<b>Purch. Order No.</b>	<p>In this field, you can enter the number of a purchase order from the window Purchase Orders, if the vendor invoice relates to a purchase order placed with the vendor. If the vendor invoice pertains to a specific item receipt, you can also enter the number of the packing slip representing the receipt in the field "Packing Slip No."</p> <p>If you only specify a purchase order number, Maconomy will automatically create allocation lines allocating the vendor invoice to entries for the open lines on the purchase order. The quantities on these lines will correspond to the quantities received in the window Purchase Receipt. However, if the system parameter "Suggest Quantity Received on Vendor Invoice" is not marked, the quantities on allocation lines based on a purchase line for which a quantity of zero has been received (or no receipt has been registered) will be set to the quantity remaining to be received for that purchase line.</p> <p>If you specify a packing slip number in the field "Packing Slip No." that matches a packing slip number entered in the window Purchase Receipt for the purchase order in question, allocation lines are only created for those lines on the purchase receipt that pertain to an item and resulted in an item movement. On these allocation lines,</p>

Field	Description
	<p>the amounts and quantities will match those received on the item receipt (any delivery costs and expense percentages specified on the purchase order will be added to the prices), and the field "For Inventory Purchase" will be marked.</p> <p>If the allocation lines created in this process match the amount of the invoice and the system parameter "Manual Release of Vend. Inv." is not marked, the invoice is automatically approved for posting.</p> <p>If the entry is a vendor credit memo, the previously invoiced amount will be transferred from each purchase order line, and Maconomy creates allocation lines for the closed purchase order lines.</p> <p>Maconomy retrieves most of the information from the purchase order, and you only have to complete "Entry Date," "Trans. No." and "Invoice No."</p> <p>In case you did not specify a vendor at the time of entering the purchase order, the field "Vendor No." must be filled in along with the field "Purchase Order No." in the card part of the window. When posting the vendor invoice, the specified vendor number is transferred to the purchase order.</p>

#### Job Island

Field	Description
<b>Job</b>	In this field, you can enter a job number to which the vendor invoice pertains. This job number will be suggested on lines created in the table part. This field also shows the name of the job specified in by the job number.

#### Allocation, Currency Island

Field	Description
<b>Status</b>	<p>This field shows the current status of the invoice displayed in the window. The field can show one of the following options:</p> <ul style="list-style-type: none"> <li>▪ <b>Awaits Allocation</b> — The new vendor invoice and invoice journal have been created, but no invoice allocation line has yet been created for the invoice in question.</li> <li>▪ <b>Allocation Started</b> — Allocation lines have been created and fully allocated, but have not yet been submitted.</li> <li>▪ <b>Awaits Approval</b> — The allocation has been submitted for approval and awaits approval for posting.</li> <li>▪ <b>Awaits Posting</b> — The invoice journal has been approved, but has not yet been posted. Noted that if you do not use approval hierarchies, and if you selected the <b>Approve vend. inv. at submissions</b> system parameter, Maconomy automatically approves the vendor invoice journals that you submitted, and this field shows this option. See the description of the <b>Submit for approval</b> and <b>Approve for posting</b> action for further information.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Allocation Completed</b> — The allocation has been fully approved and posted, and is thus completed.</li> </ul>
<b>Allocation Started</b>	<p>This field indicates if the allocation of the credit memo or vendor invoice has started. If the <b>Standard Allocation Code</b> field is selected on the information card of the vendor for whom an invoice is created, and if the <b>Manual Release of Vend. Inv.</b> system parameter is not selected, the allocation of the invoice automatically starts once you press Return on the line. You can approve the allocation line(s) created either in the Vendor Invoices single dialog workspace or Invoice Allocation single dialog workspace.</p>
<b>Released for Posting</b>	<p>This field indicates if you approved the invoice allocation for posting. When the allocation is complete, use the <b>Approve for Posting</b> action to approve it. You can only approve an invoice allocation if the sum of the allocated amounts, less any inventory purchase amounts, in the <b>Remainder, Tax</b> and <b>Remainder, Incl. Tax</b> fields is zero. If you make any more changes after approving the allocation, you must release it again.</p> <p>When an invoice allocation is approved, the vendor invoice journal can be posted in the Posting single dialog workspace in the G/L module or in the Vendor Invoices single dialog workspace in the A/P module. You can view the journal in the Show Vendor Invoices single dialog workspace, which shows the posted vendor invoices and assigned allocation lines that you created.</p> <p>You cannot post a vendor invoice journal if it includes invoices for which allocation has been started in this workspace but not yet approved.</p>
<b>Remainder, Excl. Tax</b>	<p>This field shows how much of the total amount, tax excluded remains to be allocated on the lines in the table part of the window. When you create an allocation line, Maconomy will suggest the amount in this field in the field "Amount" on the new line. The invoice allocation cannot be approved until the amount in this field is zero.</p>
<b>Remainder, Tax</b>	<p>This field shows how much of the total tax amount on the vendor invoice remains to be allocated on the lines in the table part of the window. The invoice allocation cannot be approved until the amount in this field is zero.</p> <p>The functionality of the field depends on whether the system parameter "Recalculate Tax Amount from Amount Including Tax" has been marked.</p> <p>If the parameter has not been marked, the functionality is as described below. If the parameter has been marked, substitute the term "amount excluding tax" in the description below with "amount including tax."</p> <p>On the individual lines created in the table part, the tax amount is calculated from the amount excluding tax. This means that if a tax amount remains when the full amount excluding tax has been allocated (for instance because you changed the tax amount on the invoice due to an incorrect tax amount stated by the vendor), you must manually change the tax amount on one of the allocation lines before the allocation can be approved. However, if the amount excl. tax entered on a line causes the remainder excl. tax to be fully allocated, and the difference between the tax remainder and the calculated tax for the line in question is within the margin specified in the system parameter "Margin</p>

Field	Description
	<p>for automatic correction of tax,” the tax remainder is automatically allocated to the line (rather than calculated from the amount excluding tax on the line), regardless of whether this tax amount is correct according to the amount and tax code on the line.</p> <p>If multiple tax codes are enabled, the “Remainder, Tax” field will be replaced by the following fields: “Remainder, Tax Total,” “Remainder, Tax 1,” “Remainder, Tax 2” and, if enabled, “Remainder, Tax 3.” The “Remainder, Tax Total” field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in “Tax Codes.”</p>
<b>Remainder, Incl. Tax</b>	This field shows how much of the total amount inclusive tax remains to be allocated on the lines in the table part of the window. When you create an allocation line, Maconomy will suggest the amount in this field in the field “Amount, Incl. Tax” on the new line. The invoice allocation cannot be approved until the amount in this field is zero.
<b>Responsible for Allocation</b>	In this field, you can specify the employee number of the person to be responsible for the allocation of the invoice journal. If a global location number is specified in the field “Global Location No.,” any allocation responsible assigned to the location number in question is suggested.

### Copy Vendor Invoice Island

Field	Description
<b>Vendor No.</b>	<p>In this field, you can enter a vendor number to be used for identifying a vendor invoice to be copied to the new vendor invoice. If you fill in this field, you must also enter an invoice number in the “Invoice No.” field below.</p> <p>If you want to copy the information from an existing invoice to a new invoice, you enter a new transaction number and an invoice number in the card part of the window, fill in this field and the field “Invoice No.,” and press return, and Maconomy copies the vendor invoice specified, including any assigned allocation lines. The field can only be filled in when creating an invoice. Once you have pressed Return, the values in this island can no longer be changed.</p> <p>Note that when copying a vendor invoice, the fields filled in by the user on the new invoice in the card part of the window are not affected by the copying. However, the allocation lines copied to a new invoice will contain the same dimensions as the ones specified on the allocation lines that pertain to the invoice on the basis of which copying is made, irrespective of the dimensions specified in the card part of the new invoice. You should therefore pay attention to the dimensions on copied allocation lines that can be changed manually.</p> <p>Entering a vendor number in this field can also be used for reversing the effect of an already posted invoice. See the description of the field “Reverse Debit/Credit” for further information on the functionality of reversing vendor entries.</p>
<b>Invoice No.</b>	In this field, you can enter an invoice number to be used for identifying a vendor invoice to be copied to the new vendor invoice. If you fill in this field, you must also enter a vendor number in the field “Vendor No.” in this island. As the

Field	Description
	functionality of this field is similar to that of the field "Vendor No." above, you should see the description of that field for further information.
<b>Journal No.</b>	In this field, you can enter a journal number to be used for identifying a vendor invoice to be copied to the new vendor invoice. You can fill in this field if you do not know either the vendor number or the invoice number of the invoice you want to copy. If you fill in this field, you must also enter a journal line number in the field "Journal Line No." in this island. As the functionality of this field is similar to that of the field "Vendor No." above, you should see the description of that field for further information.
<b>Journal Line No.</b>	In this field, you can enter a journal line number to be used for identifying a vendor invoice to be copied to the new vendor invoice. You can fill in this field if you do not know either the vendor number or the invoice number of the invoice you want to copy. If you fill in this field, you must also enter a journal number in the field "Journal No." in this island. As the functionality of this field is similar to that of the field "Vendor No." above, you should see the description of that field for further information.
<b>Reverse at Copying</b>	<p>In this field, you can choose whether the new vendor invoice should reverse an existing, already posted invoice at copying. If you complete two of the fields in this island and mark this field, the new vendor entry is assigned the opposite value in the field "Debit/Credit" as the existing entry when you press return. For example, if the original entry is a credit entry (a vendor invoice), the new entry will be a debit entry (a credit memo). In this way, the new entry reverses the effect of the existing entry.</p> <p>If the credit memo to be entered does not cover the full amount of the invoice to be reversed, you can enter the amount of the credit memo in the field "Amount, Incl. Tax" in the Invoice island. After you press return, the remaining amount can be allocated by using the action "Allocate Remainder." If the invoice or credit memo being copied has not already been reconciled, it is automatically reconciled against the new invoice or credit memo. To avoid exchange rate differences when copying, mark the field "Use Original Exchange Rate" below.</p>
<b>Use Original Exchange Rate</b>	<p>If you are reversing an existing vendor invoice, you can mark this field to use the same exchange rate as was used for the original vendor invoice. If you do this, there will be no exchange rate differences when you reverse the vendor invoice, unless the original currency has moved in relation to the enterprise currency. If this is the case, the difference must be handled at the time of posting.</p> <p>The vendor invoices can be inspected in the Show Vendor Invoices window</p>

### Transaction Numbering Island

Field	Description
<b>Number Series</b>	In this field, you can select the transaction number series to use. By default, this field shows the transaction number series for the transaction type specified above.

**Currency Island**

Field	Description
<b>Exchange Rate</b>	In this field, you can specify the exchange rate to be used when posting invoices in foreign currencies. Maconomy suggests the rate from the current exchange rate table, but you can change it.
<b>Fixed Exchange Rate at Payment</b>	If you mark this field, the exchange rate in which the entry is posted will be fixed when the payment is posted, even though the exchange rate may have changed according to the current exchange rate table.

**Responsible Island**

Field	Description
<b>Responsible</b>	In this field, you can specify the number of the employee responsible for approving the current invoice or credit memo. This field also shows the name of the employee specified by the responsible employee number.

**Vendor Information Island**

Field	Description
<b>Enterprise</b>	In this field, you can specify an enterprise. When you create a vendor invoice manually, Maconomy suggests the value for this field from the purchase order or (if there is no purchase order) from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables. You maintain enterprises in the <b>Enterprises</b> field in the Popup Fields single dialog workspace under the Set-Up module.
<b>Segment</b>	In this field, you can specify a segment. When you create a vendor invoice manually, Maconomy suggests the value for this field from the purchase order or (if there is no purchase order) from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables. You maintain segments in the <b>Segments</b> field in the Popup Fields single dialog workspace under the Set-Up module.
<b>Area</b>	In this field, you can specify an area. When you create a vendor invoice manually, Maconomy suggests the value for this field from the purchase order or (if there is no purchase order) from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables. You maintain areas in the <b>Area</b> field in the Popup Fields single dialog workspace under the Set-Up module.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In this field, you can enter the number of a document archive to be assigned to the vendor invoice in question. By assigning a document archive to a vendor invoice, you can keep track of the documents relevant to the vendor invoice.

Field	Description
	<p>If you need to assign a specific document (for example, a scanned image of the original vendor invoice which is stored in a document archive) to an invoice line, this can be done by specifying the name of the file in the field "File Name" below. Document archives are created in the window Document Archives in the Set-Up module.</p> <p>This field also shows the description of the document archive specified by the document archive number.</p>
<b>Document Count</b>	This field shows the number of documents in the Document Archive.
<b>File Name</b>	<p>In this field, you can enter the name of a file to be assigned to the invoice. The file name specified can refer to a document containing, for example, a scanned image of the original invoice or any other document being of particular relevance for the vendor invoice.</p> <p>If you create an invoice manually in this window, you must specify the entire path of the file in this field in order to assign the file to the invoice. When you press Return, a document archive in which the file is stored is automatically created, if Maconomy can locate the file specified. The number series for document archives to be used by Maconomy are specified in the window Number Series in the Set-Up module. If the desired file is already stored in a document archive, you can also specify the number of the document archive in the field "Document Archive No." and enter the name of the file in this field. The file assigned to the invoice can be displayed by a third party program, for example, Acrobat Reader or a browser by selecting the action "Show Document" in the Action menu of this window. In this way, you can always inspect the original invoice when processing the Maconomy invoice through allocation and reallocation in the system.</p> <p>If you need to assign a file to an invoice after having pressed Return, you specify only the number of the document archive in which the file is stored, and the file name, which should not include the entire path. Once the invoice has been posted, you cannot specify a file name in this field.</p>

### Registration Code Island

Field	Description
<b>Registration Code</b>	<p>In this field, you can enter a registration code from the Registration Codes window in the G/L module. The registration code is used instead of manually entering a number of dimension values in this island. See the description of the Registration Codes window in the G/L module for further information about registration codes.</p> <p>If a global location number is specified in the field "Global Location No." on the line, any registration code assigned to the location number in question is suggested.</p>

**Dimensions Island**

Field	Description
<b>Location</b>	In this field, you can enter a location to be assigned to the invoice/credit memo. If the window shows an already existing invoice/credit memo, the value in this field is retrieved from the field "Location" in the table part of the Vendor Invoices window.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of this field is similar to that of the field "Location" above.

**Remarks Island**

Field	Description
<b>Remarks 1-5</b>	In these fields, you can assign remarks to the invoice journal.

**Reference Invoice Island**

This island is used to link a credit memo with a vendor invoice, so the fields are only relevant for a credit memo. The purpose is to uniquely identify the invoice that should be reconciled by the credit memo.

Field	Description
<b>Credit Memo Reference</b>	This is the Invoice Number of the vendor invoice to reconcile.
<b>Journal no. reference</b>	This field shows the Journal Number of the vendor invoice referred to.
<b>Journal line no. reference</b>	This field shows the number of the line where the invoice occurs in the journal identified by the Journal no. reference.

## Invoice Allocation Lines Sub-Tab

This section includes the fields and descriptions for the Invoice Allocation Lines sub-tab.

