields to <b>Yes</b>.</p> <p>If you use approval hierarchies (that is, the <b>Approval Required</b> field on the Approval Hierarchies Rules tab is selected), Deltak recommends that you clear this field because Allow field changes should go through an approval process rather than be set manually. If this parameter is cleared, users can set Allow fields to <b>Requested</b> which can then change to <b>Yes</b> after specified workflow approval steps.</p> <p>If you choose not to use approval hierarchies, select this option to allow users to manually change the Allow fields to <b>Yes</b>.</p> <p>If you don't use a vendor/customer template and this parameter is:</p> <ul style="list-style-type: none"> <li>Set — The Allow fields default to <b>Yes</b>.</li> <li>Not set — The Allow fields default to <b>No</b>.</li> </ul>
<b>Default &lt;Vendor / Customer / Job&gt; State</b>	<p>This parameter sets the default value for the <b>Vendor State</b>, <b>Customer State</b>, or <b>Job State</b> field.</p> <ul style="list-style-type: none"> <li>If you enable this parameter, when a new vendor, customer, or job is created, the <b>Vendor State</b>, <b>Customer State</b>, or <b>Job State</b> field value is set to the entry in this parameter. The value is set up in the States tab. If you change the value name in that tab, the value on this parameter is automatically updated.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>If you disable this parameter, the <b>Vendor State</b>, <b>Customer State</b>, or <b>Job State</b> field gets its value from the parent or template vendor, customer, or job. This is not true for company vendor and company customer.</li> </ul>
<b>Group</b>	<p>This field shows the name of the group to which the current system parameter belongs. Each group name acts as a general description of the parameters in the group, often in the form of the name of the module in which the parameter has influence.</p> <p>Below is a list of the system parameters in each group.</p> <p><b>Access</b></p> <ul style="list-style-type: none"> <li>Update Rights from Groups — Select this system parameter to change the action setup for groups. When this system parameter is enabled, the setup for all roles assigned to the group are updated and the individual action setup for each role is disabled.</li> </ul> <p>Deselect this system parameter to perform action setup individually for each role.</p> <p><b>Budget</b></p> <ul style="list-style-type: none"> <li>Budget on Company Specific Customer — This parameter controls whether Maconomy verifies the existence of company-specific customers when you create or change budget journal lines.</li> </ul> <p>If this parameter is marked and you create a budget journal line for a company and a customer (where the related company-specific customer does not exist in Maconomy), Maconomy behaves depending on whether the <b>Aut. company specific customer creation</b> system parameter is enabled. If this second parameter is enabled, Maconomy creates the company-specific customer. If this second parameter is disabled, Maconomy displays an error message which states that the company-specific customer does not exist, and that you need to create this customer manually if you want to create a budget journal line for that company and customer.</p> <p>If this parameter is not marked, Maconomy only verifies that the customer exists when you create or change budget journal lines.</p> <p>By default, this parameter is enabled.</p> <ul style="list-style-type: none"> <li>Budget on Company Specific Vendor — This parameter controls whether Maconomy verifies the existence of company-specific vendors when you create or change budget journal lines.</li> </ul> <p>If this parameter is marked and you create a budget journal line for a company and a vendor (where the related company-specific vendor does not exist in Maconomy), Maconomy behaves depending on whether the <b>Aut. company specific vendor creation</b> system</p>

Field	Description
	<p>parameter is enabled. If this second parameter is enabled, Maconomy creates the company-specific vendor. If this second parameter is disabled, Maconomy displays an error message which states that the company-specific vendor does not exist, and that you need to create this vendor manually if you want to create a budget journal line for that company and vendor.</p> <p>If this parameter is not marked, Maconomy only verifies that the vendor exists when you create or change budget journal lines.</p> <p>By default, this parameter is enabled.</p> <p><b>Contact Management</b></p> <ul style="list-style-type: none"> <li>■ <b>Use Company Specific Contact Companies</b> — With this parameter, you can specify whether Maconomy should attempt to derive a company number when creating contact companies. If the parameter is marked, Maconomy will always attempt to derive a company for new contact companies. This has the effect that the contact company number is drawn from the company-specific number series belonging to the derived company. If the parameter is not marked, Maconomy does not attempt to derive a company when creating contact companies. If you do not enter a company number manually, the new contact company will therefore remain blank, and Maconomy will draw the contact company number from the 'global' number series belonging to the first company created in the system.</li> </ul> <p>Please note that contact company numbers are only drawn from a number series if no number has been specified manually, and that the company number on a contact company can always be changed after creation.</p> <ul style="list-style-type: none"> <li>■ <b>Use Contact Company Hierarchies</b> — When the system parameter is selected, hierarchy functionality is enabled for contact companies. The parameter can only be selected if no customer hierarchies exist and can only be deselected if no contact company hierarchies exist.</li> <li>■ <b>Use the same numbers for contact companies as for customers</b> — With this parameter, you can specify whether Maconomy should assign the same numbers to both contact companies and customers in certain situations. The parameter applies in the following situations.</li> </ul> <p>If the parameter is marked and you select the <b>Create Customer</b> action in the workspace Contact Companies without first specifying a new customer number in the <b>New Cust. No.</b> field, the new customer is assigned a customer number corresponding to the current contact company. If this number is already used by another customer, the customer is assigned the next available number in the Customer number series.</p>

Field	Description
	<p>If the parameter is marked, and the <b>Cust. as Contact Company</b> field in the System Information workspace is also marked, this means that creating a customer should automatically result in the creation of a contact company. In this case, the new contact company is assigned a number corresponding to the new customer number. If this number is already in use by another contact company, the contact company number is derived as described in the <b>Contact Company No.</b> field in the Contact Companies workspace.</p> <p><b>Customer</b></p> <ul style="list-style-type: none"> <li>■ Allow Users to Manually Set Allow Fields on Customers to Yes — If this system parameter is not set, a user does not have the ability to change an Allow field to <b>Yes</b>. If the submitter would like to use the company customer in a certain area, they can change an Allow field to <b>Requested</b>. The system can be set up so that, after approval during a specified step in the workflow, that Allow field changes from <b>Requested</b> to <b>Yes</b></li> <li>■ Aut. company specific customer creation — With this parameter, you can specify that Maconomy is to automatically create a company-specific customer when registrations are made on a customer for which no company-specific customer has been created yet. These registrations can, for example, be made in the General Journal, Quote, Sales Orders, and Jobs workspaces . If the parameter is not marked, Maconomy shows an error message saying that you are attempting to register information for a company-specific customer which does not exist in the system and that the company-specific customer must therefore be created manually in the Company Specific Customer Information Card workspace before the registration can be made.</li> <li>■ Automatic Approval of Customer Payments — If this parameter is marked, then imported customer payments are approved automatically. This means that if during importing customer payments, these payments are reconciled against, for example, some invoices, the reconciliation will be approved automatically.</li> <li>■ Centralized customer creation only — By marking this parameter, you specify that customers may only be created centrally, that is, in the Customer Information Card workspace. This way, a company-specific customer can only be created in the Company Specific Customer Information Card workspace if the customer has already been created as a customer in the Customer Information Card workspace. If the parameter is marked, and a user attempts to create a company-specific customer who has not already been created in the Customer Information Card workspace, Maconomy shows an error message. If the parameter is not marked, you can freely create company-specific</li> </ul>

Field	Description
	<p>customers in the Company Specific Customer Information Card workspace.</p> <ul style="list-style-type: none"> <li>■ Create Customer Entries for Zero Entries — If this company-specific system parameter is marked, Maconomy creates customer entries without an amount. Maconomy can create customer entries without an amount when posting reminders without an amount, and when posting zero-invoices.</li> <li>■ Default Company Customer State — This company-specific parameter sets the default value for the <b>Company Customer State</b> field. If this parameter is set, then when a new customer is created, the <b>Company Customer State</b> field value is set to the entry in this parameter. The value is set up on the States tab and if you change the value name on that tab, the value in this parameter is automatically updated. If this parameter is not set, the <b>Company Customer State</b> field does not get a value.</li> <li>■ Default Customer Aging Principle — This system parameter specifies the initial aging principle to be set when opening the Print A/R Aging Report window. This can be changed by the user before printing the report.</li> <li>■ Default Customer State — Copy to come.</li> <li>■ Derive default company to customer payments — If you mark this parameter, the company on the payment journal will be suggested as the default company when creating payments in the Customer Payments workspace. If the parameter is not marked, no default company will be suggested when a customer payment is created.</li> <li>■ Manual release of customer payments — By marking this parameter, you specify that customer payments must be released manually before they can be posted. Manual release is done in the Customer Payments workspace by marking the <b>Released</b> field on the lines in the sub-tab of the workspace. If you do not mark the parameter, customer payments will be automatically released for posting automatically at creation. Note that a user can only release customer payments for posting if the <b>Release Customer Payments</b> field has been marked for the user in question in the Actions workspace.</li> <li>■ Margin for customer payment variance — This system parameter is used in connection with automatic handling of minor amount variances created when reconciling customer payments against invoices in the Customer Open Entry Reconciliation or Customer Payments workspaces in the A/R module. In the parameter, you can enter the maximum deviation allowed in order for Maconomy to perform automatic reconciliation. The margin can be specified as an amount or a percentage. In this way, you can specify a margin</li> </ul>

Field	Description
	<p>allowing a difference of, for example, plus USD 3.00 to minus USD 3.00, a given percentage, or both. If you specify an amount, it should be specified in the enterprise currency of the system.</p> <p>If you enter a value in the parameter, Maconomy will automatically reconcile the payment in question against registered customer entries at the time of posting, if the difference between the amount of the payment and the amount on the invoice or invoices is within the margin specified in the parameter. Maconomy automatically uses the margin (amount or percentage) resulting in the lowest amount. When checking the variance amount, the amount specified in the parameter is automatically converted into the currency in which reconciliation is made, that is, the original currency or the standard currency of the customer. This currency conversion is made on the basis of the exchange rate table for sales. Amount variances are posted on an account for customer payment variances by means of a posting reference, which is specified in the Posting References workspace in the G/L module.</p> <p>If you do not specify a margin, or if the current difference between a payment amount and a customer invoice is greater than the margin, or if the difference cannot be reconciled, the reconciliation and closing of the invoices must be done manually, or you can choose to have the variance posted as a cash discount on the selected customer entries. Please note that this parameter can only be used if all entries to be reconciled have been selected for "Total" reconciliation. Moreover, the functionality of this parameter is only available if you have not marked the <b>Manual Release of Customer Reconciliations</b> system parameter.</p> <p>This parameter allows you to set a company-specific value in the sub-tab.</p> <ul style="list-style-type: none"> <li>■ Suggest Company Customer Name as Entry Text — If enabled, Maconomy will automatically fill the Entry Text with the chosen customer's name when creating general journal lines.</li> <li>■ Use Customer Level 2-5 — These parameters enable the customer hierarchy functionality. Selecting one of these parameters allows you to create a customer on a particular level, and makes the hierarchy fields for the selected parameter visible in workspaces where customer hierarchy fields are shown. If a level is not used, the customer hierarchy fields for that level are hidden in the workspaces. If level 2 is not used, all customer hierarchy fields are hidden.</li> </ul> <p>You have to select the parameters in order. For example, you must use level 2 first in order to use level 3.</p>

Field	Description
	<ul style="list-style-type: none"> <li>■ Include tax for debtor provisions — Enable this company-specific parameter to select whether tax should be included or excluded for debtor provisions. Enter or select a date to update existing open customer entries without approved or posted debtor provisions to include tax. If you do not choose a date, all open customer entries without approved or posted debtor provisions are updated to include tax. <b>Note:</b> Customer entries that already have approved debtor provisions are not affected by this parameter.</li> </ul> <p><b>General Ledger</b></p> <ul style="list-style-type: none"> <li>■ Allow Accrual Periods Outside Open Posting Interval — If enabled, Maconomy will allow accrual periods outside the open posting period.</li> <li>■ Allow to Block Companies with Open Assets — If you enable this company-specific system parameter, Maconomy allows you to block a company even if it has assets that are not fully depreciated.</li> <li>■ Calculate Dimension Task Periods — Select this parameter to enable Maconomy to create, calculate, and maintain dimension task periods. This system parameter is disabled by default. If it is deselected, Maconomy does not create or update the dimension task periods when you post finance entries.</li> <li>■ Calculate operating result in reports — In this parameter, you can specify if Maconomy is to show an operating result on balance and balance sheet printouts. If the parameter is marked, printouts from the workspaces Print Balance Sheet and Print Trial Balance will show a sum of the balances of the P&amp;L accounts in the chart of accounts. This sum will be shown on the year-end closing account. The printout thus simulates a year-end closing without creating the entries which would normally be created as a result of closing a year. This way, the printout can show what the balance sheet of the company would look like if the year was closed at the time of the printout.</li> <li>■ Company specific transaction number check — If you mark this parameter, it will be possible to enter a given transaction number on manual registrations such as general journal entries, fixed asset entries, vendor invoices, and so on, if it has not been used before in the company in question. As a result, it becomes possible for the same transaction number to be used in multiple companies. If you do not mark the parameter, a given transaction number can only be specified on a manual registration if it has not been used before on any other manual transaction in the system, regardless of company.</li> <li>■ Complete Dimension Derivation at Posting — If you mark this parameter, Maconomy considers all dimensions during dimension</li> </ul>

Field	Description
	<p>derivation, regardless of whether dimension values were changed. If a dimension has overwrite selected, Maconomy also rederives that dimension and overwrites the value specified by the user. Finally, marking this parameter enables Maconomy to derive dimensions from other derived dimensions.</p> <ul style="list-style-type: none"> <li>■ <b>Complete Dimension Derivation at Registration</b> — If you mark this parameter, Maconomy performs a complete dimension derivation during registration.</li> <li>■ <b>Create Intercompany Invoicing Basis</b> — In this parameter, you can specify whether you want to settle your intercompany transactions manually or by means of intercompany invoicing. As mentioned in the Multiple Companies section in the introduction to the G/L module, a redistribution of funds between individual companies in the organization results in a number of automatically created intercompany balances. Intercompany balances are G/L entries created to ensure that the accounts of all companies involved in a given transaction balance. The introduction to the Intercompany Accounts workspace describes the different types of situations in which intercompany balances are created and contains a number of posting examples.  If you mark this parameter, Maconomy will not only create the relevant intercompany balancing entries but also a number of intercompany entries when you post registrations involving more than one company, as described in the Automatic settling section in the introduction to the G/L module. When the parameter is marked, intercompany balancing entries cannot be reconciled in the Finance Reconciliation workspace. Instead, they are reconciled automatically when the intercompany entry covering the intercompany balancing entry in question is included in an intercompany invoicing in the Intercompany Invoicing workspace.  If you do not mark the parameter, posting registrations involving more than one company will only result in the creation of intercompany balancing entries no intercompany entries will be created. As a consequence, it is not possible to perform intercompany invoicing in the Intercompany Invoicing workspace. Instead, you must reconcile your intercompany balancing entries manually in the Finance Reconciliation workspace.</li> <li>■ <b>Create Unrealized Exchange Rate Variances For Control Accounts</b> — Select this parameter to create unrealized exchange rate variances for control accounts in the Print Currency Report single dialog workspace. Deselect this parameter to include unrealized exchange rate variances only for manual accounts.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ <b>Derive Customer Number From Job On Reallocate</b> — This company-specific system parameter allows you to choose whether the reference customer number should be rederived from the job if a job-related entry is reallocated in G/L reallocation.</li> <li>■ <b>Do Not Rederive Dimensions on Fixed Assets</b> — Select this parameter to indicate that changing dimensions or any other field on the asset will not force Maconomy to derive dimensions. Deselect this parameter to rederive dimensions upon the creation of the asset.</li> <li>■ <b>Do not check currency amount when posting a journal</b> — Normally, if a transaction only contains lines in one currency, the sum of currency amounts must also be 0. However, if this parameter is set, it is possible to post a journal where the sum in currency is not 0 for each transaction.</li> <li>■ <b>Intercompany tax balancing</b> — With this parameter, you can specify that tax on expenses should be posted in the company to which the expense pertains, of the company recording the expense transaction. One example could be vendor invoices, where this parameter determines if the tax should be posted in the company specified on the vendor invoice (that is, the company recording the expense transaction) or in the company specified on the individual invoice allocation lines for the vendor invoice (that is, the company to which the expense pertains).  If the parameter is not marked, tax amounts regarding expenses are posted in the company recording the transaction. In the Vendor Invoices workspace, this is the company specified for the current vendor invoice journal, whereas in other workspaces, for example, Expense Sheets, it is the company responsible for the job to which the expense sheet lines pertain. If the expense is allocated or reallocated to another company, Maconomy will only move the expense amount excluding tax to the company to which the expense is allocated, whereas the tax amount remains in the original company.  If the parameter is marked, the tax is posted in the company to which the expense is charged. This means that if, for example, a vendor invoice is recorded in one company, and the vendor invoice is allocated to another company in the Invoice Allocation workspace, Maconomy will move the entire expense amount, including tax, to the company to which the invoice is allocated.  In both cases, the amount is moved by means of a number of intercompany postings between the affected companies.  The parameter is effective in all workspaces in which expenses can be recorded, for example, Vendor Invoices, Expense Sheets, and General Journal.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li> <p>■ Match all G/L tax table lines if no value are specified in reg. — If there are registrations without a company tax code, this company-specific system parameter determines how the tax code is derived.</p> <p>Most registrations have a company tax code, but there are a few exceptions to this such as expense sheets.</p> <p>By default, this field is check marked, which means that if the registration does not have a company tax code when the system is deriving the tax code, it will take into account all lines from the corresponding G/L tax table. If the field is unmarked, the system will take into account only the lines with no company tax code, from the corresponding G/L tax table.</p> <p>This parameter allows you to set a company-specific value in the sub-tab.</p> </li> <li> <p>■ Option List for Derived Dimensions — Here you can specify default option list that will be assigned to derived dimensions when they are created.</p> </li> <li> <p>■ Reallocation of tax at job reallocation — With this parameter, you can specify if Maconomy is to include value-added tax when job entries are reallocated. It is sometimes a problem to reallocate tax entries, especially if the tax has already been reported to the tax authorities and the entry is reallocated to another company (legal entity) in the Maconomy multi-company model.</p> <p>If the parameter is not marked, Maconomy will include tax entries when reallocating entries in the Job Cost module.</p> </li> <li> <p>■ Reallocate Sub Module Dimensions — All sub module dimensions will be kept if this system parameter is true; no sub module dimensions will be kept if this system parameter is not marked (when reallocating).</p> </li> <li> <p>■ Recalculation of tax at job reallocation — Normally, Maconomy does not reallocate the incoming tax on an external expense (vendor invoice, expense sheet, general journal) when you reallocate a job entry. However, if you mark this parameter, Maconomy rederives the tax code at job reallocation. You can also change the tax codes manually.</p> <p>Maconomy adds the new tax code fields to the job reallocation entry. You cannot enter a tax code for reallocation if the original job entry does not have a tax code.</p> <p>Maconomy uses the original tax code if no tax code is entered or selected in the job reallocation entry.</p> <p>You can only change the incoming tax codes on job entries created after the introduction of this functionality.</p> </li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Tax On Customer Exchange Rate Variance Entries - If you enable this system parameter, Maconomy calculates the tax in base currency by converting the tax in job currency to base currency (in particular, it will be zero for 0-invoices). If you do not have a scenario where not having this functionality causes problems, do not enable this parameter.</li> <li>■ Text on division by 0 in G/L rep. — With this parameter, you can specify if Maconomy is to print a given text or a 0 if a division by 0 takes place in a calculation in a G/L report. A division by 0 can, for example, take place if you wish to divide a given value by the value in a certain field, but the field in question contains a blank value or a 0. If you specify a text in the <b>Text on division by 0 in G/L rep.</b> field, G/L report columns where a division by 0 takes place will show the specified text. If you do not enter a text in the field, a 0 is shown instead. Please note that if a calculation in a G/L report contains references to another column where a division by zero takes place, the result of the calculation in question will also be the text specified in this parameter.</li> <li>■ Update balance on account information card — With this parameter, you can specify if Maconomy should update the values in the <b>Balance, Enterprise, Balance, Currency, Quantity, and Quantity 2</b> fields in the Account Information Card workspace. If you do not mark the parameter, these fields are not updated when posting or year-end closing. Please note that if the parameter is marked, you can only perform a year-end closing if all companies in the system are using a fiscal year template which contains a fiscal year for the current year and the next year.</li> <li>■ Allow to Block Companies with Open Assets — If you enable this company-specific system parameter, Maconomy allows you to block a company even if it has assets that are not fully depreciated.</li> <li>■ Use dimensions from invoice line on tax entries — This parameter allows you to specify whether dimensions on tax-related G/L entries should be retrieved from the invoice line rather than from the invoice. The parameter applies to incoming invoices (vendor invoices) as well as outgoing invoices (job invoices and sales order invoices). By default, this field is unmarked, which means Maconomy will retrieve dimensions from the related invoice, not from each invoice line.</li> <li>■ Use Enterprise Currency in Intercompany Interest Calculation and Grouping — When this parameter is marked, intercompany interest calculation and intercompany entry grouping will use enterprise currency instead of original currency.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Use local accounts for unrealized exchange rate variances — If you select this parameter, then the report contains lines on the local account level and Maconomy creates finance entries for each needed local account. Deselect this parameter to enable Maconomy to create finance entries only for global accounts. The Print Currency Report window takes direction from local accounts.</li> <li>■ Use Local Account Target Group in Finance Reconciliation — If enabled, then the Local Account No. field in the Finance Reconciliation window will be represented as an interval field, for example From Local Account No. – To Local Account No. This will allow users to reconcile multiple local accounts at the same time. If disabled, then the Local Account No. field in the Finance Reconciliation window will not be represented as an interval field. It will only be possible to specify and reconcile one local account at a time.</li> <li>■ Use Reference Date as Exchange Rate Date — If enabled, Maconomy will use the Reference Date as exchange rate date on general journal lines. If disabled, Maconomy will use the Entry Date as exchange rate date on general journal lines.</li> <li>■ Validate Bank Statement Date — If you mark this company-specific system parameter, Maconomy validates whether the bank statement date is in the open posting period for the default transaction type specified on the bank statement header. This happens when the statement is approved. There is no validation if you have removed the default transaction type.</li> </ul> <p><b>Inventory</b></p> <ul style="list-style-type: none"> <li>■ Extended serial number control — If you mark this parameter, Maconomy allows the receipt of the same serial number for the same item to the same warehouse on several different item receipts. Furthermore, Maconomy will automatically create serial number receipt lines and serial number entry lines when purchasing and selling items with standard serial numbers. These lines are automatically updated with the relevant quantities, and it is therefore not necessary to manually register serial number receipt and sales of items with a standard serial number for purchase and sales. If you do not mark the parameter, the receipt of a given serial number can only be made for a combination of item number and warehouse for which the serial number in question does not already exist. Furthermore, serial number receipt and serial number entry must be made manually for all items with serial number control. Whether serial number entry at receipt and shipping is mandatory is determined by each item's setup in the island Warehouse in the Item Information</li> </ul>

Field	Description
	<p>Card. For further information about standard serial numbers, please see the description of the workspaces Serial Number Receipt and Serial Number Entry as well as the fields “Std. Serial No., Purchase” and “Std. Serial No., Sales” in the workspace Item Information Card in the Inventory module.</p> <p><b>Job Cost</b></p> <ul style="list-style-type: none"> <li>■ Aging Principle for Job Invoices — This system parameter specifies the aging principle to be used when attaching an A/R aging report to job invoices.</li> <li>■ All Posting References from Employee Department — If you mark this parameter, all posting references will be derived from the department to which the relevant employee belongs. This derivation occurs when one of the following employee-related actions is performed in Maconomy: Journal entry posting, approval of time/expense sheet registrations or invoice printing. In combination with the “Department from Employee” field in the System Information workspace, this system parameter can cause three possible scenarios: <ol style="list-style-type: none"> <li>1. If the field and this system parameter are both marked, all account references specified in the Activities workspace are derived from the employee’s department.</li> <li>2. If the field is marked and this system parameter is not marked, the P/L account will be derived from the employee’s department while all other account references are derived from the department to which the relevant job belongs.</li> <li>3. If the field is not marked, the setting of this system parameter will be ignored as the field must be marked in order for the system parameter to take effect. In this case, all account references are derived from the department to which the relevant job belongs.</li> </ol> </li> <li>■ Apply Price List 'Intercompany Price %' to Billing Price — Select this parameter to calculate the cost price (responsible company) by applying the intercompany % to the billing price in the executing company. If this parameter is not selected, the cost price (responsible company) is calculated by applying the inter-company % as a mark-up % to the cost price in the executing company.</li> <li>■ Allow Approximate Unit Price in Job Budgets — Use this system parameter to prevent Maconomy from changing the entered total cost or billing price for a job budget line in the Job Budgets or Periodic Job Budgets windows. If this system parameter is disabled, then the entered total price is recalculated to reflect the quantity multiplied by</li> </ul>

Field	Description
	<p>the unit price, which, due to rounding, might not be exactly equal to the entered amount. If enabled, the entered total price is kept, which has the consequence that the unit price on the job budget line is only approximately equal to the ratio of the total price and quantity.</p> <ul style="list-style-type: none"> <li>■ Allow Blocked Dimensions in Job Budgets — Use this parameter to allow changes to job budgets and changes in job progress for blocked dimensions (such as Location, Entity, and Purpose).</li> <li>■ Allow Change of Closed Jobs — If this parameter is set, it is possible to change certain field on closed jobs when importing.</li> <li>■ Allow Change of Overtime Spec. in Invoicing — Select this parameter to allow change of overtime specification in invoice selection.</li> <li>■ Allow Change Of Printed Job Invoice — Select this parameter to enable change of a number of fields like the address fields. This is now also possible in the Job Invoice Overview window.</li> <li>■ Allow Change of Printed Job Invoice — If you select this parameter, you can change the address fields, the invoice name field, and three remark fields on job invoices in the Show Job Invoices and Show Job Credit Memos workspaces. You can also update the payer address in Invoice Editing (independently of the system parameter).</li> <li>■ Allow change of tax on invoice lines — If you mark this parameter, Maconomy allows you to change the tax amount on individual lines in the workspace Invoice Editing to compensate for rounding differences, and so on. However, the sum of the tax amount on individual lines must still match the total tax amount as specified on the invoice. Furthermore, the system must be set up to use differentiated tax.</li> <li>■ Allow Change of Unit Price on Accrued Purchase Order Line — If this parameter is selected, it is allowed to change unit price on a purchase order line after it has been accrued (fully or partially) on a job.</li> <li>■ Allow dim. change on jobs with open invoices on account — If you mark this parameter, Maconomy allows you to change the dimension specification on jobs in the workspace Jobs, even though open invoices on account exist on the job. This parameter should be used with caution, as changing dimensions on jobs with open invoices may lead to differences when the invoice on account is later reconciled against a regular invoice, and those differences must then be corrected manually.</li> <li>■ Allow Editing of Absence Time Sheet Lines — Time sheet lines created automatically from approved absence (see system parameter "Automatically Create Time Sheet Lines from Approved Absence") cannot be changed or deleted by the user except if this system parameter is selected.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Allow expense sheet for multiple jobs — If this parameter is not marked, you can only enter expense sheet lines pertaining to the same job on an expense sheet. The job is specified in the tab of the workspace Expense Sheets. If you mark the parameter, you can specify different job numbers on the individual expense sheet lines.</li> <li>■ Allow Incomplete Expense and Mileage Registrations — If you enable this parameter, you are allowed to enter incomplete registrations when registering expenses or mileage. You are prompted to complete the lines when submitting the expense or mileage sheet.</li> <li>■ Allow Incomplete Time Registrations — If this parameter is not marked, every time sheet line must contain the following information before you can save it by pressing Return: job number, activity number and possibly task (if required on the job). If this parameter is marked, you can enter incomplete lines in time registration workspaces (Time Sheets, Daily Time Sheets, and SpeedSheet). For instance, you can omit the activity number from a line and close the workspace without receiving any error message. This parameter must be marked if you want to use the SpeedSheet. Note that if the parameter is marked, you can have identical registration combinations on multiple lines in a time sheet, even though the field “Duplicate Lines in Time Sheet” in the workspace System Information is unmarked – as long as the lines are incomplete.</li> <li>■ Allow Job Budgeting Outside Job Date Range — Enable this system parameter to allow planned start and end dates on the latest job budget revision that are out of range of the job's start and expected end date. Enabling this system parameter also allows periodic budgeting outside the job's date range.</li> <li>■ Allow Job Budget Periodization Action — Enable this system parameter to enable the use of the Periodize Budget action in Maconomy.</li> <li>■ Allow Job Journal Billing Price Base Import — Enable this parameter to specify both Billing Price Base and Billing Price Currency when importing job journals.</li> <li>■ Allow Job Specific Billing Addresses — If this parameter is marked, you can change the address and attention person of the bill-to customer of the job in the workspaces Job Information and Job Invoice Distribution. The change applies to the current job only and affects the following job cost printouts: invoice, draft invoice, credit memo, job description, quote, quote revision, and order confirmation. If the parameter is not marked, you can only change the name of the attention person—provided that the parameter “Allow Job Specific Bill</li> </ul>

Field	Description
	<p>To Customer Attention Persons" is marked. For more information, please see the description of the workspace Job Information.</p> <ul style="list-style-type: none"> <li>■ Allow Job Specific Bill To Customer Attention Persons — If this parameter is marked, you can change the name of the attention person of the bill-to customer of the job in the workspaces Job Information and Job Invoice Distribution. If the parameter "Allow Job Specific Billing Addresses" is marked, you can change the attention person's name regardless of whether this parameter is marked or not. The change applies to the current job only. For more information, please see the description of the workspace Job Information.</li> <li>■ Allow On Account Opening Balance Import — copy to come.</li> <li>■ Allow Multi-Company Job Journal — Using this parameter, you can define whether job entries registered in the workspace Job Journal can be assigned to another company than the one responsible for the job journal in question. If you do not mark this parameter, job entries in the sub-tab of a job journal can only be created for jobs assigned to the company responsible for the job journal in question. If you mark the parameter, the jobs specified for the job entries do not have to be assigned to the company responsible for the job journal. When a job journal is posted, Maconomy will move the job entries which do not concern the company responsible for the journal to a number of automatically created job journals, resulting in one journal for each of the companies involved. The automatically created journals are also posted automatically.</li> <li>■ Allow multiple credit memos per invoice — With this parameter, you can specify whether or not it should be possible to make more than one credit memo per invoice in the workspace Invoice Selection in the Job Cost module. If the parameter is marked, you can make several credit memos per invoice and Maconomy will only issue an alert, when you make a second credit memo on the basis of a job invoice of which a part has already been credited by selecting the action "Invoice to Credit Memo." If the parameter is not marked, it will only be possible to make one credit memo per invoice.</li> <li>■ Allow On Account Opening Balance Import — Select this parameter to allow import of opening on account balances. These opening balances can be imported with the program "Import Job Inv On Account." The system parameter allows you to set the field "Opening Balance Import" (internally OpeningBalanceImport) to "1" in the import. This has the effect that you can specify a billing price in job currency and a base currency in the import file instead of relying on the exchange rate setup. Moreover, if you set the system parameter "Create Journal in On Account Opening Balance Import," the invoices from the import will not give rise to a journal, so there will be no posting to AR or GL.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Allow over invoicing — With this parameter, you can specify whether it should be possible to over-invoice a customer. If the parameter is marked, it will be possible to create entries for direct invoicing that are not closed upon invoicing but instead cause a negative open sales price on the job. If the parameter is not marked, all entries for direct invoicing must be closed. This parameter allows you to set a company-specific value in the sub-tab.</li> <li>Allow separate approval requirements for time and expenses — If this parameter is marked, you can divide the approval of job registrations by the supervisor and/or project manager into separate approval of time sheet and expense sheet registrations. If the parameter is not marked, the setting for time registrations applies to both time and expense registrations. For more information, please see the island Approval in the workspace Jobs in the Job Cost module.</li> <li>Allow Users to Manually Change Job Status - Enable this parameter to allow users to manually change the job status on a new job. If this system parameter is disabled, users cannot manually convert jobs to Quote or Order (for example, by using the <b>Convert to Quote/Order</b> actions in Jobs workspace).</li> <li>Allow Users to Manually Unblock Jobs for Reg. and Inv. - Enable this parameter to allow users to manually unblock created jobs for registrations and invoicing.</li> </ul> <div style="border: 1px solid blue; padding: 5px; margin: 10px 0;"> <p><b>Note:</b> If this system parameter is disabled, you can still block a job.</p> </div> <ul style="list-style-type: none"> <li>Always Derive Cost Revenue Quotient From Job Budget — This system parameter enables a more advanced method for deriving the quotient between cost and revenue by considering the job budget associated with the forecast budget. The functionality in automatic calculations is changed concerning what factor between Cost and Revenue is to be used. If you do not have a job budget as foundation: <ul style="list-style-type: none"> <li>- Automatic calculations should be applied (currently they are not)</li> <li>- The factor to be used is 1.0 for the three activity types. This also applies if there are simply no prices for the current activity type.</li> </ul> If you do have a job budget as foundation: <ul style="list-style-type: none"> <li>- The factor is 1.0 for Outlay and Amount, whereas for Time, the factor comes from the job budget as currently.</li> </ul> </li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li> <b>Absence Approval</b> — If this parameter is marked, the absence approval functionality is activated. When the approval functionality is activated, only approved absence calendar lines are taken into consideration in the resource planning system. As a result, each employee absence calendar line must be submitted and approved in order for the absence registration to affect the planning. For further information, see the section “Employee Absence Calendars” in the introduction to the Resource Planning module.   If the parameter has previously been marked and you decide to unmark it, all registered absence whether approved, rejected or submitted or not will become effective and thereby affect the resource planning. This can cause planned hours to be deleted. Therefore, Maconomy issues a warning, and if you proceed, it marks all non-approved absence calendar lines in the system as temporary, thus avoiding that lines that were not previously effective become effective. You are also warned that all absence calendar lines must be approved before becoming effective.   If you want to change the parameter from marked to unmarked, you should ensure that only the user unmarking the parameter is logged on to the system while the procedure takes place. This ensures consistency in the planning system. </li> <li> <b>Automatically Create Time Sheet Lines from Approved Absence</b> — When absence time sheet lines are created automatically from approval of absence (enabled by this system parameter, "") then split week time sheet part B is not updated with an absence time sheet line upon creating time sheet part A. </li> <li> <b>Automatic creation of quote revisions</b> — If this parameter is not marked, the latest revision of a job quote is overwritten when a job budget is transferred to quote. If you mark this parameter, Maconomy will automatically create a revision of the quote when you transfer a job budget to quote in the workspace Job Budgets in the Job Cost module. </li> <li> <b>Automatically assign planning lines to budgets</b> — If you mark this parameter, you do not have to make an explicit reference to a job budget line when you create a line manually in the workspace Detailed Planning in the Resource Planning module (that is, not using the action “Create Plan From Job Budget”). Instead, Maconomy will attempt to find a matching job budget line for you and create the reference to that line. Note that if Maconomy fails to find a matching job budget line, the planning line will be considered an “extra” task not mentioned in the planning budget. The way in which Maconomy derives a job budget line reference is explained in the description of the workspace Job Progress in the Job Cost module. </li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Automatically generate traffic status revision codes — If you mark this parameter, you do not have to create a revision code in the workspace Job Traffic Status yourself when closing a traffic status revision. Instead, Maconomy will generate a traffic status revision code on the form "&lt;YEAR&gt;/&lt;WEEK&gt;." For instance, if the revision is closed on August 3rd 2005, Maconomy will automatically apply the revision code "2005/31," as August 3rd is in week 31 according to ISO standard 8601. The concept of traffic status revisions is explained in the description of the workspace Job Traffic Status in the Job Cost module.</li> <li>■ Automatic transferral of temporary time sheet lines when using approval hierarchies — Enable this system parameter if you want to transfer temporarily submitted time sheets for posting without approval when using approval hierarchies.</li> <li>■ Blanket invoicing per main job — Jobs for which the field "Blanket Invoicing" has been marked in the workspace Job Information will be blanket invoiced. Blanket invoicing means that all un-invoiced, but approved invoice selections for a customer are joined in one invoice, if the jobs have the same responsible company, department, tax code, and currency.  If this parameter is marked, Maconomy will always create invoices per main job, when the jobs fulfill the criteria for blanket invoicing. This means that a main job and all subjobs assigned to it are joined in one invoice. At the same time, if the jobs are assigned to different main jobs, there will be no blanket invoicing of jobs with the same bill-to customer and so on, even if the jobs are set up for blanket invoicing in the workspace Job Information. The job number printed at the top of the invoice will always be the number of the main job.  Note that even if this parameter is not marked, main job/subjob structures using an invoice layout rule where the field "Main Job Invoicing" in the workspace Invoice Layout Rules is marked will always be invoiced together as one structure. That is, even if two main job/subjob structures to the same customer, and so on, are marked for blanket invoicing, they will not be invoiced together if at least one of them uses an invoice layout rule which specifies "Main Job Invoicing."</li> <li>■ Blanket Invoicing Split by Time Unit — Use this parameter to specify per company if blanket invoices should be allowed to include contributions from jobs with different time units, for invoicing.</li> <li>■ Calculate Invoice Signature — Select this parameter to calculate a signature for invoices based on selected fields from the invoice and a private key. This is a company-specific system parameter, and was initiated to satisfy statutory requirements, such as those in Portugal.</li> </ul>

Field	Description
	<p>When this parameter is selected, the print dialogs Print Invoice, Print Credit Memo, Print Job Invoice, and Print Job Credit Memo are extended with the following variables:</p> <ul style="list-style-type: none"> <li>FormattedInvoiceNumberVar — This is based on the invoice number of the invoice itself.</li> <li>FormattedBasedOnInvoiceNumberVar — This is based on the number of the invoice being credited, otherwise it is blank.</li> <li>HashControlCharsVar — This is of the form A-B-C-D where A, B, C, D are the 1st, 11th, 21st, 31st character from the signature.</li> </ul> <p>The two "formatted" invoice numbers are in the format A B/C, where:</p> <ul style="list-style-type: none"> <li>A is the "document type" encoded as "FC" for invoices and "NC" for credit memos.</li> <li>B is an identifier for the number series from which the invoice number is taken.</li> <li>C is the invoice number.</li> </ul> <p>Here, the number series identifier B above is encoded as "1" for invoice, "2" for 0 invoices, "3" for credit memos, and "4" for 0 credit memos, all followed by the company number.</p> <p>The SHA1 hash string is based on the following information from the invoice: formatted invoice number as described above, total amount in base currency, time and date the invoice is created, and the signed hash of the previous invoice (if there is one). The "previous invoice" here is the invoice number less one than the current invoice provided that:</p> <ul style="list-style-type: none"> <li>Belongs to the same fiscal year and the current invoice with respect to date of creation.</li> <li>Belongs to the same company as the current invoice.</li> <li>Has the same number series type (which distinguishes invoice, 0 invoices, credit memos and 0 credit memos from each other).</li> </ul> <p>The hash is signed with a private key (RSA).</p> <p>The result of this process is stored in the database. In version 2.2 it is stored in the table InvoiceSignature; in version 2.1 it is stored in the table Temporal1 as entries characterized by having "SignedInvoiceHash" in the field Action.</p> <p>The fields in Temporal1 for Action = "SignedInvoiceHash" are as follows:</p> <ul style="list-style-type: none"> <li>Action: "SignedInvoiceHash"</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ SessionNumber: Invoice number</li> <li>■ Integer1: Previous invoice number</li> <li>■ String1: Formatted invoice number</li> <li>■ String2: Formatted invoice number for invoice being credited</li> <li>■ String3: Formatted printing date</li> <li>■ String4: Formatted printing time</li> <li>■ String5: Formatted total amount (Invoice.TotalBase)</li> <li>■ String6: The string being hashed and signed</li> <li>■ String7: The signature</li> <li>■ Integer2: Private key version number</li> <li>■ String8: Hash control chars</li> <li>■ Amount1: Invoice.TotalBase</li> <li>■ UserInformation: Name of user who created the invoice</li> <li>■ TheDate: Date the invoice was created</li> </ul> <ul style="list-style-type: none"> <li>■ Block New Jobs for Reg. and Inv. — Enable this parameter to block a job for budgeting, registration, and invoicing when it is created. By doing this, Maconomy supports a workflow where one person creates a job and another person approves it.</li> <li>■ Budget Type No. for Employee Control — This parameter only has effect if the system parameter “Use Fixed Budget Type for Employee Control” has been marked. If it has, you can specify in this parameter the budget type to be used for employee control on the jobs in the system.  <p>In the workspace Jobs, you can specify for each job whether Maconomy should perform employee control on registrations made on the job in question. This means that each time a registration is made concerning a given employee, Maconomy only allows the registration if the employee in question appears depending on the type of employee control selected for the job either in the latest revision of the job’s budget of the type entered in this parameter or in the latest approved revision of the job’s budget of that type.</p> <p>For further information on the available types of employee control and their effects, see the description of the <b>Employee Control</b> field in the Jobs workspace.</p> <p>You specify a budget type by entering the line number on which the desired budget type appears in the sub-tab of the “Job Budget Types” pop-up type in the Popup Fields workspace, or the order in which they</p> </li> </ul>

Field	Description
	<p>appear in the "Show Budget" pop-up field in the Job Budgets workspace.</p> <ul style="list-style-type: none"> <li>■ Automatically Create Time Sheet Lines from Approved Absence — Select this parameter to automatically create related time sheet lines if an absence is approved.</li> <li>■ Calculate Invoice Signature — Select this parameter to calculate a signature for invoices based on selected fields from the invoice and a private key. This is a company-specific system parameter, and was initiated to satisfy statutory requirements, such as those in Portugal. When this parameter is selected, the Print Invoice, Print Credit Memo, Print Job Invoice, and Print Job Credit Memo print dialogs are extended with the following variables: <ul style="list-style-type: none"> <li>- FormattedInvoiceNumberVar - This is based on the invoice number of the invoice itself.</li> <li>- FormattedBasedOnInvoiceNumberVar - This is based on the number of the invoice being credited, otherwise it is blank.</li> <li>- HashControlCharsVar - This is of the form A-B-C-D where A, B, C, D are the 1st, 11th, 21st, 31st character from the signature.</li> </ul> <p>The two "formatted" invoice numbers are in the format A B/C, where:</p> <ul style="list-style-type: none"> <li>- A is the "document type" encoded as "FC" for invoices and "NC" for credit memos</li> <li>- B is an identifier for the number series from which the invoice number is taken</li> <li>- C is the invoice number</li> </ul> <p>Here, the number series identifier B above is encoded as "1" for invoice, "2" for 0 invoices, "3" for credit memos, and "4" for 0 credit memos, all followed by the company number.</p> <p>The SHA1 hash string is based on the following information from the invoice: formatted invoice number as described above, total amount in base currency, time and date the invoice is created, and the signed hash of the previous invoice (if there is one). The "previous invoice" here is the invoice number less one than the current invoice provided that:</p> <ul style="list-style-type: none"> <li>- Belongs to the same fiscal year and the current invoice with respect to date of creation</li> <li>- Belongs to the same company as the current invoice</li> <li>- Has the same number series type (which distinguishes invoice, 0 invoices, credit memos and 0 credit memos from each other).</li> </ul> <p>The hash is signed with a private key (RSA).</p> <p>The result of this process is stored in the database. Field	Description
	<p>table Temporal1 as entries characterized by having "SignedInvoiceHash" in the field Action.</p> <p>The fields in Temporal1 for Action = "SignedInvoiceHash" are as follows:</p> <ul style="list-style-type: none"> <li>- Action: "SignedInvoiceHash"</li> <li>- SessionNumber: Invoice number</li> <li>- Integer1: Previous invoice number</li> <li>- String1: Formatted invoice number</li> <li>- String2: Formatted invoice number for invoice being credited</li> <li>- String3: Formatted printing date</li> <li>- String4: Formatted printing time</li> <li>- String5: Formatted total amount (Invoice.TotalBase)</li> <li>- String6: The string being hashed and signed</li> <li>- String7: The signature</li> <li>- Integer2: Private key version number</li> <li>- String8: Hash control chars</li> <li>- Amount1: Invoice.TotalBase</li> <li>- UserInformation: Name of user who created the invoice</li> <li>- TheDate: Date the invoice was created</li> </ul> <ul style="list-style-type: none"> <li>■ Create Journal in On Account Opening Balance Import — Select this parameter to improve the process of importing opening balances on account when implementing a new client/company. This parameter allows you to import on account invoices where the <b>Opening Balance Import</b> field is set to 1 (= yes). This means that you can specify opening balance in all relevant currencies directly in the import file. This makes the process more efficient, as without this parameter, you would have to make changes to the exchange rate tables as part of the import of the opening balances as you can only import on account balance in job currency.</li> </ul> <p>If you import with "Opening Balance Import" set to <b>Yes</b> and have the system parameter <i>Create Journal in On Account Opening Balance Import</i> de-selected, then the import only has an effect on the jobs, but <b>not</b> in G/L or A/R. Again this enables efficiency, since G/L and A/R are typically imported separately.</p> <p>This is one of two system parameters for the import of an opening balance. The other system parameter is <i>Allow On Account Opening Balance Import</i>.</p> <ul style="list-style-type: none"> <li>■ Calculate Progress at Job Closure — When closing a job with this parameter marked, Maconomy will set all estimates to completion to 0</li> </ul>

Field	Description
	<p>and progress evaluate the job to bring the planning budget up to date with actuals.</p> <p>However, if any problem should occur when closing a job, you can unmark this field and try closing it again.</p> <ul style="list-style-type: none"> <li>■ Central transferral of time sheets — If you mark this parameter, Maconomy will use central transferral of time sheets as explained in the workspace Central Time Sheet Transfer in the Job Cost module. Doing this eliminates the performance bottleneck that may arise when many users submit their time sheets at the same time.</li> <li>■ Close at End Invoicing — If you mark this parameter, the field “Close at End Inv.” will automatically be marked in the workspace Jobs when a job is created. If the field is marked on a job when end invoicing is done, the job is automatically closed.</li> <li>■ Close Job Entries on Job Reallocation — If you mark this parameter, the posting of job reallocations will cause Maconomy to automatically close original and reversing entries when relevant. If you mark this parameter and, for example, approve the reallocation of an invoiced entry where the amount reallocated is equal to the amount of the original entry, Maconomy will automatically close both the original and the reversing entries, leaving only the new entry with the reallocated information open. This way, the employee saves time as the entries do not have to be closed manually. However, other scenarios depending on factors such as the amount reallocated and whether the entry in question has been invoiced can cause Maconomy to only close the original entry in part or leave both original and reversing entries open.</li> </ul> <p>If the parameter is not marked, all of the entries remain open, allowing you to include them on your invoices as desired.</p> <ul style="list-style-type: none"> <li>■ Convert opportunity budget to baseline budget — If the system parameter is not set, all budgets from the opportunity are copied to the job.</li> <li>■ Convert Opportunity Budget to Reference Budget — If you mark this parameter, creating a job based on an opportunity for which an opportunity budget has been created will cause the sales budget of the opportunity to be copied to both the reference budget and the sales budget of the new job, leaving remaining budget types uncopied. This allows you to use the opportunity’s budget as the reference budget of the job, thus making it possible to track job performance compared to the budget originally set in the opportunity phase. If you do not mark the parameter, all budget types are copied to the new job.</li> </ul> <p>For further information about creating jobs based on opportunities, see the <b>Opportunity No.</b> field in the Jobs workspace.</p>

Field	Description
	<ul style="list-style-type: none"> <li>Count Number Of Invoice Copies On Jobs — When this system parameter is enabled, the fields NumberOfInvoices and NumberOfCreditMemos on jobheader are updated when printing invoices and credit memos. If the parameter is disabled, the job header is not updated when printing an invoices and credit memos, so it will not be locked in the database.</li> <li>Create Journal in On Account Opening Balance Import — Select this parameter to improve the process of importing opening balances on account when implementing a new client/company. This parameter allows you to import on account invoices where the field <b>Opening Balance Import</b> is set to 1 (= yes). This means that you can specify opening balance in all relevant currencies directly in the import file. This makes the process more efficient, as without this parameter, you would have to make changes to the exchange rate tables as part of the import of the opening balances as you can only import on account balance in job currency.  <p>If you import with "Opening Balance Import" set to <b>Yes</b> and have the system parameter <i>Create Journal in On Account Opening Balance Import</i> de-selected, then the import only has an effect on the jobs, but <b>not</b> in G/L or A/R. Again this enables efficiency, since G/L and A/R are typically imported separately.</p> <p>This is one of two system parameters for the import of an opening balance. The other system parameter is "Allow On Account Opening Balance Import."</p> </li> <li>Create Daily Time Sheets for Non-working Days — If you enable this parameter, Maconomy automatically creates a time sheet for a selected date that falls on a non-working day.  <p>If you disable this parameter, the user has to click the <b>Create Time Sheet</b> action to create a time sheet for the selected date that falls on a non-working day.</p> <p>This parameter is company-specific, and is disabled by default in new installations.</p> <p>For this parameter to take effect, you also have to enable the <b>Create Time Sheets Automatically</b> system parameter.</p> </li> <li>Create Jobs from Template Jobs — If you mark this parameter, the <b>Create From Template</b> field in the Jobs workspace will automatically be marked when a job is to be created, and the new job will hence be created on the basis of a template job. However, the functionality of this parameter can be overruled at any time by manually unmarking the <b>Create From Template</b> field on a given job, if you do not want the job in question to be created on the basis of a template job. If you do not mark this parameter, jobs are not created on the basis of template jobs unless you manually mark the <b>Create From Template</b> field in the</li> </ul>

Field	Description
	<p>Jobs workspace when creating a job. See the introduction of the Jobs workspace for information about the functionality of template jobs.</p> <ul style="list-style-type: none"> <li> <p><b>Create Tasks from Job Budgets, Amount</b> — Enable this parameter to enter an amount task which does not exist on a job budget line. Maconomy creates the task in the job's private task list, using the activity entered on the job budget line as derived activity. If the job is using a shared task list, a copy of that task list is automatically made private to the job in question. For more information, please see the description of the Job Tasks workspace.</p> <p>If you create a task (that is not included in the task list) from an amount budget line, the <b>Use Daily Descriptions</b> check box uses the same value as the <b>Use Daily Descriptions</b> check box on the task list itself.</p> <p>The description entered in the <b>Description</b> field on the job budget line is transferred to the new task and used as task description. If the <b>Mark 'Overwrite Activity' On Tasks</b> system parameter is enabled, the <b>Overwrite Activity</b> field is selected for the new task.</p> <p>See also the description of the <b>Extended Task Creation from Budgets</b> system parameter.</p> </li> <li> <p><b>Create Tasks from Job Budgets, Time</b> — Enable this parameter to enter a time task which does not exist on a job budget line. Maconomy creates the task in the job's private task list, using the activity entered on the job budget line as derived activity. If the job is using a shared task list, a copy of that task list is automatically made private to the job in question. For more information, please see the description of the Job Tasks workspace.</p> <p>If you create a task (that is not included in the task list) from a time budget line, the <b>Use Daily Descriptions</b> check box uses the same value as the <b>Use Daily Descriptions</b> check box on the task list itself.</p> <p>The description entered in the <b>Description</b> field on the job budget line is transferred to the new task and used as task description. If the <b>Mark 'Overwrite Activity' On Tasks</b> system parameter is enabled, the <b>Overwrite Activity</b> field is selected for the new task.</p> <p>See also the description of the <b>Extended Task Creation from Budgets</b> system parameter.</p> </li> <li> <p><b>Create Time Sheets Automatically</b> — If you enable this parameter, Maconomy automatically creates a time sheet for any date or week that the user selects when navigating the calendars in the Week and Day sub-tabs of the Time &amp; Expenses workspace.</p> <p>If you disable this parameter, the user has to click the <b>Create Time Sheet</b> action to create a time sheet for the selected date or week.</p> <p>This parameter is company-specific, and is enabled by default.</p> </li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li> <p>■ Customer Statement After Job Invoice Details — This parameter applies when you print a job invoice that shows the customer statement.</p> <p>If you select this parameter, the customer statement is shown after the detailed specification for the invoice. If you do not select this parameter, the customer statement is shown before the detailed specification for the invoice.</p> </li> <li> <p>■ Customer Statement Days for Job Invoices — This parameter applies when printing the customer statement on job invoices.</p> <p>If set (that is, not 0), Maconomy prints not only the customer entries which are open at the statement date, but also the customer entries with entry dates that fall between the statement date and the statement date minus the number of days you set. If not set, Maconomy prints only the customer entries which are open at the statement date.</p> </li> <li> <p>■ Customer Statement Restriction for Job Invoices — This parameter refers to the dimension set. The effect is that the statement only includes A/R entries with the same value as the invoice in the selected dimensions.</p> <p>If set (that is, with a not empty string), the statement includes the dimension set number to be used when printing the customer statement on job invoices. The dimension set is a dimension picker, used to select a number of dimensions (for example, Specification 1). The customer statement to be printed on the job invoice includes only the customer entries which have the same value in the dimensions (chosen in the dimension picker) as the invoice (for example, customer entries with the same Specification 1 as the invoice).</p> <p>If not set, no dimension restrictions are applied to the entries included in the customer statement.</p> </li> <li> <p>■ Default invoice line width % — In this parameter, you can enter a value for the default line width on job cost invoices. The value is used in connection with automatic word wrapping on invoice lines in the Invoice Editing workspace in the Job Cost module. Maconomy has an internal line width value of 100%. You can change that value by changing this field so that the invoice line width fits the invoice layout used in your company. If you enter, for example, "120" in this field, Maconomy will make the invoice lines wider; if you enter, for example, "80" in this field, Maconomy will make the invoice lines narrower. If you enter "0" in this field, the automatic word wrapping on invoice lines is disabled.</p> <p>You can change the value for individual invoices in the Invoice Editing workspace. For more information, please see the description of the Invoice Editing workspace in the Job Cost module.</p> </li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ &lt; Default Job / Default Project &gt; State — A default state that should be assigned to newly created jobs.</li> <li>■ Disable automatic transferral of expense sheet lines — If you mark this parameter, expense sheet lines are not automatically transferred when submitted. You may want to prevent the transfer if you want to replace the automatic, built-in Maconomy workflow with a custom workflow. In that case, expense sheet lines must be transferred in the Expense Sheet Lines or Transfer Expense Sheet Lines workspaces in the Job Cost module.</li> <li>■ Disable automatic transferral of time sheet lines — If you mark this parameter, time sheet lines (including daily time sheet lines) are not automatically transferred when submitted. You may want to prevent the transfer if you want to replace the automatic, built-in Maconomy workflow with a custom workflow. In that case, time sheet lines must be transferred in the Time Sheet Lines or Transfer Time Sheet Lines workspaces or their Daily equivalents in the Job Cost module.</li> <li>■ Disallow reg. on amount act. in time sheets — If you mark this parameter, you cannot use amount activities for registration in the Time Sheets, Daily Time Sheets, and SpeedSheet workspaces. This means that Maconomy issues a warning if you enter an amount activity in the <b>Act. No.</b> field in those workspaces. Furthermore, Maconomy's automatic conversion of numbers into hours and minutes will not work unless this parameter is marked (see the description of the SpeedSheet workspace in the Job Cost module). To register amount activities, use the Expense Sheets or Job Journal workspaces.</li> <li>■ Disallow the Creation of Time Sheets Outside Period of Employment — If you mark this parameter, Maconomy will issue an error message if you attempt to create a time sheet for an employee for a period outside the employee's period of employment, that is, before he was employed or after he ceased working for the company.</li> <li>■ Display Time as Decimal Number — The time is displayed in "hh:mm" format in Java client. Enable this parameter if you want the time to be displayed as a real number. You should enable this parameter if there are jobs or time sheets with time unit "Days."</li> <li>■ Do not inherit job dim. from previous expense sheet line — If you mark this parameter, the job, activity, and task from the previous line are not automatically suggested when creating an expense sheet line in the Expense Sheets workspace.</li> <li>■ Do not inherit job dim. from previous mileage sheet line — If you mark this parameter, the job, activity and task from the previous line will not automatically be suggested when creating a mileage sheet line in the Mileage Sheets workspace.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Employee Category On Job Budget Lines From Job Progress — This company-specific system parameter takes effect when you perform job progress and have registrations where a corresponding job budget line does not exist. You can then select <b>Create Budget Lines for Unbudgetted Tasks</b> and let Maconomy create the budget lines. This parameter also creates budget lines grouped according to employee category besides task and activity. It is the primary employee category of the employee that is taken into account. This parameter affects only jobs that allow duplicate time budget lines on the planning budget.</li> <li>Empl. cat. on job budgets required— If you mark this parameter, you must enter an employee category on each new job budget line containing a time activity, if an employee is specified. If you do not mark the parameter, employee categories are not required on job budget lines. An employee category is also required on existing job budget lines on which the specified employee is changed.</li> <li>Employee No. for direct invoicing — In this parameter, you can enter an employee number. If you enter a number, Maconomy will automatically suggest this employee number in the Invoice Selection and Itemize Invoice Selection workspaces when an employee number must be specified in connection with direct invoicing.</li> <li>Empty Description for Non Existing Dimensions on Job Invoice — When enabled, Maconomy skips adding descriptions to the invoice line when values are missing for <b>Task</b>, <b>Employee</b>, or <b>Employee Category</b>. This applies to cases where you have an invoice layout rule specifying that job entries should be shown by task, employee, or employee category, and one of the mentioned fields is empty.</li> <li>Enable Check-in Import for Submitted Timesheets - Enable this parameter to allow the import of check-in data to submitted time sheets in Maconomy.</li> <li>Enable Payment when Paid — In this parameter, you can specify whether it should be possible to use the payment when paid functionality. Part of a project delivery may include purchasing services or items on behalf of a customer. For instance, an agency may have to book airtime for a TV commercial or place an ad in a specific magazine or paper. These purchases can sometimes represent large amounts, which has a heavy impact on cash flow. Certain suppliers therefore allow you to withhold payment until you have received payment from your customer — so-called payment when paid. However, as soon as you receive payment from your customer, you must pay the supplier, even if payment is not due according to the supplier's regular</li> </ul>

Field	Description
	<p>payment terms. To set up a payment term as a Payment when Paid term, find the payment term in question in the Popup Fields workspace and mark the <b>Payment when Paid</b> field. Vendor invoices to which a payment when paid term applies are included in payments in the Banking module when payment has been received from the customer and not before. For further information about the criteria to be met in order for payment when paid invoices to be included in payments, see the <b>Pay when Paid</b> field in the Payment Selection by Vendor workspace in the Banking module.</p> <p>Only if you mark this field will it be possible to mark the <b>Pay when Paid</b> field on payment terms, vendor invoices, and vendor entries. For further information about the payment when paid functionality, see the description of the <b>Pay when Paid</b>, <b>Paid by Customer</b>, and <b>Ready for Payment</b> fields in the Change Payment Selection by Vendor workspace.</p> <p>Once marked, the parameter can only be unmarked if there are no payment terms on which the <b>Pay when Paid</b> field is marked. If you change the parameter from marked to unmarked, Maconomy will automatically unmark the <b>Pay when Paid</b> field and mark the <b>Ready for Payment</b> field on all open vendor invoices and vendor entries. However, a warning is displayed, allowing you to undo the change.</p> <ul style="list-style-type: none"> <li>■ Entity Required on Job — By marking this parameter, you make it mandatory to enter a value for the Entity dimension on all jobs created.</li> <li>■ Equal-Sized Accruals in Job Accrual Plans — By marking this parameter, the field “Weight Periods Equally” in the Job Accrual Plans workspace is automatically marked when the workspace is opened. The parameter determines whether amounts should be distributed proportionally to the number of days covered by the entire accrual period, that is, longer periods (for example, January 31/365) are allocated a greater accrual amount than shorter periods (for example, February 28/365) or whether amounts should be distributed equally over the relevant periods irrespective of variances in the lengths of the periods covered.</li> <li>■ Exchange Rate in Job Invoice Allocation as Invoiced On Account — If you select this parameter, no exchange rate difference is posted in the allocation. Instead, it appears as a write-up/down in base and enterprise currency.</li> <li>■ Exchange Rate on 0-invoices as Invoiced On Account — Select this company-specific parameter to enable Maconomy to use the same exchange rates (between job currency, company base currency, and enterprise currency) for T&amp;M entries on zero invoices as the weighted average of the exchange rates on the on account invoices being reconciled. This parameter is disabled by default.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Extended handling of tax when closing fixed price jobs — When this parameter is marked, the way that a fixed-price job is closed is handled in an extended way. This addresses some problems that can occur in these situations:               <ol style="list-style-type: none"> <li>1. Some invoices on account have tax, others not.</li> <li>2. Different tax codes on the invoices on account.</li> <li>3. Different tax codes on the job entries.</li> </ol> <p>The extended handling is that two profit entries are created instead of one: The first one makes sure that the total tax on the open entries (including this first profit entry) equals the tax net on account. The second profit entry has a blank tax code and makes sure that the open billing price (including both profit entries) equals the amount net on account.</p> </li> <li>■ Extended Task Creation from Budgets — As with the <b>Create Tasks from Job Budgets</b> parameter, if you mark this parameter, you can enter a task which does not exist on a job budget line. However, this parameter extends the automatic task creation functionality in the following ways:               <ul style="list-style-type: none"> <li>■ Task names are created automatically. The name is composed from the text in the <b>Description</b> field by combining the initial letter with a number of subsequent consonants. For example, specifying <b>Test</b> in the <b>Description</b> field could derive a task name of <b>Tst</b>. Specifying <b>Due Diligence</b> could derive <b>DDI</b> or <b>DDIgnc</b>, depending on the number of consonants to include (as specified by the <b>Number of Trailing Characters for Task Names</b> system parameter). If a task with that name already exists, the new task will have a <b>-1</b>, <b>-2</b>, and so on appended, for instance <b>Tst-1</b>.</li> <li>■ The full text from the <b>Description</b> field is used as a task description in the Job Tasks workspace. If the job budget line description is changed in the Job Budgets workspace, the change is also reflected in the task description, provided that the task description had not already been changed in the Job Tasks workspace. If the <b>Mark 'Overwrite Activity' On Tasks</b> system parameter is marked, the <b>Overwrite Activity</b> field is marked in the new task.</li> </ul> </li> <li>■ Extended use of 0-invoice system numbers — If you mark this parameter, Maconomy uses a system number from the system number series "0-invoice," if the zero invoice has been created as a consequence of a reconciliation of an invoice on account. This is, for example, the case when fixed-price jobs are used, and when the <b>Create invoice upon job closing</b> job parameter attribute is assigned the value <b>Yes</b> on the jobs in question.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>External Description in Job Budgets defaults to Description - If you enable this company-specific parameter, when you add a new line in the Job Budget Lines sub-tab of the Job Budgets single dialog workspace, the <b>External Description</b> field automatically displays the value of the <b>Description</b> field. If you do not enable this parameter, the <b>External Description</b> field is blank by default in any new lines added.</li> <li>Filter Budget Lines on Transfer to Quote — The job template functionality allows you to set up template budgets that are automatically copied to new jobs. In some cases, it is an advantage to create a great number of lines in the template budgets, taking into account all possible activities and costs. The budget responsible of each job then only needs to fill in quantities and prices on the relevant budget lines, leaving irrelevant lines untouched. To support this use of template budgets, you can specify whether Maconomy should filter away irrelevant lines (for example, lines with a quantity of zero) when transferring budget lines to quotes, making it unnecessary to manually delete irrelevant lines from the quote after transferring them from the budget. The filtering takes place if this system parameter has been marked and the <b>Create Quote Directly from Budget</b> field is also marked on the invoice layout rule of the job in question. If this parameter is not marked, no filtering takes place when a job budget is transferred to a quote.</li> <li>Fixed exchange rates in budgets only — In certain countries, it is considered good accounting practice to make currency conversion of a job's transactions per the day on which the transaction is carried out. If you mark this parameter, and if fixed exchange rates are used on the job, the use of fixed exchange rates will be delimited to the budget only, and the transactions of the job will be converted according to the exchange rate table in question. If you do not mark the parameter, all currency transactions on the job, from budget to posting, will be recalculated according to the exchange rate valid on the date specified for the job in the Job Price Information workspace in the Job Cost module. This parameter allows you to set a company-specific value in the sub-tab.</li> <li>Hide Headings On Job Invoices Without Subtotals — When this parameter is marked, there will be no headings on job invoices on jobs where the invoice layout rule specifies that there should be no subtotals.</li> <li>Hours Per Man Day — Use this company-specific parameter to define the number of hours in a work day.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Include closed jobs and jobs blocked for invoicing in invoicing windows — When you select this parameter, closed jobs and jobs blocked for invoicing are included as read-only in the following workspaces: <ul style="list-style-type: none"> <li>Invoice Selection</li> <li>On Account Invoice Selection</li> <li>Bill To Customer Distribution</li> <li>Job Invoices On Account</li> <li>Job Invoice Allocation</li> </ul> </li> <li>Invoice Selection Delimitation by G/L Entry Date — When this parameter is marked, the G/L cut-off date for the delimit action is initialized to last date of the previous month. If not, it is not set at. This applies when you use the G/L Entry Date in the Delimitation island in workspaces such as Invoice Selection, Approve Invoice Selection, Job Invoice Allocation and Batch Job Invoice Allocation.</li> <li>Job accruals from purchase orders — If you mark this parameter, the functionality regarding the creation of job accruals from purchase order lines apply. This means that it is not possible to make job accruals in the Job Journal workspace. Instead, you use the correlation between purchase orders and the Job Accruals workspace.</li> <li>Job company tax code from delivery customer — If marked, the job company tax code is derived from the delivery customer; if not, it is derived from the payment customer.</li> <li>Include Current Invoice in Invoice Customer Statement and Aging — If you mark this parameter, Maconomy includes the present invoice in the customer statement and A/R aging on job invoices.</li> <li>Job Posting Reference for Posting without Activity — Select this parameter to refer to an existing job posting reference which is then used when posting job invoices on account without an activity number.</li> <li>Keep Billing Price when Changing Cost Price — If you mark this parameter, the billing price on the line in the Job Budgets workspace is not changed, if the cost price is changed manually. However, the value in the <b>Markup %</b> field is changed to reflect the new ratio between cost and billing price. If the billing price or the markup percentage is subsequently changed manually, Maconomy performs a price calculation as described in “Appendix A: Price Calculation in the Job Cost Module.”</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li> <p>Keep delimitation when changing invoice selection — If you mark this parameter, selecting an invoicing action (that is, <b>Invoice</b>, <b>Write Off</b>, or <b>Carry Forward</b>) in the sub-tab of the Invoice Selection workspace respects any delimitation parameters set up in the tab of the workspace for underlying job entries. If, for instance, you have chosen to see job entries before a certain date by specifying the cut-off date in the Delimitation island, and you choose the <b>Invoice</b> action on a table line, no underlying job entries after the specified date are invoiced.</p> <p>If the parameter is not marked, all underlying job entries will be included in the invoicing action, regardless of any delimitation parameters.</p> </li> <li> <p>Keep Job Cost Entry Date Upon Job Transfer — If you enable this company-specific system parameter, Maconomy keeps the original job cost entry date when you perform a job transfer.</p> </li> <li> <p>Length of Invoice No. in Formatted Invoice No. — Select this parameter to control the formatting of the invoice number in the variable FormattedInvoiceNumberVar that is available in the prints of invoices and credit memos. For example, if the invoice number is 1250003 and the system parameter is 4, then the formatted invoice number would split the invoice number to "125" and "0003," which results in the formatted invoice number TF 125/0003.</p> </li> <li> <p>Keep quantity at write-downs — You can write down job entries (reduce the sales price) in the Invoice Selection workspace in the Job Cost module by entering a new, desired sales price (or markup) and selecting the <b>Transfer Desired Sales Price</b> action. Maconomy then changes the total billing price per invoice selection line proportionally. Since the "Quantity x Billing Price per Unit equals Total Billing Price" constraint must be kept, Maconomy must adjust either the <b>Quantity</b> field or the (invisible) <b>Billing Price per Unit</b> field to make the new sales price match the quantity sold. With this parameter, you can choose whether you want to adjust the quantity or the billing price per unit.</p> <p>If this parameter is unmarked, Maconomy changes the quantity in connection with write-downs. If this parameter is marked, Maconomy preserves the quantity but reduces the price per unit.</p> </li> <li> <p>Keep quantity at write-ups — The functionality of this system parameter is similar to that of the <b>Keep quantity at write-downs</b> parameter above, but concerns write-ups (increasing the sales price in the Invoice Selection workspace in the Job Cost module).</p> </li> <li> <p>Length of Invoice No. in Formatted Invoice No. — Select this parameter to control the formatting of the invoice number in the</p> </li> </ul>

Field	Description
	<p>variable FormattedInvoiceNumberVar that is available in the prints of invoices and credit memos. For example, if the invoice number is 1250003 and the system parameter is 4, then the formatted invoice number would split the invoice number to "125" and "0003," which results in the formatted invoice number TF 125/0003.</p> <ul style="list-style-type: none"> <li>Local Spec. 1-10 on Job Required — By marking these parameters, you make it mandatory to enter a value for the dimensions Local Spec. 1, Local Spec. 2, Local Spec. 3, Local Spec. 4, and so forth respectively, on all jobs created.</li> <li>Location Required on Job — By marking this parameter, you make it mandatory to enter a value for the Location dimension on all jobs created.</li> <li>Lower Indentation Level for Lines on Invoices with Headers - Select this system parameter to format printed invoices with indentation levels to indicate whether they belong to a main job or sub-job. Enabling this corrects an error in the assignment of the <b>Level</b> field on invoice lines, and provides the correct indentation and formatting when you print invoices. The <b>Level</b> field is assigned as previously done in Maconomy 2.2 or earlier versions. By default, this is disabled.</li> <li>Maintain Periodic Forecasts from Periodic Job Budgets - Enable this system parameter to allow Maconomy to propagate all changes to the periodic forecast whenever you make changes in the periodic job budget.</li> <li>Margin for internal on account tax reconciliation — If you specify a non-zero margin in this parameter, Maconomy reconciles invoices on account when they have no open amount and open tax within the specified margin. This kind of reconciliation is marked as being internal. It is posted to the account for amount rounding and is not shown on the reconciling invoice. The margin on the system parameter can be specified as an amount or a percentage of the tax amount on the invoice on account.</li> <li>Manual completion of job group — If you mark this parameter, a job group must be entered manually when a job is created.</li> <li>Margin for job exchange rate variance, % — In this parameter, you can specify a margin for the deviation allowed between the job-specific exchange rate and the default enterprise exchange rate. If the value 0.0 is entered, any deviation will be permitted. This parameter allows you to set a company-specific value in the sub-tab.</li> <li>Margin, job accrual reconc. — In this parameter, you can specify a margin as an amount in the enterprise currency and a percentage.</li> </ul>

Field	Description
	<p>When a purchase order is reconciled against a vendor invoice, there may be differences between the amounts. If the difference is within the margin in this parameter, job accruals assigned to the purchase order in question will be fully reconciled. If the difference is not within the margin, the difference is kept as an open job entry for later invoicing or crediting. When the reconciliation is attempted, the amount in enterprise currency specified in this parameter is converted to the job's currency using the current exchange rate table.</p> <ul style="list-style-type: none"> <li>■ <b>Margin, on account tax reconciliation to 0-invoice</b> — Select this parameter to enable an internal reconciliation of tax on account below a certain threshold to settle an invoice on account.</li> <li>■ <b>Mark 'Overwrite Activity' on Tasks</b> — If you mark this parameter, tasks created from a budget line (possible if the system parameter “Create Tasks from Job Budgets” or “Extended Task Creation from Budgets” is marked) are created with a mark in the field “Overwrite Activity.” This way you can support a setup where the activity number must correspond to the task number. If this parameter is not marked, the standard rules of activity derivation apply. For more information, please see the description of the Job Tasks workspace.</li> <li>■ <b>Match job posting ref. line if fields in reg. are not specified</b> — If this system parameter is turned on then posting of job entries may match job posting references, even if the job entry has empty values in matching fields (Department, Job Group, Popup 1-5, Customer Popup 1-5, Employee Popup 1-5, Vendor Popup 1-5, Employee Type, Item Group).</li> <li>■ <b>Monthly Time Reporting</b> — If you mark this parameter, you activate a link between the time sheets assigned to the same month in a given year. If, for instance, you create a time sheet on Monday 1 March 1999, Maconomy will create five time sheets, the last of which covers Monday 29 March to Wednesday 31 March. This last week is thus regarded as a split week. When you create or change a line in a week, the line is created or changed in all time sheets covered by the month in question. Furthermore, submitting, transferring, reopening, and approving a time sheet will affect all other time sheets in the same month. For further information about split weeks, please see the parameter “Split Week Time Sheet.”</li> <li>■ <b>Max. Depth for Invoice Preparation Hierarchy</b> — Select this parameter to specify a maximum depth for invoice lines produced from Invoice Preparation to ensure that lines do not extend past print layout format.</li> <li>■ <b>Max. Depth for Job Budget Hierarchy</b> — In the Job Budgets workspace, you can arrange budget lines hierarchically by indenting</li> </ul>

Field	Description
	<p>lines in multiple levels (Java™ client only). In this parameter, you can specify the maximum number of indentation levels allowed in job budgets. If you specify, for example, 6, it means that job budgets cannot be more than six levels deep, including the top level. Trying to indent lines any further will result in an error message.</p> <p>You can specify any number. Enter 0 if there should be no limitations as to the number of levels in job budget hierarchies. However, please note that only up to seven levels (including the top level) are supported by Maconomy printouts and reports, meaning that lines at level eight and any deeper levels are not included on printouts and reports.</p> <ul style="list-style-type: none"> <li>■ Number of Days to Keep Recent Choices in Invoice Selection — This company-specific system parameter controls the number of days values you entered are kept for certain fields in the following workspaces: <ul style="list-style-type: none"> <li>■ Invoice Selection workspace <ul style="list-style-type: none"> <li>■ <b>Preferred Invoice Date</b> field</li> <li>■ <b>Cut-off Date</b> field</li> <li>■ <b>G/L Entry Date</b> field</li> </ul> </li> <li>■ Account Invoice Selection workspace <ul style="list-style-type: none"> <li>■ <b>Preferred Invoice Date</b> field</li> </ul> </li> </ul> <p>Maconomy displays the saved values when you reopen the workspace, or select a different job.</p> <p>The value stored for the <b>Preferred Invoice Date</b> field is only used if the job does not already have a preferred invoice date.</p> </li> <li>■ Number of Hours per Man Day — Use this parameter when converting fixed time from days to hours and the time is not in the context of a job, such as when transferring fixed time from employees to People Planner and Financial Budgets. This parameter can be set up with company-specific values.</li> <li>■ Only Add to Employee Control from Job Employees — If you mark this company-specific parameter, the action that distributes favorites in the Job Employees workspace also updates the list of employees that are allowed to register on the job in the Employee Control workspace. Maconomy adds but does not delete employees from the list in the Employee Control workspace.</li> <li>■ Number of Trailing Characters for Task Names — With this parameter, you can specify how many consonants in the <b>Description</b> field in the Job Budgets workspace should be considered when</li> </ul>

Field	Description
	<p>generating a task name. This parameter is only used if the <b>Extended Task Creation from Budgets</b> parameter is selected. For more information, see the description of that parameter.</p> <ul style="list-style-type: none"> <li>Only Blanket Invoice via Blanket Drafts - If you enable this parameter, Maconomy does not automatically combine draft invoices printed as a batch into a blanket invoice. The drafts are printed as individual invoices even when printing from a batch workspace such as Job Invoicing, Job Crediting, Blanket Invoicing Overview, or Blanket Invoice Selection. To obtain a blanket invoice, navigate to the Blanket Invoicing Overview workspace, and combine drafts into a blanket draft. Alternatively, Maconomy creates a blanket draft when a user approves an invoice selection in the Blanket Invoice Selection workspace. If you do not enable this parameter, when a user approves an invoice selection on jobs set up for blanket invoicing and prints invoices in a batch (in the Job Invoicing workspace, for example), Maconomy automatically combines drafts belonging to the same blanket invoice collection into a single blanket invoice.</li> <li>Only One Transaction Number for Each Time Sheet — If this parameter is marked, all time sheet lines from the same time sheet will get the same transaction number.</li> <li>Only Rederive From Changed Dimensions At Job Reallocation — If this parameter is marked, only dimensions that have actually changed are rederived when a job is reallocated. When it is not marked, then all dimensions are derived just as if the job is entered by a user.</li> <li>Open Invoice Selection Without Cut-off Date — If you do not mark this parameter, Maconomy completes the field “Cut-off Date” in the workspace Invoice Selection with the date of the last day of the previous month. Nevertheless, entries later than that day are shown in the workspace until you select the action “Delimit,” which the user may find confusing. You can therefore mark this parameter to make Maconomy leave the field “Cut-off Date” blank when you open the workspace.</li> <li>Open job card without delimitation — If you mark this parameter, the sub-tab of the workspace Job Card will display all entries of the current job when the workspace is opened. If you do not mark this parameter, only open entries for the current month will be displayed when the workspace is opened. See also the system parameter “Show Only Open Entries when Opening Job Card” below and the description of the workspace Job Card in the Job Cost module.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Overwrite customer fields when creating job from template — When creating a job, certain fields are derived from the job's customer. If a job is created from a template, and this parameter is not marked, Maconomy will re-derive information about the job's customer when the job is created. Information such as the customer name, address, payment terms, and tax code is updated to reflect that which is currently specified on the customer's information card.</li> </ul> <p>If the parameter is marked, any information already specified in the template used for creating the job will not be re-derived but be transferred unchanged to the job.</p> <p>This system parameter is relevant when a particular value is set on both a template job and a customer. The system parameter resolves which value is used on a job created from a template job and a customer.</p> <p>The system parameter is irrelevant if a field value is set only on either template job or customer, because then this single value is used on the new job.</p> <p>The field values listed below are taken from the template job if this system parameter is check marked.</p> <ul style="list-style-type: none"> <li>■ Name1 – Name5</li> <li>■ Attention</li> <li>■ Telephone</li> <li>■ Telefax</li> <li>■ Telex</li> <li>■ Electronic Mail Address</li> <li>■ Payment Terms</li> <li>■ VAT</li> <li>■ Department Number</li> <li>■ Customer Group</li> <li>■ Country</li> <li>■ Currency</li> <li>■ Language</li> <li>■ Zip Code</li> <li>■ Postal District</li> <li>■ VAT Number</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Enterprise</li> <li>Segment</li> <li>Company VAT Code</li> <li>Customer Payment Mode</li> <li>Global Location Number</li> <li>Area</li> <li>Settling Company</li> <li>Team1Number – Team6Number</li> </ul> <p>Notice that regardless of the system parameter, values from the fields below are taken from the template job unless they are unmarked on the template job:</p> <ul style="list-style-type: none"> <li>To Be Blanket Invoiced</li> <li>Invoice Discount Percentage</li> <li>Inventory Number</li> <li>Price List Number</li> <li>Price Level Remark</li> <li>Job Price List</li> <li>Job Surcharge Rule Name</li> <li>Invoice Layout</li> <li>Intercompany Job Price List</li> <li>Cost Job Price List</li> <li>Standard Billing Price List</li> </ul> <ul style="list-style-type: none"> <li>Periodize Budget action clears periods before ETC date — If this system parameter is turned on, then the Periodize action in Job Budgets and Job Progress will also remove the detailed quantity, cost, and billing prices of past periods before the date of estimate to completion.</li> <li>Popup 1 required if difference between exp. and act. work hours — In combination with the registration of work time intervals in time sheets (see the island “Fixed Working Hours” in the workspace Employees), you can specify that the field “Time Sheet Popup 1” in the time sheet must be completed in case there is a difference between an employee’s expected working hours and the actual working hours for a day. This is done by marking this parameter. By forcing the user to make a choice in the time sheet pop-up field, it is easier for the</li> </ul>

Field	Description
	<p>accounting department to see how to process the user's hours — for example, if the hours are to be added or subtracted to the user's flextime account or paid out as overtime pay. See also "Time Sheet Popup 1."</p> <ul style="list-style-type: none"> <li>■ <b>Post Job Cost Intercompany Entries as Accrued until Invoiced</b> — Use this company-specific system parameter to set up Maconomy so that unbilled revenue is not posted as revenue until invoiced. For example, if the executing company uses this feature and the responsible company does not, then the postings to the accrued accounts are only performed for the executing company, and vice versa.</li> <li>■ <b>Posting References based on Job Balance</b> — Select this parameter to use the Net Job Balance feature, which enables Maconomy to automatically post any changes to work in progress and net on account to the appropriate account according to the following criteria: <ul style="list-style-type: none"> <li>■ If you post a positive job entry (or a credit memo on account) and the job balance was positive prior to posting, Accrued Revenue increases.</li> <li>■ If you post a positive job entry (or a credit memo on account) and the job balance was negative prior to posting, Deferred Revenue decreases.</li> <li>■ If you post a negative job entry (or an invoice on account) and the job balance was positive prior to posting, Accrued Revenue decreases.</li> <li>■ If you post a negative job entry (or an invoice on account) and the job balance was negative prior to posting, Deferred Revenue increases.</li> </ul> </li> <li>■ <b>Price Lookup from Employee Category Only in Budgets</b> — If this parameter is selected, prices and employee groups on employee categories are only used in job budgets. If this parameter is not selected, the prices and employee groups on employee categories are used in any price lookup.</li> <li>■ <b>Print on account spec. on invoice/credit memo</b> — If you mark this parameter, Maconomy will, in connection with printing a normal job invoice or job credit memo reconciling an amount on account, print a specification of which invoices on account and/or credit memos have been reconciled, and to which extent these have been reconciled. The specification is displayed below a tax specification, if any, on the invoice or the credit memo.</li> <li>■ <b>Prioritize cost in original currency if same as job currency</b> — On jobs in a currency different from the company base currency, an external</li> </ul>

Field	Description
	<p>cost in the same currency as the job gives rise to a job entry with a slightly different billing price, even with a markup of zero.</p> <p>If you select this parameter, the price calculation determines the billing price based on the cost price in the original currency, to avoid a rounding difference resulting from a conversion from the original currency to base currency and back to the original currency, in cases where this is the same as the job currency.</p> <ul style="list-style-type: none"> <li>■ <b>Prioritize Markup Percentage from Job Price Lists</b> — If this parameter is marked, a markup percentage specified on a job price list has priority over any billing price entered directly on an information card, for example, in the workspace Activities.</li> </ul> <p>If the parameter is not marked, any markup percentage found in a job price list will be disregarded in favor of a billing price entered directly into an information card. For more information about how prices are calculated in the Job Cost module, please see “Appendix A: Price Calculation in the Job Cost Module.”</p> <ul style="list-style-type: none"> <li>■ <b>Prioritize Partial Invoicing when Changing Quantity for Invoicing</b> — In the Invoice Selection workspace, Maconomy automatically adjusts the fields “Action” and “Close Balance” to reflect the state of the underlying job entries. If, for some reason, these fields are not visible in the workspace layout, then you may accidentally write off entries instead of carrying them forward. This would happen if you reduce the quantity for invoicing to less than the open quantity, in which case Maconomy would automatically mark the field “Close Balance.”</li> </ul> <p>If this parameter is marked, the field “Close Balance” will be unmarked when the quantity for invoicing is changed from being greater than or equal to the open quantity to being less than the open quantity. If, for example, the open quantity is 10 and the quantity for invoicing is changed from 10 to 8, then the field “Close Balance” is unmarked; but if the quantity for invoicing is changed from 12 to 10 then the field is not unmarked.</p> <ul style="list-style-type: none"> <li>■ <b>Project Required on Job</b> — By marking this parameter, you make it mandatory to enter a value for the dimension Project on all jobs created.</li> <li>■ <b>Purpose on Job Required</b> — By marking this parameter, you make it mandatory to enter a value for the Purpose dimension on all jobs created.</li> <li>■ <b>Recalculate Job Budget when Copying</b> — If you mark this parameter, Maconomy will recalculate job budgets which are copied in the Job Cost module. This means that the price fields in the original budget (cost and sales prices in base and foreign currencies, and the field “Net Cost, Base”), the markup percentage, and fields concerning</li> </ul>

Field	Description
	<p data-bbox="553 327 1349 422">purchase orders are not copied but recalculated based on the information about the customer, employees, and job price list on the job to which the budget is being copied.</p> <ul style="list-style-type: none"> <li data-bbox="505 443 1373 632">■ Re-derive when copying time sheets — If you mark this system parameter, Maconomy will keep the values for job, activity, and task number on time sheet lines copied from the previous period or copied expense sheet lines, while dimension values are re-derived to ensure that any dimension derivation changes are reflected correctly on the time sheet or expense sheet.</li> <li data-bbox="505 653 1365 842">■ Rederive Tax Code at Invoicing— If this parameter is marked, then rederived at invoicing. This will make a difference in the case of split billing where it is possible to change the "Reporting Code, Invoice" to be used for each bill-to customer in "Bill To Customer Distribution." When marked, the tax code will be (re)derived from the bill-to customer.</li> <li data-bbox="505 863 1373 1073">■ Refresh Customer Statements And Aging when Printing Invoice — If this company-specific system parameter is marked, customer aging on invoices is refreshed when printing an invoice. If the parameter is disabled, the customer aging on the invoice is the same as when printing the invoice draft, though new invoices may have been created or other invoices have been paid since. By default, this parameter is disabled.</li> <li data-bbox="505 1094 1373 1283">■ Require Complete Absence Derivation Setup upon Absence Approval — If this parameter is marked, Maconomy displays an error notification if an absence approver approves an absence and the absence type setup is not able to completely derive time sheet registration dimensions for the absence type covering the given period.</li> <li data-bbox="505 1304 1349 1493">■ Remember all settings in det. plan. Windows — If you mark this system parameter, all settings in the workspaces Detailed Planning and Detailed Employee Planning are saved between user sessions. This means that Maconomy "remembers," for example, the starting date set by the user and fills in the same date the next time the user opens the planning workspace.</li> <li data-bbox="505 1514 1373 1640">■ Reopen Time Sheet When a Line is Rejected — Use this system parameter to reopen or unsubmit a time sheet if one of the time sheet lines is rejected by a project manager in the window Approve Time Sheet Lines or Approve Job Registrations.</li> <li data-bbox="505 1661 1365 1745">■ Require Preferred Invoice Date — If you select this company-specific system parameter, Maconomy requires you to specify an invoice date before you can approve the invoice selection on a job.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Require Year on Jobs — If you mark this company-specific system parameter, you are required to enter a value in the <b>Year</b> field for jobs.</li> <li>Restore Job Entries by Default — If you select this company-specific system parameter, when you enter an invoice number for crediting in Invoice Selection, the <b>Restore Entries</b> field is marked automatically.</li> <li>Require System Number for Job Pre-Invoices — Select this company-specific parameter to control whether a unique sequence of system numbers for job pre-invoices is required (separate from the invoices sequence), or deselect to indicate that job pre-invoice numbers can share the sequence numbers on invoices. <b>Note:</b> If a company within your enterprise must share invoices and pre-invoices each have a unique numbering sequence, on the System Parameter tab, deselect the <b>Require System Number for Job Pre-Invoices</b> check box. Then, in the Company Specific Values sub-tab, create a line for the company and select the <b>Require System Number for Job Pre-Invoices</b> check box.</li> <li>Responsible &lt; Location Required on Job / Department Required on Project &gt; — Enable this system parameter to require Location to be entered on jobs.</li> <li>Secretary can Approve Time Sheets — If you mark this system parameter, an employee who has been appointed secretary for another employee can approve the time sheets for those employees for whom he/she is secretary.</li> <li>Set Default Reallocation Date to Today — With this system parameter, you can specify whether the reallocation date that is automatically suggested in the Job Reallocation, Job Reallocation by Job and Batch Job Reallocation workspaces should be today's date or the entry date of the entry being reallocated. If you mark the parameter, the entry date suggested will be today's date.</li> <li>Set Job Entries For Invoicing After Print Invoice — If you select this company-specific system parameter, job entries marked for carry forward before invoicing are set for invoicing after invoicing.</li> <li>Set Job Phase Transition Date to Today — When you close a phase, Maconomy uses the current date as the actual ending date. Maconomy also uses the current date when you choose the action for initiating the first phase. This parameter allows you to enforce an active choice of date when performing these actions. The <b>Transition Date</b> field in the tab allows you to enter a transition date for the <b>Initiate First Phase</b>, <b>End Phase</b>, <b>Approve Phase Completion</b>, and <b>Approve Milestones</b> actions. Use this parameter to configure whether this date is blank or set to the current date.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Show Only Open Activities when Opening Invoice Selection — If this parameter is marked, then the Only Open Activities checkbox in the Invoice Selection dialog will be marked by default whenever this workspace is opened.</li> <li>■ Show Only Open Entries when Opening Job Card — If you mark this parameter, the sub-tab of the workspace Job Card will only display the open entries of the current job when the workspace is opened. If you do not mark this parameter, all entries will be displayed when the workspace is opened. You can use this system parameter in conjunction with the parameter “Open job card without delimitation,” for example, to specify that the sub-tab of the workspace Job Card should default to showing all entries within the current month, or all open entries regardless of period. See also the system parameter “Open job card without delimitation” above and the description of the workspace Job Card in the Job Cost module.</li> <li>■ Show tax code summary on invoice selection lines — Selecting this parameter allows you to display and edit tax codes in the Invoice Selection sub-tab.</li> <li>■ &lt; Specification 1-10 on Job / Business Area on Project &gt; Required — By marking these parameters, you make it mandatory to enter a value for the dimensions Spec. 1, Spec. 2, Spec. 3, Spec. 4, and so forth respectively, on all jobs created.</li> <li>■ Standard Billing Price on Non-Invoiceable Entries — If you mark this company-specific parameter, Maconomy displays the standard billing rate for non-invoiceable activities and lets you view the potential billing prices of all applicable hours.</li> <li>■ Split Week Time Sheet — If you mark this parameter, Maconomy will create two time sheets for weeks with days in two different months. The two sheets are assigned a suffix A and B and you cannot register hours on those days in one part which are covered by the other part. With this as an exception, the functionality of split week time sheets is identical to that of normal time sheets. This parameter must be marked if you are using monthly time reporting.</li> <li>■ Standard note is derived from Activity before Task — When specifying an activity and a task on a purchase line (lines created in the sub-tab of the workspaces Requisitions, Requests for Quote and Purchase Orders in the A/P module), Maconomy will attempt to derive a standard note from the activity or task in question. If a standard note has been specified on only the activity or only the task, the note in question is derived and a copy of the note in question is assigned to the purchase line. However, if a standard note has been specified for both activity and task, this parameter determines whether the</li> </ul>