Field	Description
<b>Purchase Line Type</b>	<p>Use this field to indicate the type of purchase the line represents. The available values are:</p> <ul style="list-style-type: none"> <li>Fixed Asset</li> <li>Inventory</li> <li>Job Cost</li> <li>G/L</li> <li>Text Line</li> <li>Subcontractor Reconciliation</li> </ul>
<b>Account No.</b>	<p>In this field, you can enter the number of a G/L account in the company's chart of accounts, provided that the allocation line in question is related to the purchase of services/items to be posted in the G/L module and which are not related to jobs in the Job Cost module.</p> <p>The purchase is debited to the account whose account number was entered in this field. If you have made references to a purchase order number in connection with the receipt of the vendor invoice in the window Vendor Invoices, Maconomy will automatically create allocation lines in the table part. These lines correspond to the lines on the purchase order, and the value in the field "Account No." on the corresponding line in the purchase order is transferred to this field.</p> <p>Maconomy checks that the account exists, that it is a "Manual" account and that it is not blocked. Maconomy furthermore checks that the combination of dimensions on the allocation line is an allowed G/L allocation combination. Allowed allocation combinations are shown in the window G/L Allocation Combinations.</p> <p>If you specify both an account number and a job number, the dimension derivation process will include derivation of dimensions from the specified job, but the amount will be allocated to the account, meaning that no entries will be created in the Job Cost module. Even if both a job and an account have been specified, the tax code is derived from the account.</p>
<b>Local Account No.</b>	<p>Specify a local account number when you allocate the invoice to a company that uses local chart of accounts.</p>
<b>Job No.</b>	<p>If the amount on the line should be allocated to a job, enter a number in this field and leave the field "Account No." blank. If you specify both a value in the field "Account No." and a job number, the dimension derivation process will include derivation of dimensions from the specified job, but the amount will be allocated to the account, meaning that no entries will be created in</p>

Field	Description
	<p>the Job Cost module. Even if both a job and an account have been specified, the tax code is derived from the account.</p> <p>In the following, it is assumed that you specify a job and leave the field "Account No." blank.</p> <ul style="list-style-type: none"> <li>■ If you are capitalizing the job expenses, the purchase is debited the job's WIP account.</li> <li>■ If you are posting the job expenses to a P/L account, the purchase is debited the P/L account assigned to the activity specified in the field "Act. No."</li> <li>■ If you have entered a purchase order number in the window Vendor Invoices, Maconomy transfers all the purchase order lines, and inserts the value from the corresponding purchase order line's field "Job No."</li> </ul> <p>Maconomy checks that the job exists, that it has the status of "Order," and that it is neither blocked nor closed. If you enter a number here and leave the field "Account No." blank, you must enter a number in the field "Act. No." on the same line.</p> <p>If employee control has been selected for the current job, you can only enter registrations for employees who appear in the latest revision of the planning budget of the current job. For more information about controlling employee registrations, please see the description of the window Jobs.</p> <p>If fixed exchange rate information has been specified for the job in the window Job Price Information, and the system parameter "Fixed exchange rates in budgets only" has not been marked, any currency conversion between the currency of the invoice and that of the job will take place when the invoice is posted, and any variance between the exchange rate of the currency on the invoice and on the job, respectively, is posted to the account for amount rounding.</p>
<b>Act. No.</b>	<p>In this field, you enter the number of an activity, if the purchase relates to a job. If the line was created as a result of entering a purchase order number in the <b>Purchase Order No.</b> field in the tab, Maconomy suggests the value from the <b>Act. No.</b> field on the corresponding purchase order line.</p> <p>Maconomy checks that the activity exists, that it is an amount or time activity, and that it is not blocked. If you enter a number here, you must also enter a number in the <b>Job. No.</b> field and leave the <b>Item No.</b> field blank.</p>
<b>Empl. No.</b>	<p>Specify the employee number if the current allocation or reallocation line relates to a specific employee.</p>
<b>Task</b>	<p>For job related lines, it is possible to specify a task here. If a value is specified in the field, Maconomy checks that a task listing has been assigned to the job and that the listing contains the specified task.</p> <p>Specifying a value is mandatory if a task listing has been assigned to the job.</p>

Field	Description
<b>Account/Activity Name</b>	This field shows either the account text of the G/L account specified in the field "Account No.," or the activity text of the activity in the field "Act. No." The text cannot be changed here.
<b>Entry Description</b>	<p>In this field, you enter the entry text. This text is assigned to the allocation line when you post the vendor invoice. Maconomy suggests the text from the field "Account/Activity Name," but you can change it.</p> <p>If you entered a purchase order number for the invoice in the window Vendor Invoices, Maconomy will automatically create allocation lines to correspond with the purchase order, transferring the field "Line Remarks" from the purchase order to this field. If you have used an allocation code, the lines will also be created automatically, and the field "Entry Description" from the allocation code will be transferred to this field.</p>
<b>Quantity</b>	Enter the quantity of the allocation or transfer line. When you create a line without specifying a purchase order number, Maconomy automatically enters a default value of one. If you specify a purchase order number in the <b>Purchase Order No.</b> field, Maconomy suggests the quantity based on the information on the purchase order in question. For further information, see the description of the <b>Purchase Order No.</b> field.
<b>Unit</b>	This field shows the unit that applies to the current vendor invoice line.
<b>Unit Price</b>	In this field, you enter the unit price in the currency of the current vendor invoice. You must enter an amount, and it must be exclusive of tax. When you create an allocation line, Maconomy will suggest the amount from the field "Remainder, Excl. Tax" in the card part of the window.
<b>Pricing Unit</b>	If an item has been specified on the current line, this field shows the quantity of item units included in the unit price. This value is retrieved from the field "Unit, Purchase" on the Item Information Card and cannot be changed here. However, if the line is based on a purchase order line, Maconomy will attempt to derive the pricing unit from the purchase order line in question before deriving it from the Item Information Card.
<b>Discount</b>	In this field, you can enter a discount after negotiating with the vendor. If the invoice allocation line is created from a purchase order, the discount is retrieved from the purchase order.
<b>Amount Excl. Tax</b>	This field shows the price less tax of the allocation line in the currency of the vendor invoice. You can change the amount. The amount is calculated as quantity multiplied by the unit price less tax and any discount. When a new allocation line is created, Maconomy will suggest the amount from the field "Remainder Excl. Tax" in the card part of the window. If you manually enter an amount in this field, Maconomy will recalculate the unit price based on the total amount in this field. If you enter an amount in this field, Maconomy also updates the fields "Tax Amount" and "Amount Incl. Tax" based on the entered amount.

Field	Description
<b>Item No.</b>	<p>In this field, you enter the number of an item, if the purchase relates to an item. If the line was created as a result of entering a purchase order number in the field "Purchase Order No." in the card part (and a packing slip number in the field "Packing Slip No."), Maconomy suggests the value from the field "Item No" on the corresponding purchase order line.</p> <p>Maconomy checks that the item exists, and that it is not blocked. If you enter a number here, you must leave the fields "Job No.," "Account No.," and "Act. No." blank.</p> <p>If the line was created as a result of specifying a purchase order and a packing slip on the invoice in the card part, and the packing slip number matches an approved item receipt for the purchase order in question, Maconomy will perform an invoice reconciliation of the invoice against the item receipt. This will cause Maconomy to automatically adjust the cost price of the item if the system parameter "Copy Payment Information From Reference Invoice" has been marked. However, the reconciliation only takes place if the difference between the amount on the current line and the amount on the receipt line on which the current line is based is within the margin specified in the system parameter "Margin for purchase order reconciliation." If this is not the case, or if the packing slip number does not match any receipt for the specified purchase order, the reconciliation must be done manually.</p>
<b>Total for Subcontractor Reconciliation</b>	<p>The amount in the field represents the sum of the amounts from Job Entries that are selected for a specific Invoice Allocation Line in the dialog Vendor Subcontractor Reconciliation.</p>
<b>Tax Code</b>	<p>In this field, you can specify a G/L tax code to apply to the current allocation line. Maconomy suggests a G/L tax code for tax receivable. You can select another code or leave the field blank if no tax applies to the invoice.</p> <p>Maconomy suggests a tax code on the basis of the following procedure:</p> <p>If a G/L tax table has been specified in the window Company Information, a G/L tax code will be transferred from the G/L tax table on the basis of the information registered on the current invoice and invoice allocation line.</p> <p>When searching for a line in the G/L tax table, Maconomy searches for a match between the value of the tax table line in the field "Account No." and a reference account depending on whether an account or an activity has been specified on the line or if the field "For Inventory Purch." has been marked. If no line is found in the G/L tax table corresponding to the current line's registrations and the current reference account, or if no G/L tax table has been specified for the current company, Maconomy will suggest the G/L tax code specified for the reference account in question in the window Account Information Card.</p> <p>As mentioned, the reference account depends on whether an account or an activity has been specified on the line or if the field "For Inventory Purch." has been marked. If you specify an account, the reference account will be the specified account. If you specify an activity, the reference account will be the account specified as P/L account on the current activity. If you specify an</p>

Field	Description
	<p>item and mark the field "For Inventory Purch.," the reference account will be the account specified as account for non-reconciled vendor entries in the A/P Control Account to which the current vendor is assigned. The references to these accounts are made by means of dimension combinations.</p> <p>You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters window. When multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2" and, if enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Tax</b>	<p>Enter the tax amount in the invoice currency. You can only enter an amount here if you have entered a tax code in the <b>Tax Code</b> field. The amounts in the <b>Amount Excl. Tax</b> field and this field must both be either positive or negative.</p> <p>If you change the suggested amount in the <b>Amount Excl. Tax</b> field, Maconomy calculates a new tax amount using the code in the <b>Tax Code</b> field.</p> <p>When you create an allocation line, a reallocation line, or change the amount excluding tax on an existing line, Maconomy calculates the amount in this field from the amount including or excluding tax. However, if the amount excluding tax entered on a given line causes the remainder excluding tax to be fully allocated, and the difference between the tax remainder and the calculated tax for the line in question is within the margin specified in the <b>Margin for automatic correction of tax</b> system parameter, Maconomy automatically allocates the tax remainder to this field on the line (rather than calculated from the amount excluding tax), regardless of whether this tax amount is correct according to the amount and tax code on the line.</p> <p>Note that you are not required to reallocate tax. You can change the price/tax ratio when reallocating. If the reallocated tax does not add up to the original tax, or if you use different accounts, Maconomy creates an appropriate number of tax entries to fully reconcile the original tax.</p> <p>If multiple tax codes are enabled, the <b>Tax</b> field is replaced by the <b>Tax Amount Total, Currency, Tax Amount 1, Currency, Tax Amount 2, Currency</b> fields, and if enabled, <b>Tax Amount 3, Currency</b> field. When enabled, the <b>Tax Amount Total, Currency</b> field shows the sum of values in the individual tax amount fields. For further information on multiple tax codes, please see the description in <b>Tax Codes</b>.</p>
<b>Amount Incl. Tax</b>	<p>This field shows the price less tax of the allocation or reallocation line in the currency of the vendor invoice. You can change the amount. Maconomy calculates the amount as quantity multiplied by the unit price less the tax and any discount. When you create a new allocation line, Maconomy</p>

Field	Description
	<p>suggests the amount from the <b>Remainder Excl. Tax</b> field in the Invoice Allocation tab.</p> <p>If you manually enter an amount in this field, Maconomy recalculates the unit price based on the total amount in this field. If you enter an amount in this field, Maconomy also updates the <b>Tax Amount</b> and <b>Amount Incl. Tax</b> fields based on the entered amount.</p>
<b>Item Tax Code</b>	<p>Specify an item tax code created in the Popup Fields single dialog workspace. Maconomy uses this field to determine the tax code to use in the calculation of tax for the current allocation or reallocation line, as the reporting code is part of the criteria for the selection of a G/L tax code in the G/L Tax Tables single dialog workspace in the G/L module. For further information, please see the description of the <b>Tax Code</b> field.</p> <p>To post entries, use the reporting code to determine which tax report entries to create. Based on the tax report entries, you can create tax reports that show the tax and tax basis entries assigned to a given tax report field. However, you can only use this kind of reporting if you selected the <b>Extended Tax Reporting</b> field in the System Information single dialog workspace.</p> <p>If you entered a purchase order number for the vendor invoice, Maconomy automatically creates allocation lines that correspond to the purchase order, and transfers the value from the <b>Reporting Code</b> field on each purchase order line to this field on the corresponding allocation lines.</p>
<b>Reference Date</b>	<p>Enter a reference date for the current allocation or reallocation line. Maconomy transfers the date to the G/L entries from the current line. If the current entry refers to a job, Maconomy checks that the date specified in this field is within the open posting period for job entries. Additionally, if you specify a job, Maconomy uses the date in this field as the job cost posting date on the job entries from the current allocation or reallocation line.</p> <p>If you do not enter a date in this field, Maconomy suggests the date entered in the <b>Reference Date</b> field in the Invoice Allocation tab. If this field is also blank, Maconomy transfers the entry date, reallocation date, or invoice date to this field, depending on the setting of the <b>Use Invoice Date as Reference Date</b> system parameter.</p>
<b>Registration Code</b>	<p>In this field, you can enter a registration code from the window Registration Codes in the G/L module. The registration code is used instead of manually entering a number of dimension values on the current line. See the description of the window Registration Codes for more information about registration codes.</p>
<b>Company No.</b>	<p>Enter the number of the company responsible for the current invoice allocation or reallocation line.</p> <p>Note that if a company other than the company displayed in the Vendor Invoices tab of the Vendor Invoices single dialog workspace is specified in Invoice Allocation Lines sub-tab of this workspace, intercompany postings</p>

Field	Description
	<p>between the responsible company on the vendor invoice and the specified company will take place at the time of posting.</p> <p>These intercompany postings will be of the Vendor Invoice type. However, if you do not select the <b>Create intercompany entries for companies with same parent company</b> system parameter, you can only create intercompany entries if the two companies involved are not both assigned to the same parent company.</p>
<b>Location</b>	<p>Enter a value for the dimension Location. If you do not manually enter a value, Maconomy derives a value using the order of priority set up in the Dimension Derivations single dialog workspace in the G/L module. However, any manually entered value is overwritten if Maconomy derives a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the <b>Location</b> field in the Invoice Allocation tab.</p> <p>Additionally, the information is used when you post the current reallocation line, if the G/L account permits dimension allocation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Allocation Code</b>	<p>In this field, you can enter an allocation code. You can use allocation codes created in the window Allocation Codes in the G/L module.</p> <p>When you enter an allocation code in this field, Maconomy automatically creates the number of allocation lines which the code specifies, the extended price is allocated to the lines in accordance with the allocation code, and this field will be blanked. You can thus use the same allocation code on vendor invoices and allocation lines several times. In this connection, it is recommended to use allocation codes containing positive percentages. Allocation codes are used for easing registration of standard entries.</p> <p>Note that if you have entered an account number in the field "Account No." on the line, and if an allocation code has been specified on the account in question, this allocation code will be inserted in this field and hence used for allocation of the line in question.</p>
<b>Employee Name</b>	This is the name of the employee entered in the field "Empl. No."

Field	Description
<b>Job Name</b>	This is the name of the job entered in the field "Job No."
<b>Task Description</b>	This field contains a description of the task specified in the "Task" field.
<b>Customer No., Ref.</b>	In this field, you can enter a reference to a customer. You can only specify a customer number if the purchase line type is G/L. When deriving dimension values for the current line, dimension values may be derived from the specified customer. For further information on this process, see the description of the field "Location No."
<b>Customer Name, Ref.</b>	If a customer has been specified in the field "Customer No., Ref." above, this field shows the name of the customer in question.
<b>Purch. Order No.</b>	<p>This field shows the purchase order number for invoice allocation lines created by entering a purchase order number in the Vendor Invoices single dialog workspace or in the Invoice Allocation tab. When you post the vendor invoice journal or the reallocation, Maconomy registers the line as invoiced on the corresponding purchase order line. However, if the entry is a vendor credit memo, Maconomy deducts the amount from the invoiced amount. The field is completed automatically if the invoice allocation lines are created as a result of entering a purchase order number on the vendor invoice specified in the Invoice Allocation tab.</p> <p>You can also enter the purchase order number when entering new invoice allocation lines. When doing so, this field, in combination with the <b>Line No.</b> field, indicates the purchase order line to which the allocation line pertains. If you do not enter a line number, Maconomy estimates the line number based on the allocation combination. If the allocation pertains to a specific item receipt, you can also enter the number of the packing slip representing the receipt in the <b>Packing Slip No.</b> field.</p> <p>If you only specify a purchase order number and line number without specifying a packing slip, Maconomy suggests a quantity on the line, based on the information from the purchase order line in question. The quantity on the line corresponds to the quantity received for the purchase line in the Purchase Receipt single dialog workspace. However, if you do not select the <b>Suggest Quantity Received on Vendor Invoice</b> system parameter and the quantity received on the purchase order line is zero, the quantity transferred to the allocation line will be the quantity remaining to be invoiced for the purchase line.</p> <p>If you specify a packing slip number in the <b>Packing Slip No.</b> field that matches a packing slip number entered in the Purchase Receipt single dialog workspace for the purchase order in question, the amount and quantity matches those received on the item receipt (any delivery costs and expense percentages specified on the purchase order will be added to the price), and the <b>For Inventory Purchase</b> field is selected.</p>

Field	Description
<b>Purchase Order Line No.</b>	<p>This field shows the number of the purchase order line on which the amount is registered as invoiced, when the vendor invoice journal or the reallocation is posted. However, if the entry is a vendor credit memo, Maconomy deducts the amount from the invoiced amount. The field is automatically completed if the invoice allocation lines are created by entering a purchase order on the vendor invoice displayed in the Invoice Allocation tab.</p> <p>You can also enter the line number when you enter new invoice allocation lines. For further information, see the <b>Purchase Order No.</b> field.</p>
<b>Close Purchase Order Line</b>	<p>If you mark this field, the purchase order line will be closed when the journal is posted. If this means that all the purchase order lines are closed, the purchase order itself will also be closed.</p>
<b>Packing Slip No.</b>	<p>if the current line was created as a result of entering a purchase order number and a packing slip number on the vendor invoice displayed in the card part, this field shows the number of the packing slip in question.</p>
<b>Inventory Change Transaction No.</b>	<p>If you created the current line as a result of entering a purchase order number and a packing slip number on the vendor invoice displayed on the Invoice Allocation tab, this field shows the number of the inventory change transaction resulting from the approval of the purchase receipt to which the packing slip in question pertains. As allocation and reallocation lines created by entering a purchase order and packing slip number are based on inventory change transactions, this field shows the number of the inventory change transaction that contains the transaction line on which the current allocation line is based.</p>
<b>Inventory Change Transaction Line No.</b>	<p>If you created the current line as a result of entering a purchase order number and a packing slip number on the vendor invoice displayed on the Invoice Allocation tab, this field shows the number of the inventory change transaction line on which the current allocation line is based. As allocation and reallocation lines created by entering a purchase order and packing slip number are based on inventory change transactions, this field thus shows the number of the line in the table part of the inventory change transaction shown in the <b>Inventory Change Transaction No.</b> field on which the current allocation line is based.</p>
<b>Quantity 1-2</b>	<p>I Register an allocation line or reallocation line quantity. Use these fields for reports and statistics.</p>
<b>Tax Exempt</b>	<p>In this field you can enter whether the invoice line covers a tax-exempt service. Note that you can only mark this field if the field "Disclosable" in the island Invoice in this window has been marked. See the description of the field "Disclosable" in the card part of the window for further information on this field.</p>
<b>Accrual Type</b>	<p>If you select a value in this field, the cost will be accrued. You can only accrue a posting if a G/L account or job has been selected.</p> <p>If you select accrual, Maconomy will create a G/L entry on the specified G/L account or job for each G/L period specified in the fields "Period From, Accrual" and "Period To, Accrual." If you have specified an account number</p>

Field	Description
	<p>on the line, the accrual entries are posted to the account in question. If you have specified a job and not an account, the accrual entries are posted to the relevant, accrual related posting references on the activity in question or in the window Posting References, depending on whether the field "Post by Activity" is marked in the window System Information.</p> <p>The offset entries are posted to the accounts referenced for the selected accrual type in the window Popup Fields. The amount is distributed evenly on the selected periods. For accruals made on job entries, both cost and billing prices are accrued.</p>
<b>Period From, Accrual</b>	<p>In this field and the field "Period To, Accrual" you can enter a range of dates. If you select a value in the field "Accrual Type" above, Maconomy will create a G/L entry on the specified G/L account for each G/L period specified in the fields "Period From, Accrual" and "Period To, Accrual." The amount is distributed evenly on the selected periods.</p> <p>Please note that the last period must be no later than the accrual ending period set up in the field "Accrual Period, Ending" in the Posting Periods. If no ending period has been specified there, the ending period set up in the corresponding field in the window Posting Periods applies instead. If an ending period has been set up in the Posting Periods window, you can specify any period in the field "Period To, Accrual."</p>
<b>Period To, Accrual</b>	See the "Period From, Accrual" field above.
<b>Transaction Type</b>	Enter the transaction type for the entry.
<b>Parent Invoice Allocation Instance Key</b>	<p>When you use the <b>Allocate Subcontractor Differences</b> action in the the Vendor Invoices workspace, Maconomy automatically assigns a value to this field on the original invoice allocation line. The new invoice allocation lines (created as a result of using the action) are then able to refer to the original invoice allocation line.</p> <p>This field is not displayed by default.</p>

## Vendor Invoice Asset Drafts Workspace

Use this workspace to enter information about fixed assets, if an invoice allocation line is related to the purchase of a fixed asset.

In this case, Maconomy creates the fixed assets when the vendor invoice is posted.

## Allocation Tab

This section includes the fields and descriptions for the Allocation tab.

### Vendor Island

Field	Description
<b>Vendor No.</b>	This field displays the vendor number.
<b>Purchase Line Type</b>	This field displays the purchase line type.
<b>Fixed Asset Created</b>	This field displays whether a fixed asset is created for the vendor invoice.

### Invoice Island

Field	Description
<b>Trans. No.</b>	This field displays the transaction number.
<b>Transaction Type</b>	This field displays the transaction type.
<b>Invoice No.</b>	This field displays the invoice number.
<b>Invoice Date</b>	This field displays the invoice date.
<b>Vendor Invoice Type</b>	This field displays the type of vendor invoice.
<b>Entry Description</b>	This field displays the description for the invoice allocation line.
<b>Reference Date</b>	This field displays the reference date.

### Company Island

Field	Description
<b>Company</b>	This field displays the number of the company.

### Account Island

Field	Description
<b>Account</b>	This field displays the account number.

**Job Island**

Field	Description
<b>Job</b>	This field displays the job name.
<b>Activity</b>	This field displays the activity name.
<b>Task</b>	This field displays the task name.
<b>Employee</b>	This field displays the employee name.

**Item Island**

Field	Description
<b>Item</b>	This field displays the item name.

**Purchase Order Island**

Field	Description
<b>Purch. Order No.</b>	This field displays the purchase order number.
<b>Close Purchase Order Line</b>	If you select this field, the purchase order line will be closed when the journal is posted. If closing this purchase order line means that all the purchase order lines are now closed, the purchase order itself will also be closed.

**Accrual Island**

Field	Description
<b>Accrual Type</b>	This field displays the accrual type.
<b>Period From, Accrual</b>	This field displays the date on which the accrual started.
<b>Period To, Accrual</b>	This field displays the date on which the accrual ended.

**Pay to Vendor Island**

Field	Description
<b>Pay to Vendor No.</b>	This field displays the number used to pay the vendor.

### Allocated Amount Island

Field	Description
<b>Quantity</b>	This field displays the quantity.
<b>Unit</b>	This field displays the unit.
<b>Pricing Unit</b>	This field displays the pricing unit.
<b>Unit Price</b>	This field displays the price per unit.
<b>Discount</b>	This field displays any applicable discount.
<b>Amount Excl. Tax</b>	This field displays the amount excluding tax.
<b>Tax</b>	This field displays the tax amount.
<b>Amount Incl. Tax</b>	This field displays the amount including tax.
<b>Quantity 1</b>	This field displays the quantity 1.
<b>Quantity 2</b>	This field displays the quantity 2.

### Tax Island

Field	Description
<b>Tax Code</b>	This field displays the tax code.
<b>Item Tax Code</b>	This field displays the item tax code.
<b>Tax Exempt</b>	This field specifies whether or not the item is exempt from tax.

### Status Island

Field	Description
<b>Posted</b>	This field specifies whether or not the vendor invoice has been posted.
<b>Reopened</b>	This field specifies whether or not the vendor invoice has been reopened.

Field	Description
<b>Reallocation Entry</b>	The field specifies whether or not the invoice allocation line has been reallocated.

### Asset Draft Sub-Tab

This section includes the fields and descriptions for the Asset Draft sub-tab.

Field	Description
<b>Asset Group</b>	If Asset Number is filled, Asset Group will be automatically filled in. If no Asset Number is given, Asset Group is mandatory.
<b>Asset Sub Group</b>	Use this field to enter an asset sub-group. This allows you to work with a sub-division of the traditional asset groups.
<b>Asset Transaction Type</b>	<p>One of the following:</p> <ul style="list-style-type: none"> <li>▪ Acquisition: <ul style="list-style-type: none"> <li>▪ You will need to enter Asset Group. The other fields are filled in, but can be changed.</li> </ul> </li> <li>▪ Improvement: <ul style="list-style-type: none"> <li>▪ Asset Number is mandatory.</li> <li>▪ Quantity=1.</li> <li>▪ Only the fields that also occur in Asset Entries are editable, except Asset Group that follows the asset number.</li> </ul> </li> <li>▪ Write-Down: <ul style="list-style-type: none"> <li>▪ This means the vendor invoice is a credit memo.</li> <li>▪ Quantity=1.</li> </ul> </li> </ul> <p>Asset Number is mandatory.</p>
<b>Number of Assets</b>	The number of assets to be created, only available when Asset Transaction Type is Acquisition.
<b>Employee No.</b>	This field displays the employee number if an employee number is selected.
<b>Asset No.</b>	This field is mandatory if adjustment is to an existing fixed asset; otherwise it is left blank.
<b>Description</b>	This field displays the description of the asset.
<b>Cost, Currency</b>	This field displays the acquisition price for the asset.

Field	Description
<b>Cost, Base</b>	The field displays the acquisition price for the asset in base currency
<b>Acquired</b>	This field displays the asset acquisition date.
<b>Acquisition Responsible</b>	This field displays the name of the person responsible for the asset acquisition.
<b>Depreciation Method</b>	This field displays the depreciation method used.
<b>Depreciation Period</b>	This field displays the depreciation period.
<b>Post Depreciation as Job Entry</b>	When depreciating an asset, if this value is set, a job entry is posted. When the asset draft is created it gets the value from the asset group. You can edit this field.
<b>Job No.</b>	The asset that is created gets this job number if the asset transaction type is acquisition and no asset number is on the asset draft. This field is read-only.
<b>Activity</b>	The asset that is created gets this activity if the asset transaction type is acquisition and no asset number is on the asset draft. This field is read-only.
<b>Task Name</b>	The asset that is created gets this task if the asset transaction type is acquisition and no asset number is on the asset draft. This field is read-only.
<b>Model</b>	This field displays the asset model.
<b>Located</b>	This field displays the location of the asset.
<b>Responsible</b>	This field displays the person responsible for the asset draft.
<b>Serial No.</b>	This field displays the asset serial number.
<b>Internal Serial No.</b>	This field displays the asset internal serial number.
<b>Manual Depreciation</b>	This field displays the manual depreciation.
<b>Company No.</b>	This field displays the company number.
<b>Location</b>	This field displays the value that you entered for the dimension Location.

Field	Description
<b>Entity</b>	This field displays the value that you entered for the dimension Entity.
<b>Project</b>	This field displays the value that you entered for the dimension Project.
<b>Purpose</b>	This field displays the value that you entered for the dimension Purpose.
<b>Spec. 1–10</b>	This field displays the value that you entered for the dimensions Spec. 1–10.
<b>Local Spec. 1–10</b>	This field displays the value that you entered for the dimensions Local Spec. 1–10.
<b>Technical Data 1–3</b>	These fields display any technical data relating to the asset acquisition.
<b>Remarks 1–10</b>	These fields display any remarks relating to the asset draft.

## Approve Invoices Workspace

Use this workspace to approve vendor invoices.

A vendor invoice must be approved before it can be paid. If you want Maconomy to approve a vendor's invoices automatically, select the **Auto. Approval** field in the Payment Control workspace.

A vendor invoice must be approved before it can be paid in the Change Payment Selection workspace by Vendor or in the Change Payment Selection workspace in the Banking module. You use this workspace only for approving invoices.

If you want Maconomy to approve invoices automatically, you must select the **Auto. Approval** field in the Payment Control workspace. Vendor invoices from the current vendor are then automatically approved for payment. You can manually cancel the approval of payment in this workspace.

### Approve Invoices Tab

This section includes the fields and descriptions for the Approve Invoices Tab.

#### Vendor Island

Field	Description
<b>Vendor No.</b>	This field shows the number of the currently selected vendor. The field also shows the vendor's name and address. The information is retrieved from the Vendor Information Card.
<b>Attn.</b>	This is the vendor's attention person; the person to whom shipping and payment information is directed. The information is retrieved from the Vendor Information Card.

Field	Description
<b>Phone</b>	This is the vendor's phone number. The information is retrieved from the Vendor Information Card.
<b>Fax</b>	This is the vendor's fax number. The information is retrieved from the Vendor Information Card.
<b>Telex</b>	This is the vendor's telex number. The information is retrieved from the Vendor Information Card.
<b>Currency</b>	This is the currency of the invoice or credit memo. The currency is used when converting the invoice amount into the base currency of the current company and the vendor's standard currency.

**Balance Island**

Field	Description
<b>Balance, Standard</b>	This is the vendor's balance in the standard currency. The balance is updated when you post journals with vendor entries. The field updated automatically.
<b>Balance, Base</b>	This is the vendor's balance in the base currency. The balance is updated when you post journals with vendor entries. The field is updated automatically.

**Control Island**

Field	Description
<b>Block Payments</b>	<p>This field shows whether the vendor is blocked for payment. If the field is marked, the vendor is blocked.</p> <p>You can block payments if, for example, you wish to delay payment for a wrong delivery until it is corrected.</p> <p>You block and unblock vendors in the window Payment Control.</p>
<b>Responsible</b>	This is the employee responsible for approving invoices from the vendor. The name is for reference, and is used to sort lists of non-approved vendor invoices.
<b>Invoice Discount %</b>	<p>This is the percentage rate discount you normally receive on invoices from the vendor.</p> <p>You can enter the actual invoice discount amount on the item purchase order, instead of a percentage.</p>
<b>Payment Mode</b>	<p>This field shows how you normally pay the vendor. It is selected in the window Payment Control.</p> <p>When you approve the invoice, the payment mode points out the G/L account against which the payment is set off.</p>

Field	Description
<b>Payment Terms</b>	These are the payment terms which normally apply to the vendor. Payment terms are used to calculate invoice due dates. Invoices are entered and changed in the window Vendor Invoices.
<b>Buyer</b>	The buyer is responsible for contact with and purchases from the vendor.

### Company Island

Field	Description
<b>Company No.</b>	This field displays the company number of the current vendor.
<b>Name</b>	This field displays the company name of the current vendor.
<b>Base Currency</b>	This field displays which currency is used as base currency in the company specified in the field "Company No." above. For a detailed description of the concepts of base currency and enterprise currency, see the description of the field "Base Currency" in the window Company Information in the G/L module.

### Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Invoice Date</b>	This is the vendor's invoice date. Together with the vendor's payment terms, the invoice date is used to calculate the invoice due date. Maconomy retrieves the date from the vendor invoice or from an entry in the window General Journal in the G/L module.
<b>Due Date</b>	This is the entry's due date. The due date is calculated from the invoice date and the payment terms. Maconomy retrieves the date from the vendor invoice.
<b>Pay when Paid</b>	This field shows whether payment when paid applies to the invoice in question. For further information, see the description of the corresponding field in the window Change Payment Selection by Vendor.  Ready For Payment This field shows whether the current entry is ready for payment. For further information, see the description of the corresponding field in the window Change Payment Selection by Vendor.
<b>Description</b>	This is the entry text. The text is shown on the payment entry. It is retrieved from the vendor invoice.
<b>Trans. No.</b>	This is the transaction number of the entry. It is retrieved from the vendor invoice.