Field	Description
	<p>standard note should be derived from the activity or from the task. If the note should be derived from the activity, mark this parameter. If it should be derived from the task, leave the parameter unmarked.</p> <p>If a standard note has been specified on neither the activity nor the task entered on a purchase line, the standard note specified in the system parameter "Standard note for purchase lines" is used as the standard note, and if no note has been specified there, no note is automatically assigned to the purchase line.</p> <ul style="list-style-type: none"> <li>Sub Job Numbering Based On Main Job — If you select this company-specific system parameter, a job created as a sub job of another job gets a job number with the following format: &lt;main job number&gt;&lt;separator&gt;&lt;sub job number&gt;. The separator between the main job number and the sub job number, as well as the number of decimals in the sub job number, are also set up using this parameter.</li> <li>Suggest Invoice Date when Crediting — This parameter has the effect that when you enter an invoice number for crediting, the invoice date of that invoice is suggested for the credit memo. This affects the following workspaces: <ul style="list-style-type: none"> <li>Invoice Selection</li> <li>On Account Invoice Selection</li> <li>Blanket Invoicing Overview</li> <li>Blanket Invoice Selection</li> </ul> </li> <li>Synchronize Dimensions from Account Manager — Select this parameter to synchronize select dimensions from employees to the customers, company-specific customers, and jobs where they are set up as account managers. <p>Prior to selecting this parameter, create an entry in the Dimension Sets workspace and select which of the G/L dimensions will be synchronized (such as Purpose in the CPA solution). Then, enter the name of this dimension set on the system parameter.</p> <p>The synchronization ensures that if a customer (or company-specific customer, or a job) has an account manager, then the dimensions that have been selected on the dimension set are synchronized between the account manager and the customer (and similarly for company-specific customers and jobs).</p> <p>Setting up the system parameter does not in itself force synchronization; this happens when you specify the relevant dimension(s) on the employees that are account managers. For example, if you have set up that the Purpose dimension should be synchronized and you then enter a Purpose on an employee, then</p> </li> </ul>

Field	Description
	<p>this Purpose will be copied to all customers, company customers, and jobs where the employee is selected as account manager.</p> <div data-bbox="553 401 1377 527" style="border: 1px solid black; padding: 5px;"> <p><b>Note:</b> The system parameter allows you to set up company specific rules. This means the rule follows the company of the account manager (the employee).</p> </div> <ul style="list-style-type: none"> <li data-bbox="505 548 1377 831">■ Tax from extended price in expense sheets — If you mark this parameter, tax on lines in the workspace Expense Sheets will be calculated as the total line price multiplied by the tax rate. A difference, if any, between the cost loaded on the job and the total price minus tax will be posted on the account for amount rounding found by means of a dimension combination in the workspace Posting References in the G/L module. If you do not mark the parameter, tax will be calculated on the basis of the unit price multiplied by the tax rate multiplied by the quantity entered on the line.</li> <li data-bbox="505 852 1377 999">■ Tax Itemization even if no Tax on Invoice — If you select this company-specific system parameter, tax itemization is included in the printout of job invoices and credit memos, even if the invoice has no tax. If there is no tax included in an invoice, then the itemization list is empty and the itemization sum is zero.</li> <li data-bbox="505 1020 1377 1272">■ Traffic Status Revision Codes Required — If you mark this parameter, you are required to enter a revision code in the workspace Job Traffic Status when closing a traffic status revision. You can have Maconomy generate a traffic status revision code automatically by marking the system parameter “Automatically generate traffic status revision codes.” The concept of traffic status revisions is explained in the description of the workspace Job Traffic Status in the Job Cost module.</li> <li data-bbox="505 1293 1377 1545">■ Transfer desired sales price when changed — If you mark this parameter, you do not have to select the action “Transfer Desired Sales Price” in the workspace Invoice Selection when entering a new, desired sales price in the field “Desired Sales Price” in the tab. Instead, the desired sales price is transferred to the sub-tab automatically when you press Return. If the system parameter is unmarked, you have to select the action “Transfer Desired Sales Price” manually to transfer the desired sales price to the sub-tab.</li> <li data-bbox="505 1566 1377 1776">■ Transfer Sales Price to Desired Sales Price — If you mark this parameter, Maconomy will automatically calculate the desired sales price from the prices shown in the sub-tab of the workspace Invoice Selection. When you press Return on a table line, the desired sales price is recalculated and shown in the field “Desired Sales Price” in the tab. If the system parameter is unmarked, manual changes in the sub-tab will not be reflected in the desired sales price. See also the</li> </ul>

Field	Description
	<p>system parameter “Transfer desired sales price when changed” above.</p> <ul style="list-style-type: none"> <li>■ Transfer several invoice plan lines — If you mark this parameter, all due invoicing plan lines are transferred to the current invoice selection when you select the action “Transfer Invoicing Plan” in the workspace Invoice Selection or the action “Transfer Invoicing Plans” in the workspace Approve Invoice Selection. If the system parameter is unmarked, only the first due line of the invoicing plan is transferred. By default, the system parameter is marked.</li> <li>■ Update prices upon dimension change — If you mark this parameter, Maconomy will recalculate the cost price, sales price, and markup percentage when you change a dimension value on an existing line in the workspaces Job Budgets, Job Planning, Job Reallocation, Job Journal and Expense Sheets in the Job Cost module. The recalculation is performed as described in Appendix A. In this case, the term “dimension value” means the fields “Activity,” “Employee Category,” “Employee No.,” “Task,” “Location,” “Entity,” “Project,” “Purpose,” “Spec. 1-10,” and “Local Spec. 1-10,” and, in case of a reallocation or a job journal, the new entry date. If the recalculation results in a price different from zero, the amounts and the markup percentage are adjusted accordingly. If the system parameter is not marked, Maconomy will not recalculate prices as a result of changes to dimension values.</li> <li>■ Update Employee Control Field from Job Employees — If you deselect this field, the Employee Control on the job is not updated when the user applies the action that distributes favorites from Job Employees. This can be useful if People Planner is integrated with Maconomy and People Planner pushes employees from the plan into Job Employees, but the integration should not interfere with Employee Control setup on the job.</li> <li>■ Synchronize Dimensions from Account Manager — If you specify a dimension set in this parameter, the selected dimensions will be synchronized from employees to the customers, company-specific customers, and jobs where the employee is set up as account manager. The synchronization ensures that if a customer (or company-specific customer, or a job) has an account manager, then the dimensions that have been selected on the dimension set are kept synchronized between the account manager and the customer (and similarly for company-specific customers and jobs). Setting up the system parameter does not in itself force a synchronization; this happens when you specify the relevant dimension(s) on the employees that are account managers. So if, for instance, you have set up that the Purpose dimension should be synchronized and you</li> </ul>

Field	Description
	<p>then enter a Purpose on an employee, then this Purpose will be copied to all customers, company customers, and jobs where the employee is selected as account manager. Note that the system parameter allows you to set up company-specific rules. This means that the rule follows the company of the account manager (the employee).</p> <ul style="list-style-type: none"> <li>■ <b>Update Prices on Amount Registrations upon Job Reallocation</b> — With this parameter, you can specify whether Maconomy is to recalculate and update prices on affected reallocation lines for amount activities when performing job entry reallocations in the workspaces Job Reallocation and Batch Job Reallocation.</li> <li>■ <b>Update Prices on Time Registrations upon Job Reallocation</b> — With this parameter, you can specify whether Maconomy is to recalculate and update prices on affected reallocation lines for time activities when performing job entry reallocations in the workspaces Job Reallocation and Batch Job Reallocation.</li> <li>■ <b>Use Confirmed Bookings Only</b> — If you mark this parameter, it will only be possible to create allocations of the booking type “Confirmed” in connection with resource planning. Using this parameter, you can thus decide whether or not to use the functionality of the three booking types “Preliminary,” “Requested,” and “Confirmed.”</li> <li>■ <b>Use daily time sheets</b> — If you mark this parameter, the use of daily time sheets is enabled in Maconomy. This means that you can use the workspaces Daily Time Sheets and SpeedSheet and the import program Import Daily Time Sheets. The parameter is also required for a number of Portal components.  If you do not use the workspaces mentioned above, you should unmark this parameter for performance reasons, as Maconomy will otherwise automatically create daily time sheets for each weekly time sheet created. If the system parameter is unmarked, only those daily time sheets which already exist will be maintained, and it will not be possible to use the workspaces Daily Time Sheets and SpeedSheet and the import program Import Daily Time Sheets.</li> <li>■ <b>Use Fixed Budget Type for Employee Control</b> — If this parameter is not marked, employee control on jobs is carried out according to each job’s planning budget. If the parameter is marked, employee control is carried out according to each job’s budget of the type specified in the system parameter “Budget Type No. for Employee Control.”  For further information on the available types of employee control and their effects, see the description of the field “Employee Control” in the workspace Jobs.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li data-bbox="505 327 1365 617">■ Use Fixed Working Time Stamped on Time Sheets — Maconomy always "stamps" the fixed time from the weekly calendar on the employees' time sheets as they are created. If the parameter is marked, then the actual, reported working time of the employee will be compared with the employee's fixed time from the same period. If the parameter is not marked, Maconomy will compare the actual, reported working hours of an employee with the fixed hours currently in force for the employee in question. This may not always produce a historically correct result.</li> <li data-bbox="505 638 1365 793">■ Use Invoice Date as Exchange Rate Date on Job Invoices — Select this parameter to enable Maconomy to calculate the billing price of job entries in currencies other than the base currency of the company of the job at the date of invoicing. If it is deselected, Maconomy uses the date of the job entry for currency conversion.</li> <li data-bbox="505 814 1365 1205">■ Use Job Invoice Allocation Date as Exchange Rate Date — If this system parameter is turned on then the date selected for preferred invoice allocation date is used for looking up exchange rates when carrying out conversion of unit and total billing price between job currency, base currency, and enterprise currency. This system parameter only has an effect if the Exchange Rate in Job Invoice Allocation as Invoiced On Account system parameter is turned off. . If you do not select this parameter and the Exchange Rate in Job Invoice Allocation as Invoiced On Account system parameter is not selected, the job entries are allocated at the original exchange rates.</li> <li data-bbox="505 1226 1365 1381">■ Use markup % for time activities — If you mark this system parameter, Maconomy will calculate billing prices for time activities based on cost price and markup percentage in the same way as billing prices are calculated for amount activities. The calculation only uses markup percentages specified in a job price list.</li> <li data-bbox="505 1402 1365 1591">■ Use Original Quantity on Job Related Investment Tax Entries — Investment tax can be posted as a separate job entry with the same quantity as the original job entry. This can result in rounding issues as the total investment tax is calculated from the quantity and the investment tax per unit. To avoid this, deselect this parameter to set the quantity on investment tax entries to <math>\pm 1</math>.</li> <li data-bbox="505 1612 1365 1696">■ Use P&amp;L Posting of Invoices on Account — Select this parameter to post invoices and credit notes on account to the Billing Price and Open Billing Price P&amp;L accounts.</li> <li data-bbox="505 1717 1365 1780">■ Use Preferred Invoice Date as Customer Statement Date — If you select this company-specific system parameter, when calculating and</li> </ul>

Field	Description
	<p>printing the customer statement on job invoices, the customer statement date used is the preferred invoice date, meaning that the customer entries included in the customer statement are the ones which were open until the preferred invoice date. If the preferred invoice date is not set, then the customer statement date is the current date.</p> <p>If not selected, the customer statement date used is the current date.</p> <ul style="list-style-type: none"> <li>■ Use standard billing price for amount activities — If this parameter is selected, Maconomy will derive a specific standard billing price for entries concerning amount activities. For more information about standard billing price, please see “Appendix A: Price Calculation in the Job Cost Module.”</li> </ul> <p>If the parameter is not selected, the standard billing price is set to the value of the registered billing price. Please note that if job surcharges apply to the job entry, the surcharge is added to the registered billing price only when the entry is posted, in which case the registered and the standard billing price will differ.</p> <ul style="list-style-type: none"> <li>■ Use Subscription Start Date As Entry Date — If this parameter is selected, Maconomy will set the entry date to the first date in the accrual period for subscription orders invoiced in job cost.</li> </ul> <p>This parameter allows you to set a company-specific value in the sub-tab.</p> <ul style="list-style-type: none"> <li>■ Use standard billing price for time activities — If this parameter is selected, Maconomy will derive a specific standard billing price for entries concerning time activities. For more information about standard billing price, please see “Appendix A: Price Calculation in the Job Cost Module.”</li> </ul> <p>If the parameter is not selected, the standard billing price is set to the value of the registered billing price. Please note that if job surcharges apply to the job entry, the surcharge is added to the registered billing price only when the entry is posted, in which case the registered and the standard billing price will differ.</p> <p><b>Layout</b></p> <ul style="list-style-type: none"> <li>■ Show Job Pre-Invoice Reconciliation in Workspaces — If you select this parameter, Maconomy displays Job pre-invoice reconciliation.</li> <li>■ Show Local Spec. 1-10 — Select the Show Local Spec. check box to display Local Spec. 1, 2, 3, and so on, as a dimension in Maconomy. Deselect the check box to hide this parameter from users.</li> <li>■ Show Project — If you select this parameter, Maconomy displays Project as a dimension. If turned off, this dimension is hidden from users.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Show Purpose — If you select this parameter, Maconomy displays Purpose as a dimension.</li> <li>■ Show Responsible Department — If you select this parameter, Maconomy displays Responsible department (Location in standard system) as a dimension.</li> <li>■ Show Specification 1-10 — If you mark this parameter, Maconomy displays specification 1-10 as a dimension.</li> <li>■ Show Tax Sub Levels — If you mark this parameter, Maconomy displays tax sublevels.</li> <li>■ Show Three Tax Levels — If you mark this parameter, Maconomy will show three tax levels in all workspaces that include tax code functionality. This parameter is disabled by default. Please note that the parameter “Show Two Tax Levels” also needs to be marked in order for the parameter to take effect. For instance, a field previously labeled “Tax Code” will be replaced by three new fields: “Tax Code 1,” “Tax Code 2,” and “Tax Code 3.” For further information on multiple tax levels, please see “Tax Codes.”</li> <li>■ Show Two Tax Levels — If you mark this parameter, Maconomy will show two tax levels in all workspaces that include tax code functionality. For instance, a field previously labeled “Tax Code” will be replaced by two new fields: “Tax Code 1” and “Tax Code 2.” Please note that this parameter is disabled by default. For further information on multiple tax levels, please see “Tax Codes.”</li> <li>■ Show Tax Sub Levels — If you select this parameter, 4 sub levels for each VAT level display in the layout in Tax Code and G/L Tax Code workspaces, enabling you to enter the rate, posting reference, and VAT type for each sub level.  Sub levels are necessary in some countries that have more than three tax codes for a transaction. These countries have three different tax authorities (VAT reporting units), but one tax authority could collect more than one tax code. With 4 sub levels for each VAT level, Maconomy splits the VAT posting amount for the given VAT level/code into the different sub levels. The logic in all other dialogs remains unchanged, with Maconomy continuing to show and handle the total VAT amount for the given VAT level/code.  This system parameter is part of the layout group, used only to control the layout, and is used in Java client in version X1 and 2.0, and started in Workspace client from version 2.1.</li> <li>■ Show Withholding Tax on Payments — If enabled, withholding tax fields are shown in the customer and vendor payment dialogs, by default.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Show Business Area — Select this parameter to make Business Area display as a dimension in Maconomy.</li> <li>■ Show Executing Department — Select this parameter to make Executing Department (Entity in standard system) display as a dimension in Maconomy. If turned off they will be hidden from the users.</li> </ul> <p><b>Posting</b></p> <ul style="list-style-type: none"> <li>■ Allow finance entries with job reference — If marked: both Job No. and Account No. can be specified on an invoice allocation line or general journal line. When posting, a finance entry with a job reference will be created, without creating any job entries. If not marked: either Job No. or Account No. can be specified on an invoice allocation line or general journal line, not both. When posting, based on what was specified on the line, either job entries or finance entries will be created.</li> <li>■ Allow Posting of Own Journals — If you have marked one or more of the system parameters, you can use this system parameter to specify whether users should be able to post journals that they submitted themselves. If you do not mark the parameter, a submitted journal can only be posted by another user than the one who submitted it. This functionality supports a workflow where users can submit journals when they are ready to be posted, and a posting responsible can subsequently post the journals. However, using the field “Post Own Journals” in the workspace Actions, you can grant specific users access to posting journals submitted by themselves.</li> <li>■ Automatic Posting of Asset Journals — If enabled, Maconomy will automatically post asset journals when asset adjustments are approved.</li> <li>■ Automatic posting of automatic customer payments — If this parameter is marked, customer payments imported in the Banking module are automatically posted upon import. However, the automatic posting only takes place if the payment agent used in the import is set up for creation of a separate journal for error entries.</li> <li>■ Automatic posting of customer reconciliations — If this parameter is marked, Maconomy will automatically post, but not print, customer reconciliation journals when a reconciliation is approved in the workspace Customer Open Entry Reconciliation. In the same way, if a reconciliation is removed in the workspace Show Customer Reconciliation, the resulting customer reconciliation journal is posted automatically. If the parameter is not marked, such journals must be posted manually in the workspaces Posting or Print Posting Journal in</li> </ul>

Field	Description
	<p>the G/L module. Automatically posted journals can be printed in the workspace Print Posting Journal.</p> <ul style="list-style-type: none"> <li>■ Automatic posting of debtor provisions — If this parameter is marked, Maconomy will automatically post, but not print, debtor provision journals when they are approved. A debtor provision journal is created when a provision for an invoice is approved in the workspace Debtor Provisions By Invoice in the A/R module. If the parameter is not marked, such journals must be posted manually in the workspaces Posting or Print Posting Journal in the G/L module. Automatically posted journals can be printed in the workspace Print Posting Journal.</li> <li>■ Automatic posting of expense sheets — If this parameter is marked, Maconomy will automatically post, but not print, expense sheet journals when expense sheets are approved in the workspace Expense Sheets. If the parameter is not marked, such journals must be posted manually in the workspaces Posting or Print Posting Journal in the G/L module. Automatically posted journals can be printed in the workspace Print Posting Journal.</li> <li>■ Automatic posting of fixed price inclusion — If enabled, Maconomy will automatically post fixed price inclusion journals.</li> <li>■ Automatic Posting of Gross Pay — Enable this system parameter if you want gross pay journals to be automatically posted when compensation calculations are approved.</li> <li>■ Automatic posting of Intercompany Vendor Invoices — If this parameter is marked, Maconomy will automatically post, but not print, intercompany vendor invoice journals when they are created as a result of intercompany settling in the workspace Intercompany Invoicing. If the parameter is not marked, such journals must be posted manually in the workspaces Posting or Print Posting Journal in the G/L module. Automatically posted journals can be printed in the workspace Print Posting Journal. This parameter is company-specific.</li> <li>■ Automatic Posting of Interest Charge Notice — Select this parameter to automatically post interest charge notice journals.</li> <li>■ Automatic posting of invoice reallocations — If this parameter is marked, Maconomy will automatically post, but not print, invoice reallocation journals when approved in the workspace Reallocate Invoices. If the parameter is not marked, such journals must be posted manually in the workspaces Posting or Print Posting Journal in the G/L module. Automatically posted journals can be printed in the workspace Print Posting Journal.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Automatic posting of invoices — If this parameter is marked, Maconomy will automatically post, but not print, invoice journals when they are approved. An invoice journal is created when an invoice is printed, for example, in the workspace Invoice Selection in the Job Cost module or the workspace Sales Orders in the Sales Orders module. If the parameter is not marked, such journals must be posted manually in the workspaces Posting or Print Posting Journal in the G/L module. Automatically posted journals can be printed in the workspace Print Posting Journal.</li> <li>Automatic posting of job accruals — If this parameter is marked, Maconomy will automatically post, but not print, job accrual journals when they are created in the workspaces Job Accruals and Batch Job Accrual. If the parameter is not marked, such journals must be posted manually in the workspaces Posting or Print Posting Journal in the G/L module. Automatically posted journals can be printed in the workspace Print Posting Journal.</li> <li>Automatic Posting of Job Invoice Allocation — When this parameter is ticked, journals of type “Job Invoice Allocation” are posted automatically by Maconomy immediately after having been created.</li> <li>Automatic posting of job reallocations — If this parameter is marked, Maconomy will automatically post, but not print, job reallocation journals when they are approved in the workspaces Job Reallocation by Job, Job Reallocation, or Batch Job Reallocation. If the parameter is not marked, such journals must be posted manually in the workspaces Posting or Print Posting Journal in the G/L module. Automatically posted journals can be printed in the workspace Print Posting Journal.</li> <li>Automatic posting of job revenue recognition — If enabled, Maconomy will automatically post job revenue recognition journals.</li> <li>Automatic posting of job transfers — If this parameter is marked, Maconomy will automatically post, but not print, job transfer journals when they are approved in the workspace Job Transfer. If the parameter is not marked, such journals must be posted manually in the workspaces Posting or Print Posting Journal in the G/L module. Automatically posted journals can be printed in the workspace Print Posting Journal.</li> <li>Automatic posting of mileage sheets — If this parameter is marked, Maconomy will automatically post, but not print, mileage sheet journals when mileage sheets are approved in the workspaces Mileage Sheets or Approve Mileage Sheet. If the parameter is not marked, such journals must be posted manually in the workspaces Posting or Print Posting Journal in the G/L module. Automatically posted journals can be printed in the workspace Print Posting Journal.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Automatic Posting of Payment Journals — If this parameter is marked, Maconomy will automatically post payment journals created in the Banking module. Automatic posting takes place in the following situations: <ul style="list-style-type: none"> <li>■ When approving a payment selection, causing a payment to be closed</li> <li>■ When printing a payment list or check, causing a payment to be closed</li> <li>■ When creating a payment file, causing a payment selection to be closed</li> <li>■ When importing payment statuses, causing a payment to be closed</li> <li>■ When approving a bank reconciliation</li> <li>■ When approving entries in payment reports</li> </ul> <p>If the parameter is not marked, payment journals must be posted manually in the workspaces Payment Journal in the Banking module.</p> </li> <li>■ Automatic posting of time sheets — If this parameter is marked, Maconomy will automatically post, but not print, time sheet journals when time sheets are approved in the workspaces Time Sheets or Approve Time Sheets. If the parameter is not marked, such journals must be posted manually in the workspaces Posting or Print Posting Journal in the G/L module. Automatically posted journals can be printed in the workspace Print Posting Journal.</li> <li>■ Automatic posting of Vendor Reconciliations — If this parameter is marked, Maconomy will automatically post, but not print, vendor reconciliation journals when reconciliations are approved in the workspace A/P Open Entry Reconciliation. In the same way, if a reconciliation is removed in the workspace Show Vendor Reconciliation, the resulting vendor reconciliation journal is posted automatically. If the parameter is not marked, such journals must be posted manually in the workspaces Posting or Print Posting Journal in the G/L module. Automatically posted journals can be printed in the workspace Print Posting Journal.</li> <li>■ Create intercompany entries for companies with same parent company — If this parameter is marked, Maconomy will always create intercompany balancings (entries to the intercompany accounts) when posting entries that affect two different companies. However, if some companies in the company dimension represent entities which are not legal units, you may not wish to create intercompany postings</li> </ul>

Field	Description
	<p>between companies in Maconomy, if they have the same parent company. For instance, if you run your Sales department as a company in Maconomy, you may subdivide it into, for example, Export and Domestic sales, both with the company representing the Sales department as the parent company. This could, for example, be relevant if you wish to run company access control between the departments. However, as the two departments are not legal entities, you do not want Maconomy to create intercompany balancings between the two companies as a result of for instance cross-department utilization of employees. To achieve this, unmark this parameter.</p> <p>Please note that in cases where no intercompany balancings are made, no intercompany invoicing basis entries are created either, even if the parameter "Create Intercompany Invoicing Basis" is marked.</p> <ul style="list-style-type: none"> <li>■ Delay for Restarting Posting of Journal (Seconds) — Enter a delay in seconds to indicate how much time has to pass before you can attempt to restart the posting of a journal.</li> <li>■ Join Accrual Finance Entries — If enabled, Maconomy will join accrual finance entries into one finance entry when posting, if all dimensions on the entries are identical.</li> <li>■ Max Number of Entries in Other Journals — Specify the maximum number of entries for a time sheet journal. Enter 0 if there is no limit. The following journals are affected by this parameter: <ul style="list-style-type: none"> <li>■ Vendor Invoice</li> <li>■ Invoice Reallocation</li> <li>■ Job</li> <li>■ Customer Reconciliation</li> <li>■ Vendor</li> <li>■ Payment</li> <li>■ Invoice</li> <li>■ Job Reallocation</li> <li>■ Job Accrual</li> <li>■ Job Revenue Recognition</li> <li>■ Job Transfer</li> <li>■ Interest Charge Notice</li> </ul> </li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Reminder</li> <li>■ Collection</li> <li>■ Intercompany Settlement Vendor Invoice</li> <li>■ Debtor Provisions</li> <li>■ Intercompany Interest Note</li> <li>■ Intercompany Grouping</li> <li>■ Job Invoice Allocation</li> <li>■ Fixed Price Inclusion</li> <li>■ Max Number of Entries in Timesheet Journals — Specify the maximum number of entries for a time sheet journal. Enter 0 if there is no limit.</li> <li>■ Max Number of Entries in Vendor Invoice Journals — Enter the maximum number of vendor invoices in a vendor invoice journal. By default, the value in this field is zero. The vendor invoices you create group in a single journal. If the value in this field is one, only one vendor invoice saves in a journal. If the value in this field is two or higher, Maconomy automatically uses the value as reference for the number of vendor invoice entries grouped in a journal.</li> <li>■ Post Intercompany Sale for External Expenses — If this company-specific parameter is marked (and the existing Intercompany Tax Balancing system parameter is not marked), Maconomy posts the cost price on the cost account and the intercompany sales account of the executing company.</li> <li>■ Post Invoice Exchange Rate — Use this parameter to indicate whether the Job exchange rate variance is calculated and posted.</li> <li>■ Post Unrealized Job Exchange Rate Variance — Maconomy will calculate the job fixed exchange rate variance when the vendor invoice is posted and post it as realized or unrealized job exchange rate variances. The variance is only unrealized if this parameter is marked, and the vendor invoices are not closed when the invoice allocation is posted.</li> <li>■ Submission of Customer Payment Journal Required — The functionality of this parameter corresponds to that of the system parameter “Submission of General Journal required” but pertains to customer payment journals created in the workspace Customer Payment Journal.</li> <li>■ Submission of Job Journal Required — The functionality of this parameter corresponds to that of the system parameter “Submission</li> </ul>

Field	Description
	<p>of General Journal required” but pertains to job journals created in the workspace Job Journals.</p> <ul style="list-style-type: none"> <li>■ Use Sub Jobs Dimensions — If this parameter is marked, Maconomy will use sub job dimensions for deriving dimensions when updating job cost.</li> <li>■ User Specific Project Revenue Recognition Journals — If this parameter is not marked, Maconomy maintains one revenue recognition journal at a time in the General Ledger system, adding new revenue recognitions approved by any user to the same journal until it is posted, after which the next revenue recognition approval results in a new journal to which subsequent approved recognitions are added, and so on. If you mark this parameter, Maconomy will maintain separate journals for each user approving revenue recognitions.</li> <li>■ User Specific Job Reallocation Journals — If marked, the system will maintain separate journals for each user approving job reallocations. If not marked, the system maintains one journal, adding new job reallocations approved by any user to the same journal (old functionality).</li> <li>■ User Specific Job Invoice Allocation Journals — If marked, the system will maintain separate journals for each user. If not marked, the system maintains one journal, adding new job invoice allocations by any user to the same journal (old functionality).</li> <li>■ Use Balance Account Dimensions on Customer Entries — This company-specific parameter allows you to choose to use the existing functionality, or to use the dimension from the original voucher (before account derivation).</li> <li>■ Use Balance Account Dimensions on Vendor Entries — This company-specific parameter allows you to choose to use the existing functionality, or to use the dimension from the original voucher (before account derivation).</li> <li>■ User Specific Customer Reconciliation Journals — If marked, the system will maintain separate journals for each user. If not marked, the system maintains one journal, adding customer reconciliations created by any user to the same journal (old functionality).</li> <li>■ User Specific Debtor Provision Journals — If marked, the system will maintain separate journals for each user. If not marked, the system maintains one journal, adding new Debtor Provisions created by any user to the same journal (old functionality).</li> <li>■ User Specific Fixed Price Inclusion Journals — If enabled, fixed price inclusion journals will be user specific.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>User Specific G/L Reallocation Journals — If enabled, G/L reallocation journals will be user specific.</li> <li>User Specific Invoice Journals — If marked, the system will maintain separate journals for each user. If not marked, the system maintains one journal, adding new job transfers approved by any user to the same journal (old functionality).</li> <li>User Specific Payment Journals — If marked, the system will maintain separate journals for each user. If not marked, the system maintains one journal, adding new payments approved by any user to the same journal (old functionality).</li> <li>User Specific Vendor Journals — If marked, the system will maintain separate journals for each user. If not marked, the system maintains one journal, adding new vendors created by any user to the same journal (old functionality).</li> <li>Post Job Cost Intercompany Entries as Accrued until Invoiced — Use this company-specific system parameter to set up Maconomy so that unbilled revenue is not posted as revenue until invoiced.</li> </ul> <p><b>Item</b></p> <ul style="list-style-type: none"> <li>Extended serial number control — Copy to come.</li> <li>Allow Items without Inventory Control in Negative Production — If this system parameter is selected, you can have negative production of a BOM that has elements without inventory control.</li> <li>Allow Production of BOMs without Inventory Control — If this system parameter is selected, you can have production lines for BOMs without inventory control. Both negative and positive production are allowed.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Allow Production of BOMs without Inventory Control — If selected, you can have production lines for BOMs without inventory control. Both negative and positive production are allowed.</li> <li>■ Allow Items without Inventory Control in Negative Production — If this system parameter is selected, you can have negative production of a BOM that has elements without inventory control.</li> </ul> <p><b>Sales Orders</b></p> <ul style="list-style-type: none"> <li>■ Approve order when conv. quote — If you mark this parameter, orders created as a result of converting a quote are automatically approved. However, the order is only approved if the user who converts the quote has access to approving orders. If this parameter is not marked, or if the conversion is done by a user who does not have access to approving orders, the quote will be converted to a non-approved order.</li> <li>■ Approve packing list in two steps — Using this system parameter, you can specify whether the approval of a packing list should result in the creation of a packing slip and thus a delivery. If the parameter is not marked, the approval of a packing list in the workspace Packing Lists will result in the creation of a packing slip and the delivery of the packed items.  If you mark the parameter, the approval of a packing list will not cause the delivery of items as the packing slip must be created separately by selecting the action “Print Packing Slip,” “Release for Invoicing,” or “Print Invoice.”  The parameter can, for example, be used if you use destination control and you wish to print out a complete packing slip for all orders included in a consignment. Marking this parameter will ensure that last minute order changes and creation of orders will be included in a packing slip printed just before the shipping of a consignment.</li> <li>■ Automatically assign order line to consignment — Using this parameter, you can define whether Maconomy should automatically assign quote and order lines to consignments upon creation. The parameter only applies to orders with partial delivery, and on which a destination has been specified.  If you mark the parameter, the creation of a quote or order line will cause Maconomy to attempt to assign the new line to a suitable consignment even if the line itself was created automatically by Maconomy, for instance as a split-up of an existing line.  To assign the line to a consignment, Maconomy uses the method described in Appendix B: Assign Quote/Sales Order to Consignment.  The system parameter also functions as a default value for the field “Assign to Consignment” in the workspace Update Item Reservations in the Inventory module.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Check Price List Currency — Using this parameter, you can select whether Maconomy should issue a warning if the currency on a quote, sales order, credit order, invoice, credit memo, subscription order, item purchase order, or job does not correspond to the currency in the selected price list.</li> <li>■ Fix exchange rate at order creation — In this parameter, you can specify whether the date used for determining the valid exchange rates should be fixed at the creation of quotes, sales orders, and credit orders, so that the same exchange rates are used for the calculation of currency amounts throughout the order process. If you mark the parameter, Maconomy will automatically enter today's date in the field "Currency Date" when you create a quote, sales order or credit order. This way, you ensure that, for example, the quote price or the order confirmation price matches the price calculated in connection with invoicing later in the process, as the same exchange rate is used. If you do not mark this parameter, Maconomy will suggest a blank currency date when quotes, orders, and credit orders are created, and currency prices are thus calculated using the exchange rates valid on the date upon which the calculation takes place. Please note that the currency date can be changed at any point in the order process, whether the field is blank, completed manually or completed by Maconomy as a result of a mark in this parameter. For a further description of the field "Currency Date," please see the workspaces Quote, Sales Orders, and Credit Orders in the Sales Orders module.</li> <li>■ Include zero amount lines on printouts — If you mark this parameter, the printouts of quotes, order confirmations, packing slips, draft invoices, invoices, main order invoices, draft credit memos, and credit memos will also show lines where the ordered/credited quantity of the item in question is zero. If the parameter is not marked, lines with an ordered/credited quantity of zero are not included on the printouts mentioned above.</li> <li>■ Invoice Orders with Job Numbers in Job Cost — If you mark this parameter, specifying a job number in the field "Job No." in the tab of a quote, a sales order or a purchase order also causes the field "Invoice in Job Cost" to be marked automatically. Similarly, removing the job number from a quote, sales order or credit order will cause the field "Invoice in Job Cost" to be unmarked.</li> <li>■ Reset Quantity to Pack to Zero — In this field, you can specify that the number for packing should be set at zero when sales order lines are created, either as a result of converting a quote or by adding order lines in the sub-tab of the workspace Sales Orders.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ <b>Set Quantity Returned to Zero</b> — In this parameter, you can specify whether the default value suggested by Maconomy in the field “Return” on credit order and credit memo lines should be zero or the quantity credited. If you mark the field, Maconomy always suggests a returned quantity of zero. If you do not mark the field, Maconomy suggests the value specified in the field “Credited” on the credit order or credit memo line in question.</li> <li>■ <b>Split Order Lines Automatically</b> — This parameter is used for specifying whether the field “Split Lines Automatically” should be marked by default when a quote or order is created. If you mark the parameter, the field is also marked on quotes and orders created manually in the Sales Orders module. Similarly, the system parameter also functions as a default value for the Split Order Lines field in the Update Item Reservations workspace in the Inventory module.</li> <li>■ <b>Take Delivery Date On Invoice Lines Directly From Order Line</b> — When this system parameter is marked, the delivery date on invoice lines is taken directly from the order line. Note that this is not normally recommended, and that the standard functionality is to set the date to the last delivery date from the order line.</li> </ul> <p><b>Service</b></p> <ul style="list-style-type: none"> <li>■ <b>Index Linking of Service Contracts</b> — If this parameter is marked, price indexing will be used in the calculation of service contract prices.</li> </ul> <p><b>iAccess</b></p> <ul style="list-style-type: none"> <li>■ <b>URL for iAccess</b> — If you have iAccess notifications or to-dos, enter the URL to the iAccess login page to be sent in email alerts. This link is then included appropriately in the emails list of notification. If you do not enter a URL, an error message displays on any email alerts templates that are set to include a link to iAccess.</li> </ul> <p><b>Base</b></p> <ul style="list-style-type: none"> <li>■ <b>Allow Change of Approver</b> — Select this parameter to allow manual changes to the approver and substitute.</li> <li>■ <b>Allow Document Archives with no Company</b> — Select this parameter to create a document archive without a company.</li> <li>■ <b>Allow multiple levels to be approved by same user</b> — In this parameter, you can specify whether the same user should be able to approve the same vendor invoice, general journal, purchase order, or expense sheet more than once if he or she is specified on more than one approval hierarchy line through which the vendor invoice, purchase order or expense sheet is to be approved. For further</li> </ul>

Field	Description
	<p>information about approval hierarchies, see the workspace Approval Hierarchies.</p> <p>As a vendor invoice, general journal, purchase order or expense sheet can fall within more than one selection criterion specification in the same approval hierarchy, it must be approved by the holder of approval or substitute assigned to each of the approval hierarchy lines containing the overlapping criteria. If the same employee is specified as holder of approval or substitute (either directly or through a reference or employee group) on more than one line, this parameter determines whether the employee should be able to approve more than once. If you do not mark the parameter, the same employee can only approve the same vendor invoice, purchase order or expense sheet at one level, thus ensuring that transactions requiring approval by more than one person are approved by a different person at each level. If you mark the parameter, the same employee can approve vendor invoices, purchase orders and expense sheets at any number of levels.</p> <p>Please note that if you disallow multiple approvals by the same user but your approval hierarchies contain multiple lines with the same employee, it is recommended that you always specify both a holder of approval and a substitute on each approval hierarchy line. This is to avoid situations where approval is required twice by the same person but no substitute is specified to make the second approval, causing a deadlock.</p> <ul style="list-style-type: none"> <li>■ Allow Permanent Blocking of Employees — Select this parameter to enable the <b>Permanently Blocked</b> field on employee records in the Employees workspace. When this parameter is enabled, any blocked employee records remain permanently blocked and cannot be edited.</li> </ul> <div data-bbox="553 1255 1377 1356" style="border: 1px solid #0070C0; padding: 5px;"> <p><b>Note:</b> When you enable this parameter, a warning displays stating that permanently blocking employees is irreversible.</p> </div> <p>Deselect this parameter to hide the <b>Permanently Blocked</b> field on employee records.</p> <ul style="list-style-type: none"> <li>■ Allow User Masking for Company — Set the value of this system parameter to enable employee masking.</li> <li>■ Aut. creation of contact person— In this parameter, you can specify that when an employee is created in the workspace Employees, Maconomy should automatically create a contact person in the Contact Management module, and assign it to the new employee. This causes the new employee to be assigned the same number as the automatically created contact person. The parameter can only be marked if you have installed add-on 83: CRM and/or 106: Human Resources Module. For information on how the contact person</li> </ul>

Field	Description
	<p>number is derived, see the description of the <b>Contact Person No.</b> field in the workspace Contact Persons in the Contact Management module.</p> <p>The parameter must be marked if you wish to use the Contact Management module's event flow functionality to register, for example, historical information or keep track of information such as the projects in which the employee has been involved or courses he or she has taken.</p> <ul style="list-style-type: none"> <li>Automatic Update of Reporting Structure Table — If enabled, Maconomy will automatically update grouping and sorting fields on reporting structure lines when adding, changing, or removing them. If the reporting structure has many lines, then making changes can take some time, since the system has to keep all the lines in sync. Therefore, disabling this system parameter can speed up the system. However, the grouping and sorting fields will no longer be updated as soon as you add, remove, or update the line. This has to be done via the Update Table action in the Reporting Structures dialog after you make changes to the reporting structure.</li> <li>Block Unapproved Employees — When this system parameter is selected, all unapproved employees are marked as blocked, and you cannot unblock an employee unless the employee has been approved. If the approval of an employee is rejected or removed, the employee is automatically blocked.</li> <li>Block Unapproved Users — When this system parameter is selected, all unapproved users are marked as password-blocked, and you cannot unblock the password for a user unless the user has been approved. If the approval of a user is rejected or removed, the user's password is automatically blocked.</li> <li>Consider Portal Role Access When Assigning Window Groups — Enable this system parameter to ensure users with limited administration rights cannot assign a window group to another user, unless they have access to the group itself. By default, this parameter is disabled.</li> <li>Employee Mandatory for User — In this parameter, you can specify whether an employee number is mandatory when creating a user in the Users workspace.</li> <li>Enable Employee-Vendor Linking — Use this system parameter to enable the use of linking rules between employees and outlay settlement vendors. When this system parameter is enabled, the link between employee and outlay settlement vendor is specified on the vendor card, where you can enter a linking rule. This also enables the vendor creation wizard in the employee home. You can only enable</li> </ul>

Field	Description
	<p>employee-vendor linking if there is a one-to-one relationship between employees and outlay settlement vendors.</p> <ul style="list-style-type: none"> <li>■ Price Index — This index is used for calculating the price of service contracts in the service module.</li> <li>■ Prevent Archiving of Previous Fiscal Years — This system parameter specifies for how many fiscal years finance entries must be kept. This is used to prevent the new archiving functionality from marking too many finance entries for archiving. E.g. if the system parameter is set to 5, then the system will not mark any finance entries having an entry date within any of the 5 latest full fiscal years prior to the date of running the Mark for Archiving action. For example: If the date of running the action is February 20th 2014 and the fiscal years run from January 1st to December 31st then the archiving functionality can only mark finance entries having an entry date earlier than January 1st 2009. The system parameter prevents finance entries of 2009, 2010, 2011, 2012 and 2013 from being deleted and the fiscal year 2014 has not yet ended).</li> <li>■ Standard Days Week Calendar No. — Enter the calendar number to be used as a default calendar for fixed employee working time. The calendar must use "days" as the time unit.</li> <li>■ Get on account tax code from tax table — In this parameter, you can specify that Maconomy is to use tax tables for selection of the tax code assigned to the invoice or credit memo at job invoicing on account and job crediting on account. This parameter can only be marked if the <b>Use Tax Tables</b> field in the System Information workspace is marked. If you mark the parameter, Maconomy will use tax tables to find the tax code used for invoicing on account and crediting on account in the Job Cost module. The tax code is selected in the tax table in the same way as at normal invoicing, that is, on the basis of a combination of responsible company, country, company tax code, and item tax code. As the tax code is used in connection with invoicing on account, the item tax code cannot be selected on the basis of a given activity, item, employee, and so on. Therefore, the item tax code specified in the field "On Account Tax Code" in the workspace system Information is used by Maconomy for selecting the relevant line in the tax table. If the parameter has not been marked, Maconomy always uses the standard tax code from the workspace System Information for invoicing on account. See the description of the field "On Account Tax Code" in the workspace System Information for further information.</li> <li>■ Length of System Numbers — Using this parameter, you can specify the number of figures to be used in the system numbers transferred</li> </ul>

Field	Description
	<p>from a system number series in the workspace System Numbers. When a system number is transferred, Maconomy automatically adds the number of zeroes necessary for the number length to comply with this parameter. The zeroes are placed in front of the system number.</p> <ul style="list-style-type: none"> <li>■ Allow change of approver — Use this parameter to enable system change between approver, substitute and super approver.</li> <li>■ Allow change of approver — Select this parameter to change the approver, the substitute, and the super approver. The substitute and the super approver can only be changed if the employee reference field is not selected. This is a bug, as it should be possible to change if the employee reference field is different from all and employee type.</li> <li>■ Standard Days Week Calendar No. — Enter the calendar number to be used as a default calendar for fixed employee working time. The calendar must use "days" as the time unit.</li> <li>■ Standard Week Calendar No. — Using this parameter, you can specify the number of a week calendar. For each employee, this calendar will be used in periods covered by an employee revision on which no week calendar has been specified. For further information about employee revisions, see the section "Date dependent employee revisions" in the introduction to the workspace Employees.</li> <li>■ Mail Port and Server — This parameter specifies server name and port number to be used when sending mails from Maconomy, for instance from the Express Purchase Orders workspace.</li> <li>■ Note Line Width % — Similar to the way that the Default Invoice Line Width % is used in connection with automatic line wrapping on invoice lines, this parameter is used for setting how lines wrap on note lines. Maconomy has an internal line width value of 100%. You can change that value by changing this field so that the note line width fits the note layout used in your company. If you enter, for example, <b>120</b> in this field, Maconomy makes the invoice lines wider; if you enter, for example, <b>80</b> in this field, Maconomy makes the invoice lines narrower. If you enter <b>0</b> in this field, the automatic word wrapping on invoice lines is disabled.</li> <li>■ Show Todo's for Other Roles — Select this parameter for users to see todos for all of their roles. otherwise they will only be able to see todos for current role.</li> <li>■ Use Calendar Day Table — Select this parameter to populate the CalendarDay database table.</li> <li>■ Block Users When Blocking Employee — This parameter sets the field <b>Password Blocked</b> on a user account when an employee tied to</li> </ul>

Field	Description
	<p>that user is blocked. When an employee is blocked, any user accounts belonging to that employee are blocked immediately as well.</p> <p><b>Note:</b> Employees who are tied to an administrator account are not blocked. Instead, a warning message is displayed indicating that the user is an administrator and cannot be blocked.</p> <ul style="list-style-type: none"> <li>■ <b>Use Both Formal and Preferred Name On Employees and Contact Persons</b> — This parameter enables formal names on employees and contact persons.</li> </ul> <p>When the parameter is enabled, Maconomy calculates F/M/L names from the existing name on the employee. Because both first and last name are mandatory, it is required that all employee names consist of at least two names.</p> <p>The name fields are calculated so that if fields contain two names, it will be split on first and last name. If fields contain three names, it is split into first, middle, and last names. If fields contain more than three names, all but the two last names are added to the first name field.</p> <ul style="list-style-type: none"> <li>■ <b>Use First/Middle/Last Names On Employees and Contact Persons</b> — This parameter enables F/M/L names on employees and contact persons.</li> </ul> <p>When the parameter is enabled, Maconomy calculates F/M/L names from the existing name on the employee. Because both first and last name are mandatory, it is required that all employee names consist of at least two names.</p> <p>The name fields are calculated so that if fields contain two names, it is split on first and last name. If fields contain three names, it is split into first, middle, and last names. If fields contain more than three names, all but the two last names are added to the first name field.</p> <ul style="list-style-type: none"> <li>■ <b>Use Approve Compensation Agreement</b> — Select this parameter to require approval on Compensation Agreements. Deselect the parameter to approve all Compensation Agreements by default.</li> <li>■ <b>Use Internal Names in Import Dialogs</b> — Select this parameter to automatically include internal field names and line types when importing information to Maconomy.</li> </ul> <p><b>Standard Dimensions</b></p> <ul style="list-style-type: none"> <li>■ <b>Standard Company</b> — In this parameter, you can specify the standard value for the dimension Company. In those cases where the field “Company” has not been completed manually, by derivation or by a registration code, Maconomy transfers the standard company from this parameter.</li> <li>■ <b>Standard &lt; Entity / Executing Department &gt;</b> — The functionality of this parameter is similar to that of the parameter “Standard Company” above.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Standard &lt; Location / Responsible Department &gt; — The functionality of this parameter is similar to that of the parameter “Standard Company” above.</li> <li>Standard Project — The functionality of this parameter is similar to that of the parameter “Standard Company” above.</li> <li>Standard Purpose — The functionality of this parameter is similar to that of the parameter “Standard Company” above.</li> <li>Standard &lt; Spec. 1-10 / Business Area &gt; — The functionality of this parameter is similar to that of the parameter “Standard Company” above.</li> </ul> <p><b>Vendor</b></p> <ul style="list-style-type: none"> <li>Allow fully received purchase orders only — If this parameter is marked, vendor invoice allocations on which a purchase order has been specified can only be submitted if the purchase order in question has been fully received. A purchase order is fully received when the quantity of received items/services corresponds to the number of items/services on all non-closed lines on the purchase order.</li> <li>Allow Negative Purchase Orders — If you enable this parameter, you can enter a purchase order with a negative amount.</li> <li>Allow purchase for multiple jobs — If this parameter is not marked, you can only enter purchase order lines that pertain to the same job on a purchase order. The job is specified in the tab of the workspace Purchase Orders. If you mark the parameter, you can enter different job numbers on the individual purchase order lines.</li> <li>Allow Reconciliation of Non Approved Vendor Entries — This company-specific parameter enables you to reconcile non-approved vendor entries.</li> <li>Allow Users to Manually Set Allow Fields on Vendors to Yes — If this parameter is not set, a user does not have the ability to change an Allow field to <b>Yes</b>. If the submitter would like to use the company vendor in a certain area, they can change an Allow field to <b>Requested</b>. The system can be set up so that, after approval during a specified step in the workflow, that Allow field changes from <b>Requested</b> to <b>Yes</b>. For example, you may have set up approval hierarchy to change the <b>Allow Payments</b> field value from <b>Yes</b> to <b>Requested</b> if the payment information for a company-specific vendor is changed after the company vendor has been approved. This prevents payments from being made to the vendor until the new information has been approved. You can then set up the system to change the <b>Allow</b></li> </ul>

Field	Description
	<p><b>Payments</b> field value back to <b>Yes</b> after the new information is approved.</p> <ul style="list-style-type: none"> <li>■ <b>Approve vend. inv. at submission</b> — If this parameter is marked, vendor invoices are automatically approved for posting when they are submitted. If you do not mark the parameter, vendor invoices must be approved manually once they have been submitted. This parameter cannot be used in combination with approval hierarchies for vendor invoices.</li> <li>■ <b>Aut. Appr. of Purchase Transactions</b> — If this parameter is marked, vendor invoices are automatically reconciled against the corresponding purchase transactions. If the parameter is not marked, this reconciliation must take place manually in the workspace Invoice Reconciliation in the A/P module. In the system parameter “Margin, Appr. of Purchase Transactions” you can specify the maximum difference permitted for the purchase transaction and the vendor invoice to be reconciled automatically. See also the system parameter “Copy Payment Information From Reference Invoice.”</li> <li>■ <b>Aut. company specific vendor creation</b> — With this parameter, you can specify that Maconomy is to automatically create a company-specific vendor when registrations are attempted on a non-existent company-specific vendor. If you mark the parameter, Maconomy will automatically create company-specific vendors when you try to make entries on a non-existent company-specific vendor, for example, in the workspaces General Journal, Vendor Invoices, and Item Purchase Orders. If the parameter is not marked, Maconomy shows an error message saying that you are attempting to register information for a company-specific vendor which does not exist in the system and that the company-specific vendor must therefore be created manually in the workspace Company Specific Vendor Information Card before the entry can be made.</li> <li>■ <b>Automatically approve expense sheets for payment</b> — If you mark this parameter, vendor entries created as a result of posting expense sheet lines to be settled through a vendor are automatically approved for payment. When posting expense sheet lines to be settled through a vendor, Maconomy creates one or more vendor entries covering the expense sheet lines in question. The vendor entries created in this process must be approved for payment before reimbursement can take place. However, as the approval of both expense sheet lines and vendor entries can be considered redundant, you can mark this parameter to have Maconomy automatically approve the vendor entries for payment.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Automatically approve fully invoice allocated entry for payment — If you mark this parameter, vendor entries assigned to invoices fully allocated in the workspace Invoice Allocation are automatically approved for payment.</li> <li>Automatically approve fully invoice reallocated entry for payment — If you mark this parameter, vendor entries assigned to invoices fully reallocated in the workspace Reallocate Invoices are automatically approved for payment.</li> <li>Automatically approve fully reallocated entry for payment — If enabled, fully reallocated vendor entries are automatically approved for payment.</li> <li>Automatically approve mileage sheets for payment — If you mark this parameter, vendor entries created as a result of posting mileage sheet lines to be settled through a vendor are automatically approved for payment. When posting mileage sheet lines to be settled through a vendor, Maconomy creates one or more vendor entries covering the mileage sheet lines in question. The vendor entries created in this process must be approved for payment before reimbursement can take place. However, as the approval of both mileage sheet lines and vendor entries can be considered redundant, you can mark this parameter to have Maconomy automatically approve the vendor entries for payment.</li> <li>Automatically submit vendor invoices when posting — If you select this company-specific system parameter, Maconomy automatically tries to submit and approve all vendor invoices when the posting action is selected.</li> <li>Block for repeated vendor inv. no. — If enabled, Maconomy will disallow multiple vendor invoices to have the same invoice number.</li> <li>Block for reuse of vendor inv. no. — By means of this system parameter you can specify whether it should be possible to enter two vendor invoices with the same invoice number for a given vendor. If you do not mark the parameter, you can use the same invoice number several times.</li> <li>Close unreceived purchase order lines — The default of this system parameter is enabled / selected, which keeps the current behavior. If needed, disable / deselect this parameter and Maconomy will only mark Close Purchase Order Line on invoice allocation lines if the PO line is fully received</li> <li>Check for reused vendor inv. no. only this year — If enabled, Maconomy will disallow multiple vendor invoices to have the same</li> </ul>

Field	Description
	<p>invoice number in the same year. Vendor invoices with the same invoice number will be allowed as long as they were created in different years.</p> <ul style="list-style-type: none"> <li>■ Close unreceived purchase order lines — Copy to come.</li> <li>■ Consecutive check numbers required — Using this parameter, you can specify that when printing checks, the user can only enter a check number corresponding to the next check number according to the check book setup in the workspace Popup Fields.</li> <li>■ Control of reused vendor inv. no. only this year — If you mark this system parameter, the check on blocking of reuse of vendor invoice numbers specified in the system parameter “Block for reuse of vendor inv. no.” will only be made on vendor invoices registered within the current calendar year. If you do not mark the parameter, the check will be made on all vendor invoices.</li> <li>■ Control of reused vendor inv. no. only this year — If you mark this system parameter, the check on blocking of reuse of vendor invoice numbers specified in the system parameter “Block for reuse of vendor inv. no.” will only be made on vendor invoices registered within the current calendar year. If you do not mark the parameter, the check will be made on all vendor invoices.</li> <li>■ Copy Payment Information From Reference Invoice — If this parameter is marked, payment information will be copied completely from the reference invoice and it cannot be changed afterwards. If not, payment information will only be copied when the field is blank on the new invoice.</li> <li>■ Cost Adjustment at posting of vendor invoice — If enabled, the cost price on item movement is adjusted at the posting of the vendor invoice.</li> <li>■ Centralized vendor creation only — By marking this parameter, you specify that vendors may only be created centrally, that is, in the workspace Vendor Information Card. If the parameter is marked, a company-specific vendor cannot be created in the workspace Company Specific Vendor Information Card unless the vendor has already been assigned to a previously created vendor. Maconomy shows an error message, if you attempt to create a company-specific vendor with no associated vendor. If the parameter is not marked, you can freely create company-specific vendors in the workspace Company Specific Vendor Information Card.</li> <li>■ Default Company Vendor State — This system parameter specifies the default state that should be assigned to newly created company vendors.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ <b>Default Vendor Aging Principle</b> — This system parameter specifies the initial aging principle to be set when opening the Print A/P Aging Report window. This can be changed by the user before printing the report.</li> <li>■ <b>Default Vendor State</b> — This system parameter specifies the default state that should be assigned to newly created vendors. .</li> <li>■ <b>Derive Vendor Allocation Code At Posting</b> — Maconomy will create the allocation lines when the vendor invoice is created, if the system parameter is not selected (old functionality), or when the vendor invoice is posted. The allocation lines will only be created if the vendor invoice is not allocated before posting.</li> <li>■ <b>Derive Vendor Allocation Code At Posting</b> — Select this parameter to derive vendor allocation at posting. If this parameter is not selected, Maconomy will create the allocation lines when the vendor invoice is created (old functionality). The allocation lines will only be created if the vendor invoice is not allocated before posting.</li> <li>■ <b>Include non due credit memos in payment selections</b> — If enabled, non due credit memos are included when doing payment selections.</li> <li>■ <b>Manual Release of Vend. Inv.</b> — If this parameter is marked, vendor invoices must be released manually before they can be posted. If the parameter is not marked, vendor invoices are automatically submitted for approval and approved for posting once they are created. If the parameter is not marked, reconciling a vendor invoice against a purchase order the amount of which matches that of the invoice within the margin specified in the parameter "Margin for purchase order reconciliation" will cause the invoice to be automatically released for posting.</li> <li>■ <b>Manual Purchase Order Numbers</b> — If this parameter is marked, you are allowed to manually enter a purchase order number when creating a purchase order.</li> <li>■ <b>Margin for automatic correction of tax</b> — This parameter is used for making it easier to allocate invoices on which the tax amount (as specified by the vendor) is incorrect.  On lines created in the sub-tab of the workspaces Invoice Allocation and Reallocate Invoices, the tax amount is calculated from the amount including or excluding tax. This means that if a tax amount remains when the full amount excl. tax has been allocated (for instance, because you changed the tax amount on the invoice because the vendor stated an incorrect tax amount), you must manually change the tax amount on one of the allocation lines before the allocation can be approved. However, if the amount excl. tax entered on a line causes the remainder excl. tax to be fully allocated,</li> </ul>

Field	Description
	<p>and the difference between the tax remainder and the calculated tax for the line in question is within the margin specified in this system parameter, the tax remainder is automatically allocated to the line (rather than calculated from the amount excluding tax on the line), regardless of whether this tax amount is correct according to the amount and tax code on the line.</p> <p>The margin can be expressed as an amount, a percentage or both. If you specify an amount, the tax remainder is allocated in the situation described above if the difference between the calculated tax amount and the tax remainder is lower than or equal to the amount specified in the parameter. If you specify a percentage, the tax remainder is allocated in the situation described above if the difference between the calculated tax amount and the tax remainder represents this percentage or less of the calculated tax. If you specify both an amount and a percentage, the remainder is only allocated if it is within both margins.</p> <p>This parameter allows you to set a company-specific value in the sub-tab.</p> <ul style="list-style-type: none"> <li>■ <b>Margin for Purchase Order Reconciliation</b> — This parameter is used in connection with automatic purchase order reconciliation in the workspaces Vendor Invoices, Invoice Allocation and Reallocate Invoices. If you enter a value in this parameter, Maconomy will automatically check whether reconciliation of vendor invoices and assigned purchase orders can be carried out in accordance with the value entered in the parameter. In this parameter, you can enter the highest deviation allowed in order for Maconomy to perform automatic reconciliation. The margin can be specified as an amount or a percentage. In this way, you can specify a margin allowing a difference of, for example, plus USD 3.00 to minus USD 3.00, or a given percentage. If you specify an amount, it should be specified in the enterprise currency of the system.</li> </ul> <p>When checking remainders, the amounts specified in the parameter will be converted into the currency registered on the current vendor invoice. This currency conversion is made on the basis of the exchange rate table for purchase.</p> <p>If you enter an amount or a percentage in the parameter, Maconomy will automatically reconcile purchase order lines against a registered vendor invoice at the time of posting and close the purchase order if the difference between the amount on the vendor invoice and the amount on the purchase order is within the margin specified in the parameter. Maconomy automatically uses the margin (amount or percentage) resulting in the lowest amount. If you do not specify a margin, and the current difference between a vendor invoice and a purchase order is greater than the margin, or if the difference cannot</p>

Field	Description
	<p>be allocated, the allocation and closing of the purchase order must be done manually. Automatic purchase order reconciliation can only be used if you not have marked the system parameter "Manual Release of Vend. Inv."</p> <p>See also the system parameter "Copy Payment Information From Reference Invoice."</p> <p>This parameter allows you to set a company-specific value in the sub-tab.</p> <ul style="list-style-type: none"> <li>■ Use Vendor Invoice Entry Text as Invoice Allocation Entry Text — If enabled, the Entry Text on Vendor Invoice will be transferred to invoice allocation lines.</li> <li>■ Margin, Appr. of Purchase Transactions — In this parameter, you can specify the maximum difference allowed between the amount on a purchase transaction and a vendor invoice to allow the automatic approval of the reconciliation. The margin can be specified either as an amount or a percentage. Maconomy will then use the tightest margin to determine whether a reconciliation can be approved. Any deviation will be posted to the account specified by means of a dimension combination in the field "Balance" in the Warehouse Information Card in the Inventory module. Automatic approval of purchase transactions is selected in the system parameter "Aut. Appr. of Purchase Transactions." Specify an amount of 0 if you do not wish to apply a specific amount as the margin, and a percentage of 100 if you do not wish to apply a specific percentage as the margin.</li> </ul> <p>This parameter allows you to set a company-specific value in the sub-tab.</p> <ul style="list-style-type: none"> <li>■ Margin, Remainder on Vendor Invoices — In this parameter, you can specify the maximum remainder allowed on vendor invoices to allow the selection of the action "Allocate Remainder" in the workspace Invoice Allocation in the A/P module. The margin can be specified either as an amount or a percentage. Maconomy will use the tightest margin to determine whether any remainder on the current invoice can be allocated using the action. Specify an amount of 0 if you do not wish to apply a specific amount as the margin, and a percentage of 100 if you do not wish to apply a specific percentage as the margin. Set the percentage to a larger amount, if needed, to avoid generating errors.</li> </ul> <p>This parameter allows you to set a company-specific value in the sub-tab.</p> <ul style="list-style-type: none"> <li>■ Partial Re-approval of Vendor Invoices — With this parameter, you can specify how much must be reapproved when an invoice allocation is re-submitted after changing one or more allocation lines.</li> </ul>

Field	Description
	<p>When an invoice allocation is re-submitted, it must be approved according to the approval hierarchy. If the parameter is marked, only allocation lines that have been changed since last approval must be re-approved. If the parameter is not marked, all allocation lines must be re-approved.</p> <ul style="list-style-type: none"> <li> <b>Recalculate Tax Amount from Amount Including Tax</b> — With this parameter, you can specify how Maconomy is to calculate tax amounts in the workspace Invoice Allocation. The parameter influences tax calculation behavior in two situations: When creating an allocation line and when changing the tax code on an existing allocation line.           <p>Creation of new allocation line: The parameter affects how amounts are suggested on allocation lines based on the amounts on the invoice. If you do not mark the parameter, creating an allocation line will cause the invoice amount excl. tax to be transferred to the field "Amount Excl. Tax" on the new line, and the tax amount and amount including tax to be calculated on the basis of this amount and the selected/derived tax code. If the parameter is marked, the invoice amount including tax will be suggested in the field "Amount Incl. Tax," on the line and the tax amount and amount excluding tax will be calculated on the basis of this amount and the selected/derived tax code.</p> <p>Changing tax code on existing allocation line: If you do not mark the parameter, changing the tax code on an invoice allocation line will cause the tax amount on the line to be recalculated according to the new tax code and the amount excluding tax, while the amount including tax will be recalculated from the amount excluding tax and the updated tax amount. This may cause a mismatch between the invoice amount and the total amount including tax. If you mark the parameter, changing the tax code on an existing allocation line will cause the tax amount and amount excluding tax to be recalculated based on the amount including tax and the new tax code, thus keeping the allocated amount including tax in line with the invoice amount.</p> </li> <li> <b>Standard Note for Purchase Lines</b> — In this parameter, you can specify the standard note to be assigned to purchase lines created in the sub-tab of the workspaces Requisitions, Requests for Quote and Purchase Orders in the A/P module. If you specify a note, Maconomy will automatically create a copy of the specified note each time a purchase line is created, and assign the new note to the purchase line. This functionality is used for adding a number of extra fields in which the user can enter information about the individual purchase lines.           </li> </ul>

Field	Description
	<p>In the workspaces Activities and Tasks, you can also assign a standard note to each activity or task, and specifying an activity or task with a standard note on a purchase line will cause the note from the activity or task in question to be assigned to the line instead of the note specified in this parameter. If a standard note has been specified for both the activity and the task, the system parameter “Standard note is derived from Activity before Task” determines whether to use the note from the activity or from the task. If a standard note has been specified neither here nor on the activity and task entered on a given purchase line being created, no note is automatically assigned to the purchase line.</p> <p>The following method is used for setting up additional fields for further specification of purchase lines:</p> <ul style="list-style-type: none"> <li>■ Create a note type with the headings to be used as field names — In the workspace Note Types, create a note type. In the sub-tab of the note type, create a line for each additional field desired. In the field “Heading,” specify the desired field name. In the field “Format,” specify the data type of the field in question, thus ensuring that the correct type of data is always entered. See the description of the field “Format” in the sub-tab of the workspace Note Types in the Set-Up module for further information.</li> <li>■ Create a note containing the headings to be used as field names — In the workspace Notes, create a note of the type you created earlier in the process. In the sub-tab of this note, create a line for each of the headings in the note type. If you want the fields to contain default values, specify these values in the <b>Value</b> field. To make this note the standard note to be used on purchase lines, specify the number of the note in the <b>Standard note for purchase lines</b> system parameter.</li> <li>■ Suggest Quantity Received on Vendor Invoice — In this parameter, you can specify how Maconomy should interpret a quantity received of zero on purchase order lines when automatically creating invoice allocation lines based on purchase orders.</li> </ul> <p>The parameter comes into play when a purchase order number (but no packing slip number) is specified in the Vendor Invoices workspace or the Invoice Allocation workspace, and allocation lines are automatically created from the lines on this purchase order.</p> <p>If the quantity received is zero on a given line on the specified purchase order, the quantity on the allocation line created from this purchase order line will also be set to zero if this parameter is marked. If the parameter is not marked, the quantity on the allocation line will be set to the quantity remaining to be invoiced on the purchase order line, as Maconomy will then assume that the</p>

Field	Description
	<p>purchase receipt functionality is not used and that the vendor invoice is for all units of the purchased items.</p> <ul style="list-style-type: none"> <li>■ <b>Submit Only Fully Allocated Vendor Invoices</b> — This parameter prevents the submission of vendor invoices that are not fully allocated.</li> <li>■ <b>Suggest Company Vendor Name as Entry Text</b> — If enabled, Maconomy will automatically fill the Entry Text with the chosen vendor's name when creating general journal lines.</li> <li>■ <b>Use Company Vendor Name as Entry Text</b> — If enabled, Company Vendor Name will be transferred to Entry Text field on finance entries when posting vendor invoices.</li> <li>■ <b>Use Context Tax Codes on Vendor Invoices</b> — This company-specific system parameter controls where the tax code is derived from when creating invoice allocation lines on a vendor invoice.  <p>The tax code on the invoice allocation line is always derived from the G/L tax table based on the information on the invoice allocation line. Maconomy will always use an already entered tax code or a derived tax code, but if no tax code is entered or derived, and this system parameter is marked, Maconomy will use the tax code from the vendor invoice on the invoice allocation line.</p> <p>This parameter allows you to set a company-specific value in the sub-tab.</p> </li> <li>■ <b>Use Invoice Date as Exchange Rate Date on Vendor Invoices</b> — Select this parameter to use the invoice date as the exchange rate date. Deselect this parameter to use the entry date as the exchange rate date.</li> <li>■ <b>Use Invoice Date as Reference Date</b> — In this parameter, you can specify whether Maconomy should suggest the entry date/reallocation date or the invoice date in the field "Reference Date" on vendor invoice allocation and invoice reallocation lines in those cases where no reference date has been specified manually and no reference date can be found on the vendor invoice itself. If you mark the parameter, the invoice date will be suggested as the reference date on such lines. If you do not mark the parameter, the entry date (in the case of invoice allocation) or reallocation date (in the case of reallocation) is used.</li> <li>■ <b>Transfer payer identification from invoice to intercompany vendor invoice</b> — Select this parameter to enable the transfer of the payer identification number from the invoice to the corresponding intercompany vendor invoice.</li> </ul> <p><b>Extensions</b></p>

Field	Description
	<ul style="list-style-type: none"> <li>Block Employee Off-boarded in Deltek Talent Management — If this parameter is selected and the user is off-boarded in Deltek Talent Management (such as if the user has left the company), then the linked employee is blocked in Maconomy. Select this parameter so that an off-boarded field is mapped to a blocked field for the Maconomy employee. Off-boarding a user in Talent Management results in blocking a corresponding employee in Maconomy. If a company is updated for a user and that user becomes off-boarded at the same time, then the blocked field is updated only if this system parameter is enabled for the new company. If the off-boarding date is in the future, then a new employee revision is created blocking the employee on that date.</li> <li>Bottom Align Text In Purchase Prints — This parameter controls alignment of multiline text emulation in purchase prints. The background for this system parameter is that the long text emulation in the portal for purchase process-related prints was aligned so that the block of text came first, followed by the last text in the block. The last line then carried the amount related to the block of text. This did not match the way the text was aligned in the draft invoice in Job Cost, where the first line in the block carries the amounts, followed by the other lines of text below. If you set the system parameter to true and you enable the long text emulation functionality, the text now bottom aligns so that the last line carries the amounts in these windows.</li> <li>Enable Deltek Talent Management Integration — Select this field to enable Talent Management in Workspace Client for the selected company. Only the employees that are in the selected company can be linked with Talent Management users. Only Deltek Talent Management users that are in the selected company can be linked with Maconomy employees. Any Talent Management users that are not in the selected company are not imported to Maconomy. If a company is changed for the employee or for the user and that company is not set to "Enable Deltek Talent Management Integration," then the link between the employee and the user is removed.</li> <li>Enable Deltek Talent Management Skills Integration — Select this field to enable Talent Management Skills Integration in Workspace Client for the selected company. This company-specific, system parameter enables the synchronization of Deltek Talent Management skills with Maconomy skills.</li> <li>Enable Long Text Emulation in Workspaces — Select this company-specific system parameter to allow users to enter long text (that is, more than 255 characters long) in time sheet description fields. When</li> </ul>

Field	Description
	<p>you enter long text in time sheets, Maconomy copies this over to the relevant job entries and standard description fields.</p> <p>By default, this parameter is disabled. If you select this parameter, you enable long text descriptions in the Workspace Client, iAccess, and Touch.</p> <ul style="list-style-type: none"> <li>■ <b>Enable Standard Extensions</b> — Select this parameter to enable the standard extensions in the workspaces and layouts after the standard extensions are installed on the system, via Mconfig. Standard extensions you can enable with this parameter include Credit Control and Expense Justification.</li> <li>■ <b>Enable CRM Integration</b> — Select this parameter to enable the integration between Maconomy and Deltak CRM. If selected, the CRM Integration workspace displays in Maconomy.</li> <li>■ <b>Use Deltak CRM Client ID as Customer No.</b> — Select this parameter to use the Deltak CRM Client ID as the Maconomy Customer No. De-select this parameter if you want to define the Maconomy customer number by the number series in Maconomy.</li> <li>■ <b>Use Entry Dates for UK Tax Submission (Making Tax Digital)</b> — Select this parameter to use entry dates for VAT calculations in the UK Tax Submission report. Deselect this parameter to use tax settlements for VAT calculations.</li> <li>■ <b>Enable TrafficLIVE Integration</b> — Select this parameter to enable the integration between Maconomy and Deltak TrafficLIVE.</li> </ul> <p><b>Integration</b></p> <ul style="list-style-type: none"> <li>■ <b>Enable Kona Integration</b> — Select this parameter to enable Kona integration in Maconomy. A Kona link and the action to create Kona spaces are visible. A browser pane to Kona displays in the Opportunities and Jobs workspaces.</li> <li>■ <b>Remark Field Number for Job Budget Merging</b> — This parameter can be used to configure which remark field to use when matching source lines with target lines in Job Budget Merging.</li> </ul>

### Business Performance Management

- **BPM Server URL** — Set up this parameter to use BPM in the Workspace Client. If you do not use BPM, leave this parameter blank.
- **Enable Silent Sign In** — Select this parameter to enable Silent Sign In for BPM.
- **Prefer BPM Reports** — If you only want to view the BPM version of a report (even though the standard/client version is also available), set this parameter to **True**. If you want to view both versions, set this parameter to **False**. By default, this parameter is set to **True**.

- Show Standard Reports — If you want to make standard (client) reports available in the Workspace Client, set this parameter to **True**. If you only want to view BPM reports, set this parameter to **False**. By default, this parameter is set to **True**.
- BPM Server REST API URL — Select this system parameter to specify an IP and port for BPM RESTful web service. You must select this parameter to enable the Open PDF Report action in reporting workspaces. Enter the IP and not DOMAIN address. Do not copy the "/biprws" part.

## People Planner

- URL for Resource Management — Enter the URL of the People Planner Capacity Overview page. The general form is:

```
http://<server>:<port> /PeoplePlannerWebComponents /
AssignResourcePage.aspx
```

If the **URL for Resource Management** is left blank, the **Resource Management** workspace is hidden.

- Always Allow Send Action — If selected, the **Send to People Planner** button in the Portal and actions in the clients are always enabled. If it is not selected and Integration Status Notes are used, you can only push the job from Maconomy to People Planner once after creation. After this, you can only import it from People Planner.
- Create New Budget Revision on Updates — If selected, a new revision of the budget is created. The budget is updated using the **Import Working Budget from People Planner** action in the Job Budgets workspace, or if it is updated, from the People Planner client.
- Default Forecast Budget Type — Use this budget type when sending a Forecast from the Portal to People Planner.
- Default Job Budget Type — Use this budget type when sending a job from the Maconomy Client or Portal to People Planner. Possible values are an explicit budget type, for example, **Working Budget** or **@planning**. If you enter a value, that value is the budget type sent. If you do not enter a value, the budget type currently shown in Job Budgets is sent. If you enter **@planning**, the budget type set as Planning Budget for the job is used.
- Default Opportunity Budget Type — Use this budget type when sending an Opportunity from the Portal to People Planner. Possible values are an explicit budget type, for example, **Sales Estimate** or **@standard**. If you select **@standard**, the budget type sent is the one marked as Standard Opportunity Budget type for the Job Budget Types popup field. If you do not set a value, the **@standard** type is used.
- Enable Custom People Planner Actions — If selected, the following actions are enabled:
  - **Send Job to People Planner** in the Jobs, Job Budgets and Job Overview workspaces
  - **Send Opportunity to People Planner** in the Opportunities and Opportunity Budgets workspaces
  - **Import Working Budget from People Planner** in the Job Budgets workspace
  - **Update ETC from People Planner** in the Job Progress workspace

- **Enable Silent Sign In** — Select this parameter to enable Silent Sign In for People Planner portal components.
- **Include Subjobs When Sending Job to People Planner** — If selected, subjobs are included when the job is sent to People Planner from the Maconomy Client or Portal.
- **Integration Status Note Type** — This is the note type used for Integration Status Notes. It shows when jobs integrated with People Planner were last updated successfully. The standard value is **Integration Status**.
- **Update Total Cost (Base) in Budget** — If selected, the values in the **Total Cost, Base** column are overwritten with cost values from People Planner when using the **Import Working Budget from People Planner** action in the Job Budgets workspace.
- **URL for MyPlan WSC** — Use this URL when showing My Plan in the Workspace Client. The template value is **http://SERVERNAME:20002/MyPlan/**.
- **URL for MyPlan Portal** — The web access of the people planner 'My plan portal' must be entered here to make My Plan available in the Maconomy portal.
- **Web Service API Namespace** — Use this namespace when logging in to the People Planner API.
- **Web Service API Password** — Use this password if you are entered as the Web Service API User.
- **Web Service API SOAP Address** — Use this URL for the People Planner API.
- **Web Service API User** — Use to enter a user to be used by the People Planner web service.
- **URL for Planning Assistant** — Use this parameter to specify the URL to the People Planner planning assistant. When a URL is specified, the planning assistant is shown as an assistant to job budget lines on the Budgets tab in the Jobs module (Jobs » Budgeting » Budgets tab).
- **Show Planning Assistant in Periodic Job Budgets** — Select this parameter to show the Planning sliding panel in the Periodic Job Budgets workspace. This only shows if this parameter is enabled, the URL for the tab is completed, and the current user role is People Planner-related.
- **Show Planning Assistant in Job Budgets** — Select this parameter to show the Planning assistant extension in the Job Budgets workspace. This only shows if this parameter is enabled, the URL for the tab is completed, and the current user role is People Planner-related.
- **Show Planning Assistant in Progress Evaluation** — Select this parameter to show the Planning sliding panel in the Progress Evaluation workspace. This only shows if this parameter is enabled, the URL for the tab is completed, and the current user role is People Planner-related.
- **Show Resourcing Overview** — Select this parameter to show the Resourcing Overview workspace. This only shows if this parameter is enabled, the URL for the tab is completed, and the current user role is People Planner-related.
- **Submit Periodic Job Budget on Update from People Planner** — Select this parameter to automatically submit the budget after clicking the **Update Periodic Job Budget from**

**People Planner** or **Send Job to People Planner** actions. This parameter is enabled by default.

- **Update Periodic Job Budget Planned Dates on Update from People Planner** — Select this parameter to update the job budget planned dates after clicking the **Update Periodic Job Budget from People Planner** or **Send Job to People Planner** actions. This parameter is enabled by default.

### Purchase Orders

- **Warning of Receipt without Price** — If this parameter is marked, Maconomy gives a warning for each line in the Item Receipt workspace related to an item purchase order line with the price 0.

### Workspace Client

- **Enable Dark Theme in the Workspace Client** — Select this parameter to enable the dark theme for all users. If company-specific values are applied, this enables the dark theme for all users in a given company.  
Deselect this parameter to enable the classic theme for all users. If company-specific values are applied, this enables the classic theme for all users in a given company.
- **Enable Custom Fonts in the Workspace Client** — Select this parameter to enable custom fonts, such as Lato and Source Sans Pro. If company-specific values are applied, this enables custom fonts for all users in a given company.  
Deselect this parameter to enable the operating system's default fonts. If company-specific values are applied, this enables the default fonts for all users in a given company.

### Remarks Island

In this island, you can enter information about the current system parameter.

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Company Specific Values Sub-Tab

This section includes only data for company specific system parameters.

Copy to come

## Company Parameters Single Dialogs Workspace

Use this workspace to review company-specific values for system parameters.

You can also change the company-specific values in this workspace.

This workspace displays a column that contains the company-specific values as well as a column with the global system value for comparison. This is useful if you need an overview of the parameters for a specific company.

If a system parameter allows company-specific values, you can enter these in the Company Specific Values sub-tab of the System Parameters workspace, with one row per company. If you enter any values here you can use the Company Parameters workspace to look these up by

searching for company or parameter. This workspace displays a column with the company-specific values as well as a column with the global system values for comparison.

You can only change the company-specific parameter setup in this workspace. You define new parameter setups in the System Parameters workspace.

### Company Parameters Tab

This section includes the fields and descriptions for the Company Parameters tab.

#### Company Island

Field	Description
<b>Company</b>	This field shows the number and name of company for which the parameter setting apply.

#### Remarks Island

In this island, you can enter company-specific information about the current system parameter.

#### User Island

See the Getting Started topic for a description of the fields in the island User.

## System Numbers Single Dialogs Workspace

Use this workspace to maintain each company's system-assigned transaction numbers.

Maconomy assigns these numbers, in consecutive order, to transactions such as invoices, journals, and sales orders. For example, when you create a sales order, Maconomy assigns to it the next number in the Sales Order number series.

Maconomy determines the number series that you can use and the name of each series. A number in a number series must consist of a prefix, a "next number," which Maconomy automatically updates, and a "suffix."

You specify the starting number in each series, and Maconomy updates the current number each time that a number is used. Before assigning a transaction number, Maconomy checks that the number is not already in use by another company.

Maconomy's number series are fixed, and you cannot change their names.

The maximum length of a system number is nine characters. A transaction number cannot be 0. You specify the number of characters in a transaction number in the System Parameters workspace.

This workspace only displays companies to which you have been assigned separate system numbers, that is, you selected the **Separate System Numbers** field in the Company Information workspace. When you create a company with separate system numbers, Maconomy transfers the current system numbers from the standard company to the system numbers of the new company. If you have not specified a standard company in the System Information workspace, Maconomy sets all of the system numbers to zero.

## System Numbers Tab

This section includes the fields and descriptions for the System Numbers tab.

### Company Island

Field	Description
<b>Company No.</b>	This field shows the number of the current company. The sub-tab only shows the system numbers applying to the company shown in this field.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

### Prefix Specification Island

Field	Description
<b>System Numbers</b>	This field shows the prefix used on system numbers in the current company. The prefix is transferred from the workspace Company Information, and it cannot be changed here. Whenever a system number is used on a transaction, this prefix will be added in front of the system number.

## System Numbers Sub-Tab

This section includes the fields and descriptions for the System numbers sub-tab.

Field	Description
<b>Name</b>	This is the name of the number series. The name cannot be changed. Below is a list of Maconomy's number series, with a description of where they are used.
<b>Prefix</b>	In this field, you can specify the text for the first part of the compound number in the current system number series. If a prefix has been specified for the current company in the field "System Numbers" in the workspace Company Information, the company prefix will be placed in front of the prefix in this field.
<b>Next Number</b>	<p>This field shows the next number in the series. This is where you specify starting numbers for the individual number series. Maconomy updates the series every time a number is drawn. The number can be changed manually, but Maconomy verifies that the number has not been used before in the same series.</p> <p>Note that the following groups of number series cannot have numbers that overlap:</p> <ul style="list-style-type: none"><li>▪ Invoice, Credit Memo, 0-Credit Memo, and 0-Invoice</li><li>▪ Quote, Sales Order and Subscription Order</li><li>▪ Automatic Payment and Automatic Collection</li><li>▪ A/P Open Entry Reconciliation and Vendor Payment</li></ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ 0-Invoice — The next zero-invoice number. The number is used in connection with the creation of job invoices if the invoice amount is 0.00 (except blanket invoices). If the field “Next Number” is set to zero for zero-invoices, the next invoice number is taken from the system number series “Invoice.” If the zero-invoice has been created as a consequence of a reconciliation of a previously printed invoice on account, Maconomy will use the system number series “Invoice.” However, system numbers from this series are also used for printouts of zero-invoices created on the basis of a reconciliation of an invoice on account, if the system parameter “Extended use of 0-invoice system numbers” has been marked. This might, for example, be in connection with the closing of fixed-price jobs, for which the job parameter attribute “Create invoice upon job closing” has been assigned the value “Yes.”</li> <li>■ 0-Credit Memo — The next zero-credit memo number. Similar functionality as 0-Invoice.</li> <li>■ A/P Open Entry Reconciliation— The next number for A/P open entry reconciliations.</li> <li>■ Advertising Order — The next advertising order number.</li> <li>■ Approval — The next number for approval lines. Approval lines are created when purchase orders and expense sheets are submitted, if approval hierarchies are used for purchase orders and expense sheets, respectively.</li> <li>■ Asset Adjustment— The next asset adjustment number.</li> <li>■ Automatic Collection — The next number for collections automatically created in the workspace Collection Selection in the Banking module.</li> <li>■ Automatic Payment — The next number for payment files in the workspace Automatic Payment in the Banking module.</li> <li>■ Bar Code Entry — The next bar code entry number. Bar code entries are created in the workspace Bar Code Entries in the sales orders module.</li> <li>■ Budget Journal — The next budget journal number. Budget journals are created in the workspace Budget Journals in the Budget module.</li> <li>■ Check — The next check number.</li> <li>■ Client Account Adjustment — The next transaction number used for client account adjustments. These are only used in Maconomy Lawyer.</li> <li>■ Credit Memo — The next credit memo number.</li> <li>■ Customer Payment — The next system number for import of customer payment files in the workspace Read Payments in the Banking module.</li> <li>■ Expense Sheet — The next expense sheet number used in the workspace ExpenseSheets in the Job Cost module.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Follow-up Selection — The next number used in the printout of a follow-up selection in the G/L module.</li> <li>G/L Report — The next G/L report number.</li> <li>Intercompany Grouping — The next number for entries created as a result of grouping intercompany entries in the workspace Open Entry Intercompany Statement.</li> <li>Interest Notice — The next interest notice/reminder number. Reminders and interest notices use the same number series.</li> <li>Intrastat Report— The next report number for Intrastat reports for the tax authorities.</li> <li>Inventory Change Transaction — The next transaction number used for registering an item in the workspace Inventory Change.</li> <li>Inventory Count — The next list number for stock listings made in the workspace Inventory Count Listing the Inventory module.</li> <li>Invoice — The next invoice number.</li> <li>Item Purchase Orders — The next item purchase order number.</li> <li>Job — The next job number. Jobs are created in the workspace Jobs in the Job Cost module.</li> <li>Job Accruals — The next transaction number for job accruals. The transaction number is assigned to job accrual journals when created in the workspace Job Accruals and Batch Job Accruals.</li> <li>Job Revenue Recognition — The number of the next job revenue recognition journal. These journals are created when a job overrun occurs or when revenue recognition is performed on a job in the Job Cost module.</li> <li>Journal — The next journal number. The number is used for general journals and journals from Maconomy's other modules (customer journals, invoice journals, and so on).</li> <li>Packing Slip — The next packing slip number.</li> <li>Picking List— The next number for picking lists. Picking lists are created manually in the workspace Picking Lists in the Inventory module or as a result of various registrations in the Sales Orders and Inventory modules.</li> <li>Production Transaction — The next production number. Production transactions are created in the workspace BOM Production in the Inventory module and are part of Maconomy Bill of Materials.</li> <li>Purchase Order — The next purchase order number.</li> <li>Requisition — The next requisition number.</li> <li>Request for Quote — The next request for quote number.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Quote — The next quote number.</li> <li>Royalty Billing— The next royalty billing number.</li> <li>Sales List System Report — The next report number for sales list system reports to the tax authorities.</li> <li>Sales Orders — The next sales order number.</li> <li>Service Contract — The next service contract number used when creating service contracts in the workspace Service Contracts in the service module.</li> <li>Service Inventory Journal — The next journal number used in a service inventory journal printed out at the approval of inventory changes in the workspace Service Warehouses.</li> <li>Service Job — The next service job number used when creating a service job in the workspace Service Jobs in the service module.</li> <li>Subscription Order — The next subscription order number.</li> <li>Subscription Sales Order — The next sales order number for sales orders in the sales orders module, which have been created in the subscription module. The number series is only used if the field “Separate Sales Order Numbers” in the workspace System Information in the set-up module has been marked.</li> <li>Tax Settlement — The next transaction number for Tax settlement.</li> <li>Time Sheet — The next time sheet number. Time sheets are created in the workspace Time Sheets in the Job Cost module.</li> <li>Vendor Invoice Reconciliation — The next transaction number for reconciled vendor invoices.</li> <li>Vendor Payment — The next transaction number for vendor payments.</li> <li>Warehouse Transaction — The next number for warehouse transactions. Warehouse transactions are created manually in the workspace Warehouse Transactions in the Inventory module or as a result of various registrations in the Sales Orders, Item Purchase Orders, and Inventory modules.</li> </ul>
<b>Suffix</b>	In this field, you can specify the last part of the compound number in the current system number series.
<b>Last Number</b>	In this field, you can specify the highest number that the current system number series may reach. If you select 0 as the last number, there will be no upper limit.
<b>No. of Digits</b>	In this field, you enter the number of digits of which numbers in the current series should consist, not including prefix and suffix. If the number in the field “Next Number” contains fewer digits, Maconomy will add the necessary number of zeroes between the prefix and the number in the field “Next Number” to make the next number reach this number of digits. The zeroes are not added in this workspace, but will appear on the actual system numbers assigned to entries in Maconomy. If

Field	Description
	you select 0 as "Last Number," the number of digits in "Next Number" is allowed to surpass the number of digits specified in the field "No. of Digits."