Field	Description
	When the entry is paid, this number is not the one shown on the payment. Maconomy allocates a unique payment transaction number. These numbers are maintained in the window System Numbers in the Set-Up module.
<b>Trans. Type</b>	This field shows the transaction type of the entry.
<b>Invoice No.</b>	This is the vendor's invoice number. It is retrieved from the vendor invoice entered in the window Vendor Invoice.
<b>Debit, Standard</b>	These is the debit entry amount. Maconomy retrieves the amount from the vendor invoice or from an entry in the window General Journal in the G/L module.
<b>Credit, Standard</b>	These is the credit entry amount. Maconomy retrieves the amount from the vendor invoice or from an entry in the window General Journal in the G/L module.
<b>Approved Amount, Standard</b>	This field specifies the amount approved for payment. If this amount is different from the total invoiced amount, then only the approved amount can be paid.
<b>Approved</b>	<p>In this field, you approve the invoice. An entry must be approved before it can be selected for payment.</p> <p>A vendor invoice can be approved for payment either by approving the whole invoice at once in this window or by approving the individual invoice allocation lines in the window Approval Lists. If the full invoice is approved at once, the approval is transferred to all the invoice allocation lines. If the approval is removed, and the invoice is selected for payment or reconciliation, the payment or reconciliation will be canceled at the line level, and the amount for payment or reconciliation will be reset.</p> <p>The lines are approved automatically if the field "Auto. Approval" in the vendor's Payment Control window is marked. As mentioned you can remove the mark here.</p>
<b>Approved By</b>	This field shows the name of approver for the vendor entry.
<b>Approval Date</b>	This field shows the approval date for the vendor entry.
<b>Entry Date</b>	This is the entry date in the general ledger and accounts payable. The date identifies the posting period.
<b>Amount, Original</b>	This is the original invoice amount expressed in the entry's original currency.
<b>Original Currency</b>	This is the currency in which the invoice was registered (the entry's original currency).

Field	Description
<b>Entry Type</b>	<p>This field shows where the entry originated. The entry can be from a vendor invoice journal or from a general journal. The following types exist:</p> <ul style="list-style-type: none"> <li>▪ Vendor Invoice — A vendor invoice registered in the window Vendor Invoices.</li> <li>▪ Vendor Credit Memo — A vendor credit memo registered in the window Vendor Invoices.</li> <li>▪ Credit Journal — A credit entry registered in the window General Journal in the G/L module.</li> <li>▪ Debit Journal — A debit entry registered in the window General Journal in the G/L module.</li> </ul>
<b>Responsible</b>	<p>This field displays the number of the employee responsible for the current invoice. You can change the contents of the field.</p>

## Approval Lists Workspace

Use this workspace to approve or defer for payment the individual invoice allocation lines on a vendor invoice that has been allocated and posted.

Alternatively, use the Approve Invoices workspace to approve invoices as a whole.

You allocate invoice lines in the Invoice Allocation workspace or the Reallocate Invoices workspace. You can approve credit memo lines individually in a similar way.

When you have approved all of the allocation lines that belong to the same invoice, Maconomy sees the whole invoice as having been approved. You can approve invoices as a whole in the Approve Invoices workspace.

You can either select invoice allocation lines as approved or with a deferment cause that indicates that the line cannot immediately be approved by the holder of approval. Such deferred lines can be approved later, for example, when a credit memo is entered that corresponds to the deferred line. In this case both the credit memo and the previously rejected invoice line must be flagged as approved.

The tab of this workspace consists of selection criteria for specifying the sub-tab lines that you want to display. You can display all finished (approved) invoice lines per holder of approval and opt to leave out deferred lines.

In the Print Approval List workspace you can print a list of nonapproved invoices or invoice lines per holder of approval.

## Approval Lists Tab

This section includes the fields and descriptions for the Approval Lists tab.

## Selection Criteria Island

Field	Description
<b>List No.</b>	<p>If you enter a list number in this field, those vendor invoice lines that are attached to the specified list are displayed in the table part of this window. Invoice lines can be attached to a list in the Print Approval List by checking the "Create List" box. You can fill in this field if you wish to recreate the image of a printed approval list in order to enter the result of manually created invoice lines.</p> <p>Note that an invoice line is only attached to a list if you select the "Detailed" layout in the window Print Approval List.</p>
<b>Responsible</b>	If you enter the employee number of a holder of approval in this field, those vendor invoice lines that are attached to the specified employee number are displayed. Holders of approval are created in the window of that name.
<b>Company No.</b>	If you enter a company number, those vendor invoice lines that are attached to the specified company are displayed.
<b>Vendor No.</b>	If you enter a vendor number, those vendor invoice lines that are attached to the specified vendor are displayed. You can use this field to get an overview of the balance of a certain vendor.
<b>Vendor Invoice No.</b>	This field is used in conjunction with the field "Vendor No." to display the invoice lines attached to the specified vendor invoice.
<b>Deferment Cause</b>	Use this field to choose between any created deferment causes. These are created in the window Popup Fields in the Set-Up module, and are used if an invoice line cannot be approved as a consequence of the cause stated.
<b>Exclude Postponed</b>	If you check this box, invoice lines marked with a deferment cause are excluded.
<b>Show Closed</b>	If you check this box, invoice lines already approved with the "Approve for Payment" action are included.
<b>Show Lines</b>	If you check this box, the lines matching the criteria specified in this island are shown in the table part of this window.

## Invoice Allocation Lines Sub-Tab

This section includes the fields and descriptions for the Invoice Allocation Lines sub-tab.

Field	Description
<b>Responsible</b>	This field displays the employee number of the holder of approval for the current vendor invoice line.
<b>Invoice No.</b>	This field displays the invoice or credit memo number of the vendor invoice or vendor credit memo to which the current line belongs.
<b>Invoice Date</b>	This field displays the invoice date of the current line.
<b>Vendor No.</b>	This field displays the number of the vendor attached to the current invoice line.
<b>Trans. No.</b>	This field displays the transaction number derived from the current invoice line.
<b>Trans. Type</b>	This field displays the transaction type derived from the current invoice line.
<b>Entry Description</b>	This field displays the posting text entered for the current line in the window Invoice Allocation.
<b>Debit</b>	If a vendor invoice is entered, this field will contain the amount from the invoice allocation line.
<b>Credit</b>	If a vendor credit memo is entered, this field will contain the amount from the invoice allocation line.
<b>Approve</b>	If you check this field, the current invoice line will be approved when you select the action "Approve for Payment." When you select this action, the lines marked as approved will disappear from this window. Those lines may however be displayed again if you check the "Show Closed" box in the card part of the window and press enter.
<b>Deferment Cause</b>	In this field you can select a deferment cause for the current line if it cannot be approved immediately. Deferment causes are created in the window Popup Fields in the Set-Up module.
<b>List No.</b>	This field displays the list number created when the approval list is printed in the window Print Approval List. Approval lists are typically printed with a view to manual approval of the invoice lines by the responsible approval holder. For further details see the description of the field in the card part of this window and the description of the window Print Approval List.
<b>Closed</b>	When you select the "Approve for Payment" action, this field is marked for the lines which are approved. The lines disappear upon approval, but may be redisplayed if you check the "Show Closed" box in the card part of the window and press enter.
<b>Remarks</b>	In this field you can enter a remark regarding the current invoice line. You may, for example, enter additional remarks to a line which is deferred.

Field	Description
<b>Pay to Vend. No.</b>	This field displays a pay to vendor number if payment of a vendor invoice goes to another vendor than the vendor who delivered the goods.
<b>Account No.</b>	This field displays the account number which may be specified in the corresponding line in the window Invoice Allocation.
<b>Company No.</b>	This field displays the number of the company displayed in the card part of the window Vendor Invoices.
<b>Location</b>	See the description of the field "Account No." above.
<b>Entity</b>	See the description of the field "Account No." above.
<b>Project</b>	See the description of the field "Account No." above.
<b>Purpose</b>	See the description of the field "Account No." above.
<b>Spec. 1-3</b>	See the description of the field "Account No." above.
<b>Local Spec. 1-3</b>	See the description of the field "Account No." above.

## Actions

This section shows the Actions available in the Approval Lists workspace.

### Top Tab

Field	Description
<b>Approve for Payment</b>	When you select this action, invoice lines having a mark in the field "Approve" will be approved. When you approve all invoice lines for a given vendor invoice, selection of this action corresponds to marking the field "Approved" in the window Approve Invoices.
<b>Approve All</b>	When you select this action, all invoice lines are approved.

## Invoice Reconciliation Workspace

Use this workspace to reconcile vendor invoices with the packing slips that accompany received items.

Use the Invoice Control workspace instead if a packing slip does not match a vendor invoice, or if you need to reconcile part of a packing slip with an invoice or part of an invoice with a packing slip.

If you want to specify another reconciliation, for example, if a cost price difference has occurred, you can use the Invoice Control workspace. You can also use the Invoice Control workspace if you only want to reconcile part of a packing slip with an invoice or part of an invoice with a packing slip.

When you post vendor invoices for warehouse items, and when you approve item receipts, Maconomy creates an entry in the sub-tab of this workspace for the vendor that is involved. These entries are called purchase transactions, regardless of whether they come from the Accounts Payable module or the Item Purchase module.

This reconciliation is related to the way that Maconomy handles inventory value in the general ledger. Maconomy checks that the value in the warehouse is always the same as the posted value in the general ledger. Since items are typically received in the warehouse before they are posted to the general ledger, Maconomy also separates the update of the inventory value account and the vendor control account.

When you approve item receipts in the Item Purchase module and in the Purchase Receipt workspace in this module, Maconomy debits the inventory value account and credits the account for unreconciled entries. When you later enter the vendor invoice, Maconomy credits the shipment of items to the vendor control account and debits them to the account for unreconciled entries. This avoids any imbalances that can occur when items are delivered in one posting period and the corresponding vendor invoice is received in another.

Maconomy also accounts for potential differences between inventory value and invoice amounts. For example: You order items and estimate their inventory value to be 2,000 dollars (the base currency). You later receive a vendor invoice for 2,200 dollars. Hence, the inventory value is wrong and must be updated. The difference is posted to the account for cost price and quantity variance and to the account for unreconciled entries.

A persistently large balance for the account for cost price and quantity variance is a sign that you must adjust your cost prices. You do this in the Inventory Change workspace in the Inventory module.

You must always reconcile, regardless of whether the initial inventory value is identical to the invoice amount.

Note that if you select the **Aut. Appr. of Purchase Transactions** system parameter in the Set-Up module, Maconomy automatically reconciles vendor invoices against the corresponding purchase transactions. If you do not select this system parameter, you must perform the reconciliation manually in this workspace as described.

In the **Margin, Appr. of Purchase Transactions** system parameter in the Set-Up module you can specify the permissible size of the difference between a purchase transaction and a vendor invoice, so that Maconomy automatically approves the reconciliation. If the difference exceeds the allowed amount, you still perform the reallocation in this workspace. This workspace only allows you to select entries to be reconciled. You cannot change any information.

## Invoice Reconciliation Tab

This section includes the fields and descriptions for the Invoice Reconciliation tab.

### Vendor Island

Field	Description
<b>Vendor No.</b>	The vendor number is the sole and absolute identification of the vendor. The field also shows the first two lines of the vendor's name and address. The information is retrieved from the Vendor Information Card.

### Company Island

Field	Description
<b>Company No.</b>	This field displays the company number of the current vendor.
<b>Name</b>	This field displays the company name of the current vendor.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### Reconciliation Island

Field	Description
<b>Entry Date</b>	In this field, you can enter an entry date for the reconciliation in question. Maconomy suggests today's date as default, but the date can be changed manually. The date entered must be within the open posting period.

### Reconciled, Total (Base Currency/Enterprise Currency) Island

Field	Description
<b>Debit</b>	This is the debit total of the reconciled entries. The entries are reconciled in the base currency of the current company because they only affect G/L accounts. All G/L transactions are in the base currency of the current company. The field is updated when you press Return.
<b>Credit</b>	This is the credit total of the reconciled entries. The entries are reconciled in base currency of the current company because they only affect G/L accounts. All G/L transactions are in the base currency of the current company. The field is updated when you press Return.
<b>Cost Price Difference</b>	This field displays the sum of any cost price differences which have occurred when reconciling a packing slip with a vendor invoice. The cost price difference corresponds to the difference between the registered price and the price specified in the field "New Price" in a given item line in the window Invoice

Field	Description
	Control. Only cost price differences in item lines which are marked for approval in the window Invoice Control are included in the calculation.
<b>Total Difference</b>	<p>This is the difference between the debit and credit amounts. When the reconciled payments are approved, this balance is posted to the account for cost price and quantity variance. See also the introduction to the window.</p> <p>To approve the reconciliation, select the action "Approve Reconciled Payments."</p>

**Warehouse/Purchase Island**

Field	Description
<b>Responsible</b>	This is the employee responsible for approving invoices from the vendor. The name is for reference, and is used to sort lists of non-approved vendor invoices.
<b>Warehouse</b>	This is the warehouse to which items are normally delivered from the vendor. The information is retrieved from the Vendor Information Card.
<b>Control Account</b>	<p>The control account is a reference to two G/L accounts - a Vendor control account and an account for un-reconciled entries. The reference to these accounts is made by means of dimension combinations in the window Popup Fields in the Set-Up module.</p> <p>All vendor entries are posted to the General Ledger, to the accounts referred to in the control account code selected here. The accounts payable is thus a specification of Vendor control accounts in the General Ledger.</p> <p>The account for un-reconciled entries is explained in the introduction to the window.</p> <p>The control account reference is selected in the window Payment Control.</p>
<b>Department</b>	<p>This is the department which normally receives items from the vendor. The value is retrieved from the Vendor Information Card.</p> <p>The field "Department" is a reference to a G/L accounts for cash discounts and exchange rate differences. These imbalances can occur when you pay invoices. References to cash discounts and exchange rate differences are maintained in the window Posting References in the G/L module.</p> <p>Vendor Group This is the group the vendor belongs to. The information is used for statistics. The value is retrieved from the Vendor Information Card.</p>

## Purchase Transactions Sub-Tab

This section includes the fields and descriptions for the Purchase Transactions sub-tab.

Field	Description
<b>Type</b>	<p>This is the entry type. The entry can be a "Packing Slip," meaning that it was created as a result of receiving items in the Item Purchase or A/P module.</p> <p>The entry can also be an "Invoice" or a "Credit Memo," which was entered in the window Vendor Invoices.</p>
<b>Entry Date</b>	This is the entry date in the General Ledger. The entry date identifies the posting period.
<b>Trans. No.</b>	This is the entry's transaction number. If the entry is a vendor invoice, the transaction number was allocated when the invoice was entered. If the entry is a packing slip, the transaction number was allocated when item receipt was approved.
<b>Trans.Type</b>	This is the entry's transaction type.
<b>Description</b>	This is the entry text. The text was specified when the invoice was entered or item receipt approved.
<b>Debit, Base</b>	This is the entry debit amount. It is specified in the base currency of the current company. The amount is either from a vendor credit memo or item receipt.
<b>Credit, Base</b>	This field shows the entry credit amount, expressed in base currency of the current company. The amount is from a vendor invoice.
<b>Reconcile</b>	In this field, you specify whether the entry should be reconciled. If the field is checked, the entry is reconciled.
<b>Remainder, Base</b>	<p>If the window concerns a packing slip, the remainder value corresponds to the line price, calculated as "Quantity" x "New Price," for each of the item lines which are marked for approval in the window Invoice Control. A balance will only occur if a new cost price is specified.</p> <p>If the window concerns an invoice, Maconomy displays how much of the current invoice that remains to be reconciled. The value is transferred from the field "Balance" in the window Invoice Control. If no changes have been made in the window Invoice Control, Maconomy displays the full invoice amount in this field.</p>
<b>Inv. No./Purchase No.</b>	This field shows either the vendor invoice number or the item purchase order number, depending on where the entry originated. If the entry originates from a receipt registered in the window Purchase Receipt, the value is 0.
<b>Packing Slip No.</b>	This field shows the packing slip number which was entered when the vendor invoice was registered or when the item/purchase receipt was

Field	Description
	approved. You can use the number to determine which invoices are for which receipts.
<b>Invoice Date</b>	This field shows the vendor's invoice date. Together with the vendor's payment terms, the invoice date is used to calculate the invoice due date. The field is blank if the entry is from item receipt in the Item Purchase module.
<b>Amount, Original</b>	This field shows the original invoice amount expressed in the original currency.
<b>Original Currency</b>	This field shows the currency the invoice was originally entered in.
<b>Journal No.</b>	This field shows the number of the journal to which the entry was posted.
<b>Date Posted</b>	This field shows the date on which the entry was posted to the accounts payable and general ledger.

## Actions

This section shows the Actions available in the Invoice Reconciliation workspace.

### Top Tab

Field	Description
<b>Approve Reconciliation</b>	<p>Select this action to record the reconciliation. Reconciled entries will not be shown next time you open the window. If you wish to make further specifications, you can do this in the window Invoice Control.</p> <p>A transaction number is assigned to reconciled entries. The number is transferred from the system number "Vendor Invoice Reconciliation," which can be defined in the window System Numbers. The number is used as a reference to reconciliation journals and future printouts of these.</p> <p>If the reconciliation has an imbalance, the registered cost price of the items is not correct, and the inventory value should be adjusted.</p> <p>Maconomy therefore enters the difference to the account for unreconciled vendor entries (given by means of a dimension combination in the vendor's control account code) and to the account for invoice reconciliation differences (given by means of a dimension combination on the warehouse information card).</p> <p>If a cost price has been specified in the window Invoice Control which is different from the existing cost price, a cost price adjustment will be made for the item lines which are marked for approval in the window Invoice Control. However, a cost price adjustment will only be made for an item if the quantity of items specified is in stock at the time when the cost price adjustment is performed. If a price list applies, the price will be updated in the price list as well.</p>

Field	Description
	A vendor invoice can reconcile several packing slips. If this produces a difference, it will be allocated proportionally to the inventories they involve. A difference can therefore result in a number of entries to several accounts for invoice reconciliation differences.

## Invoice Control Workspace

If a packing slip does not match a vendor invoice in the Invoice Reconciliation workspace, use the Invoice Control workspace to address the problem (for example, by making a price adjustment).

You can also use this workspace to reconcile part of a packing slip with an invoice or part of an invoice with a packing slip.

Use this workspace when there is a difference between an entered vendor invoice and an item receipt related to invoice reconciliation in the Invoice Reconciliation workspace.

You might want to perform a partial reconciliation of an invoice or a packing slip. If you are working with a packing slip, the sub-tab displays item lines, showing how many items were received and at what price. If you are working with an invoice, the sub-tab is empty.

The tab of this workspace displays information about the current invoice or packing slip. The sub-tab displays the information that you might need to update so that the difference can be reconciled. A difference can occur if a shipment of goods is received at a higher price than anticipated, for example, if the vendor has marked up the price since the last shipment. If you want to perform a cost price adjustment in the sub-tab, and you want the new price to be used when making future purchases, you specify a purchase price list for the current line in the sub-tab. This ensures that the price at step 1 of the specified purchase price list is updated with the new price.

### Invoice Control Tab

This section includes the fields and descriptions for the Invoice Control tab.

#### Vendor Island

Field	Description
<b>Vendor</b>	This field displays the number of the vendor. The remaining fields display the vendor's name and address.
<b>Price List</b>	This field displays which purchase price list is used with the current vendor.

#### Company Island

Field	Description
<b>Company No.</b>	This field displays the company number and name of the current vendor.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in

Field	Description
	the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

**Invoice/Packing Slip, Base**

Field	Description
<b>Inv. No./Purch. No.</b>	This field displays the number of the current vendor invoice or the number of the item purchase order from which the current packing slip derives. If the packing slip derives from a receipt registered in the window Purchase Receipt, the value is 0.
<b>Entry Date</b>	This field displays the date upon which the current invoice or packing slip is posted.
<b>Trans. No.</b>	This field displays the transaction number which is used in the window Invoice Reconciliation to refer to the current invoice or packing slip.
<b>Trans. Type</b>	This field shows the transaction type of the current invoice or packing slip.
<b>Debit</b>	This field displays the debit amount of the current invoice or packing slip.
<b>Credit</b>	This field displays the credit amount of the current invoice or packing slip.
<b>Balance</b>	<p>If the window concerns a packing slip, the balance corresponds to the line price, calculated as "Quantity" x "New Price," for each of the item lines which are marked for approval. A balance will only occur if a new cost price is specified. In this case the value in this field cannot be changed.</p> <p>If the window concerns an invoice, the field can be changed. You can specify how great a part of the invoice should be reconciled at the invoice reconciliation. By default Maconomy displays the amount that remains to be reconciled on the current invoice.</p>
<b>Cost Price Difference</b>	This field displays the difference between the item's registered price and any changed price. Differences are only displayed for item lines that are marked for approval.

**Inventory Changes Sub-Tab**

This section includes the fields and descriptions for the Inventory Changes sub-tab.

Field	Description
<b>Item No.</b>	This field displays the number of the current item.
<b>Quantity</b>	This field displays the number of items received.

Field	Description
<b>Description</b>	This field displays the description of the current item.
<b>Price</b>	This field displays the cost price used in the packing slip. This is the price at which the item is received.
<b>New Price</b>	If the registered price is not correct, you can specify a new cost price in this field.
<b>Extended Price</b>	This field displays the total price of the current item line. If a new price is specified, the price is calculated like this: "Quantity" x "New Price."
<b>Approve</b>	Check this field if you want the information entered on the current line to be approved when reconciliation is made in the window Invoice Reconciliation.
<b>Price List</b>	Use this field to select a purchase price list, so that the price at step 1 in this price list is overwritten by the new cost price specified in the field "New Price."
<b>Price Step 1</b>	This field displays the price at step 1. This price is initially retrieved from the purchase price list specified on the current line. If no price list is specified on the current line, but for the vendor displayed in the card part of this window, then the price from step one of this price list is retrieved. If no price list is specified, the item's latest cost price is displayed, retrieved from the field "Last" in the Costs island in the current item's information card.

## Requisitions Workspace

Use this workspace to create requisitions, which are internal requests for approval to purchase services.

The workspace also displays requisitions created from job budgets in the Job Cost module.

You can also use the workspace to generate one or more requests for price quotes from suppliers.

Requisitions, unlike purchase orders, do not represent a commitment to purchase and have no impact on commitment accounts.

A requisition is an internal request for the approval of the purchase of services. You can use this workspace to create requisitions that the person who is responsible for approving purchases can evaluate and approve. The person who is responsible for making the actual purchase can then, based on the input from the requisition, place the necessary orders with the relevant suppliers by means of a purchase order. It is important to distinguish between requisitions and purchase orders, because requisitions have no influence on commitment accounts and accruals and are intended for internal use. Only purchase orders affect commitment accounts.

This workspace also displays requisitions that you create from job budgets in the Job Cost module. This enables the person who is responsible for drawing up job budgets to start a purchase process from the Job Cost module, requesting certain services, and a purchaser can manage the actual purchase process in the A/P module. You do this by using the **Create Requisitions** action in the Job Budgets workspace in the Job Cost module. When you use this action, Maconomy creates a requisition for each vendor that is specified on the selected job budget lines, copying the selected budget lines to the relevant requisitions. Most of the information on requisitions that you create from job budgets is inherited from the job budget lines

in question, but you can edit it in this workspace. For more information about creating requisitions from job budgets, see the **Create Requisitions** action in the Job Cost module.

You can use a requisition as input for one or more requests for quote, for instance if you want to compare quotes from several suppliers before deciding on the best offer, or if you need to be able to document the choice of supplier, for example, if the requisition is made in connection with a job. After the requisition is approved, you can create a request for quote by specifying a supplier, a currency, and a deadline in the Create Request for Quote/Purchase Order island and using the **Create Request for Quote** action. This causes Maconomy to create a request for quote based on the information on the requisition. If you want quotes from several suppliers, you can repeat this procedure any number of times, each time specifying a different supplier. The person who is responsible for the purchase can then edit the individual requests in the Requests for Quote workspace, for instance if a given vendor is not expected to be able to supply all of the requested services. When the editing is complete, the requests for quote can be approved, printed, and sent to the relevant vendors. When you have selected a supplier, the relevant request for quote can in turn be converted to a purchase order. The processing of requests for quote is in the overview of the Requests for Quote workspace. If you need to change a requisition after you have created requests for quote from it, you can use the **Restore Requests for Quote** action to update all of the requests for quote created from the current requisition. However, you can only do this if no quotes have been received for any of these requests for quote.

You can also create a purchase order based on a requisition, thus skipping the step of quote requests. This is useful if you already know who should deliver the services that the requisition specifies. To create a purchase order from a requisition, enter a supplier and a currency in the Create Request for Quote/Purchase Order island and use the **Create Purchase Order** action. Maconomy then creates a purchase order that you can edit in the Purchase Orders workspace before you print it and send it to the supplier. For more information about purchase orders, see the overview of the Purchase Orders workspace.

In the tab, you enter basic information about dimensions, responsible company, and, if relevant, job. If you enter a job, note whether the **Allow purchase order for multiple jobs** system parameter is selected. If that parameter is not selected, you can only create requisition lines for the job that the tab in this workspace specifies. If that parameter is selected, you can enter different job numbers on the individual lines. Selecting this parameter ensures that all lines on a purchase order are assigned to the same job.

In the sub-tab, you enter the activities and tasks that represent the services for which purchases are requested. After you enter the correct information, you can submit the requisition as an indication that the person who is responsible for approving the requisition can start the approval procedure. Use the **Submit Requisition** action to do this. The requisition is then approved using the **Approve Requisition** action. When you are done creating requests for quote and purchase orders from the requisition, you can close the requisition using the **Close Requisition** action. However, when all requests for quote and purchase orders assigned to the current requisition are closed, the requisition is also closed automatically.

## Requisitions Tab

This section includes the fields and descriptions for the Requisitions tab.

## Requisition Island

Field	Description
<b>Requisition No.</b>	In this field you can enter a requisition number. If you do not enter a number, Maconomy will automatically insert a number from the "Requisition Numbers" number series. The number cannot be changed here, once the requisition has been created.
<b>Purchase Process Header</b>	This field shows the name and number of the purchase process of which the current requisition is part.
<b>Our Ref.</b>	In this field, enter the name of the reference person on the requisition. The name is printed on the requisition. This makes it possible for the purchase responsible to know whom to contact with matters concerning the requisition. Maconomy suggests the employee assigned to the user who created the requisition if an employee number has been specified for this user in the window Users. However, if you specify a vendor in the island Suggested Vendor, the field is overwritten by any value specified in the field "Our Ref." on the information card of the vendor in question.
<b>Requisitioner</b>	In this field, you can enter the number of the employee who requisitioned the items on the current requisition. Maconomy suggests the employee assigned to the user who created the requisition if an employee number has been specified for this user in the window Users. This field also shows the name of the specified requisitioner employee.
<b>Purchaser</b>	In this field, you can enter the number of the employee who is responsible for purchasing the items on the current requisition. This field also shows the name of the specified purchase employee.
<b>Time Unit</b>	In this field, you can specify the time unit. You can specify hours or days. If you specify a vendor, this field copies the value from the specified vendor's information. However, you can change the value up until a requisition line is created.

## Create Request for Quote/Purchase Order Island

Field	Description
<b>Vendor</b>	In this field, you can enter a vendor number to be used on the next request for quote or purchase order created from the current requisition using the actions "Create Request for Quote" and "Create Purchase Order." When you select one of these actions, the request for quote or purchase order created will be assigned the specified vendor number. If you want to create several requests for quote or purchase orders from the requisition, you can change the vendor number and select the relevant action any number of times. If you do not enter a vendor

Field	Description
	<p>number in this field, but a vendor has been specified in the island Suggested Vendor, the requests for quote or purchase orders are assigned to the suggested vendor instead.</p> <p>Please note that changes made to a requisition after the creation of requests for quote or purchase orders do not cause the assigned requests for quote or purchase orders to be updated accordingly. To update all requests for quote and purchase orders assigned to a requisition, select the action "Restore Requests for Quote."</p> <p>This field also shows the name of the specified vendor.</p>
<b>Currency</b>	<p>In this field, you can specify the currency to be used on the next request for quote or purchase order created using the actions "Create Request for Quote" and "Create Purchase Order." The currency is transferred to the field "Currency" in the card part of the request for quote or purchase order. If you specify a vendor in either of the islands Create Request for Quote/Purchase Order or Suggested Vendor, Maconomy transfers the currency of the vendor in question to this field. If you specify a vendor in both islands, the currency of the vendor in the island Create Request for Quote/Purchase Order is transferred, overwriting any manually specified value.</p>
<b>Deadline for Quote</b>	<p>In this field, you can specify a deadline to be used on the next request for quote created using the action "Create Request for Quote." The date is transferred to the field "Deadline" in the card part of the request for quote.</p>

### Job Island

Field	Description
<b>Job</b>	<p>In this field, you can specify a job if the requisition concerns a job.</p> <p>The job number can either be entered manually in this window or automatically by Maconomy if the requisition was created using the action "Create Requisition" in the window Job Budgets in the Job Cost module.</p> <p>If a job number has been specified in this field, it will automatically be suggested on the requisition lines created in the table part.</p> <p>If the system parameter "Allow purchase order for multiple jobs" has not been marked, the lines in the table part can only be assigned to the job specified in this field, and if this field is left blank, you cannot assign the requisition lines to a job. If the parameter has been marked, you can enter different job numbers on the requisition lines.</p> <p>If the system parameter has been marked, changing the job number in this field will not influence existing requisition lines. However, if the parameter has not been marked, the job number in this field must match the field "Job No." in the table part of this window.</p> <p>This field also shows the name of the specified job. The name is retrieved automatically from the Job Information Card window.</p>

Field	Description
<b>Customer</b>	This field shows the number of the customer assigned to the job specified in the field "Job No." above, if any. This field also shows the name of the specified customer.

### Company Island

Field	Description
<b>Company</b>	<p>In this field, you can enter the number of the company responsible for the requisition. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>See the section "Multiple Companies" in the "Introduction to the G/L Module" module and the window Intercompany Accounts in the G/L module for a further description of the concept of responsible companies and intercompany balances.</p> <p>This field also shows the name of the specified company.</p>

### Copying Island

Field	Description
<b>Requisition</b>	<p>When creating a requisition, you can specify the number of an existing requisition in this field. If you do so, the new requisition will be a copy of the specified requisition, causing all fields on the new requisition to be completed with the values from the requisition in question. However, fields in which you have manually specified values are not overwritten by copied values. In the table part, the lines from the requisition in question are also copied to the new requisition.</p> <p>If you also mark the field "Copy Requests for Quote" below, Maconomy also creates a copy of each request for quote assigned to the requisition being copied, and assigns the copies to the new requisition.</p>
<b>Copy Requests for Quote</b>	If you complete the field "Requisition" above when creating a requisition, you can specify in this field whether Maconomy should not only copy the specified requisition but also any requests for quote assigned to the requisition being copied. For further information, see the description of the field "Requisition" above.

### Purchase Process Access Level Island

Field	Description
<b>Name</b>	In this field you can specify the name of an access level to apply to the purchase process to which the current requisition is assigned. You only have access to the current purchase process and its requisition, requests for quote and purchase orders if you have been assigned to this level or a level above this in the window User Access Levels.