## System Number Providers Single Dialogs Workspace

Use this workspace to enable the system number providers functionality and monitor or make changes to the number of providers.

This feature is supported for invoices, credit memos, zero-invoices, and zero-credit-memos.

System numbers provide unique system-assigned numbers for company records such as jobs, journals, or invoices. A system number is a shared resource that is locked by Maconomy when you obtain a new number. Until you finish the process, no other user can obtain a number of the same type.

The system number providers feature resolves this issue by introducing multiple records, called system number providers, each of which contains one system number of a given type. Each of these records can be locked independently, which allows multiple users of the same process to obtain system numbers simultaneously. For example, multiple users can print invoices simultaneously, without blocking each other.

To activate the system number providers feature, you configure two parameters by setting the **Number of Providers** and **Bound** fields in the System Number Providers island in the System Number tab. See the field descriptions for more information.

After you enable the system number providers feature the behavior of the **Next Number** field in the System Setup workspace changes. Rather than displaying the next number to be assigned, it displays one of the numbers that will be assigned in the future.

In addition, changes to the values of either the **Next Number** field or the **Number of Providers** field do not always take effect immediately. They take effect gradually as users obtain new numbers. As a result, you might have a period of time during which Maconomy assigns numbers from both the old sequence (before the value for either of these fields changed) and the new sequence (after the change). If you changed the value of either of these fields recently, and not enough invoices (for example) have been printed for that change to be fully in effect, Maconomy does not allow you to make another change; instead, it displays an error message.

**Number of providers** - Enter a number of providers. This should take into account the number of users and the amount of time they normally take to print an invoice. The number you choose should be high enough to accommodate all your users so that they do not waste any time waiting to be assigned a number, but low enough so that not too many providers are left unused too often.

**Note:** Entering a value of 0 or 1 in this field disables the functionality. Maconomy then uses the former method of obtaining system numbers.

**Bound** - This field controls the difference between the smallest and largest system number that can be printed at a given time

## Number Series Single Dialogs Workspace

Use this workspace to maintain each company's consecutive number series for identifying customers, vendors, and other entities.

Maconomy determines the number series that you can use and the name of each series. A number in a number series must consist of a prefix, a "next number," which Maconomy automatically updates, and a "suffix."

The "prefix" and "suffix" can be two random texts. You use this workspace only to maintain existing number series. In addition, Maconomy automatically updates the value in the **Next Number** field when the series is in use.

This workspace only displays companies to which you assigned separate system numbers, that is, you selected the **Separate System Numbers** field in the Company Information workspace in the G/L module.

### Number Series Tab

This section includes the fields and descriptions for the Number Series tab.

#### Company Island

Field	Description
<b>Company No.</b>	This field shows the number of the current company. The sub-tab only shows the number series applying to the company shown in this field.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

#### Prefix Specification Island

Field	Description
<b>Number Series</b>	This field shows the company prefix used on number series in the current company. The prefix is transferred from the workspace Company Information, and it cannot be changed here. Whenever a number from a number series is used, this prefix will be added in front of the number. If a prefix has been specified for the number series in question, the company prefix shown in this field will be added in front of the prefix transferred from the sub-tab of this workspace.

### Number Series Sub-Tab

This section includes the fields and descriptions for the Number Series sub-tab.

Field	Description
<b>Number Series</b>	This field shows the name of the number series. When you use a number in the number series, Maconomy checks that it has not already been used in that series. The name cannot be changed.

Field	Description
	<ul style="list-style-type: none"> <li>■ Asset Series — The next fixed asset number. When an asset is created in the workspace Assets, it is assigned the next available number unless the user enters an asset number manually.</li> <li>■ Compensation Agreement Series — Contains the next available compensation agreement number. When you create a compensation agreement in the sub-tab of the workspace Compensation Agreements in the HR module, the number will automatically be assigned to the new compensation agreement.</li> <li>■ Compensation Type Series — Contains the next available compensation type number. When you create a compensation type in the workspace Compensation Types in the HR module, the number will automatically be assigned to the new compensation type.</li> <li>■ Consignment Series — Contains the next consignment number. When a consignment is created, the number will automatically be assigned to the consignment, unless you enter a consignment number manually in the workspace Consignments.</li> <li>■ Contact Person Series — Contains the next contact person number. For more information about contact person numbers assignment, please see the description of the system parameter "Use company-specific contact companies."</li> <li>■ Contact Company Series — Contains the next contact company number. For more information about contact company numbers assignment, please see the description of the system parameter "Use company-specific contact companies."</li> <li>■ Course Series — Contains the next course number. When you create a course in the workspace Course Information Card, the number will automatically be assigned to the course, unless you enter a number manually.</li> <li>■ Customer Series — Contains the next customer number. When you create a customer, the number will automatically be assigned to the customer, unless you enter a customer number manually in the workspace Customer Information Card.</li> <li>■ Customs Document Series — Contains the next customs document number. When a customs document is printed in the workspace Print Customs Document, the number will automatically be assigned to the document.</li> <li>■ Document Archive Series — Contains the next document archive number. When a document archive is created in the workspace Document Archives, the number will automatically be assigned to the document archive.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Event Series — Contains the next event number. When you create an event, the number will automatically be assigned to the event, unless you enter an event number manually in the workspace Events.</li> <li>■ Event Flow Series — Contains the next event flow number. When you create an event flow, the number will automatically be assigned to the event flow, unless you enter an event number manually in the workspace Event Flows.</li> <li>■ Note Series — Contains the next note number. When a note is created, the number will automatically be assigned to the note, unless you enter a number manually in the workspace Notes.</li> <li>■ Opportunity Series — Contains the next opportunity number. When you create an opportunity in the workspace Opportunities, the number will automatically be assigned to the opportunity, unless you enter a number manually.</li> <li>■ Personnel Requisition Series — Contains the next personnel requisition number. When you create a personnel requisition, the number will automatically be assigned to the requisition, unless you enter a number manually in the workspace Personnel Requisitions.</li> <li>■ Purchase Process Series — Contains the next purchase process number. When a purchase process is created, the number will automatically be assigned to the process. For information about the creation of purchase processes, see the section “Purchase Processes.”</li> <li>■ Stock Option Agreement Series — Contains the next stock option agreement number. When you create a stock option agreement in the sub-tab of the workspace Stock Option Agreements, the number will automatically be assigned to the agreement, unless you enter a number manually.</li> <li>■ Target Group Series — Contains the next selection criterion specification number. When you create a selection criterion specification, the number will automatically be assigned to the specification, unless you enter a number manually in the workspace Selection Criterion Specification.</li> <li>■ Vendor Series — Contains the next vendor number. When you create a vendor, the number will automatically be assigned to the vendor, unless you enter a vendor number manually in the workspace Vendor Information Card.</li> </ul>
<b>Prefix</b>	This field shows the text for the first part of the compound number in the current number series. If a prefix has been specified for the current company in the field “Number Series” in the workspace Company Information, the company prefix will be placed in front of the prefix in this field.
<b>Next Number</b>	This field shows the next number in the current series. “Next Number” must be an integer. If you select 0 as the number, the current number series will not be used.

Field	Description
	When the number series has been in use, Maconomy automatically updates “Next Number.”
<b>Suffix</b>	This field shows the last part of the compound number in the current number series.
<b>Last Number</b>	In this field, you select the highest number that the number in the current number series may reach. If you select 0 as “Last Number,” there will be no upper limit to the numbers in the current number series.
<b>No. of Digits</b>	In this field, you enter the number of digits of which numbers in the current series should consist, not including prefix and suffix. If the number in the field “Next Number” contains fewer digits, Maconomy will add the necessary number of zeroes between the prefix and the number in the field “Next Number” to make the next number reach this number of digits. The zeroes are not added in this workspace, but will appear on the actual numbers assigned to entries in Maconomy. If you select 0 as “Last Number,” the number of digits in “Next Number” is allowed to surpass the number of digits specified in the field “No. of Digits.”

## Popup Fields Single Dialogs Workspace

Use this workspace to maintain the options in pop-up lists, which are lists of possible values that you can use to populate fields in workspaces.

For example, for the Check Book field, you enter a value for each of your check books.

This workspace allows you to maintain the options in Maconomy's pop-up fields, for example, the customer and vendor pop-up fields in the customer and vendor information cards, currency codes, payment terms, budget types, and customer groups.

Maconomy has a fixed set of pop-up fields, and you define and maintain most of the options in these menus yourself.

You can create any number of options in a pop-up field. For example, consider Check Book and Payment Terms:

- In the **Check Book** pop-up field, you can enter information about the check numbers in your check books. You must create a pop-up value for each check book.
- In the **Payment Terms** pop-up field, you can create any number of payment terms. You must create an option for each payment term that you create.

You cannot delete existing options. This is a precaution against inconsistencies such as deleting an item type when that item type is already assigned to a number of items. However, you can change the name and information for an existing option, effectively allowing you to change its application.

The information that you enter for each pop-up option is evident from the fields in the Values sub-tab in this workspace. Maconomy verifies this information.

For auditing purposes, it is recommended that you print and file the Popup Fields workspace every time that you change an option. To print the information, use the **Print Popup Field** button.

## Popup Field Tab

This section includes the fields and descriptions for the Popup Field tab.

### Popup Field Island

Field	Description
<b>Name</b>	This is the pop-up field on which you are working.
<b>Group</b>	This field shows the group that the pop-up field belongs to.

### User Island

See the Getting Started topic for a description of the fields in the island User.

## Values Sub-Tab

This section includes the fields and descriptions for the Values sub-tab.

Field	Description
<b>Name</b>	<p>In this field, you enter the name of the option. The name specified in this field will appear in Maconomy's pop-up fields. If you change the name, Maconomy immediately registers the new name in all the Maconomy workspaces in which the pop-up field in question appears.</p> <ul style="list-style-type: none"> <li>▪ <b>Absence Type</b> — This pop-up field is used for further specification of an employee's absence registered in the workspace Employee Absence Calendars in the Resource Planning module.</li> <li>▪ <b>Accrual Type</b> — In this pop-up type, you can set up different accrual types. Accrual types are used in various registration workspaces such as invoice allocation, general journals, and job journals. When an accrual type is selected on a registration, Maconomy automatically accrues the entry across the period specified on the entry.  For each accrual type, you can specify posting references for costs as well as sales, and these accounts will be used for offset entries created as a result of posting entries for which the current accrual type has been selected. You can also specify a posting description to be used for the accrual entries.  If "Pro Rata" field is marked, it means that the entries will always be distributed taking into account the number of days in the accrual period.  If "Pro Rata" is not marked, then if the accrual period covers strict financial months, the entries will be distributed evenly over the number of months in the accrual period. If the accrual period does not cover strict financial months, the entries will be distributed on daily basis, based on the company fiscal calendar. (This corresponds to the old functionality.)</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li> <b>A/P Control Accounts</b> — Used as posting references to A/P control accounts and as posting reference for non-balanced entries (or A/P suspense). These pertain to entering of item receipts in the Item Purchase module and entering of vendor invoices in the Accounts Payable module. </li> </ul> <p>Using the control account specification, you can group vendors in different G/L posting accounts. The sum of the balances of vendor control accounts corresponds to the total accounts payable balance for the Accounts Payable module.</p> <p>In the field “A/P Suspense Entries” you enter a dimension combination. The specified dimension combination can also contain dimension values to be used in this connection.</p> <p>Enter a dimension combination in the field “Control Account.” The specified dimension combination can also contain dimension values to be used in this connection.</p> <p>The posting reference for non-reconciled vendor entries is used for pointing out a G/L account (and potentially other relevant dimension values) used in the event that a vendor invoice or credit memo is not entered directly to G/L accounts or to jobs in the workspace Invoice Allocation before posting.</p> <p>For the sake of clarity, the term “account” in the following description is used about posting references where an account number and any other dimension values are found by means of a dimension combination.</p> <p>For example, if you mark “Inventory Control” on an invoice allocation, Maconomy interprets the invoice allocation line as an allocation for warehouse (or item) purchases that are to balance against an item receipt in the Item Purchase module. In this case, the account for unreconciled vendor entries works as a balancing account, assuming the physical delivery of goods (item receipt) occurs and is recorded before the vendor invoice arrives. When you enter and approve the item receipt, the account for inventory value is debited and the account for unreconciled vendor entries (suspense) is credited for the value of the delivery. When you later record the vendor invoice, the invoice amount is credited to the Vendor Control Account and debited to the account for unreconciled vendor entries. This prevents posting imbalances when items arrive in one period and the invoice in another.</p> <p>Another example occurs if you post the Vendor Invoice Journal before allocating G/L expense accounts to the invoice. The invoice will then be reallocated later in the workspace Reallocate Invoices. In this case, the Account for Unreconciled Vendor Entries serves as a suspense account for the value of vendor invoices that have not been finally allocated to G/L accounts or jobs.</p> <p>In the field “Being Paid” you enter a dimension combination. This account is an offset account to the dimension combination specified in the field “Post. ref., being paid” in the sub-tab of the workspace External Accounts in the Banking module. The account can be considered a “waiting account” on which amounts being paid are posted until the bank has completed the payments in question.</p>

Field	Description
	<p>When the payments are completed and approved, the amounts are transferred to the control account. The specified dimension combination can also contain other dimension values to be used in this connection.</p> <ul style="list-style-type: none"> <li> <b>A/R Control Accounts</b> — These are G/L posting references to customer control accounts (or A/R control accounts). These are normally balance sheet accounts. Using these control accounts, you can group customers in various G/L accounts receivable accounts. The sum of the balances for customer control accounts corresponds to the total balance for the accounts receivable module (or A/R subledger).         </li> </ul> <p>In Maconomy Lawyer, the individual client's balance is posted to various different accounts, depending on whether the client is paying or receiving money. The sum of these account balances correspond to the client account balances and outstanding balances with your clients. Client account balances can be printed.</p> <p>Enter a dimension combination containing the G/L account to be used for the control account in the field "Control Account." The dimension combination can also contain other dimension values to be used in connection with the control account.</p> <p>In Maconomy Lawyer, the account number corresponds to the dimension combination to the account for outstanding debts from all clients with the given control account.</p> <p>In the "Client Balance Account" you enter a G/L account number that must also be a control account. This field is only used in Maconomy Lawyer and points to the client account balance account for clients with the given control account.</p> <p>In the field "Being Collected" you enter a dimension combination. The account is an offset account to the account specified in the field "Account, being collected" in the sub-tab of the workspace External Accounts in the Banking module. The account can be considered a "waiting account" on which amounts being collected are posted until the bank has completed the collections in question. When the collections are completed and approved, the amounts are transferred to the control account. The specified dimension combination can also contain other dimension values to be used for other purposes.</p> <p>In the field "Debtor Provisions" you enter a dimension combination. Provisions created in the workspace Debtor Provisions By Invoice in the A/R module are credited to this balance account. The offset account to this account is specified in the workspace Posting References in the G/L module. This account is primarily used by reports showing invoices with amounts and provisions made on the invoices. When an invoice is fully reconciled with a payment (whether or not the full amount was paid), the amount posted on this account is reversed.</p> <ul style="list-style-type: none"> <li> <b>Account Group</b> — Used for grouping G/L accounts, allowing the printout of information about the accounts in one specific group or all groups.         </li> <li> <b>Areas</b> — Used for the creation of options in the field "Area" in the workspace Campaigns in the contact management module.         </li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Budget Type</b> — Used for describing a budget model in the Budget module. A given fiscal year can only contain one budget model of a given type. The budget type is assigned to a new budget model in the workspace Create Budget Model or later in the workspace Budget Models. The budget type can, for example, be used for specifying the nature of the budget model, for example, “Internal Budget,” “External Budget,” “Anchor,” or “First Draft Year.” In reporting, you can use the budget type to extract data about a given budget.  The field “Current” can be marked for no more than one budget type. Certain Portal reports displaying budget figures are based on the current budget type, meaning that the reports will display figures from the budget model whose budget type is marked as the current one.</li> <li>▪ <b>Budget Version Type</b> — Used for describing a version of a budget model in the Budget module. A given fiscal year can only contain one version of a budget model of a given version type. The budget version type is assigned to a budget model at the creation of a budget version in the workspace Budget Models. The budget version type can, for example, be used for specifying the nature of the version, for example, a “Preliminary” and an “Approved” version. In reporting, you can use the budget type to extract data about a given budget.</li> <li>▪ <b>Carriers</b> — Carriers are methods of delivery to customers. If the carrier has been created as a vendor, you can enter the number of the vendor in question. This way, you can add the name and address of the carrier to a number of printouts using Maconomy’s layout editing tools.</li> <li>▪ <b>Cash Discount Codes</b> — Cash discount codes are among other things used for specifying how much discount should be granted when a customer pays an invoice within a certain period. The codes apply to invoices reconciled in the workspace Customer Open Entry Reconciliation in the Accounts Receivable module. You specify the desired discount percentage in the field “Discount %.” In the field “Max Discount Percentage,” you can specify the upper limit to discounts granted on entries with the current cash discount code. This means you cannot approve the reconciliation of a payment against an entry pertaining to a customer with a given cash discount code if a discount greater than the upper limit of the discount code in question has been granted.  The pop-up field can furthermore be used in connection with cash discounts on vendor invoices. An example of delivery terms might be “Net 10 Days, 2%.” In this case, you enter “2” in the field “Discount %,” “10” in the field “No. of Days,” and “Net” in the field “Net/EOM/Week.”  You can then specify in the field “Tax Adjustment” if any tax amount should be adjusted according to a cash discount, or if the tax should remain as first indicated despite any cash discount. If you choose to adjust the tax amount according to the cash discount, then the cash discounts subsequently shown in the workspaces Payment Selection and Change Payment Selection in the Banking module will include tax. If you do not choose to adjust for tax, the cash discount amounts shown in the workspaces mentioned will exclude tax.</li> </ul>

Field	Description
	<p>When posting a payment journal which gave rise to a cash discount, the cash discount is posted excluding tax on a cash discount account, whereas the tax part of the cash discount is posted on an account for cash discount tax. Such an account is found by means of a dimension combination in the workspace Intercompany Accounts in the G/L module.</p> <p>The terms for achieving cash discount are specified on the individual vendor in the workspaces Payment Control and Company Specific Payment Control.</p> <p>Please note that adjusted cash discount tax when paying vendor invoices only works if the current vendor invoice is created in the workspace Vendor Invoices, and not General Journal.</p> <ul style="list-style-type: none"> <li> <p><b>Check Book</b> — Used for specifying name and number on check books.</p> <p>In the field “First Check No.,” you specify the check number to be used for the first check book that is created.</p> <p>In the field “Next Check No.,” you specify the number to be used as the next check number. The number must be equal to or greater than the number specified in the field “First Check No.”</p> <p>By marking the field “Spaces in Written Amounts,” you can specify that amount texts are to be printed with spaces between the words. For instance, an amount such as “USD 100.00” will be printed out as “One hundred” if the field is marked, while it will be printed out as “Onehundred” if the field is not marked.</p> </li> <li> <p><b>Company Customer State Type</b> — These are used to specify the state of the company customer when it is in the approval process. When a new customer is created, the <i>Default Customer State</i> system parameter sets the <b>Customer State</b> field default value to the name listed in this table.</p> </li> <li> <p><b>Company Popup 1-5</b> — Used for the creation of options to be used in the fields “Popup 1-5” in the workspace Company Information in the G/L module.</p> </li> <li> <p><b>Company Tax Codes</b> — This pop-up field is used for selecting the correct tax code on sales orders, credit orders, and vendor invoices, and for grouping customers and vendors in connection with extended tax reporting.</p> <p>In the first case, you distinguish between the registration of items on, for example, a sales order and the registration of amounts on G/L accounts in, for example, the workspace General Journal. However, the tax code is only determined from a tax table or G/L tax table if country dependent tax has been selected in the workspace System Information. When registering items, the company tax code is part of the selection criteria in the workspace Tax Tables in the G/L module. If the tax table does not contain any lines with the company tax code in question, Maconomy uses the tax code from the item. When you enter amounts on a G/L account, Maconomy checks if a G/L tax table has been selected for the company responsible for the entry in question. If it has, the company tax code is part of the selection criteria in the company's G/L tax table. If no G/L tax table has been specified for the company or if no G/L tax table line</p> </li> </ul>

Field	Description
	<p>contains the company tax code in question, Maconomy uses the tax code from the G/L account's information card.</p> <p>In the second case, the company tax code is used for determining the tax report field in which the tax and/or tax basis for the entry in question is to be included. Tax report fields are created in the workspace Tax Report Fields, and defined in the workspace Tax Report Specification. You can thus define where on a tax form to put the different types of tax entries with which you work. The latter functionality is, however, only available if you have selected extended tax reporting in the workspace System Information.</p> <ul style="list-style-type: none"> <li>▪ <b>Company Vendor State Type</b> — These are used to specify the state of the company vendor when it is in the approval process. When a new vendor is created, the <i>Default Vendor State</i> system parameter sets the <b>Vendor State</b> field default value to the name listed in this table.</li> <li>▪ <b>Consignment Type</b> — Used for further specification of the handling of an order. The pop-up is for instance used for specifying the course of the order (for instance "Via Terminal") or the type of items to be included in a consignment (for instance "Chilled Goods").</li> <li>▪ <b>Contact Company Popup 1-5</b> — Used for the creation of options to be used in the fields "Popup 1-5" in the workspace Contact Companies in the Contact Management module.</li> <li>▪ <b>Contact Mode</b> — Used for the creation of options to be used in the field "Contact Mode" in the workspaces Campaigns, Events, Events per Contact Company, and Events per Employee in the Contact Management module.</li> <li>▪ <b>Contact Person Popup 1-20</b> — Used for the creation of options to be used in the fields "Popup 1-5" in the workspace Contact Persons in the Contact Management module.</li> <li>▪ <b>Currencies</b> — Specify the currencies to be used in Maconomy here. Enter a name only. In the field "ISO Code" you can enter the currency's ISO code, which is used for automatic payments. In the fields "Monetary Unit 1" and "Monetary Unit 2," you can enter the monetary units of the currency in question, for example dollars and cents.</li> <li>▪ <b>Customer Groups</b> — These are used for grouping customers for statistical purposes. Enter a name only.</li> <li>▪ <b>Customer Popup 1-5</b> — These are used in the workspace Customer Information Card for specifying additional information about customers. The pop-up values on a customer are transferred to quotes, orders, invoices, and so on, in the Sales Orders module.</li> <li>▪ <b>Customer State Type</b> — Use this column to enter names for the state of the customer when it is in the approval process. When a new customer is created, the <i>Default Customer State</i> system parameter sets the <b>Customer State</b> field default value.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Customer Types</b> — These are used for grouping customers for statistical purposes. Enter a name only.</li> <li>▪ <b>Day of Month</b> — In this field, specify a date to use as due date for the "Day of Month" method.</li> <li>▪ <b>Days</b> — Select this check box to assign the unit value you created to "days". You can select this check box for only one unit value.</li> <li>▪ <b>Deferment Causes</b> — Used for specifying the reason why a line in the workspace Approval Lists has not been approved. Enter a name only.</li> <li>▪ <b>Delivery Modes</b> — Delivery modes are used when entering item purchase orders. Enter the name of the code. In the field "EU Shipment code," enter the one-digit official EU code to describe how the delivery is made. This code is only used for Intrastat reports and is issued by the EU.</li> <li>▪ <b>Delivery Terms</b> — Delivery terms are used when entering item purchase orders. Enter a name only.</li> <li>▪ <b>Departure Types</b> — This pop-up type is not used in the current version of Maconomy.</li> <li>▪ <b>Depreciation Methods</b> — There are two different depreciation methods, both linear: Straight Line and Straight Line, By month. The first one does the calculation on a daily basis, the second one on a monthly.</li> <li>▪ <b>Duty Code</b> — These are used for specifying the duty code to be used in connection with the workspaces Item Purchase Orders, Item Receipt, and Item Information Card. A duty code consists of a name and a duty rate. The duty rate must be larger than or equal to zero.</li> <li>▪ <b>E-Form Popup 1-10</b> - This pop-up field is used to create options for pop-up fields in an e-form type or e-form.</li> <li>▪ <b>Employee Popup 1-5</b> — Used for the creation of options to be used in the fields "Popup 1-5" in the workspace Employee Information Card.</li> <li>▪ <b>Employee Types</b> — These are used for grouping employees. Enter a name only.</li> <li>▪ <b>Enterprises</b> — Enterprise is used for grouping customers to make statistics. Enter a name only.</li> <li>▪ <b>Event Type</b> — Used for the creation of options to be used in the field "Event Type" in the workspaces Campaigns, Events, Events per Contact Company, and Events per Employee in the Contact Management module. In the field "Note Type," specify the note type whose heading options should be available as headings in the sub-tab of the workspace Events. For more information, see the description of the field "Heading" in the workspace Events. When assigning a note to a given event, it will only be possible to assign a note of the type specified in the definition of the event type in question. When you have specified a note type, you can also mark the field "Create Aut. Note." When this field is</li> </ul>

Field	Description
	<p>marked for an event type, creating an event of the type in question will cause Maconomy to automatically create a note of the type specified for that event type and assign it to the new event. This means that it is not necessary to manually create and assign a note to the event or select the action "Create Note" in the workspace Events.</p> <ul style="list-style-type: none"> <li>▪ <b>Forecast Popup 1-5</b> — Used for the creation of options to be used in the fields "Forecast Popup 1-5" in the workspace Opportunity Budgets in the Contact Management module.</li> <li>▪ <b>Hours</b> — Select this check box to assign the unit value you created to "hours". You can select this check box for only one unit value.</li> <li>▪ <b>Invoicing Form</b> — Specifies the desired invoicing forms in connection with subscriptions. For each invoicing form, it is possible to specify whether invoicing is to take place periodically or per delivery. If you choose to deliver periodically, the period must be specified. It is also possible to specify that deliveries must be paid in advance. If you choose to invoice periodically, you must specify a period by marking either the field "No. of Days" or the field "Number of months." The field "Per delivery" must be marked if the current invoicing form is used for standing orders in the subscription module. For standing orders, it applies that invoicing is done concurrently with delivery and not periodically. If you choose periodic invoicing and prefer invoicing and payment to take place prior to delivery, the field "To be paid in advance" must be marked.</li> <li>▪ <b>Item Popup 1-5</b> — These are used in the workspace Item Information Card for specifying additional information about items. The pop-up values on an item are transferred to, for example, order lines in the Sales Orders module.</li> <li>▪ <b>Item Types</b> — Item types are used for classifying items. They are distinct from item groups. Item types are used for statistics and to limit the scope of customer discount agreements. Enter a name only.</li> <li>▪ <b>Item Tax Codes</b> — Used for group items, charges and activities. The item tax code is only used when you select "Extended Tax Reporting" in the workspace System Information.</li> <li>▪ <b>Job Budget Types</b> — These are used for grouping different types of job budgets in the field "Budget Type" in the workspace Job Budgets in the Job Cost module. The job budget type in Maconomy's standard set-up is called "Original." In the field "Change only for quotes," you can mark the jobs for which it is allowed to change the budget. If you mark the field, budgets of the current type can only be changed for jobs on quote, whereas budgets for jobs, which are on order, cannot be changed. If, on the other hand, you have not marked the field, budgets of the current type can be changed for jobs on order.</li> </ul>

Field	Description
	<p>The field "Standard opportunity budget type" can only be marked for one budget type. The field is used in relation to the workspace Opportunity Budgets. In the workspace Opportunity Budgets, you can select a template job, and preview the different budgets of this job using the field "Show Budget." If no budget type is selected there, the budget type for which the field "Standard opportunity budget type" is marked is displayed. If the field is not marked on any budget type, the baseline budget of the template job is shown.</p> <ul style="list-style-type: none"> <li>▪ <b>Job State Type</b> - Use this column to enter names for the job when it is in the approval process. When a new job is created, the <b>Default Job State</b> system parameter sets the <b>Job State</b> field's default value.</li> <li>▪ <b>Job Popup 1-5</b> — These are used when you create various options for the fields "Popup 1-5" in the workspace Jobs in the Job Cost module.</li> <li>▪ <b>Language</b> — Languages are used for specifying customers' and vendors' languages, generally for issuance of various external documents. Enter a name only.  You can use languages to specify external printouts, such as invoices and account statements. By adding various language printouts using Maconomy's layout editing tools, you can print external documents in these languages. Furthermore, in the workspace Language Texts, you can translate specific texts, such as activity texts, into the languages created in this pop-up type. See the workspace Language Texts for a further description of this functionality.  Languages are also used for retrieving item texts of various languages for item lines in the sales orders module. For item texts, it is only necessary to create three language versions, in that the first three languages in the pop-up field menu correspond to the three item texts in the workspace Item Information Card in the Inventory module.</li> <li>▪ <b>Minimum No. of Days</b> — In this field, you can specify a value for the minimum length of a payment term in days.</li> <li>▪ <b>Nature of Transaction</b> — These are used for specifying which Nature of Transaction you are reporting in Intrastat Reports to the tax authorities. The nature of transaction is entered on the sales order or item purchase order.  In the field "EU Type," you enter the official transaction types that are issued by your tax authorities.</li> <li>▪ <b>Net/EOM/Week/Day of Month</b> — An existing field. Renamed to include the "Day of Month" method.</li> <li>▪ <b>Notification Category</b> — This pop-up field is not used after version 9.0 Service Pack 5. For this pop-up field, you can define notification categories and their priority types. Notifications are used in the Maconomy Portal, and each notification belongs to a category. The categories are referenced in the workspace Notification Types. In the field "Name," specify the name of the notification category you want to create, for example, "Alert" or "Message." In the</li> </ul>

Field	Description
	<p>field "Priority Type," select an option list which contains priority options. The selected option list will be suggested as default in the workspace Notification Types. For more information, please see the description of the workspace Notification Types.</p> <ul style="list-style-type: none"> <li> <b>Offset Accounts</b> — These are used for simplifying data entries in the general journal. The field "Posting Reference" must be filled in with a dimension combination containing the G/L account number for the specified offset, for example, the bank account. The dimension combination can also contain other dimension values to be used in this connection. </li> <li> <b>Order Modes</b> — These are used for grouping orders for statistical purposes. Mark the field "End User Required" if you want to require the entry of an end customer number on orders of the given mode. </li> <li> <b>Payment Terms</b> — This information is used for calculating the date on which invoices become due for payment. In the field "Net/EOM/Week," you type Net, EOM, or Week. Net indicates that the invoice is due a specified number of days after the invoice date. EOM (end of month) means the invoice is due a specified number of days after the last day of the current month. Week means that the invoice is due a specified number of days after the last day of the current week. In the field "No. of Days," you specify the number of days to be added in the above three calculations, Net, EOM, or Week. If the number of days is zero, and the calculation method is Net, the terms of payment are thus Net Cash (or COD). If you specify days as 30, 60, 90 and so on, Maconomy interprets them as one month, two months, and so on. However, if the calculation method is EOM, 30, 60, 90 days, and so on, is interpreted as the last day in the following month, the month after that, and so on. However, you can also enter a "No. of Months," If you also fill out this field, the above functionality is by-passed, that is: 30 days will be 30 days and not one month. Mark the field "Payment when Paid" if the current payment term is for payment when paid. If you mark the field, the corresponding field will automatically be marked on vendor invoices where the current payment term is used. However, the field can be unmarked on the individual vendor invoices. For further information about the Payment when Paid functionality, see the description of the system parameter "Enable Payment when Paid," which must be marked to be able to mark this field. If the field "Business Days" is marked, then the due date calculated using the payment terms must be a business day (according to the holiday calendar in use.) If it is not marked, the due date can be any day. If the field "A/R, Next Business Day" is marked, then if the invoice due date that is calculated using the payment terms must be a business day and it is not, the due date will be changed to the next business day. If not marked, and if the invoice due date calculated using the payment terms must be a business day </li> </ul>

Field	Description
	<p>and it is not, it will change the due date to the previous business day. It will be applied only if "Business Days" is marked.</p> <p>If the field "A/P, Next Business Day" is marked, then if the vendor invoice due date that is calculated using the payment terms must be a business day and it is not, the due date will be changed to the next business day. If not marked, and if the vendor invoice due date calculated using the payment terms must be a business day and it is not, it will change the due date to the previous business day. It will be applied only if "Business Days" is marked.</p> <ul style="list-style-type: none"> <li> <b>Primary Dates</b> — Primary dates are used for supplying a common set of dates for traffic plans in the Job Cost module. Primary dates make it possible to compare traffic plans across jobs and to use similar criteria in traffic status reports. The primary dates are selectable in the sub-tab of the workspace Timing Plans in the Job Cost module and are shown as table column headings in the workspace. </li> <li> <b>Prior Periods</b> — Prior periods are used when posting to closed periods, for instance in connection with an old fiscal year. <p>You can specify a period and a fiscal year for a prior period. If you do so, the prior period will be open in the specified period only. It is optional whether you wish to use a specific period or fiscal year in connection with prior periods.</p> <p>In the field "Sub-Total Account," you can specify a dimension combination containing the account number to be used on period end transfers between two financial periods. The specified dimension combination can also contain other dimension values to be used for other purposes. A period end transfer will automatically be made if you specify a prior period in the sub-tab of the workspace General Journal without specifying that the journal is a prior period journal. When the journal is posted, three entries will be made for each line causing a period end transfer. One entry on the account specified on the line in question and two entries on the sub-total account which is found by means of the dimension combination specified in this field. If, for example, a journal line contains a debit amount of \$1,000 on account number 2130 with the posting date of 10/1-98, and the field "Prior-Period" contains a prior period with the ending date 31/12-97, Maconomy will automatically create the following entries: On account number 2130, \$1,000 is debited with the posting date 31/12-97, that is, the last day in the specified prior period. On the sub-total account, \$1,000 is credited with the posting date 10/1-98. Finally, \$1,000 is debited on the period end transfer account with the posting date 10/1-98. The functionality is similar when the prior-period is after the current period. However, the entries in the prior-period are assigned a posting date corresponding to the first day of the prior-period instead of the last.</p> <p>In the fields "Period" and "Fiscal Year," you can specify either a period or a fiscal year for a prior period.</p> <p>In the field "Open For Registration," you can specify whether the post-entry is open for registering data.</p> </li> </ul>

Field	Description
	<p>In the field "Open For Import," you can specify whether the post-entry is open for the import of data.</p> <p>In the workspace Import Journals in the enterprise module, you can import a financial entry that belongs to the open posting interval and has an entry date that falls within the post-entry period. If you do so, Maconomy creates an extra journal indicating the post-entry period in question.</p> <ul style="list-style-type: none"> <li>■ <b>Property Types</b> — Used for grouping properties in the workspace Property Information Card in the Inventory module. For instance, properties such as 110 volts and 220 volts can be grouped in a property type called "Potential Difference."</li> <li>■ <b>Provision Cause</b> — Used for providing the user with a number of predefined reasons for creating provisions in the workspace Debtor Provisions By Invoice in the A/R module. The user can select from the provision causes specified in this workspace, which can subsequently be used as selection criteria in reports.</li> <li>■ <b>Report Formats</b> — Used for specifying the format of printed G/L Reports. In the fields "Style Type," "Style Format," and "Style Size," you can specify information about the appearance of the font.  <p>The standard formats in Maconomy are: "Normal," "Bold," "Underline," "Italic," and "Small." You cannot create additional options, but if you wish to use other formats, you can redefine the standard formats using Maconomy's layout editing tools.</p> <p>In the field "Overrun Text," you can specify whether text should overrun when exceeding the column width.</p> </li> <li>■ <b>Purchase Order Status</b> — On a purchase order, you can specify a status code which can, for example, be used when closing a purchase order manually. This way, you can easily find manually closed purchase orders using the Find menu.</li> <li>■ <b>Segments</b> — Segment is used for grouping customers to make statistics. Enter a name only.</li> <li>■ <b>Service Contract Status Codes</b> — Service contract status codes are used for grouping service contracts for statistical purposes. Enter a name only.</li> <li>■ <b>Service Job Types</b> — Service job types are used for grouping service jobs for statistical purposes. Enter a name only.</li> <li>■ <b>Skill Type</b> — This pop-up type defines the skill types to be used in the field "Type" in the workspace Skills and is used to describe certain skills and other employee properties of interest for job planning purposes.</li> <li>■ <b>Standard Descriptions</b> — Standard Descriptions are used with entries in general journals and vendor invoices. You can enter any number of frequently used entry descriptions, eliminating the need to type these each time they are used.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Style</b> — In this pop-up type, you can create the options to be available in the fields of the island Style Selection in the workspace Line Styles in the G/L module. The line style functionality is used when printing G/L report output to RTF files. The options created here only represent style names, and not the formats implied in these styles, as the actual formats of the styles whose names you create here should be defined in one or several template RTF files to which you can then refer when printing G/L reports to RTF files. As the options created here are used for applying the relevant styles to the output data lines, it is very important that the style names here are identical to those used in the relevant template RTF documents. For a detailed description of the use of styles when creating RTF files in connection with G/L reports, see the workspace Line Styles.</li> <li>▪ <b>Subscription Group</b> — Subscription groups are used for dividing subscriptions into different groups in the workspace Subscription Information Card in the add-on module Subscription.</li> <li>▪ <b>Subscription Status</b> — Subscription status is used in connection with subscription order lines in the add-on module Subscription. The field is described in detail in the workspace Subscription Order Lines.</li> <li>▪ <b>Tax Account References</b> — Tax code references are used in the workspace Tax Reporting Units for specifying which G/L accounts are to be used in tax reporting. In the field "Name," you can enter the name of the tax reporting item.</li> <li>▪ <b>Tax Popup 1-4</b> — These four pop-up fields can be used for reporting purposes. They are available in Tax Codes and G/L Tax Codes, and they are shown in the sub-tab of Show G/L Entries.</li> <li>▪ <b>Tax Type</b> — Tax types are used in the workspace Finance Tax Codes in the G/L module for grouping entries used in the calculation of tax settlement. In the field "Include on Printout," you can specify for each tax type whether it is to appear on tax settlement printouts sorted by tax type. This allows you to ensure that tax types that are no longer in used are not included on printouts. For further information, see the description of the action "Print Settlement" in the General Ledger module.</li> <li>▪ <b>Time Sheet Popup 1</b> — In combination with the registration of work time intervals in time sheets (see the island "Fixed Working Hours" in the workspace Employees), you can specify that the field "Time Sheet Popup 1" must be completed in case there is a difference between an employee's expected working hours and the actual working hours for a day. This is done by marking the system parameter "Popup 1 required if difference between exp. and act. work hours." If the system parameter is marked, you must choose among the pop-up options specified for this pop-up field. This could, for example, be "Overtime" and "Flexitime." This way, the user could specify that the difference should be paid out ("Overtime") or added to/subtracted from his or her Flexitime account ("Flexitime"). Note that the fields are for information only.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Time Unit</b> — Time units are used for specifying the time unit to be used in connection with the pricing of subscriptions that are settled according to their duration. It is possible to define an arbitrary number of time units, and a time unit can be defined as a number of months or a number of days or a number of hours.  If the time unit is less than a month, you must enter a number of days in the field “No. of Days” or a number of hours in the field “No. of Hours.” If the time unit goes beyond 24 hours, you must specify a number of days or a number of hours. Similarly, if the time unit goes beyond a month, you must enter a number of months. It is not possible to enter a number in more than one column.</li> <li>▪ <b>Traffic Status Flag</b> — Traffic status flags are used for assigning a status to primary dates of traffic plans in the Job Cost module.</li> <li>▪ <b>Transaction Mode</b> — Used in the workspace Inventory Change for further description of each inventory change transaction. If, for instance, you wish to register shrinkage in an inventory movement, the transaction mode can be used for specifying whether the shrinkage was caused by breakage or discarding. Transaction modes are also used in the workspace Print Inventory Journal, where you can choose to print inventory journals for a given transaction mode.</li> <li>▪ <b>Transaction No. Series</b> — This pop-up type is used for creating the names of the transaction number series which are defined for each company in the workspace Transaction No. Series. This functionality can, for instance, be used for keeping entries of different nature separated. For example, it can be practical to have a separate number series for entries regarding fixed assets.</li> <li>▪ <b>Units</b> — This is used for defining the units in which an item is recorded in a warehouse. Examples are piece, pound, box, tube, and so on. Enter the name of the unit only.</li> <li>▪ <b>Vehicle Type</b> — This is used for defining vehicle types. At least one vehicle type must be defined to use mileage sheets and mileage rules.</li> <li>▪ <b>Vendor Groups</b> — These are used for group vendors for statistical purposes. Enter a name only.</li> <li>▪ <b>Vendor Popup 1-5</b> — These are used in the workspace Vendor Information Card for specifying additional information about vendors. The pop-up values on a vendor are transferred to a number of vendor related transactions in the A/P module, for instance Vendor Invoices.</li> <li>▪ <b>Vendor State Type</b> — These are used to specify the state of the vendor when it is in the approval process. When a new vendor is created, the <i>Default Vendor State</i> system parameter sets the <b>Vendor State</b> field default value to the name listed in this table.</li> </ul> <p>For further information, see Related Topics.</p>

## Option Lists Workspace

Use this workspace to maintain option lists, which are lists of possible values that you can use to populate fields in workspaces.

For example, you can set up a list called "Customer Satisfaction," with the values "Very satisfied," "Satisfied," and "Not satisfied."

In the workspaces wherein you can use option lists, you first specify the option list from which you can select an option, and then in another field you can specify one of the options from the list. This functionality is useful in connection with a marketing campaign, for example, where each event represents a telephone call to a customer. You could create a number of events and assign an option list with all likely responses to those events. After each telephone call, you can select the option that represents the customer's reaction to the call.

The Option Lists tab in this workspace displays an option list, including a number and a description. In the Options sub-tab, you can add the appropriate options for the option list. Note that you can limit the access to using options in the option lists via Maconomy's extended access control system.

### Option Lists Tab

This section includes the fields and descriptions for the Option Lists tab.

#### Option List Island

Field	Description
<b>Option List No.</b>	In this field, you enter the number of the current option list. The number cannot be changed on existing option lists.
<b>Description</b>	In this field, you can enter a description of the option list. The description can also be changed on existing option lists.

#### Remarks Island

In these fields, you can enter additional remarks regarding the current option list.

#### Access Level Island

Field	Description
<b>Access Level</b>	In this field, you can assign an access level to the option list. A user only has access to the current option list (and thereby using the options in the option list) if he has been assigned to this level or a level above this in the workspace User Access Levels. This access control ensures that when working with for instance a job entry, you can only enter an option from an option list to which you have access, and in this workspace you can only see and edit the option lists to which you have access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to options and option lists may depend on other factors. For further information about the standard access control configuration, please see the section "Introduction to the Access Control System" in the Set-Up module.

Field	Description
	You can only specify an access level to which you have access yourself. This field also shows a description of the access level.

**User Island**

See the Getting Started topic for a description of the fields in the island User.

**Options Sub-Tab**

This section includes the fields and descriptions for the Options sub-tab.

Field	Description
<b>Name</b>	In this field, you enter an option for the current option list.
<b>Description</b>	In this field, you enter a description of the current option.
<b>Remarks 1-3</b>	In these fields, you can enter additional remarks regarding the current option list.

**Actions**

This section includes the actions available in the E-Forms tab.

**Option Lists Tab**

Field	Description
<b>Delete Option List</b>	Use this action to delete an option list. <div><b>Note:</b> An error message displays if you attempt to delete an option list that is currently being used in an e-form or e-form type.</div>

**Options Sub-tab**

Field	Description
<b>Delete Option</b>	Use this action to delete an option list value from an option list. <div><b>Note:</b> An error message displays if you attempt to delete an option list value that is currently being used in an e-form or e-form type.</div>

## Countries Single Dialogs Workspace

Use this workspace to identify the countries that you use in Maconomy for tax calculation and other purposes.

The countries that you identify here are listed as pop-up values for the country fields in workspaces.

For each country code, you can specify an ISO code, an EU country code, and an address format.

After you enter a country in this workspace, you cannot delete it anywhere.

For example, you can use countries to split up tax calculation and reporting to tax authorities.

When you create a country in this workspace, Maconomy creates a pop-up value that contains the name of that country. You can then select the countries as pop-up values in workspaces where a specification of country may be relevant, for example, on information cards and transactions.

In addition to an ISO code and an EU country code, you can specify an address format. The selected format determines the order of the address fields of such as for customers and vendors on printouts from Maconomy.

### Countries Tab

This section includes the fields and descriptions for the Countries tab.

#### Country Island

Field	Description
<b>Name</b>	In this field, you can specify the name of the country.
<b>ISO code</b>	In this field, you can specify the ISO code of the current country. The code is used in connection with automatic payment.
<b>Country Code</b>	If the current country is an EU country, you can specify the country code to be used on Intrastat reports in this field.
<b>Member of EU</b>	In this field, you can specify whether the country is a member of the European Union. The value in this field affects the reporting of EU sales to tax authorities.
<b>EU Country Code</b>	If the current country is an EU country, you can specify the 2 character country code to be used on Intrastat reports in this field.
<b>Address Format</b>	In this field, you can choose between three address format standards. When printing the address of, for example, customers and vendors from a number of workspaces in Maconomy, the address format of the country to which the customer, vendor and so on, is assigned determines the order in which the address fields are printed.

**Remarks Island**

Field	Description
<b>Remarks</b>	In these fields, you can enter various information about the current country.

**Validation Island**

Field	Description
<b>Validate Zip Codes</b>	Mark this field if Maconomy should automatically validate zip codes entered in addresses pertaining to the current country. This means that when a user enters a zip code, for example, when entering the address of a customer, employee, vendor, and so on, assigned to the current country, Maconomy checks that the zip code is included in the list defined for the current country in this workspace.

**User Island**

See the Getting Started topic for a description of the fields in the island User.

## Address Formats Single Dialogs Workspace

Use this workspace to specify standard address formats for the countries and regions with which you do business.

**Address Format Tab**

This section includes the fields and descriptions for the Address Format tab.

**Address Format Island**

Field	Description
<b>Address Format Name</b>	Enter the name of the address format.
<b>Description</b>	In this field, you enter a description of the address in the “Address Format Name.”

**User Island**

See the Getting Started topic for a description of the fields in the island User.

## Address Format Lines Sub-Tab

This section includes the fields and descriptions for the Address Format Lines tab.

Field	Description
<b>Prefix</b>	Enter a text which will be put in front of an address format field. The text entered in this field is printed each time the table line is printed. For example, if the current line is of the type "Header," the prefix entered in this field could be "Invoice No." or "Amount.". For the Attention field you can use the prefix @Att to indicate that the prefix on prints should be calculated according to the language text @Att.
<b>Field 1–5</b>	In these fields you can select the Maconomy fields to be included in the address format. The fields are included in the order you add them here. For example, if you indicate Field 1: Postal District; Field 2: Country; Field 3: Zip Code =>, then on this address line, the Postal District, Country, and Zip Code will show, in this order.
<b>Separator 1-5</b>	In this field you can specify which separator to use between Fields 1- 5. For example, comma or space.
<b>Suffix</b>	In this field, you can enter a text which will be appended to the address format field.

## Postal Districts Single Dialogs Workspace

Use this workspace to identify the individual postal districts for the countries and regions with which you do business.

For consistency and brevity, the term "zip code" is used in the following descriptions; however, the same information applies to other types of postal codes that countries use.

After you establish a list of valid postal districts and their zip codes, you can use this information to automatically populate fields in workspaces and to check that the zip codes that you enter manually are valid.

For each country, you can create a list of the postal districts within that country, specifying the zip code and name that pertain to each postal district. The Postal Districts tab displays the name of the current country. In the Postal Districts sub-tab you can create a line for each postal district existing in that country.

By creating a list of postal districts for a given country you make it possible to search for a zip code in that country when you enter addresses in, for example, customer information cards, orders, and so on. For instance, if you are creating a customer and you need to enter an address, you can place the cursor in the zip code field and press Ctrl+G (or Apple+G on Macintosh) to look up the zip codes in the country of the customer in question. In addition, when you enter a zip code in another workspace, Maconomy automatically inserts the relevant postal district name, provided that you created the zip code in the zip code list for the country in question.

For each country you can also specify whether Maconomy should automatically validate the zip codes used in entries and information cards. You do this by selecting the **Validate Zip Codes** field. If you select this field for a given country, only zip codes that you created in the list of postal districts for the country in question are accepted when you enter zip codes in other workspaces,

such as customer information cards and orders. If you do not use validation for a given country, you can still look up zip codes for that country, but you can enter any zip code, even if does not appear in the list of postal districts.

## Post Districts Tab

This section includes the fields and descriptions for the Post Districts tab.

### Country Island

Field	Description
<b>Name</b>	This field shows the name of the currently selected country.
<b>Validate Zip Codes</b>	Mark this field if Maconomy should automatically validate zip codes entered in addresses pertaining to the current country. This means that when a user enters a zip code, for example, when entering the address of a customer, employee, vendor, and so on, assigned to the current country, Maconomy checks that the zip code is included in the list defined for the current country in this workspace.

### User Island

See the Getting Started topic for a description of the fields in the island User.

## Postal Districts Sub-Tab

This section includes the fields and descriptions for the Postal Districts sub-tab.

Field	Description
<b>Zip Code</b>	In this field, specify the zip code of the postal district entered on the current line.
<b>Postal District</b>	In this field, specify the name of the current postal district.

## Language Texts Single Dialogs Workspace

Use this workspace to specify that certain words and phrases that are used in Maconomy should be translated to different languages.

You can translate some general terms, and some phrases used in workspaces, reports, and invoices.

Maconomy uses the language that is relevant in a particular circumstance. For example, on job invoices, Maconomy uses the language of the job that is being billed. If text has not been translated into the relevant language, Maconomy uses the standard language for your Maconomy implementation.

In the Language Texts tab, you can browse the translatable texts, and in the Language Text Lines sub-tab you can create a line with a translation of the current text for each language. You create languages in the **Language** pop-up type in the Popup Fields workspace.

Maconomy uses the texts that are translated in this workspace on various printouts such as invoices and credit memos. In addition, some workspaces, such as the Item Information Card in the Inventory module, contain a number of fields to display information in several languages. You can also translate a number of general terms used across all Maconomy modules.

When printing out information, Maconomy uses the translation in the language that is relevant in the context. For instance, when printing a job invoice, Maconomy uses the translations in the language of the job in question, and when printing a sales order, Maconomy uses the translations in the language of the customer. However, with for activity descriptions, the text from this workspace is only used if the related job uses an invoice layout rule that has specification per activity or sum activity. If the invoice layout rule uses a specification per entry, Maconomy uses the entry description that you provided for the current entry at the time of entry.

If a text has not been translated into the language in question, Maconomy uses the text in the standard language.

## Language Texts Tab

This section includes the fields and descriptions for the Language Texts tab.

### Language Text Island

Field	Description
<b>Language Text Group</b>	This field displays whether the current text is a system text (for example, a fixed text on a printout), an option in a pop-up field or an activity description. Furthermore, the field displays the identification of the system text, activity, pop-up type, item, and so on, whose text is to be translated (for example, activity number, item number or the name of a pop-up type).
<b>Description</b>	This field displays the current text in Maconomy's standard language. For a number of the language text groups, you can change the standard language text in this field, whereas the standard language text for other groups can only be changed in the workspaces in which information of the current type is usually maintained, that is, in the workspace Activities, if the current language text is an activity description.

### User Island

See the Getting Started topic for a description of the fields in the island User.

## Language Text Lines Sub-Tab

This section includes the fields and descriptions for the Language Text Lines sub-tab.

Field	Description
<b>Language</b>	In this field, you can enter the language into which you want the current text translated. The text in the field "Text" on the current line will thus be used in

Field	Description
	various contexts where this language is relevant. For instance, when printing a job invoice, Maconomy uses the translations in the language of the job in question, and when printing a sales order, Maconomy uses the translations in the language of the customer. If a text has not been translated into the language used in a given context, Maconomy will use the text as it appears in the standard language in the tab of the workspace.
<b>Description</b>	In this field, you can enter the translation of the text in the language specified in the field "Language" on the current line.

## Exchange Rate Tables Single Dialogs Workspace

Use this workspace to maintain rate tables for currency exchange.

You can create any number of exchange rate tables. In the System Information workspace, you specify the exchange rate tables to be used in different circumstances (for example, for sales, purchases, and duty).

For each exchange rate table, you define a reference currency, such as the Euro. Then you list other countries and specify how their currencies are converted from the reference currency.

You can create exchange rates by adding new lines in the Exchange Rates sub-tab. An exchange rate is valid from the specified date until the next date that has an exchange rate of the current currency. If you delete an exchange rate, and you have entered an exchange rate of the same currency with an earlier date, that rate is valid instead. For example, if you entered an exchange rate of GBP on May 1, June 1, and July 1, the May 1 rate is valid until June 30 if you delete the June 1 rate. If you want to create lines for all of the currencies that you entered into Maconomy in a new exchange rate table, you can use the **Create All Exchange Rates** action.

There is no limit on the quantity of currencies in an exchange rate table.

### Exchange Rate Tables Tab

This section includes the fields and descriptions for the Exchange Rate Tables tab.

#### Exchange Rate Table Island

Field	Description
<b>Name</b>	Here you specify a name. You cannot create two exchange rate tables with the same name. You can change the name of an existing exchange rate table.
<b>Reference Currency</b>	In this field, you can specify the currency to be the reference currency in the current exchange rate table. The reference currency is the currency whose relation to other currencies is specified in the sub-tab. You can choose between the enterprise currency and the Euro.

**Selection Criteria Island**

Field	Description
<b>Currency</b>	Here, you select the currency if you wish to see exchange rates for a single currency.
<b>Date</b>	<p>In these fields, you can specify a range of dates. The sub-tab of the workspace will only show currencies valid in the specified range of dates.</p> <p>When you create an exchange rate table, it is necessary to enter a date in the first date field. Maconomy then creates a line with this date for each currency in the sub-tab of the workspace.</p>

**User Island**

See the Getting Started topic for a description of the fields in the island User.

**Exchange Rates Sub-Tab**

This section includes the fields and descriptions for the Exchange Rates sub-tab.

Field	Description
<b>Date</b>	Here, you enter the date of the exchange rate. The exchange rate is valid from the specified date until the next date with an exchange rate for the current currency. The date in this field cannot be changed.
<b>Currency</b>	Here you select from existing currency codes (for example, GBP, SEK). Currency codes are maintained in the workspace Popup Fields.
<b>Exchange Rate</b>	Here you enter the exchange rate between the currency on the line and the reference currency of the exchange rate table. You can enter it as the price of the foreign currency in base or the other way round, depending on whether the field "Exchange Rate in Reference Currency" in the workspace System Information has been marked. You use the unit entered in the field "Standard Unit" in the workspace System Information.

**Actions**

This section shows the Actions available in the Exchange Rate Tables workspace.

**Top Tab**

Field	Description
<b>Create All Exchange Rates</b>	When you select this action, Maconomy creates lines for all currencies registered in the system, leaving out the reference currency and currencies included in the Euro on the starting date of the period in question. The values shown in the column "Exchange Rate" are transferred from the field "Standard Unit" in the island Currency in the workspace System Information in the Set-Up module, but can be changed manually.

## Currency Rounding Single Dialogs Workspace

Use this workspace to identify the currencies for which rounding is permitted during the exchange process, and how Maconomy should perform rounding for each of these currencies.

In the Currency Rounding Lines sub-tab, you can create a line for each of the currencies to be rounded. In the **Round to** field, you can specify how amounts should be rounded when Maconomy performs amount calculations and converts currencies. Maconomy rounds the amounts to the unit that you specify for the current currency in this workspace. Maconomy only performs rounding of amounts in a current currency if you create a line for the current currency in this workspace, and you select the **Round off amounts** field in the System Information workspace. When Maconomy performs the currency conversion, it only rounds off an amount in the currency to which the amount is converted.

You can also define an external rounding unit for each currency, which causes Maconomy to automatically round invoice, interest note, and credit memo totals so that the total printed on invoices in the currency in question is rounded to the specified unit.

### Currency Rounding Tab

This section includes the fields and descriptions for the Currency Rounding tab.

#### User Island

See the Getting Started topic for a description of the fields in the island User.

### Currency Rounding Lines Sub-Tab

This section includes the fields and descriptions for the Currency Rounding Lines sub-tab.

Field	Description
<b>Currency</b>	In this field, you can enter the currency for which rounding is to be performed. Amount rounding in the current currency will thus be done to the unit specified in the field "Round to" on the current line.
<b>Round to</b>	<p>In this field, you can specify to which unit you want amounts to be rounded in the current currency. This can, for example, be to USD 10.00, USD 1.00, or USD 0.25. Rounding off the current currency will thus result in the amount being rounded to the specified unit.</p> <p>Maconomy performs rounding of amounts at calculations in the currency in question, for example, at calculation of prices and discounts or conversions to the currency in question. No rounding is performed if you enter an amount manually.</p>
<b>External Rounding Unit</b>	In this field, you can specify the unit in the current currency to which totals on invoices, interest notes and credit memos should be rounded. If you specify an external rounding unit, invoice, interest note and credit memo totals are rounded to the specified unit. However, rounding only takes place if the currency of the invoice, interest note or credit memo in question is the same as the base currency of the company responsible for the transaction in question. Any

Field	Description
	difference between the amount before and after this type of rounding is posted on the account for rounding specified in the workspace Posting References.

## Selection Criterion Specification Single Dialogs Workspace

Use this workspace to set up sets of selection criteria, or queries, that you can use to locate records in the Maconomy database.

For example, assume that you want a monitor to find only those purchase orders for amounts under USD 10,000 that belong to Company 1. You can create selection criteria to find all of the entries in the Requisition table that are associated with Company 1 and have a value of less than USD 10,000 in the **Line Total, Currency** field.

For example, assume that you want a monitor to find only those purchase orders for amounts under USD 10,000 that belong to Company 1. You can create selection criteria to find all of the entries in the Requisition table that are associated with Company 1 and have a value of less than USD 10,000 in the "Line Total, Currency field."

Each set of selection criteria can contain multiple lines. On each line, you identify the table that contains the data, the field that you are searching on, an operator such as "equal to" or "more than," and a target value. In the preceding example, one line would find all purchase orders under USD 10,000, and a second line would narrow the selection to purchase orders that belong to Company 1.

Note that when you set up selection criterion specifications, it is an advantage to have a basic knowledge of database terminology.

A selection criterion specification consists of a number of criteria that are grouped under a selection criterion specification number. In the Selection Criterion Specification tab you enter the number and name of the current criterion specification. In the Selection Criterion Specification Lines sub-tab you select the criteria that different types of information must meet to match the selection criteria that you define in the selection criterion specification. On each line you can indicate which table and which field in that table in Maconomy's database should form the basis of the delimitation. You also select an operator, such as "equal to," "more than," and so on, and a value that the operator should compare to, to see which entries in the table meet each criterion. For example, you can specify that the criterion specification should obtain the entries in the Requisition table that have a value of less than USD 10,000 in the **Line Total, Currency** field. In this way you create a selection criterion specification that obtains only purchase orders that amount to less than USD 10,000.

A selection criterion specification can contain several lines, so that you can, for example, define that the specification should obtain purchase orders that have a value of more than 10,000 in the **Line total, currency** field and that relate to a certain vendor. You do this by creating the necessary number of lines with criteria that should all be matched to meet the selection criterion specification.

### Example 1

You want to create a selection criterion specification that obtains the purchase orders in company 1 that amount to less than USD 10,000. In the selection criterion specification you should create the following lines:

Outer Logical Operator	Table Section	Field Name	Operator	Value 1
	Purchase Order	Line total, currency	Less than	10,000
	Purchase Order	Company no.	Equal to	1

All consecutive lines for which you have not specified an outer logical operator represent a group of criteria called a criterion series. A value must match the criteria for all lines within a criterion series to match this criterion series. An expense sheet, purchase order, and so on, matches a selection criterion specification if it matches one or more criterion series in the selection criterion specification. The term "outer logical operator" is explained later in this introduction.

In this example, the two lines constitute a criterion series; a value must meet both criteria to match the criterion series and thus match the selection criterion specification.

You can create several criterion series in the same selection criterion specification. A purchase order, expense sheet, and so on, matches a selection criterion specification if it meets just one of the criterion series of the selection criterion specification.

You separate criterion series by using a line that contains the outer logical operator "OR."

### Example 2

You want to create a selection criterion specification that obtains the purchase orders in company 1 that amount to less than USD 10,000. The selection criterion specification should also obtain the purchase orders that relate to vendor number 31201918, regardless of the total amount of the purchase order, and to which company the purchase order relates. In the selection criterion specification you should create the following lines:

Outer Logical Operator	Table Section	Field Name	Operator	Value 1
	Purchase Order	Line total, currency	Less than	10,000
	Purchase Order	Company no.	Equal to	1
OR				
	Purchase Order	Vendor no.	Equal to	31201918

The first two lines represent a criterion series, and a value must meet both criteria of this series for a purchase order to match the criterion series. The last line is also a criterion series in itself, because the outer logical operator "OR" separates this line from the first criterion series.

As a purchase order matches the selection criterion specification if it meets one or several of the criterion series of the selection criterion specification. Thus a purchase order matches the selection criterion specification if it either relates to company 1 and amounts to less than USD 10,000 or it is assigned to vendor no. 31201918.

When you use the outer logical operator "OR," none of the criteria of the lines above the "OR" operator apply to those criterion series that are below the "OR" operator. It is therefore necessary to repeat the criteria that apply to the criteria on both sides of the "OR" operator. The following example illustrates this requirement.

**Example 3**

You want to create a selection criterion specification that obtains the purchase orders in company 1 that amount to less than USD 10,000. The criterion specification should also obtain the purchase orders that relate to vendor no. 31201918, regardless of the total of the purchase order, but the company number should still be 1. In the selection criterion specification you create the following lines:

Outer Logical Operator	Table Section	Field Name	Operator	Value 1
	Purchase Order	Line total, currency	Less than	10,000
	Purchase Order	Company no.	Equal to	1
OR				
	Purchase Order	Vendor no.	Equal to	31201918
	Purchase Order	Company no.	Equal to	1

Note that Maconomy performs a delimitation twice on the company number because the first line that contains the company number delimitation only applies above the "OR" operator. If the last line that has company number delimitation had not been created in the selection criterion specification, this criterion specification would only obtain all purchase orders that have vendor number 31201918 regardless of company number, in addition to the purchase orders that meet the criteria in the first two lines.

You can specify as a criterion that a purchase order, expense sheet, and so on, should match another selection criterion specification to match the current selection criterion specification. You do this by creating a line that has the operator "Matches" and entering the number of the selection criterion specification in question in the **Value 1** field. Using the operator "Does Not Match" you can specify that a purchase order, expense sheet, and so on, must not match a certain selection criterion specification, to match the current selection criterion specification.

If you want to perform more delimitations on the same field within the same criterion series, you use an inner logical operator. For example, you might want a criterion series to obtain all of the purchase orders that relate to company 1 and that also represent an amount of USD 10,000 or less.

If you do not use an inner logical operator, you would in this case need to create two criterion series of two lines each, that is, a criterion series that obtains purchase orders in company 1 that amount to USD 10,000 and another series that obtains purchase orders in company 1 that amount to less than USD 10,000.

By using an inner logical operator you can, however, couple the two criteria that relate to the purchase order amount in the same criterion series. When you use an inner logical operator, you do not enter a table section and a field name because Maconomy uses the table section and the field name that apply to the previous line. You can create a selection criterion specification similar to the preceding scenario by entering the following lines:

Outer Logical Op.	Table Section	Field Name	Inner Logical Op.	Operator	Value 1
-------------------	---------------	------------	-------------------	----------	---------

	Purchase Order	Company no.		Equal to	1
	Purchase Order	Line total, currency		Equal to	10,000
			Or	Less than	10,000

Because this uses no outer logical operator, all of these lines are considered one criterion series. In line 3 the selection criterion specification includes the inner logical operator "Or," which means that the table section and field name on this line correspond to the ones on line 2. Because the lines belong to the same criterion series, this selection criterion specification obtains purchase orders in company 1 that amount to USD 10,000 or less.

The inner logical operator can be either "And" or "Or." The following example illustrates the function of the "And" operator.

#### Example 4

You want to create a selection criterion specification that obtains the jobs that belong to company 1, and in which the words "urgent" and "support" form part of the texts that you entered for the job in the Job Descriptions workspace. In the selection criterion specification you enter the following lines:

Outer Logical Op.	Table Section	Field Name	Inner Logical Op.	Operator	Value 1
	Job	Company no.		Equal to	1
	Job text line	Text		Contains	urgent
			And	Contains	support

In this case, the inner logical operator "And" means that the conditions in both lines 2 and 3 must be met for a job to match the selection criterion specification. This specification thus does not obtain jobs for which only one of the words is included in the job text lines.

You can create several consecutive lines with an inner logical operator. You use the "And" operator to link to the closest preceding line; however, "Or" does not link to any lines above.

The following examples illustrate this functionality.

#### Example 5

You want to create a selection criterion specification that identifies the jobs for which the words "urgent" and "support" are included in the texts that you entered for the job in the Job Descriptions workspace. If the text lines do not include these two words, a job should still match the selection criterion specification if a text line for the job contains the word "priority." In the selection criterion specification you create the following lines:

Outer Logical Op.	Table Section	Field Name	Inner Logical Op.	Operator	Value 1
	Job Text Line	Text		Contains	urgent
			And	Contains	support

			Or	Contains	priority
--	--	--	----	----------	----------

In this example the "And" operator in line 2 means that line 2 links to line 1. The "Or" operator does not link to any of the lines above it. The result is that the conditions in lines 1 and 2 must either both be met, or the condition in line 3 must be met.

### Example 6

The following selection criterion specification generates the same result as for example 5:

Outer Logical Op.	Table Section	Field Name	Inner Logical Op.	Operator	Value 1
	Job text line	Text		Contains	priority
			Or	Contains	urgent
			And	Contains	support

In this example, the "And" operator in line 3 means that line 3 links to line 2. The "Or" operator in line 2 does not link to any of the lines above it. The result is that either the conditions in lines 2 and 3 must both be met, or the conditions in line 1 must be met.

### Example 7

You want to create a selection criterion specification that obtains the jobs for which the words "urgent" and "support" are contained in the texts that you entered for the job in the Job Descriptions workspace. If the text lines do not contain these two words, a job should, however, match the selection criterion specification if a text line for the job contains either the word "priority" or the word "important." In the selection criterion specification you enter the following lines:

Outer Logical Op.	Table Section	Field Name	Inner Logical Op.	Operator	Value 1
	Job text line	Text		Contains	priority
			Or	Contains	important
			Or	Contains	urgent
			And	Contains	support

In this example the "And" operator on line 4 means that line 4 links to line 3. The "Or" operator on lines 2 and 3 does not link to any of the lines above it. The result is that either the conditions in lines 3 and 4 must both be met or the conditions in one of the lines 1 and 2 must be met.

A selection criterion specification type indicates what kind of information you can set up delimitation on in a given selection criterion specification. Each selection criterion specification type identifies one or more database tables or database table sections whose fields are available for setting up selection criteria. At the same time, the selection criterion specification type of a given selection criterion specification determines the contexts in which you can use the criterion specification. There are two kinds of selection criterion specification type:

- **Manually created selection criterion specification types** — In the Selection Criterion Specification Types workspace you can manually create your own selection criterion

specification types, indicating for each type the database table for which you can set up selection criteria on selection criterion specifications of the type in question. For instance, if you specify the "NoteLine" table on a selection criterion specification type, selection criterion specifications of that type can define criteria for the fields in that table.

For manually created types, you cannot create lines in the Selection Criterion Specification Lines sub-tab. Instead, you define the selection criteria with an SQL expression in a text file that you import using the **Import SQL File** action. For more information about this, see the description of the **Import SQL File** action.

You can only use manually created types in connection with monitors where they determine the criteria that the individual entries in the database table indicated by the type must meet for a certain action to be executed. For more information about this, see the description of the Monitors workspace.

- **Predetermined selection criterion specification types** — Maconomy comes with a number of predefined types that you cannot change. Each of the predefined types has a predefined area of usage; you can only use them in that context. This means that you can only select for use in certain workspaces the selection criterion specifications of a given predefined type. Because the use of each predefined type is fixed, a number of tables and table sections (parts of tables) that are relevant in this context are preassigned to each type, allowing you to set up criteria on information in those tables.

On selection criterion specifications of predefined types, you set up criteria in the Selection Criterion Specification Lines sub-tab of this workspace.

You can use predefined selection criterion specifications in the following contexts. For information about the options that are available for the individual contexts, see the description of the **Type** field.

- **Approval Hierarchy Selection** — In connection with approval hierarchy selection, you use selection criterion specifications to determine the approval hierarchy to be used for the approval of each purchase order, expense sheet, or vendor invoice allocation line. You do this in the Approval Hierarchy Selection workspace, where you create a number of hierarchy lines, each of which contains its own selection criterion specification. On each line you also select the approval hierarchy to be used on purchase orders/expense sheets/allocation lines that match the selection criterion specifications of the line in question. This way you can, for example, ensure that purchase orders that are assigned to different companies are approved through company-specific approval routines.

Note that you must create separate approval hierarchy selections for purchase orders, expense sheets, and allocation lines, respectively. In approval hierarchy selections for purchase orders, you use selection criterion specifications of the **Requisition** type. You use criterion specifications of the **Expense Sheet** type in the approval hierarchy selection for expense sheets. You use selection criterion specifications of the **Vendor Invoice** type in the approval hierarchy selection for vendor invoice allocation lines.

- **Approval hierarchies** — In connection with approval hierarchies, you use selection criterion specifications to decide who should approve each purchase order, expense sheet, or vendor invoice allocation line. You select the hierarchy to be used for the approval of each entry in the Approval Hierarchy Selection workspace, as described previously. You define each approval hierarchy by creating a number of hierarchy

lines, each of which has its own selection criterion specification, and a person who approves purchase orders/expense sheets/allocation lines that match the selection criterion specification of the line in question. This way you can, for example, ensure that as long as a purchase order does not amount to more than a certain amount, it should only be approved by the person who submits the purchase order, whereas purchase orders for larger amounts should also be approved by the supervisor of the person who submits the purchase order.

Note that you should create a number of separate approval hierarchies for purchase orders, expense sheets, and allocation lines, respectively. In approval hierarchies for purchase orders, you use selection criterion specifications of the **Requisition** type. You use selection criterion specifications of the **Expense Sheet** type in the approval hierarchies for expense sheets. You use selection criterion specifications of the **Vendor Invoice** type in the approval hierarchies for vendor invoice allocation lines.

- **Campaigns** — In connection with campaigns, you use selection criterion specifications to determine which contact companies and contact persons should be included in each campaign. In the sub-tab of the Campaigns workspace you can create any number of lines, each of which contains its own selection criterion specification. When you initiate the campaign, Maconomy thus creates events for all of the contact companies and contact persons that match the selection criterion specifications in the sub-tab. This way you can, for example, focus the campaign on all of the contact companies within a certain postal code area.
- **Job Searches** — In connection with job searches you use selection criterion specifications to find certain jobs in the Job Search workspace. In the Job Search workspace you can switch between existing selection criterion specifications of this type; the sub-tab displays the jobs that match the current selection criterion specification. This enables you to easily find jobs with, for example, a certain job processing status or jobs for which you are the project manager.

## Selection Criterion Specification Tab

This section includes the fields and descriptions for the Selection Criterion Specification tab.

### Selection Criterion Specification Island

Field	Description
<b>Selection Criterion Specification No.</b>	In this field you can enter an identification number when creating a selection criterion specification. If you do not specify a number, Maconomy assigns the next available number from the Target Group Series in the workspace Event Series.
<b>Description</b>	In this field you can enter a short description of the current selection criterion specification.
<b>Type</b>	In this field you can specify a selection criterion specification type. The type indicates the use of the selection criterion specification as well as the information on which criteria can be made. This is described in further detail in the introduction to this workspace. The field "Definition Format" indicates

Field	Description
	<p>whether the selected type is a manually created one or one of the predefined options. "SQL Expression" indicates that the type was created manually, whereas "Selection Criterion Specification Lines" indicates a predefined option.</p> <p>The following options are predefined in the system:</p> <ul style="list-style-type: none"> <li>■ Contact company — The selection criterion specification can be used in connection with campaigns in the Contact Management module for the selection of the contact companies that should be included in a campaign.</li> <li>■ Contact person — The selection criterion specification can be used in connection with campaigns in the Contact Management module for the selection of the contact persons that should be included in a campaign.</li> <li>■ Purchase Order — The selection criterion specification can be used in the workspaces Approval Hierarchy Selection and Approval Hierarchies. In the workspace Approval Hierarchy Selection, selection criterion specifications of this type can be used to determine which approval hierarchy for purchase orders should be used for the approval of purchase orders that match each selection criterion specification. In the workspace Approval Hierarchies, selection criterion specifications of this type are used to define who should approve purchase orders that match each selection criterion specification. However, as mentioned above, the definition of the hierarchy to be used for the approval of each purchase order is determined in the workspace Approval Hierarchy Selection.</li> <li>■ Expense sheet — The selection criterion specification can be used in the workspaces Approval Hierarchy Selection and Approval Hierarchies. In the workspace Approval Hierarchy Selection, selection criterion specifications of this type are used to determine the approval hierarchy for expense sheets to be used for the approval of expense sheets that match each selection criterion specification. In the workspace Approval Hierarchies, selection criterion specifications of this type are used to define who should approve expense sheets that match each selection criterion specification. However, as mentioned above, the definition of the hierarchy to be used for approval of each expense sheet is determined in the workspace Approval Hierarchy Selection.</li> <li>■ Vendor Invoice — The selection criterion specification can be used in the workspaces Approval Hierarchy Selection and Approval Hierarchies. In the workspace Approval Hierarchy Selection, selection criterion specifications of this type are used to determine the approval hierarchy for vendor invoice allocation lines to be used for the approval of vendor invoice allocation lines that match each selection</li> </ul>

Field	Description
	<p>criterion specification. In the workspace Approval Hierarchies, selection criterion specifications of this type are used to define who should approve vendor invoice allocation lines that match each selection criterion specification. However, as mentioned above, the definition of the hierarchy to be used for approval of allocation lines is determined in the workspace Approval Hierarchy Selection.</p> <ul style="list-style-type: none"> <li>■ <b>Job</b> — This selection criterion specification can be used in the workspace Job Search where, in the tab, you can switch between the existing selection criterion specifications of this type, and the sub-tab shows which jobs match the current selection criterion specification. Moreover, this selection criterion specification can be used in connection with job parameter selection rules. Job parameter selection rules are used when setting-up various parameters, such as revenue recognition and pricing methods for jobs. By means of assigning selection criterion specifications to job parameter selection rules, you can define that one certain set of job parameter selection rules should be valid for, for example, all jobs belonging to one certain company whereas another set of job parameter selection rules should be valid for jobs belonging to another company. See the description of the workspaces Job Parameters and Job parameter Selection Rules in the Job Cost module for further information.</li> <li>■ <b>Customer</b> — This selection criterion specification can be used in the workspace User Types where it is used for pointing out the customers on the basis of which users should be created. For further information on this process, see the description of the workspace User Types.</li> </ul>
<b>Definition Format</b>	<p>This field shows whether the selection criteria of the current selection criterion specification are defined by means of lines in the sub-tab or an imported SQL expression. If you have selected a manually created selection criterion specification type in the field "Type" above, the value is always "SQL File." If you have selected a predefined type, the value is always "Selection Criterion Specification Lines."</p>
<b>Public</b>	<p>In this field you can specify if the current selection criterion specification should be available for other users. If the field is not marked, the selection criterion specification will only be displayed in this workspace for the user that has created it and only this person has the possibility of using it in the workspace Job Search.</p> <p>Only users for whom the field "Change Public Selection Criterion Specifications" is marked in the workspace Actions can change selection criterion specifications which are marked as public.</p>
<b>Blocked</b>	<p>In this field you can block the selection criterion specification for changes. If the field is marked, it is not possible to change the existing table lines, just as it is not possible to add or delete lines. The selection criterion specification can, however, be reopened for changes by removing the mark.</p>

Field	Description
<b>Project Manager</b>	If you create a new selection criterion specification with the Job type, you can reference fields in the sub-tab to the employee that is specified in the <b>Project Manager</b> field on the job.

### User Island

See the Introduction topic for a description of the fields in the island User.

### Selection Criterion Specification Lines Sub-Tab

This section includes the fields and descriptions for the Selection Criterion Specification Lines sub-tab.

Field	Description
<b>Outer Logical Op.</b>	In this field you can use the outer logical operator “OR” to separate criterion series in the selection criterion specification. When the sub-tab comprises several consecutive lines, it means that the criteria of all of these lines should be met in order for an entry to match the selection criterion specification. By creating a line with the outer logical operator “OR” you can define, however, that an entry needs only to meet the criteria above or below the “OR” operator to match the selection criterion specification. For further details on the functionality of this operator, see the examples in the introduction to this workspace. When this operator is used, none of the other fields on the line can be completed.
<b>Table Section</b>	<p>In this field you can select which table section in Maconomy’s database the current selection criterion line should use for delimitation. A table section is a section of the entries in a table in Maconomy’s database. The table Contact, for example, has an entry for each event created in Maconomy, whereas the table section Personal Contact is a section of the table Contact and only contains the events on which a contact person number has been entered.</p> <p>In a table section you can delimit by exactly the same fields as the ones available in the table that forms the basis of the section in question.</p> <p>Table sections provide the possibility of creating more precise selection criterion specifications because by selecting a certain table section you have already excluded part of the irrelevant entries in the table. By, for example, using the table section Personal Contact, you have already excluded all the events on which a contact person has not been entered, as mentioned in the above example.</p> <p>It is predetermined within Maconomy which table sections are available for each selection criterion specification type. Below is a list of the table sections available for each of the predefined selection criterion specification types and an explanation of the function of the individual sections.</p> <ul style="list-style-type: none"> <li>▪ <b>Contact Company</b> — This selection criterion specification group is used for selecting contact companies that meet certain criteria. The following table sections can be used:</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Customer — This table section comprises the entries in the table Customer that are assigned to a contact company. A contact company thus matches the selection criterion specification if it is assigned to a customer which meets the criterion of the line. A contact company only matches the selection criterion specification, however, if it also meets any other criteria created in the sub-tab.</li> <li>Company Customer — This table section comprises the entries in the table CompanyCustomer which through their parent customer are assigned to a contact company. A contact company thus matches the selection criterion specification if it is assigned to a company-specific customer that meets the criteria of the line. A contact company only matches the selection criterion specification, however, if it also meets any other criteria created in the sub-tab.</li> <li>Contact — This table section comprises all entries in the table ContactHeader, that is, all events in the workspace Events. A contact company thus matches the selection criterion specification if it is stated in one or more events that meet the criterion of the line. A contact company only matches the selection criterion specification, however, if it also meets any other criteria created in the sub-tab.</li> <li>Contact Company — This table section comprises all entries in the table ContactCompanies, that is, all contact companies in the workspace Contact Companies. A contact company thus matches the selection criterion specification if its information meets the criterion of the line. A contact company only matches the selection criterion specification, however, if it also meets any other criteria created in the sub-tab.</li> <li>Contact Person — This table section comprises all entries in the table ContactPerson, that is, all contact persons in the workspace Contact Persons. A contact company thus matches the selection criterion specification if it has a contact person assigned to it which meets the criterion of the line. A contact company only matches the selection criterion specification, however, if it also meets any other criteria created in the sub-tab.</li> <li>Contact Text — This table section comprises all entries in the table NoteLine, that is, all lines in the sub-tab of the workspace Notes. A contact company thus matches the selection criterion specification if it is assigned to one or several events for which there is a description line that meets the criterion of the line. A contact company only matches the selection criterion specification, however, if it also meets any other criteria created in the sub-tab.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Personal Contact</b> — This table section comprises all entries in the table ContactHeader where the field “Contact Person No.” has been completed, that is, all events in the workspace Events that relate to a certain contact person. A contact company thus matches the selection criterion specification if it is assigned to one or several events that meet the criterion of the line and for which a contact person has been specified. A contact company will, however, only match the selection criterion specification if it also meets any other criteria created in the sub-tab.</li> <li>▪ <b>Personal Contact Text</b> — This table section comprises the entries in the table NoteLine to which a reference is made on an event where the field “Contact Person No.” has been completed. This means that the table section comprises those lines in the sub-tab of the workspace Events which are assigned to an event with a contact person number. A contact person thus matches the selection criterion specification if it is stated in one or more contact person related events that have a description line that meets the criterion of the line. A contact company will, however, only match the selection criterion specification if it also meets any other criteria created in the sub-tab.</li> <li>▪ <b>Vendor Invoice</b> — This selection criterion specification type is used for selecting vendor invoice allocation lines that meet certain criteria. The following table sections can be used: <ul style="list-style-type: none"> <li>▪ <b>LawyerJobInformation</b> — This table section comprises the entries in the table LawyerJobInformation, that is, information about the committed funds of each client in the Maconomy Lawyer add-on system (only available in Danish versions). An invoice allocation line thus matches the selection criterion specification if the committed funds of the client to which the job specified on the allocation line pertains meet the criterion of the line. An allocation line only matches the selection criterion specification, however, if it meets any other criteria in the sub-tab.</li> <li>▪ <b>Invoice Allocation Line</b> — This table section comprises the entries in the table InvoiceAllocationLine which have not yet been posted, that is, all allocation lines in the sub-tab of the workspace Invoice Allocation. An allocation line thus matches the selection criterion specification if it has not been posted and meets the criterion of the line. An allocation line only matches the selection criterion specification, however, if it meets any other criteria in the sub-tab.</li> <li>▪ <b>Vendor</b> — This table section comprises all global vendors, that is, vendors in the workspace Vendor Information Card. An allocation line thus matches the selection criterion specification if it regards a vendor</li> </ul> </li> </ul>

Field	Description
	<p>who meets the criterion of the line. An allocation line only matches the selection criterion specification, however, if it meets any other criteria in the sub-tab.</p> <ul style="list-style-type: none"> <li>▪ Vendor Invoice — This table section comprises the entries in the table VendorInvoiceJournal, that is, vendor invoices entered in the sub-tab of the workspace Vendor Invoices or the tab of the workspace Invoice Allocation. An allocation line thus matches the selection criterion specification if it concerns a vendor invoice that meets the criterion of the line. An allocation line only matches the selection criterion specification, however, if it meets any other criteria in the sub-tab.</li> <li>▪ Employee — This table section comprises the entries in the table Employee, that is, information entered in the workspace Employees. An allocation line thus matches the selection criterion specification if an employee that meets the criterion of the line has been specified on the allocation line. An allocation line only matches the selection criterion specification, however, if it meets any other criteria in the sub-tab.</li> <li>▪ Job — This table section comprises the entries in the table JobHeader, that is, information entered in the workspace Jobs. An allocation line thus matches the selection criterion specification if it contains a reference to a job that meets the criterion of the line. An allocation line only matches the selection criterion specification, however, if it meets any other criteria in the sub-tab.</li> <li>▪ Job Invoicing — This table section comprises the entries in the table JobInvoicing, that is, information about the cost and sales prices used in connection with the invoicing of a given job. An allocation line thus matches the selection criterion specification if it contains a reference to a job whose invoicing cost and sales price information meets the criterion of the line. An allocation line only matches the selection criterion specification, however, if it meets any other criteria in the sub-tab.</li> <li>▪ Job Registration — This table section comprises the entries in the table JobRegistration, that is, information about the open cost and sales prices of a given job. An allocation line thus matches the selection criterion specification if it contains a reference to a job whose open cost and sales price information meets the criterion of the line. An allocation line only matches the selection criterion specification, however, if it meets any other criteria in the sub-tab.</li> <li>▪ Job — This selection criterion specification type is used for selecting jobs that meet certain criteria. The following table sections can be used:</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Event</b> — This table section comprises the entries in the table ContactHeader which have been assigned to a job, that is, all events in the workspace Events for which a job number has been specified. A job thus matches the selection criterion specification if it has been assigned to an event which meets the criterion of the line. A job only matches the selection criterion specification, however, if it meets any other criteria in the sub-tab.</li> <li>▪ <b>Event Line</b> — This table section comprises all entries in the table NoteLine pertaining to notes that have been assigned to an event, that is, all lines in the sub-tab of the workspace Events. A job thus matches the selection criterion specification if there are one or several events referring to the job in question whose sub-tab contains a description line that meets the criterion of the line. A job only matches the selection criterion specification, however, if it also meets any other criteria created in the sub-tab.</li> <li>▪ <b>Job</b> — This table section comprises all entries in the table JobHeader, that is, jobs in the workspace Jobs. A job thus matches the selection criterion specification if its information meets the criterion of the line. A job will, however, only match the selection criterion specification if it also meets any other criteria created in the sub-tab.</li> <li>▪ <b>Job Invoicing</b> — This table section comprises the entries in the table JobInvoicing, that is, information about the invoicing that has taken place for the jobs in the system. This type of information is, for example, shown in the workspace Job Card. A job thus matches the selection criterion specification if its invoicing information meets the criterion of the line. A job only matches the selection criterion specification, however, if it meets any other criteria in the sub-tab.</li> <li>▪ <b>Job Registration</b> — This table section comprises the entries in the table JobRegistration, that is, information about current open cost and sales prices of each job in the system. This type of information is, for example, shown in the workspace Job Card. A job thus matches the selection criterion specification if its open cost and sales price information meets the criterion of the line. A job only matches the selection criterion specification, however, if it meets any other criteria in the sub-tab.</li> <li>▪ <b>Job Text Line</b> — This table section comprises all entries in the table NoteLine pertaining to notes that have been assigned to a job, that is, all lines in the sub-tab of the workspace Job Descriptions. A job thus matches the selection criterion specification if the job in question has one or more job description lines that meet the criterion of the line. A job only matches the selection criterion specification if it also meets any other criteria created in the sub-tab.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>LawyerJobInformation</b> — This table section comprises the entries in the table LawyerJobInformation, that is, information about the committed funds of each client in the Maconomy Lawyer add-on system (only available in Danish versions). A job thus matches the selection criterion specification if the committed funds of the client to which the job pertains meet the criterion of the line. A job only matches the selection criterion specification, however, if it meets any other criteria in the sub-tab.</li> <li>▪ <b>Purchase Order</b> — This selection criterion specification type is used for selecting purchase orders that meet certain criteria. The following table sections can be used: <ul style="list-style-type: none"> <li>▪ <b>Vendor</b> — This table section comprises the vendors in the workspace Vendor Information Card for which there are non-approved purchase orders. A purchase order thus matches the selection criterion specification if it relates to a vendor whose information meets the criterion of the line. A purchase order will, however, only match the selection criterion specification if it also meets any other criteria that may have been created in the sub-tab.</li> <li>▪ <b>Purchase Order</b> — This table section comprises all entries in the table RequisitionHeader where the field “Approved” has not been completed, that is, all non-approved purchase orders in the workspace Purchase Orders. A purchase order thus matches the selection criterion specification if it has not been approved, and the information in the workspace Purchase Orders meets the criterion of the line. A purchase order only matches the selection criterion specification if it also meets any other criteria that may have been created in the sub-tab.</li> <li>▪ <b>Job</b> — This table section comprises all entries in the table JobHeader, that is, all jobs in the workspace Jobs. A purchase order thus matches the selection criterion specification if it relates to a job whose information meets the criterion of the line. A purchase order will, however, only match the selection criterion specification if it also meets any other criteria that may have been created in the sub-tab.</li> <li>▪ <b>Job Invoicing</b> — This table section comprises the entries in the table JobInvoicing, that is, information about the invoicing that has taken place for the jobs in the system. This type of information is, for example, shown in the workspace Job Card. A purchase order thus matches the selection criterion specification if it relates to a job whose invoicing information meets the criterion of the line. A purchase order will, however, only match the selection criterion specification if it also meets any other criteria that may have been created in the sub-tab.</li> </ul> </li> </ul>

A contact person will, however, only match the selection criterion specification if it also meets any other criteria that may have been created in the sub-tab.</li> <li>■ <b>Contact Text</b> — This table section comprises all entries in the table NoteLine pertaining to notes assigned to an event for which a contact company with an assigned contact person is registered. This means that the table section comprises lines in the sub-tab of the workspace Events that relate to events for which a contact company has been registered with an assigned contact person — even if the contact person is not stated on the individual event. A contact person thus matches the selection criterion specification if this person is assigned to a contact company stated in one or more events for which there is a description line that meets the criterion of the line. A contact person will, however, only match the selection criterion specification if this person also meets any other criteria that may have been created in the sub-tab.</li> <li>■ <b>Personal Contact</b> — This table section comprises all entries in the table ContactHeader where the field "Contact Person No." has been completed, that is, all events in the workspace Events that relate to a certain contact person. A contact person thus matches the selection</li> </ul>

Field	Description
	<p>criterion specification if this person is stated on one or more events that meet the criterion of the line. A contact person will, however, only match the selection criterion specification if this person also meets any other criteria that may have been created in the table.</p> <ul style="list-style-type: none"> <li>▪ <b>Personal Contact Text</b> — This table section comprises the entries in the table NoteLine pertaining to notes to which a reference is made on an entry in the table Contacts where the field “Contact Person No.” is completed. This means that the table section comprises the lines in the sub-tab of the workspace Events that are related to events with a contact person number. A contact person thus matches the selection criterion specification if this person is stated on one or more events for which there is a description line that meets the criterion of the line. A contact person will only match the selection criterion specification, however, if this person also meets any other criteria that may have been created in the sub-tab.</li> <li>▪ <b>Customer</b> — This selection criterion specification type is used for selecting customers that meet certain criteria. The following table sections can be used: <ul style="list-style-type: none"> <li>▪ <b>Customer</b> — This table section comprises the customers in the workspace Customer Information Card. A customer thus matches the selection criterion specification if its static information meets the criterion of the line. A customer will, however, only match the selection criterion specification if it also meets any other criteria that may have been created in the sub-tab.</li> </ul> </li> </ul> <p>If you select a time/expense sheet in the filter list, the drop-down list for this field is updated with the following options:</p> <ul style="list-style-type: none"> <li>▪ Purchase Order</li> <li>▪ Purchase Order Line</li> <li>▪ Subcontractor Vendor</li> </ul> <p>All fields for the specified table section then become available as options in the <b>Field Name</b> field.</p>
<b>Field Name</b>	<p>In this field you can define which field in the selected table section on which you want to make a delimitation on the current line. When the current selection criterion specification is used (for example, when contact companies for a marketing campaign are selected), Maconomy will run through the entries of the selected table section, and for each entry Maconomy will compare the value of this field with the criterion consisting of the operator of the line and the values in the field “Value 1” and “Value 2.” The entries that meet this criterion match the selection criterion specification if they also meet any other criterion of the remaining lines of the sub-tab. For further details of the correlation between criteria in several lines of the same selection criterion specification, see the introduction to this workspace.</p>

Field	Description
<b>Inner Logical Op.</b>	<p>In this field you can define an inner logical operator if you want to make several delimitations to the same field within a given criterion series. You can choose between the operators “Or” and “And.” The functions of these two inner logical operators are described in further detail in the introduction to this workspace. When you create an inner logical operator on a line, you cannot define a table section and a field name on that line, as Maconomy will use the table section and field name which applies to the previous line.</p>
<b>Operator</b>	<p>In this field you can select the operator to be used for comparing the values of the selected data base field and the values entered in the fields “Value 1” and “Value 2.” The operator could, for example, be “Less Than” which means that the criterion of the line can only be met by the entries in the table section whose value in the selected data base field is less than the value entered in the field “Value 1.”</p> <p>The field type of the field selected in the field “Field Name” decides which operators are used. The operators “More Than” and “Less Than” can, for example, not be used in connection with check boxes. In short, the different field types represent the following fields in Maconomy’s workspaces:</p> <ul style="list-style-type: none"> <li>■ Amount Value — Amount fields. Only numbers with a maximum of two decimals can be specified.</li> <li>■ Boolean Value — Checkboxes. The fields can have the value “Yes” or “No.”</li> <li>■ Date Value — Date fields. The date is specified as normally in Maconomy.</li> <li>■ Integer Value — Fields that can only have numbers without decimals.</li> <li>■ Pop-Up Value — Options in Maconomy’s pop-up fields. The value can be both text and numbers.</li> <li>■ Real Value — Numbers with a maximum number of decimals which is specified in the workspace Preferences in Maconomy’s Edit menu.</li> <li>■ String Values — Text fields. The value can be both text and numbers, however, the field has a maximum limit of 255 characters.</li> </ul> <p>You can choose from the following operators:</p> <ul style="list-style-type: none"> <li>■ Less Than — The value in the specified data base field must be less than the value in the field “Value 1” to meet the criterion of the line. You cannot use this operator if you have selected a field of the type “Boolean Value” in the field “Field Name.”</li> <li>■ Greater Than — The value in the specified data base field must be greater than the value in the field “Value 1” to meet the criterion of the line. You cannot use this operator if you have selected a field of the type “Boolean Value” in the field “Field Name.”</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Equal to</b> — The value in the specified data base field must be identical to the value in the field “Value 1” to meet the criterion of the line. By using this operator and leaving the field “Value 1” blank you can specify that the specified data base field only meets the criterion of the line if it has not been completed.</li> <li>▪ <b>Different From</b> — The value in the specified data base field only meets the criterion of the line if it is not identical to the value in the field “Value 1.”</li> <li>▪ <b>Between</b> — The value in the specified data base field only meets the criterion of the line if it is between the values defined in the fields “Value 1” and “Value 2.” You cannot use this operator if you have selected a field of the type “Boolean Value” in the field “Field Name.”</li> <li>▪ <b>Contains</b> — The value in the specified data base field only meets the criterion of the line if it contains a word starting with the value defined in “Value 1” - even though the field may contain characters after the first string. In this connection a word is considered a number of characters between two spaces or the characters which run from the beginning of the field to the first spacing.  <p>If, for example, “Little” has been entered in the field “Value 1,” the field values “Little John” and “James Little” will meet the criterion because the string “Little” either occurs in the beginning of the field or immediately after a spacing. But the field value “Doolittle” will not meet the criterion as in this case the string “Little” does not occur after a spacing.</p> <p>This operator can only be used if the specified data base field is of the type “String Value.”</p> </li> <li>▪ <b>Matches</b> — When you use this operator, you must specify in the field “Value 1” a number of another selection criterion specification created in this workspace, whereas you cannot specify a table section with a relating field name.  <p>A purchase order, expense sheet, and so on, thus meets the criterion of the line if it matches the selection criterion specification specified.</p> </li> <li>▪ <b>Does Not Match</b> — When you use this operator, you must specify in the field “Value 1” a number of another selection criterion specification created in this workspace, whereas you cannot specify a table section with a relating field name.  <p>A purchase order, expense sheet, and so on, thus meets the criterion of the line if it does not match the specified selection criterion specification.</p> </li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Less Than or Equal to</b> — The value in the specified data base field must be less than or equal to the value in the field “Value 1” to meet the criterion of the line. You cannot use this operator if you have selected a field of the type “Boolean Value” in the field “Field Name.” This makes it possible to, for example, have one approval hierarchy for vendor invoices where the amount of the vendor invoice is higher than the amount of the related purchase order, and another hierarchy if the amount of the vendor invoice is less than or equal to the amount of the related purchase order.</li> <li>▪ <b>Greater Than or Equal to</b> — The value in the specified data base field must be greater than or equal to the value in the field “Value 1” to meet the criterion of the line. You cannot use this operator if you have selected a field of the type “Boolean Value” in the field “Field Name.” The functionality of this line matches that of “Less than or Equal to” above.</li> <li>▪ <b>Within Margin</b> — Use this operator to check if fields are within the specified margin (either fixed value or percentage). If you choose this, Maconomy performs two-way validation. For example, if you select this option and specify a fixed margin of '5', the expression is evaluated as true if and only if the value resulting from applying the math operations to the specified fields falls within the (-5; 5) range.</li> <li>▪ <b>Outside Margin</b> — Use this operator to check if fields are outside the specified margin (either fixed value or percentage). If you choose this, Maconomy performs two-way validation. For example, if you select this option and specify a fixed margin of '5', the expression is evaluated as true if and only if the value resulting from applying the math operations to the specified fields falls outside the (-5; 5) range.</li> <li>▪ <b>Above or Equal to Margin</b> — Use this operator to check if fields are above or equal to the specified margin (either fixed value or percentage). If you choose this, Maconomy performs one-way validation. For example, if you select this option and specify a fixed margin of '5', the expression is evaluated as true if and only if the value resulting from applying the math operations to the specified fields is greater than or equal to 5.</li> <li>▪ <b>Below or Equal to Margin</b> — Use this operator to check if fields are below or equal to the specified margin (either fixed value or percentage).</li> </ul>

Field	Description
	<p>If you choose this, Maconomy performs one-way validation. For example, if you select this option and specify a fixed margin of '5', the expression is evaluated as true if and only if the value resulting from applying the math operations to the specified fields is lower than or equal to 5.</p>
<b>Value 1</b>	<p>In this field you can specify the value to which each entry in the selected table section should be compared in the field specified in the field "Field Name."</p> <p>When the current selection criterion specification is used (for example, when contact companies are selected for a marketing campaign), Maconomy will run through all entries in the selected table section, and for each entry Maconomy will compare the value in the specified field with the criterion consisting of the operator on the line and the values in the fields "Value 1" and "Value 2." The entries that meet this criterion match the selection criterion specification if they meet any other criteria on the remaining lines in the sub-tab.</p> <p>If you have specified the operators "Matches" or "Does Not Match," the field "Operator" must, however, include the number of another selection criterion specification created in this workspace, and the criterion in the line is thus met by the entries that match or do not match the specified selection criterion specification.</p> <p>For further details on the correlation between criteria in several lines in the same selection criterion specification, see the introduction to this workspace.</p>
<b>Value 2</b>	<p>If the operator in the current line is "Between," you can specify in this field the upper value of the interval in which a value should range to meet the criterion of the line. When the current selection criterion specification is used (for example, when contact companies are selected for marketing campaigns), Maconomy will run through all entries in the selected table section, and for each entry Maconomy will check if the value is within the interval which is contained by the values in the fields "Value 1" and "Value 2." The entries that are within this interval match the selection criterion specification if they meet any other criteria of the remaining lines in the sub-tab.</p> <p>For further details on the correlation between criteria in more lines in the same selection criterion specification, see the introduction to this workspace.</p>
<b>Math Operator</b>	<p>Select a mathematical operator from the drop-down list.</p> <p>Use this field to perform addition/subtraction/multiplication/division between two or more fields.</p>
<b>Table Section, Operand</b>	<p>In this field you can select a table section in Maconomy's database. Which table section that can be used is depending of the type of the Selection Criterion Specification see the description of the field "Table Section" to see which tables that belongs to which types.</p> <p>This field can be used together with the field "Field Name, Operand" to select a database value that should be used instead of Value 1. For example, it is possible to compare if the amount on the vendor invoice is less than or equal to the amount of the related purchase order.</p>

Field	Description
<b>Field Name, Operand</b>	In this field you can select a field name form the relation selected in the field “Table Section, Operand.” The field must be of same type as the field selected in the filed “Field Name.” See the description of the functionality for the field “Table Section, Operand.”