Field	Description
	<p>This access control ensures that in other windows, you can only refer to information relating to purchase processes to which you have access, and you can only see information about purchase processes to which you have access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to purchase processes and its requisition, requests for quote and purchase orders may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section “Introduction to the Access Control System” in the Set-Up module.</p> <p>If no access level is specified, all users have access to the current purchase process.</p>
<b>Description</b>	This field shows a description of the access level specified in the field “Name” above.

### User Island

See the “Getting Started” topic for a description of the fields in the island User.

### Remarks Island

Field	Description
<b>Remarks 1-10</b>	In these fields, you can enter any remarks you wish to make about the requisition. If the requisition is converted to a request for quote or purchase order, the remarks are transferred to the request for quote or purchase order in question.

### Delivery Island

Field	Description
<b>Pref. Delivery Date</b>	In this field, you can enter your preferred delivery date. Maconomy suggests today’s date. However, you can change or delete the date. The preferred delivery date is transferred to the corresponding field on the requests for quote and purchase orders created from the current requisition.

### Suggested Supplier Island

Field	Description
<b>Vendor</b>	In this field, you can enter the vendor number of the vendor who you suggest should supply the services on the current requisition. The person who is to carry out the actual purchase can use this information as input for the choice of supplier, although the field is only for information. If you do not enter a vendor number in the island Create Request for Quote/Purchase Order, but you enter a vendor in this field, the requests for quote or purchase orders created when using the actions “Create Request for Quote” and “Create Purchase Order” are assigned to this vendor.

Field	Description
	The other lines in this field show the vendor's name and address. Maconomy suggests the information from the Vendor Information Card, but you can change it.
<b>Attn.</b>	This field shows the vendor's attention person. Maconomy suggests the name from the vendor information card, but you can change it.
<b>Country</b>	This is the vendor's country. Maconomy suggests the vendor's state/country from the vendor information card, but you can change it.
<b>Phone</b>	This field shows the vendor's phone number. Maconomy suggests the number from the vendor information card, but you can change it.
<b>Fax</b>	This field shows the vendor's fax number. Maconomy suggests the number from the vendor information card, but you can change it.
<b>Telex</b>	This field shows the vendor's telex number. Maconomy suggests the number from the vendor information card, but you can change it.

### Dimensions Island

Field	Description
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, the standard value is transferred from the window System Parameters in the Set-Up module.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

**Status Island**

Field	Description
<b>Submitted</b>	This field displays whether the current requisition has been submitted. The field is automatically marked by Maconomy upon selecting the action "Submit Requisition" in the Action menu. You cannot mark the field manually.
<b>Approved</b>	<p>This field shows whether the current requisition has been approved. The field is automatically marked by Maconomy upon selecting the action "Approve Requisition."</p> <p>However, this approval will automatically be cancelled by Maconomy if one or more fields of importance to the value of the requisition, such as quantity, are changed. If the approval is cancelled, the requisition must be reapproved. Nevertheless, it is possible to change certain fields without cancelling the approval.</p>
<b>Closed</b>	This field shows whether the requisition is closed. To mark the field, select the action "Close Requisition" in the Action menu. A requisition is automatically closed when all requests for quote and purchase orders assigned to it have been closed. When the requisition has been closed, all fields are closed, and it is not possible to change any of the information on the requisition. The mark in this field can only be removed by using the action "Reopen Requisition" in the Action menu. You can only use this action if you have been given access to it in the window Actions in the Set-Up module.

**Requisition Lines Sub-Tab**

This section includes the fields and descriptions for the Requisition Lines sub-tab.

Field	Description
<b>Job No.</b>	<p>In this field, you can enter the number of a job in the Job Cost module if the requisition line concerns a job. Maconomy checks that the job exists, that it is on order, and that it is neither blocked nor closed. If you complete this field, you must complete the field "Activity No." and leave the field "Account No." blank.</p> <p>If the system parameter "Allow purchase order for multiple jobs" has not been marked, the lines in the table part can only be assigned to the job specified in the card part, and if no job has been specified in the card part, you cannot assign lines to a job number. If the parameter has been marked, you can enter different job numbers on the lines.</p>
<b>Job Name</b>	This field displays the name of the job specified in the field "Job No." on the line. The information is retrieved from the window Jobs and cannot be changed here.
<b>Activity No.</b>	<p>In this field, you enter the number of the activity in the Job Cost module representing the item or service that you wish to order.</p> <p>Maconomy checks that the activity number exists, that it is an amount activity and that it is not blocked.</p>

Field	Description
	If you have completed the field "Job No." in the card part of the window, you must enter an activity here and leave the field "Account No." blank.
<b>Empl. No.</b>	<p>In this field, you can enter the number of the employee assigned to the requisition line.</p> <p>If the job on the line uses employee control, you can only enter registrations for employees who appear in the latest revision of the planning budget of the current job. For more information about controlling employee registrations, please see the description of the field "Employee Control" in the window Jobs.</p>
<b>Account No.</b>	<p>In this field, you can enter an account number if the requisition line is for items or services which you are posting directly to profit and loss, and which do not pertain to a job in the Job Cost module. Maconomy checks that the account is an existing manual account and that it is not blocked.</p> <p>The field has no effect on the requisition, but if a purchase order is created from the requisition, the purchase is debited to the account when you enter the vendor invoice. For further information about the effects of account numbers on purchase orders, see the field "Account No."</p> <p>If you enter an account here, you cannot enter a job number in the field "Job No." in the card part or an activity in the field "Activity No." on the same line in the table.</p>
<b>Acct./Account Name</b>	This field shows either the account text of the G/L account specified in the field "Account No.," or the text assigned to the activity entered in the field "Act. No."
<b>Line Remarks</b>	In this field, you assign a text to the requisition line. It is printed on the requisition. Maconomy suggests the text from the field "Act./Account Name," but you can change it.
<b>Text Line</b>	If you mark this field, the line will be perceived as a text line if no entry has been made in either of the fields "Job No.," "Activity No.," or "Account No." on the current requisition line. Any text in the field "Line Remarks" will then be used as text and printed on the requisition.
<b>Fixed Asset Line</b>	Use this field to indicate if the line is a fixed asset line.
<b>Quantity</b>	In this field, you enter the quantity of services that you wish to order.
<b>Delivery Date</b>	In this field, you enter the delivery date on which you want the services to be delivered. Maconomy suggests today's date.
<b>Registration Code</b>	In this field you can enter a registration code from the window Registration Codes in the G/L module. The registration code is used instead of manually entering a number of dimension values on the current line. See the description of the window Registration Codes for more information about registration codes.

Field	Description
<b>Company No.</b>	When creating a requisition line, Maconomy suggests the company from the Dimension island in the card part of the window. If the current line is entered for another company than the one suggested, you can enter its number here.
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the field "Location" in the card part of the window.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Task</b>	If you have specified a job on the line, you can enter the task to which the purchase pertains here. If you enter a value in the field, Maconomy checks that a task list has been assigned to the job and that the list contains the specified task.
<b>Task Description</b>	This field displays the description of the task entered in the field "Task" on the current reallocation line.
<b>Job Budget Line No.</b>	If the current line was created from a job budget line, this field shows the number of the budget line in question.
<b>Job Budget Line WBS Description</b>	This field summarizes the placement of the job budget lines in the job budget WBS (work breakdown structure).
<b>Employee Name</b>	This field displays the name of the employee specified in the field "Empl. No."
<b>Note No.</b>	If a standard note has been specified for either the task or the activity entered on the line, a copy of the standard note from the task or activity in

Field	Description
	<p>question is automatically created when creating a line, and the copy is assigned to the new line by means of this field. If a standard note has been specified for both the activity and the task, the setting of the system parameter "Standard note is derived from Activity before Task" determines which of the notes is to be used.</p> <p>In some cases, the information on a given task or activity is not specific enough, as certain details may change from order to order. For instance, if the activity is for a print job, the basic information about the activity is static, but each time a printing job is ordered, you may wish to also register such information as the paper quality, binding, and so on. It is therefore useful to add a number of fields so that a user ordering a print job is allowed to enter this information. Once the line has been created and this field has automatically been completed, you can enter the additional information by opening the window Notes in the Set-Up module, selecting the note in this field, and specifying the relevant data in the table part.</p> <p>For further information on the use and set-up of additional fields through notes, see the description of the system parameter "Standard note for purchase lines" in the Set-Up module.</p>
<b>Note Description</b>	This field shows a description of the note specified in the field "Note No." above.

## Employee Requisitions Workspace

In the Requisitions workspace, you can create requests for price quotes from suppliers.

Use the Requests for Quote workspace to record the responses you receive from suppliers so that you can compare quotes. Then you can generate a purchase order directly from the workspace.

Use this workspace to work with requests for quote, created in the Requisitions workspace as a result of using the **Create Request for Quote** action.

You use a request for quote for setting up a document to send to a supplier, asking for a quote for certain services. When you receive a quote, you can enter information about the price quoted as well as general information and remarks about the quote.

You can create several requests on the basis of the same requisition, for instance if you want several suppliers to quote a price for the same services. The option of entering several quote prices provides documentation on the choice of supplier and can also be used for comparing quotes. You can make the comparison in the Request for Quote Overview workspace, where you can select a requisition, and each line in the sub-tab displays information (including quote price) about a request for quote assigned to that requisition.

The tab shows one request for quote. Here you can enter information about the supplier, delivery time, delivery mode, payment, and so on. The sub-tab shows requested items or services. Here you can specify the services for which you want the supplier to provide a quote. Most of the information in this workspace is inherited from the requisition from which the request for quote was created, but you can change it here.

After you enter the correct information in the request, you can use the **Approve Request for Quote** action to indicate that the request is ready to be printed and sent to the supplier.

Each time that you receive a quote, you enter the quoted prices in the individual price fields on the request that matches the quote in question. When you decide on a quote, you accept the relevant request for quote using the **Create Purchase Order** action, which causes Maconomy to create a purchase order in the Purchase Orders workspace. When you accept a request for quote, Maconomy rejects all of the other requests that pertain to the same requisition. However, you can reopen requests for quote individually, for instance, if only part of the services are to be provided by one vendor, while the rest should be provided by another.

## Requisition Tab

This section describes the Requisition tab.

### Copy to Come

Field	Description

## Requests for Quote Workspace

Use this workspace to record the responses that you receive from suppliers so that you can compare quotes, then generate a purchase order directly from this workspace.

Use this workspace to work with requests for quote, created in the Requisitions workspace as a result of using the **Create Request for Quote** action.

You use a request for quote for setting up a document to send to a supplier, asking for a quote for certain services. When you receive a quote, you can enter information about the price quoted as well as general information and remarks about the quote.

You can create several requests on the basis of the same requisition, for instance if you want several suppliers to quote a price for the same services. The option of entering several quote prices provides documentation on the choice of supplier and can also be used for comparing quotes. You can make the comparison in the Request for Quote Overview workspace, where you can select a requisition, and each line in the sub-tab displays information (including quote price) about a request for quote assigned to that requisition.

The tab shows one request for quote. Here you can enter information about the supplier, delivery time, delivery mode, payment, and so on. The sub-tab shows requested items or services. Here you can specify the services for which you want the supplier to provide a quote. Most of the information in this workspace is inherited from the requisition from which the request for quote was created, but you can change it here.

After you enter the correct information in the request, you can use the **Approve Request for Quote** action to indicate that the request is ready to be printed and sent to the supplier.

Each time that you receive a quote, you enter the quoted prices in the individual price fields on the request that matches the quote in question. When you decide on a quote, you accept the relevant request for quote using the **Create Purchase Order** action, which causes Maconomy to create a purchase order in the Purchase Orders workspace. When you accept a request for quote, Maconomy rejects all of the other requests that pertain to the same requisition. However, you can reopen requests for quote individually, for instance, if only part of the services are to be provided by one vendor, while the rest should be provided by another.

## Requests for Quote Tab

This section includes the fields and descriptions for the Requests for Quote tab.

## Request for Quote Island

Field	Description
<b>Request for Quote No.</b>	This field shows the number of the current request for quote. When a new request is created, Maconomy automatically assigns a number from the "Request for Quote" number series.
<b>Requisition No.</b>	This field shows the number of the requisition on which the current request for quote is based.
<b>Purchase Process No.</b>	This field shows the number of the purchase process of which the current request for quote is part. For information on purchase processes, see the introduction to the window Requisitions.
<b>Our Ref.</b>	In this field, enter the name of the reference person on the requisition. Maconomy suggests the name from the corresponding field on the requisition on which the current request is based.
<b>Buyer</b>	In this field, you can enter the name of the person who normally enters purchases from this vendor. This makes it possible for the vendor to know who to contact with matters concerning the request for quote. Maconomy suggests the value from the corresponding field on the vendor's information card.
<b>Requisitioner</b>	In this field, you can enter the number of the employee who requisitioned the items on the current request for quote. This field also shows the name of the specified requisitioner employee.
<b>Purchaser</b>	In this field, you can enter the number of the employee who is responsible for purchasing the items on the current request for quote. Maconomy suggests the employee number assigned to the user who created the request if an employee has been specified for this user in the window Users. This field also shows the name of the specified purchaser employee.
<b>Time Unit</b>	In this field, you can specify the time unit. You can specify hours or days. If you specify a vendor, this field copies the value from the specified vendor's information. However, you can change the value up until a request for quote line is created.
<b>Status</b>	In this field, you can select a status code for the request for quote to indicate its current status. The options in the field are created as options in the pop-up field type "Requisition Status" in the window Popup Fields in the Set-Up module.
<b>Deadline</b>	In this field, you can enter the deadline by which the vendor must respond with a quote. The date is printed on the request for quote. Maconomy suggests the date from the field "Deadline for Quote" on the requisition on which the current request is based, if any.

### Billing Address Island

Field	Description
<b>Vendor</b>	<p>This is the number of the vendor to whom payment should be made if the quote received from the vendor in the island Dispatching Address is accepted. When the quote is accepted, the information is transferred to the corresponding field in the window Purchase Orders. The number is retrieved automatically from the Vendor Information Card, but you can change it here.</p> <p>The two vendor numbers are not necessarily the same, since a delivery can come from one vendor and be paid to another.</p> <p>The other lines in this field show the vendor's name and address, retrieved from the Vendor Information Card.</p>
<b>Attn.</b>	This field shows the name of the pay to vendor's attention person, retrieved from the Vendor Information Card, and it cannot be changed here.
<b>Country</b>	This field shows the pay to vendor's country. It is retrieved from the Vendor Information Card and cannot be changed here.

### Delivery Island

Field	Description
<b>Pref. Deliv. Date</b>	In this field, you enter your preferred delivery date, or the date you agreed with the vendor. Maconomy suggests the preferred delivery date specified in the island Delivery in the window Requisitions when the request for quote was created.
<b>Delivery Mode</b>	<p>In this field, you select how the items quoted are to be delivered. Maconomy suggests the value from the Vendor Information Card, but you can select another delivery mode here.</p> <p>Delivery modes are maintained in the window Popup Fields in the Set-Up module.</p>
<b>Delivery Terms</b>	<p>In this field, you select the desired delivery terms. Maconomy suggests the value from the Vendor Information Card, but you can select another.</p> <p>Delivery terms are maintained in the window Popup Fields in the Set-Up module.</p>

### Price, Currency Island

Field	Description
<b>Currency</b>	In this field, you select the currency of the request for quote. Maconomy suggests the currency from the field "Currency" on the requisition on which the current request is based.
<b>Line Sum</b>	This field shows the sum of the prices on the lines in the table part (from the field "Price, Currency"), expressed in the currency specified in the field "Currency" above. The value cannot be changed here.