## Actions

This section shows the Actions available in the Selection Criterion Specification workspace.

### Top Tab

Field	Description
<b>Import SQL File</b>	<p>This action is only available for selection criterion specifications where the type specified in the field “Type” is a manually created option. See the field “Type” for further information on manually created options.</p> <p>When you select the action, Maconomy prompts you for a text file containing the SQL expression that makes up the selection criteria of the selection criterion specification. The SQL expression must only contain selection criteria (queries) on fields in the database table indicated by the selection criterion type specified in the field “Type.” The SQL expression is then stored in Maconomy overwriting any previously stored SQL expression and applied whenever the selection criterion specification is used.</p>
<b>Export SQL File</b>	<p>When you select this action, Maconomy exports the SQL expression file that makes up the selection criteria of the selection criterion specification to a text file. Maconomy prompts you for a file name and location in which to store the file. This allows you to edit the SQL expression and re-import it using the action “Import SQL File.”</p>

## Selection Criterion Specification Types Single Dialogs Workspace

Use this workspace to create the options that are to be available in the **Type** field in the Selection Criterion Specification workspace.

In the Selection Criterion Specification workspace you create sets of selection criteria, or queries, that you can use to locate records in the Maconomy database. Use the Selection Criterion Specification Types workspace to establish the specification types that are available for use.

The selection criterion specification type that you select on a selection criterion specification indicates the database relation to which the selection criterion specification in question should apply. For instance, if you create a selection criterion specification type in this workspace, specifying that it pertains to the **NoteLine** relation, selecting this type in the Selection Criterion Specification workspace means that the criteria on the specification in question apply to the contents of the fields in the relation **NoteLine**.

Note that in the current Maconomy version, you can only use selection criterion specifications that have types that you created in this workspace in connection with monitors. For more information about monitors, see the description of the Monitors workspace.

In addition to the selection criterion specification types that you can create manually in this workspace, Maconomy provides a number of predefined selection criterion specification types that you cannot change. These are described in the section about the Selection Criterion Specification workspace.

### Selection Criterion Specification Types Tab

This section includes the fields and descriptions for the Selection Criterion Specification Types tab.

#### Selection Criterion Specification Type Header Island

Field	Description
<b>Name</b>	When creating a selection criterion specification type, you can specify a name for the new type here. Once the type has been created, the field is closed, and the name can no longer be changed.
<b>Database Relation</b>	When creating a selection criterion specification type, you can specify the database relation to which the type should apply. For instance, if you create a selection criterion specification type in this workspace, specifying that it pertains to the relation "NoteLine," selecting this type in the workspace Selection Criterion Specification means that the criteria on the specification in question apply to the contents of the fields in the relation "NoteLine."  Once the type has been created, the field is closed, and the database relation can no longer be changed.
<b>Definition Format</b>	This field shows whether selection criteria of the current selection criterion specification type should be defined by means of lines in the sub-tab or an imported SQL expression. On manually created selection criterion specification types, the value is always "SQL File." On predefined types, the value is always "Selection Criterion Specification Lines."

#### User Island

See the Getting Started topic for a description of the fields in the island User.

## Week Calendars Single Dialogs Workspace

Use this workspace to set up a calendar of work weeks.

For each week, you enter a week number and name, the entry date used when posting time sheets for the week, and the fixed working hours for each day.

In the Employees workspace, you can specify a week calendar for each revision of each employee. The fixed working hours depend on the employee who enters hours and the date for which he or she enters hours. However, the fixed hours of an employee also depend on the fixed working hours that you defined in the Employees workspace, because the lower number of hours is used. For more information about how an employee's fixed hours are determined for a given date, see the description of the Fixed Working Hours island in the Employees workspace.

If you change the number of fixed hours for an employee, either in this workspace or the Employees workspace, it also affects time sheets that are created, submitted, or approved before the change was made. In other words, the overtime calculation for an employee is also affected for past weeks when you change the employee's number of fixed hours. For more information, see the description of the **Submit Time Sheet** action in the Time Sheets workspace in the Job Cost module.

In the Week Calendars tab of the Week Calendars workspace, you can specify the number and name of the week calendar. You can also set up selection criteria to limit the number of lines that the Weeks sub-tab displays. On each line in the Weeks sub-tab you can specify a week number, an entry date, and the fixed working hours for each day.

## Week Calendars Tab

This section includes the fields and descriptions for the Week Calendars tab.

### Week Calendar Island

Field	Description
<b>Week Calendar</b>	In this field, you can specify the number of the week calendar if you are creating a calendar. Once the calendar has been created, the field is closed for editing. You can also specify a name for the current week calendar in this field.
<b>Time Unit</b>	I Use this field to specify the unit for time (Hour or Day) for the weekly calendar. You can only use the weekly calendar for employees with the same time unit.

### Remarks Island

Field	Description
<b>Remarks</b>	In these fields, you can enter various information about the current week calendar.

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Selection Criteria Island

Field	Description
<b>Show</b>	In these fields, you can specify a range of weeks if you wish to limit the number of lines shown in the sub-tab.

## Copying Island

Field	Description
<b>From</b>	If you wish to copy the fixed hours from one week in the current week calendar to a range of other weeks, you can specify the week to be copied in this field. If you complete the field and specify a range of weeks in the field "To," Maconomy will create a line for each of the weeks in the field "To" when you select the function "Copy Week Calendar," and the hours from the week in this field will be transferred to the new lines.
<b>To</b>	In this field, you can specify a range of weeks to be created as copies of an existing line in the week calendar. If you specify a range in this field and enter a week to be copied in the field "From," Maconomy will create a line for each week in this range when you select the function "Copy Week Calendar." The hours from the week in the field "From" will be transferred to the new lines.

## Weeks Sub-Tab

This section includes the fields and descriptions for the Weeks sub-tab.

Field	Description
<b>Week No.</b>	In this field, you enter the week number to which the current line applies.
<b>Year</b>	In this field, you enter the year to which the current line applies.
<b>Entry Date</b>	In this field, you enter a date if all time sheet entries for the current week are to be posted to this date. This field is only valid if "One Entry per Week" or "One Entry per Month" has been selected in the field "Allocation Method" in the workspace System Information.
<b>Date, Monday</b>	This field shows the date of the Monday in the current week.
<b>Total</b>	This field shows the total fixed working time for the current week, in hours or days, depending on the Time Unit. The field is calculated by the sum of the time specified in the fields Monday–Sunday.
<b>Monday-Sunday</b>	In these fields, you can enter the fixed working time for each day in the current week, in hours or days, depending on the Time Unit.
<b>Check-in, Monday-Sunday</b>	In these fields, you can enter the expected check-in time for each day in the current week. For more information, see the island "Fixed Working Hours."
<b>Check-out, Monday-Sunday</b>	The functionality of these fields is similar to that of the field "Check-in, Monday–Sunday" above, but concerns the expected check-out time.
<b>Absence, Monday-Sunday</b>	The functionality of these fields is similar to that of the field "Check-in, Monday–Sunday" above, but concerns expected regular absence time.

Field	Description
<b>Remarks, Monday-Sunday</b>	In these fields, you can enter remarks about the number of hours on the days in question.

## Actions

This section shows the Actions available in the Week Calendars workspace.

### Top Tab

Field	Description
<b>Copy Week</b>	When you select this function, Maconomy creates a line for each week in the range specified in the field "To" in the island Copying. The hours from the week in the field "From" will be transferred to the new lines. If an entry date has been specified on the week line being copied, the entry dates on the new lines are set at the same week day.

## Holiday Calendars Single Dialogs Workspace

Use this workspace to set up one or more calendars of non-business days (weekends and public holidays).

You can create separate calendars for different regions, countries, vendors, and so on.

In the Holiday Calendars tab, you can specify which weekdays should be considered business days. In the Holidays sub-tab, you can specify which dates are considered holidays.

You can create any number of holiday calendars, as needed. You can, for example, create calendars for various regions and countries, and you can also create calendars that are specific for a particular vendor, for example.

### Holiday Calendars Tab

This section includes the fields and descriptions for the Holiday Calendars tab.

#### Holiday Calendar Island

Field	Description
<b>Holiday Calendar Name</b>	In this field, you can specify the name of the holiday calendar if you are creating a calendar. Once the calendar has been created, the field is closed for editing.
<b>Description</b>	In this field, you can enter a description of the holiday calendar.
<b>Valid Until</b>	In this field you must enter a date that the holiday calendar is valid until. The date can be changed after the calendar has been created.

**Selection Criteria Island**

Field	Description
<b>Date</b>	In these fields, you can specify a range of dates if you wish to limit the number of lines shown in the sub-tab.

**Business Days Island**

Mark the days of the week that should be considered normal business days.

**User Island**

See the Getting Started topic for a description of the fields in the island User.

## Holidays Sub-Tab

This section includes the fields and descriptions for the Holidays sub-tab.

Field	Description
<b>Holiday Date</b>	In this field, you enter the week number to which the current line applies.
<b>Name</b>	In this field, you enter the name of the holiday.
<b>Description</b>	In this field, you enter a description of the holiday.

## Talent Management Countries Workspace

Use up this workspace to enter Talent Management information.

You can use Deltak Talent Management to manage recruitment and other HR processes while you use Maconomy to manage other company processes. Employee data is required in both applications, which is entered on the tab and sub-tab here within Maconomy, and enables the Talent Management and Maconomy one-way integration from Talent Management.

## Talent Management Countries Tab

Use up to this workspace to map Talent Management countries to Maconomy countries.

**Talent Management Island**

Field	Description
<b>Talent Mgmt. Country</b>	Select the country associated with the employee in Talent Management. The country displays and the related ID auto-populates.
<b>Abbrev.</b>	This field shows the abbreviation of this country, derived from Talent Management.

### Maconomy Island

Field	Description
<b>Maconomy Country</b>	<p>Select the country in Maconomy that corresponds to the Talent Management country.</p> <p><b>Note:</b> If you want the Talent Management country to map to the Employee Country field, then select its value here.</p>
<b>Maconomy Name 5</b>	<p>Enter a Maconomy country name as a free text. It is saved in Employee Name 5 field.</p> <p><b>Note:</b> If you want the Talent Management country to map to the Employee Name 5 field, then select its value here.</p>

### User Island

Field	Description
<b>Created</b>	This field shows the name of the user who initially created the information in this workspace.
<b>Changed</b>	This field shows the date on which the information was last updated.
<b>Version</b>	This field shows the number of versions for country mapping. Maconomy automatically increases the version number by one every time the information on the line is changed. It is not possible to retrieve previous versions.

### Talent Management States Sub-Tab

Use this workspace to map Talent Management states to Maconomy states.

Field	Description
<b>State Id. Talent Management</b>	This fields shows the identification code of the state in which the employee resides, as it derived from Talent Management.
<b>State Name</b>	This field shows the name of the state.
<b>State Abbrev.</b>	This field shows the abbreviation of this state.
<b>Maconomy Country</b>	<p>Select the state in Maconomy that corresponds to the Talent Management state.</p> <p><b>Note:</b> If you want the Talent Management state to map to the Employee Country field, then select its value here.</p>

Field	Description
<b>Maconomy Name 5</b>	In this field you can enter the Maconomy state name as a free text.  <b>Note:</b> If you want the Talent Management state to map to an Employee Name 5 field, then select its value here.

## Talent Management Integration Setup Workspace

Use up to workspace to set up information to enable the Talent Management and Maconomy integration.

See the *Deltek Maconomy Integration with Talent Management* document for integration procedures.

### Talent Management Integration Setup Tab

Use this tab to set up Talent Management integration information.

#### Background Job User Island

Field	Description
<b>Background Job User Created by</b>	This field shows the name of the user who has entered user data for the background job.
<b>Background Job User Created on</b>	This field shows the date on which user data was entered for the background job.
<b>Background Job User Changed by</b>	This field shows the name of the user who last updated the user data for the background job.
<b>Background Job User Changed on</b>	This field shows the date on which the user data for the background job was last updated.
<b>Background Job User Removed by</b>	This field shows the name of the user who has removed the user data for the background job.
<b>Background Job User Removed on</b>	This field shows the date on which the user data for the background job was removed.
<b>Version</b>	This field shows the version of the user data for the background job.

**REST Service Island**

Field	Description
<b>REST Service URL</b>	Enter a Maconomy RESTful service URL to for monitors to use when scheduled synchronizations run.

**Monitors Island**

Field	Description
<b>Import New Hires Monitor Interval</b>	Enter the frequency with which new hire information should be imported from Talent Management, in number of minutes. The default value is 60 minutes. If this field is set to 0, then the import runs once a day and the execution time is between 00:00 and 00:59 minutes.
<b>Sync All Emp. with Talent Management Monitor Interval</b>	Enter the frequency with which all employee information should be synchronized with Talent Management, in number of minutes. The default value is 0. If this field is set to 0, then the monitor runs once a day and the execution time is between 00:00 and 00:59 minutes.

**SD\_SU\_Talent\_Management\_Integration\_SetupWS\_Actions**

This section shows the Actions available in the Talent Management Integration Setup workspace.

Field	Description
<b>Set Background Job User</b>	Use this action to open a wizard for entering data for a user that will be used specifically for running the background job. This background user enables the scheduled imports of Talent Management and Maconomy data synchronization.
<b>Remove Background Job User</b>	Use this action to delete the background job user.
<b>Import New Hires from Talent Management</b>	Use this action to import new hire data from Talent Management, create a linked employee in Maconomy, and assign an employee number in Maconomy to each new hire. If an employee already exists with a Talent Management User ID, then the employee is updated with linked user data and the user is marked as exported.
<b>Sync All Empl. with Talent Management</b>	Use this action to update employees with the latest Talent Management user data. Employees are updated only if they are linked with a Talent Management user (and have a Talent Management User ID), and the linked Talent Management user has been updated since the last synchronization.  <b>Note:</b> You can parameterize this action (via MDML) so that the synchronization is forced even if the user information in Talent Management has not been updated since the last synchronization.

Field	Description
<b>Import Skill Types from Talent Management</b>	Use this action to import skill types from Talent Management to Maconomy, and create a background task to add, update, or select a skill type as deleted when removed from Talent Management.
<b>Import Skills from Talent Management</b>	Use this action to import skills from Talent Management, and create a background task to add, update, or remove skills in Maconomy. You must use this action only after skill types have been imported from Talent Management.

## Employees Single Dialogs Workspace

Use this workspace to enter and maintain information about employees, including each employee's basic information (name, position, work hours, and so on) and the job cost and billing prices applied to the employee's labor.

This workspace is used for information about company employees. This includes basic personal information, as well as various employment information such as supervisor, secretary, salaries, and working hours. You can also specify cost and billing prices to be used in relation to job cost entries pertaining to the employee.

This workspace consists of the Employees tab, where you can maintain the information about the employee, and the Employee Revisions sub-tab, where you can create and maintain revisions of the employee information that is accurate in specific periods. These revisions are known as date-dependent employee revisions.

### Date Dependent Employee Revisions

Using date dependent employee revisions, you can keep a history of employee information, so that you can always go back and review previous salaries, titles, working hours, and so on.

You can also set up revisions to this information to be applied on specific future dates (for example, if a person's billing price will go up on January 1 of the new year).

Each line in the Employee Revisions sub-tab represents an employee revision with a set of employee information applying to a specific period indicated using the **From Date** and **To Date** fields. The period may have an open starting and/or ending date. When you create a new employee, Maconomy automatically creates a revision on which the starting and ending date are both blank, indicating that this revision applies on all dates.

The employee revision applied on today's date is called the current revision. In the sub-tab, the **Is Current** field is automatically marked on the line containing the current revision. Changing information in the Employees tab causes the information on the current revision to be updated accordingly, and vice versa. Changing the information in the tab (or the current revision in the sub-tab) does not cause a new revision to be created automatically. To keep track of changed employee data, you must create new revisions manually in the sub-tab.

Most of the information in each employee revision is for information only, and is not used in other areas of the system. For instance, the name displayed in the **Employee Name** field in a large number of workspaces is always taken from current revision of the employee, not from the revision applying to data such as the selected entry date. Therefore, unless otherwise specified in the field description of each employee related field in other workspaces, the information shown is retrieved from the current employee revision.

However, on time sheets (both daily and weekly), Maconomy uses the employee revision applying to each date covered by the time sheet to find the right week calendar and calculate fixed working hours.

Example: Hugo Rune's current employee revision

Hugo Rune specifies that his fixed working hours on Monday to Friday is eight hours a day. However, on Wednesday, November 7 2007, this changes to four hours a day. To ensure that this change is automatically reflected in his time sheets, you can create a new revision in the Employee Revisions sub-tab, specifying a starting date of November 7 2007, and entering four hours as the fixed working hours for Monday to Friday. When Hugo Rune creates a weekly time sheet for the week starting on November 5 2007, Maconomy uses eight hours for November 5 and 6, and four hours from the new revision for November 7 and future working days.

When calculating prices on entries in the Job Cost module, Maconomy may also retrieve pricing information from the following fields:

- Cost
- Intercompany Price
- Billing Price
- Standard Billing Price
- Item No.

Maconomy uses the prices for these fields from the revision applying on the specified entry date.

Information about dimension values derived from the employee is not stored in employee revisions, as date dependent dimension derivation is set up in the Derived Dimensions workspace in the G/L module.

To add a new employee revision, add a line in the sub-tab. Information from the revision covering the previous period is automatically copied to the new revision so that you only need to change the information which differs from the current revision.

For each line, you must also specify the period in which the revision should be valid. The period is specified by entering the desired starting date of the period. Maconomy then automatically assigns an ending date in accordance with the nearest starting dates on the other lines in the sub-tab. If you enter a date which lies within the period covered by another line, the new line is assigned the ending date of the line whose period the current line overlaps, and the ending date of that line is changed accordingly.

If you delete a revision, the period of the revision above the deleted revision is prolonged, as it is assigned the ending date of the deleted line. If you delete the first revision, the following revision receives an open starting date.

The line with the latest starting date always has an open ending date, and the line with the earliest ending date always has an open starting date. This ensures that there is an employee revision applying to every date.

## Employees Tab

This section includes the fields and descriptions for the Employees tab.

### Employee Information Island

Field	Description
<b>Employee No.</b>	Enter the number of the new employee. Maconomy verifies that the number does not already exist. The number is the sole and absolute identification of the employee. To retrieve existing employees, you can use the search functions in the Find menu.
<b>Formal First Name</b>	Use this field to enter the person's formal first name. The field is only available if formal names are enabled, in which case it is mandatory. If formal names are enabled, Maconomy will keep the preferred name in sync with the formal name until the preferred name is changed manually.
<b>Formal Middle Name</b>	Use this field to enter the person's formal middle name. The field is only available if formal names are enabled.
<b>Formal Last Name</b>	Use this field to enter the person's formal last name. The field is only available if formal names are enabled, in which case it is mandatory.
<b>Preferred First Name</b>	Use this field to enter the person's preferred first name. The field is only available if F/M/L names are enabled, in which case it is mandatory. If formal names are enabled, Maconomy will keep the preferred name in sync with the formal name until the preferred name is changed manually.
<b>Preferred Middle Name</b>	Use this field to enter the person's preferred middle name. The field is only available if F/M/L names are enabled. If formal names are enabled, Maconomy will keep the preferred name in sync with the formal name until the preferred name is changed manually.
<b>Preferred Last Name</b>	Use this field to enter the person's preferred last name. The field is only available if F/M/L names are enabled, in which case it is mandatory. If formal names are enabled, Maconomy will keep the preferred name in sync with the formal name until the preferred name is changed manually.
<b>Initials</b>	In this field, you can specify the initials by which the employee is known in your company. Maconomy checks that the initials are not used by other employees in the system.
<b>Maiden Name</b>	Use this field to enter the person's maiden name.
<b>Name in Local Alphabet</b>	Use this field to enter the person's name in their local alphabet.

Field	Description
<b>Gender</b>	In this field, you can specify the gender of the employee. The field is for reference only.
<b>Date of Birth</b>	In this field, you can specify the employee's date of birth.
<b>Age</b>	This field shows the age of the current employee, calculated on the basis of the date of birth specified above.
<b>Soc. Security No.</b>	Enter the employee's social security number. This field is for reference only. If you have entered social security number validation rules for the employee's country in the workspace Rules of Validation in the Set-Up module, Maconomy will verify that the social security number complies with these validation rules.
<b>Sales Employee</b>	In this field, you can mark the employee as sales employee. You can only create commission agreements (in the workspace Employee Commission Agreements) for sales employees, and only sales employees can be entered in the "Sales Rep. No." fields in other workspaces in Maconomy.
<b>Account Manager</b>	In this field, you can mark the employee as account manager.
<b>Profession</b>	Enter the employee's profession. This is for reference only.
<b>Education</b>	Enter the employee's education. This is for reference only.
<b>Department</b>	<p>Here you can enter to which department the employee belongs. If you have marked the field "Department from Employee" in the workspace System Information, Maconomy uses the department to select posting references from the workspace Activities when posting time activity entries in the Job Cost module. This makes it possible to post income and costs of time activities to two different departments.</p> <p>Departments are created in the workspace Posting References in the G/L module.</p>
<b>Primary Category</b>	In this field, you can assign the employee in question to a primary employee category to be used for planning of the employee's time in the resource planning module. See also the description of the workspace Employee Categories.
<b>Employee Type</b>	Here you can select the employee type. Employee types are created in the workspace Popup Fields.
<b>Willing to Relocate</b>	Use this field to note if the employee is willing to relocate.
<b>Transfer To People Planner</b>	If this field is marked, the employee will be included in the scheduled import to People Planner. Setting the Transfer To People Planner field will only have an effect if the field is included in the relevant queries in the .I files on the web server.

## Employment Island

Field	Description
<b>Position</b>	Enter the employee's position. This is for reference only.
<b>Alternative Job Title</b>	Use this field to register a job title with a different classification level than Position field. The field corresponds to a similar field in Talent Management.
<b>EEO Classification</b>	Use this field for equal employment opportunity tracking. The field corresponds to a similar field in Talent Management.
<b>Date Employed</b>	Enter the date when the employee started working for you. This is for reference only.
<b>Termination Date</b>	Enter the date the employment was terminated. The date is used in connection with time sheets entered in the Job Cost module, where Maconomy verifies that the employee is actually employed in the period covered by the time sheets.
<b>Time Sheet Start Date</b>	Use this field to enter the date the employee starts using timesheets. Maconomy automatically keeps the field synchronized with the <b>Date Employed</b> field unless you manually enter a different value.
<b>Time Sheet End Date</b>	Use this field to enter the date the employee stops using timesheets. Maconomy automatically keeps the field synchronized with the <b>Termination Date</b> field unless you manually enter a different value.
<b>Blocked</b>	If you mark this field, the employee is blocked. This means the employee cannot be used in any other workspaces in the Job Cost module or as sales representative in a sales order, credit order, invoice, or credit memo.
<b>Permanently Blocked</b>	Select this check box to permanently block the employee record from modification.  When you select this check box, a warning message displays stating you can no longer make changes to the employee record.
<b>Notice Date</b>	If the employee has been terminated or has resigned, you can enter the date on which the employee was given or gave notice in this field.
<b>Retirement Date</b>	In this field, you can specify the date on which the employee has retired or is expected to retire. If you specify a date in this field, Maconomy automatically calculates the employee's retirement age in the field below on the basis of the employee's birthday and the retirement date. If you specify a retirement age manually, the retirement date is calculated as the day on which the employee reaches the specified retirement age.
<b>Retirement Age</b>	In this field, you can specify the age at which the employee has retired or is expected to retire. If you specify an age in this field, Maconomy automatically calculates the retirement date in the field above. The retirement date is calculated as the day on which the employee reaches the age specified in this field. If you specify a retirement date manually,

Field	Description
	the retirement age is calculated on the basis of the employee's birthday and the retirement date.
<b>Length of Service Date</b>	Select the date the person was employed to determine the length of service.
<b>Length of Service</b>	This field displays the number of years the person is employed. This field is automatically computed based on the date entered in the <b>Length of Service Date</b> field.
<b>Previous Employee No.</b>	Use this field to add an employee number from a previous position. Maconomy issues a warning if you enter the number of an existing employee.

**Address island**

Field	Description
<b>Title</b>	Use this field to enter a personal title (for example, Mr., Ms., Dr.) for the person. Maconomy suggests values for the option list 'Personal Titles' but it is possible to enter any value.
<b>Country</b>	Copy to come.

**Contact Information Island**

Field	Description
<b>Phone</b>	In this field, you can specify the primary phone number of the current employee. The field is for reference only.
<b>Phone 2</b>	In this field, you can specify the secondary phone number of the current employee. The field is for reference only.
<b>Mobile</b>	In this field, you can specify the primary mobile phone number of the current employee. The field is for reference only.
<b>Mobile 2</b>	In this field, you can specify the secondary mobile phone number of the current employee. The field is for reference only.
<b>E-mail</b>	In this field, you can specify the e-mail address of the employee. The field is for reference only.
<b>Personal E-mail</b>	Use this field to enter the contact person's personal e-mail address.

**Related Employees Island**

Field	Description
<b>Supervisor</b>	<p>Here you can enter the number of a senior employee. You can enter an employee number for a user in the workspace Users to establish a connection between users and employees. Unless the user has been given access to all time sheets in the workspace Actions, the user will only have access to changing, creating and printing his or her own time sheets and those of junior employees. Furthermore, the user can only approve time sheets for junior employees. This field also shows the name of the supervisor. You cannot change it here.</p> <p>If the supervisor has left/is leaving the company before the employee, Maconomy issues an alert.</p>
<b>Secretary</b>	<p>In this field you can enter the number of a secretary to whom an employee has been assigned. Among the tasks of a secretary can be entering the employee's time sheets and transferring them for further editing in the workspace Job Journal.</p> <p>In the workspace Users, it is possible to enter the employee number of a user by which you create a link between users and employees. Unless the user has been granted access to all time sheets in the workspace Actions, he only has access to editing, creating, and printing out his own and junior employees' time sheets.</p> <p>This field also shows the name of the secretary. The name cannot be changed here.</p>
<b>Mentor</b>	<p>In this field you can enter the number of a mentor assigned to the employee, for instance to help training the employee. The mentor assigned in this field is automatically granted read-only access to the time and expense sheets of the employee in question.</p> <p>This field also shows the name of the mentor. The name cannot be changed here.</p>
<b>Absence Approver</b>	<p>In this field, you can specify the number of the employee responsible for approving absence for the current employee.</p> <p>The specified employee will then be able to submit, approve, reject and reopen absence for the current employee using the actions in the workspaces Employee Absence Calendars, Absence Calendar Lines, and Employee Calendars in the Resource Planning module. Furthermore, the secretary of the specified employee will be able to submit absence for the current employee.</p> <p>If the system parameter "Approval of Absence" has not been marked, the field has no effect.</p> <p>This field shows the name of the absence approver. The name cannot be changed here.</p>

**Substitutes Island**

Field	Description
<b>Substitute 1–5</b>	These fields can be used to support the handling of substitute approvals for the absence management module. Each line will show the substitute approver as determined in the “Substitute” fields in the tab of the workspace.

**Outlay Settlement Island**

Field	Description
<b>Vendor</b>	In this field, you can specify the number of a vendor, thus associating the employee with a vendor in the A/P module. This way, outlay reimbursements to a given employee can be handled through the A/P module. In the workspace Activities in the Job Cost module, you can mark the field “Settle Through Vendor” if outlays made by an employee in connection with a given activity should be reimbursed through a vendor. The reimbursement will then take place through the vendor specified in this field for the employee in question. This field also shows the name of the specified vendor.

**Fixed Working Time Island**

Field	Description
<b>Week Calendar No.</b>	<p>Enter or select a week calendar to assign to the current employee.</p> <p>The functionality of this field is date-dependent. This means that for each date covered by a given time sheet, Maconomy looks up the value in this field in the employee revision covering the date in question, and applies this value to the date in question in the time sheet.</p> <p>Example: Two employee revisions exist for employee Hugo Rune. Revision 1 covers the period up to Tuesday November 6 2007. Revision 2 covers the period from Wednesday November 7 2007 and on. Revision 1 specifies week calendar W1 and Revision 2 specifies week calendar W2. When Hugo Rune creates a time sheet for the week starting Monday November 5, Maconomy uses the employee revisions to identify the week calendar to use for determining work hours, absence, and so on, on each of the days in this time sheet. As a result, week calendar W1 is used for November 5 and 6, and week calendar W2 is used for November 7, 8, and 9.</p> <p>If no week calendar is specified for the employee on a given revision, the employee is assigned the standard week calendar specified by the <b>Standard Week Calendar No.</b> parameter in the System Setup workspace during the period covered by the revision. If you do not specify a week calendar in a given revision and you have not specified a week calendar in the system parameter, the fixed hours of the employee during the period of the revision in question corresponds to the hours specified in the <b>Working Time Monday to Working Time Sunday</b> fields in the revision. For a further description of this functionality, refer to the <b>Working Time</b> field below.</p> <p>If a different week calendar is selected, a warning message displays stating that absence registrations using allowance already exist for the period (employee revision), and changing the value may require allowance adjustment.</p>

Field	Description
	<p>For the current employee revision, the week calendar number in this field may be updated as a result of entering a week calendar on a line in the workspace Employee Positions in the Human Resources module. For further information on this, see the description of the <b>Week Calendar No.</b> field in the workspace Employee Positions.</p>
<b>Working Time (Monday - Friday)</b>	<p>Enter the employee's working hours for each day.</p> <p>If you change an existing working time, a warning message displays stating that absence registrations using allowance already exist for the period (employee revision), and changing the value may require allowance adjustment.</p> <p>You cannot enter a value higher than the one specified in the <b>Maximum Time</b> field in the Job Cost island. The fields in the column correspond to the <b>Working Time Monday</b> to <b>Working Time Sunday</b> fields in the sub-tab. This column with the fixed working time for each weekday is in hours or days, depending on the time unit.</p> <p>The functionality of this field is date-dependent. This means that for each date covered by a given time sheet, Maconomy looks up the value in this field in the employee revision covering the date in question, and applies this value to the date in question in the time sheet.</p> <p>If the employee uses hours, the fixed hours of a given employee on a given day is determined by the hours specified here and in the week calendar which applies to the employee on the date in question, Maconomy using the lower number of hours.</p> <p>You can specify a week calendar for each employee revision. The week calendar can either be specified directly in the <b>Week Calendar No.</b> field on the employee revision, or it can be the standard week calendar specified in the workspace System Parameters. Similar to the fields in this island, a week calendar contains a fixed number of working time for each day.</p> <p>If you do not specify a week calendar in a given revision and you have not specified a week calendar in the workspace System Parameters, the fixed hours of the employee during the period of the revision in question will correspond to the hours specified in the fields "Working Time Monday"–"Working Time Sunday" in the revision (corresponding to the fields in the tab).</p> <p>If the employee should, for example, work part-time for a period, you can therefore enter four hours for each working day in the revision covering the period in question, and let the employee use the standard week calendar. If the in the standard calendar are eight hours, the fixed hours of the part-time employee will still be four hours, as the hours in the employee revision are, in this case, lower than in the week calendar. However, holidays for which no working time has been specified in the standard week calendar will also apply to the part time employee as the number of hours in the week calendar in this case is lower than in the employee revision.</p> <p>If the number of fixed hours is changed for a given employee, either by changing the information on an existing employee revision, by creating or deleting a revision or by editing the week calendar specified for the employee, it also affects time sheets pertaining to the period of the revision created, submitted, or approved</p>

Field	Description
	<p>after the change is made. In other words, the overtime calculation for an employee is also affected for past weeks when you change the employee's number of fixed hours. For more information, please see the description of the action "Submit Time Sheet" in the workspace Time Sheets in the Job Cost module.</p> <p>If you also complete the fields "Check-in," "Check-out," and "Absence" below, the amount of working time in this field must correspond with the work time interval less the specified absence. When these fields are completed, the calculated working time is transferred to this field automatically.</p>
<b>Check in</b>	<p>In the fields in this column, you can enter the time when the current employee is expected to check in for work. As for working hours, this information can be specified in the week calendar as well, and the same rules apply: in case of differences between the week calendar and the information in this workspace, the shorter working time amount prevails. This column cannot be used with employees with Time Unit "Day".</p> <p>The check-in, check-out, and absence may be used in the workspace Time Sheets as a help to ensure that all actual work hours are registered, and that overtime or flex hours are registered correctly as such. For more information, see the description of the field "Registration."</p> <p>The functionality of the fields in this column is date-dependent. This means that for each date covered by a time sheet, Maconomy looks up the value in this field in the employee revision covering the date in question, and applies this value to the date in question in the time sheet.</p> <p>Maconomy tries to assist you in the entry of times in the fields in this island. The fields "Working Time," "Check-in," "Check-out," and "Absence" are all interdependent in the following ways:</p> <p>If:</p> <ul style="list-style-type: none"> <li>▪ Check-in, check-out, or absence have been changed,</li> <li>▪ and Working Hours has not been changed,</li> <li>▪ and check-in and check-out have been completed,</li> </ul> <p>then the field "Working Time" is calculated as check-out time less check-in time less absence and completed.</p> <p>If:</p> <ul style="list-style-type: none"> <li>▪ Check-out has not been completed,</li> <li>▪ and check-in or absence or Working Time have been changed,</li> <li>▪ and check-in has been completed,</li> </ul> <p>then the field "Check-out" is calculated as check-in time plus working time and absence and completed.</p> <p>If:</p> <ul style="list-style-type: none"> <li>▪ Check-in has not been completed,</li> </ul>

Field	Description																								
	<ul style="list-style-type: none"><li>and check-out or absence or Working Hours have been changed,</li><li>and check-out has been completed,</li></ul> <p>then the field “Check-in” is calculated as check-out time less Working Hours less absence and completed.</p> <p>The table below gives examples of the short form of entries and the results when you press Tab or Enter. Note that if you specify a work time interval, you cannot change the field “Working Time” manually.</p> <table><tr><th>Check-In</th><th>Result</th><th>Check-Out</th><th>Result</th><th>Absence</th><th>Hours</th></tr><tr><td>7</td><td>07:00:00</td><td>16</td><td>16:00:00</td><td>0.5</td><td>8.5</td></tr><tr><td>0830</td><td>08:30:00</td><td>1615</td><td>16:15:00</td><td>0.5</td><td>7.3</td></tr><tr><td>22</td><td>22:00:00</td><td>5</td><td>05:00:00</td><td>1</td><td>6.0</td></tr></table> <p>Note also (line 3 in the table above) that it is possible to specify an interval which spans midnight. In this case, the working time is considered to belong to the date on which work was begun.</p>	Check-In	Result	Check-Out	Result	Absence	Hours	7	07:00:00	16	16:00:00	0.5	8.5	0830	08:30:00	1615	16:15:00	0.5	7.3	22	22:00:00	5	05:00:00	1	6.0
Check-In	Result	Check-Out	Result	Absence	Hours																				
7	07:00:00	16	16:00:00	0.5	8.5																				
0830	08:30:00	1615	16:15:00	0.5	7.3																				
22	22:00:00	5	05:00:00	1	6.0																				
Check out	The functionality of this field is similar to that of the field “Check-in” above.																								
Absence	<p>In this field, you can enter how many hours the current employee is expected to be absent for each day in the week. For instance, a half-hour lunch break can be specified as regular absence. Thus, a regular working day of 7.5 hours can be entered like this: Check-in: 9:00; Check-out: 17:00; Absence: 0.5. Result: 7.5 working time, which is transferred to the field “Working Time.”</p> <p>The functionality of this field is date-dependent. This means that for each date covered by a time sheet, Maconomy looks up the value in this field in the employee revision covering the date in question, and applies this value to the date in question in the time sheet. This column cannot be used for employees with Time Unit "Day".</p>																								

### Dimension Combination Island

Field	Description
<b>Dim. Comb. No.</b>	<p>In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the workspace Dimension Combinations.</p> <p>If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the current employee. However, any dimension derivation values specified in this island will be used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the employee information card.</p>

Field	Description
	The functionality on period specific sets of derived dimension values in the workspace Derived Dimensions, which is described in the field "Account" below, also applies to this field.

### Commission Island

Field	Description
<b>Posting Reference</b>	<p>In this field, you enter the number of a dimension combination that contains the G/L account to be used when posting general journals from commission calculations in the Commission Calculation workspace in the Sales Orders module. The dimension combination can also contain other dimension values to be used in this connection. When these general journals are posted, the employee's commission amount is debited this account and the other dimension values in this dimension combination.</p> <p>This field should only be filled in if the employee is a sales representative.</p>
<b>Posting Reference, Offset</b>	<p>In this field, you enter the number of a dimension combination that contains the G/L account to be used when posting general journals from commission calculations in the Commission Calculation workspace in the Sales Orders module. The dimension combination can also contain other dimension values to be used in this connection. When these general journals are posted, the employee's commission amount is credited this account and the other dimension values in this dimension combination.</p> <p>This field should only be filled in if the employee is a sales representative.</p>

### Derived Account Island

Field	Description
<b>Account</b>	<p>In this field, you can enter a value for the dimension Account if you want a value to be derived from the current employee. If you also want the specified value to overwrite existing values for the dimension, complete the field "Overwrite." If you do not choose overwriting, the dimension value will only be derived if the dimension field for which derivation is taking place has neither been completed manually nor by entering a registration code.</p> <p>Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used rather than the value (if any) found for this dimension in the dimension combination in question. This means that the dimension combination only applies to this dimension if you have not entered a value in this field.</p> <p>Please note that if a dimension combination has been specified in the field "Dim. Comb. No.," a mark in the field "Overwrite" will only have effect if you have also entered a dimension value. If you mark the field "Overwrite" but you do not enter a dimension value in this field, the "Overwrite" field is ignored, as dimension values and overwriting specification are always retrieved together from the same dimension derivation island, dimension combination or dimension combination line.</p>

Field	Description
	<p>In the workspace Derived Dimensions, you can create period specific sets of derived dimensions if the dimension values to be derived from the current employee should vary, depending on the entry date of the registrations to which dimension values are derived from the current employee. In this context, the value in this field is always reflected in the corresponding field on the dimension derivation line that has a blank ending date, and changing the dimension values in this field will cause the corresponding information on that dimension derivation line to be updated accordingly, and vice-versa.</p> <p>When you create an employee, Maconomy automatically creates a line in the workspace Derived Dimensions with the information specified in this island, and a blank starting and ending date, indicating that this line applies on all registrations regardless of entry date. In effect, as long as you do not need the dimension values derived from the employee to change on a given date, you only need to enter dimension derivation information in this island.</p> <p>Please note, however, that if you have added period specific set of derived dimensions in the workspace Derived Dimensions, the dimension derivation line that has a blank ending date is not necessarily the dimension derivation line valid on today's date. You should therefore be aware that if period specific sets of derived dimensions have been created for the employee, the dimension values derived from the current employee are not necessarily those appearing in this island.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L Module" as well as the description of the workspaces Dimension Derivation and Dimension Combinations in the G/L module for further information about dimension derivation. For information on period specific sets of derived dimensions, see the workspace Derived Dimensions in the G/L module.</p>
<b>Local Account</b>	Copy to come.

### Derived Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Account" above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Account" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Account" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Account" above.
<b>Spec. 2-3</b>	The functionality of these fields is similar to that of the field "Account" above.

Field	Description
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Account” above.

**Tax Island**

Field	Description
<b>Withholding Rate</b>	Enter the employee’s withholding rate. This field is for reference only.
<b>Allowance per Month</b>	Enter the employee’s monthly tax allowance, if applicable. The amount is entered in the base currency of the company specified in the field “Company No.” This field is for reference only.
<b>Allowance per Fortnight</b>	Enter the employee’s fortnightly tax allowance, if applicable. This field is for reference only. The amount is entered in the base currency of the company specified in the field “Company No.”
<b>Allowance per Week</b>	Enter the employee’s weekly tax allowance, if applicable. This field is for reference only. The amount is entered in the base currency of the company specified in the field “Company No.”
<b>Allowance per Day</b>	Enter the employee’s daily tax allowance, if applicable. This field is for reference only. The amount is entered in the base currency of the company specified in the field “Company No.”
<b>Tax Allowance Card</b>	You can mark this field if the employee has a valid tax allowance card. This field is for reference only.
<b>Tax Allowance</b>	Here you can enter the employee’s total tax allowance. This field is for reference only. The amount is entered in the base currency of the company specified in the field “Company No.”

**Planning Time Island**

Field	Description
<b>Reduction %</b>	<p>In this field, you can enter a reduction percentage of the employee’s available time, “planning time,” as part of the fixed amount of working time. This percentage specifies that the employee in question will not be at the company’s disposal when planning tasks in the workspace Detailed Planning in the Resource Planning module. This might, for example, be the case if an employee often has to take on urgent matters, attend weekly recurring meetings, and so on. In such cases, it might be a disadvantage to make plans for the employee’s entire available time.</p> <p>An employee’s planning time for a given date is calculated as the registered for the day in question divided by the percentage specified in this field. If the value in this field is for example 25% and the fixed working time in a week is 40 hours, the planning time for this week will be <math>40 (25\% \text{ of } 40) = 40 - 10 = 30</math>. See the description of the workspace Detailed Planning in the resource planning module for more information about employees’ planning time.</p>

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Company Island

Field	Description
<b>Company</b>	In this field, you can specify the number of the company in which the employee is employed. This field shows the name of the specified company.
<b>Base Currency</b>	This field shows the base currency used in the company specified in the field "Company No." above. Amounts entered in the island Price Information should be entered in this currency. If you do not enter a currency, Maconomy will automatically use the enterprise currency of the system.

### Personnel Requisition Island

Field	Description
<b>Requisition</b>	<p>If the current employee was created on the basis of a contact person associated with a personnel requisition, for instance because he or she was created as a contact person as a result of applying for a position on a personnel requisition, this field shows the number of the requisition in question.</p> <p>When an employee is created from a contact person associated with a personnel requisition, certain information is transferred from the specified requisition to the new employee. This information includes the requisition number, supervisor, and derived dimensions.</p> <p>This field shows a description of the requisition.</p>

### Creation Island

Field	Description
<b>Template Empl.</b>	If you enter the number of an existing employee here, information from this employee will be copied when you create an employee. Fields where you have already entered a value are not overwritten. The employee name and number appear.
<b>Linking Rule</b>	Use this field to enter a linking rule that describes the linking from the template employee to the new employee. If no value is entered, the standard linking rule will be inserted. It is mandatory to have a linking rule if you have entered a template employee.

### Create User Island

Field	Description
<b>Copy Users From Template</b>	Select this field when creating a new employee to copy the user from the template employee to the new employee.

Field	Description
<b>Create User</b>	Select this field when creating a new employee to create a user attached to the employee. The field is only open when you create a new employee.
<b>User Type</b>	When <b>Create User</b> is selected, you can use this field to select a user type for the new employee.
<b>User Name</b>	Use this field to enter a user name for the new user. If you do not enter a name, the system will generate the name according to setup of user type.
<b>Validity Period</b>	In this field you can enter the new user's validity period.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can specify the name of an access level. You only have access to the current employee if you have been assigned to the same of a higher level in the workspace User Access Levels. This means that you can only specify employees (for example, on a job budget line) to which you have access. Furthermore, a given user can only see the employee card for employees to which the user has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to employees may depend on other factors. For more information about this, please see the section "Introduction to the Access Control System."</p> <p>If no access level is specified, all users have access to the current employee.</p> <p>This field shows the description of the selected access level, as entered in the workspace Access Levels.</p>

### Bank Island

Field	Description
<b>Bank Name</b>	Here you can enter the name of the employee's bank. This field is for reference only.
<b>Reg. No.</b>	Here you can enter the registration number of the employee's bank. This field is for reference only.
<b>Account No.</b>	Here you can enter the employee's bank account number. This field is for reference only.

### Vendor Island

Field	Description
<b>Last Approval List</b>	This field shows the number of the last approval list printed out in the A/P module, on which the current employee has been specified as responsible.

## Job Cost Island

Field	Description
<b>Time Unit</b>	Use this field to specify the unit of time for the employee, as either Hour or Day. This field affects the interpretation of every field that represents time on the employee and will also be the Time Unit on new time sheets created by (or for) the employee in the period covered by the current employee revision.
<b>Base Salary Rate</b>	This is the base salary rate for the employee. If you change this field, Maconomy will update the Cost with the sum of this field and the overhead rate. The base salary rate is per hour or day, depending on the Time Unit.
<b>Overhead Rate</b>	This is the overhead cost rate allocated to the employee. If you change this field, Maconomy will update the Cost with the sum of this field and the base salary rate. The overhead rate is per hour or day, depending on the Time Unit.
<b>Overhead Rate %</b>	Copy to come.
<b>Overhead Rate as &amp;</b>	Copy to come.
<b>Cost</b>	<p>In this field, you can enter the employee's cost per hour or day (depending on Time Unit). This cost is suggested in job budgeting and job journals in the Job Cost module. However, the calculation of cost prices may also depend on other factors.</p> <p>Enter the amount in the base currency of the company specified in the field "Company No." If you leave the field blank, Maconomy will use the cost of the item in the field "Item No." If you leave both fields blank, the cost for time activities for this employee is considered to be zero.</p> <p>The functionality of this field is date-dependent. This means that when creating job entries pertaining to the current employee, Maconomy looks up the value in this field in the employee revision covering the entry date in question, and applies the cost found in that revision.</p>
<b>Intercompany Price</b>	In this field, you can enter a price to be used as the cost when the employee registers hours on a job assigned to another company than the one in which the employee is employed. However, the calculation of cost prices may also depend on other factors, as described in "Appendix A: Price Calculation in the Job Cost Module." Enter the amount in the base currency of the company specified in the field "Company No." The intercompany price is per hour or day, depending on the Time Unit.
<b>Billing Price</b>	Enter the billing price per hour for entries registered by the current employee. This billing price is suggested in job budgeting and job journals in the Job Cost module if you have specified in the field "Hourly Rate" in the workspace System Information that hourly costs are determined by employee. If it is not, Maconomy alerts you if you enter a price here anyway. However, the

Field	Description
	<p>calculation of billing prices may also depend on other factors. The billing price is per hour or day, depending on the Time Unit.</p> <p>If you do not enter a price here and hourly costs are by employee, Maconomy will use the billing price of the item in the field "Item No." (see below). If both fields are blank, the billing price for time activities for this employee is considered to be zero.</p> <p>Enter the amount in the base currency of the company specified in the field "Company No."</p> <p>The functionality of this field is date-dependent. This means that when creating job entries pertaining to the current employee, Maconomy looks up the value in this field in the employee revision covering the entry date in question, and applies the billing price found in that revision.</p>
<b>Standard Billing Price</b>	<p>In this field, you can enter the standard billing price per hour for entries registered by the current employee. The standard billing price will be used if the system parameter "Use standard billing price for time activities" is marked, otherwise the standard billing price is set to equal the registered billing price. However, the calculation of standard billing prices may also depend on other factors, as described in "Appendix A: Price Calculation in the Job Cost Module." The standard billing price is per hour or day, depending on the Time Unit.</p> <p>A standard billing price can be used as a measuring point for performance analyses in which you compare the actual, registered billing price with the standard billing price. In this way, the standard billing price acts as a target price which should be achieved for this activity. The standard billing price is derived in the same way as the regular billing price, except that the item price list system is not used.</p> <p>The functionality of this field is date-dependent. This means that when creating job entries pertaining to the current employee, Maconomy looks up the value in this field in the employee revision covering the entry date in question, and applies the standard billing price found in that revision.</p>
<b>Item No.</b>	<p>Here you can enter a warehouse item, from which the sales price and cost will be suggested in budgeting, and which will be used in job journal entries for this employee. You can use such an item price to simplify the assignment of billing prices for billable hours. Rather than entering a billing price for each individual employee, you need only create a warehouse item that can be assigned to one or more employees. Different levels of billing rates can be set up as separate items.</p> <p>An item number in this field will not be used if you enter price in the field "Cost," and if you either enter a price in the field "Billing Price" or mark in the workspace System Information that hourly costs are to be determined by activity. Maconomy will alert you if this is the case.</p> <p>Maconomy verifies that the item you enter here exists in the system and is not discontinued.</p> <p>The functionality of this field is date-dependent. This means that when creating job entries pertaining to the current employee, Maconomy looks up</p>

Field	Description
	the value in this field in the employee revision covering the entry date in question, and applies the item number found in that revision.
<b>Job Price Group No.</b>	<p>In this field you can assign the current employee to a job price group. When you refer to this job price group on a line in a job price list, the price on that price list line is used on job entries where</p> <ul style="list-style-type: none"> <li>▪ The current employee is specified.</li> <li>▪ The job which the entry concerns uses the job price list in question.</li> <li>▪ The information in the job entry also matches any other selection criteria on the job price list line.</li> </ul> <p>For further information about job price groups, please see the description of the workspace Job Price Groups in the Job Cost module.</p> <p>The functionality of this field is date-dependent. This means that when creating job entries pertaining to the current employee, Maconomy looks up the value in this field in the employee revision covering the entry date in question, and applies the job price group found in that revision.</p>

### Time Registration Island

Field	Description
<b>Maximum Working Time</b>	<p>Here you can enter the maximum number of time per day that can be entered for the employee in the workspace Time Sheets in the Job Cost module. This field is per hour or day, depending on the Time Unit.</p> <p>The functionality of this field is date-dependent. This means that for each date covered by a time sheet, Maconomy looks up the value in this field in the employee revision covering the date in question, and applies this value to the date in question in the time sheet.</p>
<b>Use Fixed Working Time as Maximum</b>	Copy to come.
<b>Minimum Working Time</b>	<p>In this field, you can specify whether a minimum amount of working time is to be calculated for the employee. If you mark the field, a minimum amount of working time is calculated for each week day. The minimum number of time corresponds to the fixed time less the number specified in the field "Deviation Allowed." When the employee submits a time sheet, Maconomy checks if the minimum number of time has been registered. If not, the time sheet cannot be submitted. For a further description of fixed working time, please see the description of the fields in the island Fixed Working Time and the workspace Week Calendars. This field is per hour or day, depending on the Time Unit.</p> <p>The functionality of this field is date-dependent. This means that for each date covered by a time sheet, Maconomy looks up the value in this field in the</p>

Field	Description
	employee revision covering the date in question, and applies this value to the date in question in the time sheet.
<b>Deviation Allowed</b>	<p>If you have marked the field “Minimum Hours,” you can specify a number of hours in this field. Along with the fixed working time, the amount in this field is used for calculating the minimum amount of time which the employee must specify for each day in a time sheet. The minimum number of hours is calculated as the fixed working time less the number in this field. When the employee submits a time sheet, Maconomy checks if the minimum number of hours has been registered for each day. If not, the time sheet cannot be submitted. For a further description of this, please see the description of the fields in the island and the workspace Week Calendars.</p> <p>The functionality of this field is date-dependent. This means that for each date covered by a time sheet, Maconomy looks up the value in this field in the employee revision covering the date in question, and applies this value to the date in question in the time sheet.</p>
<b>Must Use Time Sheets</b>	<p>If this field is marked, the current employee is forced to create time sheets. The usual time sheet workflows apply with regard to submission and approval and so on, and the time sheets will appear in reports such as Print Time Sheet Overview. In the Portal, the Time Sheet Status component will color code the weeks for which no time sheet has been created, thus prompting for the creation of a time sheet. This is standard Maconomy behavior.</p> <p>If the field is not marked, the employee is not forced to create time sheets. If he does so anyway, the usual time sheet workflow applies, and they will appear in reports. In the Portal, the Time Sheet Status component will not color code the weeks for which no time sheet has been created.</p> <p>The functionality of this field is date-dependent. This means that for each date, Maconomy looks up the value in this field in the employee revision covering the date in question, and applies this value to the date in question to determine whether a time sheet must be created.</p>
<b>Absence Hours per Day</b>	<p>Enter the maximum number of absence hours per day.</p> <p>By default, the value in this field is zero.</p> <p>You must enter a value other than zero if the time unit on an invoked vacation period has been or is <b>Hours</b>.</p> <p>You must also enter a value other than zero if employees are to receive allowance in hours.</p> <p>An error message displays if the functionality invokes this conversion value and the value is still zero.</p> <p>If you change the value in this field, the current employee revision is also updated.</p> <p>If you change the value in this field, a warning message displays stating that absence registrations using allowance already exist for the the period (employee revision), and changing the value may require allowance adjustment.</p> <p>An error message displays if the value is set to a negative number or more than 24 hours.</p>

### Check-in Island

Field	Description
<b>Check-in</b>	<p>Select one of the following options to enable or disable multiple check-in entries for the employee:</p> <ul style="list-style-type: none"> <li>▪ <b>Disabled</b> - Select this option to disable multiple check-ins for the employee.</li> <li>▪ <b>Optional</b> - Select this option to enable multiple check-in entries per day. However, the employee is not required to submit check-in entries on any work day. When the employee submits the time sheet, Maconomy does not validate the check-in balance.</li> <li>▪ <b>Required</b> - If the work day has fixed hours, selecting this option requires the employee to register at least one check-in entry for the day.</li> <li>▪ <b>Required with Balance</b> - Select this option to require the employee to register at least one check-in entry for the day. Maconomy automatically validates check-in balance when the timesheet is submitted.</li> </ul>

### Check-in/out Time Entry Island

Field	Description
<b>Registration</b>	<p>In this field you can specify if the current employee should be required to specify actual check-in and check-out times as well as absence on his or her time sheet.</p> <p>In the time sheet, the employee can enter the time of his or her check-in (coming) and check-out (leaving). Furthermore, any extraordinary absence can be registered, such as, for example, private appointments. These times are used to calculate the actual working time for each day in the time sheet. The actual working time is compared with the hours registered on tasks in the sub-tab of the time sheet. In case of differences, Maconomy can prompt the user for corrective entries or additional registrations. Furthermore, in case of a deviation between the expected working time (defined in this workspace or in the week calendar) and the actual working time as calculated in the time sheet, Maconomy may require the user to enter a value in a pop-up field, for example, to specify if the difference should count as overtime or flextime. The options for this pop-up field are entered in the pop-up "Time Sheet Popup 1" in the workspace Popup Fields.</p> <p>This way, the check-in, check-out, and absence times may be used in the workspace Time Sheets as a help to ensure that all actual work hours are registered, and that overtime or flextime is registered correctly as such.</p> <p>The field can have one of three values:</p> <ul style="list-style-type: none"> <li>▪ <b>Optional</b> — If this value is selected, the employee may register actual check-in and check-out times and absence (work time intervals) in the time sheet.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Mandatory</b> — If this value is selected, the employee is required to register actual work time intervals in the time sheet before the time sheet can be submitted.</li> <li>▪ <b>At Overtime</b> — If this value is selected, the employee is required to register actual work time intervals in the time sheet if the sub-tab entries amount to more hours than the employee's.</li> <li>▪ <b>Not Allowed</b> — For employees with Time Unit "Day," the value "Not Allowed" must be selected.</li> </ul>
<b>Deviation Allowed</b>	<p>The allowed deviation specified in this field refers to the maximum permitted difference between actual working hours and the number of registered hours. The difference is shown in the field "Balance" in the time sheet. This field cannot be completed for employees with Time Unit "Day."</p> <p>If registration of actual work hours intervals is required ("Mandatory" is selected in the field "Registration" above), it will only be possible to submit a time sheet if the balance is zero. In order to allow for a small balance, you can set this field to, for example, a half-hour.</p> <p>Furthermore, it will be possible to configure Maconomy to require the employee to enter actual work time intervals, but still submit time sheets even though the balance is different from zero: Set the field "Registration" above to "Mandatory," and set the allowed deviation for the employee to a high value, for example, 24 hours.</p> <p>The functionality of this field is date-dependent. This means that for each date covered by a time sheet, Maconomy looks up the value in this field in the employee revision covering the date in question, and applies this value to the date in question in the time sheet.</p>

### Document Archive Island

Field	Description
<b>Document Archive</b>	<p>In this field, you can assign a document archive to the employee in question. The document archive assigned to an employee can, for example, contain files such as the CV and the employment contract of the employee or other documents relevant to the employee in question. You can only specify a document archive to which you have been granted access. Document archives are created in the workspace Document Archives in the Set-Up module. See the description of that workspace for further information on the use of document archives.</p> <p>This field also shows the description of the specified document archive.</p>

**Contact Person Island**

Field	Description
<b>Contact Person No.</b>	<p>If the current employee is assigned to a contact person, this field shows the number of the contact person in question. When creating an employee, you can assign the employee to an existing contact person by specifying the number of the contact person in question in this field. However, if the system parameter “Aut. creation of contact person” is marked, you cannot specify a contact person when creating an employee, as Maconomy will then automatically create a contact person and assign it to the new employee.</p> <p>Assigning an employee to a contact person is necessary if you wish to use the Contact Management module's event flow functionality to register, for example, historical employee information or keep track of information such as the projects in which the employee has been involved or courses he or she has taken.</p>

**Subcontractor Island**

Field	Description
<b>Subcontractor</b>	<p>In this field you can select a subcontractor vendor number (if any) for the employee. Job entries posted for the employee will have the reconciliation subcontractor number assigned accordingly. This serves as a base to match them against Vendor Invoices when approving Invoice Allocation/Reallocation in “Invoice Allocation” or “Reallocate Invoices” dialogs. This field also shows the name of the specified subcontractor.</p>

**Salary Island**

Field	Description
<b>Base Salary</b>	<p>Here you can enter the employee's base salary. The amount must be entered in the base currency of the company specified in the field “Company No.” You can also add a code next to the salary amount. The code can denote a salary group, and so on. The fields are for reference only.</p>
<b>Salary Supplement</b>	<p>Here you can enter the employee's salary supplement, if applicable. The amount must be entered in the base currency of the company specified in the field “Company No.” You can also add a salary code in the text field. The fields are for reference only.</p>
<b>Overtime Rate</b>	<p>Here you can enter the employee's hourly rate for overtime work. The amount must be entered in the base currency of the company specified in the field “Company No.” You can also add a salary code in the text field. The fields are for reference only.</p>

**Pension Island**

Field	Description
<b>Pension Plan</b>	These two fields are used for marking whether the employee has a private pension plan or has joined the company pension plan or both. The fields are for reference only.
<b>Pension Type</b>	These two fields are used for describing the employee's pension plans. The fields are for reference only.
<b>Amount</b>	Here you can enter the amounts to be paid towards the employee's pension. The amounts must be entered in the base currency of the company specified in the field "Company No.," and the fields are for reference only.

**Absence Management Island**

Field	Description
<b>Vacation Calendar</b>	Enter or select the vacation calendar of the employee.

**Notify Employee When Island**

Field	Description
<b>Specified as Responsible for Invoice Allocation</b>	In this field, you can specify whether the employee prefers to be notified when specified as responsible for allocating an invoice. The field is for information only, as Maconomy does not automatically notify the employee.
<b>Specified as Responsible for Approval</b>	In this field, you can specify whether the employee prefers to be notified when specified as responsible for approving, for example, a purchase order or an expense sheet. The field is for information only, as Maconomy does not automatically notify the employee.

**Remarks Island**

You can use these text fields for any notes or comments on the employee.

**Print Control Island**

Field	Description
<b>Statistics 1-4</b>	In these fields, you can enter a number of statistics codes for further specification of the employee. The statistics codes can, for example, be used as selection criteria in a number of printouts.

**Option List Fields Island**

Field	Description
<b>List</b>	In these fields, you can select a number of option lists containing values that you wish to use for further specification of the employee. In the fields "Value" in this island, you can

Field	Description
	then select values from these lists. If you do not enter an option list in one of the option list fields, you can enter any value in the corresponding value field.
<b>Value</b>	In these fields, you can specify values available in the respective option lists specified in this island. If you have not entered an option list in one of the option list fields, you can enter any value in the corresponding value field.

#### Extra Fields Island

Field	Description
<b>Popup 1-5</b>	In these fields, you can select various information about the employee. These are pop-up fields, which means that you can choose from the options created for each field. They are created as values Employee Popup 1 – Employee Popup 5 in the Popup Fields workspace.

#### Talent Management Island

Field	Description
<b>User Id.</b>	In this field you can enter an ID of a Talent Management user to map to this employee. Once the Talent Management user is linked with the employee, the data is copied from the user to the employee. You cannot update mapped fields manually when this field has a value. If this field is left blank, then the employee is not linked with any Talent Management user and all mandatory fields have to be entered manually. If you change a value of this field, then the employee is re-linked with the corresponding Talent Management user. All mapped fields are overwritten with linked Deltek Talent Management user data. If this field has value that is deleted later, then the employee is unlinked from the Talent Management user, and all fields can only be updated manually. Notice that the supervisor is not overridden if no supervisor is specified in Talent Management OR if the specified Talent Management user is not linked to a Maconomy employee. If Talent Management is used where the supervisor relationship is not managed in Talent Management, the layout of the Employees workspace must be modified to allow this information to be entered in Maconomy.

#### Contact Person island

Field	Description
<b>Title</b>	Use this field to enter a personal title (for example, Mr., Ms., Dr.) for the person. Maconomy suggests values for the option list 'Personal Titles' but it is possible to enter any value.
<b>Maiden Name</b>	Use this field to enter the contact person's maiden name.
<b>Name in Local Alphabet</b>	Use this field to enter the contact person's name in his local alphabet.

Field	Description
<b>Personal E-mail</b>	Use this field to enter the contact person's personal e-mail address.
<b>Previous Employee No.</b>	Use this field to add an employee number from a previous position. Maconomy issues a warning if you enter the number of an existing employee.

### Employees island

Field	Description
<b>Maiden Name</b>	Use this field to enter the contact person's maiden name.
<b>Name in Local Alphabet</b>	Use this field to enter the contact person's name in their local alphabet.
<b>Willing to Relocate</b>	Use this field to note if the employee is willing to relocate.
<b>Alternative Job Title</b>	Use this field to register a job title with a different classification level than Position field. The field corresponds to a similar field in Talent Management.
<b>EEO Classification</b>	Use this field for equal employment opportunity tracking. The field corresponds to a similar field in Talent Management.
<b>Date Employed</b>	The functionality of this existing field is changed so that time sheet registrations are no longer validated against this field. Instead, they are validated against the <b>Time Sheet Start Date</b> field. Likewise, calculation of missing time sheet notifications is based on <b>Time Sheet Start Date</b> field.
<b>Termination Date</b>	The functionality of this existing field is changed so that time sheet registrations are no longer validated against this field. Instead, they are validated against the new <b>Time Sheet Start Date</b> field.
<b>Time Sheet Start Date</b>	Use this field to enter the date the employee starts using timesheets. Maconomy will automatically keep the field synchronized with the <b>Date Employed</b> field unless you manually enter a different value.
<b>Time Sheet End Date</b>	Use this field to enter the date the employee stops using timesheets. Maconomy will automatically keep the field synchronized with the <b>Termination Date</b> field unless you manually enter a different value.
<b>Previous Employee No.</b>	Use this field to enter an employee number for a previous employment. Maconomy issues a warning if you enter the number of an existing employee.
<b>Title</b>	You can use this field to enter a personal title (for example, Mr., Ms., Dr.) for the employee. Maconomy suggests values from the <b>Personal Titles</b> option list but it is possible to enter any value.

Field	Description
<b>Personal E-mail</b>	Use this field to enter the employee's personal email address.
<b>Personnel Requisition</b>	When Talent Management integration is enabled, this field displays the requisition no. from Talent Management. When Talent Management integration is disabled, the functionality is unchanged. The Maconomy personnel requisition is displayed.
<b>Maiden Name</b>	Use this field to enter the contact person's maiden name.
<b>Name in Local Alphabet</b>	Use this field to enter the contact person's name in their local alphabet.
<b>Willing to Relocate</b>	Use this field to note if the employee is willing to relocate.
<b>Alternative Job Title</b>	Use this field to enter a job title with a different classification level than Position field. The field corresponds to a similar field in Talent Management.
<b>EEO Classification</b>	Use this field for equal employment opportunity tracking. The field corresponds to a similar field in Talent Management.
<b>Time Sheet Start Date</b>	Use this field to enter the date the employee starts using timesheets. Maconomy automatically keeps the field synchronized with the <b>Date Employed</b> field unless you manually enter a different value.
<b>Time Sheet End Date</b>	Use this field to enter the date the employee stops using timesheets. Maconomy automatically keeps the field synchronized with the <b>Termination Date</b> field unless you manually enter a different value.
<b>Title</b>	Use this field to enter a personal title (for example, Mr., Ms., Dr.) for the employee. Maconomy suggests values from the <b>Personal Titles</b> option list but it is possible to enter any value.
<b>Personal E-mail</b>	Use this field to enter the employee's personal email address.

### Employee Revisions Sub-Tab

The functionality of each field in the sub-tab of this workspace is similar to the one described for the corresponding field in the tab.

However, the fields in the island Derived Dimensions are not included in the sub-tab, as date-dependent dimension derivations are set up in the workspace "Derived Dimensions" in the G/L module. In the Minimum Hours, the value specified here only takes effect within the period specified on the Employee Revision line. In addition to the fields in the tab, the sub-tab contains the fields "From Date" and "To Date" whose functionality is described in the introduction to date-dependent employee revisions.

Field	Description
<b>Check-in</b>	<p>Select one of the following options to enable or disable multiple check-in entries for the employee:</p> <ul style="list-style-type: none"> <li>▪ <b>Disabled</b> - Select this option to disable multiple check-ins for the employee.</li> <li>▪ <b>Optional</b> - Select this option to enable multiple check-in entries per day. However, the employee is not required to submit check-in entries on any work day. When the employee submits the time sheet, Maconomy does not validate the check-in balance.</li> <li>▪ <b>Required</b> - If the work day has fixed hours, selecting this option requires the employee to register at least one check-in entry for the day.</li> <li>▪ <b>Required with Balance</b> - Select this option to require the employee to register at least one check-in entry for the day. Maconomy automatically validates check-in balance when the timesheet is submitted.</li> </ul>
<b>Absence Hours per Day</b>	<p>Enter the maximum number of absence hours per day. By default, the value in this field is zero. You must enter a value other than zero if the time unit on an invoked vacation period has been or is <b>Hours</b>. You must also enter a value other than zero if employees are to receive allowance in hours. An error message displays if the functionality invokes this conversion value and the value is still zero. If you change the value in this field, the current employee revision is also updated. If you change the value in this field, a warning message displays stating that absence registrations using allowance already exist for the the period (employee revision), and changing the value may require allowance adjustment. An error message displays if the value is set to a negative number or more than 24 hours.</p>
<b>Working Time (Monday - Friday)</b>	<p>Enter the employee's working hours for each day. If you change an existing working time, a warning message displays stating that absence registrations using allowance already exist for the period (employee revision), and changing the value may require allowance adjustment. You cannot enter a value higher than the one specified in the <b>Maximum Time</b> field in the Job Cost island. The fields in the column correspond to the <b>Working Time Monday</b> to <b>Working Time Sunday</b> fields in the sub-tab. This column with the fixed working time for each weekday is in hours or days, depending on the time unit. The functionality of this field is date-dependent. This means that for each date covered by a given time sheet, Maconomy looks up the value in this field in the employee revision covering the date in question, and applies this value to the date in question in the time sheet. If the employee uses hours, the fixed hours of a given employee on a given day is determined by the hours specified here and in the week calendar which applies to</p>

Field	Description
	<p>the employee on the date in question, Maconomy using the lower number of hours.</p> <p>You can specify a week calendar for each employee revision. The week calendar can either be specified directly in the <b>Week Calendar No.</b> field on the employee revision, or it can be the standard week calendar specified in the workspace System Parameters. Similar to the fields in this island, a week calendar contains a fixed number of working time for each day.</p> <p>If you do not specify a week calendar in a given revision and you have not specified a week calendar in the workspace System Parameters, the fixed hours of the employee during the period of the revision in question will correspond to the hours specified in the fields “Working Time Monday”–“Working Time Sunday” in the revision (corresponding to the fields in the tab).</p> <p>If the employee should, for example, work part-time for a period, you can therefore enter four hours for each working day in the revision covering the period in question, and let the employee use the standard week calendar. If the in the standard calendar are eight hours, the fixed hours of the part-time employee will still be four hours, as the hours in the employee revision are, in this case, lower than in the week calendar. However, holidays for which no working time has been specified in the standard week calendar will also apply to the part time employee as the number of hours in the week calendar in this case is lower than in the employee revision.</p> <p>If the number of fixed hours is changed for a given employee, either by changing the information on an existing employee revision, by creating or deleting a revision or by editing the week calendar specified for the employee, it also affects time sheets pertaining to the period of the revision created, submitted, or approved after the change is made. In other words, the overtime calculation for an employee is also affected for past weeks when you change the employee’s number of fixed hours. For more information, please see the description of the action “Submit Time Sheet” in the workspace Time Sheets in the Job Cost module.</p> <p>If you also complete the fields “Check-in,” “Check-out,” and “Absence” below, the amount of working time in this field must correspond with the work time interval less the specified absence. When these fields are completed, the calculated working time is transferred to this field automatically.</p>
<b>Week Calendar No.</b>	<p>Enter or select a week calendar to assign to the current employee.</p> <p>The functionality of this field is date-dependent. This means that for each date covered by a given time sheet, Maconomy looks up the value in this field in the employee revision covering the date in question, and applies this value to the date in question in the time sheet.</p> <p>Example: Two employee revisions exist for employee Hugo Rune. Revision 1 covers the period up to Tuesday November 6 2007. Revision 2 covers the period from Wednesday November 7 2007 and on. Revision 1 specifies week calendar W1 and Revision 2 specifies week calendar W2. When Hugo Rune creates a time sheet for the week starting Monday November 5, Maconomy uses the employee revisions to identify the week calendar to use for determining work hours, absence, and so on, on each of the days in this time sheet. As a result, week</p>

Field	Description
	<p>calendar W1 is used for November 5 and 6, and week calendar W2 is used for November 7, 8, and 9.</p> <p>If no week calendar is specified for the employee on a given revision, the employee is assigned the standard week calendar specified by the <b>Standard Week Calendar No.</b> parameter in the System Setup workspace during the period covered by the revision. If you do not specify a week calendar in a given revision and you have not specified a week calendar in the system parameter, the fixed hours of the employee during the period of the revision in question corresponds to the hours specified in the <b>Working Time Monday to Working Time Sunday</b> fields in the revision. For a further description of this functionality, refer to the <b>Working Time</b> field below.</p> <p>If a different week calendar is selected, a warning message displays stating that absence registrations using allowance already exist for the period (employee revision), and changing the value may require allowance adjustment.</p> <p>For the current employee revision, the week calendar number in this field may be updated as a result of entering a week calendar on a line in the workspace Employee Positions in the Human Resources module. For further information on this, see the description of the <b>Week Calendar No.</b> field in the workspace Employee Positions.</p>

## Actions

This section shows the Actions in the Employees workspace.

### Top Tab

Field	Description
<b>Attach Document</b>	This action enables you to attach a document to the employee record.
<b>Sync. with Talent Management</b>	This action updates the employee with the latest user data from Talent Management. Employees are updated only if they have a Talent Management user ID and the user has changed since the last synchronization.

## Employee Categories Single Dialogs Workspace

Use this workspace to set up employee categories, which are groups of people who share common features (for example, employees from the same department or in the same position).

Each employee category has its own price information, including cost price, intercompany price, sales price, and a price group, if applicable. This enables you to calculate costs in a job budget based on employee categories, rather than specific employees.

Each employee can have one primary category and an unlimited number of secondary categories.

An employee category is a certain group of employees who have specific common features. They can, for instance, have common technical or educational skills, belong to the same department, or work in the same physical location. An employee can belong to several categories, if, for example, he or she performs different work tasks. Each employee who belongs to a category always belongs to one primary category.

## Employee Categories Tab

This section includes the fields and descriptions for the Employee Categories tab.

### Employee Category Island

Field	Description
<b>Employee Category</b>	In this field, you enter the number of the employee category. The number cannot be changed, when you have pressed Return. In this field, you also enter the name of the employee category.
<b>Transfer to People Planner</b>	If this field, is marked the employee category will be included in the scheduled import to People Planner. Setting the Transfer To People Planner field will only have an effect if the field is included in the relevant queries in the .I files on the web server.
<b>Generic Resource</b>	Select this check box to set an employee as a budget planning resource. If selected, People Planner identifies the employee as a dummy employee. If deselected, the employee is identified as a real employee and, subsequently, impacts the People Planner license count. By default, this field is not selected.
<b>Export or Update Employee in Deltak CRM</b>	Use this action to export or update a specific employee from Maconomy, and create a background task to create or update the selected employee in Deltak CRM.

### Company Island

Field	Description
<b>Company</b>	If you enter a company number in this field, all employees in the current category must belong to the specified company. If you do not enter a company number, employees from any company can be assigned to the current employee category. This field also shows the name of the specified company.
<b>Base Currency</b>	This field shows the base currency used in the company specified in the field "Company No." above. Amounts entered in the island Price Information should be entered in this currency. If you do not enter a currency, Maconomy will automatically use the enterprise currency of the system.

## Price Information Island

Field	Description
<b>Time Unit for Prices</b>	In this field you can enter the time unit for the prices on the employee category.

Field	Description
<b>Cost</b>	<p>This is the sum of the base salary rate and the overhead rate. If you change this field directly and the overhead rate is zero, then the base salary rate will be updated to the same amount; otherwise, the overhead rate will be updated. This cost price will be used in cases where an employee category has been specified instead of a specific employee on a line in a job budget in the workspace Job Budgets. However, the cost price from the employee category is only used if you have selected one of the values "By Employee" or "Employee Priority" in the field "Hourly Rate" in the workspace System Information in the Set-Up module.</p> <p>If you select the action "Calculate Average Prices," the fields in this island are filled in with the average of the prices specified for the members of the current employee category converted into the base currency shown in the island Company. See the description of the action "Calculate Average Prices" for further information on this action.</p>
<b>Base Salary Rate</b>	This is the base salary rate per hour or day (depending on the time unit) for the employee category. If you change this field, Maconomy updates the Cost with the sum of this field and the overhead rate.
<b>Overhead Rate</b>	This is the overhead cost rate per hour or day (depending on the time unit) allocated to the employee category. If you change this field, Maconomy will update the Cost with the sum of this field and the base salary rate.
<b>Intercompany Price</b>	The value of this field is the intercompany price per hour or day (depending on the time unit). The functionality of this field is similar to that of the <b>Cost</b> field.
<b>Billing Price</b>	The value of this field is the billing price per hour or day (depending on the time unit). The functionality of this field is similar to that of the <b>Cost</b> field.
<b>Standard Billing Price</b>	The value of this field is the standard billing price per hour or day (depending on the time unit). The functionality of this field is similar to that of the <b>Cost</b> field.
<b>Job Price Group No.</b>	In this field, you can assign a job price group to the current employee category. If you specify an employee category but no specific employee on a job budget line, Maconomy automatically checks the field "Price Group, Empl." on each line of the job price list assigned to the job, if any, to find the job price group number in this field and, in this way, to find the correct price. The number in this field is thus used instead of the job price group which can be defined for each single employee in those cases where a budget line contains an employee category but no employee number.

**Selection Criteria Island**

Field	Description
<b>Show Lines</b>	In this field, you can mark whether the sub-tab should display information about the employees in the current employee category who meet the criteria specified in this island. If you do not mark the field, no lines are displayed in the sub-tab of this workspace.
<b>Employee No.</b>	In these fields, you can enter a range of employee numbers. The sub-tab will only show employees in the current employee category with numbers within the specified range.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. The sub-tab will only display employees in the employee category who have been assigned to a company whose number is within the specified range.
<b>Department</b>	The functionality of this field is similar to that of the field "Location."
<b>Employee Type</b>	The functionality of this field is similar to that of the field "Location."

**Remarks Island**

In these fields, you can assign remarks to the current employee category.

**Access Level Island**

Field	Description
<b>Access Level</b>	<p>In this field, you can enter the name of an access level created in the workspace Access Levels in the Set-Up module. If you enter an access level, only users, who in the workspace User Access Levels have been given access to the level in question or a level above the specified level, can see and change information about the current employee category in this workspace.</p> <p>Moreover, when entering information such as planning lines and job budget lines, a given user will only be able to enter employee categories with access levels to which the user himself has access. A user does not need access to the employee category to which a given employee is assigned to specify the employee on, for example, planning lines and job budget lines. Instead, when entering an employee number, Maconomy checks whether the user has access to the access level specified for the employee in question in the tab of the workspace Employees.</p> <p>This field also shows the description of the specified access level.</p>

**Membership Criteria Island**

Field	Description
<b>Department</b>	The functionality of this field is similar to that of the field "Location."

Field	Description
<b>Employee Type</b>	The functionality of this field is similar to that of the field "Location."

**Membership Criteria, Dimensions Island**

Field	Description
<b>Location</b>	In this field, you can enter the name of a location. If you enter a location, only employees assigned to the location in question can be members of the employee category.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location."
<b>Project</b>	The functionality of this field is similar to that of the field "Location."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location."
<b>Specification 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."

**Copy Employee List Island**

Field	Description
<b>Copy From Category</b>	<p>In this field, you can enter an employee category number. When you select the action "Copy Employee List," the employees in the specified category will be included in the copied employee category.</p> <p>This field also shows the name of the specified employee category.</p>

**User Island**

See the Getting Started topic for a description of the fields in the island User.

**Selection Criteria, Dimensions Island**

Field	Description
<b>Location</b>	In these fields, you can enter a range of locations. The sub-tab will only display employees in the current employee category who in have been assigned to a location within the specified range.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location."
<b>Project</b>	The functionality of this field is similar to that of the field "Location."

Field	Description
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location."
<b>Specification 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."

### Employee Category Members Sub-Tab

This section includes the fields and descriptions for the Employee Category Members sub-tab.

Field	Description
<b>Employee No.</b>	In this field, you can enter the number of an employee to be assigned to the employee category. You can remove an employee from the category by deleting the table line, but only if the employee category in question is not assigned to a job budget line for an open job.
<b>Name</b>	This field shows the name of the employee specified in the field "Employee No." above.
<b>Primary Category</b>	<p>If you mark this field, the current employee category will be the primary category of the employee specified on the line. This category will thus be the category which is the best fitting selection for the employee in question. A senior consultant can, for example, belong to both the category "Senior Consultant" and the category "Consultant," but his primary category will be "Senior Consultant." If an employee belongs to several employee categories, you always have to assign the employee a primary category.</p> <p>If you mark this field for an employee who is already assigned to another primary category, the mark in the field "Primary Category" on the other employee category will automatically be removed. When an employee is assigned to an employee category for the first time, this field is automatically marked.</p> <p>The selection of a primary category can have influence when resolving exceeding task allocation. See the description of the island Resource Planning in the workspace System Information for further information on this topic.</p>
<b>Cost</b>	This field displays the cost price of the employee specified in the field "Employee No." The amount is displayed in the base currency of the company to which the employee is assigned.
<b>Base Salary Rate</b>	This is the base salary rate for the employee category. If you change this field, Maconomy will update the Cost with the sum of this field and the overhead rate.

Field	Description
<b>Overhead Rate</b>	This is the overhead cost rate allocated to the employee category. If you change this field, Maconomy will update the Cost with the sum of this field and the base salary rate.
<b>Intercompany Price</b>	This field displays the intercompany price of the employee specified in the field "Employee No." The amount is displayed in the base currency of the company to which the employee is assigned.
<b>Billing Price</b>	This field displays the billing price of the employee specified in the field "Employee No." The amount is displayed in the base currency of the company to which the employee is assigned.
<b>Standard Billing Price</b>	The functionality of this field is similar to that of the field "Cost."
<b>Time Unit</b>	This field displays the time unit for the employee (member of the employee category). The prices in the sub-tab are displayed per hour or day, depending on this unit.
<b>Base Currency</b>	This field displays the base currency of the company to which the employee is assigned.
<b>Company</b>	This field displays the company to which the employee has been assigned.
<b>Position</b>	The functionality of this field is similar to that of the field "Company."
<b>Profession</b>	The functionality of this field is similar to that of the field "Company."
<b>Education</b>	The functionality of this field is similar to that of the field "Company."
<b>Department</b>	The functionality of this field is similar to that of the field "Company."
<b>Employee Type</b>	The functionality of this field is similar to that of the field "Company."
<b>Remarks 1-5</b>	These fields displays the remarks assigned to the employee in the current employee revision in the workspace Employees. The contents of the fields can be changed, if, for example, you want the fields to display specific information on the employee's assignment to the category in question.

## Actions

This section shows the Actions available in the Employee Categories workspace.

### Top Tab

Field	Description
<b>Delete Employee List</b>	If you use this action, all employees who belong to the current employee category, and who are within the specified selection criteria, are deleted from the list. These employees will thus no longer belong to the current category. However, if an employee is directly specified on a planning line or a job budget line and specified by means of an employee category to which he belongs, that employee is not deleted from the list.
<b>Copy Employee List</b>	When you use this action, all employees who are assigned to the employee category specified in the Copy Employee List island are copied to and thus included in the current category. If one or more employees who belong to this copied category are not covered by the membership criteria of the current category, or if they are already members of the current category, those employees are not copied, and Maconomy issues a message on this matter.
<b>Calculate Average Prices</b>	When you use this action, Maconomy calculates average prices for the employee category in the unit specified in the <b>Time Unit</b> field in the tab. For employees with another (the other) time unit, their prices are converted based on the number of hours per man day specified in the <b>Hours per Man Day</b> system parameter.

## Employee Commission Agreements Single Dialogs Workspace

Use this workspace to assign commission agreements to sales employees and to identify the date range for each commission agreement.

You use commission agreements to calculate sales commissions that are payable to your company's employees.

The concept of commissions is described in more detail in the section about the Commission Agreements workspace. See that section for more information about the use of commission agreements and how commission is calculated.

In the Employee Commission Agreements tab, you can browse through the sales employees, who are employees for whom the **Sales Rep.** field is selected in the current employee revision for that employee in the Employees workspace. In the Employee Agreements sub-tab, you can create a line for each commission agreement to be assigned to the current employee.

For each commission agreement, you must specify the period to which the commission agreement applies. The period on a given line cannot overlap the period of another line for the same employee.

## Employee Commission Agreements Tab

This section includes the fields and descriptions for the Employee Commission Agreements tab.

**Employee Information Island**

Field	Description
<b>Employee No.</b>	This field shows the name of the current employee.
<b>Employee Name</b>	This field shows the number of the current employee.
<b>Blocked</b>	This field shows if the current employee has been blocked.
<b>Sales Employee</b>	This field shows if the current employee is a sales representative.
<b>Department</b>	This field shows the name of the department to which the current employee belongs.

**User Island**

See the Getting Started topic for a description of the fields in the island User.

**Commission Calculation Island**

Field	Description
<b>Posting Ref., Commission</b>	<p>In this field, you enter the number of a dimension combination containing the G/L account to be used when posting general journals from commission calculations in the workspace Commission Calculation in the Sales Orders module. The dimension combination can also contain other dimension values to be used in this connection. When these general journals are posted, the employee's commission amount is debited this account and the other dimension values in this dimension combination.</p> <p>This field should only be filled in if the employee is a sales representative.</p>
<b>Posting Ref., Offset</b>	<p>In this field, you enter the number of a dimension combination containing the G/L account to be used when posting general journals from commission calculations in the workspace Commission Calculation in the Sales Orders module. The dimension combination can also contain other dimension values to be used in this connection. When these general journals are posted, the employee's commission amount is credited this account and the other dimension values in this dimension combination.</p> <p>This field should only be filled in if the employee is a sales representative.</p>

**Commission Calculation, Dimensions Island**

Field	Description
<b>Transfer Location</b>	You can mark this field to automatically transfer any location dimension from invoices and credit memo lines to the employee's commission entries. If, for example, you use the location dimension for departments or divisions, the commission calculation will produce a commission entry for every location proportionate to the commission part involving the department or division.
<b>Transfer Entity</b>	The functionality of this field is similar to that of the field "Transfer Location" above.
<b>Transfer Project</b>	The functionality of this field is similar to that of the field "Transfer Location" above.
<b>Transfer Purpose</b>	The functionality of this field is similar to that of the field "Transfer Location" above.
<b>Transfer Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Transfer Location" above.
<b>Transfer Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Transfer Location" above.

**Employee Agreements Sub-Tab**

This section includes the fields and descriptions for the Employee Agreements sub-tab.

Field	Description
<b>From Date</b>	Here you can enter the date the employee's commission agreement is valid from.
<b>To Date</b>	Here you can enter to what date the employee's commission agreement is valid.
<b>Commission Agreement</b>	In this field, enter the commission agreement valid in the period defined in the fields "From Date" and "To Date." The commission agreement must be created in the workspace Commission Agreements in the Sales Orders module.

**Teams Single Dialogs Workspace**

Use this workspace to set up teams of employees.

A team is a multi-disciplinary group of employees who work together on jobs, such as a creative person, an art director, and a copywriter who work together on ad campaigns.

You can use teams in traffic management, where you can specify the teams to be assigned to the individual tasks in the timing plan. For more information about teams, see the information about the Timing Plans and Job Traffic Status workspaces in the Job Cost module.

If your employees often work together in the same groups—for instance a group that consists of a creative person, an art director, and a copywriter—you can set up those groups as teams in this workspace.

In the Teams tab, you can specify the team number and name of the current team. In the Team Members sub-tab, you can create a line for each of the employees who is part of the team.

## Teams Tab

This section includes the fields and descriptions for the Teams tab.

### Team Island

Field	Description
<b>Team No.</b>	This field shows the number of the current team. When creating a team, you must specify the number of the team in this field.
<b>Team Name</b>	In this field, you can specify a name for the current team.
<b>Blocked</b>	If you mark this field, the team is blocked. This means that the team cannot be assigned to timing plan lines or job budget lines in other workspaces. You can unblock a team by removing the mark in this field.
<b>Block when Unused</b>	<p>If you mark this field, the field “Blocked” above is automatically marked for the current team when all jobs to which the team is assigned have been closed. However, reopening a job to which the team is assigned will cause the team to be unblocked.</p> <p>The functionality only applies when the team is assigned to one or more jobs, meaning that the team is not automatically blocked if the team is not assigned to any jobs.</p>
<b>Transfer to Employee Control</b>	If you mark this field, the members of the current team will automatically be transferred to the employee control list of the jobs to which the team is assigned. If a given team member is already on the employee control list of a given job, the value in the field “Standard Task” in the sub-tab may overwrite the value in the corresponding field on the employee control list. For further information, see the description of the field “Standard Task.”

### Access Level Island

Field	Description
<b>Access Level</b>	In this field, you can specify an access level if you wish to limit the access to using the current team. If you specify an access level, a user can only use the current team if he or she has been granted access to the access level in question or a superior level in the access level hierarchy. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to teams may depend on other factors. You can grant users access to access levels in the workspace User

Field	Description
	Access Levels. If you do not specify an access level in this field, all users will have access to using the current team. This field shows the description of the specified access level.

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Team Members Sub-Tab

This section includes the fields and descriptions for the Team Members sub-tab.

Field	Description
<b>Team Member</b>	When creating a line, enter the number of the employee to be assigned to the current team in this field. It is possible to assign the same employee to more than one team.
<b>Employee Name</b>	This field shows the name of the employee specified in the field "Team Member" on the line.
<b>Primary Employee Category No.</b>	This field shows the number of the primary employee category of the employee specified in the field "Team Member" on the line.
<b>Primary Employee Category Name</b>	This field shows the name of the employee category shown in the field "Primary Employee Category No." on the line.
<b>Standard Task</b>	This field only applies if the field "Transfer to Employee Control" is marked in the tab. When that field is marked, assigning the current team to a job causes the members of the team to automatically be added to the job's employee list in the workspace Employee Control. In this field, you can specify the value to be applied to the field "Standard Task" on the employee control line created (or updated, if the employee is already in the list) for the employee on the line. Please note that if an employee control line already exists for the employee in question when the team is assigned to a job, the value in this field will overwrite any existing value in the employee control list. However, a blank value in this field will not overwrite the value in the employee control list.

## Team Generators Single Dialogs Workspace

Use this workspace to set up team generators.

A team generator is a set of rules that automatically creates teams for a job, based on information about the job and about the employees associated with it, and assigns the teams to the job.

You can assign up to six teams to a job, with each team generated from a different set of rules.

To run a team generator, use the **Create Teams** action in the Timing Plans workspace.

You can assign up to six teams to each job, in the **Team 1-6** fields in the Timing Plans workspace. There is a team generator for each of these six fields. This means that when you create teams for a given job, the team that a particular generator creates is assigned to the team field to which the generator in question pertains. The **Job Team Reference** field indicates the team field to which the current team generator pertains. In other words, when you create teams for a job, the team that the generator creates that has job reference number 1 creates a team that Maconomy automatically assigns to the **Team 1** field, and so on.

The teams that you create using generators can consist of any combination of the employees who are referenced on a job. This includes the project manager, sales representative, and the employees specified in the **Employee 1-10** fields. In the Members island, you specify how the teams that the current generator creates should be put together. If, for instance, you select the **Include** field for the project manager and employee 3, creating teams for a given job results in the creation of a team where the members are the employee specified as project manager for the job, and the employee specified in the **Employee 3** field for the job.

If you do not select any of the fields in the Members island for a given generator, that generator does not create any teams.

## Team Generators Tab

This section includes the fields and descriptions for the Team Generators tab.

### Team Island

Field	Description
<b>Job Team Reference</b>	This field shows the team reference number to which the current generator applies. This means that if the value in this field is, for example, 3, selecting the action "Create Teams" in the workspace Timing Plans will cause the team generated from this generator to be assigned as team 3 (in the field Team 3 in the workspace Timing Plans) on the job.

### Members Island

In this island you can specify which employees referenced on jobs should be included in the teams created by the current generator. The island consists of a number of rows, each representing an employee reference on jobs. For instance, you can specify whether the project manager of a given job should be a member of the team generated for the job in question, based on the current generator.

Field	Description
<b>Project Manager</b>	If you mark the field "Include," the employee specified as project manager on the job in question will be included in the team generated as a result of selecting the action "Create Teams" in the workspace Timing Plans. If you mark the field "Required," the action "Create Teams" will fail if no employee has been specified in the field "Project Manager" on the job. In the field "Std. Task," you can specify the task to be assigned as standard task on the team member line created for the employee in question. This may only be relevant

Field	Description
	if all jobs are associated with identically named tasks. For further information about the standard task, see the field "Standard Task."
<b>Job Sales Rep.</b>	The functionality of this field is similar to that of the field "Project Manager" above.
<b>Job Employee 1-10</b>	The functionality of these fields is similar to that of the field "Project Manager" above.

#### Remarks Island

Field	Description
<b>Remarks</b>	In these fields, you can enter various remarks about the current team generator.

#### Employee Group Blocking Island

Field	Description
<b>Block Team when Unused</b>	In this field, you can specify whether the corresponding field should be marked for the teams created based on the current generator. For further information about this functionality, see the description of the field "Block Team when Unused" in the workspace Teams.
<b>Transfer to Employee Control</b>	In this field, you can specify whether the corresponding field should be marked for the teams created based on the current generator. For further information about this functionality, see the description of the field "Transfer to Employee Control" in the workspace Teams.

#### Employee Group Naming Island

Field	Description
<b>Team Number</b>	<p>In this field, you can specify how a team number should be derived or put together when a team is created from the current generator. The following options are available:</p> <ul style="list-style-type: none"> <li>Number Series — If you select this value, team numbers will be picked from the number series "Team Numbers" in the workspace Number Series.</li> <li>Initials — If you select this value, the team number will consist of the initials of the employee members, separated by a slash. If, for instance, a team is generated, consisting of the employees Hugo Rune and Martin Walkyier, the team number will be HR/MW. If a team with this number already exists, a similar number suffixed by a dash and a number will be used (for instance HR/MW-1). The initials are placed in the order in which the employee references appear in the island Members. This means that in the team</li> </ul>

Field	Description
	<p>number, the initials of the project manager (if included) comes before the initials of the sales rep. (if any), and so on.</p> <ul style="list-style-type: none"> <li>■ <b>First Name Letters</b> — If you select this value, the team number will consist of the first letter of the first name of each member. For instance, if the members are named “Hugo Rune” and “Martin Walkyier,” the team number will be “HM.” If a team with this number already exists, a similar number suffixed by a dash and a number will be used (for example, HM-1). The letters are placed in the order in which the employee references appear in the island Members. This means that in the team number, the letter from the project manager (if included) comes before the letter from the sales rep. (if any), and so on.</li> <li>■ <b>Surname Letters</b> — If you select this value, the team number will consist of the first letter of the last names of the employee members without separation. For instance, if the members are named “Hugo Rune” and “Martin Walkyier,” the team number will be “RW.” If a team with this number already exists, a similar number suffixed by a dash and a number will be used (for example, “RW-1”). The letters are placed in the order in which the employee references appear in the island Members. This means that in the team number, the letter from the project manager (if included) comes before the letter from the sales rep. (if any), and so on.</li> </ul>
<b>Team Name</b>	<p>In this field, you can specify how a team name should be put together when a team is created from the current generator. The following options are available:</p> <ul style="list-style-type: none"> <li>■ <b>First Names</b> — If you select this value, the team name will be put together from the first names of the members, separated by an ampersand. For example, if the employee names are “Hugo Rune” and “Martin Walkyier,” the generated team name will be “Hugo &amp; Martin.”</li> <li>■ <b>Last Names</b> — If you select this value, the team name will be put together from the last names of the members, separated by an ampersand. For example, if the employee names are “Hugo Rune” and “Martin Walkyier,” the generated team name will be “Rune &amp; Walkyier.” If an employee name consists of more than two names, only the last name will be used. For example, if the employee names are “George L. Newman” and “Stanley K. Spadowski,” the generated team name will be “Newman &amp; Spadowski.”</li> <li>■ <b>Entire Names</b> — If you select this value, the team name will be put together from the full names of the members, separated by an ampersand. For example, if the employee names are “Hugo Rune” and “Martin Walkyier,” the generated team name will be “Hugo Rune &amp; Martin Walkyier.”</li> </ul>

## Calculate Working Time Single Dialog Workspace

Use this workspace to manage accumulated planning data, which the Resource Planning Portal uses.

This is the data Maconomy uses in the process of booking employees for projects, including the employees' fixed working hours, absence calendars, and number of hours already allocated to other efforts.

To improve system performance, Maconomy stores this information and automatically updates it only when certain events take place. Use this workspace to set up a range of dates within which Maconomy accumulates planning data.

You use this workspace to manage accumulated planning data. "Planning data" means the data that is used in the process of booking employees for projects, that is:

1. The fixed working hours specified for the employee, either in the week calendar to which the employee is assigned, or directly in the workspace Employees
2. Effective employee absence, as specified in the Employee Absence Calendars workspace
3. The number of planned hours per day and week, that is, the number of hours already allocated to the employee

Accumulating planning data is a requirement for using the Resource Planning Portal. For more information about effective absence calendar lines, see the "Calendar lines entering into effect" in the Resource Planning module.

In the Resource Manager Dashboard, the Employee Load report, and elsewhere in the Resource Planning Portal, a system of "traffic lighting" is used. When allocating planning hours to employees, Maconomy displays a time line for each employee. The time line is divided into slots of, for example, one week. The color of each slot depends on the booking level of the employee, for example, red (overbooked), light green (free), dark green (partially booked), and so on. In the Resource Manager Dashboard and the Employee Load report, a text in each slot shows the number of hours for which the employee is booked and the employee's available hours, for example, "12/37." For more information, see the description of the Portal module Resource Planning.

To accomplish this, Maconomy needs to know for how many hours each employee is potentially available (the employee's fixed working hours), and for how many hours the employee has already been booked. If Maconomy calculates these figures every time that a resource manager changes a planning line, performance would suffer. For this reason, Maconomy accumulates and stores this information in the database for easy and fast access:

1. Fixed working hours
2. Effective employee absence
3. Number of planned hours per day and week

In this workspace, you can control the amount of data that Maconomy should manage by setting up a range of dates within which Maconomy accumulates planning data. For performance reasons, you should limit this range of dates to the probable planning span of your company, that is, the range of dates within which planning is performed in the Resource Management Portal. A typical span could be three months before today's date and one year ahead in time. Maconomy

updates the amount of accumulated data when you use the **Calculate** and **Delete** actions. The date range applies to the employees whom you select in the Employee Selection Criteria island. The calculated data is not static, however. Maconomy dynamically updates the calculated data when certain events take place:

1. If you change a week calendar. For instance, if you assign an employee to a different week calendar with fewer work hours, with a weekly day off, Maconomy automatically adjusts the accumulated planning data for that employee.
2. If you change the fixed hours in the Employees workspace. Maconomy adjusts the affected weekdays for the employee in question, but only for the period for which the change was made.
3. If you change the reduction percentage of an employee in the Employees workspace. Maconomy updates the number of the employee's available hours.
4. If you change the effective absence calendar lines for an employee, if new lines become effective, and if effective lines lose their status as effective.

Even though Maconomy recalculates the data automatically, you have the option to force a recalculation if, for example, you want a change in the fixed hours of an employee to take effect as of a date prior to today's date.

Note that if you have used planning before installing a version of Maconomy that supports the accumulation of planning data (introduced in Maconomy 8.0 Service Pack 11), you need to initialize planning data. For more information, see the description of the **Initialize Data** action.

The description of this workspace assumes that you perform the actions that it describes manually. However, you can import a monitor and set it up to perform the actions automatically at regular intervals. A Maconomy consultant typically imports and sets up monitors. Contact Maconomy staff for more information.

## Calculate Working Time Tab

This section includes the fields and descriptions for the Calculate Working Time tab.

### Date Range Island

Field	Description
<b>Start Date</b>	In this field, you enter the starting date of the date range for which accumulated planning data should be calculated or deleted for the employees selected in the Employee Selection Criteria island when you select the actions "Calculate" or "Delete." The date entered will automatically be adjusted back to the Monday immediately preceding the date entered (unless you enter a Monday).
<b>Closing Date</b>	In this field, you enter the ending date of the date range. The date entered will automatically be adjusted forward to the Sunday immediately following the date entered (unless you enter a Sunday).

**Employee Selection Criteria Island**

Field	Description
<b>Employee No.</b>	In these fields, you can specify a range of employees. The actions in this workspace only apply to the selected range of employees.
<b>Company No.</b>	In these fields, you can specify a range of companies. The actions in this workspace only apply to employees assigned to companies within the selected range.
<b>Supervisor No.</b>	In this field, you can specify an employee number. The actions in this workspace only apply to employees for whom the employee selected in this field is supervisor.
<b>Primary Empl. Cat.</b>	In this field, you can specify the number of an employee category. The actions in this workspace only apply to employees for whom the category selected in this field is the primary category.

**Employee Selection Criteria, Dimensions Island**

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Employee Type</b>	The functionality of this field is similar to that of the field "Supervisor No." above.
<b>Department</b>	The functionality of this field is similar to that of the field "Supervisor No." above.

**Calculate Island**

Field	Description
<b>Force Recalculation</b>	Maconomy recalculates the accumulated data automatically as described in the introduction to this workspace. However, you can mark this field to force a recalculation, for example, if you want a change in the fixed hours of an employee to take effect as of a date prior to today's date.

## Actions

This section shows the Actions available in the Calculate Work Hours workspace.

### Top Tab

Field	Description
<b>Calculate</b>	When you select this action, fixed hours, planning time and information regarding absence are calculated for the employees and dates within the specified ranges. This enables "traffic lighting" (color-coded resource planning in the Portal) for the specified ranges of dates and employees.
<b>Delete</b>	When you select this action, the calculated values related to planning are deleted for the specified ranges of dates and employees. You can use this to clear the database of calculations pertaining to old dates, for example, dates more than three months back in time, to keep the amount of historic data down. You can always recreate the data by setting a date range and selecting the action "Calculate."

## Linking Rules Single Dialogs Workspace

Use this workspace to set up rules for copying field information from "parent" customers, vendors and contact companies to their "children."

You can link customers, vendors, or contacts to parent tables, so that changes that you make to the parent automatically flow to the children. The rules that you set up in this workspace determine which data flows from the parent to the child.

Because the general functionality of linking rules is identical for customers, vendors, and contact companies, the term following examples use "customer."

Copying field information means that you can copy the information that you entered on a certain customer's information card to one or more customers' or company-specific customers' information cards. You can place customers in a kind of hierarchy, where one customer is placed as parent customer, and one or more customers are then placed as subordinate customers in relation to the parent customer. You assign a subordinate customer to a parent customer on the subordinate customer's information card in the Parent Customer island, where you specify the parent customer and the linking rule.

If you have defined a template customer in the System Information or Company Information workspace, Maconomy uses this customer as the template customer when you create customers. However, to have Maconomy automatically inherit information from the template customer, you must set up at least one linking rule for the relevant database tables (Customer and Company Customer).

Using linking rules enables you to quickly and safely fill in standard customers' or company-specific customers' information because the information that you enter on a parent customer's information card can be copied to subordinate customers' information cards automatically. The amount of information copied from a parent customer to one or more subordinate customers depends on the linking rule that you use in each case.

In a linking rule, you specify the standard linking method that you want to use in the current rule, as well as which exceptions you want to apply to the rule. For example, you can create a rule that uses the standard linking method "Full," which means that all of the information specified on a

given parent customer's information card is always copied to the assigned subordinate customers' information cards. In the Linking Rule Lines sub-tab of the Linking Rules workspace, you can then add a number of exceptions to this linking method. Example exceptions could be that you assign the **None** linking method to the **Name1**, **Name2**, **Attn.**, **Phone**, and **E-mail** fields. Specifying these exceptions results in Maconomy not copying information from these specific fields from the parent customer to the subordinate customers, because the content of these fields is meant to be unique for each customer.

In the Linking Rules tab, you can enter the name of the current linking rule and identify the database tables to be linked, as specified by the **Parent Table** and **Subordinate Table** fields. You can also choose the standard linking method to be used in the current linking rule. In addition, you can indicate whether the linking rule should be used as the standard linking rule for the selected database tables. You use a standard linking rule, for example, in those cases where you created a company-specific customer without specifying a linking rule on this company-specific information card. In the Linking Rule Lines sub-tab, you can create a number of specific field rules with assigned linking methods. With these specific field rules, you can thus specify a number of exceptions to the current standard linking method that you specified in the Standard Linking island.

## Linking Rules Tab

This section includes the fields and descriptions for the Linking Rules tab.

### Linking Rule Island

Field	Description
<b>Name</b>	<p>In this field, you can enter the name of the linking rule. The name is used in the workspace Customer Information Card or the workspace Company Specific Customer Information Card in the island Parent Customer for assigning the current rule to the current customer in such a way that the rule is used for copying information from the parent customer to the subordinate customer. Similar functionality applies to vendors.</p> <p>If you create a linking rule to be used between contact companies and contact persons, the name of the linking rule is used in the island Contact Company in the workspace Contact Persons in the Marketing module for assigning the current rule to the current contact person. This means that the rule is used for copying information from the contact company specified in the island Contact Company to the current contact person. See the introduction to the workspace Contact Persons in the Contact Management module for further information about using linking rules for the creation of contact persons.</p>
<b>Description</b>	In this field, you can enter a description of the linking rule.
<b>Parent Table</b>	In this field, you select or enter the name of one of the tables "Customer," "Creditor" or "ContactCompany." The field is used for assigning the relevant table to the current linking rule. By using the function "Find Database Relation" in the Find menu, you can choose between those tables which can be used in connection with linking rules in the current version of Maconomy.

Field	Description
<b>External Name</b>	This field shows the external name of the table specified in the field "Main Table" above.
<b>Subordinate Table</b>	<p>In this field, you can choose between the tables "CompanyCustomer" and "Customer" or the corresponding tables for Creditor. If you want to create a linking rule to apply to contact persons, you must enter the name of the table "ContactPerson" in this field. By using the function "Find Database Relation" in the Find menu, you can choose between those tables which can be used in connection with linking rules in the current version of Maconomy.</p> <p>The table "CompanyCustomer" contains information about the customers created as company-specific customers in the workspace Company Specific Customer Information Card. If you specify the table "CompanyCustomer," you therefore create a linking rule where enterprise wide customers are superior to company-specific customers, and information will thus flow from standard customers to company-specific customers in accordance with the specified linking method. For further information on creating and using company-specific customers, please see the workspace Company Specific Customer Information Card in the A/R module.</p> <p>The table "Customer" contains information about all customers created in the workspace Customer Information Card. If you specify the table "Customer," you therefore create a linking rule where enterprise wide customers are arranged in a sort of hierarchy where one or several customers are superior to other customers. The information flowing to subordinate customers and the extent to which this information can be changed on the subordinate customers depends on the standard linking method and any exceptions specified for the linking rule. Similar functionality applies to vendors and company specified vendors.</p>
<b>External Name</b>	This field shows the external name of the table specified in the field "Subordinate Table" above.
<b>Standard Linking Rule</b>	<p>In this field, you can choose whether the current linking rule should be used as the standard linking rule. A standard linking rule is automatically used by Maconomy when no specific linking rule is specified in the island Parent Customer for "regular" or company-specific customers, but only the number of the customer from which you want to inherit information. You can thus save time using a standard linking rule, as you do not have to manually specify a linking rule on new or existing company-specific or "regular" customers.</p> <p>If you want new customers to inherit information from the standard customer specified in the workspace System Information or Company Information, then you have to specify that the standard customer is the parent customer in one of the two workspaces mentioned above. For information to be inherited from the standard customer to new customers, a standard linking rule must be created for this purpose in this workspace between the tables "Customer" and "Customer." The linking rule is created using "Customer" in the main table and "Customer" in the subordinate table. Furthermore, the linking rule must specify the fields that you want to be inherited from the standard customer to the new</p>

Field	Description
	<p>customers. By marking this linking rule as the “Standard Linking Rule,” the linking rule can automatically be applied when creating customers, if you do not specify another linking rule when creating the customer. Similar functionality applies to linking rules created for vendors and linking rules created between contact companies and contact persons.</p> <p>If you do not mark the field, linking rules must be specified manually in the island Parent Customer on the information cards in the A/R and A/P modules and in the island Contact company in the workspace Contact Persons in the Contact Management module.</p>

### Standard Linking Island

Field	Description
<b>Linking Method</b>	<p>In this pop-up field, you can choose between the four linking methods “Full,” “Partial,” “At Creation,” and “None.” If you select the linking method “Full,” all information and all changes from the parent customer’s information card will be copied to the information cards of the subordinate customers using the current linking rule. This applies at creation of customers as well as when changing information on the parent customer’s information card. When selecting this linking method, you cannot manually change copied values on subordinate customers’ information cards, as these values always have to be identical to the values specified on the parent customer’s information card. Similar functionality applies to linking rules created for vendors.</p> <p>If you select the linking method “Full” for a linking rule applying to contact companies and contact persons, all information and all changes from a contact company’s information card will be copied to the information cards of the contact persons being assigned to the contact company in question.</p> <p>If you select the linking method “Partial,” all information and all changes from the parent customer’s information card will be copied to the information cards of the subordinate customers using the current linking rule, unless you have actively entered values in the current fields on the subordinate customer’s information card. When creating a customer, this means that field values from the parent customer will only be copied to the subordinate customer if you have not already entered values in the current fields on the new customer’s information card. When changing a value on the parent customer’s information card, this value will only be copied to the subordinate customer’s information card if the fields had identical values on the parent customer’s information card and on the subordinate customer’s information card before the change was made. If the values were different before the change was made, the new value will not be copied to the subordinate customer’s information card. Similar functionality applies to linking rules created for vendors and contact persons.</p> <p>If you select the linking method “At Creation,” values will only be copied from the parent customer’s information card to the information cards of the subordinate customers using the current linking rule at the creation of customers. Upon creation, the copied values can hence be changed manually. Similar functionality applies to linking rules created for vendors and contact persons.</p>

Field	Description
	If you select the linking method "None," no values will be copied to subordinate customers' information cards. Please note that when using the linking methods "Partial" and "At Creation," the content of certain pop-up fields will not be copied to subordinate customers' information cards. Similar information applies to linking rules created for vendors and contact persons.

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Linking Rule Lines Sub-Tab

This section includes the fields and descriptions for the Linking Rule Lines sub-tab.

Field	Description
<b>Internal Field Name</b>	In this field, you can enter the name of a field to which you want to assign a specific linking method. Using the action "Find Database Field" in the Find menu, you can choose between all database fields in the table selected in the tab. By entering a field name in this field, you can thus include exceptions to the standard linking method specified above in the island Linking Method. By assigning specific linking methods to the individual field names, you can, for example, create a rule with the standard linking method "Full," and make exceptions to the fields "Name1," "Name2," "Contact Person," and "Payment Terms," all being assigned with the linking method "None." In this way, you can create a linking rule ensuring full accordance between the connected customers' information cards except from specific fields whose values are to be independent of the parent customer's values.
<b>External Field Name</b>	This field shows the external field name of the database field specified in the field "Internal Field Name" above. The name cannot be changed here.
<b>Linking Method</b>	In this field, you can select the specific linking method to be used for the current field name.

## Rules of Validation Single Dialogs Workspace

Use this workspace to set up the rules that Maconomy uses to validate employee Social Security numbers and customer and vendor CNR, company registration, and tax numbers, to ensure that these numbers comply with local legislation in different countries.

You can set up different rules for different countries.

To set up a rule of validation, in the Rules of Validation tab select the field for which you want to define the rule. On each line in the Validation Rules sub-tab, you can then set up the validation rule for this field in a given country. Using this method, you can set up different validation rules for tax numbers in different countries, for example. When you enter information for a customer, vendor, or employee, Maconomy runs a validation check to see whether the specified tax number,

CNR number, company registration number, and social security number comply with the rules that you set up for the respective fields in the country to which the customer, vendor, or employee is assigned. Note that validation rules for "CNR No." apply to CNR numbers for customers and social security numbers for employees.

Maconomy only runs a validation check on a given field if you created a rule of validation for that field for the country in question.

## Rules of Validation Tab

This section includes the fields and descriptions for the Rules of Validation tab.

### Validation Field Island

Field	Description
<b>Field Name</b>	This field shows the name of the field on which the validation check will be applied. It is possible to create rules of validation for the fields "CNR No.," "Company Registration No.," "Tax No.," and "Company Location No." Please note that validation rules for "CNR No." apply to CNR numbers for customers and social security numbers for employees.

### User Island

See the Getting Started topic for a description of the fields in the island User.

## Validation Rules Sub-Tab

This section includes the fields and descriptions for the Validation Rules sub-tab.

Field	Description
<b>Country</b>	In this field, you can select the country for which the rule of validation is to be applied.
<b>Minimum Number Of Characters</b>	In this field, you can enter the minimum number of characters a number in the country above must contain.
<b>Maximum Number Of Characters</b>	In this field, you can enter the maximum number of characters a number in the country above may contain.
<b>Modulus Principle</b>	In this field, you can select a modulus principle. It is only possible to choose a modulus principle if the field "Allow Only Figures" has been marked.
<b>Allow Only Figures</b>	If you mark this field, you specify that a number can only consist of figures.

## Modulus Calculation Single Dialogs Workspace

Use this workspace to maintain information needed to apply the modulus calculation method to validate tax numbers, civil registration numbers, Giro numbers, payment identification, and so on.

This workspace is for internal Deltek use only.

Use this workspace to maintain information used in the modulus calculation method, which is used in the Rules of Validation workspace or in connection with electronic payment.

If you want to create modulus calculation methods, contact your Maconomy consultant for assistance.

When importing incoming and outgoing payment formats, Maconomy automatically creates modulus calculation methods that are used for outgoing electronic payments and electronic reading of incoming payments. You can also use these methods in the Rules of Validation workspace. You should not change these methods because that could cause Maconomy's Banking module to malfunction.

### Modulus Calculation Tab

This section includes the fields and descriptions for the Modulus Calculation tab.

#### Modulus Calculation Island

Field	Description
<b>Name</b>	Here, you enter the name of the current modulus calculation method. The modulus figure should normally be part of the name.
<b>Modulus Chars.</b>	Here, you enter the number of modulus characters in the current calculation method.
<b>Modulus Number</b>	Here, you enter the modulus number.
<b>Include Length</b>	If you mark this field, the length control of the identification part of the current number will be carried out as described in section 2 above.
<b>Calculate Weight Figure</b>	If you mark this field, a sequence of weight figures must be specified in the field "Weighting." If you do not mark the field, the fields "Weighting" and "Calculate Sum of Digits" will have no importance.
<b>Weighting</b>	Here, you specify a list of weight figures. The sequence of figures must be separated by blank characters.
<b>Calculate Sum of Digits</b>	If you mark this field, Maconomy calculates the sum of digits of the control sum that is calculated from the weight figure and the identification part as described above.
<b>Calculate Remainder</b>	If you mark this field, the control part will be calculated as described in section 4 above.

Field	Description
<b>Prefix</b>	In this field, you can specify a prefix to be used in the modulus calculation. The prefix is placed before the number for which modulus calculation is being made. This means that the prefix is also placed before any number of zeroes added to the calculation number to reach the correct number of digits. However, the prefix is also included in the total number of digits, meaning that the number of modulus characters, the number of digits in the calculation number, the number of zeroes, and the number of digits in the prefix make up the correct number of digits. Furthermore, the prefix is placed before the calculated modulus figure.
<b>Suffix</b>	In this field, you can specify a suffix to be used in the modulus calculation.
<b>Calculate Recursively</b>	If you mark this field, the calculation is made by a modulus 10 recursive method. The calculation is based on a fixed matrix, and the fields "Modulus Chars.," "Modulus Number," "Include Length," "Calculate Weight Figure," "Weighting," "Calculate Sum of Digits," and "Calculate Remainder" are therefore ignored for the current calculation method.
<b>Validation of IBAN no.</b>	This field is marked if the validation rule is used to validate IBAN account numbers.

### Test Calculation Island

Field	Description
<b>Number</b>	Here, you enter the identification part of the number of which you wish to make a test calculation. The test calculation will tell you whether the algorithm is correct.
<b>Total No. Of Char.</b>	Here, you enter the number of characters in the number. Number of characters includes both the identification part and the control part.
<b>Calculated Value</b>	This field shows the calculated value of the current calculation method when the control part is calculated from the specified text calculation number.

### User Island

See the Getting Started topic for a description of the fields in the island User.

## Installation Information Single Dialogs Workspace

Use this workspace to record where and from whom you bought the Maconomy product and to print the registration letter.

When you send the registration letter to your Maconomy dealer, you receive a unique control number for your company that gives you access to the Maconomy modules that you purchased. These modules are listed in this workspace.

Enter the control number in the **Control No.** field in this workspace.

If you do not enter the control number within 100 days of installing the program, Maconomy blocks access to all modules. However, you can still enter your company information and print the registration letter.

You then send the registration letter to your Maconomy dealer. The address and telephone number are printed on the registration letter. When they receive your letter, they send a control number to the person whose information you entered as the contact with your company.

The registration letter includes a questionnaire that Deltek asks you to complete. Your answers will help to improve service and support.

Note that you must send in a new registration letter every time that you buy one or more new Maconomy products.

## Installation Information Tab

This section includes the fields and descriptions for the Installation Information tab.

### Address Island

This island shows your company's name and address. They cannot be changed here, but you can change them in the workspace Company Information.

### Information Island

Field	Description
<b>Phone</b>	This shows your company's telephone number.
<b>Fax</b>	This shows your company's fax number.
<b>Contact Person</b>	Here you can enter your contact person in PPU Maconomy. PPU Maconomy will address the control number to this person.
<b>Dealer</b>	Enter the name of your Maconomy dealer. You must enter a name.
<b>Sales Rep.</b>	Here you can enter the name of the sales representative who sold you Maconomy.

### Version Island

Field	Description
<b>Installation No.</b>	This field shows the installation number for your installation of Maconomy. It was entered when Maconomy was installed and cannot be changed.
<b>Reg. No.</b>	This is the registration number for your version of Maconomy. It was entered when Maconomy was installed. It cannot be changed.
<b>Control No.</b>	This field shows the control number for your installation of Maconomy. It was entered when Maconomy was installed and cannot be changed.

## Installation Lines Sub-Tab

This section includes the fields and descriptions for the Installation Lines sub-tab.

Field	Description
<b>Product</b>	This shows to which Maconomy products you have access.
<b>Package No.</b>	This is the product's package number.
<b>Installation Date</b>	This is the date Maconomy was installed. If you do not enter your control number, you only have access to Maconomy for 100 days after this date.
<b>Permanent Access</b>	<p>This field shows whether you have permanent access to your Maconomy product. You will have permanent access when you enter your control number. You receive your control number when your Maconomy dealer has received your registration letter.</p> <p>Note that you must send in a new registration letter every time you buy a new Maconomy product.</p>

## Actions

This section shows the Actions available in the Installation Information workspace.

### Top Tab

Field	Description
<b>Print Registration Letter</b>	<p>Select this function to print a registration letter. The registration letter contains a questionnaire that we ask you to complete. Your answers will help us and our dealers improve service and support. You can send the letter by mail or fax. Our address and telephone number is printed on the registration letter. When we receive your letter, we will send a control number to the person you have entered as our contact with your company. This control number is unique for your company and gives you permanent access to the functions in Maconomy that you have bought. If you do not enter the control number within 100 days of installing the program, Maconomy blocks access to all modules. However, you can still enter your company information and print the registration letter. When you receive your control number, enter it in the field "Control No." in this workspace.</p> <p>You must send in a new registration letter every time you buy one or more new Maconomy products.</p>

## Support Documentation Single Dialogs Workspace

Use this workspace to retrieve information that can help you to solve routine support cases.

This enables you to look up standard support case types and, if applicable, document them internally, thus saving valuable time.

This workspace displays a description of the currently selected support type ID. The Target Group island displays specific technical support information. Finally, the Export Control island lets you specify length restrictions and a file name for subsequent export of the currently selected support type.

## Support Documentation Tab

This section includes the fields and descriptions for the Support Documentation tab.

### Description Island

Field	Description
<b>Identification</b>	This field shows the name of the currently selected support type ID. The identification name describes the functionality to which the associated support type pertains.
<b>Description 1-5</b>	These fields may be used to describe the actions that should be performed to allow you to document the currently shown support type.

### Target Group Island

This island contains a list of case-dependent value fields, allowing you to specify the technical details relevant to the current support type.

The list can be used to pinpoint the values that may need to be changed to solve issues pertaining to the current support type. Please note that you must enter a valid value in each of the case-dependent value fields to export the support documentation file. The empty fields in this island have no effect.

Field	Description
<b>Import File Name</b>	Location of the file containing the SQL statements to import. If this field is left empty, running the <b>Create Documentation</b> action prompts you to select a file.
<b>Statement No.</b>	Enter the statement number to verify that the encrypted code in the imported file is valid.
<b>Omit Standard Information</b>	If this field is selected, standard information (such as the companies you have in the system, system parameters and their values, and information on installed addons) is not included in the output file.
<b>Fixed Length</b>	If this field is selected, you can specify the width of the columns in the output file using the <b>Min. Length</b> and <b>Max. Length</b> fields.
<b>Min. Length</b>	Enter the minimum length of the columns in the output file.
<b>Max. Length</b>	Enter the maximum length of the columns in the output file.
<b>File Name</b>	Enter the name of the output file after clicking the <b>Create Documentation</b> action. If no file name is specified, the file is named "outputfile.txt".

Field	Description
<b>Create Documentation</b>	Use this action to run the selected support type. The result of running this action is an output file with information relevant to the selected support type.

### Export Control Island

Field	Description
<b>Fixed Length</b>	If you mark this field, a fixed length will be applied to the current support type if it is exported to a different file format.
<b>Min. Length</b>	This field allows you to specify a minimum length for the current support type if it is exported to a different file format.
<b>Max. Length</b>	This field allows you to specify a maximum length for the current support type if it is exported to a different file format.
<b>File Name</b>	In this field you can enter a name for the export file that will be generated if you select the Create Documentation action. This file name is for reference only as the name of the actual export file can be changed at any time without updating the file name entered in this field.

### Actions

This section shows the Actions available in the Support Documentation workspace.

#### Top Tab

Field	Description
<b>Create Documentation</b>	<p>When you select this action, the documentation for the current support type will be updated and exported to a support documentation file for internal use and easy sharing with the Maconomy support team.</p> <p>If you try to perform the action on a support type that does not contain any errors, an error message will appear to inform you that no errors were found in the support type. Consequently, no documentation will be created.</p>

## Workflow Section

Use this section to learn about Workflow workspaces.

The workspaces that this section describes constitute the runtime interface to workflow specifications. Workflows are defined using the MWL specification language-the Maconomy Workflow Language.

As of Maconomy version 9.0 Service Pack 5, the workspaces in the Workflow module are for reference and viewing only, and most of the workspaces are read-only, meaning that you cannot change them. However, you can revert the workspaces to their pre-Service Pack 5 state by changing the MDL layouts, if this is required to maintain old-style workflows.

Using the Maconomy Workflow Language (MWL), workflows can be defined in Maconomy. A workflow is a chain of actions and events that bring entities through a series of states. MWL automates the process of pushing business entities through a number of well-defined states. For instance, you can define a workflow for a purchase process-the workflow evaluates a purchase order (PO), creates to-dos for the appropriate people that they should approve the PO, makes sure that the items are received correctly, and so on-constructed exactly to suit your specific needs. For more information about MWL, contact your Maconomy Account Manager.

The Workflow module includes the following workspaces. The specification workspaces display the MWL workflow data that is installed in Maconomy. The workspaces are basically read-only with no actions. However, you can modify a few titles at run time, and you can enable and disable lifecycle definitions and asynchronous monitors:

- Life Cycle Definitions - The life cycle and stage definitions
- Life Cycle Transition Definitions - The transition definitions and how they are connected with stages
- Notification Categories - The definition of various kinds of notifications, such as to-dos, alerts, and so on
- Notification Types - The definition of notification types
- General Monitors - The groups of monitors
- Monitors - The definitions of synchronous and asynchronous monitoring actions

You use the following runtime workspaces in the Workflow module to debug and view lifecycles and notifications:

- Life Cycles - View instances of lifecycles that exist in Maconomy
- Life Cycle Transitions - View instances of transitions that have occurred in Maconomy and manually execute a transition
- Notifications - View current instances of notifications

For more information about the specifics of setting up workflows, see the descriptions of these workspaces

## Life Cycle Definitions Single Dialogs Workspace

Use this workspace to view, enable, or disable lifecycles, which define how an entity progresses from one stage to another (for example, how a job progresses from being created to being closed, and all of the stages in between). For each entity, you see the individual stages in the lifecycle.

This workspace is for internal Deltek use only.

Note that if you have installed workflows from an earlier Maconomy version before 9.0 Service Pack 5, you can open the fields in this workspace to edit them as described in "Introduction to Workflows."

Note that the information that this workspace displays is for internal use in Maconomy only. The Maconomy Workflow functionality is not yet fully released.

In this workspace, you can view and enable or disable lifecycle definitions. A lifecycle defines the progression of one object in Maconomy (for example, a customer or a job) from one point in its

existence (for example, from a job being created) to any other point (for example, when a job is closed). Each of these points is called a stage. The progression of an object from one stage to another is called a transition. For instance, when someone submits a time sheet, it progresses from the "Created" stage to the "Submitted" stage. You can view the specifications of transitions in the Life Cycle Transition Definitions workspace.

In the Life Cycle Definitions tab, you can see the type of object to which a lifecycle definition is assigned, such as time sheets. In the Life Cycle Stage definitions sub-tab, you can see the individual stages.

You enter and edit all of the information in this workspace in the Maconomy Workflow Language. For more information about the functionality of workflows, see "Introduction to Workflows."

## Life Cycle Definitions Tab

This section includes the fields and descriptions for the Life Cycle Definitions tab.

### Definition Island

Field	Description
<b>Life Cycle Definition No.</b>	In this field, you can see the number of the current life cycle definition.
<b>Name</b>	In this field, you can see and edit a descriptive name of the current life cycle definition.
<b>Internal Relation Name</b>	<p>This field shows the internal name of a Maconomy database relation. This is the relation to which a workflow is attached. Whenever an object is created in this relation, a workflow is initiated as defined in MWL. For instance: If JobHeader is specified as the relation, a workflow will be initialized for every job created in Maconomy.</p> <p>Note that instance keys must be created for the relation in this field for workflows to take effect. For more information, please see the description of the workspace Database Relations.</p>
<b>Active for New Life Cycles</b>	If this field is marked, the current life cycle definition is active. From the moment the life cycle definition is active, every new instance of the relation referenced in the field "Internal Relation Name" above will be part of a workflow.
<b>Starting Stage</b>	This field shows the starting stage of the current life cycle definition. For more information about stages, please see the introduction to this workspace.
<b>MWL Version</b>	These fields show the major and minor version numbers of the MWL script used for defining the current workflow specification. If the content of the fields is "0 0," the current workflow was not specified using MWL, but is a pre-Service Pack 5 workflow.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can specify the name of an access level. You only have access to the current life cycle definition if you have been assigned to the same or a higher level in the workspace User Access Levels. This means that you can only specify life cycle definitions to which you have access. Furthermore, a given user can only see the life cycle definitions to which he or she has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to life cycle definitions may depend on other factors. For more information about this, please see the section “Introduction to the Access Control System.”</p> <p>If no access level is specified, this field has no influence on user access to the current life cycle definition.</p> <p>This field also shows a description of the specified access level.</p>

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Life Cycle Stage Definitions Sub-Tab

This section includes the fields and descriptions for the Life Cycle Stage Definitions sub-tab.

Field	Description
<b>Stage No.</b>	In this field, you can enter a distinctive name or number of a life cycle stage when creating a life cycle stage. The name or number cannot be changed later. This is the name to be used when referring to the life cycle stage in other workspaces or in the Portal. For instance, if the current definition concerns time sheets, you could enter “Submitted” in this field.
<b>Name</b>	In this field, you can enter a descriptive name of the current life cycle stage. The name can be changed later. This is the external name of the life cycle stage and is, for example, viewed in status fields in Portal components. For instance, if the current definition concerns time sheets, you could enter “Time Sheet Submitted” in this field.
<b>Perspective</b>	In this field, you can specify the name of a perspective. This is used when the current life cycle is split into threads parallel processes originating from the same life cycle stage. In the Portal, you can change the .l files of certain components to specify which perspectives of a life cycle should be shown. For instance, when Maconomy performs life cycle transitions automatically, it is not relevant for the users to see all life cycle stages in a portal component. To exclude automatic life cycles from view, you can, for example, give them the name “Automatic” in this field and adjust the .l file of the component to exclude life cycles of this type from view.
<b>Created by</b>	This field shows the name of the user who originally created the current life cycle stage definition.

Field	Description
<b>Created on</b>	This field shows when the current life cycle stage definition was created.
<b>Changed by</b>	This field shows the name of the last user to change the current life cycle stage definition.
<b>Changed on</b>	This field shows when the current life cycle stage definition was last changed.
<b>Version</b>	This field shows the version number of the current life cycle stage definition every time the definition is changed, this number is increased by one.

## Life Cycle Transition Definitions Single Dialogs Workspace

Use this workspace to define the transitions or actions that make an entity progress in a workflow. For example, submitting a time sheet is an action that advances the time sheet from the Created stage to the Submitted stage.

This workspace is for internal Deltak use only.

Users perform some transitions manually, but others occur automatically. For example, a monitor can detect that some time sheets have been submitted but not approved by the end of the month and can proceed to approve the time sheets automatically.

The Maconomy Workflow functionality is not yet fully released.

In the Life Cycle Transition Definitions tab of this workspace, you can view the transition definition and see its link to a specific lifecycle definition. You can also see which actions in Maconomy cause the transition and the requirements for the action to occur.

In the Life Cycle Rule Definitions sub-tab, you can view and define the stage or stages in which the current transition can be selected (the incoming stage/stages) and the stage to which the object is progressed after the transition is made (the outgoing stage).

You define and edit all of the information in this workspace in the Maconomy Workflow Language. For more information about the functionality of workflows, see "Introduction to Workflows."

### Life Cycle Transition Definitions Tab

This section includes the fields and descriptions for the Life Cycle Transition Definitions tab.

#### Definition Island

Field	Description
<b>Life Cycle Definition No.</b>	This field shows the number or name of a life cycle definition previously created in MWL. This is the life cycle to which the current life cycle transition definition is attached. Among other things, the life cycle defines which type of object the life cycle and associated transitions concern, for example, time sheets.
<b>Transition No.</b>	This field shows a distinctive number or name for the current life cycle transition.

Field	Description
<b>Name</b>	In this field, you can enter a descriptive name of the current transition, for example, "Approve Customer Creation."
<b>Internal Action Name</b>	This is the name of the action associated with the current transition. The action can be either custom or built-in. For instance, in the case of a time sheet, the initial stage of "Created" can be reached by selecting "Create" in the workspace Time Sheets. Other internal actions are "Update" (occurs when a user presses the Enter key in a field), "Approve" (occurs in several workspaces when the user selects "Approve" in the Action menu), or "Delete" (when the user deletes the current object by selecting "Delete" in the Index menu). Custom actions are added to dialogs using the Maconomy extension languages MEXL and MDXL.
<b>Perspective</b>	This field shows the name of a perspective. This is not used in MWL workflows.
<b>Transition Condition, Procedure</b>	This field shows if an M-Script procedure is specified to check whether the criteria for carrying out the transition are fulfilled. For instance: if the current transition definition causes a time sheet to progress to the stage Approved, a procedure may check if the time sheet has in fact been submitted. If it has, the M-Script procedure associated with the condition is executed.
<b>Before Transition, Procedure</b>	This field shows if an M-Script procedure is specified to run when the transition is attempted. The procedure may check various criteria for the transition. If the transition is initiated by a time sheet changing its stage from "Created" to "Submitted" as in the example above, the "Before Transition" procedure might check whether the current user is in fact a supervisor or secretary to the employee whose time sheet was submitted. If these criteria fail (that is, the current user is not the supervisor or secretary of the time sheet employee), the transition name as specified in the field "Name" above (for example, "Approve Time Sheets") is not selectable. If the criteria are fulfilled, the transition can be attempted.
<b>After Transition, Procedure</b>	This field shows if an M-Script procedure is specified to check various criteria after the transition is attempted. If the transition, for example, concerns the approval of purchase orders, an "After Transition" procedure might calculate the effect of the approval and compare with information specified for the current user. If the current user is, for example, not permitted to approve purchase orders exceeding USD 10,000, the transition will fail with an error message. In this case, the entire transition will be rolled back (undone), and no database transactions will have taken place.

### User Island

See the Getting Started topic for a description of the fields in the island User.

## Life Cycle Rule Definitions Island

Field	Description
<b>Stage No.</b>	In this field, add the name or number of a stage as defined in the workspace Life Cycle Definitions. As the name implies, a transition marks the action of a progression of an object between stages. For example, the approval of a time sheet involves a transition between (at least) two stages, for example, "Submitted" and "Approved." A transition definition must contain at least one stage specification.
<b>Direction</b>	<p>In this field you specify the direction of the current transition in relation to the stage specified in the field "Stage No." A stage can be either "Incoming" or "Outgoing" in relation to the current transition. In the time sheet example above, the stage "Submitted" is "Incoming," because the time sheet object enters the transition procedure in submitted condition. The stage "Approved" is "Outgoing," because the object leaves the transition in approved condition.</p> <p>In case of parallel processing, a transition can have multiple ingoing or outgoing stages.</p> <p>If a transition has only an incoming stage, then that stage is by definition the ending stage, as no further actions can be performed on the object.</p>

## Notification Categories Single Dialogs Workspace

Use this workspace to set up notification categories and their priority types, both of which are used in sending notifications via workflows.

This workspace is for internal Deltek use only.

The two standard notification categories are To-dos and Alerts, but you can set up additional categories.

You use categories to categorize notifications. You can use the priority type to specify an option list with priorities for the notifications in a given category.

The Maconomy Workflow functionality is not yet fully released.

Each notification belongs to a category. The categories are referenced by workflows defined using MWL, and can be assigned to notification types in the Notification Types workspace.

In the standard Maconomy system there are two basic categories, To-dos and Alerts, that Maconomy recognizes and uses.

Before Maconomy version 8.0, Service Pack 16, you created the information that appears in this workspace in the **Notification Category** pop-up field in the Popup Fields workspace. The information in the pop-up field does not apply to workflows subsequent to version 8.0, Service Pack 16.

For more information about the functionality of workflows, see "Introduction to Workflows."

## Notification Categories Tab

This section includes the fields and descriptions for the Notification Categories tab.

### Notification Category Island

Field	Description
<b>Notification Category</b>	In this field, you can enter the name of a new notification category.
<b>Name</b>	In this field, you can see or edit a descriptive name of the current notification category, for example, "Alert" or "Message."
<b>Priority Type</b>	In this field, you can select an option list which contains priority options. The selected option list will be suggested as default in the workspace Notification Types. For more information, please see the description of the workspace Notification Types.

### Remarks Island

Field	Description
<b>Remarks</b>	In these fields, you can enter additional information about the current notification category.

### User Island

See the Getting Started topic for a description of the fields in the island User.

## Notification Types Single Dialogs Workspace

Use this workspace to set up notification types, which act as templates for notifications that are sent via workflows.

This workspace is for internal Deltak use only.

The Maconomy Workflow functionality is not yet fully released.

Notifications are generated by pieces of M-Script code or general monitors that you can invoke in various ways. For instance, a general monitor may discover that a certain job has exceeded its budget, and the M-Script procedure assigned to that monitor then brings up an alert in the Portal for the project manager of the job in question. For more information, see the description of the Monitors workspace. You can view and edit notifications in the Notifications workspace.

For more information about the functionality of workflows, see "Introduction to Workflows."

## Notification Types Tab

This section includes the fields and descriptions for the Notification Types tab.

### Notification Type Island

Field	Description
<b>Notification Type</b>	If you are creating a notification type, you can enter a name in this field. The type name cannot be changed.
<b>Name</b>	In this field, you can enter or change a description of the current notification type.
<b>Internal Relation Name</b>	This field shows the internal name of a Maconomy database relation. The relation must correspond to the internal relation name specified on the monitor which generates a notification of this type.
<b>Life Cycle Definition No.</b>	This field shows the number of the life cycle definition associated with the current notification type.
<b>General Monitor No.</b>	This field shows the number of the general monitor associated with the current notification type.
<b>Duplicate management</b>	<p>In this pop-up field, you can see how Maconomy handles a situation in which a monitor generates two or more identical notifications of the current type. If this situation arises, four options are available for each notification type:</p> <ul style="list-style-type: none"> <li>■ <b>Allow Duplicates</b> — With this option, Maconomy permits the same notification to be generated and displayed multiple times.</li> <li>■ <b>Keep First</b> — With this option, Maconomy keeps the first notification generated and deletes any subsequent, identical notifications.</li> <li>■ <b>Keep Last</b> — With this option, Maconomy keeps the last notification generated and deletes any previous, identical notifications.</li> <li>■ <b>Error when Encountering Duplicate</b> — With this option, Maconomy will report an error if a notification is generated which is identical to previous notifications.</li> </ul>

### User Island

See the Getting Started topic for a description of the fields in the island User.

**Category Island**

Field	Description
<b>Notification Category</b>	In this pop-up field, you can select a notification category defined in the workspace Notification Categories. For more information, please see the description of the workspace Notification Categories.
<b>Name</b>	This field shows the external name assigned to notifications of the category selected in the field "Notification Category."
<b>Priority Type</b>	In this field, you can select an option list. The option list should contain priority values. For instance, a notification category called "Alert" could refer to an option list with three values: "Green," "Amber," and "Red." This way, an M-Script procedure can issue alerts of varying degrees of severity, for example, depending on the degree by which a job budget is exceeded.  Please note that a default priority type may have been defined for the notification category in question in the workspace Notification Categories (or, for pre-Service Pack 5 workflows, in the workspace Popup Fields).
<b>Standard Priority</b>	In this field, you can enter the value of an option in the option list specified in the field "Priority Type" above. This value will be used as priority value when the notification of this type is raised, unless an M-Script procedure specifies otherwise.

**Show as Island**

In the fields in this island, you can specify how the notifications using the current notification type should be displayed in the Portal. You can only complete one of the fields below.

Field	Description
<b>Presentation Report</b>	In this field, you specify the ID of a report written in MRL ("Maconomy Reporting Language"). By means of this report, you can specify which information you want to display in the notification, based on the relation supplied by the monitor which generated the notification.  For instance, if the monitor has raised a notification to a supervisor because some time sheets for employees under his supervision have not been submitted, then a number of fields in the relation TimeSheets are available for display. The MRL report specified in this field selects the fields that should be displayed in the notification, for example, employee name, employee number, and time sheet week number. For more information, please refer to the manuals "MRL Language Reference" and "Printout Design Using MPL."
<b>Presentation Component</b>	In this field, you specify the ID of a Portal component. If an MRL report is not sufficient for displaying the notification, for example if you need to include an action button, you can write a Portal component to contain the notification, and specify it in this field.
<b>Presentation Dialog</b>	In this field you can select a Java Client workspace that the notification should link to. This will make the notification available from the Java Client. It is only possible to link a notification type to a dialog that shows the relation in the field "Internal Relation Name" in the tab.

## Group Notification Types Sub-Tab

This section includes the fields and descriptions for the Group Notification Types sub-tab.

Field	Description
<b>Group Name</b>	This field shows the group name for those members who will be able to receive notifications of the Notification Type that the tab shows.
<b>Role Number</b>	This field shows the number of the role that was assigned to this group. For all roles that are created as a result of creating a group, the role number corresponds to that group name. This number might vary from the group name if the role was assigned to the group in an upgrade from a previous version of Maconomy.
<b>Role Name</b>	This field shows the Portal role name that was automatically created and assigned to the group when the group was created.
<b>Standard Component</b>	This field shows the ID of the standard component for the role that was assigned to this group. The standard component is displayed in the Portal immediately after login, unless another standard component was specified for the user who logged in. In that case, that user-specific standard component is displayed. If a particular user has several assigned roles, Maconomy chooses the standard component to show randomly from those roles.

## Actions

This section shows the Actions available in the Notification Types workspace.

### Top Tab

Field	Description
<b>Add All Groups</b>	Use this action to add to the sub-tab all groups that exist in Maconomy.
<b>Remove All Groups</b>	Use this action to remove all groups from the sub-tab.
<b>Recalculate Notifications</b>	Use this action to recalculate notifications of this type.
<b>Recalculate All Notifications</b>	Use this action to recalculate notifications of all types.

## Group Notification Types Single Dialogs Workspace

Use this workspace to add notification types to a group.

This workspace is for internal Deltek use only.

The Group Notification Types tab displays the name of the group and the associated portal role.

You can add notification types to the list in the Group Notification Types sub-tab.

## Group Notification Types Tab

This section includes the fields and descriptions for the Group Notification Types tab.

### Group Island

Field	Description
<b>Name</b>	This field shows the name of the group.
<b>Access with Expired Password</b>	This check box is selected if a user who has access to this group can activate the workspaces in this group, even if his or her password has expired. If this check box is not selected, a user who has access to this group cannot activate the workspaces in this group if his or her password has expired.

### Portal Island

Field	Description
<b>Role No.</b>	This field shows the number of the role that was assigned to this group. For all roles that are created as a result of creating a group, the role number corresponds to that group name. This number might vary from the group name if the role was assigned to the group in an upgrade from a previous version of Maconomy.
<b>Role Name</b>	This field shows the Portal role name that was automatically created and assigned to the group when the group was created.
<b>Standard Component</b>	This field shows the ID of the standard component for the role that was assigned to this group. The standard component is shown in the Portal immediately after login, unless another standard component was specified for the user who logged in. In that case, that user-specific standard component is displayed. If a particular user has several assigned roles, Maconomy chooses the standard component to show randomly from those roles.

### User Island

See the Getting Started topic for a description of the fields in the island User.

## Group Notification Types Sub-Tab

This section includes the fields and descriptions for the Group Notification Types sub-tab.

Field	Description
<b>Notification Type</b>	Select the notification type.

Field	Description
<b>Belongs to Workflow</b>	This field shows whether the notification type belongs to a workflow.
<b>Definition Key No.</b>	This field shows the notification type's definition key number.
<b>Name</b>	This field shows the notification type's name.
<b>Internal Relation Name</b>	This field shows the notification type's internal relation name.
<b>Priority Type</b>	This field shows the notification type's priority type.
<b>Standard Priority</b>	This field shows the notification type's standard priority type.
<b>Life Cycle Definition No.</b>	This field shows the number of the life cycle definition that is associated with this notification type.
<b>General Monitor No.</b>	This field shows the number of the general monitor that is associated with this notification type.
<b>Duplicate management</b>	This field indicates whether this group notification type can be used to generate and show notifications multiple times.
<b>Notification Category</b>	This field shows the notification category.
<b>Notification Category Name</b>	This field shows the notification category name, such as ToDo.

## Actions

This section shows the Actions available in the Group Notification Types workspace.

### Top Tab

Field	Description
<b>Add All Notification Types</b>	Use this action to add to the sub-tab all notification types that exist in Maconomy.
<b>Remove All Notification Types</b>	Use this action to remove all notification types from the sub-tab.

## User Notification Types Single Dialogs Workspace

Use this workspace to see which notification types are associated with a user.

This workspace is for internal Deltek use only.

## Users Tab

This section includes the fields and descriptions for the Users tab.

### Username Island

Field	Description
<b>Name</b>	This field shows the name of the user. You can browse through all of the users in the system.
<b>Employee No.</b>	This field shows the employee number assigned to the user.

### Company Island

Field	Description
<b>Company No.</b>	Enter the company number assigned to the user.
<b>Name</b>	This field shows the company name that is associated with the company number.

### Selection Criteria Island

Field	Description
<b>Show for Invalid User</b>	Select this check box to enable the display of existing notifications for users whose credentials are not valid. For example, if you browse to a user whose validity period has ended, and this field is selected, Maconomy will still show any existing notifications.

### User Type Island

Field	Description
<b>Type</b>	This field shows the user type.
<b>Administrator</b>	Select this check box to indicate that the user is an administrator user.
<b>Template</b>	This check box is selected if the user is a template user.

### Validity Island

Field	Description
<b>Period</b>	Enter beginning and ending dates for the user validity period.

Field	Description
<b>Password Expiry Date</b>	Enter the date on which the user's password expires.
<b>Password Blocked</b>	Select this check box to indicate that the user's password is blocked.

## User Notification Types Sub-Tab

This section includes the fields and descriptions for the User Notification Types sub-tab.

Field	Description
<b>Notification Type</b>	This field shows the notification types that are included in the groups of which the user is a member.
<b>Belongs to Workflow</b>	This field indicates whether the notification type belongs to a workflow.
<b>Definition Key No.</b>	This field shows the definition key number of the notification type.
<b>Notification Type Name</b>	This field shows the name of the selected notification type.
<b>Notification Category</b>	This field shows the notification category of the selected notification type.
<b>Internal Relation Name</b>	This field shows the internal relation name of the selected notification type.

## Actions

This section shows the Actions available in the User Notification Types workspace.

### Top Tab

Field	Description
<b>Recalculate Notifications</b>	Use this action to recalculate all notifications for the user in question.

## General Monitors Single Dialogs Workspace

A general monitor is a collection of notification types and monitors that are not associated with any lifecycle. You install all general monitors in separate namespaces.

This workspace is for internal Deltek use only.

## General Monitors Tab

This section includes the fields and descriptions for the General Monitors tab.

### General Monitor Island

Field	Description
<b>General Monitor No.</b>	This field shows the name of the current general monitor.
<b>Name</b>	In this field, you can enter or change a short description of the current general monitor.
<b>Internal Relation Name</b>	This field shows the name of a relation in the Maconomy database. A general monitor is limited to watching items in one relation only. Only relations for which object instance keys have been initialized can be selected in this field. For more information about instance keys, please see the description of the workspace "Database Relations."
<b>MWL Version</b>	These fields show the major and minor version numbers of the MWL script used for defining the current general monitor. If the content of the fields is "0 0," the current workflow was not specified using MWL, but is a pre-Service Pack 5 workflow.

### User Island

See the Getting Started topic for a description of the fields in the island User.

## Monitors Single Dialogs Workspace

Use this workspace to set up monitors and specify the actions that each monitor triggers. You can also view monitors in this workspace.

This workspace is part of the Maconomy Workflow module and is for internal Deltek use only.

A monitor is a device that watches fields in the Maconomy database for specific changes, then performs one or more actions when a change occurs. For example, a monitor can send an email to a project manager when a job exceeds its budget, or notify a supervisor if an employee does not submit a time sheet when it is due.

You create monitors using the M-Script programming language.

The Maconomy Workflow functionality is not yet fully released.

Before Maconomy 9.0 Service Pack 5, you defined monitors in this workspace.

If the change occurs in a monitored object, the monitor automatically performs an action or series of actions. You also define these actions in this workspace.

You can use this functionality for a wide range of purposes such as the following:

- Send an email to a project manager if one of his or her jobs exceeds its budget.
- Notify a supervisor in the Portal if one or more employees has not submitted his or her time sheet by the Tuesday following the end of the time sheet week.

- Automatically approve time sheets for a company in Maconomy if they have not been approved four days after submission.
- Raise an alert in the Portal if an amount is committed through a purchase order that exceeds half of the budgeted revenue for a month.

The actions that a monitor performs are M-Script procedures. This makes the use of monitors very flexible—the limits of what can be done are set by M-Script, not Maconomy. M-Script is a full programming language with a direct interface with Maconomy.

The database is monitored at regular intervals. The developer who creates a workflow defines intervals by M-Script procedures.

You define and edit all of the information in this workspace in the Maconomy Workflow Language. For more information about the functionality of workflows, see "Introduction to Workflows."

## Monitors Tab

This section includes the fields and descriptions for the Monitors tab.

### Monitor Island

Field	Description
<b>Monitor No.</b>	This field shows the name of the current monitor.
<b>Name</b>	In this field, you can enter or change a short description of the current monitor.
<b>Owner</b>	<p>In this field, you can enter the name of a user in Maconomy. By default, your own user name is entered in the field, but you can change it. However, the specified user must have been given access to approve monitors in the workspace Actions. When activated, the monitor will run with this user as "owner," that is, with the access rights of the user in question. This means that when monitoring the database as specified in the island Condition, the access rights of the user in this field are used. Furthermore, the actions specified in MWL are carried out with respect to the access rights of the user specified in this field. See also the description of the field "Action Run By, Procedure."</p> <p>Please note that this field can only be completed by a user who has been given access to approve monitors in the workspace Actions.</p>
<b>Approved</b>	This field shows if the current monitor has been approved using the action "Approve" in this workspace.

### Scheduling Island

The fields in this island show when and how often the current monitor should evaluate if the conditions shown in the island Condition are fulfilled.

For instance, using an M-Script you can specify that the database should be checked every Tuesday at noon. If Tuesday is a holiday, the check should be performed Wednesday noon.

Field	Description
<b>Scheduled Execution, Package</b>	This field shows if an M-Script package containing the procedure to calculate the next execution of the monitor has been specified.
<b>Next Monitoring</b>	<p>These two fields show the date and time of the next time Maconomy should perform a monitoring as shown in the island Condition. If these fields are blank, the current monitor is not activated.</p> <p>The M-Script procedure specified above should update this field automatically.</p>
<b>Enabled</b>	This field shows if the current monitor has been enabled using the action “Enable” in this workspace. A monitor can be disabled by using the action “Disable” in this workspace.

### Notification Island

Field	Description
<b>Notification Type</b>	<p>In this field, you can specify the name of a notification type. If you complete this field, a notification of the specified type (for example, a To Do or an Alert) is raised for each item matched by the selection criteria specified for the current monitor.</p> <p>For instance, if the Maconomy database is monitored for time sheets which are two days overdue, a notification line will be created for each such time sheet. See also the field “Notification Recipient” below.</p> <p>Notification types are created in the workspace Notification Types.</p>
<b>Notification Recipient</b>	This field shows if a procedure has been specified which can select the recipient of the notifications raised when the database is monitored as described in the island Condition, and the field “Notification Type” above is completed.

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Condition Island

The fields in this island show which entry or entries in the database are monitored by the current monitor.

For instance, it may have been specified that only entries in the JobHeader relation should be monitored, and only jobs that are part of a selection criterion specification which selects fixed-price jobs managed by a specific employee. An M-Script procedure can then specify that an action should be triggered if any of the budgets of those jobs are exceeded.

Field	Description
<b>Internal Relation Name</b>	This field shows the name of a relation in the Maconomy database. The monitor is limited to watching items in one relation only, and object instance keys must have been initialized for the relation in question. For more information about instance keys, please see the description of the workspace "Database Relations."
<b>Life Cycle Definition No.</b>	This field shows the number of a life cycle definition. Together with the field "Life Cycle Stage No." below, the field shows that only those entries which are in a certain life cycle stage are selected for monitoring. This could, for example, be time sheets which have been submitted, but not approved. Note that the life cycle definition constitutes the scope, or namespace, of the monitor. If a monitor has not yet been assigned to a life cycle, the monitor must be assigned to a general monitor in the field "General Monitor No." below.
<b>Life Cycle Stage No.</b>	This field shows the number of a life cycle stage. The stage must be defined in the life cycle definition shown in the field above. For more information, see the description of the field "Life Cycle Definition No." above.
<b>General Monitor No.</b>	This field shows the number of a general monitor, if the monitor is not yet part of a life cycle. The general monitor acts as a name space which groups a set of monitors and notification types. A monitor must be assigned to either a life cycle definition or a general monitor. For more information, please see the description of the workspace General Monitors.
<b>Target Group, Procedure</b>	If this field is marked, an M-Script has been specified in MWL to select a group of entries for monitoring. This could, for example, be jobs with a certain group of customers.

### Action Island

Field	Description
<b>Action, Procedure</b>	<p>This field shows if an Action procedure has been specified. This procedure should contain instructions on which actions should be performed if the monitoring as defined in the island Condition returns true.</p> <p>For instance, the M-Script procedure could be used to send a notification to the supervisor of users who have failed to submit their time sheets on time.</p>
<b>Action Run by, Procedure</b>	<p>This field shows if an Action Run By procedure has been specified. This procedure should contain instructions on which user should be specified as responsible for the actions performed by the procedure specified as Action procedure.</p> <p>For instance, if the M-Script Action procedure automatically approves a purchase order, the procedure in this field should be used for returning the user who approves the purchase order. If this is not done, then the owner of the current monitor (as specified in the island Monitor) will be assigned as the user responsible for approving the purchase order. It would usually be more relevant to specify another user, for example, the purchase responsible for the company which is responsible for the purchase order, on the approval.</p>

Field	Description
<b>On Startup, Procedure</b>	<p>This field shows if an On Startup procedure has been specified. This procedure should contain instructions on which actions should be performed before the Action procedure, if the monitoring as defined in the island Condition returns true.</p> <p>The action is performed with respect to the access rights assigned to the user specified in the field "Owner" in the island Monitor.</p>
<b>On Close, Procedure</b>	<p>This field shows if an On Close procedure has been specified. This procedure should contain instructions on which actions should be performed after the Action procedure, if the monitoring as defined in the island Condition returns true.</p> <p>The action is performed limited by the access rights assigned to the user specified in the field "Owner" in the island Monitor.</p> <p>For example, you could use this procedure to send an e-mail to a supervisor, specifying the number of time sheets which have not been submitted on time by employees for which he is supervisor.</p>

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can specify the name of an access level. You only have access to the current monitor if you have been assigned to the same or a higher level in the workspace User Access Levels. This means that you can only specify monitors to which you have access. Furthermore, a given user can only see the monitor to which he or she has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to monitors may depend on other factors. For more information about this, please see the section "Introduction to the Access Control System."</p> <p>If no access level is specified, this field has no influence on user access to the current monitor.</p> <p>This field also shows a description of the specified access level.</p>

## Life Cycles Single Dialogs Workspace

Use this workspace to review your workflows and see the lifecycle stages that are a part of each workflow, primarily for debugging and testing purposes.

This workspace is for internal Deltek use only.

This workspace displays the lifecycle history of every object in Maconomy that is part of a workflow. An object is identified by its object instance key.

A workflow is initiated for an object when the object fulfills the criteria specified for an active lifecycle transition definition.

Viewing the life cycle of an object can be useful for debugging and testing purposes, but is rarely necessary after a workflow is running as designed.

The Life Cycles tab displays information about the lifecycle definition to which the current object is assigned. The Life Cycle Stages sub-tab displays a history of the stages through which the object has passed in its lifecycle, and which stage the object is currently in.

## Life Cycles Tab

This section includes the fields and descriptions for the Life Cycles tab.

### Definition Island

Field	Description
<b>Life Cycle Definition No.</b>	This field shows the number of the life cycle definition to which the current object is assigned. An object's life cycle definition, including transitions, define the object's workflow.
<b>Object Instance Key</b>	This field shows the current object's unique identity in the Maconomy database. In order to create workflows for objects of a certain type, instance keys must be activated in the workspace Database Relations for the database relation to which the object belongs. This is done automatically when installing an MWL workflow.
<b>Internal Relation Name</b>	This field shows the name of the database relation in which the current object is stored.
<b>Object Synchronization</b>	<p>If this field is marked, the workflow is active and is synchronized with the stages of the object. Furthermore, you cannot delete the current life cycle. The fact that you must unmark this field to delete a life cycle is an extra precaution against deleting life cycles. Deleting a life cycle can create an imbalance in the database if the database keeps trying to synchronize an object which does not exist.</p> <p>If the field is unmarked, the object can freely be changed and moved through stages without regarding the workflow. It should only be unmarked if you want to delete a workflow or if you need to resolve a deadlock situation.</p>

### User Island

See the Getting Started topic for a description of the fields in the island User.

## Life Cycle Stages Sub-Tab

This section includes the fields and descriptions for the Life Cycle Stages sub-tab.

Field	Description
<b>Stage No.</b>	This field shows the name of a stage. Every time an object enters a new stage, the stage is listed on a new line in this workspace. As the object passes through stages, a complete history is built. The current stage is marked in the field "Active" below.

Field	Description
<b>Created on</b>	This field shows the date on which the object entered the current stage.
<b>Time of Creation</b>	This field shows the time on which the object entered the current stage.
<b>Active</b>	<p>If this field is marked, the current stage is active, that is, that the stage on the current line is the object's current stage. You can change this field.</p> <p>If you mark this field, the current stage becomes active. This way you may override a workflow. You should only do this during a workflow debugging phase, not in a setting using live data. It is possible for multiple stages to be active.</p> <p>If you unmark this field, the current stage is no longer active. Transitions with this stage as incoming stage will no longer be available.</p>
<b>Created by User</b>	This field shows the name of the user who caused the object to enter into the current stage, for instance by selecting an action.
<b>Created by Transition</b>	This field shows the name of the transition action which caused the object to enter into the current stage.

## Life Cycle Transitions Single Dialogs Workspace

Use this workspace to review your workflows and see the lifecycle transitions that are a part of each workflow, primarily for debugging and testing purposes.

This workspace is for internal Deltak use only.

This workspace displays the lifecycle transitions of every object in Maconomy that is part of a workflow. An object is identified by its object instance key.

A workflow is initiated for an object when the object fulfills the criteria specified for an active lifecycle transition definition. The workspace gives you a history of the transitions performed on an object throughout the object's lifecycle in Maconomy.

Viewing the life cycle transitions for an object can be useful for debugging and testing purposes, but is rarely necessary after a workflow is running as designed.

The Life Cycle Transitions tab displays information about the lifecycle definition to which the current object is assigned. The Life Cycle Transition Definitions sub-tab displays a history of the transitions through which the object has passed in its lifecycle, and which transition is currently active for the object.

## Life Cycle Transitions Tab

This section includes the fields and descriptions for the Life Cycle Transitions tab.

### Definition Island

Field	Description
<b>Life Cycle Definition No.</b>	This field shows the number of the life cycle definition to which the current object is assigned. An object's life cycle definition, including transitions, define the object's workflow.
<b>Object Instance Key</b>	This field shows the current object's unique identity in the Maconomy database. In order to create workflows for objects of a certain type, instance keys must be activated in the workspace Database Relations for the database relation to which the object belongs.
<b>Internal Relation Name</b>	This field shows the name of the database relation in which the current object is stored.

### Selection Criteria Island

Field	Description
<b>Show Lines</b>	If you mark this field and press Enter, the sub-tab will show the lifecycle transitions for the current life cycle definition. If the field is not marked, no lines are shown.
<b>Show Active Only</b>	If you mark this field, the sub-tab only shows active lifecycle transitions for the current life cycle definition, and only if the field "Show Lines" above is marked.
<b>Transition No.</b>	Here you can enter a Transition No. The sub-tab will only show the transition with this number. The table will only show the transition if the field "Shows lines" is marked.
<b>Perspective 1-5</b>	In these fields, you can enter a perspective name. If one or more perspective names are entered, the table will only show transitions that are assigned to the perspective(s) in question.

## Life Cycle Transition Definitions Sub-Tab

This section includes the fields and descriptions for the Life Cycle Transition Definitions sub-tab.

Field	Description
<b>Transition No.</b>	This field shows the number (internal name) of a life cycle transition.
<b>Name</b>	This field shows the external name of the transition as shown in the Portal.

Field	Description
<b>Active</b>	If this field is marked, the current transition is active, that is, it can be executed.
<b>Status</b>	This field shows the status message of the current transition, either "Transition is active" or a text returned by the MWL workflow.
<b>Internal Action Name</b>	This field shows the internal action name defined for the current transition in the workspace Life Cycle Transition Definitions.

## Notifications Single Dialogs Workspace

Use this workspace to view or create notifications, which are alerts that Maconomy sends as part of a workflow. For example, if an employee does not submit a time sheet when it is due, the employee's supervisor receives a notification.

For example, if an employee does not submit a timesheet when it is due, the employee's supervisor receives a notification.

This workspace is for internal Deltek use only.

The two standard notification categories are To-dos and Alerts, but you can define additional categories.

For instance, a notification might be shown to a supervisor indicating that a user for whom the supervisor is responsible has not submitted his or her time sheet. The notification can be a To Do, an Alert, or any other notification category that you define. For more information, see the description of the Notification Types workspace.

You do not typically create notifications manually. Notifications are generated by the workflow engine or by M-Script code, which can be invoked in various ways.

### Notifications Tab

This section includes the fields and descriptions for the Notifications tab.

#### Notification Island

Field	Description
<b>Notification Type</b>	This field shows the type of the current notification. The notification type defines how the notification is displayed.
<b>Notification Type Name</b>	This field shows the name of the current notification displayed on the "Notification Type."
<b>Created</b>	These two fields show the date and time of the creation of the current notification. The notification is typically created automatically by a monitor.
<b>Instance Key</b>	This field shows the key of the current notification. Instance keys are enabled by default for the relation Notification. The instance key provides a single, unique key for the current notification item. The regular database

Field	Description
	key consists of a combination of the values in four fields in this workspace: "Notification Type," "Created" (both date and time), and "Instance Key." Using the unique instance keys makes it easier to identify and use the current notification programmatically.
<b>User</b>	This field shows the name of the user for whom the notification was raised.
<b>Internal Relation Name</b>	This field shows the internal relation name of the objects to which the current notification refers. This information derives from the notification type. If the current notification type is used in connection with a job issue (for example, if a job exceeds budget), the internal relation name is JobHeader.
<b>Object Instance Key</b>	If an internal relation name is specified in the field "Internal Relation Name" above, this field shows the instance key of the object that generated the current notification.
<b>Monitor No.</b>	This field shows the number of a monitor, if the current notification was generated by a monitor. Monitors can be inspected in the workspace Monitors.
<b>Confirmed</b>	When a notification has been confirmed, that is, it has been checked that the notification applies, this field is completed with the date and time when the notification was confirmed.

#### Extra Fields Island

Field	Description
<b>Text 1-10</b>	In these fields, you can enter additional text to apply to the notification in question. One way to use these fields is to enter parameters for the MScript procedures displaying the current notification. For instance, the M-Script procedure might be programmed to look in the field "Text 3" for a help text for the current notification.

#### Remarks Island

In these fields, you can enter a number of remarks to apply to the notification in question.

#### Show As Island

Field	Description
<b>Current</b>	These two fields show a date and a time which indicate when the current notification was shown in the Portal. If the date and time are in the future, the current notification has not yet been shown in the Portal. The date and time can be set by an MScript procedure, or you can specify a date and time manually in this workspace.

Field	Description
<b>Closed</b>	If this field is marked, the notification has been closed. A notification can be closed if it is no longer relevant, for example, if the notification concerns exceeded budgets of jobs which have subsequently been closed.
<b>Notification Text</b>	An M-Script procedure can generate any text about a notification. For instance, instead of simply specifying that a job exceeds budget, the M-Script can calculate the percentage by which the budget is exceeded and display it in this field. The text is inserted in this field and displayed in the Portal to the notification recipient.
<b>Priority</b>	This field shows the priority assigned to the current notification. The priority must be member of an option list which is assigned to the current notification type in the workspace Notification Types.

### User Island

See the Getting Started topic for a description of the fields in the island User.

### Actions

This section shows the actions available in the Notifications workspace.

### Top Tab

Field	Description
<b>Confirm Notification</b>	If you select this action, the current notification is confirmed manually.

## User Notifications Single Dialogs Workspace

Use this workspace to review all notifications created for a specific user.

This workspace is for internal Deltek use only.

### User Notifications Tab

This section includes the fields and descriptions for the User Notifications tab.

### Username Island

Field	Description
<b>Name</b>	This field shows the user name.
<b>Employee No.</b>	This field shows the user's employee number.

**Company Island**

Field	Description
<b>Company No.</b>	This field shows the employee's company number.
<b>Name</b>	This field shows the company name.

**Selection Criteria Island**

Field	Description
<b>Effective Date</b>	Enter beginning and ending dates for the effective period. Maconomy uses these date fields to select which notifications are shown in the sub-tab of the workspace. Maconomy only shows notifications whose Effective From Date and Effective From Time are in the past or contain no values in the clients.
<b>Notification Type</b>	Enter a notification type to restrict the display in the sub-tab to only notifications of the selected type.
<b>Instance Key</b>	Enter the exact notification to be displayed in the sub-tab. Maconomy uses this criterion internally.
<b>Include Closed</b>	Select this check box to indicate whether closed notifications are to be shown in the sub-tab.

**User Type Island**

Field	Description
<b>Type</b>	This field shows the user type.
<b>Administrator</b>	This check box indicates whether the user is an administrator.
<b>Template</b>	This check box indicates whether the user is a template.

**Validity Island**

Field	Description
<b>Period</b>	This field shows the beginning and ending dates for the user's validity period.
<b>Password Expiry Date</b>	This field shows the date on which the user's password expires.
<b>Password Blocked</b>	This check box indicates whether the user's password is blocked.

## Notifications Sub-Tab

This section includes the fields and descriptions for the Notifications sub-tab.

Field	Description
<b>Notification Type</b>	This field shows the notification type.
<b>Notification Type Name</b>	This field shows the name of the notification type.
<b>Notification Text</b>	This field shows the notification text. (Maconomy does not use this text.)
<b>Effective From, Date</b>	This field shows the starting date that the notification is effective. (Maconomy does not use this date.)
<b>Effective From, Time</b>	This field shows the starting time that the notification is effective. (Maconomy does not use this date.)
<b>Priority Type</b>	This field shows the priority type for this notification, such as green, amber, or red.
<b>Priority</b>	This field shows the notification's priority. The priority must be a member of an option list that is assigned to this notification type in the Notification Types workspace.
<b>Created on</b>	This field shows the date on which the user notification was created.
<b>Time of Creation</b>	This field shows the time when the user notification was created.
<b>Confirmed, Date</b>	This field shows the date on which the notification was checked to ensure that it applies.
<b>Confirmed, Time</b>	This field shows the time at which the notification was checked to ensure that it applies.
<b>Closed</b>	This check box is selected if the notification has been closed. A notification might be closed if it is no longer relevant—for example, it concerns exceeded budgets of jobs that have subsequently been closed.
<b>Internal Relation Name</b>	This field shows the internal relation name of the objects to which this notification refers. This information derives from the notification type. If this notification type is used in connection with a job issue—for example, if a job exceeds its budget—the internal relation name is JobHeader.
<b>Object Instance Key</b>	If the Internal Relation Name contains a value, the Object Instance Key field shows the instance key of the object that generated the current notification.

Field	Description
<b>Allow No Notification Receiver</b>	This check box is selected if you can leave the Name field in the tab blank.
<b>Monitor No.</b>	This field shows the number of a monitor, if a monitor generated this notification. You can inspect monitors in the Monitors workspace.
<b>Created by</b>	This field shows the user name of the person who created this notification.
<b>Changed by</b>	This field shows the user name of the person who last changed this notification.
<b>Changed on</b>	This field shows the date on which this notification was last changed.
<b>Version</b>	This field shows this notification's version number.
<b>Workspace Name</b>	This field shows the workspace that will be opened when the user clicks the notification in the ToDo menu.
<b>Icon</b>	This field shows the names of the icon associated with the notification.
<b>Notification Description</b>	This field contains the text description of the notification displayed in the ToDo menu. The string may contain references to Argument 1-5 written as ^1-^5.
<b>Argument 1-5</b>	These fields show additional details that might be included in a textual description of the notifications when a user views them. For example, for a missing daily time sheet notification, these fields might show the date and the day name.
<b>Target</b>	This field shows the name of the pane that will be opened when the user clicks the notification in the todo menu .
<b>Target Restriction Title</b>	This field shows the title of the filter restriction to the target pane.
<b>Target Focus Key 1-4</b>	Each of these fields shows the unique key that identifies the entity that is being shown in the target pane.
<b>Waypoint 1-4</b>	If the target pane is a sub pane. These fields specifies the waypoint panes.
<b>Waypoint Restriction Title 1-4</b>	This field shows the title of the filter restriction to the waypoint panes. Waypoint Focus Key 1-1, 1-2, 1-3, 1-4 through Waypoint Focus Key 4-1, 4-2, 4-3, 4-4 Each of these fields shows the unique key that identifies the super-entity for the target entity. For example, one of these fields might

Field	Description
	show the instance key for a SumFinanceBudgetHeader, which covers the Financeheader, which is the target entity.