Field	Description
<b>Quote Discount %</b>	<p>Here you can enter a quote discount percentage. Maconomy suggests the invoice discount percentage from the Vendor Information Card, but you can change it.</p> <p>The invoice discount percentage is deducted from the line sum, and this is shown on the quote printout, allowing the vendor to see how much discount you expect.</p> <p>Note that a quote discount % is added to any discount entered on the individual table lines.</p>
<b>Quote Discount</b>	<p>In this field, you can enter a quote discount amount if the discount is specified as a fixed amount and not as a percentage. The amount will be allocated on the table lines when the quote is printed. You cannot enter both a percentage in the field "Quote Discount %" and an amount in this field. Note that a quote discount is added to any discount entered on the individual table lines.</p>
<b>Quote Tax</b>	<p>This field displays the total invoice tax amount for the lines of the current request for quote.</p> <p>If multiple tax codes are enabled, the "Quote Tax" field will be replaced by the following fields: "Quote Total Tax," "Quote Tax 1," "Quote Tax 2" and, if enabled, "Quote Tax 3." The "Quote Total Tax" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Quote Sum</b>	<p>This field displays the total quote amount including tax and discounts.</p>

### Company Island

Field	Description
<b>Company</b>	<p>In this field, you can enter the number of the company responsible for the request for quote. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>See the section "Multiple Companies" in the chapter "Introduction to the G/L Module" and the window Intercompany Accounts in the G/L module for a further description of the concept of responsible companies.</p> <p>This field also shows the name of the specified company.</p>
<b>Base Currency</b>	<p>This field shows the currency used as base currency in the company specified in the field "Company No." above.</p>

**Purchase Process Access Level Island**

Field	Description
<b>Name</b>	<p>In this field you can specify the name of an access level to apply to the purchase process to which the current request for quote is assigned. You only have access to the current purchase process and its requisition, requests for quote and purchase orders if you have been assigned to this level or a level above this in the window User Access Levels. This access control ensures that in other windows, you can only refer to and see information relating to purchase processes to which you have access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to purchase processes and its requisition, requests for quote and purchase orders may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If no access level is specified, all users have access to the current purchase process.</p>
<b>Description</b>	This field shows a description of the access level specified in the field "Name" above.

**Vendor Information Island**

Field	Description
<b>Department</b>	<p>In this field, you can enter the department which the request for quote involves. Maconomy suggests the value from the corresponding field on the Vendor Information Card, but you can select another department here.</p> <p>You maintain departments in the window Posting References in the G/L module.</p>
<b>Vendor Group</b>	This is the vendor group to which the vendor belongs. The value cannot be changed here, but you can change it in the vendor information card.
<b>Enterprise</b>	<p>In this field, you can specify an enterprise. Maconomy suggests the value from the corresponding field on the Vendor Information Card, but you can select another enterprise here. This field is used when deriving a G/L tax code from G/L tax tables.</p> <p>You maintain enterprises in the Popup Fields window in the Set-Up module.</p>
<b>Segment</b>	<p>In this field, you can specify a segment. Maconomy suggests the value from the corresponding field on the Vendor Information Card, but you can select another segment here. This field is used when deriving a G/L tax code from G/L tax tables.</p> <p>You maintain segments in the Popup Fields window in the Set-Up module.</p>
<b>Area</b>	<p>In this field, you can specify an area. Maconomy suggests the value from the corresponding field on the Vendor Information Card, but you can select another area here. This field is used when deriving a G/L tax code from G/L tax tables.</p>

Field	Description
	You maintain areas in the Popup Fields window in the Set-Up module.
<b>Tax No.</b>	In this field, you select the tax number for the request. Maconomy automatically suggests the value from the corresponding field in the window Payment Control, but you can change it here.
<b>Language</b>	<p>In this field, you select the language of the request. Maconomy suggests the value from the corresponding field on the vendor information card, but you can select another language here.</p> <p>The language code makes it possible to have Maconomy automatically print the request for quote in a layout matching the language of the vendor. You maintain languages in the window Popup Fields in the Set-Up module.</p>
<b>Company Tax Code</b>	<p>In this field, you must specify a company tax code created in the window Popup Fields. If the request for quote is converted to a purchase order, the value in this field is transferred to the corresponding field on the resulting purchase order. On the purchase order, the company tax code is used by Maconomy for determining the tax code to be used in the calculation of tax for the services on the purchase order. For further information on this, see the description of the field "Company Tax Code." If the request for quote is not converted to a purchase order, this field has no effect.</p> <p>Maconomy suggests the reporting code from the vendor's information card, but you can select another reporting code for the current request for quote.</p>

### Payment Island

Field	Description
<b>Pmt. Terms</b>	<p>In this field, you select the desired payment terms. Maconomy suggests the value from the vendor information card.</p> <p>You maintain payment terms in the window Popup Fields in the Set-Up module.</p>

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

### Extra Fields Island

Field	Description
<b>Popup 1-5</b>	In these fields, you can select a number of pop-up values for further specification of the vendor. Maconomy suggests the values from the dispatch vendor's information card, but you can change the values here. If the request for quote is converted to a purchase order, the pop-up values are transferred to the corresponding fields on the purchase order. However, pop-up fields with a blank value on the information card of the vendor will not overwrite any manually specified value in this field. The options are created in the window Popup Fields in the Set-Up module.

**Remarks Island**

Field	Description
<b>Remarks 1-10</b>	In this field, you can enter any remarks you wish to make about the request for quote. If the request for quote is converted to a purchase order, the remarks are transferred to the purchase order.

**Vendor's Order Island**

Field	Description
<b>Order No.</b>	If the vendor states a sales order number on his quote, you can enter this order number here. If the request for quote is converted to a purchase order, the order number is transferred to the corresponding field on the purchase order.
<b>Your Reference</b>	When you receive a quote, you can enter in this field the name of the person at the vendor's who is responsible for the quote, or, if you have had contact with the vendor before receiving a quote, you can enter the name of the person with whom you were in contact.  Maconomy suggests the name from the corresponding field on the Vendor Information Card, that is, the person with whom you usually have contact when dealing with the vendor in question.
<b>Our Cust. No.</b>	In this field, you can enter your company's customer number registered with the vendor. Maconomy suggests the value from the corresponding field on the Vendor Information Card, but you can change it.

**Job Island**

Field	Description
<b>Job No.</b>	In this field, you can enter the job to which the request for quote pertains. Maconomy suggests the name from the corresponding field on the requisition on which the current request is based.  If the system parameter "Allow purchase order for multiple jobs" has not been marked, the lines in the table part can only be assigned to the job specified in this field, and if this field is left blank, you cannot assign the lines to a job. If the parameter has been marked, you can enter different job numbers on the request for quote lines.  If the system parameter has been marked, changing the job number in this field will not influence existing request for quote lines. However, if the parameter has not been marked, the job number in this field must match the field "Job No." in the table part of this window.
<b>Job Name</b>	This field shows the name of the job specified in the field "Job No." above, if any.
<b>Customer No.</b>	This field shows the number of the customer assigned to the job specified in the field "Job No." above, if any.

Field	Description
<b>Name</b>	This field shows the name of the customer shown in the field "Customer No." above, if any.

**Quote Island**

Field	Description
<b>Expiry Date</b>	When you have received a quote from the vendor, you can specify the expiry date of the quote in this field. The expiry date is the last date on which the quote is valid.

**Dispatching Address Island**

Field	Description
<b>Vendor</b>	<p>In this field, you can enter the number of the vendor from whom you want to request a quote. Maconomy suggests the vendor specified in the island Create Request for Quote/Purchase Order in the window Requisitions when the request for quote was created.</p> <p>You can change the vendor number on a request for quote, as long as no purchase order lines have been created, and the request has not been approved. Please note that the information in a number of islands in the window will change if you change the specified vendor.</p> <p>The other lines in this field show the vendor's name and address. Maconomy suggests the information from the Vendor Information Card, but you can change it.</p>
<b>Attn.</b>	This field shows the vendor's attention person. Maconomy suggests the name from the Vendor Information Card, but you can change it.
<b>Country</b>	This is the vendor's country. Maconomy suggests the vendor's state/country from the Vendor Information Card, but you can change it.
<b>Phone</b>	This field shows the vendor's phone number. Maconomy suggests the number from the Vendor Information Card, but you can change it.
<b>Fax</b>	This field shows the vendor's fax number. Maconomy suggests the number from the Vendor Information Card, but you can change it.
<b>Telex</b>	This field shows the vendor's telex number. Maconomy suggests the number from Vendor Information Card, but you can change it.

**Ship to Address Island**

Field	Description
<b>Customer No.</b>	In this field, you can enter a Ship to Customer number. This is, for example, relevant if the request for quote is related to a job, and the vendor is delivering the items or services directly to your customer. Maconomy retrieves the customer's name and address from the customer information card. Name and address cannot be changed here.

Field	Description
	The Ship to Address can be added to the purchase order printout using Maconomy's layout editing tools.
<b>Attn.</b>	This field shows the attention person of the ship-to customer specified in the field above. The name is taken from the customer information card and cannot be changed here.
<b>Country</b>	This field shows the county of the ship-to customer specified in the field above. The country is taken from the customer information card and cannot be changed here.

### Dimensions Island

Field	Description
<b>Location</b>	In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, the standard value is transferred from the window System Parameters in the Set-Up module.  See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

### Status Island

Field	Description
<b>Date Printed</b>	This field shows the date on which the request for quote was printed after being approved. This means that the field is automatically completed when the action "Print Request for Quote" is selected or when the request for quote has been approved and is printed using the functions "Print This" or "Print..." in the

Field	Description
	File menu. If the request is printed through the File menu before it is approved, the field is not completed.
<b>Approved</b>	<p>If this field is marked, the current request for quote has been approved. You approve a request for quote by selecting the action "Approve Request for Quote."</p> <p>However, this approval will automatically be cancelled by Maconomy if certain fields on the request are changed. If the approval is cancelled, the request must be reapproved. Nevertheless, it is possible to change the fields related to quotes, for example, price fields without cancelling the approval.</p>
<b>Approved by</b>	This field displays the name of the employee who approved the current request for quote.
<b>Date</b>	This field displays the date on which the current request for quote was approved.
<b>Quote Received</b>	If this field is marked, a quote has been registered as received. You register receipt of a quote by selecting the action "Receive Quote."
<b>Received by</b>	This field displays the name of the employee who registered receipt of the quote.
<b>Date</b>	This field displays the date on which the quote was registered as received.
<b>Accepted</b>	<p>If this field is marked, the current request for quote has been accepted and converted to a purchase order. You approve a request for quote and convert it by selecting the action "Create Purchase Order." Please note that this causes all other requests assigned to the same requisition to be rejected. For further information on this, see the description of the action "Create Purchase Order."</p> <p>When a request for quote has been converted, it is no longer possible to change any information on it.</p>
<b>Accepted by</b>	This field displays the name of the employee who accepted the current request for quote.
<b>Date</b>	This field displays the date on which the current request for quote was converted to a purchase order.
<b>Rejected</b>	If this field is marked, the current request for quote has been rejected. You reject a request for quote by selecting the action "Reject Request for Quote," but a request for quote can also be rejected as a result of accepting another request for quote assigned to the same requisition. For further information on this, see the description of the action "Create Purchase Order." When a request for quote has been rejected, it is not possible to convert it to a purchase order. However, the rejection can be cancelled by using the action "Cancel Rejection of Quote."
<b>Rejected by</b>	This field displays the name of the employee who rejected the current request for quote.

Field	Description
<b>Date</b>	This field displays the date on which the current request for quote was rejected.
<b>Closed</b>	This field shows whether the request for quote is closed. If this field is marked, the request is closed. To mark the field, select the action "Close Request for Quote" in the Action menu. When the request has been closed, all fields on the request are closed, and it is not possible to change any of the information in the window. However, the request can be reopened by means of the action "Reopen Request for Quote." You can only use this action if you have been given access to it in the window Actions in the Set-Up module.
<b>Closed by</b>	If the current request for quote has been closed, this field displays the name of the user who closed the request.
<b>Date</b>	If the current request for quote has been closed, this field displays the date on which it was closed.

### Document Archive Island

Field	Description
<b>Document Archive</b>	This field shows the number of the document archive assigned to the current quote request. This field also shows the description of the document archive.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.

### Request for Quote Lines Sub-Tab

This section includes the fields and descriptions for the Request for Quote Lines sub-tab.

Field	Description
<b>Job No.</b>	<p>In this field, you can enter the number of a job in the Job Cost module if the current line concerns a job. Maconomy checks that the job exists, that it is on order, and that it is neither blocked nor closed. If you complete this field, you must complete the field "Activity No." and leave the field "Account No." blank.</p> <p>If the system parameter "Allow purchase order for multiple jobs" has not been marked, the lines in the table part can only be assigned to the job specified in the card part, and if no job has been specified in the card part, you cannot assign lines to a job number. If the parameter has been marked, you can enter different job numbers on the lines.</p>
<b>Activity No.</b>	<p>In this field, you enter the number of the activity in the Job Cost module representing the item or service that you wish to order.</p> <p>Maconomy checks that the activity number exists, that it is an amount activity and that it is not blocked.</p> <p>If you have completed the field "Job No." in the card part of the window, you must enter an activity here and leave the field "Account No." blank.</p>

Field	Description
<b>Empl. No.</b>	<p>In this field, you can enter the number of the employee assigned to the request for quote line.</p> <p>If employee control has been selected for the job specified on the line, you can only enter registrations for employees who appear in the latest revision of the planning budget of the current job. For more information about controlling employee registrations, please see the description of the field "Employee Control" in the window Jobs.</p>
<b>Account No.</b>	<p>In this field, you can enter an account number if the current line is for items or services which you are posting directly to profit and loss, and which do not pertain to a job in the Job Cost module. Maconomy checks that the account is an existing manual account and that it is not blocked.</p> <p>The field has no effect on the request for quote, but if a purchase order is created from the request for quote, the purchase is debited to the account when you enter the vendor invoice. For further information on the effects of account numbers on purchase orders, see the field "Account No."</p> <p>If you enter an account here, you cannot enter a job number in the field "Job No." in the card part or an activity in the field "Activity No." on the same line in the table.</p>
<b>Acct./Account Name</b>	<p>This field shows either the account text of the G/L account specified in the field "Account No.," or the text assigned to the activity entered in the field "Act. No." The text cannot be changed here.</p>
<b>Line Remarks</b>	<p>In this field, you assign a text to the request for quote line. It is printed on the request for quote. Maconomy suggests the text from the field "Acct./Activity Name," but you can change it.</p>
<b>Text Line</b>	<p>If you check this field, the line will be perceived as a text line, and you cannot enter any information in the fields "Job No.," "Activity No.," or "Account No." on the current line. Any text in the field "Line Remarks" will then be used as text. The field can only be marked when creating a line.</p>
<b>Fixed Asset Line</b>	<p>Use this field to indicate if the line is a fixed asset line.</p>
<b>Quantity</b>	<p>In this field, you enter the quantity that you wish to order.</p>
<b>Unit Price, Currency</b>	<p>When you receive a quote from the vendor, you can specify the quoted price for the items or services on the current line in this field. The total quoted price for the line is then calculated as quantity times unit price less any discount. If you manually enter an amount in the field "Price, Currency," Maconomy will recalculate the unit price based on the total amount in that field.</p> <p>The amount should be specified in the currency specified in the card part of the request for quote.</p>
<b>Discount, Currency</b>	<p>When you receive a quote from the vendor, you can specify any quoted discount for the items or services on the current line in this field. The amount</p>