## Show My Notifications Single Dialogs Workspace

Use this workspace to review all notifications that you are set up to receive.

This workspace is for internal Deltek use only.

### My Notifications Tab

This section includes the fields and descriptions for the My Notifications tab.

#### Username Island

Field	Description
<b>Name</b>	This field shows the name of the current user.

#### Current Role Island

Field	Description
<b>Role Name</b>	This field displays the role name the notification belongs to.

### Notifications Sub-Tab

This section includes the fields and descriptions for the Notifications sub-tab.

Field	Description
<b>Role Name</b>	This field displays the role name to which the notification belongs.
<b>Notification Type</b>	This field shows the notification type.
<b>Notification Type Name</b>	This field shows the name of the notification type.
<b>Notification Text</b>	This field shows the notification text. (Maconomy does not use this text.)
<b>Effective From, Date</b>	This field shows the starting date that the notification is effective. (Maconomy does not use this date.)

Field	Description
<b>Effective From, Time</b>	This field shows the starting time that the notification is effective. (Maconomy does not use this date).
<b>Priority Type</b>	This field shows the priority type for this notification, such as green, amber, or red.
<b>Priority</b>	This field shows the notification's priority. The priority must be a member of an option list that is assigned to this notification type in the Notification Types workspace.
<b>Created on</b>	This field shows the date on which the user notification was created.
<b>Time of Creation</b>	This field shows the time when the user notification was created.
<b>Confirmed, Date</b>	This field shows the date on which the notification was checked to ensure that it applies.
<b>Confirmed, Time</b>	This field shows the time at which the notification was checked to ensure that it applies.
<b>Closed</b>	This check box is selected if the notification has been closed. A notification might be closed if it is no longer relevant for example, it concerns exceeded budgets of jobs that have subsequently been closed.
<b>Internal Relation Name</b>	This field shows the internal relation name of the objects to which this notification refers. This information derives from the notification type. If this notification type is used in connection with a job issue, for example, if a job exceeds its budget, the internal relation name is JobHeader.
<b>Object Instance Key</b>	If the Internal Relation Name contains a value, the Object Instance Key field shows the instance key of the object that generated the current notification.
<b>Allow No Notification Receiver</b>	This check box is selected if you can leave the Name field in the tab blank.
<b>Monitor No.</b>	This field shows the number of a monitor, if a monitor generated this notification. You can inspect monitors in the Monitors workspace.
<b>Created by</b>	This field shows the user name of the person who created this notification.
<b>Changed by</b>	This field shows the user name of the person who last changed this notification.
<b>Changed on</b>	This field shows the date on which this notification was last changed.
<b>Version</b>	This field shows this notification's version number.

Field	Description
<b>Remarks 1-3</b>	These fields show additional remarks.
<b>Text 1-10</b>	These fields show additional text for the notification.
<b>Argument 1-5</b>	These fields show additional details that might be included in a textual description of the notifications when a user views them. For example, for a missing daily time sheet notification, these fields might show the date and the day name.
<b>Target Focus Key 1-4</b>	Each of these fields shows the unique key that identifies the entity that is being shown in the target pane. Waypoint Focus Key 1-1, 1-2, 1-3, 1-4 through Waypoint Focus Key 4-1, 4-2, 4-3, 4-4 Each of these fields shows the unique key that identifies the super-entity for the target entity. For example, one of these fields might show the instance key for a SumFinanceBudgetHeader, which covers the Financeheader, which is the target entity.

## Email Alerts Setup Single Dialogs Workspace

Use this workspace to perform the basic setup that is required to send email alerts via a workflow and to maintain a list of email alerts and notifications that have been set up in Maconomy.

This workspace also allows you to update a list of installed/customized portal alerts and ToDos and Maconomy notifications.

You can use email alerts functionality to:

- Generate email alerts based on selection criteria that use employee relation fields (from-to value ranges).
- Send Email Alerts in test mode action to run email alerts without actually sending out emails. This mode results in a list of users and of the notifications to be sent.
- Link directly to Workspace Client.
- Assign access levels to control access to email alerts templates.
- Log email distribution events sent to an email address when a distribution finishes.
- Log email distribution errors sent to an email address when a distribution finishes.

## Email Alerts Setup Tab

This section includes the fields and descriptions for the Email Alerts Setup tab.

### Mail Server Island

Field	Description
<b>SMTP Server Name</b>	Enter the SMTP server name as the administrator provided it, for example, "smtp.companyname.com" for sending emails. You must obtain this value from the administrator.
<b>SMTP Server Port No.</b>	Enter the SMTP server port number for sending emails. You must obtain this value from the administrator. The standard port number is 25.

## Email Alerts Notification Types Sub-Tab

This section includes the fields and descriptions for the Email Alerts Notification Types sub-tab.

Field	Description
<b>Description</b>	This field shows the description for the notification type, for example, "Approve Time as Project Manager" or "Inv. Due."
<b>Category</b>	This field shows the category for the notification type. Valid values are Alert or ToDo.
<b>Shortlisted for Templates</b>	Select this check box if this notification type should be shortlisted for selection in mail templates.
<b>Notification Type</b>	This field shows the name for the notification type, for example, "ApproveTimeSheetLines."
<b>Portal or Client Notification</b>	This field shows Portal or Client to indicate whether this notification type refers to portal alerts and to-dos, or to client notifications, respectively.

## Actions

This section shows the Actions available in the Email Alerts Setup workspace.

### Top Tab

Field	Description
<b>Update Type List</b>	Run this action to create the list of all notification types available for email alerts. This list contains notification types defined in the Notification Types window and notifications (ToDos and alerts) defined in the portal and custom notifications.

## Email Alerts Templates Single Dialogs Workspace

Use this workspace to create email templates for notifications that are to be sent to specific distribution groups.

This workspace is for internal Deltek use only.

### Email Alerts Templates Tab

This section includes the fields and descriptions for the Email Alerts Templates tab.

#### Template Island

Field	Description
<b>Name</b>	Enter a name for the template. You cannot change this name after you create the template.
<b>Description</b>	Enter a description of the purpose for the template, for example, "Company 1 employees missing time sheet submission."

#### Email Details Island

Field	Description
<b>Email Subject</b>	Enter text to be used as the subject line of every email, for example, "Actions Due in Maconomy." Maconomy automatically substitutes each employee's name for the token <%employeeName%>.
<b>Email Subject, Supervisor</b>	Enter text to be used as the subject line of every email to the employee's supervisor, for example, "Your employee <%employeeName%> Due Actions in Maconomy." Maconomy automatically substitutes the employee's name for the token <%employeeName%>.
<b>Email Opening Paragraph</b>	Enter text to be used as the first paragraph of every email to the employee, for example, "Hello <%employeeName%>. Please attend to the following due actions:" This text can include newlines. Maconomy automatically substitutes the employee's name for the token <%employeeName%>.
<b>Email Opening Paragraph, Supervisor</b>	Enter text to be used as the first paragraph of every email to the employee's supervisor, for example, "Employee <%employeeName%> is asked to attend to the following due actions:" This text can include newlines. Maconomy automatically substitutes the employee's name for the token <%employeeName%>.
<b>Email Closing Paragraph</b>	Enter text to be used for the last part of the email body after the list of notifications, for example, "Thank you." This text can include newlines.

Field	Description
	Maconomy automatically substitutes the employee's name for the token < %employee% >.
<b>Reply-to Name</b>	Enter the name to appear next to the reply-to address in the email.
<b>Reply-to Email Address</b>	Enter the email address to appear as the reply-to address in the email.
<b>Portal Login URL</b>	Enter the HTTP URL to the portal login page if a portal todo or alert is included among the notifications that you selected in the sub-tab of the workspace. This link is then included appropriately in the emails list of notifications.
<b>Workspace Client Link</b>	Select a value from the drop-down field to determine whether to include links to the workspace client in your email template.
<b>iAccess Link</b>	Select a value from the drop-down field to determine whether to add an iAccess link in your email template.  If you do not specify a URL in the <b>URL for iAccess</b> system parameter, an error message displays if you choose to include an iAccess link in an email template.

### Employee Selection Island

Field	Description
<b>Employee No.</b>	In the first box, enter the first number in the range of employee numbers for employees who are to receive email alerts.  In the second box, enter the ending number in the range of employee numbers for the employees who are to receive email alerts.  The administrator might select a particular employee.
<b>Company No.</b>	In the first box, enter the first number in the range of company numbers for employees who are to receive email alerts.  In the second box, enter the ending number in the range of company numbers for the employees who are to receive email alerts.  The administrator might select a particular company and then adjust the email paragraphs to that company's language.

### Email Alerts Selections Sub-Tab

This section includes the fields and descriptions for the Email Alerts Selections sub-tab.

Field	Description
<b>Description</b>	This field shows the description for the notification type.

Field	Description
<b>Category</b>	This field shows the category for the notification type. Values are Alert or ToDo.
<b>Include in Send</b>	Select this check box if this notification type must be included in the email alerts that Maconomy sends to employees selected by this template.
<b>Include Notification Details</b>	<p>Select this check box to display a link to each notification, and to display detailed information for each notification listed in the email. Clicking the link will redirect you to the specific notification in the Workspace Client.</p> <div> <b>Note:</b> If there are more than three notifications available, the email displays the remaining number of other notifications that require attention. </div>
<b>Send to Supervisor</b>	Select this check box if the supervisor of each employee who receives an email must also receive an email.
<b>Notification Type</b>	This field shows the notification type's ID.
<b>Portal or Client Notification</b>	This field indicates whether the notification type refers to portal alerts and todos or to client notifications.

## Actions

This section shows the Actions available in the Email Alerts Templates workspace.

### Top Tab

Field	Description
<b>Copy Email Details</b>	Use this action to copy the email details from a selected template, and add these details to your current email template.

## Email Alerts Distributions Single Dialogs Workspace

Use this workspace to create distribution groups for email notifications.

In the Email Alerts Templates workspace, you can create separate email templates for different distribution groups.

This workspace is for internal Deltek use only.

The Email Alerts Distributions workspace allows you to keep a number of distributions for execution upon request. Each distribution sends out emails according to the email templates assigned to the distribution.

## Email Alerts Distributions Tab

This section includes the fields and descriptions for the Email Alerts Distributions tab.

### Distribution Island

Field	Description
<b>Name</b>	Enter a name for the distribution. You cannot change this name after you create the distribution.
<b>Description</b>	Enter a description for the distribution, for example, "Everyone who forgot to submit a time sheet. This should be executed every Monday morning."

## Email Alerts Mail Group Definitions Sub-Tab

This section includes the fields and descriptions for the Email Alerts Mail Group Definitions sub-tab.

Field	Description
<b>Template Name</b>	This field shows the email template name. Maconomy uses this template when it sends out notifications for this distribution.
<b>Include in Send</b>	If the administrator has selected this check box, the action Send Email Alerts sends emails to employees who are included by the mail template.

## Format Specification Overview

This chapter contains a description of the Format Specification module. This module enables you to create and edit formats that you can use for the import and export of data, for example, as payment formats for payments and customer payments.

You use a payment format in connection with the Banking module in Maconomy. For more information about setting up payment modes, payment agents, and so on, see the description of the Banking module.

Using import and export formats, you can import financial data from Maconomy from a file of a certain format or export it to other systems in a given format.

### Output Data Format Section

This section includes the fields and descriptions for the Output Data Format workspaces.

#### Specification of Output Data Formats Single Dialog Workspace

Use this workspace to enter general information about the output data format that it displays.

When you create an output data format, you need access to the documentation that specifies the contents of the output data format. You typically obtain this documentation from the company or person who is going to use the format, for example, a bank if you are specifying a payment format.

This workspace is general. You can use it to create all types of formats. You might not need to fill in all of the fields, depending on what type of format you are creating.

- If you plan to use the output data format in connection with a vendor payment format, select the output data format name in the Specification of Outgoing Payment Formats workspace.
- If you plan to use the output data format in connection with a customer payment format, select the output data format name in the Specification of Customer Payment Formats workspace.
- If you plan to use the output data format in connection with an export of financial data, select the output data format name in the Specification of Export Formats workspace.

#### Specification of Output Data Formats Tab

This section includes the fields and descriptions for the Specification of Output Data Formats tab.

#### Output Data Format Island

Field	Description
<b>Name</b>	When creating an output data format, you can enter its name in this field. This is the name by which it will be known in this module. You cannot change the name of existing output data formats.

Field	Description
<b>Field Delimiter</b>	In this field, you can enter a character to be used as a divider between fields in the output data format. You typically enter a comma (",") or Tab. The Tab character is entered like this: "#TAB."
<b>Record End</b>	In this field, you can enter a character or code to be used as a divider between records in the output data format. You typically enter a Carriage Return/Line Feed as a divider. This is entered like this: "13 10."
<b>Yes</b>	In this field, you can enter the way a "Yes" is represented in an output data format. A "Yes" can, for example, be represented by "1" or "Y," depending on the specifications for the output data format.
<b>No</b>	In this field, you can enter the way a "No" is represented in an output data format. A "No" can, for example, be represented by "0" or "N," depending on the specifications for the output data format.
<b>Decimal</b>	In this field, you can enter a character to be used as a decimal in amount fields in the output data format. Certain formats do not use a decimal but assume that all amounts are entered in cents or pence.
<b>Text Encloser</b>	In this field, you enter a "text enclosing character," that is, a character used to enclose fields of the "Text" type in the format. Typically, the double quotation mark (" ") is used.
<b>General Encloser</b>	In this field, you enter a "general enclosing character," that is, a character used to enclose fields of all types in the format, not just text fields.
<b>Fixed Length</b>	This field is not used in the current version of Maconomy.
<b>Character Encoding</b>	In this field, you enter the encoding that is used by the bank. The file will be in UTF-8 if no character encoding has been specified.

### Access Level Island

Field	Description
<b>Access Level Name</b>	Enter the name of the access level required to access the format and its forms.
<b>Access Level Description</b>	Enter the description of the access level required to access the format and its forms.

### Document Header 1-3 Islands

Field	Description
<b>Header</b>	These fields are used to generate XML-based payment formats, for example, the EU SEPA format.

Field	Description
<b>Attribute 1-3 Identification</b>	These fields are used to generate XML-based payment formats, for example, the EU SEPA format.
<b>Attribute 1-3 Value</b>	These fields are used to generate XML-based payment formats, for example, the EU SEPA format.

### Document Tag 1-3 Islands

Field	Description
<b>Tag</b>	These fields are used to generate XML-based payment formats, for example, the EU SEPA format.
<b>Attribute 1-3 Identification</b>	These fields are used to generate XML-based payment formats, for example, the EU SEPA format.
<b>Attribute 1-3 Value</b>	These fields are used to generate XML-based payment formats, for example, the EU SEPA format.

### Grouping Island

In this island you can specify whether the format should divide the file into groups (sections). In this way, the payment file can attain the structure as discussed in the introduction to this module, which specified the general format of the file like this:

FileStartRecord, (SectorStartRecord, PaymentRecord+, SectorEndRecord)+, FileEndRecord

Field	Description
<b>No.</b>	This field shows the number of the sector. The number is not used elsewhere in the format specification.
<b>Fixed Text</b>	In this field, you can enter a description of the field to be used as a sector divider in the field "Reference." The description is only seen in this window.
<b>Reference</b>	<p>In this field, you enter the reference to be used as divider between the sectors. When the payment file is created, Maconomy will create a section every time this field appears. For example, you can create a section in the file for every vendor to be paid by entering the following reference in this field:</p> <p><b>#VENDOR.BANKACCOUNT</b></p> <p>The text before the dot specifies the relation in the database from which the field is taken, and the rest specifies the name of the field. "Appendix D: Reference Fields in Format Specifications" in the Reference Manual contains a list of all the fields to which you can make a reference.</p>

### Variable Island

In this island you can define a number of variables. The specified variables are used elsewhere in the format specification. You can, for example, define that variable 3 contains the total number of records in the file. In the window Specification of Output Data Records you can specify that

variable 3 should be increased by 1 for each record. In the file's end record, you can then write the content of the variable, which at that point in time will contain the total number of entries in the file.

Field	Description																
<b>No.</b>	<p>This field shows the number of the variable. The number is used when a reference is made to the variable from elsewhere in the format specification.</p> <p>The numbers 1-10 are shown, but a variable with the number 0 also exists. This variable always holds the value of the current field, that is, the value currently being written to the payment file. It is also possible to refer to this variable.</p>																
<b>Type</b>	<p>In this pop-up field, you can select the type of the variable. The type determines the possible actions with the variable, and determines how the format evaluates the content of the variable. For instance, variables of the type "Text Field" are perceived to contain text, and consequently they cannot, for example, be added to other fields, even if they happen to contain a number. At the same time, you cannot, for example, assign a text string to a variable of the type "Integer Field."</p> <p>The following types exist:</p> <table> <tr> <th>Type</th><th>Content</th></tr> <tr> <td>Integer Field</td><td>Integer</td></tr> <tr> <td>Amount Field</td><td>Amount</td></tr> <tr> <td>Text Field</td><td>Text</td></tr> <tr> <td>Boolean Field</td><td>"TRUE" or "FALSE"</td></tr> <tr> <td>Date Field</td><td>Date</td></tr> <tr> <td>Time Field</td><td>Time</td></tr> <tr> <td>Decimal Field</td><td>Real Number</td></tr> </table>	Type	Content	Integer Field	Integer	Amount Field	Amount	Text Field	Text	Boolean Field	"TRUE" or "FALSE"	Date Field	Date	Time Field	Time	Decimal Field	Real Number
Type	Content																
Integer Field	Integer																
Amount Field	Amount																
Text Field	Text																
Boolean Field	"TRUE" or "FALSE"																
Date Field	Date																
Time Field	Time																
Decimal Field	Real Number																
<b>Description</b>	In this field, you can enter a description of the current variable. The text is only displayed in this window.																

### Print Control Island

In this island you can specify information to be used if you have chosen to print a control list. A control list is a paper document which can be sent to the bank along with the payment file. The printing of a control list is selected in the island Print Control in the window Specification of Outgoing Payment Formats.

The specifications in the fields of this island refer to the variables specified in the island Variables in this window. The control list will contain the content of the variables you select in this island. The variables are assigned values for each record or field. See the description of the island Variables below and the windows Specification of Output Data Records and Specification of Output Data Fields.

Field	Description
<b>Transaction No.</b>	In this field, you can specify which variable contains the transaction number. In certain formats, the transaction number can be split by multiple records pertaining to the same payment (for example, the amount and four remittance lines of a check can have the same transaction number).
<b>Entries</b>	In this field, you can specify which variable contains the sum of the number of records contained in the current payment file.
<b>Amount Entries</b>	In this field, you can specify which variable contains the sum of the number of amount records contained in the current payment file.
<b>Amount</b>	In this field, you can specify which variable contains the sum of the amounts contained in the current payment file.
<b>Account No.</b>	In this field, you can specify which variable contains the sum of the account numbers contained in the current payment file. The sum may be needed as a checksum.
<b>Create File per Grouping</b>	In this field, you can specify if you want to create a payment file per grouping. Groupings (sectors) in a file are defined in the island Grouping.

### Description Island

Field	Description
<b>Capital Letters Only</b>	If this field is marked, all letters are changed to capital letters in the format.
<b>Substitute Text</b>	If this field is marked, the list in the table part of the window is used. The character in the field "Local Character" replaces the character in the field "External Character List" in the format. This feature is often used for languages which contain international characters, such as "æ," "ø," and "å," and the current output data format does not support these. See the description of the table part of this window for more information.
<b>UTF-8 Character Set</b>	You can use this field if the bank expects a file in UTF-8. It is highly recommended that you enter the needed character encoding in the "Character Encoding" field instead.

### User Island

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the format.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the format.

Field	Description
<b>Version</b>	This field shows the latest version number of the format. The number is incremented by one each time a change is made to the format.

### Substitution Tables Sub-Tab

This section includes the fields and descriptions for the Substitution Tables sub-tab.

Field	Description
<b>LocalCharacter</b>	If the field “Substitute Text” in the island Description in the card part is marked, Maconomy will replace occurrences of the character in this field with the character in the field “External Character List” on the current line in the table part.
<b>External Character List</b>	Maconomy will replace the character in the field “Local Character” on the current line in the table part with the character specified by an ASCII value in this field. In certain formats, the letter “æ,” for example, has to be replaced by ASCII value 35 – which is the character “#.”

## Specification of Output Data Forms Single Dialog Workspace

Use this workspace to enter the forms that an output data format can contain.

As an example of output data forms, a BACS payment format might include several forms, corresponding to the various ways of transferring money via BACS.

### Specification of Output Data Forms Tab

This section includes the fields and descriptions for the Specification of Output Data Forms tab.

#### Output Data Form island

Field	Description
<b>Output Data Format</b>	This field shows the output data format to which the current output data form belongs. When you create an output data form, enter the name of the output data format to which the form should belong in this field. You cannot change the format assignment of existing output data forms.
<b>Output Data Form</b>	When creating an output data form, you can enter the name by which it should be known in this field. You cannot change the name of existing output data forms.
<b>Description</b>	In this field, you can enter a description of the current output data form. The description is only shown in this window.

#### Fields Island

The fields in this island reflect the fields in the island Electronic Payment Control in the window Payment Modes in the Banking module. The ten rows of fields in that island get their values from

this window. In the table part of this window, you can further specify the values of the pop-up fields shown in the window Payment Modes.

The fields are unrelated to the fields defined in the window Specification of Output Data Fields.

Field	Description
<b>No.</b>	This field shows the number of the field. The number is used when a reference is made to the field from the table part of this window. Furthermore, the number in this field reflects the number of the row in the island Electronic Payment Control in the window Payment Modes with which you are working.
<b>Fixed Text</b>	In this field, you can enter the name of the current field. This text is displayed as a label in the field "Description" in the island Electronic Payment Control in the window Payment Modes.  If you are using payment formats from several different banks in Maconomy, it is good practice to always use the same field for similar information. For instance, field 1 is always used for "Remittance Mode," field 2 for "Check Type," and so on. This is not mandatory, but important as Maconomy in the pop-up field in the window Payment Modes will display all the values defined for the current field (for example, field 1) in all payment forms in Maconomy. Some will not be applicable and cannot be selected, but it may confuse the user to have an option of selecting, for example, a check type in a field called "Remittance Mode."
<b>Type</b>	In this pop-up field, you can specify the type of values to be selected in this field. For a description of the different options in this field, please refer to the description of the field "Type" in the window Specification of Output Data Formats. When the payment format is generated, the content of the fields is validated by the selected type, if a type is selected.
<b>Complete</b>	If this field is marked, you can only use the field values specified in the table part of this window in the window Payment Modes. If the field is not marked, the user can enter a value himself/herself in the field "Value" in the island Electronic Payment Control in the window Payment Modes.

### Remittance Island

In this island, you can enter labels for the pop-up fields at the bottom of the island Remittance in the window Payment Modes.

In those pop-up fields, you can select a field to be inserted in the remittance, for example, invoice number, transaction number, or due date.

Field	Description
<b>No.</b>	This field shows the number of the label, which reflects the number of the field in the island Remittance in the window Payment Modes, the label of which is specified here.
<b>Fixed Text</b>	In this field, you can enter the label for the pop-up field to which the number in the field "No." above refers.
<b>Length</b>	In this field, you can specify the maximum length of the current field. If the remittance field is longer than this, it is truncated.

**Form Tag Island**

Field	Description
<b>Tag</b>	The fields in this island are used to generate XML-based payment formats, for example, the EU SEPA format. Maconomy will, if specified, create a tag in the XML payment file with the given name and the three attributes.
<b>Attribute 1-3 Identification</b>	See the description of the “Tag Identification” field.
<b>Attribute 1-3 Value</b>	See the description of the “Tag Identification” field.

**User Island**

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the form.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the form.
<b>Version</b>	This field shows the latest version number of the form. The number is incremented by one each time a change is made to the form.

**Output Data Form Fields Sub-Tab**

This section includes the fields and descriptions for the Output Data Form Fields sub-tab.

Sometimes, the only difference between two output data forms may be the value of a single field. The bank may, for example, differentiate between payment files where “Remittance by Statement of Account” has been selected and where “Remittance by Letter” has been selected, as there may be a price difference between the two remittance modes. Instead of creating a separate output data form, where the only difference is the value of this remittance field, you can create one or several entries in the table part of this output data form within the payment format assigned to a payment mode in Maconomy. You can create references to the value in these fields in the records by which the output data format is built.

Field	Description
<b>Field No.</b>	The number in this field refers to the fields in the island Fields in the card part. For each line referring to the same field, an option is created in the pop-up field to which the field refers in the window Payment Modes in the Banking module.
<b>Description</b>	In this field, you can enter a description of the current option. This is the text displayed in the corresponding pop-up field in the window Payment Modes.

Field	Description
<b>Transfer Value</b>	The value in this field is transferred to the payment file when the file is created. The value is transferred if a reference is made from the window Specification of Output Data Fields to the field in the window Payment Modes.
<b>Standard Value</b>	If you mark this field, the value on this line is used as the default value if nothing else is specified in the corresponding pop-up field in the window Payment Modes.

## Specification of Output Data Records Single Dialog Workspace

Use this workspace to define the records that belong to each output data format.

The Output Data Record island shows the format and form to which the current record is assigned.

Maconomy writes the contents of these records to the file you create when you use a format. The file could be from the Payment Files workspace if you create a payment file, or from the Collection File workspace if you create a collection file (used for customer payments). All of the information in the file is contained in records.

### Specification of Output Data Records Tab

This section includes the fields and descriptions for the Specification of Output Data Records sub-tab.

#### Output Data Record Island

Field	Description
<b>Output Data Format</b>	This field shows the output data format to which the current output data record pertains. When you create an output data record, enter the name of the output data format to which the record should belong in this field. You cannot change the format assignment of existing output data records.
<b>Output Data Form</b>	This field shows the output data form to which the current output data record belongs. When creating an output data record, you can enter the name of the output data form to which the record should belong. If you enter "#STANDARD," this record pertains to all output data forms within the current output data format. You cannot change the form assignment of existing output data records.
<b>Record Type</b>	This field shows the type of the current record. When you create a record, you can choose between the following types in this field: "File Start Record", "Sector Start Record", "Payment Record", "Sector End Record", and "File End Record". The type cannot be changed later.
<b>System No.</b>	If two records belong to the same output data format and form and have the same record type, the system number is used for telling them apart. Such

Field	Description
	identical records are written to the payment file sequentially by system number.
<b>Record ID</b>	<p>In this field, you enter a name to identify a record. This ID can be assigned to a whole group of fields which are then displayed in the table part. If the ID is changed, no fields are shown in the table part, or another group of fields are displayed. When creating a field in the window Specification of Output Data Fields, you specify the group (record ID) to which the field should belong.</p> <p>There are several effects of this. It makes it possible to use the same fields in the table part of other records when the action "Copy Record" is used. It is also important to note that if you select "Delete Output Data Record" in the Index menu, and an ID is displayed in this field, all fields in the specified group are deleted. If you only want to delete the record, but not the assigned fields (which may also be assigned to other records), you must remember to remove the record ID from this field before deleting the record.</p>
<b>Cancellation</b>	This field is not used in the current version of Maconomy.

### Variable Operations Island

Field	Description
<b>1-10</b>	<p>In these fields, you can enter calculation formulas for the variables defined in the window Specification of Output Data Formats for the current format. The number refers to the variable with the corresponding number in the window Specification of Output Data Formats; variable 1 = variable 1, variable 2 = variable 2, and so on.</p> <p>The variable operation takes place every time the current record is written to the file. In the table part of this window, you can enter more variable operations to be performed for each field in the current record when it is written to the file.</p> <p>As an example of a calculation, you can increase the variable specifying the total number of entries by one for each payment record. If it is specified in the window Specification of Output Data Formats that variable 3 is of the type "Integer Field," you can specify the following in field no. 3 in this island:</p> <p><code>#VARIABLE.3 + 1</code></p> <p>This assigns the value of variable 3 plus 1 to variable 3.</p> <p>If variable 5 has been specified as having the type "Amount Field," you can specify the following in field no. 5 in this island:</p> <p><code>#VARIABLE.5 + #PAYMENTLINE.PAYMENTCURRENCY</code></p> <p>This means that variable 5 is assigned the value of variable 5 plus the amount from the current payment record. In this way, the total payment is summed up, so it can be written, for example, in the end record of the payment file.</p> <p>You can also refer to the special variable <code>#VARIABLE.0</code>, which contains the value currently being written to the payment file.</p> <p>"Appendix D: Reference Fields in Format Specifications" in the Reference Manual contains a list of all the fields to which you can refer.</p>

Field	Description
	<p>You can use the following expression operators:</p> <p>+   -   &gt;   &lt;   =   &gt;=   &lt;=   &lt;&gt;   *   /   %</p> <p>On a Macintosh, the operators &gt;=, &lt;=, and &lt;&gt; can also be written like this:</p> <p>Š   ð   !</p> <p>The operator / means division and returns a real number, also when dividing two integers. The operator % returns a percentage</p> <p>– #VARIABLE3 % VARIABLE4 thus shows variable 3 less variable 4, divided by variable 4 and multiplied by 100. If variable 4 is 0, the result will also be 0.</p>

### Copying Island

You can copy records to save typing time. In this island, you can specify which elements should be updated when copying. The copying takes place when you select the action “Copy Record.”

Field	Description
<b>New Output Data Format</b>	In this field, you enter the name of an existing output data format. The copied record is assigned to this output data format.
<b>New Output Data Form</b>	In this field, you enter the name of an existing output data form. The copied record is assigned to this output data form. If you do not enter an output data form in this field, the new record is assigned to the same form as the record from which you copy.
<b>New Record Type</b>	In this pop-up field, you select the record type of the new record.
<b>New No. Series</b>	In this field, you can enter a serial number. The copied record is assigned to this serial number.
<b>New Record ID</b>	In this field, you can enter a record ID. The copied record is assigned to this record ID.

### Print Condition Island

In this island, you can specify conditions which must be fulfilled for the current record to be written to the payment file when it is created.

A condition consists of a Boolean (logic) expression, for example:

#VARIABLE.7 > 0.00

You can enter conditions in both fields in this island or only one, or you can choose not to enter any conditions.

Field	Description
<b>Before</b>	If the expression in this field evaluates to “True,” the current record is written to the file.
<b>After</b>	If the expression in this field evaluates to “True,” the current record is written to the file. The record is evaluated after it has been created, but before it is written to the file.

**Print Control Island**

Field	Description
<b>Print record</b>	The current record is only written to the file if this field is marked.
<b>Max. Repeats</b>	In this field you can enter the number of times the current record can be repeated. Repetitions may occur with records which write remittance lines to the file. The record will (if blanket payment is used) be repeated for each remittance line which belongs to a payment order, up to the number of times specified in this field.

**User Island**

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the record.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the record.
<b>Version</b>	This field shows the latest version number of the record. The number is incremented by one each time a change is made to the record.

**Output Data Fields Sub-Tab**

This section includes the fields and descriptions for the Output Data Fields sub-tab.

The common denominator for all the fields in the table part of this window is that they have been assigned the record ID shown in the field "Record ID" in the card part.

You can create, change, and delete output data fields in this window. Since all fields in the table part also exist in the window Specification of Output Data Fields, they are discussed further in the description of that window.

Field	Description
<b>Description</b>	This field contains the description of the output data field from the window Specification of Output Data Fields.
<b>Field No.</b>	This field shows the number of the current field on the line. All fields are given a number in the window Specification of Output Data Fields. No two fields can exist with the same number, alternative number, and record ID.
<b>Alt. Field No.</b>	This field shows the alternative field number of the current field on the line.
<b>Type</b>	This field shows the type of the output data field.
<b>Table Reference</b>	If the field on the current line is a reference field, this field displays to which table in the Maconomy database the field refers.

Field	Description
<b>Contents</b>	This field shows the contents of the output data field. If the field is a reference field, this field will contain the reference to the database field which will populate the field. "Appendix D: Reference Fields in Format Specifications" in the Reference Manual contains a list of valid reference fields.
<b>Contents Type</b>	This pop-up field specifies of which type the contents of the field should be.
<b>Format</b>	This field displays how the contents of the field should be formatted.
<b>Code Type</b>	This field displays the code type selected for the field if the field contains a reference to a pop-up field.
<b>Fixed Length</b>	This field displays whether the field has a fixed length and if so it's maximum length. If a value has been specified in this field, the fields "Min. Length" and "Max. Length" must contain identical values.
<b>Min. Length</b>	This field displays whether the field contains a defined minimum length and if so its minimum length.
<b>Max. Length</b>	This field displays whether the field contains a defined maximum length and if so it's maximum length.
<b>Verify Field Length</b>	If this field is marked Maconomy verifies the length of the field. When the verification takes place, depends on the contents of the field.
<b>Modulus Principle</b>	This field displays which modulus principle that has been selected to verify the validity of the current field, if any.
<b>Alignment</b>	This field displays how the current field should be aligned in the payment file.
<b>Fill Character</b>	This field displays which fill character is used in the current field, if a fixed length has been specified for the field.
<b>Multiple Descriptions</b>	If this field is marked, there are fields with the same field number, but another alternative field number.
<b>No. of Repeats</b>	This field displays whether the current output data field should be repeated when printing to the payment file, and in that case how many times.
<b>Conditional Expression</b>	This field contains a possible condition that needs to be fulfilled before the field is printed to the payment file.
<b>Variable Operations</b>	If this field is marked, the variable operations specified in the fields "Operation 1-10" on the current line in the table part must be executed. If the field is not marked, the operations are not executed.
<b>Operation 1-10</b>	These fields contain information about the operations that need to be executed with the variable of the output data format.

Field	Description
<b>Field Tag, Identification</b>	These fields are used to generate XML based payment formats, for example, the EU SEPA format.
<b>Field Tag, Attribute 1-3 Identification</b>	These fields are used to generate XML based payment formats, for example, the EU SEPA format.
<b>Field Tag, Attribute 1-3 Value</b>	These fields are used to generate XML based payment formats, for example, the EU SEPA format.

**Attention:** For further information about these fields, see the description of the island [Variable Operations](#) in this window.

## Actions

This section shows the Actions available in the Specification of Output Data Records workspace.

### Top Tab

Field	Description
<b>Copy Record</b>	When you select this action, the current record including the conditions specified in the island Copying is copied.

## Specification of Output Data Fields Single Dialog Workspace

Use this workspace to define the fields that are assigned to each output data record.

The fields make up the contents of the records that Maconomy writes to the output data file. The **Record ID** field shows the records to which the current field is assigned.

## Specification of Output Data Fields Tab

This section includes the fields and descriptions for the Specification of Output Data Fields tab.

### Field Description Island

Field	Description
<b>Record ID</b>	<p>This field displays the record ID that the current output data field is assigned to. When you create an output data field, you write the name of the record ID that the field should be assigned to in this field. It is not possible to change the record ID assignment for existing output data records.</p> <p>By specifying a record ID you split up the fields in groups. It is possible to assign a record ID to any given record, which means that all fields with the specified ID are assigned to the record and displayed in the table part of the record in</p>

Field	Description
	question. All fields with the specified record ID are printed to the payment file along with the assigned record when creating the payment file.
<b>Field No.</b>	In this field you can specify a field number. The field number defines the sort order of fields printed to the payment file that are from the same record. The field number can later be changed by using one of the actions in the Action menu.
<b>Alt. Field No.</b>	<p>In this field you can specify an alternative or secondary field number, that is, a subordinate field number. By specifying such a number you create a series of coherent fields. This can be, for example, to fields with the number 46, only the fields are subordinated as alternative field numbers. The contents of alternative fields assigned to the same field are combined in a single string.</p> <p>This function is also useful in connection with specification of conditions. It is possible to create a conditional construction by specifying a condition for the alternative field #1. If the condition is fulfilled, field #1 and #2 are printed, otherwise only field #2 is printed. If at the same time a condition has been specified for field #2, this corresponds to a construction of the type IF-ELSEIF. For further information about conditional sentences, see the description of the island Conditional Expression.</p>
<b>Description</b>	In this field you can write a short description of the current output data field's role in the payment format.

### Special Island

Field	Description
<b>Multiple Fields</b>	If this field is marked, there are one or more fields with the same field number, but with a higher alternative field number. All fields in such a series of fields are marked in this field with the exception of the last field in the series.
<b>No. of Repeats</b>	<p>In this field, you can specify how many times the current field should be repeated, that is, the number of times the field's value should be printed to the payment file. Certain formats can be used to specify that specific (identical) fields should be printed. This is done by specifying that the field should be repeated x number of times.</p> <p>This function is typically used for printing remittance line in connection with a collective vendor settlement. You can, for example, specify that the payment file should include one line per invoice to be settled. Also, empty fields are printed.</p>

### Field Handling Island

Field	Description
<b>Record ID</b>	In this field, you can specify a record ID in connection with copying and transfer of fields. For further information about record IDs, see the description of the actions in the Action menu.

Field	Description
<b>Field No.</b>	In this field, you can specify a field number in connection with copying and moving fields. For further information about field numbers, see the description of the actions in the Action menu.
<b>Alt. Field No.</b>	In this field, you can specify an alternative field number in connection with copying and moving fields. For further information about alternative field numbers, see the description of the actions in the Action menu.
<b>Insert Quantity</b>	In connection with insertion of fields you should specify the number of fields to be inserted in this field. For further information about insertion of fields, see the description of the action "Enter Field" in the Action menu.

### Field Tag Island

Field	Description
<b>Tag</b>	These fields are used to generate XML-based payment formats, for example, the EU SEPA format. Maconomy will, if specified, create a tag in the XML payment file with the given name and the three attributes.
<b>Attribute 1-3 Identification</b>	See the description of the "Tag Identification" field.
<b>Attribute 1-3 Value</b>	See the description of the "Tag Identification" field.

### Conditional Expression Island

In this island, you can specify a condition that should be fulfilled before the current field is printed to the payment file when creating the file. A condition consists of a Boolean (logical) expression, for example:

#VARIABLE.7 > 0,00

### Variable Operations Island

Field	Description
<b>Variable Operations</b>	If this field is marked, the variable operations specified in the fields "1-10" below are executed. If the field is not marked, the operations are not executed.
<b>1-10</b>	<p>In these fields, you can specify calculation formulas for the variables specified for the current format in the window Specification of Output Data Formats. The number refers to the variable with the corresponding number in the window Specification of Output Data Formats - variable 1 = variable 1, variable 2 = variable 2, and so on.</p> <p>The variable operation takes place right before the actual field is written to the file. Fields are written to the file after the record to which they are assigned.</p>

Field	Description
	<p>As an example of a calculation you can add the amount from the current payment order to the variable which specifies the total amount for the entire payment file. If you have specified that variable 5 is of the type "Amount Field" in the window Specification of Output Data Formats, you can write the following in no. 5 in this island:</p> <p><code>#VARIABLE.5 + #PAYMENTLINE.PAYMENTCURRENCY</code></p> <p>The result is that variable 5 is assigned the value of variable 5 plus the amount from the current payment order.</p> <p>You can also refer to the special variable <code>#VARIABLE.0</code>, which contains the value currently written to the payment file.</p>

**Note:** In "Appendix D: Reference Fields in Format Specifications" of the Reference Manual you can find a list of all fields that can be referred to.

### Field Contents Island

In this island, you specify information about the field's format and contents.

Field	Description
<b>Field Type</b>	<p>In this field, you specify the field type. The type is validated upon printing to the payment file. The following options are available:</p> <ul style="list-style-type: none"> <li>■ <b>Constant</b> — Specifies the constant value in the field "Contents." The field "Table" should be left empty.</li> <li>■ <b>Not Used</b> — Inserts an empty field in the payment file. Other fields in this island are ignored. Use this option if the definition of the payment file allows specification of information in the payment file that you do not want specified or that is not supported by Maconomy. This corresponds to the specification of a constant with no contents, but this is more accurate label.</li> <li>■ <b>Reference Field</b> — This field type allows you to print a field value in Maconomy's database. The table from which the field is copied is specified in the below field "Table," and the field name is specified in the field "Contents." You can find a list of valid field names in "Appendix D: Reference Fields in Format Specifications" in the Reference Manual.</li> <li>■ <b>New Remittance Field</b> — This field type specifies that the field is a remittance field. The remittance text is copied from the table part of the window Payment Modes in the Banking module and is subject to the selection made in the window. The field will be a bundle of all fields in the table part combined in one string (concatenation).</li> <li>■ <b>Remittance Field</b> — If you specify this type, you can have the current field display various information from the vendor entry. This is done by referring to the desired information in the field "Content." If you do not</li> </ul>

Field	Description
	<p>specify a reference in the field “Content,” the field will show the amount paid in the currency of the entry in question.</p> <p>The following references can be made:</p> <p>#REMITTANCETEXT@</p> <p>#AMOUNTCURRENCY</p> <p>#AMOUNTBASE</p> <p>#AMOUNTENTERPRISE</p> <p>#DISCOUNTCURRENCY</p> <p>#DISCOUNTBASE</p> <p>#DISCOUNTENTERPRISE</p> <p>#INVOICEAMOUNTCURRENCY</p> <p>#REMAINDERAMOUNTCURRENCY</p> <p>#VOUCHERNUMBER</p> <p>#INVOICENUMBER</p> <p>#INVOICEDATE</p> <p>#ENTRYTEXT</p> <p>#SUPPLIERNUMBER</p>
<b>Table</b>	<p>If the field has the type “Reference Field,” the table of the reference field is specified in this field.</p>
<b>Code Type</b>	<p>If the contents of the field are a reference to a pop-up field, you must specify the pop-up field type in this field. You can choose between the code types CurrencyType and CountryType. The last mentioned type, however, was made obsolete from Maconomy version 5.0.</p> <p>To refer to the values in a pop-up field you must specify the field in which the desired value is specified in the window Popup Fields in the Set-Up module. You can, for example, refer to a currency’s ISO code by specifying the following in this field:</p> <p>CurrencyType.#String1</p> <p>This requires that the field is a reference field and that you refer to a field of the type CurrencyType in the field “Contents,” for example:</p> <p>#PAYMENTLINE.CURRENCY</p> <p>Pop-up fields contain the following fields (the top field is the key value and is not listed below):</p> <p>#String 1-4</p> <p>#Amount 1-2</p> <p>#Real 1-3</p> <p>#Integer 1-2</p> <p>#Boolean 1-2</p>

Field	Description		
Contents	In this field, you specify the contents of the field. The contents depend on the value specified in the field “Field Type” above.		
Contents Type	In this field, you can specify which field type you are referring to. The type is verified upon printout of the payment file. The following types exist:		
	Type	Content	
	Integer Field	Integer	
	Amount Field	Amount	
	Text Field	Text	
	Boolean Field	“TRUE” or “FALSE”	
	Date Field	Date	
	Time Field	Time	
	Decimal Field	Real number	
Format	In this field, you can specify the format of the field. The contents of this field depend on the field contents type specified in the field “Contents Type.”		
	Field Type	Format	Description
	Integer field	<empty>	Integer.
	Amount field	#DELETESIGN	Removes signs from negative amounts.
		#DOLLARAMOUNT	Displays the dollar part of the amount.
		#CENTAMOUNT	Displays the cent part of the amount. Can be used in formats where the dollar and cent part of the amount should be displayed in separate fields.
		#FORMATS or: <empty>	Formats the amount like this: Dollar part + the sign specified as decimal separator in the window Specification of Output Data Formats + Cent part.
Text field	#REMOVEBLANKS	Removes all blank characters.	

Field	Description		
		#UPPERCASE	Converts the string to capitals.
		#SUBSTITUTETEXT	Substitutes characters according to the conversion table in the window Specification of Output Data Formats.
		#FORMATS	Transfers the string only.
	Boolean field	<empty>	The value is converted in accordance with the selection made in the fields "Yes" and "No" in the window Specification of Output Data Formats.
	Date field	Combinations of: D2 M2 Y2 Y4 T	The date elements specified can be entered in any order. Separators are specified as "T" followed by the desired character/sign.
	Time field	Combinations of: S2 M2 H2	The specified time elements can be specified in any order. You cannot use separators.
	Decimal field	<empty>	Real value.
	Text fields: You can only combine more format definitions using a space, for example: #UPPERCASE #SUBSTITUTETEXT		
<b>Fixed Length</b>	In this field, you can specify the maximum number of characters allowed in the field. If the value in the field is shorter than the specified fixed length, the value in the field "Fill Character" is copied to this field. If the value is longer, an error message is displayed when you create the payment file.		
<b>Min. Length</b>	In this field, you can specify a minimum length for the current output data field. A specification in this field also indicates that the field should be completed.		
<b>Max. Length</b>	In this field, you can specify a maximal length for the current output data field. If the value is longer, an error message is displayed when you create the payment file.		

Field	Description
<b>Verify Field Length</b>	The field length is only verified if this field is marked. When the verification takes place depends on the contents of the field. The verification often takes place when you create the payment file, but may also take place when, for example, entering an account number in the window Vendor Information Card.
<b>Modulus Principle</b>	In this field, you can specify a modulus verification of the field's value. The modulus verification often has to be carried out for account numbers. You can choose between the modulus calculation methods available in the window Modulus Calculation in the Set-Up module.
<b>Alignment</b>	In this field, you can specify how the contents of the field should be aligned in the payment file: "Right justified" or "Left justified."
<b>Fill Character</b>	In this field, you can specify a fill character that is used in fields with a fixed length. If you do not specify a fill character in this field, a blank character (space) will be used.

### User Island

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the data field.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the data field.
<b>Version</b>	This field shows the latest version number of the data field. The number is incremented by one each time a change is made to the data field.

## Input Data Format Section

This section includes the fields and descriptions for the Input Data Format section workspaces.

### Specification of Input Data Forms Single Dialog Workspace

Use this workspace to create input data forms that users can select in the Customer Payment Modes workspace.

#### Specification of Input Data Forms Tab

This section includes the fields and descriptions for the Specification of Input Data Forms tab.

### Input Data Form Island

Field	Description
<b>Input Data Format</b>	This field displays which input data format to which the current input data form is assigned. The name of existing formats cannot be changed.  When creating an input data form, you write the name of an existing input data form in this field.

Field	Description
<b>Input Data Form</b>	<p>This field displays the name of the current input data form. Names of existing forms cannot be changed.</p> <p>When creating an input data form, you write the name of an existing input data form in this field. The name is displayed in the pop-up field "Customer Payment Form" in the window Customer Payment Modes in the Banking module.</p>

## Specification of Input Data Formats Single Dialog Workspace

Use this workspace to enter general information that should apply to the input data format that it displays.

When you create an input data format you must have access to the documentation that describes the structure of the input data format. You typically obtain this documentation from the company or person who is going to use the format, for example, a bank in connection with a format that specifies which payments you have received, who has made the payments, and what they cover.

When you import an input data file, such as a payment receipt file from a bank, Maconomy verifies that the imported file complies with the specified format. The format ensures that the imported payments are posted correctly in Maconomy.

This workspace is general. You can use it to create all types of formats. You might not need to fill in all of the fields, depending on what type of format you are creating.

### Specification of Input Data Formats Tab

This section includes the fields and descriptions for the Specification of Input Data Formats tab.

#### Input Data Format Island

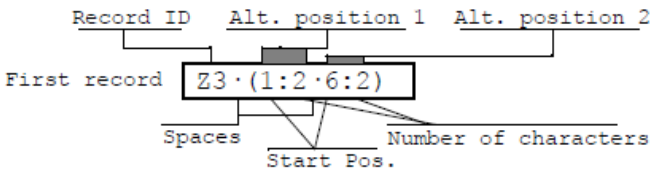

Field	Description
<b>Name</b>	Upon creation of an input data format you can write the name of the format in this field. The name of existing input data formats cannot be changed.
<b>Field Delimiter</b>	<p>In this field, you can specify a character that is used as a delimiter between fields in the input data format. Typically, a comma (",") or a tab would be used as a delimiter. The tab character is written as follows: "#TAB."</p> <p>If no delimiter is used between fields, the fields have a fixed length. In that case, the length is specified in the field "Fixed Length" below.</p>
<b>Record End</b>	<p>In this field, you can specify a character or a code that is used as delimiter between records in the input data format. Typically, a line break (carriage return/line feed) would be used as delimiter. This is specified as follows: "13 10."</p> <p>If a record end code is not used, then all records have the same length. The length is specified in the field "Fixed Length" below.</p>
<b>Yes</b>	In this field, you can specify which character in the imported file should be interpreted as "Yes." Possible ways of specifying "Yes" could be "Y" or "1," but it depends on the specifications in the input data format.

Field	Description
<b>No</b>	In this field, you can specify which character in the imported file should be interpreted as “No.” Possible ways of specifying “No” could be “N” or “0,” but it depends on the specifications in the input data format.
<b>Decimal</b>	In this field, you can specify a character that is used as decimal in amount fields in the input data format. Certain formats do not use a decimal, but assumes that all amounts are specified in cents (for US currency).
<b>Text Encloser</b>	In this field, you specify a “text enclose,” that is, a character used around fields of the type “Text” in the format. Typically, a quotation mark (“ ”).
<b>General Encloser</b>	In this field, you specify a “general enclose,” that is, a character used around all types of fields in the format, that is, not only text fields.
<b>Fixed Length</b>	If no character or code is specified in the field “Record End,” and all records have the same length, you can specify the fixed length of all records in the input data format in this field. If the value entered in this field is “0,” the function is not used.
<b>Fixed No. of Fields</b>	If a delimiter or code is specified in the field “Field Delimiter,” but no character or code is specified in the field “Record End,” then you can specify in this field how many fields every record in the input data format must contain. If the value entered in this field is “0,” the function is not used.
<b>Number of Lines per Record</b>	In this field, you can specify the number of lines into which the record is split. Some input formats split long records into several lines, and you can specify the number of lines in this field. Records of this type are typically fixed-length records as well.
<b>Character Encoding</b>	In this field, you enter the encoding that is used by the bank. Maconomy will use the default encoding if no character encoding has been specified.

### Input Data Records Island

Field	Description
<b>First Record</b>	<p>In this field, you must specify the identification of the first record in the input data file. This identification must be in the first position specified in the two fields below in order for the file to be correctly imported in Maconomy using this format. The identification is specified in the format description issued by the bank (when dealing with a payment receipt format).</p> <p>In certain cases, the position of the first record can be variable. In such cases, you can specify one or more alternative position(s) for the first record according to the following syntax:</p> <p>&lt;id&gt; (&lt;pos&gt;:&lt;length&gt; [&lt;pos&gt;:&lt;length&gt;])</p> <p>The syntax is shown in the graphic below. The illustration depicts the field “First Record,” in which the text “Z3 (1:2 6.2)” has been specified.</p>

Field	Description
	 <p>If the first record (identified by “Z3”) does not exist in the position specified in the fields “Start Identification” and “Id. Chars” below, the format specification searches for the field “Z3” in position 1 and the next two characters. If this does not produce the result “Z3” either, the format specification searches from position 6 and the next two characters. If the identification does not exist here either, the reading of the format produces an error.</p>
<b>Start Identification</b>	In this field, you must specify in which position the record identification specified in the field “First Record” above starts. Maconomy checks the first record in the file and reads from the specified position.
<b>Id. Chars.</b>	In this field, you must specify the number of characters occupied by the identification specified in the field “First Record” above. Maconomy starts the import from the position in the first record in the file as specified in the field “Start Identification” above and the number of characters that you enter in this field.

### Access Level Island

Field	Description
<b>Access Level Name</b>	Enter the name of the access level required to access the format and its forms.
<b>Access Level Description</b>	Enter the description of the access level required to access the format and its forms.

### Variable Island

In this island, you can define a number of variables. The specified variable is used in other places in the format specification. For example, you can define that variable #3 contains the total number of records in the file. In the window Specification of Input Data Records, you can specify that variable #3 should be increased by 1 for each record. You can then inspect the contents of the variable in the end record of the file, which at that time contains the total number of records.

Field	Description
<b>No.</b>	This field displays the variable number. The number is used when you refer to the variable from other windows/fields in the format specification.
<b>Type</b>	In this pop-up field, you can select the variable type. The type determines which actions the variable should execute, and how the format interprets the contents. Variables of, for example, the type “Text Field” are considered as text and therefore cannot be multiplied, even though they contain figures. At the same

Field	Description																
	<p>time, you can therefore, for example, assign text to a variable of the type “Integer Field.”</p> <p>The following types are available:</p> <table> <tr> <th>Type</th><th>Contents</th></tr> <tr> <td>Integer Field</td><td>Integer</td></tr> <tr> <td>Amount Field</td><td>Field</td></tr> <tr> <td>Text Field</td><td>Text</td></tr> <tr> <td>Boolean Field</td><td>“TRUE” or “FALSE”</td></tr> <tr> <td>Date Field</td><td>Date</td></tr> <tr> <td>Time Field</td><td>Time</td></tr> <tr> <td>Decimal Field</td><td>Real value</td></tr> </table>	Type	Contents	Integer Field	Integer	Amount Field	Field	Text Field	Text	Boolean Field	“TRUE” or “FALSE”	Date Field	Date	Time Field	Time	Decimal Field	Real value
Type	Contents																
Integer Field	Integer																
Amount Field	Field																
Text Field	Text																
Boolean Field	“TRUE” or “FALSE”																
Date Field	Date																
Time Field	Time																
Decimal Field	Real value																
<b>Description</b>	<p>In this field, you can write a description of the current variable.</p> <p>The description is only shown in this window.</p>																

### Delivery No. Island

Field	Description
<b>Verify Delivery No.</b>	If this field is marked, Maconomy verifies that the file has not been imported before. This is done by checking the delivery number in the import file. The delivery number is located using the positional indicators in the two fields below.
<b>Start</b>	In this field, you can specify in which position the delivery number in the file starts. Maconomy checks the first record in the file and reads from the specified position.
<b>Length</b>	In this field, you can specify the number of characters occupied by the delivery number. Maconomy reads the identification from the position in the first record specified in the field “Start” above and the number of characters specified in this field.

### User Island

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the format.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the format.
<b>Version</b>	This field shows the latest version number of the format. The number is incremented by one each time a change is made to the format.

## Input Data Substitution Tables Sub-Tab

This section includes the fields and descriptions for the Input Data Substitution Tables sub-tab.

Field	Description
<b>Local Character</b>	When importing the file, Maconomy replaces occurrences of the character in the field “External Character List” on the current line with the character in this field.
<b>External Character List</b>	When importing the file, Maconomy replaces occurrences of the character specified using the ASCII value specified in this field with the character in the field “Local Character” on the current line in the table part. For instance, in some formats the letter “æ” is represented by the associated ASCII value, which is 145.

## Specification of Input Data Records Single Dialog Workspace

Use this workspace to define the records that are assigned to each input data record.

The Input Data Record island contains information about the format and form to which the current record is assigned.

You can also use this workspace to specify that Maconomy should perform calculations or other operations on the variable. Maconomy performs the variable operations in the following order:

1. The fields that are defined in the Specification of Input Data Records sub-tab.
2. The operations that are specified in the Variable Operations island.
3. The operations that are specified in the Calculation island.

## Specification of Input Data Records Tab

This section includes the fields and descriptions for the Specification of Input Data Records tab.

### Input Data Record Island

Field	Description
<b>Input Data Format</b>	This field displays the input data format assigned to the current input data record. When you create an input data record, you can write the name of the input data format, which should be assigned to the record, in this field. You cannot change the assigned input data format of an existing record.
<b>Input Data Form</b>	This field displays the input data form assigned to the current input data record. When you create an input data record, you can write the name of the input data form, which should be assigned to the record, in this field. If you write “#STANDARD,” this record applies to all input data forms within the current input data format. You cannot change the assigned input data form of an existing record.
<b>Record Type</b>	This field displays the current record’s type. When you create a record, you can choose between the following record types: “File Start Record,” “Sector

Field	Description
	Start Record," "Payment Record," "Sector End Record," and "File End Record." You cannot change an existing record type.
<b>System No.</b>	This field is not used in the current version of Maconomy.
<b>Record ID</b>	<p>In this field, you can write a name that identifies the record. This ID can be assigned to a whole group of fields which are then displayed in the table part. If the ID is changed, no fields are displayed in the table part, or another group of fields are displayed. When creating a field in the window Specification of Input Data Records, the group (record ID) assigned to the field is specified.</p> <p>Please note that if you select the action "Delete Input Data Record" from the File menu and a record ID is displayed in this field, all fields in the current group of fields will be deleted. If you only want to delete the record, but not the fields (which might be assigned to other records), remove the record ID from this field before you delete the record.</p>
<b>Identification</b>	In this field, you must specify the current record's identification. Contrary to the field "Record ID" above, you have the freedom to choose an ID in this field, but you must specify the identification specified for the current record in the received format specification.
<b>Fixed Record Length</b>	In this field, you can specify the length that should be applied to the current records. Certain formats specify that a fixed length should be applied to all records; this is specified in the window Specification of Input Data Formats. The specification in this field only applies to the current record.
<b>No. of Fields</b>	In this field, you can specify the number of fields the current record should consist of, if the window Specification of Input Data Formats specifies a character or a code in the field "Field Delimiter," but no character or code in the field "Record End" in the same window. Please note that if the field "Fixed No. of Fields" in the window Specification of Input Data Formats contains a number, you do not need to specify a number in this field.
<b>Next Record</b>	<p>In this field, you can specify which records can follow the current record. This is specified by referring to the identification entered for the record in question in the field "Identification." This way you can be sure that the structure of the input data file is correct.</p> <p>If the current record has the type "File Start Record," and the payment format specifies that this record must be followed by a record of the type "Sector Start Record," then in this field you can enter the identification of the record in question. If the format allows several types of records to follow the current one, you can enter several record identifications, separated by a space, for example, like this: "01•10•15." If the current record is the last record (of the type "File End Record," you can enter "EOF" (End of File) in this field.</p> <p>Maconomy searches for the identification of the next record from the position(s) specified in the island Input Data Records in the window Specification of Input Data Formats.</p>

### Calculation Island

Field	Description
1-10	<p>In these fields, you can specify calculation formulas for variables defined for the current format in the window Specification of Input Data Formats. The number refers to the variable with the corresponding number in the window Specification of Input Data Formats - variable 1 = variable 1, variable 2 = variable 2, and so on.</p> <p>The fields can either be used as a calculation or as a control of the customer payment file. The calculation or control takes place after all fields and variable operations of the current record have been processed. In the following, some examples of usage of these fields are shown.</p> <p>Example 1</p> <p>In one field, Maconomy checks the value of the field using variable operations. Depending of the value of the field, the variables 1-4 are set to "true" or "false." In this example, variable 1 has been set to "true," and variables 2-4 have been set to "false." In the field in this island which refers to variable 1, the value "#COMPLETED" is specified. This value is the name of a field of the type Boolean. You can find the field names to which you can refer in the list in "Appendix D: Reference Fields in Format Specifications" of the Reference Manual. In the fields 2-4 other field references to Boolean fields are specified.</p> <p>When the calculations in this island are carried out (as the last calculations in the current record), the value of the field #COMPLETED is set to "true." After the payment file has been read in Maconomy, this is displayed in the window Show Collection Orders in the Banking module as a mark in the field "Completed" in the table part for the customer payment record in question.</p> <p>Example 2</p> <p>In a variable of the type "Amount," the amount of each customer payment record can be added up. In the end record of the file, the total amount can then be compared with the amount specified in the start record of the file to make sure that the amounts are identical. If they are not the same, it may be an indication that the file has been tampered with manually.</p>

### Variable Operations Island

Field	Description
1-10	<p>In these fields, you can specify calculation formulas for variables defined for the current format in the window Specification of Input Data Formats. The number refers to the variable with the corresponding number in the window Specification of Input Data Formats - variable 1 = variable 1, variable 2 = variable 2, and so on.</p> <p>The variable operation is carried out each time the current record is written to the file. In the table part of this window, you can specify further variable operations that should be carried out for each field in the current record when the record is written to the file. The variable operations in the table part are performed before the variable operations in the card part.</p> <p>As an example of a calculation, you can increase the variable for a customer payment record that specifies the total number of records by one. If you have specified in the</p>

Field	Description
	<p>window Specification of Input Data Formats that variable 3 is of the type “Integer,” you can write the following in front of line no. 3 in this island</p> <p><b>#VARIABLE.3 + 1</b></p> <p>The result is that variable 3 is assigned the value of variable 3 plus one.</p> <p>If variable 5 has been specified as being of the type “Amount Field,” you can write the following in front of line no. 5 in this island:</p> <p><b>#VARIABLE.5 + #INPUTDATA.LINE.AMOUNTCURRENCY</b></p> <p>The result is that variable 5 is assigned the value of variable 5 plus the amount from the current customer payment record. This way, the total customer payment is summarized.</p> <p>You can also refer to the special variable <b>#VARIABLE.0</b>, which contains the value currently read from the customer payment file.</p> <p>In “Appendix D: Reference Fields in Format Specifications” in the Reference Manual you can find a list of all elements that you can refer to.</p> <p>You can use the following operators in the expressions:</p> <p>+   -   &gt;   &lt;   =   &gt;=   &lt;=   &lt;&gt;   *   /   %</p> <p>On a Macintosh, you can also write &gt;=, &lt;= and &lt;&gt; as follows:</p> <p>Š   ŏ   !</p> <p>The operator / indicates division and returns a real value, also when dividing two integers. The operator % returns a percentage – <b>#VARIABLE3 % VARIABLE4</b> thus shows variable 3 less variable 4, divided by variable 4 and multiplied by 100. If variable 4 is 0, the result will also be 0.</p>

### User Island

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the record.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the record.
<b>Version</b>	This field shows the latest version number of the record. The number is incremented by one each time a change is made to the record.

### Input Data Fields Sub-Tab

This section includes the fields and descriptions for the Input Data Fields sub-tab.

It is common for all fields in the table part of this window that they are assigned the record ID displayed in the field “Record ID” in the card part.

In this window, you can create, change and delete input data fields. As all fields are also found in the window Specification of Input Data Fields, please refer to the description of this window for more information about these actions.

Field	Description
<b>Field No.</b>	This field displays the number of the current field on the line. All fields are assigned a number in the window Specification of Input Data Fields. Two fields cannot be assigned the same number, alternative field number, and/or record ID.
<b>Description</b>	This field displays the input data field description from the window Specification of Input Data Fields.
<b>Field Type</b>	This field displayed the type of the input data field.
<b>Contents</b>	This field displays the contents of the field. If the field is a reference field, it displays the reference to the database field to which the contents of the file's field should be written. In "Appendix D: Reference Fields in Format Specifications" in the Reference Manual you can find a list of available reference fields.
<b>Contents Type</b>	This pop-up field specifies the field type contents.
<b>Format</b>	This field displays the format of the contents of the field.
<b>Fixed Length</b>	This field displays whether the field has been assigned a fixed length and if so the specified length. If a value is displayed in this field, the value in the field "Max. Length" is the same value.
<b>Min. Length</b>	This field displays whether the field has been assigned a minimum length and if so the specified length.
<b>Max. Length</b>	This field displays whether the field has been assigned a maximum length and if so the specified length.
<b>Field Identification</b>	This field displays the identification assigned to the current field in accordance with the format specification.
<b>Mandatory Completion</b>	If this field is marked, the current field must contain a value.
<b>Variable Operations</b>	If this field is marked, the variable operations specified in the fields "Operation 1-10" on the current line in the table part will be executed. If the field is not marked, the operations will not be executed.
<b>Operation 1-10</b>	These fields contain the operations that should be executed along with the variable of the output data format. For further information about variable operations, please refer to the description of the island Variable Operations in this window.

## Specification of Input Data Fields Single Dialog Workspace

Use this workspace to define the fields that are assigned to each input data record.

You specify the association with a record by entering a record ID in the **Record ID** field in the Field Description island.

### Specification of Input Data Fields Tab

This section includes the fields and descriptions for the Specification of Input Data Fields tab.

#### Field Description Island

Field	Description
<b>Record ID</b>	<p>This field displays the record ID assigned to the current input data field. When you create an input data field, you must write the name of the record ID that should be assigned to the field. You cannot change record IDs assigned to existing input data fields.</p> <p>By specifying a record ID, you split up fields in groups. On any given record it is possible to assign a record meaning that all fields with the specified ID are assigned to the field and displayed in the table part of the record in question. Maconomy presupposes that all fields with the specified record ID exist in the specified record in the file to be imported.</p>
<b>Field No.</b>	In this field, you can specify a field number. The field number decides the order in which fields from the same record are read.
<b>Description</b>	In this field, you can enter a short description of the role of the current input data field in the input data format.

#### Field Condition Island

Field	Description
<b>Field Identification</b>	<p>In this field you can specify the ID of the correct field according to the format specifications. When the customer payment file is read, Maconomy checks if the current field has the ID specified in this field. If this is not the case, Maconomy checks if the field with the ID specified in this field must be completed (that is, if the field "Mandatory Completion" below is marked).</p> <p>If the field "Mandatory Completion" is marked, Maconomy will report an error, and the reading will be aborted. If the field "Mandatory Completion" is not marked, Maconomy will repeat this routine for the next record in the row (as specified in the field "Next Record").</p> <p>This way you can allow formats which permit a variable number of fields for each record. Example: A payment record in a file contains the fields "&amp;03," "&amp;05," "&amp;06," "&amp;23," and "&amp;24." The next record contains the fields "&amp;03," "&amp;05," "&amp;23," and "&amp;24." Since the field with the field ID "&amp;06" does not have a mark in the field "Mandatory Completion," reading the customer payment file will not result in an error when reading the second record where the field "&amp;06" is missing.</p>

Field	Description
<b>Mandatory Completion</b>	If this field is marked, the field whose ID is specified in the field “Field Identification” above must be completed. See the description of that field above.

### Variable Operations Island

Field	Description
<b>1-10</b>	<p>In these fields, you can specify calculation formulas for the variables specified for the current format in the window Specification of Input Data Formats. The number refers to the variable with the corresponding number in the window Specification of Input Data Formats; variable 1 = variable 1, variable 2 = variable 2, and so on.</p> <p>The variable operation takes place right before the actual field is imported. Fields are imported from the record to which they are assigned.</p> <p>As an example of a calculation you can add the amount from the current customer payment file to the variable which specifies the total amount for the entire payment file. If you have specified that variable 5 is of the type “Amount Field” in the window Specification of Input Data Formats, you can write the following in no. 5 in this island:  <code>#VARIABLE.5 + #INPUTDATALINE.AMOUNTCURRENCY</code></p> <p>The result is that variable 5 is assigned the value of variable 5 plus the amount from the current customer payment record. In this way, the total payment sum for all records is summed up in all sections.</p> <p>It is also possible to refer to the special variable <code>#VARIABLE.0</code>, which contains the value currently being imported from the payment file.</p> <p>In “Appendix D: Reference Fields in Format Specifications” in the Reference Manual you can find a list of all fields that can be referred to.</p>

### Field Contents Island

In this island, you specify information about the field’s format and contents.

Field	Description
<b>Field Type</b>	<p>In this field, you must specify the field type. The type is validated when you import the file. The following options are available:</p> <ul style="list-style-type: none"> <li>Constant — You specify the value of the constant in the field “Contents.”</li> <li>Not Used — Specifies an empty field in the field. This option is used if the specifications in the file result in the specification of information that you do not want to import or which Maconomy do not support. Choosing this option corresponds to specification of a constant with no contents but this is more accurate.</li> <li>Reference Field — With this field type you can import a value from the file and assign it to a field in the Maconomy database. The relation into which the field is copied is either <code>#REMITTANCEHEADER</code> or</li> </ul>

Field	Description																
	<p>#CUSTOMERPAYMENTLINE, but the relation selection is done automatically in Maconomy. The field name is specified in the field “Contents.” A list of valid field names can be found in “Appendix D: Reference Fields in Format Specifications” in the Reference Manual.</p> <ul style="list-style-type: none"><li>▪ New Remittance Field — This field type is not used in input data formats.</li><li>▪ Remittance Field — This field type is not used in input data formats.</li></ul>																
Contents	In this field, you specify the contents of the field. The contents depend on the value specified in the field “Field Type” below.																
Contents Type	<p>In this field, you can specify which field type you are referring to. The type is verified when the file is imported.</p> <p>The following types exist:</p> <table><tr><th>Type</th><th>Content</th></tr><tr><td>Integer Field</td><td>Integer</td></tr><tr><td>Amount Field</td><td>Amount</td></tr><tr><td>Text Field</td><td>Text</td></tr><tr><td>Boolean Field</td><td>“TRUE” or “FALSE”</td></tr><tr><td>Date Field</td><td>Date</td></tr><tr><td>Time Field</td><td>Time</td></tr><tr><td>Decimal Field</td><td>Real number</td></tr></table>	Type	Content	Integer Field	Integer	Amount Field	Amount	Text Field	Text	Boolean Field	“TRUE” or “FALSE”	Date Field	Date	Time Field	Time	Decimal Field	Real number
Type	Content																
Integer Field	Integer																
Amount Field	Amount																
Text Field	Text																
Boolean Field	“TRUE” or “FALSE”																
Date Field	Date																
Time Field	Time																
Decimal Field	Real number																
Format	<p>In this field, you can specify the format of the field. The contents of this field depend on the field contents type specified in the field “Contents Type.”</p> <table><tr><th>Field Type</th><th>Format</th><th>Description</th></tr><tr><td>Integer field</td><td>&lt;empty&gt;</td><td>Integer.</td></tr><tr><td rowspan="3">Amount field</td><td>#DOLLARAMOUNT</td><td>Displays the dollar part of the amount.</td></tr><tr><td>#CENTAMOUNT</td><td>Displays the cent part of the amount. Can be used in formats where the dollar and cent part of the amount should be displayed in separate fields.</td></tr><tr><td>&lt;empty&gt;</td><td>Formats the amount like this: Dollar part + the sign specified as decimal separator in the window</td></tr></table>	Field Type	Format	Description	Integer field	<empty>	Integer.	Amount field	#DOLLARAMOUNT	Displays the dollar part of the amount.	#CENTAMOUNT	Displays the cent part of the amount. Can be used in formats where the dollar and cent part of the amount should be displayed in separate fields.	<empty>	Formats the amount like this: Dollar part + the sign specified as decimal separator in the window			
Field Type	Format	Description															
Integer field	<empty>	Integer.															
Amount field	#DOLLARAMOUNT	Displays the dollar part of the amount.															
	#CENTAMOUNT	Displays the cent part of the amount. Can be used in formats where the dollar and cent part of the amount should be displayed in separate fields.															
	<empty>	Formats the amount like this: Dollar part + the sign specified as decimal separator in the window															

Field	Description		
			Specification of Input Data Formats + Cent part.
	Text field	#REMOVEBLANKS	Removes all blank characters.
		#REMOVEPRECEDINGZEROS	Removes zeroes from the left of the text string, unless this results in a shorter string than defined in the field "Min. Length."
		#SUBSTITUTETEXT	Substitutes characters according to the conversion table in the window Specification of Input Data Formats.
		<empty>	Transfers the string only.
	Boolean field	<empty>	The value is converted according to the selection made in the fields "Yes" and "No" in the window Specification of Input Data Formats.
	Date field	Combinations of: D2 M2 Y2 Y4 T	The date elements specified can be entered in any order. Separators are specified as "T" followed by the desired character/sign.
	Time field	Combinations of: S2 M2 H2	The specified time elements can be specified in any order. You cannot use separators.
	Decimal field	<empty>	Real value.
	For text fields, you can combine multiple format definitions using a space, for example: #REMOVEBLANKS #SUBSTITUTETEXT		
<b>Fixed Length</b>	If no character or code has been specified as a field delimiter in the window Specification of Input Data Formats, you can specify the fixed number of characters of the data field in this field. If a field delimiter has been specified, for example, "#TAB" for tab-separated files, then the length of the field is defined as		

Field	Description
	the number of character between one tab character to the next or to EOF (End of File).
<b>Min. Length</b>	<p>In this field, you can specify a minimum length of the current input data field, if the field uses a character or code as a field delimiter. A specification in this field also indicates that the field must be completed.</p> <p>If no field delimiter is used, the field may, for example, be used in connection with the reading of a bank account number. Such a field has the type "Text Field," and in the field "Format" the format specification "#REMOVEPRECEDINGZEROS" will be specified. In order not to remove zeroes from bank account numbers that actually begin with a "0," the minimum length is set to "7" in this field, which would permit a bank account number such as this: "0123456."</p>
<b>Max. Length</b>	<p>In this field, you can specify a maximum length of the current input data field. Maconomy automatically sets the value in this field to equal the field "Fixed Length," if no character or code is used as field delimiter. If the value in the import file is longer, an error message is displayed when you read the file.</p>

### User Island

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the data field.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the data field.
<b>Version</b>	This field shows the latest version number of the data field. The number is incremented by one each time a change is made to the data field.

## Outgoing Payment Format Section

This section includes the fields and descriptions for the Outgoing Payment Format section workspaces.

### Specification of Outgoing Payment Format Single Dialog Workspace

Use this workspace to enter specific information about outgoing payment formats that do not apply to the export of financial data.

You can view the outgoing payment formats that you create in this workspace in the **Payment Format** pop-up field in the Payment Agents workspace in the Banking module.

## Specification of Outgoing Payment Format Tab

This section includes the fields and descriptions for the Specification of Outgoing Payment Format tab.

### Outgoing Payment Format Island

Field	Description
<b>Name</b>	In this field, you can specify the name of the current outgoing payment format. Names of existing outgoing payment formats are displayed in the pop-up field "Payment Format" in the window Payment Agents in the Banking module.
<b>Output Data Format</b>	In this field, you can specify the name of the output data format that you want to use in the current outgoing payment format. Output data formats are created in the window Specification of Output Data Formats. The format must already exist. Payment files are created on the basis of this format in the Banking module.
<b>Input Data Format</b>	In this field, you can specify the name of the input data format that you want to use in the current outgoing payment format. Input data format are created in the window Specification of Input Data Formats. The format must already exist. This format is used when importing payment status files in the window Read Payment Status in the Banking module.

### Print Control Island

Field	Description
<b>Show Control Listing</b>	If you mark this field, a control listing is printed after the payment file has been created. This listing can be attached to the payment file when sending it to the bank.
<b>Show Extended Control Listing</b>	The functionality of this field is similar to that of the field "Show Control Listing" above. However, the printed listing contains more information, including payment numbers and the vendors' company registration numbers.

### Access Level Island

Field	Description
<b>Access Level Name</b>	Enter the name of the access level required to access the format and its forms.
<b>Access Level Description</b>	Enter the description of the access level required to access the format and its forms.

**System Numbers Island**

Field	Description
<b>System Number 1-3</b>	<p>Maconomy can manage concurrent numbering of payment orders. In these fields, you can specify whether the three system numbers should be reset every day, month, year, or never. You can, for example, specify a system number that is reset once a year in one field, and a system number that is reset every day.</p> <p>In the fields "Next System No. 1-3" in the island Payment Information in the window Payment Agents in the Banking module, you can change the current system number value, for example, to specify an initial value.</p> <p>You can refer to these fields in an output data field by referring to the fields #PAYMENT.SYSTEMNUMBER1-3. System numbers are unique per payment agent.</p>

**User Island**

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the format.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the format.
<b>Version</b>	This field shows the latest version number of the format. The number is incremented by one each time a change is made to the format.

## Specification of Outgoing Payment Form Single Dialog Workspace

Use this workspace to enter specific information about individual outgoing payment forms.

You can view the outgoing payment forms that you create in this workspace in the **Payment Form** pop-up field in the Payment Modes workspace in the Banking module.

**Specification of Outgoing Payment Form Tab**

This section includes the fields and descriptions for the Specification of Outgoing Payment Form tab.

**Outgoing Payment Format Island**

Field	Description
<b>Outgoing Payment Format</b>	Select the name of an existing output data format that you want to specify an outgoing payment form for in this pop-up field.

Field	Description
<b>Outgoing Payment Form</b>	In this field, you can specify a name for the outgoing payment form that you want to create for the current outgoing payment format. This is the name displayed in the pop-up field "Payment Form" in the window Payment Modes in the Banking module.
<b>Output Data Form</b>	In this field, you can specify the name of the output data form that you want to use as output data form for the current outgoing payment form. Output Data Forms are created in the window Specification of Output Data Forms. You can only specify existing forms.
<b>Input Data Form</b>	In this field, you can specify the name of the input data form that you want to use as input data form for the current outgoing payment for. Input data forms are created in the Specification of Input Data Forms. You can only specify existing forms. The form is used when you import payment status files in the window Read Payment Status in the Banking module.

### User Island

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the form.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the form.
<b>Version</b>	This field shows the latest version number of the form. The number is incremented by one each time a change is made to the form.

### Payment Island

Field	Description
<b>Allow Blanket Payment</b>	In this pop-up field, you can specify whether it should be specified for the current outgoing payment form that payments should be combined, that is, that all payments to the same vendor are combined in one collective payment. If you select "Yes" in this field, you cannot remove the mark in the field "Blanket Payment" in the window Payment Modes in the Banking module. If you select "No," however, you cannot mark the field. If you select "Partial" in this field, the payment mode can be used with or without blanket payment. The field must be completed. For more information, please see the description of the window Payment Modes.
<b>Currency Payment</b>	If you mark this field, the current payment is made in foreign currency. This means that a warning message is displayed if the format is used for payments to domestic vendor (that is, in national currency).
<b>Allow Zero Entries</b>	If you mark this field, payment orders with a zero balance are included in the payment file. This happens if the field "Include Payment Ord. with 0 Balance" in the window Payment Modes is marked.

**Remittance Island**

Field	Description
<b>Allow Remittance</b>	In this pop-up field, you can specify whether the current outgoing payment form should allow for remittance of the vendor. If you select "Yes" in this field, you cannot remove the marking of the field "Notify Payment Recipient" in the window Payment Modes in the Banking module. If you select "No," however, you cannot mark the field. If you select "Partial" in this field, the payment mode can be used with or without remittance. The field must be completed.
<b>Length on Lines</b>	This field corresponds to the field "Max characters per line" in the window Payment Modes and specifies the maximum length on a remittance line.
<b>Maximum Number of Lines</b>	This field corresponds to the field "No. of Lines Per Paym. Order" in the window Payment Modes and specifies the maximum number of lines allowed in remittance per payment order.

## Export Payment Forms Single Dialog Workspace

Use this workspace to create a file to be used as a payment format.

In the Export Payment Forms tab you identify for which outgoing payment format you want to view outgoing payment forms. In the Outgoing Payment Forms sub-tab you identify which outgoing payment forms Maconomy should write to the file.

When you use the **Export** action, Maconomy creates a file that contains a payment format with the specified payment forms. Maconomy prints the specification of the format, forms, records, and fields as text that you can reimport into Maconomy.

### Export Payment Forms Tab

This section includes the fields and descriptions for the Export Payment Forms tab.

**Selection Criteria Island**

Field	Description
<b>Outgoing Payment Format</b>	This pop-up field displays the outgoing payment formats created in the window Specification of Outgoing Payment Format. When you have selected a format and press Return, the table part displays the outgoing payment forms assigned to the selected outgoing payment format.

## Outgoing Payment Forms Sub-Tab

This section includes the fields and descriptions for the Outgoing Payment Forms sub-tab.

Field	Description
<b>Outgoing Payment Form</b>	This field displays the outgoing payment forms assigned to the outgoing payment format (in the window Specification of Outgoing Payment Form) selected in this window.
<b>Export</b>	If you mark this field, the marked outgoing payment form is included in the file created when you select the action "Export."

## Actions

This section shows the Actions available in the Export Payment Forms workspace

### Top Tab

Field	Description
<b>Export</b>	<p>When you select this action, the outgoing payment forms marked in the table part of the window are exported to a file. The file created is placed in the specified Maconomy folder. The file name is a combination of the word "Payment," the name of the selected outgoing payment format, and the current version of Maconomy, for example, "Payment - BankOfBoston (X)."</p> <p>You can later import the export file into Maconomy using an import program resulting in the inclusion/creation of the imported outgoing payment format and its payment forms in Maconomy. These can, for example, be inspected in the windows Payment Agents and Payment Modes in the Banking module.</p> <p>Please note that names of database fields, and so on, are converted to the database kernel language on export in order to facilitate moving formats between different language versions of the Maconomy system.</p>

## Customer Payment Format Section

This section includes the fields and descriptions for the Customer Payment Format section workspaces.

## Specification of Customer Payment Formats Single Dialog Workspace

Use this workspace to enter specific information about individual customer payment formats.

You can select the customer payment formats that you create in this workspace in the **Customer Payment Format** pop-up field in the Payment Agents workspace in the Banking module.

## Specification of Customer Payment Formats Tab

This section includes the fields and descriptions for the Specification of Customer Payment Formats tab.

### Customer Payment Format Island

Field	Description
<b>Name</b>	In this field, you can specify the name of the current customer payment format. This name can be selected in the pop-up field "Customer Payment Format" in the window Payment Agents in the Banking module.
<b>Output Data Format</b>	In this field, you can specify the name of the output data format that you want to use for the current customer payment format. Output data formats are created in the window Specification of Output Data Formats. You can only select an existing format. This is the format from which you create customer collection files in the window Collection Files in the Banking module. These files are sent to the bank in connection with customer collection.
<b>Input Data Format</b>	In this field, you can specify the name of the input data format that you want to use for the current customer payment format. Input data formats are created in the window Specification of Input Data Formats. You can only select an existing format. This is the format which is used when customer payment files are read in the window Read Customer Payments in the Banking module.

### Posting Island

Field	Description
<b>Enter Trans. No.</b>	This field is used when reading customer payments into Maconomy. If the field is marked, you must either specify a transaction number series in the island Customer Payment Control in the window Payment Agents or specify a transaction number in the window Read Customer Payments when reading a customer payment file using this format. If the field "Consecutive Trans. No." is marked in the window Payment Agents, Maconomy will increase the specified transaction number by one for every customer payment read.

### Access Level Island

Field	Description
<b>Access Level Name</b>	Enter the name of the access level required to access the format and its forms.
<b>Access Level Description</b>	Enter the description of the access level required to access the format and its forms.

**System Numbers Island**

Field	Description
<b>System Number 1-3</b>	<p>Maconomy can keep track of the number of collection orders that are dispatched. In these fields, you can specify whether the three system numbers should be reset per day, month, year, or never. For instance, you can specify a system number which is reset once a year in one field, and a system number which is reset every day in another field.</p> <p>In the fields “Next System Number 1-3” in the island Customer Payment Information in the window Payment Agents in the Banking module, you can change the current value of the system number, for example, to set an initial value.</p> <p>You can refer to these fields in an output data field by referring to the fields #PAYMENT.SYSTEMNUMBERS1-3. The system numbers are unique per payment agent.</p>

**User Island**

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the format.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the format.
<b>Version</b>	This field shows the latest version number of the format. The number is incremented by one each time a change is made to the format.

## Specification of Customer Payment Forms Single Dialog Workspace

Use this workspace to enter specific information about individual customer payment forms.

You can select the customer payment forms that you create in this workspace in the **Customer Payment Form** pop-up field in the Customer Payment Modes workspace in the Banking module.

**Specification of Customer Payment Forms Tab**

This section includes the fields and descriptions for the Specification of Customer Payment Forms tab.

**Cust. Payment Form Island**

Field	Description
<b>Customer Payment Format</b>	In this pop-up field, you must select the name of the existing output data format for which you want to specify a customer payment form.

Field	Description
<b>Cust. Payment Form</b>	In this field, you can specify the name of the customer payment form that you want to create for the current customer payment format. This is the name displayed in the pop-up field "Customer Payment Form" in the window Customer Payment Modes in the Banking module.
<b>Input Data Form</b>	In this field, you can specify the name of the input data form that you want use for the current customer payment form. You can only specify an existing form. The form is used when you import customer payment files in the window Read Customer Payments in the Banking module.
<b>Output Data Form</b>	In this field, you can specify the name of output data form that you want to use for the current customer payment form. Output data forms are created in the window Specification of Output Data Forms. You can only specify an existing form. The form is used when you create collection files in the window Collection Files in the Banking module.

### Remittance Island

Field	Description
<b>Allow Remittance</b>	In this pop-up field, you can select whether the current customer payment form should allow for remittance of the customer. If you select "Yes" in this field, it will not be possible to remove the marking of the field "Notify Recipient" in the window Customer Payment Modes in the Banking module. If, on the other hand, you select "No," you cannot mark the field. If you select "Partial" in this field, the customer payment mode is used with or without remittance. The field must be completed.
<b>Length on Lines</b>	This field corresponds to the field "Max. Number of Characters per Line" in the window Customer Payment Modes and specifies the maximum length of a remittance line.
<b>Maximum Number of Lines</b>	This field corresponds to the field "Number of Lines per Collection Order" in the window Customer Payment Modes and specifies the maximum number of lines allowed as remittance per collection order.

### Validation Island

Field	Description
<b>Payer Identification</b>	<p>Maconomy calculates a payer ID when creating invoices, interest charge notices, reminder letters, and so on. This payer ID will adhere to the validation rules specified in this island.</p> <p>It is possible to specify a minimum length, a maximum length, and a modulus principle for the payer ID. You can choose between the modulus calculation principles that exist in the window Modulus Calculation in the Set-Up module.</p>
<b>Amount</b>	If a modulus principle has been specified on this line, Maconomy will calculate a control digit when creating invoices, interest charge notices,

Field	Description
	<p>reminder letters, and so on. The concatenation of the amount and the control digit will adhere to the validation rules specified in the modulus principle.</p> <p>It is possible to specify a minimum length, a maximum length, and a modulus principle for the payer ID. You can choose between the modulus calculation principles that exist in the window Modulus Calculation in the Set-Up module.</p>
<b>Global Location No.</b>	In the window Payment Information, you can specify a global location number for each customer. The current customer payment form can only be used for customers whose global location number matches the criteria set up in this row.
<b>Agreement No.</b>	The functionality of this field corresponds to that of the field "Global Location No." above, but refers to the field "Collection Agreement" in the window Payment Information.
<b>Group No.</b>	The functionality of this field corresponds to that of the field "Global Location No." above, but refers to the field "Collection Group No." in the window Payment Information.

### Collection Island

Field	Description
<b>Allow Blanket Collection</b>	In this pop-up field, you can select whether collections should be handled collectively for the current customer payment form, that is, all collections to the same customer are combined. If you select "Yes" in this field, it will not be possible to remove the marking of the field "Blanket Collection" in the window Customer Payment Modes in the Banking module. If, on the other hand, you select "No," the field cannot be marked. If you select "Partial" in this field, the customer payment mode can be used with or without blanket collection. The field must be completed.
<b>Currency Collection</b>	This field is not used in the current version of Maconomy.
<b>Collection Total</b>	This field is used in connection with certain automatic payment service format. For Danish customers with "PBS" (Danish payment service agent) who have a "BS-Total" subscription, the payment agent (PBS) will send a manual payment form to the customer, if the customer in question does not have a payment agreement with PBS. If this field is not marked, a collection agreement number must be specified in the island Payment Control in the window Payment Information for the customer, for the customer to be collected. If the field is marked, this check is not performed, and the customer can be collected regardless of the presence of a collection agreement number.

Field	Description
<b>Allow Zero Entries</b>	If you mark this field, collections with zero balances are included in the import. This will happen if the field "Include Collections with Balance = 0" in the window Customer Payment Modes in the Banking module is marked.
<b>Include only Invoices and Credit Memos</b>	If you mark this field, collections for invoices and credit memos only are included in the import.
<b>Allow Negative Collections</b>	Maconomy can join a number of customer entries in one collection. The total amount is the total of all debit entries (such as invoices) minus the total of all credit entries (such as credit notes). If you mark this field, the total amount for the collection can be negative.

### User Island

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the form.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the form.
<b>Version</b>	This field shows the latest version number of the form. The number is incremented by one each time a change is made to the form.

## Export Customer Payment Forms Single Dialog Workspace

Use this workspace to create a file which can be used as a customer payment format.

In the tab, select the customer payment format for which you want to view customer payment forms. In the sub-tab, specify which customer payment formats should be written to the file.

When you click the **Export** action, a file containing a customer payment format with the specified customer payment forms is created. The specifications of the format, forms, records, and fields are printed to the file in text format, and the file can then be imported into Maconomy. The customer payment format and forms can now be inspected in the Banking module.

### Export Customer Payment Forms Tab

This section includes the fields and descriptions for the Export Customer Payment Forms tab.

#### Selection Criteria Island

Field	Description
<b>Customer Payment Format</b>	This field displays customer payment formats created in the Specification of Customer Payment Formats workspace. When you select a format from the drop-down list and press ENTER, Maconomy displays the customer

Field	Description
	payment forms assigned to the chosen customer payment format in the sub-tab.

### Customer Payment Form Informations Sub-Tab

This section includes the fields and descriptions for the Customer Payment Form Informations Sub-Tab.

Field	Description
<b>Cust. Payment Form</b>	This field displays the customer payment forms assigned to the customer payment format (in the Specification of Customer Payment Formats workspace) selected in the tab of this workspace.
<b>Export</b>	If you select this check box, the corresponding customer payment form is included in the file created using the <b>Export</b> action.

### Actions

This section shows the Actions available in the Export Customer Payment Forms workspace.

#### Top Tab

Field	Description
<b>Export</b>	<p>When you select this action, the customer payment forms marked in the sub-tab are exported to a file. The file created is placed in the specified Maconomy folder. The file name is a combination of the word "Customer Payment", the name of the selected customer payment format, and the current version of Maconomy, for example, "Customer Payment - BankOfBoston (X)."</p> <p>You can later import the export file into Maconomy using an import program. The imported customer payment format and its payment forms can, for example, be inspected in the Payment Agents and Customer Payment Modes workspaces in the Banking module.</p>

**Note:** Names of database fields, and so on, are converted to the database kernel language on export to facilitate moving formats between different language versions of the Maconomy system.

## Import Format Section

This section includes the fields and descriptions for the Import Format Section workspaces.

### Specification of Import Formats Single Dialog Workspace

Use this workspace to enter specific information about individual import formats.

You can select the import formats that you create in this workspace in the **Import Format** pop-up field in the Data Agents workspace in the G/L module.

#### Specification of Import Formats Tab

This section includes the fields and descriptions for the Specification of Import Formats tab.

#### Import Format Island

Field	Description
<b>Name</b>	In this field, you can specify the name of the current import format. This name can be selected in the pop-up field "Import Format" in the window Data Agents in the G/L module.
<b>Output Data Format</b>	This field is not used in the current version of Maconomy.
<b>Input Data Format</b>	In this field, you can specify the name of the input data format that you want to use for the current import format. Input data formats are created in the window Specification of Input Data Formats. You can only select an existing format. This is the format which is used when data files are read in the window Import Data in the G/L module.

#### Access Level Island

Field	Description
<b>Access Level Name</b>	Enter the name of the access level required to access the format and its forms.
<b>Access Level Description</b>	Enter the description of the access level required to access the format and its forms.

#### System Numbers Island

Field	Description
<b>System Number 1-3</b>	These fields are not used in the current version of Maconomy.

**User Island**

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the format.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the format.
<b>Version</b>	This field shows the latest version number of the format. The number is incremented by one each time a change is made to the format.

## Specification of Import Forms Single Dialog Workspace

Use this workspace to enter specific information about individual import forms.

Import forms created in this workspace can be selected in the **Import Form** field in the Import Modes workspace of the G/L module.

### Specification of Import Forms Tab

This section includes the fields and descriptions for the Specification of Import Forms tab.

**Import Form Island**

Field	Description
<b>Import Format</b>	In this field, you must select the name of the existing import format for which you want to specify an import form.
<b>Import Form</b>	In this field, you can specify the name of the import form that you want to create for the current import format. This is the name displayed in the <b>Import Form</b> field in the Import Modes workspace of the G/L module.
<b>Input Data Form</b>	In this field, you can specify the name of the input data form that you want use for the current import form. You can only specify an existing form. The form is used when you import data files in the Import Data workspace of the G/L module.
<b>Output Data Form</b>	This field is not used in the current version of Maconomy.
<b>Entry Type</b>	In this field, you can select the entry type to be assigned to data imported using the current import form. You can choose between "G" (General Ledger entry), "R" (Accounts Receivable entry), and "P" (Accounts Payable entry), corresponding to the available selections in the General Journal workspace of the G/L module.

**User Island**

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the form.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the form.
<b>Version</b>	This field shows the latest version number of the form. The number is incremented by one each time a change is made to the form.

**Export Import Forms Single Dialog Workspace**

Use this workspace to create a file that you can import and use as an import format in the G/L module.

In the Export Import Forms tab you select the import format for which you want to view import forms. In the Data Import Forms sub-tab you specify which import forms Maconomy should write to the file.

When you use the **Export** action, Maconomy creates a file that contains an import format with the specified import forms. Maconomy prints the specifications of the format, forms, records, and fields to the file in text format; you can then import the file into Maconomy. You can view and select the import format and forms in the Data Agents and Import Modes workspaces in the G/L module.

**Export Import Forms Tab**

This section includes the fields and descriptions for the Export Import Forms Tab tab.

**Selection Criteria Island**

Field	Description
<b>Import Format</b>	This pop-up field displays the import formats created in the window Specification of Import Formats. When you have selected a format and press Return, the import forms assigned to the chosen import format are displayed in the table part.

**Data Import Forms Sub-Tab**

This section includes the fields and descriptions for the Data Import Forms Sub-Tab.

Field	Description
<b>Import Form</b>	This field displays the import forms assigned to the import format (in the window Specification of Import Forms) selected in the card part of this window.
<b>Export</b>	If you mark this field, the marked import form is included in the file created using the action "Export."

## Actions

This section shows the Actions available in the Export Import Forms workspace.

### Top Tab

Field	Description
<b>Export</b>	<p>When you select this action, the import forms marked in the table part of the window are exported to a file. The file created is placed in the Maconomy folder. The file name is a combination of the word "Import," the name of the selected import format, and the current version of Maconomy, for example, "Import - Import from BankOfBoston (X)."</p> <p>You can later import the exported file into Maconomy using an import program. The imported import format and its forms can, for example, be inspected in the windows Data Agents and Import Modes in the G/L module.</p>

**Note:** Names of database fields, and so on, are converted to the database kernel language on export to facilitate moving formats between different language versions of the Maconomy system.

## Export Format Section

This section includes the fields and descriptions for the Export Format section workspaces.

### Specification of Export Formats Single Dialog Workspace

Use this workspace to enter specific information about individual export formats.

You can select the export formats that you create in this workspace in the **Export Format** pop-up field in the Data Agents workspace in the G/L module.

### Specification of Export Formats Tab

This section includes the fields and descriptions for the Specification of Export Formats tab.

### Export Format Island

Field	Description
<b>Name</b>	In this field, you can specify the name of the current export format. This name can be selected in the pop-up field "Export Format" in the window Data Agents in the G/L module.
<b>Output Data Format</b>	In this field, you can specify the name of the output data format that you want to use for the current export format. Output data formats are created in the window Specification of Output Data Formats. You can only select an existing format. This is the format which is used when data files are exported in the window Export Data in the G/L module.

Field	Description
<b>Input Data Format</b>	This field is not used in the current version of Maconomy.

#### Access Level Island

Field	Description
<b>Access Level Name</b>	Enter the name of the access level required to access the format and its forms.
<b>Access Level Description</b>	Enter the description of the access level required to access the format and its forms.

#### User Island

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the format.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the format.
<b>Version</b>	This field shows the latest version number of the format. The number is incremented by one each time a change is made to the format.

## Specification of Export Forms Single Dialog Workspace

Use this workspace to enter specific information about individual export forms.

You can select the export forms that you create in this workspace in the **Export Form** pop-up field in the Conversion Rules workspace in the G/L module.

#### Specification of Export Forms Tab

This section includes the fields and descriptions for the Specification of Export Forms tab.

#### Export Form Island

Field	Description
<b>Export Format</b>	In this pop-up field, you must select the name of the existing export format for which you want to specify an export form.
<b>Export Form</b>	In this field, you can specify the name of the export form that you want to create for the current export format. This is the name displayed in the pop-up field "Export Form" in the window Conversion Rules in the G/L module.
<b>Input Data Form</b>	This field is not used in the current version of Maconomy.

Field	Description
<b>Output Data Form</b>	In this field, you can specify the name of the output data form that you want use for the current export form. You can only specify an existing form.

**User Island**

Field	Description
<b>Created</b>	This field shows the date and name of the user who created the form.
<b>Changed</b>	This field shows the date and name of the user who recently made changes to the form.
<b>Version</b>	This field shows the latest version number of the form. The number is incremented by one each time a change is made to the form.

## Export Export Forms Single Dialog Workspace

Use this workspace to create a file that you can import and use as an export format in the G/L module.

In the Export Export Forms tab, you select the export format for which you want to view export forms. In the Data Export Forms sub-tab, you specify the export forms that Maconomy should write to the file.

When you use the **Export** action, Maconomy creates a file that contains an export format with the specified export forms. Maconomy prints the specifications of the format, forms, records, and fields to the file in text format; you can then import the file into Maconomy. You can view and select the export format and forms in the Data Agents and Conversion Rules workspaces in the G/L module.

### Export Export Forms Tab

This section includes the fields and descriptions for the Export Export Forms tab.

**Selection Criteria Island**

Field	Description
<b>Export Format</b>	This pop-up field displays the export formats created in the window Specification of Export Formats. When you have selected a format and press Return, the export forms assigned to the chosen export format are displayed in the table part.

## Data Export Forms Sub-Tab

This section includes the fields and descriptions for the Data Export Forms sub-tab.

Field	Description
<b>Export Form</b>	This field displays the export forms assigned to the export format (in the window Specification of Export Forms) selected in the card part of this window.
<b>Export</b>	If you mark this field, the marked export form is included in the file created using the action "Export."

## Actions

This section shows the Actions available in the Export Export Forms workspace.

### Top Tab

Field	Description
<b>Export</b>	<p>When you select this action, the export forms marked in the table part of the window are exported to a file. The file created is placed in the Maconomy folder. The file name is a combination of the word "Export," the name of the selected export format, and the current version of Maconomy, for example, "Export - Export from BankOfBoston (X)."</p> <p>You can later import the exported file into Maconomy using an import program. The imported export format and its forms can, for example, be inspected in the windows Data Agents and Conversion Rules in the G/L module.</p> <p>Please note that names of database fields, and so on, are converted to the database kernel language on export in order to facilitate moving formats between different language versions of the Maconomy system.</p>

## API Overview

This chapter describes a number of windows in Maconomy that have one thing in common: They are rarely, if ever, opened directly in a client.

The functionality in the workspaces in this module is intended for use by other Maconomy processes. For instance, you can use the information and the actions for building custom workflows in the Maconomy Portal using M-Script.

### Accounts Payable – Lookup

This section includes the fields and descriptions for the Accounts Payable – Lookup workspaces.

### Requisition Lines API Single Dialogs Workspace

Use this workspace to search for and view information about a specific requisition line.

#### Requisition Lines Tab

This section includes the fields and descriptions for the Requisition Lines tab.

#### Requisition Line Island

Field	Description
<b>Line No.</b>	This field shows the line number that is related to the requisition line.
<b>Line Remarks</b>	This field shows text for the requisition line.
<b>Text Line</b>	This field shows whether a text line is assigned to the current requisition line.
<b>Job No.</b>	This field shows the number of the job that is related to the requisition line.
<b>Task</b>	For lines with a job number, this field may show a related task.
<b>Activity No.</b>	This field shows the activity number that is related to the requisition line.
<b>Closed</b>	This field shows whether the requisition is closed.
<b>Empl. No.</b>	This field shows the number of the employee assigned to the requisition line.
<b>Account No.</b>	This field shows the account number of the customer that is relevant to the requisition line.

Field	Description
<b>Acct./Account Name</b>	This field shows the name of the account that is related to the requisition line.
<b>Company No.</b>	This field shows the number of the company that is related to the requisition line.

**Requisition Island**

Field	Description
<b>Requisition No.</b>	This field shows the requisition number that is related to the requisition line.
<b>Requisition Job Number</b>	This field shows the number of a job in the Job Cost module, if the requisition concerns a job.

**Purchase Process Island**

Field	Description
<b>Purchase Process Number</b>	This field shows the purchase process number that is related to the requisition line.
<b>Purchase Process Job Number</b>	This field shows the project job number of the requisition.

**Registration Island**

Field	Description
<b>Quantity</b>	This field show the quantity of services/items that have been ordered.

**Delivery Island**

Field	Description
<b>Delivery Date</b>	This field shows the delivery date on which you want the items or services to be delivered.

**Dimensions Island**

Field	Description
<b>Location</b>	This field shows the location dimension value which is assigned to the requisition line.
<b>Entity</b>	This field shows the entity dimension value which is assigned to the requisition line.

Field	Description
<b>Project</b>	This field shows the project dimension value which is assigned to the requisition line.
<b>Purpose</b>	This field shows the purpose dimension value which is assigned to the requisition line.
<b>Spec. 1–3</b>	These fields show the values in the dimensions Specification 1-3 assigned to the requisition line.
<b>Local Spec. 1–3</b>	This field shows up to three local specified dimensions for the requisition line.

## Request for Quote Lines API Single Dialogs Workspace

Use this workspace to search for and view information about a specific request for quote line.

### Request for Quote Lines Tab

This section includes the fields and descriptions for the Request for Quote Lines tab.

#### Request for Quote Line Island

Field	Description
<b>Line No.</b>	This field shows the line number that is related to the request for quote line.
<b>Line Remarks</b>	This field shows text that has been assigned to the request for quote line. It is printed on the request for quote.
<b>Text Line</b>	This field shows whether a text line is assigned to the current request for quote line.
<b>Job No.</b>	This field shows the number of the job in the Job Cost module if the current line concerns a job.
<b>Task</b>	For lines with a job number, this field may show the task to which the request for quote pertains.
<b>Activity No.</b>	This field shows the number of the activity in the Job Cost module that represents the item or service that you wish to order.
<b>Closed</b>	This field shows whether the current line is closed. The field cannot be changed on a closed request for quote. When you select the action “Close Request for Quote,” this field will be marked on all lines on the request for quote. If the action “Reopen Request for Quote” is selected, this field will remain marked, regardless of its status before the request was closed. You can then unmark the field individually as needed.
<b>Empl. No.</b>	This field shows the number of the employee assigned to the request for quote line.

Field	Description
<b>Account No.</b>	This field shows the account number if the current line is for items for services that you are posting directly to profit and loss, and which do not pertain to a job in the Job Cost module. This field has no effect on the request for quote, but if a purchase order is created from the request for quote, the purchase is debited to the account when you enter the vendor invoice.
<b>Acct./Account Name</b>	This field shows either the account text of the G/L account specified in the "Account No." field or the text assigned to the activity entered in the "Act No." field. The text cannot be changed here.
<b>Company No.</b>	This field shows the number of the company that is related to the request for quote line.

#### Request for Quote Island

Field	Description
<b>Request for Quote No.</b>	This field shows the requisition number that is related to the request for quote line.
<b>Request for Quote Job Number</b>	This field shows the number of a job in the Job Cost module, if the request for quote line concerns a job.

#### Purchase Process Island

Field	Description
<b>Purchase Process Number</b>	This field shows the purchase process number that is related to the request for quote line.
<b>Purchase Process Job Number</b>	This field shows the project job number of the request for quote line.

#### Registration Island

Field	Description
<b>Quantity</b>	This field shows the quantity of services/items that you wish to order.
<b>Unit Price</b>	This field shows the unit price when you have received a quote from the vendor. The total quoted price for the line is then calculated as quantity times unit price less any discount. If you manually entered an amount in the "Price, Currency" field, Maconomy recalculates the unit price based on the total amount in that field. The amount should be specified in the currency specified in the card part of the request for quote.
<b>Price</b>	This field shows the total quoted price less tax of the current line in the currency of the request for quote. If you specify a quantity and a unit price, the amount is

Field	Description
	calculated as quantity times unit price less any discount. If you manually entered an amount in this field, Maconomy recalculates the unit price based on the total amount in this field. The amount should be specified in the currency specified in the card part of the request for quote.
<b>Tax Code 1</b>	<p>This field shows a G/L tax code for tax receivable to be used for calculation of tax on the current quote line.</p> <p>Maconomy suggests a tax code on the basis of the following procedure:</p> <p>If a G/L tax table has been specified in the Company Information window, a G/L tax code is transferred from the G/L tax table on the basis of the information registered on the current invoice. When searching for a line in the G/L tax table, Maconomy searches for a match between the value of the tax table line in the "Account No." field and a reference account that depends on whether an account or an activity has been specified on the current line. If no line is found in the G/L tax table that corresponds to the current line's registrations and the reference account, or if no G/L tax table has been specified for the current company, Maconomy suggests the G/L tax code specified for the reference account in question in the Account Information Card window.</p> <p>As mentioned, the reference account depends on whether the current line contains an account number or an activity number. If the line contains an account number, the reference account is the account in question. If the line contains an activity, the reference account is the account specified as the P&amp;L account in the information card of the activity in question.</p> <p>You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters window. When multiple tax codes are enabled, the "Tax Code" field is replaced by the "Tax Code 1," "Tax Code 2," and, if enabled, "Tax Code 3" fields.</p>
<b>Tax Amount</b>	<p>This field shows the tax amount for the current request for quote line.</p> <p>If multiple tax codes are enabled, the "Tax Amount" field is replaced by the "Tax Amount Total," "Tax Amount 1," "Tax Amount 2," and, if enabled, "Tax Amount 3" fields. The "Tax Amount Total" field calculates the sum of the other individual tax fields.</p>

### Delivery Island

Field	Description
<b>Delivery Date</b>	This field shows the date on which you want the items or services to be delivered.

### Dimensions Island

Field	Description
<b>Location</b>	This field shows the location dimension value which is assigned to the request for quote line.

Field	Description
	<p>If you did not manually enter a value, Maconomy attempts to derive a value, using the order of priority set up in the Dimension Derivation window in the G/L module. However, any manually entered value is overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the "Location" field in the card part of the window.</p> <p>See the section on dimension derivation in "Introduction to the G/L Module," as well as the description of the Dimension Derivation window, for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the "Location" field above.
<b>Project</b>	The functionality of this field is similar to the functionality of the "Location" field above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the "Location" field above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the "Location" field above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the "Location" field above.

## Purchase Order Lines API Single Dialogs Workspace

Use this workspace to search for and view information about a specific purchase order line.

### Purchase Order Lines Tab

This section includes the fields and descriptions for the Purchase Order Lines tab.

#### Purchase Order Line Island

Field	Description
<b>Purchase Line Type</b>	This field shows supplementary text for a further description of the purchase order line.
<b>Line No.</b>	This field shows the line number that is related to the purchase order line.
<b>Line Remarks</b>	This field shows text for the request for quote line, which prints on the purchase order line.
<b>Job No.</b>	This field shows the number of the job that is related to the purchase order line.

Field	Description
<b>Task</b>	For lines with a job number, this field may show a related task.
<b>Activity No.</b>	This field shows the activity number that is related to the purchase order line.
<b>Closed</b>	This field shows whether the purchase order is closed.
<b>Empl. No.</b>	This field shows the number of the employee assigned to the purchase order line.
<b>Account No.</b>	This field shows the account number of the customer that is relevant to the purchase order line.
<b>Acct./Account Name</b>	This field shows the name of the account that is related to the purchase order line.
<b>Company No.</b>	This field shows the number of the company that is related to the purchase order line.

#### Purchase Order Island

Field	Description
<b>Purch. Order No.</b>	This field shows the purchase order number that is related to the purchase order line.
<b>Purchase Order Job Number</b>	This field shows the number of a job in the Job Cost module, if the purchase order concerns a job.

#### Purchase Process Island

Field	Description
<b>Purchase Process Number</b>	This field shows the purchase process number that is related to the purchase order line.
<b>Purchase Process Job Number</b>	This field shows the project job number of the purchase process.

#### Registration Island

Field	Description
<b>Quantity</b>	This field show the quantity of services/items that have been ordered.
<b>Unit Price</b>	This field shows the unit price in the currency of the current vendor. This price excludes tax.

Field	Description
<b>Price</b>	This field show the quoted price for the items or services on the current line.
<b>Tax Code 1</b>	This field shows a G/L tax code for tax receivable to be used for calculation of tax on the current quote.
<b>Tax Amount</b>	This field shows the tax amount for the current request for quote line.

#### Delivery Island

Field	Description
<b>Delivery Date</b>	This field shows the delivery date on which you want the items or services to be delivered.
<b>Deliv. Remarks</b>	This field shows delivery remarks to be used in connection with the delivery of the items.
<b>Date Received</b>	This field shows the date on which the delivery was received.
<b>Quantity Received</b>	This field shows the quantity received.

#### Dimensions Island

Field	Description
<b>Location</b>	This field shows the location dimension value which is assigned to the purchase order line.
<b>Entity</b>	This field shows the entity dimension value which is assigned to the purchase order line.
<b>Project</b>	This field shows the project dimension value which is assigned to the purchase order line.
<b>Purpose</b>	This field shows the purpose dimension value which is assigned to the purchase order line.
<b>Spec. 1-3</b>	These fields show the values in the dimensions Specification 1-3 assigned to the purchase order line.
<b>Local Spec. 1-3</b>	This field shows up to three local specified dimensions for the purchase order line.

## Job Cost – Creation Section

This section includes the fields and descriptions for the Job Cost – Creation workspaces.

### Employee Control Lines Single Dialogs Workspace

Use this workspace to view employee control list lines, one employee and job at a time.

You can also approve an employee or revoke that approval.

The approval functionality in this workspace is also intended for use by other Maconomy processes. For instance, you can use the information and the approval actions in this workspace to build custom workflows in the Maconomy Portal using M-Script.

Use this workspace to manage employee control lists. An employee control list exists for every job; if appropriate, you can use employee control lists to restrict the access to make entries on a job. This helps to prevent accidental, incorrect entries. For more information, see the description of the Employee Control workspace in the Job Cost module.

#### Employee Control Lines Tab

This section includes the fields and descriptions for the Employee Control Lines tab.

#### Employee Information Island

Field	Description
<b>Employee No.</b>	This field shows the number of the employee in the employee control list for the job shown in the Employee Control island. If employee control is enabled for the job, this employee may register entries on the job.
<b>Name</b>	This field shows the name of the employee.

#### Employee Control Island

Field	Description
<b>Job No.</b>	This field shows the number of the job to which the current employee control line applies.
<b>Employee Control Activated</b>	If this field is marked, employee control has been activated for the current job in the windows Jobs or Employee Control.
<b>Task List</b>	This field shows the task list of the current job.
<b>Standard Task</b>	In this field you can specify a task name from the task list of the current job. If you specify a task, the task will be used as the standard task for registration whenever the current employee makes registrations on the job. This way you can overrule the standard task for registration specified for the task list for the current job, on a per-employee basis. If you do not specify a

Field	Description
	<p>task in this field, the task specified as standard task for registration in the task list will be used as standard task. Note that the task specified here will be considered the standard task for the employee, even if the employee control list is not enabled.</p> <p>If the task entered in this field is deleted in the window Task Lists, or if the task list for the job is changed to one which does not include the task entered in this field, then this field is cleared. Maconomy shows a message first.</p>
<b>Task Description</b>	This field shows the description of the selected standard task.
<b>Approved</b>	<p>This field shows if the current employee has been approved in the employee control list. An employee must be approved to be able to register on a job. You can manually change the approval status of an employee by selecting the action "Approve Employee Control" in this window.</p> <p>For more information, please see the description of the window Employee Control in the Job Cost module.</p> <p>Note that if you do not wish to use the approval functionality, you can assign the value "Yes" to the job parameter attribute "Automatically approve employee control lines at creation" of the type "Registration" in the window Job Parameters. This way, any employee added to the job employee control list is automatically approved.</p>
<b>Approved by</b>	This field shows the name of the user who approved the current employee, if the field "Approved" above is marked.
<b>Approval Date</b>	This field shows the date on which the current employee was approved, if the field "Approved" above is marked.

## Actions

This section shows the actions available in the Employee Control Lines workspace.

### Top Tab

Field	Description
<b>Approve Employee Control</b>	When you select this action, the employee in this window is approved for registration on the current job. This corresponds to marking the field "Approved" in the table part of the window Employee Control.
<b>Remove Approval</b>	When you select this action, approval of the employee in this window for registration on the current job is revoked. This corresponds to unmarking the field "Approved" in the table part of the window Employee Control.

## Job Cost – Budgeting Section

This section includes the fields and descriptions for the Job Cost – Budgeting workspaces.

### Job Budgets API Single Dialogs Workspace

The People Planner web service integration uses this workspace to retrieve job and job budget data for use in People Planner.

#### Job Budgets API Tab

This section includes the fields and descriptions for the Job Budgets API tab.

##### Job Island

Field	Description
<b>Job No.</b>	This is the number of the job to which the budget applies. The value cannot be changed manually, but you can retrieve other jobs using the search functions in the Find menu.
<b>Job Name</b>	This is the job's name. It cannot be changed here. The name is entered and can be changed in the Jobs window.
<b>Start Date</b>	In this field, you can enter the date on which the job is scheduled to start. It is purely for reference.
<b>Estimated Ending Date</b>	In this field, you can enter the date on which the job is expected to be finished. This date is for information only.

##### Revision Island

Field	Description
<b>Job Budget Revision</b>	This field shows revision number for the job budget type.
<b>Submitted</b>	This field shows if the job budget has been submitted.
<b>Approved</b>	This field shows if the job budget has been approved.
<b>Reopened</b>	This field shows if the job budget has been reopened.

##### Remarks Island

Field	Description
<b>Remarks</b>	These fields show comments related to the job budget revision.

**Job Budget Type Island**

Field	Description
<b>Show Budget</b>	In this field, you choose the budget you wish to view.
<b>Current Budget</b>	This field shows the Current Budget for the job.
<b>Forecast Budget</b>	This field shows the Forecast Budget for the job.
<b>Planning Budget</b>	This field shows the Planning Budget for the job.
<b>Baseline Budget</b>	This field shows the Baseline Budget for the job.

**Line Creation Island**

Field	Description
<b>Default Line Type</b>	In this pop-up field, you can select a default value for the field "Line Type" in new job budget lines added to the job budget.

**Job Progress Island**

Field	Description
<b>Latest Estimate Date</b>	This field shows the latest date of job progress evaluation.
<b>Completed (Original)</b>	This field shows how many budgeted hours have been completed.
<b>Estimated Time To Compl. (Original)</b>	<p>This field is applicable for time activities and amount activities for progress by quantity only when the unit of measure is Hours.</p> <p>This field shows the number of hours/quantity or the expected costs required to complete the planning budget line as of the date specified in the "Date" field. The field thus shows the suggested estimate to completion.</p>
<b>ETC Deviation (Original)</b>	<p>This field is applicable for time activities and amount activities for progress by quantity only when the unit of measure is Hours.</p> <p>This field shows the deviation of the "Total" field compared to the same field of the previous row. If no previous row exists, this field will have the value "0." In other words, this field shows the difference between the current and the previous job progress evaluation with respect to the total number of hours or costs as planned in the planning budget.</p>
<b>Total (Original)</b>	This field shows the sum of used and estimate to completion quantity, also for amount activities marked for progress by quantity.

Field	Description
	This field shows the new estimated total as of the estimate date. This field equals the sum of the values of the "Actual" and "Estimate to Completion" fields. The field corresponds to the total estimate of the "Quantity" field in the Job Budgets window.
<b>Completed (Updated)</b>	This field shows the updated value of budgeted hours completed.
<b>Estimated Time To Compl. (Updated)</b>	This field shows the updated value of time estimated to job completion.
<b>Total (Updated)</b>	<p>This field is applicable for time activities and amount activities for progress by quantity only when the unit of measure is Hours.</p> <p>This field shows the resulting total number of hours/quantity or costs estimated for the job. The number is calculated as the sum of the "Actual" and "Estimate to Compl." fields, and the sum total corresponds to the value of the "Quantity" field (if you are currently showing Hours) or the "Total Cost, Base" field (if you are currently showing Cost Price) in the Job Budgets window.</p>

#### Job Budget Resource Allocation island

Field	Description
<b>Resource Allocation Complete</b>	<p>Select this check box to update the budgeted number of hours in the latest revision of the planning budget to the sum of the allocated hours sent from People Planner.</p> <p>For budget lines on amount activities, the total cost price is similarly updated to the sum of the allocated cost sent from People Planner.</p> <p>However, if you have performed job progress evaluation on the latest budget revision when selecting this check box, the budgeted number of hours is updated to the sum of the actual hours registered as of the progress evaluation date and the hours allocated to future periods.</p> <p>For budget lines on amount activities, the budgeted cost is updated to the actual cost plus the cost of hours allocated to future periods.</p> <p>When you select this check box, the <b>Update Job Budget</b> action in the Update Job Budget Resource Allocations single dialog workspace updates budget quantity and budgeted cost as described above.</p> <p>If you select this check box when you perform a progress evaluation, the estimated hours/cost to completion is found as the hours/cost from resource allocations after the estimate date. With this setup, any estimated hours to completion on time sheets are ignored during progress evaluation.</p>

Field	Description
<b>Copy Resource Allocations</b>	When you select this check box, the <b>Copy Budget</b> action also copies any resource allocations assigned to the job budget.

## Job Budgets Lines Sub-Tab

This section includes the fields and descriptions for the Job Budgets Lines sub-tab.

Field	Description
<b>Description</b>	In this field, you enter a text, which is attached to the activity on quotes and order confirmations. If you enter an activity, Maconomy suggests either the activity text from the “Description” field in the Activities window or the description of the entered task (if any) in the Job Tasks window, but you can change it on the budget line. In the Activities window, you can set up which text to derive as budget line description for each activity. The original activity text is displayed in the field “Activity Name.”
<b>Line Type</b>	<p>In this pop-up field, you select the type of the current job budget line. Selecting a value is mandatory. In the card part, the field “Default Line Type” in the island Line Creation defines the default value of this field, that is the value which is automatically suggested when you create the line. You may then select something else. You can choose from the following values:</p> <ul style="list-style-type: none"> <li>■ <b>Sum/Text</b> — If you select this value, the current line can be used as a text line, simply adding a line of text to the budget, or as a sum line. A sum line is used as a grouping level when you use a work breakdown structure as described in “Getting Started with the Java Client.” In both cases, no reference to activity or task may be specified on the line, and the line cannot be marked as a milestone.</li> <li>■ <b>Time</b> — If you select this value, the current line is used for specifying a time activity. The activity number will change to the activity specified in the job parameter attribute “Default Time Activity” of the type “Budgeting.”</li> <li>■ <b>Outlay</b> — If you select this value, the current line is used for specifying an outlay activity. The activity number will change to the activity specified in the job parameter attribute “Default Outlay Activity” of the type “Budgeting.”</li> <li>■ <b>Amount</b> — If you select this value, the current line is used for specifying an amount activity. The activity number will change to the activity specified in the job parameter attribute “Default Amount Activity” of the type “Budgeting.”</li> <li>■ <b>Milestone</b> — If you select this value, the current line is used for specifying a milestone. Any existing activity number will be removed, and the field “Milestone” will be marked (this field is not shown in the standard layout of the Job Budgets window).</li> </ul>

Field	Description
	<p>Note that by changing the line type, you change the activity number. See the description of the “Act. No.” field for considerations with regard to changing the activity number.</p> <p>If you specify an activity in the “Act. No.” field, this field will change to reflect the type of activity that you entered, that is, “Time,” “Amount,” or “Outlay.”</p>
<b>Task</b>	<p>In this field, you can specify the task to which the job budget line is to be assigned. Specifying a task list is mandatory, if a task list has been specified for the job, typically via the template based on which the job was created, or if the action “Require Tasks” has been selected in the Job Tasks window.</p> <p>If neither of the system parameters “Create Tasks from Job Budgets” nor “Extended Task Creation from Budgets” (see below) has been marked, you must enter a task that exists in the task list in question.</p> <p>If both this field and the “Act. No.” field are left blank, the line can be used as a text line for a more detailed budget description or as a grouping level in a work breakdown structure.</p> <p>If either of the system parameters “Create Tasks from Job Budgets” or “Extended Task Creation from Budgets” has been marked, you can enter a task that does not already exist in the job’s task list. When you do, Maconomy will create the task in the job’s private task list, using the activity entered on the line as derived activity. If a job-specific task list does not already exist, the shared task list assigned to the job will be copied and made job-specific. For more information, see the description of the Job Tasks window.</p> <p>If the system parameter “Mark ‘Overwrite Activity’ On Tasks” is marked, the “Overwrite Activity” field is marked in the new task. The description entered in the “Description” field is transferred to the new task and used as task description according to the rules outlined in the description of the two system parameters that concern task creation. Be aware that the specified activity can be set up to derive either the activity text or the task description in the “Description” field. The way the new task is named is defined by and described in the system parameters “Number of Trailing Characters for Task Names” and “Extended Task Creation from Budgets.”</p> <p>Tasks may need to be approved (see the Approve Tasks window). If this is the case, you cannot use the actions “Submit Budget” or “Transfer to Sales Order” until all tasks in the budget have been approved.</p> <p>If dimension values have been specified for the task, these dimensions are automatically suggested on new budget lines unless other values have been entered manually. If the Job Tasks or Task Lists window specifies that derived dimension values should overwrite existing dimensions values, any manually entered dimensions will be overwritten.</p>
<b>Activity No.</b>	<p>In this field, you enter the number of the activity for which you wish to make a budget estimate. If both this field and the field “Task” are blank, the line is a text line. If this field shows “*,” the line is a summary line which creates a subtotal when the budget is printed using the “Standard” layout.</p>

Field	Description
<b>Quantity</b>	<p>If the job is for several similar units, for example, two advertisements, three houses, or ten meters of cable, the quantity of these units can be given here. You can then use the Budget island in this window and the Summary island in the Job Card window to see the "Total" values per unit.</p>
<b>Employee Category No.</b>	<p>In this field, you can assign a certain employee category to the job budget. If no specific employee has been specified for this line, Maconomy will instead use the cost, intercompany, or billing price for the specified employee category for price calculations if the "Hourly Rate" field in the System Information window in the Set-Up module has been set to "By Employee" or "Employee Priority."</p> <p>If the current job is set up for price control from budgets (see "Price control from budgets"), the employee category is added to the Employee Category Prices island in the card part when you add or change the employee category, if it is not already present in that island.</p> <p>If you specify or change an employee category on an existing line, prices are only recalculated if the system parameter "Update prices upon dimension change" has been marked. For further information about price calculations, see "Appendix A" Price Calculation in the Job Cost Module" and the system parameter "Update prices upon dimension change" in the Set-Up module.</p> <p>If the system parameter "Empl. cat. on job budgets required" is marked, it will not be possible to leave out an employee category number in this field, unless the "Empl." field is also blank.</p>
<b>Planned Starting Date</b>	<p>In this field, you can enter the date when you plan to begin the activity. Maconomy uses the prices that are valid on this date when deciding which version of the price list assigned to the job, if any, should be used for price calculation on job budget lines. If you do not specify a date in this field, Maconomy uses today's date for the calculation of prices.</p> <p>If you later change the value in this field, Maconomy will recalculate prices on job budget lines only if the budget has not been approved, and if the system is set up to update prices upon dimension change in the System Parameters window. You can also choose to have Maconomy recalculate prices by means of the action "Recalculate Job Budget." When you select this action, Maconomy will also use the price lists that are valid on the date specified in this field, if any, for the recalculation.</p> <p>By selecting the action "Transfer Job Dates," you can prefill this field with the value of the "Start Date" field in the Jobs window for the current job. At the same time, the "Planned Ending Date" field is completed with the value of the "Estimated Ending Date" field in the Jobs window.</p> <p>When you create requisitions or purchase orders from the current line, the date in this field is transferred to the "Pref. Deliv. Date" field in the card part of the requisition or purchase order and the "Delivery Date" field in the table part. Furthermore, the specified date can be used in reports.</p> <p>If you copy a budget with a planned starting date to a new budget with the same job number, this field will also be copied to the new budget. However,</p>

Field	Description
	you should note that a date in this field does not influence the possibility of assigning periods to the budget line in the Periodic Job Budgets window.
<b>Planned Ending Date</b>	<p>In this field, you can enter the date when you plan to end the activity. The date specified will be of importance in the Detailed Planning window in the Resource Planning module as the date specified in this field will be copied to planning lines created on the basis of the budget in question.</p> <p>By selecting the action "Transfer Job Dates," you can prefill this field with the value of the "Estimated Ending Date" field in the Jobs window for the current job. At the same time, the "Planned Starting Date" field is completed with the value of the "Start Date" field in the Jobs window.</p>
<b>Baseline Budget Quantity</b>	This field shows the quantity in baseline budget.
<b>Latest Estimate Date (Task Progress)</b>	This field shows the latest date of task progress evaluation.
<b>Completed (Task Progress)</b>	This field shows how many budgeted hours have been completed.
<b>Estimated Time to Completion (Task Progress)</b>	<p>This field is applicable for time activities and amount activities for progress by quantity only when the unit of measure is Hours.</p> <p>This field shows the number of hours/quantity or the expected costs required to complete the planning budget line as of the date specified in the "Date" field. The field thus shows the suggested estimate to completion, but you can change the value if you want to modify the suggested estimate.</p>
<b>ETC Deviation (Task Progress)</b>	<p>This field is applicable for time activities and amount activities for progress by quantity only when the unit of measure is Hours.</p> <p>This field shows the deviation of the "Total" field compared to the same field of the previous row. If no previous row exists, this field will have the value "0." In other words, this field shows the difference between the current and the previous job progress evaluation with respect to the total number of hours or costs as planned in the planning budget.</p>
<b>Total (Task Progress)</b>	<p>This field shows the sum of used and estimate to completion quantity, also for amount activities marked for progress by quantity.</p> <p>This field shows the new estimated total as of the estimate date. This field equals the sum of the values of the "Actual" and "Estimate to Completion" fields. The field corresponds to the total estimate of the "Quantity" field in the Job Budgets window.</p>

Field	Description
<b>Completed, Updated (Task Progress)</b>	In this field, you can enter the updated date the activity is completed.
<b>Total, Updated (Task Progress)</b>	This field is applicable for time activities and amount activities for progress by quantity only when the unit of measure is Hours. This field shows the resulting total number of hours/quantity or costs estimated for the job. The number is calculated as the sum of the "Actual" and "Estimate to Compl." fields, and the sum total corresponds to the value of the "Quantity" field (if you are currently showing Hours) or the "Total Cost, Base" field (if you are currently showing Cost Price) in the Job Budgets window.
<b>Line Path</b>	This field shows the line path. For top level budget lines this is the line number. For indented lines it shows the parent line number "dot" sub line number. For example, the line path of subline 1 of parent line 2 would be "2.1."
<b>Line No.</b>	This field shows the budget line number. Note this may not be unique. For indented lines numbering restarts so several indented lines may have, for example, line number 1.
<b>Instance Key</b>	This field shows the instance key of the budget line.
<b>Parent Job Budget Line</b>	For indented budget lines this field shows the instance key of the parent budget line. For a top level budget line it is blank.
<b>Approved as Instance Key</b>	This field shows the instance key of the budget line in the latest approved revision.
<b>First Instance Key</b>	This field shows the instance key of the first revision of this budget line.
<b>Job Budget Line Reference</b>	If job budget merging functionality is used this field may hold a reference to the first instance key of another budget type.

## Actions

This section shows the actions available in the Job Budgets API workspace.

### Top Tab

Field	Description
<b>Submit Budget</b>	Use this action to submit the budget.

Field	Description
<b>Approve Budget</b>	Use this action to approve the budget.
<b>Reopen Budget</b>	<p>Use this action to reopen the selected budget.</p> <p>When you reopen an approved budget, Maconomy creates a new revision, which also provides a new revision of the resource allocations that have been imported to the budget.</p>
<b>New Revision</b>	<p>Use this action to create another revision of the current job budget and the assigned periodic job budget, if any.</p> <p>If you have set up a job to use imported resource allocations, data regarding them is also saved in the revision.</p> <p>You cannot create another revision of an approved budget; it must be reopened first. The previous revision is locked, and except for revision remarks and revision code, it can no longer be changed. All previous revisions of the job budgets to which you have access can be viewed in the Job Budget Revisions workspace.</p>
<b>Delete Budget</b>	<p>Use this action to delete the budget.</p> <p>If you have set up the job to use imported resource allocations, this also deletes any resource allocations that have been imported to the budget.</p>
<b>Remove Zero Lines</b>	<p>Use this action to remove any lines in the current budget that have a total cost and billing price of zero.</p> <p>Generally, Sum/Text and Milestone lines are not deleted. However, depending on the structure of the budget in question, some lines may be deleted if they are included in the same level as zero lines.</p> <p>For example, if you have a number of text lines together with regular lines in a subtree, and all of the regular lines are zero, all of the text lines in that subtree are also deleted.</p> <p>If you have set up a job to use imported resource allocations, this action also deletes resources allocated to the budget lines.</p> <p>Maconomy displays a warning message to confirm the deletion of budget lines.</p>
<b>Recalculate Budget</b>	<p>Use this action to recalculate the budget. Note that a large batch of tasks/employees/dimensions on a budget may impact performance. Consider running this as a Scheduled Background Task so that it instead updates periodically.</p> <p>For budget lines with imported resource allocations, when the action is invoked, prices are calculated in two steps. The first step recalculates prices for the resource allocations. The second step updates prices on budget lines to the weighted average of the prices on the resource allocations.</p> <p>If the job has a progress evaluation on the latest budget revision, the price recalculation covers only the imported resource allocations for periods after the progress evaluation date. Moreover, the budgeted cost is updated to the weighted average of the actual cost and the cost allocated to future periods.</p>

Field	Description
	<p>The budgeted billing price is updated to a similar weighted average for billing prices.</p> <p>On a job set up to use job budget resource allocations, a warning displays if progress evaluation has been performed previously on a past revision, even if the current revision of the planning budget does not have a progress evaluation.</p>
<b>Update Baseline Information</b>	Use this action to refresh the data shown.
<b>Copy Budget</b>	<p>Use this action to copy the selected budget.</p> <div style="border: 1px solid blue; padding: 5px; margin: 10px 0;"> <p><b>Note:</b> If the specified job is set up to use imported budget resources, using this action also enables you to copy resource allocations from the selected budget.</p> </div> <p>When copying a budget on a job that is set up to use resource allocations, you can choose to either copy only new lines from the budget, or overwrite any duplicate lines.</p> <p>A job budget may have existing job budget lines prior to receiving copies of job budget lines from an original job budget. These existing job budget lines will remain and keep their resource allocations. However, existing but duplicate job budget lines, including resources, are replaced by a copy of the original job budget line and resources.</p>
<b>Transfer from Budget</b>	<p>Use this action to create a quote or order confirmation selection, depending on whether the job status is quote or order. If a previous selection is available, Maconomy displays a warning message that the new selection will replace the previous one.</p> <p>Quotes are created in accordance with the invoice layout rule specified for the job in the Jobs workspace. If you have entered dimensions in the <b>Transfer from Budget</b> field on an invoice layout rule, Maconomy transfers the selected dimensions from budget lines to the quote.</p>
<b>Print Order Confirmation</b>	<p>Use this action to print a job order confirmation based on the existing quote revision. This action is available only when the job status is <b>Order</b>.</p> <p>If you have not yet created a quote revision and the <b>Approval of Quote Required</b> job parameter is disabled, this action transfers budget lines to the quote in the same way as the <b>Transfer to Quote</b> action, and prints the quote as an order confirmation.</p>
<b>Print Quote</b>	<p>If you have not yet created a quote revision, this action transfers budget lines to the quote in the same way as the <b>Transfer to Quote</b> action, and prints the quote.</p>

## Periodic Job Budgets API Single Dialogs Workspace

Use this workspace as an interface to some of the functionality in Periodic Job Budgets.

### Periodic Job Budgets API Tab

This section includes the fields and descriptions for the Periodic Job Budgets tab.

#### Job Information Island

Field	Description
<b>Job No.</b>	This field shows the number of the job to which the current budget applies. The value cannot be changed manually.
<b>Customer No.</b>	This field shows number of the customer associated with the job (the ship-to customer).

#### Properties Island

Field	Description
<b>Job Budget Follows Periodic Job Budget</b>	<p>If you mark this field, the figures on the budget lines will be linked to the figures entered for the periods in this window; that is, the quantities, cost, and sales prices displayed on the regular budget lines will be equal to the sum of the quantities, cost, and sales prices specified for the corresponding fields in the periods in this window. In this connection you should note that Maconomy does not issue a warning before changing the amounts and quantities on the budget lines when this field is marked. Therefore, you should use this function with caution.</p> <p>The mark in this field is automatically removed when a budget line is created or if a figure in a field related to the regular budget is changed.</p> <p>By not marking this field, you can allocate quantities and prices to periods without having these changes reflected on the regular budget lines.</p>

#### Periods Island

Field	Description
<b>Show</b>	In these fields, you can specify a range of periods to be displayed in the Budget island and in the table part of the window. If, for example, you specify the period "1/2002 – 6/2002," the leftmost column in the Budget island will display six lines, one for each month from January to June, 2002. The periods displayed are determined by the way in which periods are set up in the Fiscal Year window in the G/L module.

**Budget Type Island**

Field	Description
<b>Show Budget</b>	In this field, you choose the budget that you wish to see. The budget lines are shown in the table, and the sums of the defined periods are displayed in the Budget island. When you open this window or browse through the different jobs in this window, you will see the budget of the type that you looked at last.
<b>Current Budget</b>	In this field, you choose which budget you are currently using for the job. It can be changed as long as you have not made any purchase orders or requisitions. The budget chosen here is regarded as the job's overall budget elsewhere in Maconomy. Budget types are created in the Popup Fields window in the Set-Up module.
<b>Forecast Budget</b>	In this field, you choose the budget to be used as the current job's forecast budget. In the forecast budget you can enter, for example, activities, cost, billing prices, and dates, and use these to evaluate potential jobs. Forecast budgets can be analyzed using the Analyzer report/report template Job Forecasts.
<b>Planning Budget</b>	<p>In this field, you choose the budget to be used as the current job's planning budget. The planning budget is used to register dates, employees, and items to give an overview of the expected use of these resources. Planning budgets can be analyzed using the Analyzer report/report template Planning Budgets.</p> <p>If the value in this field is changed, Maconomy checks the existence of any planning lines in the Detailed Planning window in the Resource Planning module that have been created on the basis of the previous planning budget. If there are no such lines, the planning budget for the job in question will be changed. If such planning lines exist, however, Maconomy will issue a warning indicating that all planning lines assigned to the current budget will be removed from the detailed planning.</p> <p>If the current planning budget belongs to a job for which one or both of the job parameter attributes "Duplicate lines (amount) on planning budget" or "Duplicate lines (time) on planning budget" have the value "No," you can only change the budget type if the selected type does not contain more than one line with the same combination of activity and task. If you change the budget type, Maconomy will issue a warning, and any job progress entries and task progress entries are deleted for the job.</p> <p>The table part of the Job Planning window shows budget lines from the planning budget of the current job.</p>

## Actions

This section shows the actions available in the Periodic Job Budgets API workspace.

### Top Tab

Field	Description
<b>Reset Prior Period Figures</b>	Select this action to reset all period figures on all the lines for the periods that lie before the current start period. The result will be that Prior Periods rows in the window Periodic Job Budgets will be zero. Depending on whether the periodic budget is in sync (the field "Job Budget Follows Periodic Job Budget" is ticked) with the non-periodic budget, running the action will either influence the non-allocated figures or bring down the non-periodic budget figures.
<b>Allocate Un-allocated Budget Figures</b>	Select this action to allocate the un-allocated quantity, cost and billing price on job budget lines. The un-allocated figures will be placed in the first period in the current view of the periodic job budget. The unit cost and unit billing prices of all the periods in the periodic job budget will be changed to the unit prices of the corresponding job budget line. Furthermore, the action will tick the field "Job Budget Follows Periodic Job Budget" to true.
<b>Submit Budget</b>	<p>When you select this action, the job budget currently displayed changes status to "Submitted." This is a way of indicating that the budget is ready for approval. A job budget cannot be approved until it has been submitted. For more information about submitting and approving multiple job budgets at a time, please see the description of the Approve Job Budgets window.</p> <p>Only users for whom the "Can Change Job Budget" field in the Actions window in the Set-Up module is marked can submit job budgets.</p>
<b>Approve Budget</b>	<p>When you select this action, the job budget currently displayed is approved. You can only approve a budget if it has been submitted. On approval, Maconomy takes a "snapshot" of the budget, which can then be viewed in the Job Budget Revisions window. The job budget can then no longer be changed, except for the following fields: "Planned Starting Date," "Planned Ending Date," "Deliv. Remarks," "Vendor," "Your Reference," "Create Sales Order," "Selected," "Purchase Order Currency," and "Remarks 1-10." These fields all have in common the fact that they are of no financial consequence for the job. If you want to change any other fields, you must first reopen the budget and edit the revision created as a result of the reopening.</p> <p>For further information about approving multiple job budgets at a time, please see the description of the Approve Job Budgets window.</p> <p>Only users for whom the "Approve Job Budgets" field in the Actions window in the Set-Up module is marked can approve job budgets.</p> <p>If the budget is of the type specified as the job's planning budget, all new/changed skill requirements created in the Job Planning window or the Skill Requirements window in the Resource Planning module for budget lines on the current planning budget will be checked. If the employee specified on the planning line does not fulfill the new/changed skill requirements specified for the job budget line in question, a warning will be issued for each violation.</p>

Field	Description
	<p>In addition, the booking type specified on the lines of the planning budget will be copied to the detailed planning upon approval, so that the allocation type of each budget line will be transferred to its related detailed planning line.</p> <p>If the current job is a fixed-price job with overrun handling, and if “Budget” is selected as the basis for the fixed price on the job parameter attribute “Fixed-Price Budget,” a new fixed price can result in the creation, reduction, or increase of an overrun on the job when the budget is approved. This happens if already registered postings on the job before or after the approval of the budget have exceeded the fixed price. In this case, a job revenue recognition journal is created to be posted in the G/L module. For more information, see the description of the job parameter attribute “Handling of Overruns.” For this attribute, you can specify whether a job assigned this job parameter should handle overruns. An overrun occurs when the costs registered on a job exceed the agreed-to fixed price of the job. The “fixed price” of a time-and-material job can either be the budgeted billing price of the latest approved job budget or the approved quote price of the time-and-material job.</p>
<b>Reopen Budget</b>	<p>When you select this action, the job budget currently displayed is reopened. At the same time, Maconomy creates a revision. A “snapshot” of the budget as it looked in the previous revision can be seen in the Job Budget Revisions window.</p> <p>If fixed exchange rate information has been specified for the job in the Job Price Information window, and the information has changed since the budget was last submitted, Maconomy will recalculate the budget on the basis of the new currency information when the budget is reopened.</p> <p>The job budget must then be submitted before it can be approved again. For further information about submitting and approving multiple job budgets at a time, please see the description of the Approve Job Budgets window.</p> <p>Only users for whom the “Reopen Job Budgets” field in the Actions window in the Set-Up module is marked can reopen budgets.</p>
<b>Copy Budget From Template</b>	<p>Select this action to copy budget from job template.</p>

## Job Budget Type Selection API Single Dialogs Workspace

Use this workspace to change the budget type that Maconomy displays when you open workspaces that display job budgets.

If another user is viewing the same job, Maconomy shows its information to you in read-only mode—for example, in the Job Budgets and Job Budgets API workspaces. The People Planner integration uses this workspace.

### Job Budget Type Selection API Tab

This section includes the fields and descriptions for the Job Budget Type Selection API tab.

Field	Description
<b>User</b>	This field shows the user name to change the default budget type to view for.
<b>Job No.</b>	This field shows the job number to change the default budget type to view for
<b>Budget Type</b>	In this field you can set the budget type to be shown next time the user opens a window showing the budget for the selected job.

### Job Budgets Card API Single Dialogs Workspace

Use this workspace to use some of the same functionality that is available in the Job Budgets workspace's tab.

### Job Budgets Card API Tab

This section includes the fields and descriptions for the Job Budgets Card API tab.

#### Job Island

Field	Description
<b>Job No.</b>	This field shows the job number and name.
<b>Job Group</b>	This is shows the job group of the job.
<b>Status</b>	This field shows the status of the current job.
<b>Template</b>	This check box is selected if the job is a template job.
<b>Responsible</b>	This field shows the name of the person responsible for the job. Maconomy suggests the name of the user.
<b>Closed</b>	This check box is selected if the current job is closed.

#### Budget Type Island

Field	Description
<b>Show Budget</b>	In this field, you choose the budget you wish to preview.

Field	Description
<b>Current Budget</b>	This field shows the job budget type selected as the Current Budget for the job.
<b>Forecast Budget</b>	This field shows the job budget type currently selected as the Forecast Budget for the job.
<b>Planning Budget</b>	This field shows the job budget type currently selected as the Planning Budget for the job.

#### Quote Price, Curr. Island

Field	Description
<b>Effective Quote Price</b>	This field shows the effective quote price of the job.

#### Customer Island

Field	Description
<b>Customer No.</b>	This field shows the customer number and name.

#### Limit Island

Field	Description
<b>Hours</b>	This field shows the amount of employee hours you estimate will be spent on the job. This figure can either be compared to the total budgeted hours in the field "Time" in the islands Budget, Base and Budget, Currency where the figure is also shown, or you can use it in a subsequent budget control calculation, in which you compare the customer budget with the job's actual figures. Cost, Base In this field, you enter
<b>Cost, Base</b>	This field shows the budgeted cost of the job you estimate will be spent on the job. The limit amount can either be compared to the total of budgeted costs in the field "Total" in the island Budget, Base and Budget, Currency, or you can use it in a subsequent budget control calculation, in which you compare the costs with the job's actual figures.
<b>Billing Price, Curr.</b>	This field shows the budgeted billing price of the job you estimate. The amount here is the same as the amount given in the field "Max. Billing Price" in the window Jobs. The limit amount can either be compared to the total of the budgeted billing prices in the field "Total" in the islands Budget, Base and Budget, Currency, or you can use it in a subsequent budget control calculation, in which you compare the billing price with the job's actual figures.

### Budgeted Realization Island

Field	Description
<b>Contracted Billing Price for Time</b>	This field shows the price that was agreed on with the customer for time, usually reflected in a job price list.
<b>Total Billing Price for Time</b>	This field displays the total billing price budgeted for time activities.
<b>Calculated Realization Rate</b>	This field displays the realization rate calculated from Contract Billing Price and Total Time.
<b>Budgeted Realization Rate</b>	<p>This field displays a weighted average of the approved budgeted realization for the selected jobs.</p> <p>OR</p> <p>This field displays the approved budgeted realization for the job.</p> <p>OR</p> <p>This field shows the budgeted realization rate. This is the revenue recognized as a percentage of the invoiced work in progress (WIP). This is based on the Billing Price and the WIP for Invoicing fields of time.</p> <p>OR</p> <p>This field displays the same value as Calculated Realization Rate but allows you to change the value if you want to. When the budget is submitted and approved, the value is locked.</p>

### Forecast Island

Field	Description
<b>Probability %</b>	This field shows the probability percentage rating for whether the current job, which is on quote, will result in an order. When the job is converted to an order, Maconomy will automatically change the value of this field to "100." The value in this field is used in the Analyzer report/report template Job Forecasts to determine, for example, the expected profit on current jobs on quote.

### Status Island

Field	Description
<b>Submitted</b>	This field displays if the job budget has been submitted. The field is automatically marked when the action "Submit Budget" is selected. Note that as this window and the window Job Budgets are linked, this field will be selected if the current job budget has been submitted in the window Job Budgets, and vice versa.
<b>Submitted by</b>	This field shows the name of the user who submitted the job budget.

Field	Description
<b>Date</b>	This field shows the date on which the job budget was submitted.
<b>Approved</b>	This field shows if the job budget has been approved. The field is automatically marked when the action "Approve Budget" is selected, and the mark is removed when the budget is reopened to a new revision.
<b>Approved by</b>	This field shows the name of the user who approved the job budget.
<b>Date</b>	This field shows the date on which the job budget was approved.
<b>Reopened</b>	This field shows if the job budget has been reopened. The field is automatically marked when the action "Reopen Budget" is selected
<b>Reopened by</b>	This field shows the name of the user who reopened the job budget.
<b>Date</b>	If the job budget has been reopened, this field shows the date that it was reopened.
<b>Sent to People Planner</b>	This field shows the date and time stamp for when the budget type was last sent to People Planner.

### Budget, Base Island

Field	Description
<b>Time</b>	This field shows the total of the budgeted hours, costs, billing prices and gross margin, which have been entered in the table part for time activities. It also shows the average gross margin percent for the budget's time activities.
<b>Amount</b>	This field shows the total of the budgeted costs and billing prices entered for amount activities in the table part. It also shows the average gross margin for all amount activities. Since the budgeted amount for amount activities does not correspond to a number of hours, the "Time" field is empty.
<b>Total</b>	This is the total of all the budgeted costs and billing prices entered in the table part of the window. Since it is not possible to enter hour estimates for amount activities, the "Hours" field is empty. The total of budgeted hours is shown in the "Time" field.
<b>Hereof Outlays</b>	This field shows the budgeted costs for all amount activities, for which the cost type has been set to "Outlays." This field shows only the cost part of the relevant outlays.
<b>Excluding Outlays</b>	This field shows the budgeted costs for all amount activities, for which the cost type has not been set to "Outlays," as well as the gross margin from the outlay. For more information about outlay activities, please see the description of the window Activities.

Field	Description
<b>Total Per</b>	This field shows the unit given in the window Unit Analysis, as well as the values in the "Total" row, divided by the quantity given in the Unit Analysis island. If, for example, the job is for 2 advertisements, 3 houses or 10 meters of cable, you can use this row to check cost and billing prices per unit.
<b>Quote Price</b>	This field shows a quote for the entire job, as the amount entered in the "Quote Price" field in the window Jobs. The amount can be printed on a quote or order confirmation to the customer in the window Quote Editing. you create a quote from the job budget by choosing "Transfer to Quote" in the Action menu, or if you change the quote in the window Quote Editing, the amount here will automatically be changed to the total of the budget lines. You cannot then change it. When you create invoice selections in the window Invoice Selection, you can transfer the quote price to the invoice.

### Budget, Currency Island

Field	Description
<b>Time</b>	The fields in this island correspond to the fields in the island Budget, Base. The only difference is that here the amounts are shown in the currency used on the job.
<b>Amount</b>	The fields in this island correspond to the fields in the island Budget, Base. The only difference is that here the amounts are shown in the currency used on the job.
<b>Total</b>	The fields in this island correspond to the fields in the island Budget, Base. The only difference is that here the amounts are shown in the currency used on the job.
<b>Hereof Outlays</b>	The fields in this island correspond to the fields in the island Budget, Base. The only difference is that here the amounts are shown in the currency used on the job.
<b>Excluding Outlays</b>	The fields in this island correspond to the fields in the island Budget, Base. The only difference is that here the amounts are shown in the currency used on the job.
<b>Total Per</b>	The fields in this island correspond to the fields in the island Budget, Base. The only difference is that here the amounts are shown in the currency used on the job.
<b>Limit</b>	<ul style="list-style-type: none"> <li>Limit, Hours — This field displays the amount from the Hours field in the Limit island. It is the amount of employee hours you estimate will be spent on the job.</li> <li>Limit, Cost — This field displays the cost from the Cost, Base field in the Limit island. It is the budgeted cost of the job in the job's base currency.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Limit, Billing Price — This field displays the amount from the Billing Price, Curr. field in the Limit island. It is the budgeted cost of the job in the job's currency</li> </ul>
<b>Quote Price</b>	The fields in this island correspond to the fields in the island Budget, Base. The only difference is that here the amounts are shown in the currency used on the job.

### Unit Analysis Island

Field	Description
<b>Quantity</b>	If the job is for several similar units, for example, 2 advertisements, 3 houses or 10 meters of cable, the quantity of these units can be given here. You can then use the Budget island in this window and the Summary island in the window Job Card to see the "Total" values per unit.
<b>Unit</b>	If there is a value in the "Quantity" field, this field shows the unit.

### Daily Descriptions Island

Field	Description
<b>Use Daily Descriptions</b>	<p>A daily description is a descriptive text that you can add to any combination of task, activity, and day in the time sheet. For more information, see the corresponding field in the Job Tasks window.</p> <p>The setting of this field acts as a default value for tasks created in the current budget (if task creation in job budgets is permitted).</p>

### Billing Price Deviations Island

Field	Description
<b>Standard Billing Prices, Base</b>	This field shows the standard billing price per unit in the base currency of the company.
<b>Billing Price, Base</b>	This field shows the amount from the field "Billing Price, Currency" on the current budget line converted into the base currency.
<b>Budgeted Up/Down</b>	This field shows the difference between the budgeted billing price and the standard billing price. The amount in this field is the write-up or write-down of the budgeted billing price compared to the standard billing price. For more information about standard billing price, please see "Appendix A: Price Calculation in the Job Cost Module."

**Line Creation Island**

Field	Description
<b>Default Line Type</b>	In this pop-up field, you can select a default value for the field “Line Type” in new job budget lines added to the job budget.

**Transfer Job Dates Island**

Field	Description
<b>Activity Type</b>	This field displays the type of the current activity.
<b>Overwrite Existing Dates</b>	With this check box, you can decide whether the “Transfer Job Dates” action should overwrite any dates already entered by the user in the job budget line “Planned Starting Date” and “Planned Ending Date” fields.

**Revision Island**

Field	Description
<b>Revision No.</b>	This field shows the job budget revision number.
<b>Remarks</b>	In these fields, you can enter information about the current revision of the job budget.

**User Island**

See the chapter “Getting Started” for a description of the fields in the User island.

**Actions**

This section shows the actions available in the Job Budgets Card API workspace.

**Top Tab**

Field	Description
<b>Calculate Job Surcharge</b>	<p>When you select this action, Maconomy will calculate surcharges for those lines in the table part that match the criteria for surcharge calculation. The surcharges are calculated from the job surcharge rule specified in the “Job Surcharge Rule” field in the Price island. If no job surcharge rule has been specified for the job, you cannot select this action.</p> <p>Existing surcharge lines are deleted, and additional surcharge lines are created. If the calculation of job surcharges results in the creation of several lines with the same combination of activity, employee, and dimensions, the lines will be summarized on one line.</p> <p>The functionality of job surcharge rules is described in further detail in the Job Surcharge Rules window.</p>

Field	Description
<b>Transfer to Quote</b>	<p>When you select this action, Maconomy creates a quote or order confirmation selection, depending on whether the job status is quote or order. Both types can be edited, approved, and printed in the Quote Editing window. If you have created a selection earlier, Maconomy warns you that the new selection will replace the previous one, which may have been edited. If the system parameter "Automatic creation of quote revisions" has been marked, another revision of the quote is automatically created when you select this action. If the parameter is not marked, any existing quote is overwritten with the new quote. If the existing quote was already approved, it is automatically reopened first. You can only choose this action if the budget shown in the window is the current one.</p> <p>Selections are made according to your specifications in the Quote island in the Invoice Layout Rules window. If you only want the printout to show a total, the suggestion will not show lines, and the total price will be the one shown in the "Quote Price" field in the Budget island.</p> <p>If the job is a fixed-price job, or if the quote was previously approved in the Quote Editing window, Maconomy shows a warning, and the "Effective Quote Price" field is not updated until the quote has once again been approved in the Quote Editing window. For further information, please see the description of the Quote Editing window.</p> <p>A quote is created in accordance with the invoice layout rule specified for the job in the Jobs window. If the "Show Markup Separately" field is marked for the invoice layout rule in question, the use of this action will lead to the creation of a quote in which the costs of all amount activities will be shown in the table part, with an extra line showing the markup. If different activities have different tax codes, a separate markup line for each tax code is created. If printouts are to be shown with a total only, the quote will not include individual lines, and the total price will thus be equal to the price in the "Quote Price" field in the Budget, Currency and Budget, Base islands.</p> <p>If printouts are to show more than the total, and if they are to show time and amount activities by entry, one budget line in this window will create one quote line in the table part of the Quote Editing window, provided that the budget line has a billing price. If time and amount activities are shown by summary activity, all budget lines for the same summary activity will create one quote line. Quote lines are sorted by activity number.</p> <p>Note that in the latter case, the quote lines will carry the same tax as the tax rate chosen for the sum activity. If you apply differentiated taxes or activities both subject and not subject to tax, the activities for the same summary activity should have the same tax code as the summary activity.</p> <p>The quote lines will have the same prices as those entered for the budget lines, provided that it is specified on the invoice layout rule that amounts are to be shown on lines. If amounts are not to be shown on lines, the field will show "0.00."</p> <p>When budgets are transferred to quotes, Maconomy changes the amount in the "Effective Quote Price" field in the card part of this window to the sum of</p>

Field	Description												
	<p>the budget lines, if printouts are to show more than the total. Maconomy alerts you if the quote price is changed.</p> <p>If you have assigned texts to the job budget lines in the Job Budget Texts window, and if "Include Text Lines" is marked on the invoice layout rule, the texts will be transferred to the quote. However, they will not be transferred if the printout is only showing totals, or if the level of detail is By Summary Activity or By Activity.</p> <p>If the quote layout is set to be created directly from the budget, and the budget is arranged hierarchically—that is, you have applied a work breakdown structure—the only group headers that are transferred to the quote are the ones at the top level. However, non-header lines in groups at lower levels in the structure are transferred to the quote as if they belonged to the header at the top level.</p> <p>Furthermore, instead of appearing as headers above the individual lines within their group, top-level group headers appear below their subordinate lines. If the last line or lines in a group at level 3 or lower are text lines, these lines are not transferred to the quote, as they would otherwise appear to concern the header at the top level, instead of their actual group header (which is not transferred). As a result, if the job budget looks as follows:</p> <p><b>Analysis</b></p> <p style="padding-left: 40px;">Initiation</p> <p style="padding-left: 40px;">Site Inspection</p> <p style="padding-left: 40px;"><b>Analysis Report</b></p> <p style="padding-left: 80px;">Information Gathering</p> <p style="padding-left: 80px;">Layout</p> <p style="padding-left: 80px;">&lt;text line&gt;</p> <p>Transferring the quote to the budget will result in the following lines in the Quote Editing window:</p> <table border="1"> <thead> <tr> <th>Description</th><th>Sum Line</th></tr> </thead> <tbody> <tr> <td>Initiation</td><td>No</td></tr> <tr> <td>Site Inspection</td><td>No</td></tr> <tr> <td>Information Gathering</td><td>No</td></tr> <tr> <td>Layout</td><td>No</td></tr> <tr> <td>Analysis</td><td>Yes</td></tr> </tbody> </table> <p>In the example above, amounts have been disregarded. However, the sum lines created in the quote will sum up amounts from the relevant quote lines.</p> <p>If a job surcharge rule has been specified for the job, and a line in the table part of this window activates the surcharge rule in question, Maconomy will</p>	Description	Sum Line	Initiation	No	Site Inspection	No	Information Gathering	No	Layout	No	Analysis	Yes
Description	Sum Line												
Initiation	No												
Site Inspection	No												
Information Gathering	No												
Layout	No												
Analysis	Yes												

Field	Description
	<p>warn you that job surcharges should be calculated before you transfer the budget to a quote.</p> <p>A user can only carry out this action if the “Change Job Budgets” and “Transfer to Quote” fields in the Actions window in the Set-Up module are marked for the user in question. Also, if the transfer results in the reopening of a quote because the previous quote was already approved, the “Reopen Job Quotes” field must also be marked for the user in the Actions window.</p>
<b>Print Quote</b>	<p>When you select this action, you print a job quote to the customer. You can only choose this action if there is a quote for the job, that is, if the job status is “Quote.”</p> <p>A job quote must be approved before the quote can be printed. The exception to this is if the job parameter attribute “Approval of Quote Required” of the type “Budgeting” has the value “No.” If that is the case, a quote can be printed before approval, but only from this window.</p> <p>If you have not previously edited or created the job quote in the Quote Editing window, Maconomy will create and print a job quote on the basis of the budget lines in this window and in accordance with the information specified in the invoice layout rule assigned to the current job. Maconomy will also change the amount in the “Quote Price” field in the card part of this window to the sum of the budget lines.</p> <p>If there is an existing quote selection that is either entered directly in the Quote Editing window or created using the action “Transfer Quote” in this window, Maconomy will print the existing quote. Note that you can also print a quote for a job that has been closed. However, if you do so, you cannot make any changes to the quote related to the job.</p> <p>It is also possible to print job quotes in the Quote Editing window. In the Print Job Quote window you can print quotes in batches.</p> <p>Only users for whom the “Can Change Job Budget” field in the Actions window in the Set-Up module is marked can perform this action.</p>
<b>Print Order Confirmation</b>	<p>When you select this action, you print a job order confirmation to the customer for the job in the window. This is only possible if the job status is “Order.”</p> <p>A job quote must be approved before the order confirmation can be printed. The exception to this is if the job parameter attribute “Approval of Quote Required” of the type “Budgeting” has the value “No.” If that is the case, an order confirmation can be printed before approval, but only from this window.</p> <p>If you have not previously edited or created a job quote or a job order confirmation in the Quote Editing window, Maconomy will create and print a job order confirmation on the basis of the budget lines in this window and in accordance with the information specified in the invoice layout rule assigned to the current job. Maconomy will also change the amount in the “Quote Price” field in the card part of this window to the sum of the order confirmation lines.</p> <p>If there are existing quote or order confirmation selections that are either entered directly in the Quote Editing window or that are created in this window using the action “Transfer Quote,” Maconomy will print the existing selection.</p>

Field	Description
	<p>Note that you can also print an order confirmation for a job that has been closed.</p> <p>It is also possible to print job order confirmations in the Quote Editing window. In the Print Job Order Confirmation window you can print order confirmations in batches.</p> <p>Only users for whom the “Can Change Job Budget” field in the Actions window in the Set-Up module is marked can perform this action.</p>
<b>Create Requisitions</b>	<p>When you select this action, Maconomy automatically creates requisitions for those amount activities in the job budget that have a vendor number and a mark in the “Selected” field. A requisition is an internal request for the approval of the purchase of services. This means that you can use this action to create requisitions that the person or department responsible for approving purchases can evaluate and approve, and this person or department can then, based on the input from the requisition, place the necessary orders with the relevant suppliers by means of a purchase order. You can only use this action if the budget shown in the window is the current one and if the job in question has not been blocked.</p> <p>Maconomy creates a requisition for each combination of vendor and purchase order currency specified on the marked lines, and each of the requisitions is assigned to a separate, new purchase process (see “Purchase Processes” in the A/P module). The earliest date in the “Planned Starting Date” field on lines with the same combination of vendor and currency is used as the preferred delivery date in the card part of the resulting requisition. If there is no planned date, Maconomy uses today’s date. Requisitions can be edited in the Requisitions window in the Accounts Payable module.</p> <p>When you create requisitions, Maconomy updates the “Number of Requisitions” field on the budget lines.</p> <p>Information such as payment terms and delivery mode is retrieved from the vendor information card in the A/P module.</p> <p>The currency of each requisition is taken from the “Currency, Purchase Creation” field on the budget lines that result in the requisition in question. If this field is blank, the currency is taken from the vendor’s information card. If fixed exchange rate information has been specified for the job in the Job Price Information window, the specified fixed exchange rate information is applied, but only if the system parameter “Fixed exchange rates in budgets only” has not been marked.</p> <p>If you have assigned texts to the job budget lines in the Job Budget Texts window, and if the “Text Lines for Purchase” field in the Job Information window is marked, the texts will be transferred to the relevant purchase orders.</p>
<b>Create Purchase Orders</b>	<p>When you select this action, Maconomy automatically creates purchase orders for those amount activities in the job budget that have a vendor number and a mark in the “Selected” field. A purchase order is an order for the vendor service described by the budget line’s amount activity. The amount on the purchase order line will be the cost sum on the budget line less the</p>

Field	Description
	<p>sum of previously created purchase order lines. If this amount is negative, the amount on the purchase order line will be 0. You can only use this action if the budget shown in the window is the current one, and if the job in question has not been blocked.</p> <p>Maconomy checks that none of the lines selected for purchase order creation will cause budget violations according to the rules set up in the job parameter attributes "Limit Purchase Amount to Budget," "Limit Purchase on Sum or Line Level," "Limit Purchase, Currency Margin," and "Limit Purchase, Percentage Margin" for the job. If even one line causes a budget violation, the action is cancelled for all lines, including lines that do not cause any budget violations. Budget violations can, for example, take place if purchase orders already exist for the lines, and the new purchases, combined with existing purchases, will cause the budgeted amount to be exceeded. For further information, see the descriptions of these attributes in the job parameter "Budgeting."</p> <p>Maconomy creates a purchase order for each combination of vendor and purchase order currency specified on the marked lines, and each of the purchase orders is assigned to a separate, new purchase process (see "Purchase Processes" in the A/P module). The earliest date in the "Planned Starting Date" field on lines with the same combination of vendor and currency is used as the preferred delivery date in the card part of the resulting purchase order. If there is no planned date, Maconomy uses today's date. Purchase orders can be edited in the Purchase Orders window in the Accounts Payable module.</p> <p>When you create purchase orders, Maconomy updates the "Number of Purchase Orders" and "Purchase Order Total" fields on the budget lines. The purchase order number is then shown in the "Last Purchase Order No." field on every budget line.</p> <p>Information such as payment terms and delivery mode is retrieved from the vendor information card in the A/P module.</p> <p>The currency of each purchase order is taken from the "Currency, Purchase Creation" field on the budget lines that result in the purchase order in question. If this field is blank, the currency is taken from the vendor's information card. If fixed exchange rate information has been specified for the job in the Job Price Information window, the specified fixed exchange rate information is applied, but only if the system parameter "Fixed exchange rates in budgets only" has not been marked.</p> <p>If you have assigned texts to the job budget lines in the Job Budget Texts window, and if the "Text Lines for Purchase" field in the Job Information window is marked, the texts will be transferred to the relevant purchase orders.</p>
<b>Transfer to Sales Order</b>	<p>When you select this action, Maconomy automatically creates sales order lines for job budget item lines, which are assigned to job budget lines marked in the "Create Sales Order" field. Text lines created in the Job Budget Item Lines window are also transferred. If you have previously created a sales order line for a job budget item line, it will not be processed again. The order lines are added to a sales order for the job. If such an order does not exist,</p>

Field	Description
	<p>Maconomy automatically creates a sales order for the job with a mark in the "Invoice in Job Cost" field. If there is more than one order assigned to the job, Maconomy chooses the order with the highest order number.</p> <p>If the "New Order when Transf. to Sales" field in the System Information window in the Set-Up module has been marked, another order will always be created when the action "Transfer to Sales Order" is selected.</p> <p>When you create sales order lines on the basis of job budget item lines, Maconomy copies the budgeted billing price to the order line. If you wish this price to be recalculated before it is transferred, use the "Recalculate Prices" action in the Job Budget Item Lines window.</p> <p>You cannot select this action if the current job has been closed. However, you can reopen a job using the "Reopen Job" action in the Jobs window.</p>
<b>Transfer Job Dates</b>	<p>When you select this action, Maconomy transfers the starting date and the expected ending date of the job to the "Planned Starting Date" and "Planned Ending Date" fields in the job budget lines. The dates are transferred from the "Start Date" and "Estimated Ending Date" fields in the Jobs window.</p>
<b>Delete Budget</b>	<p>When you select this action, Maconomy deletes the budget in the window. Approved budgets and the budget for a closed job cannot be deleted.</p>
<b>Remove Zero Lines</b>	<p>When you select this action, Maconomy removes any lines in the current budget that have a total cost and billing price of zero. Generally, "Sum/Text" and "Milestone" lines will not be deleted. However, depending on the structure of the budget in question, some lines may be deleted if they are included in the same level as zero lines. For example, if you have a number of text lines together with regular lines in a subtree, and all of the regular lines are zero, all of the text lines in that subtree will also be deleted. Maconomy will issue a warning before deleting any budget lines.</p>
<b>Copy Budget</b>	<p>When you select this action, Maconomy copies the budget shown in the Copy Budget island, meaning that an existing budget with a certain revision number is either copied from another job or from the job that is currently shown in the window.</p> <p>If the system parameter "Recalculate Job Budget when Copying" in the System Parameters window in the Set-Up module is not marked, a simple line-by-line copying of the budget is performed. However, currency amounts will be recalculated to the new job's currency. If "Recalculate Job Budget When Copying" is marked, Maconomy will recalculate the budget when it is copied. This means that the price fields (costs, billing prices, and standard billing prices in base and currency plus "Net Cost, Base"), the "Markup %" field, and the fields concerning purchase orders and requisitions are not copied, but are recalculated on the basis of information of the job concerning the customer, the employees, and the job price list. That is why the new budget does not necessarily show the same amounts as the budget that it was copied from. If fixed exchange rate information has been specified in the Job Price Information window for the job to which information is copied, Maconomy recalculates currency amounts in the budget on the basis of the specified fixed exchange rate information.</p>

Field	Description
	<p>If a periodic job budget has been created for the job that is being copied, the periods of that budget are also copied to the new budget. The periodic job budget can be seen and edited in the Periodic Job Budgets window.</p> <p>If lines exist in the budget that is to be overwritten, it is not possible to copy. Furthermore, it is only possible to copy from one budget to another if both budgets are created in advance.</p> <p>In addition, it is not possible to copy the lines of another budget to a planning budget if this implies that two identical lines are created on the planning budget, and one or both of the job parameter attributes “Duplicate lines (amount) on planning budget” or “Duplicate lines (time) on planning budgets” has the value “No” for the job in question.</p> <p>If the task on a budget line to be copied does not exist in the task list for the current job, the line will not be copied, unless the system parameter “Extended Task Creation from Budgets” is marked. If it is marked, the task will be created in the job-specific task list of the current job.</p>
<b>Recalculate Budget</b>	<p>When you select this action, Maconomy recalculates prices on the job budget lines currently displayed. Maconomy uses the price lists that are valid as of the date specified in the “Planned Starting Date” field on each job budget line, or, if no such date has been specified, today’s date. If the recalculated price is 0, any price specified on a budget line will not be overwritten.</p> <p>You should be aware that Maconomy will also recalculate prices on lines where the “Line Specific Billing Price” field is marked and update the job-specific prices list lines underlying the budget lines. This applies when you are recalculating the baseline budget, and the job uses price control from budgets (see “Price control from budgets”). When recalculating, Maconomy looks up prices in much the same way as if another line was created. If a price list determines a price that is different from the price that is specified for the relevant employee category, that price will be applied (and the line will be marked as having a line-specific billing price).</p> <p>Moreover, you should note that if the “Job Budget Follows Periodic Job Budget” field has been marked on the budget in question in the Periodic Job Budgets window, the figures specified in the periods on the relevant budget lines will also be recalculated when using this action. However, if the “Job Budget Follows Periodic Job Budgets” field has not been marked, regular figures and periodic figures are also recalculated, but the recalculation of the periodic figures is carried out independently of the recalculation of the regular budget figures.</p> <p>The job parameter attributes “Keep Purchase Billing Price Upon Recalculation” and “Keep Purchase Cost Price Upon Recalculation” control how Maconomy should act when you recalculate the budget, and the purchase currency differs from the base currency. For more information, see the description of the job parameter attribute type “Budgeting.”</p>

Field	Description
<b>Rederive Tax Codes on Job Budget</b>	This action will derive tax codes on all job budget lines according to the tax code setup, thus reverting any user settings on this job budget.
<b>New Revision</b>	When you select this action, Maconomy creates another revision of the current job budget and the assigned periodic job budget, if any. You cannot create a revision of an approved budget; it must be reopened first. The previous revision is locked, and except for revision remarks and revision code, it can no longer be changed. All previous revisions of the job budgets to which you have access can be viewed in the Job Budget Revisions window.
<b>Submit Budget</b>	When you select this action, the job budget currently displayed changes status to "Submitted." This is a way of indicating that the budget is ready for approval. A job budget cannot be approved until it has been submitted. For more information about submitting and approving multiple job budgets at a time, please see the description of the Approve Job Budgets window.  Only users for whom the "Can Change Job Budget" field in the Actions window in the Set-Up module is marked can submit budgets.
<b>Approve Budget</b>	When you select this action, the job budget currently displayed is approved. You can only approve a budget if it has been submitted. On approval, Maconomy takes a "snapshot" of the budget, which can then be viewed in the Job Budget Revisions window. The job budget can then no longer be changed except for the following fields: "Planned Starting Date," "Planned Ending Date," "Deliv. Remarks," "Vendor," "Your Reference," "Create Sales Order," "Selected," "Purchase Order Currency," and "Remarks 1-10." These fields all have in common that they are of no financial consequence for the job. If you want to change any other fields, you must first reopen the budget and edit the revision that is created as a result of the reopening.  For further information about approving multiple job budgets at a time, please see the description of the Approve Job Budgets window.  Only users for whom the "Approve Job Budget" field in the Actions window in the Set-Up module is marked can approve budgets.  If the budget contains lines with tasks that are not included in the job's task list, you must correct the error before approving the budget. If approval of tasks is mandatory, all tasks on which budgeting has been done must be approved before you can approve the budget.  If the budget is of the type specified as the job's planning budget, all new/changed skill requirements created in the Job Planning window or the Skill Requirements window in the Resource Planning module for budget lines on the current planning budget will be checked. If the employee specified on the planning line does not fulfill the new/changed skill requirements specified for the job budget line in question, a warning will be issued for each violation.  In addition, the booking type specified on the lines of the planning budget will be copied to the detailed plan upon approval, so that the booking type of each budget line will be transferred to its related detailed planning line.

Field	Description
	<p>If the current job is a fixed-price job with overrun handling, and if "Budget" is selected as the basis for the fixed price on the job parameter attribute "Fixed-Price Budget," a new fixed price can result in the creation, reduction, or increase of an overrun on the job when the budget is approved. This happens if already registered postings on the job before or after the approval of the budget have exceeded the fixed price. In this case, a job revenue recognition journal is created to be posted in the G/L module. For more information, see the description of the job parameter attribute "Handling of Overruns" of the job parameter type "Revenue Recognition" in the Job Parameters window.</p>
<b>Reopen Budget</b>	<p>When you select this action, the job budget currently displayed is reopened. At the same time, Maconomy creates a revision. A "snapshot" of the budget as it looked in the previous revision can be seen in the Job Budget Revisions window.</p> <p>If fixed exchange rate information has been specified for the job in the Job Price Information window, and the information has changed since the budget was last submitted, Maconomy will recalculate the budget on the basis of the new currency information when the budget is reopened.</p> <p>The job budget must then be submitted before it can be approved again. For further information about submitting and approving multiple job budgets at a time, please see the description of the Approve Job Budgets window.</p> <p>Only users for whom the "Reopen Job Budget" field in the Actions window in the Set-Up module is marked can reopen budgets.</p>
<b>Copy Budget from Template</b>	<p>This action copies the budget from the template job.</p>
<b>Update Prices to Realization Rate</b>	<p>This action adjusts the billing prices on all budget lines with time activities so that the calculated realization rate will equal the realization rate entered in the Budgeted Realization Rate field.</p>
<b>Import Working Budget from People Planner</b>	<p>This action allows you to import a working budget from People Planner. When invoked, the "Quantity" values on the budget lines will be updated with budgeted hours from corresponding budget lines in People Planner.</p> <p>If the "Update Total Cost (Base) in Budget" system parameter is enabled, the values in the "Total Cost, Base" fields will also be updated with cost values from People Planner.</p> <p>It is enabled by the system parameter "Enable Custom People Planner Actions."</p> <p>This action will connect to People Planner and import the changes that have been made to the working budget since the action "Send Job to People Planner" was carried out. See also the "Send Job to People Planner" action below.</p>
<b>Send Job to People Planner</b>	<p>This action will send the job, including budget, to People Planner. The following system parameters affect this functionality:</p>

Field	Description
	<ul style="list-style-type: none"> <li>Always Allow Send Action — If this is false, and Integration Status Notes are used, you can only push the job from Maconomy to People Planner once. After that, it will only be possible to import it from People Planner.</li> <li>Include Subjobs When Sending Job to People Planner — Allows you to include subjobs when sending jobs to People Planner.</li> <li>Default Job Budget Type — If a value is entered, this will be the budget type that is sent. If a value is not entered, the budget type currently shown in Job Budgets will be sent. There is an exception if the job has been sent to People Planner previously using another budget type. In that case, this budget type will be used again.</li> </ul> <p>This action is only available if the add-ons for People Planner and Custom Actions are installed and the Enable Customer People Planner Actions system parameter is set to “true.”</p>

## Job Budgets Table API Single Dialogs Workspace

Use this workspace to use some of the same functionality that is available in the Job Budgets workspace.

For embedded use this workspace provides better performance for updating budget lines than the regular Job Budgets workspace because the calculated fields are not included in the Job Budgets tab, so they do not require recalculation after table updates.

### Job Budgets Tab

This section includes the fields and descriptions for the Job Budgets tab.

#### Job Island

Field	Description
<b>Job No.</b>	This field shows the job number and name.
<b>Closed</b>	This check box is selected if the job is closed.

#### Budget Island

Field	Description
<b>Budget Type</b>	This field shows the budget type of the job budget currently showing.
<b>Revision No.</b>	This field shows the job budget revision number.

**Status Island**

Field	Description
<b>Submitted</b>	This field shows if the job budget has been submitted.
<b>Approved</b>	This field shows if the job budget has been approved.
<b>Reopened</b>	This field shows if the job budget has been reopened.

**Job Budgets Lines Sub-Tab**

This section includes the fields and descriptions for the Job Budgets Lines sub-tab.

Field	Description
<b>Description</b>	In this field, you enter a text, which is attached to the activity on quotes and order confirmations.
<b>Line Type</b>	In this pop-up field, you select the type of the current job budget line. Selecting a value is mandatory.
<b>Employee Category No.</b>	In this field, you can assign a certain employee category to the job budget. If no specific employee has been specified for this line, Maconomy will instead use the cost, intercompany or billing price for the specified employee category for price calculations, if the field "Hourly Rate" in the window System Information in the Set-Up module has been set to "By Employee" or "Employee Priority."
<b>Employee Category Name</b>	This field shows the name of the current employee category.
<b>Employee No.</b>	<p>In this field, you can enter the number of the employee to be associated with the given activity.</p> <p>If you enter a value, and the activity is a time activity, Maconomy will suggest a cost based on the employee. Similarly, if you have specified in the "Hourly Rate" field in the System Information window that hourly rates are determined by employees, Maconomy will suggest a billing price based on the employee. However, if you specify or change an employee on an existing line, prices are only recalculated if the system parameter "Update prices upon dimension change" has been marked. For a further description of how Maconomy calculates these prices, please refer to "Appendix A: Price Calculation in the Job Cost Module."</p> <p>If an employee category has been specified in the "Empl. Cat. No." field, this field must either be blank or the employee specified must be a member of the employee category. If an employee is specified in this field, it will not be possible to specify that other employees than the one specified in this field should work on the job in the Detailed Planning window in the Resource Planning module. If, on the other hand, this field</p>

Field	Description
	<p>is blank, it is possible to plan for one or more employees who belong to the specified category (or all employees if no category has been specified).</p> <p>If the system parameter “Empl. cat. on job budgets required” is marked, it is not possible to specify an employee unless an employee category is also specified.</p> <p>If the current job uses Traffic Control, and one or more teams have been selected for the job in the Timing Plans or Job Traffic Status windows, the employee specified here must be a member of that team. For more information, see the windows mentioned and the Teams window in the Set-Up module.</p> <p>Please note that if employee control of the type “Employee List” has been selected for the job, the employee must exist in the job’s employee control list. For more information, please see the description of the “Employee Control” field in the Jobs window.</p>
<b>Employee Name</b>	This field shows the name of the employee entered in the “Employee No.” field above.
<b>Task</b>	In this field, you can specify the task to which the job budget line is to be assigned.
<b>Quantity</b>	In this field, you enter the budgeted quantity for the line.
<b>Activity No.</b>	In this field, you enter the number of the activity for which you wish to make a budget estimate. If both this field and the field “Task” are blank, the line is a text line. If this field shows “*,” the line is a summary line which creates a subtotal when the budget is printed using the “Standard” layout.
<b>Cost, Base</b>	In this field, you enter the budgeted cost in the base currency for one unit of the activity on the budget line. For a further description of how Maconomy calculates these prices, please refer to “Appendix A: Price Calculation in the Job Cost module.”
<b>Billing Price, Curr.</b>	In this field, you enter the budgeted billing price in the job’s currency of one unit of the activity on the budget line. If the activity is non-invoiceable, you cannot enter a price here, and the value must be “0.00.”
<b>Markup %</b>	In this field, you enter the budgeted gross margin % for the activity on the budget line.
<b>Line Specific Billing Price</b>	If the current job is set up for price control from budgets (see “Price control from budgets”), this field indicates if the billing price differs from the price originally derived from the employee category on the current line. If the line is not marked, the price is the original price.
<b>Total Cost, Base</b>	This field shows the total estimated cost in base currency for the budget line. The total cost is found by multiplying the number in the “Quantity” field by the cost per piece in the “Cost” field.

Field	Description
<b>Total Billing Price, Currency</b>	This field shows the budget lines total budgeted billing price in the job currency. The total billing price is calculated by multiplying the number in the "Quantity" field by the billing price per piece in the "Billing Price, Currency" field.
<b>Purchase Currency</b>	<p>In this field, you can select a currency. Depending on whether you have entered the cost in base currency or in another currency, the value is calculated in the "Cost, Base" field or the "Cost, Purchase Currency" field by means of this currency. If another currency is subsequently selected, the value in the "Cost, Purchase Currency" field is then recalculated. For a further description of how Maconomy calculates these prices, please refer to "Appendix A: Price Calculation in the Job Cost Module."</p> <p>If the job budget is structured hierarchically, selecting a purchase currency on a group header line makes it possible to see the total purchase amount for the subordinate lines in a specific currency.</p>
<b>Cost, Purchase Currency</b>	In this field, you can enter or see the cost in the currency selected in the field "Purchase Currency." If you enter a value here, the value in the field "Cost, Base" will be calculated.
<b>Total Cost, Purchase Currency</b>	In this field, you can see the total budgeted cost in the current job's currency. The total cost price is calculated by multiplying the figure in the field "Quantity" by the cost per unit in the field "Cost, Purchase Currency."
<b>Billing Price, Purchase Currency</b>	If you want to enter the billing price in another currency than the job's currency, you can use this field.
<b>Total Billing Price, Purchase Currency</b>	Copy to come.
<b>Cost Type</b>	This field shows the cost type selected for the current activity in the window Activities: "Turnover" or "Outlays."
<b>Inc. in Fixed Price</b>	In this field, you can mark whether or not the entry applying to the line should be included in the fixed price of a job. The set-up of the job in question determines whether or not this field is automatically marked when a line is created. The field can be marked/unmarked manually.
<b>Deliv. Remarks</b>	In this field, you can enter delivery remarks to be used in connection with the delivery of the items.
<b>Billing Price, Base</b>	This field shows the amount from the field "Billing Price, Currency" on the current budget line converted into the base currency.
<b>Total Billing Price, Base</b>	This field shows the amount from the field "Billing Price Total, Currency" on the current budget line converted into the base currency.

Field	Description
<b>Standard Billing Price, Base</b>	This field shows the standard billing price per unit in the base currency of the company.
<b>Total Standard Billing Price, Base</b>	This field shows the total standard billing price of the current budget entry in the currency of the job.
<b>Vendor</b>	In this field, you can enter the number of a vendor, if the activity on the budget line is an amount activity. Maconomy verifies that the vendor exists in the Accounts Payable module.
<b>Vendor Name</b>	This is the first line of the name of the vendor whose number is entered in the "Vendor" field. You cannot change the name here.
<b>Your Reference</b>	In this field, you enter the reference person used on purchase orders that are created from the current budget line. It is only possible to enter a reference person if the field "Cust. No." is completed.
<b>Create Sales Order</b>	If you mark this field, Maconomy will create sales order lines for items and text lines assigned to the budget line in the window Job Budget Item Lines when you select "Transfer to Sales Order."
<b>Selected</b>	If you mark this field, Maconomy will create a requisition or purchase order line for the budget line when you select "Create Requisitions" or "Create Purchase Orders," respectively, in the Action menu.
<b>Currency, Purchase Creation</b>	In this field, you can select the currency which should be transferred to requisitions and purchase orders created on the basis of the budget line. If you specify a blank value, the currency specified on the vendor's information card is used.
<b>Number of Purchase Orders</b>	This field shows how many purchase orders have been made on the basis of this budget line.
<b>Number of Requisitions</b>	This field shows how many requisitions have been made on the basis of this budget line.
<b>Last Purchase Order No.</b>	This field shows the number of the last purchase order created on the basis of the current line.
<b>Purchase Order Total</b>	This field shows the sum of the purchase order lines created on the basis of the budget line.
<b>Exec. Company No.</b>	This field shows the name of the company carrying out the specified activity. The field cannot be changed.
<b>Exec. Company Name</b>	This field shows the name of the executing company.

Field	Description
<b>Number of Requisitions</b>	This field shows how many requisitions have been made on the basis of this budget line.
<b>Last Purchase Order No.</b>	This field shows the number of the last purchase order created on the basis of the current line.
<b>Purchase Order Total</b>	This field shows the sum of the purchase order lines created on the basis of the budget line.
<b>Exec. Company No.</b>	This field shows the name of the company carrying out the specified activity. The field cannot be changed.
<b>Location</b>	This field shows the value of the location dimension specified on the current job budget.
<b>Entity</b>	This field shows the value of the entity dimension specified on the current job budget.
<b>Project</b>	This field shows the value of the purpose dimension specified on the current job budget.
<b>Purpose</b>	This field shows the value of the purpose dimension specified on the current job budget.
<b>Spec. 1–3</b>	This field shows the value of the spec. 1 - spec. 3 dimension specified on the current job budget.
<b>Local Spec. 1–3</b>	This field shows the value of the local spec. 1 – local spec. 3 dimension specified on the current job budget.
<b>Net Cost, Base</b>	This field shows the budgeted net cost of the job in the job's base currency.
<b>Tax Code</b>	This field shows a G/L tax receivable code if the activity on the line is an amount activity.
<b>Activity Name</b>	This field displays the text defined for the current activity.
<b>Task Description</b>	This field shows the text defined for the current task, if a description has been entered in the field "Task."
<b>Job Budget Text</b>	In the window Job Budget Texts, it is possible to assign text lines to a job budget line. This field, which cannot be changed, displays whether such text lines are assigned to the current line.
<b>Standard Billing Price, Currency</b>	This field only applies to time activities. The field shows the value in the field "Standard Billing Price, Currency" converted into a standard billing price per day.

Field	Description
<b>Total Standard Billing Price, Currency</b>	<p>This field shows the total standard billing price of the current budget entry in the currency of the job.</p> <p>If the system parameter “Update prices upon dimension change” has been marked, the price in this field is updated when certain key information on the line is changed, for instance, the activity, employee, or dimension values. For further information on this and for a complete list of the fields that cause the price to be updated, see the description of the system parameter “Update prices upon dimension change.” If the system parameter is not marked, and you wish to ensure that all prices reflect the current setup of the budget lines, use the “Recalculate Job Budget” action.</p>
<b>Remarks 1–10</b>	<p>In these fields, you can assign remarks to the current job budget line. The remarks are for information only and can be used in reports.</p>
<b>Quantity Planned</b>	<p>This field shows how many hours have so far been planned for the job budget line in question in the window Detailed Planning in the Resource Planning module.</p>
<b>Changed in Revision No.</b>	<p>This field shows the number of the job budget revision in which the current line was last changed.</p>

## Actions

This section shows the actions available in the Job Budgets Table API workspace.

### Top Tab

Field	Description
<b>Create Requisitions</b>	<p>When you select this action, Maconomy automatically creates requisitions for those amount activities in the job budget that have a vendor number and a mark in the “Selected” field. A requisition is an internal request for the approval of the purchase of services. This means that you can use this action to create requisitions that the person or department responsible for approving purchases can evaluate and approve, and this person or department can then, based on the input from the requisition, place the necessary orders with the relevant suppliers by means of a purchase order. You can only use this action if the budget shown in the window is the current one, and if the job in question has not been blocked.</p> <p>Maconomy creates a requisition for each combination of vendor and purchase order currency specified on the marked lines, and each of the requisitions is assigned to a separate, new purchase process (see “Purchase Processes” in the A/P module). The earliest date in the “Planned Starting Date” field on lines with the same combination of vendor and currency is used as the preferred delivery date in the card part of the resulting requisition. If there is no planned date, Maconomy uses today’s date. Requisitions can be edited in the Requisitions window in the Accounts Payable module.</p>

Field	Description
	<p>When you create requisitions, Maconomy updates the “Number of Requisitions” field on the budget lines.</p> <p>Information such as payment terms and delivery mode is retrieved from the vendor information card in the A/P module.</p> <p>The currency of each requisition is taken from the “Currency, Purchase Creation” field on the budget lines that result in the requisition in question. If this field is blank, the currency is taken from the vendor’s information card. If fixed exchange rate information has been specified for the job in the Job Price Information window, the specified fixed exchange rate information is applied, but only if the system parameter “Fixed exchange rates in budgets only” has not been marked.</p> <p>If you have assigned texts to the job budget lines in the Job Budget Texts window, and if the “Text Lines for Purchase” field in the Job Information window is marked, the texts will be transferred to the relevant purchase orders.</p>
<b>Create Purchase Orders</b>	<p>When you select this action, Maconomy automatically creates purchase orders for those amount activities in the job budget that have a vendor number and a mark in the “Selected” field. A purchase order is an order for the vendor service described by the budget line’s amount activity. The amount on the purchase order line will be the cost sum on the budget line less the sum of previously created purchase order lines. If this amount is negative, the amount on the purchase order line will be 0. You can only use this action if the budget shown in the window is the current one, and if the job in question has not been blocked.</p> <p>Maconomy checks that none of the lines selected for purchase order creation will cause budget violations according to the rules set up in the job parameter attributes “Limit Purchase Amount to Budget,” “Limit Purchase Sum or Line Level,” “Limit Purchase, Currency Margin,” and “Limit Purchase, Percentage Margin” for the job. If even one line causes a budget violation, the action is cancelled for all lines, including lines that do not cause any budget violations. Budget violations can, for example, take place if purchase orders already exist for the lines, and the new purchases, combined with existing purchases, will cause the budgeted amount to be exceeded. For further information, see the descriptions of these attributes in the job parameter “Budgeting.”</p> <p>Maconomy creates a purchase order for each combination of vendor and purchase order currency specified on the marked lines, and each of the purchase orders is assigned to a separate, new purchase process (see “Purchase Processes” in the A/P module). The earliest date in the “Planned Starting Date” field on lines with the same combination of vendor and currency is used as the preferred delivery date in the card part of the resulting purchase order. If there is no planned date, Maconomy uses today’s date. Purchase orders can be edited in the Purchase Orders window in the Accounts Payable module.</p> <p>When you create purchase orders, Maconomy updates the “Number of Purchase Orders” and “Purchase Order Total” fields on the budget lines. The</p>

Field	Description
	<p>purchase order number is then shown in the “Last Purchase Order No.” field on every budget line.</p> <p>Information such as payment terms and delivery mode is retrieved from the vendor information card in the A/P module.</p> <p>The currency of each purchase order is taken from the “Currency, Purchase Creation” field on the budget lines that result in the purchase order in question. If this field is blank, the currency is taken from the vendor’s information card. If fixed exchange rate information has been specified for the job in the Job Price Information window, the specified fixed exchange rate information is applied, but only if the system parameter “Fixed exchange rates in budgets only” has not been marked.</p> <p>If you have assigned texts to the job budget lines in the Job Budget Texts window, and if the “Text Lines for Purchase” field in the Job Information window is marked, the texts will be transferred to the relevant purchase orders.</p>
<b>Transfer to Sales Order</b>	<p>When you select this action, Maconomy automatically creates sales order lines for job budget item lines, which are assigned to job budget lines marked in the “Create Sales Order” field. Text lines created in the Job Budget Item Lines window are also transferred. If you have previously created a sales order line for a job budget item line, it will not be processed again. The order lines are added to a sales order for the job. If such an order does not exist, Maconomy automatically creates a sales order for the job with a mark in the “Invoice in Job Cost” field. If there is more than one order assigned to the job, Maconomy chooses the order with the highest order number.</p> <p>If the “New Order when Transf. To Sales” field in the System Information window in the Set-Up module has been marked, an order will always be created when the action “Transfer to Sales Order” is selected.</p> <p>When you create sales order lines on the basis of job budget item lines, Maconomy copies the budgeted billing price to the order line. If you wish this price to be recalculated before it is transferred, use the “Recalculate Prices” action in the Job Budget Item Lines window.</p> <p>You cannot select this action if the current job has been closed. However, you can reopen a job using the “Reopen Job” action in the Jobs window.</p>

## Update Job Budget Resource Allocations Workspace

Use this workspace as an interface to some of the functionality in Job Budgets.

This is the start of your concept.

This workspace is used as a standard Java extension for integrating job budgets with People Planner. The Update Job Budget Resource Allocations single dialog workspace allows you to create, update, and delete job budget resource allocations. It only has an update state. Four fields are used to make up the key of the resource allocation:

- instance key of the budget line
- employee number

- calendar year
- calendar month

If a job budget resource allocation with the entered values already exists, the quantity is updated. Otherwise, the resource allocation is created.

**Note:** The resource allocations in Maconomy allow you to create reports on the job budget lines based on the resource allocations sent from People Planner. The underlying data structure allows you to report by employee number, calendar year and month, as well as by fields on the budget line. Resource allocation does not have fields with the fiscal year or fiscal period.

## Update Job Budget Resource Allocations Tab

This section includes the fields and descriptions for the Update Job Budget Resource Allocations tab.

### Key island

Field	Description
<b>Job Budget Line Instance Key</b>	Select a job budget line in the planning budget for the job that you wish to update.
<b>Employee No.</b>	If you are updating a budget line for a time activity, select an employee. For budget line on amount activities, leave this field blank.
<b>Year</b>	Enter the year of the resource allocation.
<b>Month</b>	Enter the month of the resource allocation.

### Values island

Field	Description
<b>Quantity</b>	Enter the allocated quantity for the line. If you are updating a budget line for an amount activity, leave this field blank. If you enter a value of <b>0</b> in this field, Maconomy does not create the resource allocation. If you enter a value of <b>zero</b> for an existing resource allocation, Maconomy deletes it. For time activities, the cost price, billing price, and standard billing price on the resource allocation is calculated based on the general price setup in Maconomy.
<b>Cost</b>	Enter the allocated total cost price for the line. If you are updating a budget line for a time activity, leave this field blank.

Field	Description
	<p>If you enter a value of <b>zero</b> in this field, Maconomy does not create the resource allocation. If you enter a value of <b>zero</b> for an existing resource allocation, Maconomy deletes it.</p> <p>For amount activities, the total cost price is as entered in this field. The billing and standard billing prices are calculated based on the given total cost price and the general price setup (such as a markup % in a price list).</p> <p>By default, the resource quantity in this field is set to <b>one</b>.</p>

### Control island

Field	Description
<b>Delete Allocations</b>	Select this check to box to delete all resource allocations and the assigned employee for the specified budget line.

### Update Job Budget island

Field	Description
<b>Job No.</b>	Enter or select a job number if you wish to update all lines for a specific job when you use the <b>Update Job Budget</b> action.

## Actions

This section shows the actions available in the Update Job Budget Resource Allocations workspace.

### Top Tab

Note that with a batch set of allocations in People Planner, the performance of this action is impacted. However, it is possible to set up a Scheduled Background Task to recalculate job budgets periodically and therefore reduce the need to manually choose this action.

Field	Description
<b>Update Job Budget</b>	<p>Use this action to update all lines on the latest revision of the planning budget on the job specified in the <b>Job No.</b> field.</p> <p>For budget lines with a time activity, the unit cost price, unit billing price, and unit standard billing prices are updated to the weighted average of these unit prices on the job budget resource allocations.</p> <p>If you have performed progress evaluation on the latest revision of the budget, these unit prices are updated to the weighted average for actual cost as of the progress evaluation date and the cost of allocated hours for future periods.</p> <p>For budget lines with an amount activity, the unit prices are not updated. Additionally, you can see the allocated and unallocated quantity and cost in the Job Budgets sub-tab.</p> <p>For budget lines with a time activity, the unit prices on a job budget resource allocation are calculated based on the employee of the resource allocation, the</p>

Field	Description
	other dimensions of the budget line, and are calculated as of the current date. If the budget line already has job budget resource allocations for the given employee, then the prices will be taken from the resource allocation with the latest price calculation.

## Job Cost – Registration Section

This section includes the fields and descriptions for the Job Cost – Registration workspaces.

### Time Sheet Lines API Single Dialogs Workspace

Use this workspace to view user-submitted time sheet lines, one at a time, and to transfer those time sheet lines for posting, provided that the time sheet lines meet the criteria for transfer.

You only use this workspace if you selected the **Disable automatic transferal of time sheet lines** system parameter. If you did not select that parameter, Maconomy transfers time sheet lines as soon as the conditions for transfer are met, so you need not use the transfer action in this workspace.

**Note:** The functionality in this workspace is intended for use by other Maconomy processes. For instance, you can use the information and the transfer action in this workspace to build custom workflows in the Maconomy Portal using M-Script. It is rarely necessary to use this workspace to transfer time sheet lines.

### Time Sheet Lines API Tab

This section includes the fields and descriptions for the Time Sheet Lines API tab.

#### Time Sheet Line Information Island

Field	Description
<b>Employee No.</b>	This field shows the number and name of the employee who submitted the current time sheet line.
<b>Line No.</b>	This field shows the line number of the current time sheet line.
<b>Start Date</b>	This field shows the date of the first day in the week covered by the time sheet of the current time sheet line.
<b>Job No.</b>	This field shows the job number of the current time sheet line.
<b>Activity No.</b>	This field shows the activity number of the current time sheet line.
<b>Time Unit</b>	This field shows the time unit of the time sheet line.

Field	Description
<b>Monday – Sunday</b>	These fields show the time entered for every day of the week covered by the time sheet of the current time sheet line.
<b>Description</b>	This field shows the description entered for the current time sheet line.
<b>Task</b>	This field shows the task name of the current time sheet line.
<b>Total</b>	This field shows the total number of hours entered for the current time sheet line.
<b>Approval, Project Manager</b>	This field shows the status which the project manager of the job on the current line has assigned to the current time sheet line in the window Approve Time Sheet Lines.
<b>Approved by</b>	This field shows the name of the project manager who assigned the current approval status (shown in the field “Approval, Project Manager”) to the current time sheet line.
<b>Approval Date</b>	This field shows the date on which the project manager assigned the current approval status (shown in the field “Approval, Project Manager”) to the current time sheet line.
<b>Comment</b>	This field shows any comments entered by the project manager in connection with the approval, release or rejection of the current time sheet line.
<b>Approved by Superior</b>	This field shows if the current time sheet line has been approved by the time sheet user’s superior.
<b>Released by Superior</b>	This field shows if the current time sheet line has been released by the time sheet user’s superior.
<b>Fully Transferred</b>	This field shows if the current time sheet line has been fully transferred, in which case the transfer action does not apply.

## Actions

This section shows the actions available in the Time Sheet Lines API workspace.

### Top Tab

Field	Description
<b>Transfer Time Sheet Line for Posting</b>	When you select this action, Maconomy attempts to transfer the current time sheet line for posting. The line will only be transferred if all approval criteria have been fulfilled with respect to project manager and superior, depending on setup.

## Transfer Time Sheet Lines Single Dialogs Workspace

Use this workspace to view time sheet lines that users submit, and to transfer those time sheet lines for posting, provided that the time sheet lines meet the criteria for transfer.

Use the Transfer Time Sheet Lines tab to enter the dates, jobs, activities, tasks, and employees for which you want to view time sheet lines in the Time Sheet Lines sub-tab.

The first time that you open this workspace, press **Return** to make Maconomy remember your search criteria between sessions.

You only use this workspace if you selected the **Disable automatic transferal of time sheet lines** system parameter. If you did not select that parameter, Maconomy transfers time sheet lines as soon as the conditions for transfer are met, so you need not use the transfer action in this workspace.

**Note:** The functionality in this workspace is intended for use by other Maconomy processes. For instance, you can use the information and the transfer action in this workspace to build custom workflows in the Maconomy Portal using M-Script. It is rarely necessary to use this workspace to transfer time sheet lines.

### Transfer Time Sheet Lines Tab

This section includes the fields and descriptions for the Transfer Time Sheet Lines tab.

#### Selection Criteria Island

Field	Description
<b>Show Lines</b>	If you mark this field, Maconomy will show the lines selected by the criteria in this island when you press Return. This field is by default not marked, as the table part may contain a great number of lines.  Note that the action "Transfer Time Sheet Lines" works on all lines identified by the selection criteria, regardless of whether this field is marked.
<b>Date</b>	In these fields you can enter a range of dates. The table part will show lines from time sheets with a starting date within this range, and the action "Transfer Time Sheet Lines" will transfer time sheet lines with a starting date within this range.
<b>Week/Year</b>	The functionality of these fields is similar to that of the field "Date" above, but concerns a range of the combination of a week number and a year.
<b>Employee No.</b>	The functionality of these fields is similar to that of the field "Date" above, but concerns the number of the employee who submitted the time sheet line.
<b>Job No.</b>	The functionality of these fields is similar to that of the field "Date" above, but concerns the job number of the time sheet line.
<b>Activity No.</b>	The functionality of these fields is similar to that of the field "Date" above, but concerns the activity number of the time sheet line.

Field	Description
<b>Task</b>	The functionality of these fields is similar to that of the field “Date” above, but concerns the task of the time sheet line.
<b>Show Fully Transferred</b>	If you mark this field, Maconomy will include lines which have been fully transferred already.

### Time Sheet Lines Sub-Tab

This section includes the fields and descriptions for the Time Sheet Lines sub-tab.

Field	Description
<b>Employee No.</b>	This field shows the number of the employee who submitted the current time sheet line.
<b>Employee Name</b>	This field shows the name of the employee who submitted the current time sheet line.
<b>Line No.</b>	This field shows the line number of the current time sheet line.
<b>Start Date</b>	This field shows the date of the first day in the week covered by the time sheet of the current time sheet line.
<b>Job No.</b>	This field shows the job number of the current time sheet line.
<b>Activity No</b>	This field shows the activity number of the current time sheet line.
<b>Task</b>	This field shows the task name of the current time sheet line.
<b>Time Unit</b>	This field shows the time unit of the time sheet line.
<b>Monday-Sunday</b>	These fields show the time entered for every day of the week covered by the time sheet of the current time sheet line.
<b>Description</b>	This field shows the description entered for the current time sheet line.
<b>Approval, Project Manager</b>	This field shows the status which the project manager of the job on the current line has assigned to the current time sheet line in the window Approve Time Sheet Lines.
<b>Approved by</b>	This field shows the name of the project manager who assigned the current approval status (shown in the field “Approval, Project Manager”) to the current time sheet line.
<b>Approval Date</b>	This field shows the date on which the project manager assigned the current approval status (shown in the field “Approval, Project Manager”) to the current time sheet line.

Field	Description
<b>Comment</b>	This field shows any comments entered by the project manager in connection with the approval, release or rejection of the current time sheet line.
<b>Approved by Superior</b>	This field shows if the current time sheet line has been approved by the time sheet user's superior.
<b>Released by Superior</b>	This field shows if the current time sheet line has been released by the time sheet user's superior.

## Actions

This section shows the actions available in the Transfer Time Sheet Lines workspace.

### Top Tab

Field	Description
<b>Transfer Time Sheet Lines</b>	When you select this action, Maconomy attempts to transfer the time sheet lines identified by the selection criteria in the card part for posting. A line will only be transferred if all approval criteria have been fulfilled with respect to project manager and superior, depending on setup.

## Daily Time Sheet Lines API Single Dialogs Workspace

Use this workspace to view user-submitted daily time sheet lines, one at a time, and to transfer those daily time sheet lines for posting, provided that the lines meet the criteria for transfer.

You only use this workspace if you select the **Disable automatic transferal of time sheet lines** system parameter. If you do not select that parameter, Maconomy transfers the daily time sheet lines as soon as the conditions for transfer are met, so you need not use the transfer action in this workspace.

**Note:** The functionality in this workspace is intended for use by other Maconomy processes. For instance, you can use the information and the transfer action in this workspace to build custom workflows in the Maconomy Portal using M-Script. It is rarely necessary to use this workspace to transfer daily time sheet lines.

## Daily Time Sheet Lines API Tab

This section includes the fields and descriptions for the Daily Time Sheet Lines tab.

### Time Sheet Line Information Island

Field	Description
<b>Employee No.</b>	This field shows the number and name of the employee who submitted the current daily time sheet line.

Field	Description
<b>Line No.</b>	This field shows the line number of the current daily time sheet line.
<b>Date</b>	This field shows the date of the current daily time sheet line.
<b>Job No.</b>	This field shows the job number of the current daily time sheet line.
<b>Activity No.</b>	This field shows the activity number of the current daily time sheet line.
<b>Quantity</b>	This field shows the number of hours entered for the current daily time sheet line.
<b>Time Unit</b>	This field shows the time unit of the time sheet line.
<b>Description</b>	This field shows the description entered for the current time sheet line.
<b>Task</b>	This field shows the task name of the current daily time sheet line.
<b>Approved by Superior</b>	This field shows if the current daily time sheet line has been approved by the time sheet user's superior.
<b>Released by Superior</b>	This field shows if the current daily time sheet line has been released by the time sheet user's superior.
<b>Fully Transferred</b>	This field shows if the current daily time sheet line has been fully transferred, in which case the transfer action does not apply.

## Actions

This section shows the actions available in the Daily Time Sheet Lines API workspace.

### Top Tab

Field	Description
<b>Transfer Time Sheet Line for Posting</b>	When you select this action, Maconomy attempts to transfer the current daily time sheet line for posting. The line will only be transferred if all approval criteria have been fulfilled with respect to project manager and superior, depending on setup.

## Job Time Registration Single Dialogs Workspace

Use this workspace to view and enter time entries for a specific job.

The Job tab displays a job, and the Registrations sub-tab displays the daily time sheet lines for the current employee for that job.

## Job Tab

This section includes the fields and descriptions for the Job tab.

### Your Task Island

Field	Description
<b>Employee</b>	This field shows the name of the employee.
<b>Description</b>	This field shows the description entered for the current job.
<b>Expected Hours</b>	This field shows the expected number of hours to complete the current job.
<b>Total Entered Hours</b>	This field shows the total number of hours entered for the current job.
<b>Completed</b>	This check box is selected if the current job is completed.

### Job Island

Field	Description
<b>Job No.</b>	This field shows the number and name of the current job.
<b>Customer</b>	This field shows the customer selected on the job.
<b>Project Manager</b>	This field shows the name and number of the project manager.

### Job Description Island

This island shows any description entered by the project manager in connection with the time registration of the current job.

## Registrations Sub-Tab

This section includes the fields and descriptions for the Registrations sub-tab.

Field	Description
<b>Date</b>	This field shows the date of the current daily time registration line.
<b>Weekday</b>	This field shows the day of the week associated with the current daily time registration line.

Field	Description
<b>Daily Description</b>	This field provides description to the current daily time registration line.
<b>Hours</b>	This field shows the number of hours spent on the current daily time registration line.
<b>Task</b>	This field shows the task number associated with the current daily time registration line.
<b>Task Description</b>	This field shows the task description associated with the selected task.

## Transfer Daily Time Sheet Lines Single Dialogs Workspace

Use this workspace to view user-submitted daily time sheet lines, and to transfer those daily time sheet lines for posting, provided that the lines meet the criteria for transfer.

Use the Transfer Daily Time Sheet Lines tab to enter the dates, jobs, activities, tasks, and employees for which you want to see daily time sheet lines in the Daily Time Sheet Lines sub-tab. The first time that you open this workspace, press **Return** to make Maconomy remember your search criteria between sessions.

You only use this workspace if you selected the **Disable automatic transference of time sheet lines** system parameter. If you did not select that parameter, Maconomy transfers the daily time sheet lines as soon as the conditions for transfer are met, so you need not use the transfer action in this workspace.

**Note:** The functionality in this workspace is intended for use by other Maconomy processes. For instance, you can use the information and the transfer action in this workspace to build custom workflows in the Maconomy Portal using M-Script. It is rarely necessary to use this workspace to transfer daily time sheet lines.

### Transfer Daily Time Sheet Lines Tab

This section includes the fields and descriptions for the Transfer Daily Time Sheet Lines tab.

#### Selection Criteria Island

Field	Description
<b>Show Lines</b>	If you mark this field, Maconomy will show the lines selected by the criteria in this island when you press Return. This field is by default not marked, as the table part may contain a great number of lines.  Note that the action "Transfer Time Sheet Lines" works on all lines identified by the selection criteria, regardless of whether this field is marked.
<b>Date</b>	In these fields you can enter a range of dates. The table part will show lines from daily time sheets from a date within this range, and the action

Field	Description
	“Transfer Time Sheet Lines” will transfer daily time sheet lines from a date within this range.
<b>Employee No.</b>	The functionality of these fields is similar to that of the field “Date” above, but concerns the number of the employee who submitted the daily time sheet line.
<b>Job No.</b>	The functionality of these fields is similar to that of the field “Date” above, but concerns the job number of the daily time sheet line.
<b>Activity No.</b>	The functionality of these fields is similar to that of the field “Date” above, but concerns the activity number of the daily time sheet line.
<b>Task</b>	The functionality of these fields is similar to that of the field “Date” above, but concerns the task of the daily time sheet line.
<b>Show Fully Transferred</b>	If you mark this field, Maconomy will include lines which have been fully transferred already.

### Daily Time Sheet Lines Sub-Tab

This section includes the fields and descriptions for the Daily Time Sheet Lines sub-tab.

Field	Description
<b>Employee No.</b>	This field shows the number of the employee who submitted the current daily time sheet line.
<b>Employee Name</b>	This field shows the name of the employee who submitted the current daily time sheet line.
<b>Line No.</b>	This field shows the line number of the current daily time sheet line.
<b>Date</b>	This field shows the date of the current daily time sheet line.
<b>Job No.</b>	This field shows the job number of the current daily time sheet line.
<b>Activity No.</b>	This field shows the activity number of the current daily time sheet line.
<b>Task</b>	This field shows the task name of the current daily time sheet line.
<b>Quantity</b>	This field shows the number of hours entered for the current daily time sheet line.
<b>Time Unit</b>	This field shows the time unit of the time sheet line.

Field	Description
<b>Description</b>	This field shows if any description entered on the current daily time sheet line.
<b>Approved by Superior</b>	This field shows if the current daily time sheet line has been approved by the time sheet user's superior.
<b>Released by Superior</b>	This field shows if the current daily time sheet line has been released by the time sheet user's superior.

## Actions

This section shows the actions available in the Transfer Daily Time Sheet Lines workspace.

### Top Tab

Field	Description
<b>Transfer Time Sheet Lines</b>	When you select this action, Maconomy attempts to transfer the daily time sheet lines identified by the selection criteria in the card part for posting. A line will only be transferred if all approval criteria have been fulfilled with respect to project manager and superior, depending on setup.

## Expense Sheet Lines Single Dialogs Workspace

Use this workspace to view user-submitted expense sheet lines, one at a time, and to transfer expense sheet lines for posting, provided that the lines meet the criteria for transfer.

You only use this workspace if you selected the **Disable automatic transferal of time sheet lines** system parameter. If you did not select that parameter, Maconomy transfers the expense sheet lines as soon as the conditions for transfer are met, so you need not use the transfer action in this workspace.

**Note:** The functionality in this workspace is intended for use by other Maconomy processes. For instance, you can use the information and the transfer action in this workspace to build custom workflows in the Maconomy Portal using M-Script. It is rarely necessary to use this workspace to transfer expense sheet lines.

## Expense Sheet Lines Tab

This section includes the fields and descriptions for the Expense Sheet Lines tab.

### Expense Sheet Line Information Island

Field	Description
<b>Expense Sheet No.</b>	This field shows the number of the expense sheet to which the current expense sheet line belongs.

Field	Description
<b>Employee</b>	This field shows the name and number of the employee who submitted the current expense sheet line.
<b>Line No.</b>	This field shows the line number of the current expense sheet line.
<b>Entry Date</b>	In these fields you can enter a range of dates. The table part will show expense sheet lines with an entry date within this range, and the action "Transfer Time Sheet Lines" will transfer time sheet lines with a starting date within this range.
<b>Job No.</b>	This field shows the job number related to the current expense sheet line
<b>Activity No.</b>	This field shows the activity number specified on the current expense sheet line.
<b>Task</b>	This field shows the task name of the current expense sheet line.
<b>Description</b>	This field shows the description entered for the current expense sheet line.
<b>Amount, Currency</b>	This field shows the total amount entered for the current expense sheet line, in currency.
<b>Approval, Project Manager</b>	This field shows the status which the project manager of the job on the current line has assigned to the current expense sheet line.
<b>Approved by</b>	This field shows the name of the user who assigned the approval status to the current expense sheet line.
<b>Approval Date</b>	This field shows the date the expense sheet was approved or rejected.
<b>Comment</b>	This field shows comments entered by the project manager who assigned the approval status to the current expense sheet line.
<b>Approved by Superior</b>	This field shows if the current expense sheet line has been approved by the expense sheet user's superior.
<b>Released by Superior</b>	This field shows if the current expense sheet line has been released by the expense sheet user's superior.
<b>Fully Transferred</b>	This field shows if the current expense sheet line has been fully transferred, in which case the transfer action does not apply.

## Actions

This section shows the actions available in the Expense Sheet Lines workspace.

### Top Tab

Field	Description
<b>Transfer Expense Sheet Line for Posting</b>	When you select this action, Maconomy attempts to transfer the current expense sheet line for posting. The line will only be transferred if all approval criteria have been fulfilled with respect to approval hierarchies, project manager, and superior, depending on setup.
<b>Create favorite</b>	This action allows you to create and edit your own personal favorites.

## Transfer Expense Sheet Lines Single Dialogs Workspace

Use this workspace to view user-submitted expense sheet lines that users submit, and to transfer those expense sheet lines for posting, provided that the lines meet the criteria for transfer.

Use the Transfer Expense Sheet Lines tab to enter the dates, expense sheets, jobs, activities, tasks, and employees for which you want to see expense sheet lines in the Expense Sheet Lines sub-tab.

The first time that you open this workspace, press **Return** to make Maconomy remember your search criteria between sessions.

You only use this workspace if you selected the **Disable automatic transferal of time sheet lines** system parameter. If you did not select that parameter, Maconomy transfers the expense sheet lines as soon as the conditions for transfer are met, so you need not use the transfer action in this workspace.

**Note:** The functionality in this workspace is intended for use by other Maconomy processes. For instance, you can use the information and the transfer action in this workspace to build custom workflows in the Maconomy Portal using M-Script. It is rarely necessary to use this workspace to transfer daily time sheet lines.

## Transfer Expense Sheet Lines Tab

This section includes the fields and descriptions for the Transfer Expense Sheet Lines tab.

### Selection Criteria Island

Field	Description
<b>Show Lines</b>	<p>If you mark this field, Maconomy will show the lines selected by the criteria in this island when you press Return. This field is by default not marked, as the table part may contain a great number of lines.</p> <p>Note that the action "Transfer Expense Sheet Lines" works on all lines identified by the selection criteria, regardless of whether this field is marked.</p>

Field	Description
<b>Entry Date</b>	In these fields you can enter a range of dates. The table part will show expense sheet lines with an entry date within this range, and the action "Transfer Time Sheet Lines" will transfer time sheet lines with a starting date within this range.
<b>Expense Sheet No.</b>	The functionality of these fields is similar to that of the field "Entry Date" above, but concerns a range of expense sheet numbers.
<b>Employee No.</b>	The functionality of these fields is similar to that of the field "Entry Date" above, but concerns the number of the employee who submitted the expense sheet line.
<b>Job No.</b>	The functionality of these fields is similar to that of the field "Entry Date" above, but concerns the job number of the expense sheet line.
<b>Activity No.</b>	The functionality of these fields is similar to that of the field "Entry Date" above, but concerns the activity number of the expense sheet line.
<b>Task</b>	The functionality of these fields is similar to that of the field "Entry Date" above, but concerns the task of the expense sheet line.
<b>Show Fully Transferred</b>	If you mark this field, Maconomy will include lines which have been fully transferred already.

### Transfer Expense Sheet Lines Sub-Tab

This section includes the fields and descriptions for the Transfer Expense Sheet Lines sub-tab.

Field	Description
<b>Expense Sheet No.</b>	This field shows the number of the expense sheet to which the current expense sheet line belongs.
<b>Employee No.</b>	This field shows the number of the employee who submitted the current expense sheet line.
<b>Employee Name</b>	This field shows the name of the employee who submitted the current expense sheet line.
<b>Line No.</b>	This field shows the line number of the current expense sheet line.
<b>Entry Date</b>	This field shows the entry date of the current expense sheet line.
<b>Job No.</b>	This field shows the job number specified on the current expense sheet line.
<b>Activity No.</b>	This field shows the activity number specified on the current expense sheet line.

Field	Description
<b>Task</b>	This field shows the task name of the current expense sheet line.
<b>Description</b>	This field shows the description entered for the current expense sheet line.
<b>Currency</b>	This field shows the currency of the amount entered for the current expense sheet line.
<b>Amount, Currency</b>	This field shows the total amount entered for the current expense sheet line, in currency.
<b>Approval, Project Manager</b>	This field shows the status which the project manager of the job on the current line has assigned to the current expense sheet line in the window Approve Expense Sheet Lines.
<b>Approved by</b>	This field shows the name of the project manager who assigned the current approval status (shown in the field "Approval, Project Manager") to the current expense sheet line.
<b>Approval Date</b>	This field shows the date on which the project manager assigned the current approval status (shown in the field "Approval, Project Manager") to the current expense sheet line.
<b>Comment</b>	This field shows any comments entered by the project manager in connection with the approval, release or rejection of the current expense sheet line.
<b>Approved by Superior</b>	This field shows if the current expense sheet line has been approved by the expense sheet user's superior.
<b>Released by Superior</b>	This field shows if the current expense sheet line has been released by the expense sheet user's superior.

## Actions

This section shows the actions available in the Transfer Expense Sheet Lines workspace.

### Top Tab

Field	Description
<b>Transfer Expense Sheet Lines</b>	When you select this action, Maconomy attempts to transfer the expense sheet lines identified by the selection criteria in the card part for posting. A line will only be transferred if all approval criteria have been fulfilled with respect to approval hierarchies, project manager, and superior, depending on setup.

## Time Sheet Line Expenses Single Dialogs Workspace

Use this workspace to view expense sheet lines that are related to a time sheet line.

## Time Sheet Line Tab

This section includes the fields and descriptions for the Time Sheet Line tab.

### Information Island

Field	Description
<b>Employee No.</b>	This field shows the number of the employee who submitted the current time sheet line expenses.
<b>Line No.</b>	This field shows the line number of the current time sheet line expenses.
<b>Start Date</b>	This field shows the date of the first day in the week covered by the time sheet of the current time sheet line expenses.
<b>Job No.</b>	This field shows the job number of the current time sheet line expenses.
<b>Activity No.</b>	This field shows the activity number of the current time sheet line expenses.
<b>Description</b>	This field shows the description of the current time sheet line expenses.
<b>Task</b>	This field shows the task assigned to the current time sheet line expenses.

### Registrations Island

Field	Description
<b>Time Unit</b>	This field shows the time unit of the time sheet line.
<b>Monday-Sunday</b>	These fields show the time entered for every day of the week covered by the time sheet of the current time sheet line expenses.

## Expenses Sub-Tab

This section includes the fields and descriptions for the Expenses sub-tab.

Field	Description
<b>Expense Sheet No.</b>	Enter the number of the Expense Sheet to which this line belongs.
<b>Entry Date</b>	In this field, you enter an entry date. Maconomy suggests the current date, if it falls within the time sheet period, or the starting date of the period otherwise.

Field	Description
<b>Description</b>	In this field, you can enter a description of the current expense sheet.
<b>Reference</b>	In this field, you can enter a text as reference to the expense, such as a transaction number.
<b>Quantity</b>	In this field, you can specify the number of units of the current activity for which an expense is incurred.
<b>Unit Price, Currency</b>	In this field, you enter the expense amount in the currency selected in the field "Currency." The amount should be entered including tax, if any.
<b>Amount, Currency</b>	This field shows the total expense amount for the current activity in the currency chosen in the field "Currency." The amount is calculated as the value in the field "Quantity" multiplied by the value in the field "Unit Price, Currency."
<b>Favorite</b>	In this field you can select a favorite. The favorites derive from the window Favorites. You can create and edit your own personal favorites, or other people, for instance a project manager, your department manager, or the finance department, can create favorites and distribute them to a selection of employees from the window Job Employees.
<b>Task</b>	In this field, you can enter the task assigned to the specified expense.
<b>Currency</b>	In this field, you can choose a currency. By also specifying an exchange rate for the selected currency in the below field "Exchange Rate," the exchange rate specified will be used as default on expense sheet lines in the table part having the same currency as the one specified in this island.
<b>Exchange Rate</b>	In this field, you can enter an exchange rate for the currency specified in the above field "Currency." If you do not enter an exchange rate, Maconomy suggests the exchange rate specified for the currency in question in the window Exchange Rates.
<b>Document Name</b>	In this field, you can enter the name of one of the documents in the document archive specified in the card part of the window.
<b>Tax Code</b>	This field shows a G/L tax receivable code if the activity on the line is an amount activity.
<b>Tax, Currency</b>	This field shows the tax amount in the job's currency.
<b>Submitted</b>	This field shows whether the mileage sheet has been submitted.
<b>Submitted by</b>	This field shows the name of the user who submitted the current mileage sheet. The contents of this field cannot be changed.
<b>Approved</b>	This field shows whether the expense sheet is fully approved. If you use approval hierarchies, this field is marked when the last approver has

Field	Description
	approved the expense sheet. Otherwise, the field is automatically marked when the supervisor approves the expense sheet, and the mark is removed if the sheet is reopened.
<b>Approved by</b>	This field shows the name of the user whose approval resulted in the expense sheet being fully approved as described under the field "Approved." If approval is not required, the name of the user who submitted the expense sheet is displayed.

## Actions

This section shows the actions available in the Time Sheet Line Expenses workspace.

### Top Tab

Field	Description
<b>Expense</b>	This action creates expense lines for days with registered time on the time sheet line. If no open expense sheet exists, or there is more than one open expense sheet, a wizard is shown that allows selection of an existing expense sheet or creation of another one.

## Time Sheet Line Mileage Single Dialogs Workspace

Use this workspace to view mileage sheet lines that are related to a time sheet line.

### Time Sheet Line Mileage Tab

This section includes the fields and descriptions for the Time Sheet Line Mileage tab.

#### Information Island

Field	Description
<b>Employee No.</b>	This field shows the number of the employee who submitted the current time sheet line mileage.
<b>Line No.</b>	This field shows the line number of the current time sheet line mileage.
<b>Start Date</b>	This field shows the date of the first day in the week covered by the time sheet of the current time sheet line mileage.
<b>Job No.</b>	This field shows the job number of the current time sheet line mileage.
<b>Activity No.</b>	This field shows the activity number of the current time sheet line mileage.

Field	Description
<b>Description</b>	This field shows the description of the current mileage sheet.
<b>Task</b>	This field shows the task assigned to the current mileage sheet.

### Registrations Island

Field	Description
<b>Time Unit</b>	This field shows the time unit of the time sheet line.
<b>Monday-Sunday</b>	These fields show the time entered for every day of the week covered by the time sheet of the current time sheet line mileage.

### Mileage Sub-Tab

This section includes the fields and descriptions for the Mileage sub-tab.

Field	Description
<b>Mileage Sheet No.</b>	Enter the number of the Mileage Sheet to which this line belongs.
<b>Entry Date</b>	In this field, you enter an entry date. Maconomy suggests the current date, if it falls within the time sheet period, or the starting date of the period otherwise.
<b>Description</b>	In this field, you can enter a description of the current mileage sheet.
<b>Quantity</b>	In this field, you can specify the number of units of the current activity for which an expense is incurred.
<b>Unit Price, Currency</b>	In this field, you enter the expense amount in the currency selected in the field "Currency." The amount should be entered including tax, if any. Maconomy calculates the total amount based on information from job price lists and activity information cards.
<b>Amount, Currency</b>	This field shows the total expense amount for the current mileage in the currency selected in the field "Currency." The amount is calculated as the value in the field "Quantity" multiplied by the value in the field "Unit Price, Currency."
<b>From</b>	In this field, you enter the name of the location from where your journey starts.
<b>To</b>	In this field, you enter the destination of your journey.

Field	Description
<b>Vehicle</b>	In this field, you enter, for example, whether you use your own car or a company car. In some countries it is mandatory to enter this information for tax purposes.
<b>Favorite</b>	In this field you can select a favorite. The favorites derive from the window Favorites. You can create and edit your own personal favorites, or other people, for instance a project manager, your department manager, or the finance department, can create favorites and distribute them to a selection of employees from the window Job Employees.
<b>Currency</b>	In this field, you can select the currency of the expense. Maconomy suggest the enterprise currency. You cannot change the currency on a reopened mileage sheet line if the line has been transferred for posting.
<b>Exchange Rate</b>	This field shows the exchange rate between the currency on the line and the base currency of the employee assigned to the mileage sheet. The exchange rate shown in the field can either be the exchange rate specified in the "Exchange Rate" field in the card part of the window or a default exchange rate transferred from the relevant exchange rate table.
<b>Submitted</b>	This field shows whether the mileage sheet has been submitted. The field will be marked automatically if you select the action "Submit Mileage Sheet." If changes are made in a mileage sheet that is not transferred or approved, the mark will be removed from this field again.
<b>Submitted by</b>	This field shows the name of the user who submitted the current mileage sheet. The contents of this field cannot be changed.
<b>Approved</b>	This field shows whether the mileage sheet is fully approved. If you use approval hierarchies, this field is marked when the last approver has approved the mileage sheet. Otherwise, the field is automatically marked when the supervisor approves the mileage sheet, and the mark is removed if the sheet is reopened.
<b>Approved by</b>	This field shows the name of the user whose approval resulted in the mileage sheet being fully approved as described under the field "Approved." If approval is not required, the name of the user who submitted the mileage sheet is displayed.

## Actions

This section shows the actions available in the Time Sheet Line Mileage workspace.

### Top Tab

Field	Description
<b>Mileage</b>	This action creates mileage lines for days with registered time on the time sheet line. If no open mileage sheet exists, or there is more than one open mileage sheet, a wizard is shown that allows selection of an existing mileage sheet or creation of another one.

## Daily Time Sheet Line Expenses Single Dialogs Workspace

Use this workspace to view expenses that are related to a daily time sheet line.

### Daily Time Sheet Line Tab

This section includes the fields and descriptions for the Daily Time Sheet Line tab.

#### Information Island

Field	Description
<b>Employee No.</b>	This field shows the number of the employee on the daily time sheet line.
<b>Line No.</b>	This field shows the line number of the daily time sheet line.
<b>Date</b>	This field shows the date covered by the daily time sheet line.
<b>Job No.</b>	This field shows the job number of the daily time sheet line.
<b>Activity No.</b>	This field shows the activity number of the daily time sheet line.
<b>Task</b>	This field shows the task assigned to the daily time sheet line.
<b>Quantity</b>	This field shows the number of units entered on the daily time sheet line.
<b>Time Unit</b>	This field shows the time unit of the time sheet line.
<b>Description</b>	This field shows the description of the current daily time sheet line.
<b>Remarks</b>	This field shows additional information on the daily time sheet line
<b>Job Description</b>	Copy to come

### Expenses Sub-Tab

This section includes the fields and descriptions for the Expenses sub-tab.

Field	Description
<b>Expense Sheet No.</b>	This field shows the number of the expense sheet to which the current expense sheet line belongs.

Field	Description
<b>Entry Date</b>	This field shows the entry date. Maconomy selects the date of the daily time sheet.
<b>Description</b>	In this field, you can enter a description of the current expense sheet line.
<b>Reference</b>	In this field, you can enter a text as reference to the expense, such as a transaction number.
<b>Quantity</b>	In this field, you can specify the number of units of the current activity for which an expense is incurred.
<b>Unit Price, Currency</b>	In this field, you enter the expense amount in the currency selected in the field "Currency." The amount should be entered including tax, if any.
<b>Amount, Currency</b>	This field shows the total expense amount for the current activity in the currency chosen in the field "Currency." The amount is calculated as the value in the field "Quantity" multiplied by the value in the field "Unit Price, Currency."
<b>Favorite</b>	In this field you can select a favorite. The favorites derive from the window Favorites. You can create and edit your own personal favorites, or other people, for instance a project manager, your department manager, or the finance department, can create favorites and distribute them to a selection of employees from the window Job Employees.
<b>Task</b>	In this field, you can enter the task assigned to the specified expense.
<b>Currency</b>	This field shows the currency of the amount entered for the current expense sheet line.
<b>Exchange Rate</b>	In this field, you can enter an exchange rate for the currency specified in the above field "Currency." If you do not enter an exchange rate, Maconomy suggests the exchange rate specified for the currency in question in the window Exchange Rates.
<b>Document Name</b>	In this field, you can enter the name of one of the documents in the document archive of the expense sheet.
<b>Tax Code</b>	This field shows a G/L tax receivable code if the activity on the line is an amount activity. OR In this field, you select the tax code to be used. You cannot change the tax code on a reopened expense sheet line if the line has been transferred for posting.
<b>Tax, Currency</b>	This field shows the tax amount in the currency selected in the field "Currency." The tax can be calculated in two ways, depending on whether the system parameter "Tax from extended price in expense sheets" is marked. For further information about the functionality of this system

Field	Description
	parameter, see the description of the window System Parameters in the Set-Up module.
<b>Submitted</b>	This field shows whether the expense sheet line has been submitted.
<b>Submitted by</b>	This field shows the name of the user who submitted the expense sheet line.
<b>Approved</b>	This field shows whether the expense sheet line is fully approved.
<b>Approved by</b>	This field shows the name of the user whose approval resulted in the expense sheet line being fully approved as described under the field "Approved."

## Actions

This section shows the actions available in the Daily Time Sheet Line Expenses workspace.

### Top Tab

Field	Description
<b>Expense</b>	This action creates expense lines for the selected daily time sheet line. If no open expense sheet exists, or there is more than one open expense sheet, a wizard is shown that allows selection of an existing expense sheet or creation of another one.

## Daily Time Sheet Line Mileage Single Dialogs Workspace

Use this workspace to view the mileage that is related to a daily time sheet line.

### Daily Time Sheet Line Tab

This section includes the fields and descriptions for the Daily Time Sheet Line tab.

#### Information Island

Field	Description
<b>Employee No.</b>	This field shows the number of the employee on the daily time sheet line.
<b>Line No.</b>	This field shows the line number of the daily time sheet line.
<b>Date</b>	This field shows the date covered by the daily time sheet line.
<b>Job No.</b>	This field shows the job number of the daily time sheet line.

Field	Description
<b>Activity No.</b>	This field shows the activity number of the daily time sheet line.
<b>Task</b>	This field shows the task assigned to the daily time sheet line.
<b>Quantity</b>	This field shows the number of units entered on the daily time sheet line.
<b>Time Unit</b>	This field shows the time unit of the time sheet line.

<b>Remarks</b>	This field shows additional information on the daily time sheet line
<b>Job Description</b>	Copy to come

## Mileage Sub-Tab

This section includes the fields and descriptions for the Mileage sub-tab.

Field	Description
<b>Mileage Sheet No.</b>	This field shows the number of the mileage sheet to which the current mileage line belongs.
<b>Entry Date</b>	This field shows the entry date. Maconomy selects the date of the daily time sheet.
<b>Description</b>	In this field, you can enter a description of the current mileage line.
<b>Quantity</b>	In this field, you can specify the number of units of the current activity for which an expense is incurred.
<b>Unit Price, Currency</b>	In this field, you enter the expense amount in the currency selected in the field "Currency." The amount should be entered including tax, if any. Maconomy calculates the total amount based on information from job price lists and activity information cards.
<b>Amount, Currency</b>	This field shows the total expense amount for the current mileage in the currency selected in the field "Currency." The amount is calculated as the value in the field "Quantity" multiplied by the value in the field "Unit Price, Currency."
<b>From</b>	In this field, you enter the name of the location from where your journey starts.

Field	Description
<b>To</b>	In this field, you enter the destination of your journey.
<b>Vehicle</b>	In this field, you enter, for example, whether you use your own car or a company car. In some countries it is mandatory to enter this information for tax purposes.
<b>Favorite</b>	In this field you can select a favorite. The favorites derive from the window Favorites. You can create and edit your own personal favorites, or other people, for instance a project manager, your department manager, or the finance department, can create favorites and distribute them to a selection of employees from the window Job Employees.
<b>Currency</b>	In this field, you can select the currency of the expense. Maconomy suggest the enterprise currency. You cannot change the currency on a reopened mileage sheet line if the line has been transferred for posting.
<b>Exchange Rate</b>	This field shows the exchange rate between the currency on the line and the base currency of the employee assigned to the mileage sheet. The exchange rate shown in the field can either be the exchange rate specified in the "Exchange Rate" field in the card part of the window or a default exchange rate transferred from the relevant exchange rate table.
<b>Submitted</b>	This field shows whether the mileage sheet has been submitted.
<b>Submitted by</b>	This field shows the name of the user who submitted the current mileage sheet.
<b>Approved</b>	This field shows whether the mileage sheet is fully approved. If you use approval hierarchies, this field is marked when the last approver has approved the mileage sheet. Otherwise, the field is automatically marked when the supervisor approves the mileage sheet, and the mark is removed if the sheet is reopened.
<b>Approved by</b>	This field shows the name of the user whose approval resulted in the mileage sheet being fully approved as described under the field "Approved." If approval is not required, the name of the user who submitted the mileage sheet is displayed.

## Actions

This section shows the actions available in the Daily Time Sheet Line Mileage workspace.

### Top Tab

Field	Description
<b>Mileage</b>	This action creates a mileage line for the date of the daily time sheet line. If no open mileage sheet exists, or there is more than one open mileage sheet, a wizard is shown that allows selection of an existing mileage sheet or creation of another one.

## Job Cost – Invoicing Section

This section includes the fields and descriptions for the Job Cost – Invoicing workspaces.

### Draft Invoice Entry API Single Dialogs Workspace

Use this workspace to view draft invoice entries.

The standard layout includes very few fields; many more fields are available for inclusion in the layout.

Draft invoice entries capture information about entries that are approved for invoice selection. For time-and-material invoices this is information about the job entries. For on-account invoices this is information about on-account invoice selection entries.

This workspace is not currently used in any workspaces; however, Maconomy uses the search filter for the workspace to present the draft invoice entries that are associated with draft invoices. This enables you to see information about the foundation of the draft invoices—in particular, detailed information about any write up/down on a draft invoice.

#### Draft Invoice Entry API Tab

This section includes the fields and descriptions for the Draft Invoice Entry API tab.

#### Card Part Island

Field	Description
<b>Instance Key</b>	As noted above, the layout shows the three key fields.
<b>Invoice Editing No.</b>	This is the reference to the Invoice Editing Header.
<b>Job No.</b>	This field shows the number of the job to which the current draft invoice entry pertains.

### Show Job Invoice On Account Reconciliations Single Dialogs Workspace

Use this workspace to view a job invoice and the on-account invoices that are reconciled—that is, a specification of the on-account reduction.

## Job Invoice On Account Reconciliation Tab

This section includes the fields and descriptions for the Job Invoice On Account Reconciliation tab.

## Information Island

Field	Description
<b>Invoice No.</b>	This is the number of the reconciled invoice on account.
<b>Job No.</b>	This field shows the number of the job to which the current job invoice on account pertains.
<b>Reconciling Invoice No.</b>	This field shows the number of the invoice which reconciles the on account invoice.
<b>Debit/Credit</b>	This field shows Debit for invoices and Credit for credit memos.
<b>Amount Reconciled, Currency</b>	This field shows the amount reconciled on the invoice on account, in the job's currency.
<b>Amount Reconciled, Base</b>	This field shows the amount which was reconciled by the invoice or credit memo on the current line, in the base currency of the company responsible for the job.
<b>Tax Reconciled, Currency</b>	This field shows the tax amount reconciled in the job's currency. If multiple tax codes are enabled, the "Tax, Currency" field will be replaced by the following fields: "Total Tax, Currency," "Tax 1, Currency," "Tax 2, Currency" and, if enabled, "Tax 3, Currency." The "Tax Total, Currency" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Tax Reconciled, Base</b>	This field shows the tax amount which was reconciled by the invoice or credit memo on the current line, in the base currency of the company responsible for the job.
<b>Amount Reconciled, Enterprise</b>	This field shows the amount which was reconciled by the invoice or credit memo on the current line, in the enterprise currency.
<b>Tax Reconciled, Enterprise</b>	This field shows the tax amount which was reconciled by the invoice or credit memo on the current line, in the enterprise currency
<b>Bill to Customer</b>	This field shows the customer who was invoiced.
<b>Appropriation</b>	This field shows the bill-to customer appropriation.

Field	Description
<b>Transaction Timestamp</b>	If transaction time stamps are enabled on the installation, this fields shows the time of creation or, if the record has been updated, the time of the latest update of the record.
<b>Reconciled Tax Spec. Entry Key</b>	This field holds a reference to the "VAT Specification Entry."
<b>Invoice Allocation</b>	This field shows the number of the invoice allocation.
<b>Job Invoice Allocation No.</b>	This field shows the number of the job invoice allocation.
<b>Reconciling Job No.</b>	This field shows the number of the job which reconciles the on account invoice.
<b>Bill to Customer</b>	This field shows the customer who was invoiced.
<b>Appropriation</b>	This field shows the bill-to customer appropriation.

## Job Cost – Lookup Section

This section includes the fields and descriptions for the Job Cost – Lookup workspaces.

### Show Job Subscription Orders Single Dialogs Workspace

Use this workspace to view all of the subscription orders for a selected job.

#### Show Job Subscription Orders Tab

This section includes the fields and descriptions for the Show Job Subscription Orders tab.

#### Job Island

Field	Description
<b>Job</b>	This field shows the number and name of the job.
<b>Job Group</b>	This field shows the name of the job group.
<b>Status</b>	This field shows the status of the current job.
<b>Responsible</b>	This field shows the role of the person responsible for the current job.

Field	Description
<b>Closed</b>	This check box is selected if the current job is closed.

### Subscription Orders Sub-Tab

This section includes the fields and descriptions for the Subscription Orders sub-tab.

Field	Description
<b>Subscr. Order No.</b>	This field shows the number of the subscription order.
<b>Activity No.</b>	This field shows the activity set on the subscription order.
<b>Task</b>	This field shows the task name set on the subscription order.
<b>Invoice in Job Cost</b>	This field shows whether the subscription order will be invoiced in job cost or as a sales order.
<b>Accrual Type</b>	This field shows the accrual type of the subscription order.
<b>Sales Rep. No.</b>	This field shows the number assigned to the sales representative of the subscription order.
<b>Sales Rep.</b>	This field shows the name of the sales representative of the subscription order.
<b>Attention</b>	In this field you can specify the subscription's attention person.
<b>Approved</b>	This field indicates whether the subscription order has been approved.
<b>Created by</b>	This field shows the user name of the user who created the subscription order.
<b>Created on</b>	This field shows when the subscription order was created.

## Reporting Section

This section describes the Reporting section.

### Copy to Come

Field	Description

## Report Criteria Single Dialogs Workspace

Use this workspace as a basis when creating BPM reports.

This workspace enables you to see all of the possible fields that you can use as prompts for a report.

## SD\_AI\_Analytix InfoView Single Dialogs Workspace

Use this workspace to open the BPM web client.

This workspace has an integrated browser element so that you can use it as an internal browser.

## Job Cost – Setup Section

This section includes the fields and descriptions for the Job Cost – Setup workspaces.

## Tasks API Single Dialogs Workspace

Use this workspace to approve tasks that you created in Maconomy.

You can approve a task or revoke the approval of a task in this workspace, and you can edit the description, derived activity, and blocked status of each task.

You can view tasks, one task list and task at a time. You manage tasks in the Task Lists or Job Tasks workspaces in the Job Cost module. You can create tasks in the Job Budgets workspace. For more information, see the description of the Job Tasks workspace in the Job Cost module.

Use the **Task Approval** field in the System Information workspace in the Set-Up module to specify whether tasks must be approved.

**Note:** The approval functionality in this workspace is intended for use by other Maconomy processes. For instance, you can use the information and the approval action in this workspace to build custom workflows in the Maconomy Portal using M-Script. You can also approve tasks in the Approve Tasks workspace in the Job Cost module.

### Tasks API Tab

This section includes the fields and descriptions for the Tasks API tab.

#### Task List Island

Field	Description
<b>Task List</b>	This field shows the name and description of the task list.

**Tasks Island**

Field	Description
<b>Task Name</b>	This field shows the name of the task to which the actions in this window will apply.
<b>Description</b>	In this field, you can edit the description of the current task.
<b>Blocked</b>	This field shows if the current task is blocked.
<b>Activity</b>	<p>In this field you can edit the activity which the current task should derive. When a task is created automatically from a job budget, a default activity of the correct type is applied to it by means of a job parameter attribute of the type "Budgeting." You can assign another activity here.</p> <p>This way you can overrule the standard application of activity to tasks created automatically, thus separating the financial aspects of job budgeting from the project management aspects.</p>
<b>Approved</b>	This field shows if the current task has been approved. You can approve or revoke approval by marking or unmarking this field, or you can select the action "Approve" or "Remove Approval" in this window.
<b>Approved by</b>	This field shows the name of the user who approved the current task, if the field "Approved" above is marked.
<b>Approval Date</b>	This field shows the date on which the current task was approved, if the field "Approved" above is marked.

**Actions**

This section shows the actions available in the Tasks API workspace.

**Top Tab**

Field	Description
<b>Approve</b>	<p>When you select this action, the task in this window is approved.</p> <p>This corresponds to marking the field "Approved" above or in the table part of the windows Job Tasks or Task Lists.</p>
<b>Remove Approval</b>	<p>When you select this action, approval of the task in this window is revoked.</p> <p>This corresponds to unmarking the field "Approved" above or in the table part of the windows Job Tasks or Task Lists.</p>

## Contact Management Section

This section includes the fields and descriptions for the Contact Management workspaces.

### Contact Group Members Single Dialogs Workspace

Use this workspace to view, edit, and create contact group members.

This workspace displays one contact group member at a time, so that you can edit individual contact group members without having to view all of the group members in a table.

You can browse the individual members of the contact groups. When you edit a contact group member, Maconomy updates that member accordingly in the Contact Groups workspace.

To create a contact group member, specify the contact group and contact group type to which you want to add the member and enter the relevant contact person, contact company, and so on. The new member then appears in the specified group in the Contact Groups workspace.

#### Contact Group Members Tab

This section includes the fields and descriptions for the Contact Group Members tab.

#### Contact Group Member Island

Field	Description
<b>Contact Group No.</b>	This field shows the number of the contact group to which the current contact group member belongs. When creating a contact group member, specify the contact group to which the new member should be added in this field.
<b>Contact Group Type</b>	<p>This field shows the contact group type of the contact group shown in the field "Contact Group No." above. When creating a contact group member, specify the contact group type of the contact group to which the new member should be added in this field.</p> <p>When you create a contact group member, Maconomy suggests the option lists from the contact group type of the current contact group. The suggested option lists are retrieved from the respective fields "Option List 1-5" in the island Option Lists on Contact Group Members in the window Contact Group Types. However, you can change the option lists here.</p>
<b>Contact Comp. No.</b>	This field shows the number of the contact company to which the current contact group member belongs.
<b>Contact Person No.</b>	This field shows the number of the contact person to which the current contact group member belongs.

**Date Fields Island**

Field	Description
<b>Date 1-5</b>	In these fields, you can enter a number of dates for further specification of the current contact group member.

**Option Lists Fields Island**

Field	Description
<b>List</b>	In these fields, you can specify the option lists containing the values you wish to use for further specification of the contact group member. In the fields "Value," you can then select values from the corresponding lists. When you create a contact group member, Maconomy suggests the option lists from the contact group type of the current contact group. The suggested option lists are retrieved from the respective fields "Option List 1-5" in the island Option Lists on Contact Group Members in the window Contact Group Types. However, you can change the option lists here.
<b>Value</b>	In these fields, you can specify values available in the option lists specified in the fields "List" on the current contact group member. The fields can, for example, be used for further specification of the contact group member.

**Text Fields Island**

Field	Description
<b>Text 1-10</b>	In these fields, you can enter a number of texts for further specification of the current contact group member. The fields are for information only.

## Contact Companies API Single Dialogs Workspace

Use this workspace to view information about contact companies.

This is an API workspace that is not intended for end users.

### Contact Companies Tab

This section includes the fields and descriptions for the Contact Companies tab.

**Contact Company Island**

Field	Description
<b>Company No.</b>	This field shows the number assigned to the contact company.
<b>Attn.</b>	This field shows the name of the contact person
<b>Country</b>	This field shows the state or country where the contact company is located.

Field	Description
<b>Phone</b>	This field shows the phone number of the contact company.
<b>Fax</b>	This field shows the fax number of the contact company.
<b>Telex</b>	This field shows the telex number of the contact company.
<b>E-mail</b>	This field shows the e-mail address of the contact company.
<b>Department</b>	This field shows the department where the sales representative of the contact company belongs.
<b>Sales Rep</b>	This field shows the number assigned to the sales representative of the contact company.
<b>Name</b>	This field shows the name of the sales representative of the contact company.

#### Customer Island

Field	Description
<b>New Cust. No.</b>	If you want to register the current contact company as a customer, you can enter a new customer number here. For further information about the functionality of the field and the creation of customers from contact companies, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Customer No.</b>	If you want to register an existing customer as a contact company, you can enter the customer number in this field when you create a contact company. For further information about the functionality of the field and assigning customers to contact companies, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Termination Date</b>	If cooperation with the customer shown in the field "Customer No." above has been terminated, this field shows the date at which the termination took place.

#### Company Island

Field	Description
<b>Company No.</b>	In this field, you can enter the number of a company to which the contact company is assigned. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

**Access Level Island**

Field	Description
<b>Name</b>	In this field, you can enter the name of an access level. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Description</b>	This field shows the description of the access level specified in the field above.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	<p>In this field, you can assign a document archive to the note in question. Document archives are created in the workspace Document Archives in the Set-Up module. See the description of that workspace for further information on the use of document archives.</p> <p>This field also shows a description of the specified document archive.</p>
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

**Print Control Island**

Field	Description
<b>Statistics 1-4</b>	In these fields, you can enter various statistic codes. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.

**Extra Fields Island**

Field	Description
<b>Date 1-5</b>	In these fields, you can enter a number of dates relevant to the contact company. The fields are for information only.

**User Island**

See the chapter “Getting Started” for a description of the fields in the User island.

**Remarks Island**

In these fields, you can enter additional remarks about the contact company.

**Information Island**

Field	Description
<b>Enterprise</b>	In this field, you can attach the company to an enterprise. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Segment</b>	In this field, you can select a segment. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Area</b>	In this field, you can select an area. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Industry Code</b>	Here you can enter an industry code for the current contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Popup 1-20</b>	In these fields, you can select information concerning the current contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Information 1-5</b>	In these fields, you can enter general information concerning the current contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Origin</b>	In this field, you can register the place from which the current contact company originates. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.

**Option List Fields Island**

Field	Description
<b>List</b>	In this field, you can specify the option lists containing the values you wish to use for further specification of the contact company. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Value</b>	In these fields, you can specify values available in the respective option lists specified in this island. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Companies.

## Actions

This section shows the actions available in the Contact Companies API workspace.

### Top Tab

Field	Description
<b>Create Customer</b>	This action is used for creating a customer from the current contact company. For further information about the functionality of the action, please see the description of the action "Create Customer" in the window Contact Companies.

## Opportunity Partners API Single Dialogs Workspace

Use this workspace to view contact companies that are partners on an opportunity.

### Opportunity Partners Tab

This section includes the fields and descriptions for the Opportunity Partners tab.

#### Opportunity Partner Island

Field	Description
<b>Opportunity No.</b>	This field shows the opportunity number.
<b>Contact Company No.</b>	This field shows the number of the contact company that is partner on the opportunity.
<b>Role</b>	This field shows the partner's role for the opportunity.

## Contact Management – Registration Section

This section includes the fields and descriptions for the Contact Management – Registration workspaces.

## Opportunity Budgets API Single Dialogs Workspace

The People Planner integration uses the Opportunity Budgets API workspace, which displays information about opportunity budgets.

## Opportunity Budgets Tab

This section includes the fields and descriptions for the Opportunity Budgets tab.

### Opportunity Island

Field	Description
<b>Opportunity No.</b>	This field shows the number of the current opportunity.
<b>Description</b>	In this field, you can enter a description of the current opportunity.
<b>Status</b>	This field shows the status of the current opportunity. The value is taken from the corresponding field in the Opportunities window.
<b>Phase</b>	This field shows the current phase of the current opportunity. The value is taken from the corresponding field in the Opportunities window.
<b>Probability %</b>	In this field, you can specify the success probability percentage of the current opportunity. For further information about the probability percentage, see the description of the corresponding field in the Opportunities window.
<b>Currency</b>	In this field, you can select the currency in which the figures in the opportunity budget are to be displayed and entered. If you change the currency after entering budget figures, the figures will be converted automatically. Please note that amounts are rounded when converted into a new currency. This means that changing the currency and subsequently returning to the original currency may cause the amounts to differ slightly from the original ones.
<b>Budget Created</b>	This field shows whether a budget has been created for the current opportunity. It is only possible to enter information in the table part if a budget has been created. Budgets are created using the "Create Budget" action.

### Template Job Island

Field	Description
<b>Template Job No.</b>	<p>In this field, you can select a template job. When you select a template job, you can preview the budget of the job in question to determine whether the budget of the template job matches the opportunity in question. Once you have selected a template job and pressed Return, you can view the different budgets of the template job using the "Show Budget" field in the Budget Type island. Maconomy suggests the budget type marked as the standard opportunity budget type (see "Job Budget Types" in the Set-Up module). If no budget type is marked as standard opportunity budget type, the baseline budget of the template job is suggested.</p> <p>When you select the "Create Budget" action, the budgets of all budget types for the template job are copied to the new opportunity budget. However, until the action is selected, the window shows budgets as a preview only.</p>

Field	Description
<b>Name</b>	This field shows the name of the job specified in the "Template Job No." field above.

**Contact Company Island**

Field	Description
<b>Contact Comp. No.</b>	This field shows the number of the contact company to which the current opportunity pertains.
<b>Name</b>	This field shows the name of the contact company to which the current opportunity pertains. You can change the name here, causing it to be updated accordingly in the Opportunities window.
<b>Customer No.</b>	This field shows the number of the customer assigned to the contact company of the current opportunity.

**Budgeting Island**

Field	Description
<b>Hours Per Man Day</b>	<p>In this field, you can specify how many hours are in a man day. In the table part, quantities for time activities can be specified either as a number of hours or a number of days. There are separate fields for specifying hours and days. When you specify a number of days, the corresponding number of hours is automatically calculated by multiplying the number of days by the value in this field. Similarly, when you specify a number of hours, the corresponding number of days is calculated by dividing the number of hours by the value in this field.</p> <p>This field is also used for calculating prices per day from hour-based prices.</p>
<b>Start Date</b>	This field shows the expected starting date of the job based on the opportunity.
<b>Expected Closing Date</b>	This field shows the expected ending date of the job based on the opportunity.

**Budget, Base Island**

The functionality of the fields in this island corresponds to that of the fields in the Budget, Base island in the Job Budgets window.

**Budget, Currency Island**

The fields in this island correspond to the fields in the Budget, Base island. The only difference is the fact that in this island, the amounts are shown in the currency selected for the opportunity.

**Line Creation Island**

The functionality of the field in this island corresponds to that of the field in the Line Creation island in the Job Budgets window.

**Unit Analysis Island**

The functionality of the fields in this island corresponds to that of the fields in the Unit Analysis island in the Job Budgets window.

**Company Island**

Field	Description
<b>Company</b>	This field shows the number and name of the company to which the opportunity is assigned.
<b>Base Currency</b>	This field shows the currency used as the base currency in the company shown in the "Company" field above.

**User Island**

See the chapter "Getting Started" for a description of the fields in the User island.

**Budget Type Island**

Field	Description
<b>Show Budget</b>	In this field, you choose the budget you wish to preview, if no budget has been created for the opportunity, or the budget you wish to work with if a budget has been created. Once you have selected a template job in the "Template Job No." field and pressed Return, you can view the different budgets of the template job using this field. Maconomy suggests the budget type marked as standard opportunity budget type in the window Popup Fields. If no budget type is marked as standard opportunity budget type, the baseline budget of the template job is suggested.

**Employee Category Prices Island**

The functionality of the fields in this island corresponds to that of the fields in the Employee Category Prices island in the Job Budgets window.

**Limit Island**

The functionality of the fields in this island corresponds to that of the fields in the Limit island in the Job Budgets window.

**Billing Price Deviations Island**

The functionality of the fields in this island corresponds to that of the fields in the Billing Price Deviations island in the Job Budgets window.

**Copy Budget Island**

The functionality of the fields in this island corresponds to that of the fields in the Copy Budget island in the Job Budgets window.

## Job Budget Lines Sub-Tab

This section includes the fields and descriptions for the Job Budget Lines sub-tab.

Field	Description
<b>Description</b>	In this field, you enter a text, which is attached to the activity on quotes and order confirmations.
<b>Line Type</b>	In this pop-up field, you select the type of the current job budget line. Selecting a value is mandatory.
<b>Line No.</b>	This field shows the budget line number. Note this may not be unique. For indented lines numbering restarts so several indented lines may have, for example, line number 1.
<b>Instance Key</b>	This field shows the instance key of the budget line.
<b>Parent Job Budget Line</b>	For indented budget lines this field shows the instance key of the parent budget line. For a top level budget line it is blank.
<b>First Instance Key</b>	This field shows the instance key of the first revision of this budget line.
<b>Job Budget Line Reference</b>	If job budget merging functionality is used this field may hold a reference to the first instance key of another budget type.
<b>Approved as Instance Key</b>	This field shows the instance key of the budget line in the latest approved revision.
<b>Task</b>	In this field, you can specify the task to which the job budget line is to be assigned.
<b>Act. No.</b>	In this field, you enter the number of the activity for which you wish to make a budget estimate. If both this field and the field "Task" are blank, the line is a text line. If this field shows "*", the line is a summary line which creates a subtotal when the budget is printed using the "Standard" layout.  Empl. Cat. No. In this field, you can assign a certain employee category to the job budget. If no specific employee has been specified for this line, Maconomy will instead use the cost, intercompany or billing price for the specified employee category for price calculations, if the field "Hourly Rate" in the window System Information in the Set-Up module has been set to "By Employee" or "Employee Priority."
<b>Quantity</b>	In this field, you enter the budgeted quantity for the line.
<b>Quantity, Days</b>	The functionality of this field is similar to that of the field "Quantity" above. However, this field only applies to time activities, and you enter the budgeted quantity as a number of days instead of a number of hours.

Field	Description
<b>Cost, Base</b>	In this field, you enter the budgeted cost in the base currency for one unit of the activity on the budget line. For a further description of how Maconomy calculates these prices, please refer to "Appendix A: Price Calculation in the Job Cost module."
<b>Cost Per Day, Base</b>	This field only applies to time activities. The field shows the value in the field "Cost, Base" converted into a cost per day.
<b>Total Cost, Base</b>	This field shows the total estimated cost in base currency for the budget line. The total cost is found by multiplying the number in the "Quantity" field by the cost per piece in the "Cost" field.
<b>Billing Price, Curr.</b>	In this field, you enter the budgeted billing price in the job's currency of one unit of the activity on the budget line. If the activity is non-invoiceable, you cannot enter a price here, and the value must be "0.00."  Billing Price Per Day, Curr. This field only applies to time activities. The field shows the value in the field "Standard Billing Price, Currency" converted into a standard billing price per day.
<b>Total Billing Price, Currency</b>	This field shows the budget lines total budgeted billing price in the job currency. The total billing price is calculated by multiplying the number in the "Quantity" field by the billing price per piece in the "Billing Price, Currency" field.
<b>Markup %</b>	In this field, you enter the budgeted gross margin % for the activity on the budget line.
<b>Line Specific Billing Price</b>	If the current job is set up for price control from budgets (see "Price control from budgets"), this field indicates if the billing price differs from the price originally derived from the employee category on the current line. If the line is not marked, the price is the original price.
<b>Cost Type</b>	This field shows the cost type selected for the current activity in the window Activities: "Turnover" or "Outlays."
<b>Inc. in Fixed Price</b>	In this field, you can mark whether or not the entry applying to the line should be included in the fixed price of a job. The set-up of the job in question determines whether or not this field is automatically marked when a line is created. The field can be marked/unmarked manually.
<b>Planned Starting Date</b>	In this field, you can enter the date you plan to begin the activity. Maconomy uses the prices valid per this date when deciding which version of the price list assigned to the job, if any, should be used for price calculation on job budget lines. If you do not specify a date in this field, Maconomy uses today's date for the calculation of prices.
<b>Planned Duration</b>	In this field, you can enter a planned duration of the activity. This duration will always be the number of days from the planned starting date to the planned ending date.

Field	Description
<b>Planned Ending Date</b>	In this field, you can enter the date you plan to end the activity. The date specified will be of importance in the window Detailed Planning in the Resource Planning module as the date specified in this field will be copied to planning lines created on the basis of the budget in question.
<b>Milestone</b>	This box is checked if the budget line is of type "Milestone."
<b>Standard Billing Price, Currency</b>	This field shows the standard billing price per unit in the currency of the job.
<b>Standard Billing Price Per Day, Currency</b>	This field only applies to time activities. The field shows the value in the field "Standard Billing Price, Currency" converted into a standard billing price per day.
<b>Total Standard Billing Price, Currency</b>	<p>This field shows the total standard billing price of the current budget entry in the currency of the job.</p> <p>If the system parameter "Update prices upon dimension change" has been marked, the price in this field is updated when certain key information on the line is changed, for instance, the activity, employee, or dimension values. For further information on this and for a complete list of the fields that cause the price to be updated, see the description of the system parameter "Update prices upon dimension change." If the system parameter is not marked, and you wish to ensure that all prices reflect the current set-up of the budget lines, use the "Recalculate Job Budget" action.</p>
<b>Purchase Currency</b>	<p>In this field, you can select a currency. Depending on whether you have entered the cost in base currency or in another currency, the value is calculated in the "Cost, Base" field or in the "Cost, Purchase Currency" field by means of this currency. If another currency is subsequently selected, the value in the "Cost, Purchase Currency" field is then recalculated. For a further description of how Maconomy calculates these prices, please refer to "Appendix A: Price Calculation in the Job Cost Module."</p> <p>If the job budget is structured hierarchically, selecting a purchase currency on a group header line makes it possible to see the total purchase amount for the subordinate lines in a specific currency.</p>
<b>Cost, Purchase Currency</b>	<p>In this field, you can enter or see the cost in the currency selected in the "Purchase Currency" field. If you enter a value here, the value in the "Cost, Base" field will be calculated. If a value is entered in the "Cost, Base" field, the calculated cost is displayed in the currency in this field. The two fields cannot be filled in at the same time. For a further description of how Maconomy calculates these prices, please refer to "Appendix A" Price Calculation in the Job Cost Module."</p> <p>If the system parameter "Update prices upon dimension change" has been marked, the price in this field is updated when certain key information on</p>

Field	Description
	<p>the line is changed, for instance, the activity, employee, or dimension values. For further information on this and for a complete list of the fields that cause the price to be updated, see the description of the system parameter "Update prices upon dimension change." If the system parameter is not marked, and you wish to ensure that all prices reflect the current setup of the budget lines, use the "Recalculate Job Budget" action.</p> <p>If the user does not have access to cost for time, as specified in the Actions window in the Set-Up module, the value here will be zero and cannot be changed.</p> <p>Maconomy multiplies the cost in this field with the figure in the "Quantity" field, so that the total cost is calculated in the "Total Cost, Purchase Currency" field.</p> <p>If purchase order lines have been created from the current line, and you decrease the amount in this field, Maconomy checks whether the new amount causes budget violations according to the rules set up in the job parameter attributes "Limit Purchase Amount to Budget," "Limit Purchase on Sum or Line Level," "Limit Purchase, Currency Margin," and "Limit Purchase, Percentage Margin" for the job. If the change causes a budget violation, an error message is displayed.</p>
<b>Cost Per Day, Purchase Currency</b>	This field only applies to time activities. The field shows the value in the field "Cost, Purchase Currency" converted into a cost per day.
<b>Total Cost, Purchase Currency</b>	In this field, you can see the total budgeted cost in the current job's currency. The total cost price is calculated by multiplying the figure in the field "Quantity" by the cost per unit in the field "Cost, Purchase Currency."
<b>Billing Price, Purchase Currency</b>	If you want to enter the billing price in another currency than the job's currency, you can use this field.
<b>Billing Price Per Day, Purchase Currency</b>	This field only applies to time activities. The field shows the value in the field "Billing Price, Purchase Currency" converted into a billing price per day.
<b>Billing Price Total, Purchase Currency</b>	This field shows the total billing price on the current budget line converted into the purchase currency.
<b>Deliv. Remarks</b>	In this field, you can enter delivery remarks to be used in connection with the delivery of the items.
<b>Billing Price, Base</b>	This field shows the amount from the field "Billing Price, Currency" on the current budget line converted into the base currency.

Field	Description
<b>Billing Price Per Day, Base</b>	This field only applies to time activities. The field shows the value in the field "Billing Price, Base" converted into a billing price per day.
<b>Billing Price Total, Base</b>	This field shows the amount from the field "Billing Price Total, Currency" on the current budget line converted into the base currency.
<b>Standard Billing Price, Base</b>	This field shows the standard billing price per unit in the base currency of the company.
<b>Total Standard Billing Price, Base</b>	This field shows the total standard billing price of the current budget entry in the currency of the job.
<b>Exec. Company No.</b>	This field shows the name of the company carrying out the specified activity. The field cannot be changed.
<b>Name</b>	This field shows the name of the executing company.
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the Dimension Derivation window in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, the standard value is transferred from the System Parameters window in the Set-Up module.</p> <p>If the system parameter "Update prices upon dimension change" has been marked, changing the location on a line will cause the prices on the line to be recalculated according to the method described in "Appendix A: Price Calculation in the Job Cost Module." If the current job is set up for price control from budgets (see "Price control from budgets"), and the "Line Specific Billing Price" field is marked for the current line, the billing price is not changed upon recalculation.</p> <p>If the budget controls prices, the function of the system parameter "Update prices upon dimension change" is different. Even if the parameter is set, changing dimensions does not affect the prices. Only changing the employee category on lines related to a time activity will cause a recalculation of the price, and the line will be considered line-specific. To recalculate the price after changing dimensions, use the "Recalculate Job Budget" action.</p> <p>See the section on dimension derivation in "Introduction to the G/L Module," as well as the description of the Dimension Derivation window, for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to that of the "Location" field above.

Field	Description
<b>Project</b>	The functionality of this field is similar to that of the “Location” field above.
<b>Purpose</b>	The functionality of this field is similar to that of the “Location” field above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the “Location” field above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the “Location” field above.
<b>Net Cost, Base</b>	This field shows the budgeted net cost of the job in the job’s base currency.
<b>Net Cost Per Day, Base</b>	This field only applies to time activities. The field shows the net cost per day budgeted for the current job budget line. The value is based on the value in the field “Net Cost, Base” above and the number of hours per man day specified for the job in the field “Hours per Man Day” in the window “Jobs.”
<b>Tax Code</b>	This field shows a G/L tax receivable code if the activity on the line is an amount activity.
<b>Activity Name</b>	This field displays the text defined for the current activity.
<b>Task Description</b>	This field shows the text defined for the current task, if a description has been entered in the field “Task.”
<b>Empl. Cat. Name</b>	This field shows the name of the employee category specified in the field “Empl. Cat. No.” above.
<b>Job Budget Text</b>	In the window Job Budget Texts, it is possible to assign text lines to a job budget line. This field, which cannot be changed, displays whether such text lines are assigned to the current line.
<b>Remarks 1-10</b>	In these fields, you can assign remarks to the current job budget line. The remarks are for information only and can be used in reports.

## Actions

This section shows the actions available in the Opportunity Budgets API workspace.

### Top Tab

Field	Description
<b>Copy Budget</b>	The functionality of this action is similar to that of the “Copy Budget” action in the Jobs window.
<b>Print Price Overview</b>	The functionality of this action is similar to that of the “Print Price Overview” action in the Job Budgets window.

Field	Description
<b>Recalculate Budget</b>	The functionality of this action is similar to that of the “Recalculate Job Budget” action in the Job Budgets window.
<b>Require Tasks</b>	The functionality of this action is similar to that of the “Require Tasks” action in the Job Tasks window.
<b>Disallow Tasks</b>	The functionality of this action is similar to that of the “Disallow Tasks” action in the Job Tasks window.
<b>Create Budget</b>	<p>When you select this action, Maconomy creates a job for the current opportunity and copies budget information from the selected template job to the new job.</p> <p>The job is created on the basis of the job that is specified in the field “Template Job No.,” meaning that both basic information and budget information is copied from this job. The new job is assigned a job number that corresponds to the number of the opportunity, prefixed by an underscore. For example, if the opportunity number is 10050, the number of the new job will be _10050. If another job with the generated job number already exists, Maconomy adds an extra underscore to the job number, for example, resulting in the number __10050. This procedure is repeated until a unique job number is found.</p> <p>Maconomy copies all information from all budget types. This means that even if you selected a given budget type in the “Show Budget” field, any budget figures that exist for the template job for other budget types are also copied.</p> <p>When a budget has been created, the sales estimate in the “Sales Estimate, currency” field in the Opportunities window can no longer be updated manually. Instead, it corresponds to the total billing price budgeted for the budget type marked as the standard opportunity budget type (see “Job Budget Types” in the Set-Up module). If no budget type is marked as standard opportunity budget type, the total billing price of the baseline budget of the template job is used instead.</p>
<b>Delete Budget</b>	When you select this action, the job created for the opportunity is deleted, along with all lines in the table part. This means that to enter budget information for the opportunity, you must specify a template job and select the “Create Budget” action again.

## SD\_AI\_Setup Section

Use up to 35 words to describe this conceptual topic. Write complete sentences.

This is the start of your concept.

## SD\_AI\_Setup Set-up Section

This section includes the fields and descriptions for the Setup Set-up section.

## SD\_AI\_Current Employee API Single Dialogs Workspace

Use this workspace to view data about a current employee.

This workspace is intended to be used whenever the workspace should show data for the current employee.

## Setup – Workflow Section

This section includes the fields and descriptions for the Setup-Workflow workspaces.

### Email Alerts Setup API Single Dialogs Workspace

Use this workspace to add and remove entries from the sub-tab of the Email Alerts Setup workspace.

### Email Alerts Notification Types Tab

This section includes the fields and descriptions for the Email Alerts Notification Types tab.

#### Notification Type Island

Field	Description
<b>Description</b>	This field shows the description for the notification type, for example, “Approve Time as Project Manager” or “Inv. Due.”
<b>Category</b>	This field shows the category for the notification type. Valid values are Alert or ToDo.
<b>Shortlisted for Templates</b>	Select this check box if this notification type should be shortlisted for selection in mail templates.
<b>Notification Type</b>	This field shows the name for the notification type, for example, “ApproveTimeSheetLines” or “Portal::Standard::Portals::Vendor::VendorInvoiceDue”“VendorInvoiceDue.”
<b>Portal or Client Notification</b>	This field shows Portal or Client to indicate whether this notification type refers to portal alerts and to-dos, or to client notifications, respectively.