Field	Description
	should be specified in the currency specified in the card part of the request for quote.
<b>Price, Currency</b>	<p>In this field, you can specify the total quoted price less tax of the current line in the currency of the request for quote. If you specify a quantity and a unit price, the amount is calculated as quantity times unit price less any discount. If you manually enter an amount in this field, Maconomy will recalculate the unit price based on the total amount in this field.</p> <p>The amount should be specified in the currency specified in the card part of the request for quote.</p>
<b>Tax Code</b>	<p>In this field, you specify a G/L tax code for tax receivable to be used for calculation of tax on the current line. You can select another code or leave the field blank, if the invoice is not subject to tax.</p> <p>Maconomy suggests a tax code on the basis of the following procedure:</p> <p>If a G/L tax table has been specified in the window Company Information, a G/L tax code will be transferred from the G/L tax table on the basis of the information registered on the current invoice. When searching for a line in the G/L tax table, Maconomy searches for a match between the value of the tax table line in the field "Account No." and a reference account which depends on whether an account or an activity has been specified on the current line. If no line is found in the G/L tax table corresponding to the current line's registrations and the reference account, or if no G/L tax table has been specified for the current company, Maconomy will suggest the G/L tax code specified for the reference account in question in the window Account Information Card.</p> <p>As mentioned, the reference account depends on whether the current line contains an account number or an activity number. If the line contains an account number, the reference account is the account in question. If the line contains an activity, the reference account is the account specified as the P&amp;L account in the information card of the activity in question.</p> <p>You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters window. When multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2" and, if enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Tax Amount, Currency</b>	<p>This field displays the tax amount for the current request for quote line.</p> <p>If multiple tax codes are enabled, the "Tax Amount, Currency" field will be replaced by the following fields: "Tax Amount Total, Currency," "Tax Amount 1, Currency," "Tax Amount 2, Currency" and, if enabled, "Tax Amount 3, Currency." The "Tax Amount Total, Currency" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in "Tax Codes."</p>

Field	Description
<b>Item Tax Code</b>	<p>In this field, you must specify an item tax code created in the window Popup Fields. If the request for quote is converted to a purchase order, the value in this field is transferred to the corresponding field on the resulting purchase order line. On the purchase order, the company tax code is used by Maconomy for determining the tax code to be used in the calculation of tax for the services on the purchase order. For further information on this, see the description of the field "Item Tax Code." If the request for quote is not converted to a purchase order, this field has no effect.</p> <p>Maconomy suggests the reporting code from the account or activity, but you can select another reporting code for the current line.</p>
<b>Delivery Date</b>	<p>In this field, you enter the delivery date on which you want the services to be delivered. Maconomy suggests today's date.</p>
<b>Registration Code</b>	<p>In this field you can enter a registration code from the window Registration Codes in the G/L module. The registration code is used instead of manually entering a number of dimension values on the current line. See the description of the window Registration Codes for more information about registration codes.</p>
<b>Company No.</b>	<p>When creating a line, Maconomy suggests the company from the Dimension island in the card part of the window. If the current line is entered for another company than the one suggested, you can enter its number here.</p>
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the field "Location" in the card part of the window.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	<p>The functionality of this field is similar to the functionality of the field "Location" above.</p>
<b>Project</b>	<p>The functionality of this field is similar to the functionality of the field "Location" above.</p>
<b>Purpose</b>	<p>The functionality of this field is similar to the functionality of the field "Location" above.</p>
<b>Spec. 1-3</b>	<p>The functionality of these fields is similar to the functionality of the field "Location" above.</p>
<b>Local Spec. 1-3</b>	<p>The functionality of these fields is similar to the functionality of the field "Location" above.</p>
<b>Task</b>	<p>For lines with a job number, it is here possible to enter the task to which the request for quote pertains. If you enter a value in the field, Maconomy checks</p>

Field	Description
	that a task list has been assigned to the job and that the list contains the specified task.
<b>Price, Base</b>	This field shows the price in the field "Unit Price," converted into the base currency of the company responsible for the current request for quote. The amount cannot be changed here.
<b>Tax, Base</b>	The functionality of this field is similar to the functionality of the field "Price, Base" above.
<b>Discount, Base</b>	The functionality of this field is similar to the functionality of the field "Price, Base" above.
<b>Closed</b>	You can mark this field to show that the current line is closed. The field cannot be changed on a closed request for quote. When you select the action "Close Request for Quote," this field will be marked on all lines on the request for quote. If the action "Reopen Request for Quote" is selected, this field will remain marked, regardless of its status before the request was closed. You can then unmark the field individually as needed.
<b>Base Currency, Company</b>	This field shows the currency used as base currency in the company specified in the field "Company No." on the line.
<b>Job Name</b>	This field displays the name of the job specified in the field "Job No." on the line. The information is retrieved from the window Jobs and cannot be changed here.
<b>Task Description</b>	This field displays the description of the task entered in the field "Task" on the current request for quote line.
<b>Job Budget Line No.</b>	If the current line was created from a job budget line, this field shows the number of the budget line in question.
<b>Job Budget Line WBS Description</b>	This field summarizes the placement of the job budget lines in the job budget WBS (work breakdown structure).
<b>Employee Name</b>	This field displays the name of the employee specified in the field "Empl. No."
<b>Note No.</b>	If a standard note has been specified for either the task or the activity entered on the line, a copy of the standard note from the task or activity in question is automatically created when creating a line, and the copy is assigned to the new line by means of this field. If a standard note has been specified for both the activity and the task, the setting of the system parameter "Standard note is derived from Activity before Task" determines which of the notes is to be used.

Field	Description
	<p>In some cases, the information on a given task or activity is not specific enough, as certain details may change from order to order. For instance, if the activity is for a print job, the basic information about the activity is static, but each time a printing job is ordered, you may wish to also register such information as the paper quality, binding, and so on. It is therefore useful to add a number of fields so that a user ordering a print job is allowed to enter this information. Once the line has been created and this field has automatically been completed, you can enter the additional information by opening the window Notes in the Set-Up module, selecting the note in this field, and specifying the relevant data in the table part.</p> <p>For further information on the use and set-up of additional fields through notes, see the description of the system parameter "Standard note for purchase lines" in the Set-Up module.</p> <p>The information entered in the note is also printed on external order documents.</p>
<b>Note Description</b>	This field shows a description of the note specified in the field "Note No." above.

## Request for Quote Overview Workspace

Use this workspace to compare the quotes that you receive from suppliers.

Use the Requests for Quote workspace to record the quotes that you receive from suppliers, then use this workspace to compare the quotes.

This workspace provides an overview of the prices and terms quoted by the individual vendors in a given purchase process. For more information about the concept of purchase processes, see the description of the Requisitions workspace.

The tab is where you can select a purchase process. The sub-tab displays information about the requests for quote that are assigned to the current purchase process, including the total price quoted and various terms. The sub-tab information corresponds to the information that the tab of the Requests for Quote workspace displays; you can change that information here, which results in appropriate updates to the Requests for Quote workspace.

### Request for Quote Overview Tab

This section includes the fields and descriptions for the Request for Quote Overview tab.

#### Purchase Process Island

Field	Description
<b>Purchase Process No.</b>	This field shows the number of the current purchase process. The table part shows a line for each request for quote assigned to this purchase process. For further information on the concept of purchase processes, see the introduction to the window Requisitions.

Field	Description
<b>Description</b>	In this field, you can enter a description of the current purchase process. The field is for information only.
<b>Status</b>	This field shows the status of the current purchase process.
<b>Job No.</b>	This field shows the number of the job to which the current purchase process is assigned.
<b>Job Name</b>	This field shows the name of the job shown in the field "Job No." above, if any.
<b>Requisitioner Employee No.</b>	This field shows the number of the employee who requisitioned the items on the current purchase process.
<b>Name</b>	This field shows the name of the requisitioner employee specified above.
<b>Purchaser Employee No.</b>	This field shows the number of the employee who is responsible for purchasing the items on the current purchase process.
<b>Name</b>	This field shows the name of the purchaser employee specified above.

#### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field you can specify the name of an access level to apply to the current purchase process. You only have access to the current purchase process and its requisition, requests for quote and purchase orders if you have been assigned to this level or a level above this in the window User Access Levels. This access control ensures that in other windows, you can only refer to information relating to purchase processes to which you have access, and you can only see information about purchase processes to which you have access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to purchase processes and its requisition, requests for quote and purchase orders may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If no access level is specified, all users have access to the current purchase process.</p> <p>This field also shows the description of the specified access level.</p>

### Company Island

Field	Description
<b>Company</b>	In this field, you can enter the number of the company responsible for the current purchase process. This field also shows the name of the specified company.

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

### Requests for Quote Sub-Tab

This section includes the fields and descriptions for the Requests for Quote sub-tab.

Field	Description
<b>Request for Quote No.</b>	This field shows the number of the current request for quote.
<b>Requisition No.</b>	This field shows the number of the requisition on which the current request for quote was based.
<b>Our Ref.</b>	In this field, you can enter the name of the reference person on the request for quote. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Buyer</b>	In this field, you can enter the name of the reference person on the request for quote. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Requisitioner Employee No.</b>	In this field, you can enter the number of the employee who requisitioned the items on the current request for quote.
<b>Requisitioner Employee Name</b>	This field shows the name of the requisitioner employee specified above.
<b>Purchaser Employee No.</b>	In this field, you can enter the number of the employee who is responsible for purchasing the items on the current request for quote.
<b>Purchaser Employee Name</b>	This field shows the name of the requisitioner employee specified above.
<b>Status</b>	In this field, you can specify the status of the request for quote. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Order No.</b>	If the vendor states a sales order number on his quote, you can enter this order number here. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.

Field	Description
<b>Your Reference</b>	When you receive a quote, you can enter in this field the name of the person at the vendor's who is responsible for the quote, or, if you have had contact with the vendor before receiving a quote, you can enter the name of the person with whom you were in contact. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Our Cust. No.</b>	In this field, you can enter your company's customer number registered with the vendor. Maconomy suggests the value from the corresponding field on the vendor information card, but you can change it.
<b>Job No.</b>	In this field, you can enter the job to which the request for quote pertains. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Job Name</b>	This field shows the name of the job specified in the field "Job No." above, if any.
<b>Deadline</b>	In this field, you can enter the deadline by which the vendor must respond with a quote. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Expiry Date</b>	When you have received a quote from the vendor, you can specify the expiry date of the quote in this field. The expiry date is the last date on which the quote is valid. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Vendor</b>	In this field, you can enter the number of the vendor whom the request for quote concerns. Maconomy suggests the value from the corresponding field in the island Dispatch Address in the window Requests for Quote.
<b>Name 1-5</b>	In these fields, you can enter information on the name and address of the dispatch vendor specified above. Maconomy suggests the value from the corresponding fields in the island Dispatch Address in the window Requests for Quote.
<b>Zip Code</b>	In this field, you can enter the zip code of the dispatch vendor specified above. Maconomy suggests the value from the corresponding fields in the island Dispatch Address in the window Requests for Quote.
<b>Postal District</b>	In this field, you can enter the postal district of dispatch vendor specified above. Maconomy suggests the value from the corresponding fields in the island Dispatch Address in the window Requests for Quote.
<b>Attn.</b>	This field shows the vendor's attention person. Maconomy suggests the value from the corresponding field in the island Dispatch Address in the window Requests for Quote.
<b>Country</b>	This is the country of the dispatch vendor specified above. Maconomy suggests the value from the corresponding field in the island Dispatch Address in the window Requests for Quote.

Field	Description
<b>Phone</b>	This field shows the phone number of the dispatch vendor specified above. Maconomy suggests the value from the corresponding field in the island Dispatch Address in the window Requests for Quote.
<b>Fax</b>	This field shows the fax number of the dispatch vendor specified above. Maconomy suggests the value from the corresponding field in the island Dispatch Address in the window Requests for Quote.
<b>Telex</b>	This field shows the telex number of the dispatch vendor specified above. Maconomy suggests the value from the corresponding field in the island Dispatch Address in the window Requests for Quote.
<b>Vendor No.</b>	This is the number of the vendor to whom payment should be made if the current quote is accepted. Maconomy suggests the value from the corresponding field in the island Pay to Address in the window Requests for Quote.
<b>Pref. Deliv. Date</b>	In this field, you enter your preferred delivery date, or the date you agreed with the vendor. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Delivery Mode</b>	In this field, you select how the items quoted are to be delivered. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Delivery Terms</b>	In this field, you select the desired delivery terms. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Customer No.</b>	In this field, you can enter a Ship to Customer number. This is, for example, relevant if the purchase request for quote is related to a job, and the vendor is delivering the items or services directly to your customer. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Currency</b>	In this field, you select the currency of the request for quote. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Line Sum</b>	This field shows the total quoted price entered on the lines assigned to the current request for quote. The quote prices are entered in the window Requests for Quote.
<b>Quote Discount %</b>	In this field, you can enter any discount percentage quoted by the supplier. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Quote Discount</b>	In this field, you can enter any discount amount quoted by the supplier. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Quote Tax</b>	This field shows the total tax amount for the current request for quote.

Field	Description
<b>Quote Sum</b>	This field shows the total amount for the current request for quote.
<b>Company No.</b>	This field shows the number of the company responsible for the current request for quote.
<b>Pmt. Terms</b>	In this field, you select the desired payment terms. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Department</b>	In this field, you can enter the department which the quote involves. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Vendor Group</b>	This is the vendor group to which the vendor belongs. The value cannot be changed here, but you can change it in the vendor information card.
<b>Enterprise</b>	In this field, you can specify an enterprise. Maconomy suggests the value from the corresponding field on the Vendor Information Card, but you can select another enterprise here. This field is used when deriving a G/L tax code from G/L tax tables.  You maintain enterprises in the Popup Fields single dialog workspace in the Set-Up module.
<b>Segment</b>	In this field, you can specify a segment. Maconomy suggests the value from the corresponding field in the Vendor Information Card, but you can select another segment here. This field is used when deriving a G/L tax code from G/L tax tables.  You maintain segments in the Popup Fields single dialog workspace in the Set-Up module.
<b>Area</b>	In this field, you can specify an area. Maconomy suggests the value from the corresponding field in the Vendor Information Card, but you can select another area here. This field is used when deriving a G/L tax code from G/L tax tables.  You maintain areas in the Popup Fields single dialog workspace in the Set-Up module.
<b>Tax No.</b>	In this field, you select the tax number for the request. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Language</b>	In this field, you select the language of the request. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Company Tax Code</b>	In this field, you must specify a company tax code created in the window Popup Fields. If the request for quote is converted to a purchase order, the value in this field is transferred to the corresponding field on the resulting purchase order. On the purchase order, the company tax code is used by Maconomy for determining the tax code to be used in the calculation of tax for the services on the purchase order. For further

Field	Description
	<p>information on this, see the description of the field "Company Tax Code." If the request for quote is not converted to a purchase order, this field has no effect.</p> <p>Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.</p>
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, the standard value is transferred from the window System Parameters in the Set-Up module.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Created by</b>	This field shows the name of the user who created the current request for quote.
<b>Created on</b>	This field shows the date on which the current request for quote was created.
<b>Changed by</b>	This field shows the name of the last user to change the current request for quote.
<b>Changed on</b>	This field shows the date on which the current request for quote was changed.
<b>Version</b>	This field shows the version number of the current request for quote, that is, the number of times information has been entered on it.
<b>Date Printed</b>	This field shows the date on which the request for quote was printed. If the request for quote has not yet been selected, this field is blank. For further information on printing requests for quote, see the description of the corresponding field in the card part of the window Requests for Quote.

Field	Description
<b>Approved</b>	If this field is marked, the current request for quote has been approved. You approve a request for quote by selecting the action “Approve Request for Quote” in the window Requests for Quote. For further information on approving requests for quote, see the description of the corresponding field in the card part of the window Requests for Quote.
<b>Approved By</b>	This field displays the name of the employee who approved the current request for quote.
<b>Date</b>	This field displays the date on which the current request for quote was approved.
<b>This quote has been received</b>	This field shows whether a quote has been registered as received for the current request for quote. To mark the field, select the action “Receive Quote” in the window Requests for Quote. For further information on receiving quotes, see the description of the corresponding field in the card part of the window Requests for Quote.
<b>Received by</b>	If the quote has been received, this field displays the name of the user who received the quote.
<b>Date</b>	If a quote has been received, this field displays the date on which it was received.
<b>Accepted</b>	This field shows whether the quote received on the current request for quote has been accepted. To mark the field, select the action “Create Purchase Order” in the window Requests for Quote. For further information on accepting quotes, see the description of the corresponding field in the card part of the window Requests for Quote.
<b>Accepted by</b>	If the quote received on the current request for quote has been accepted, this field displays the name of the user who accepted the quote.
<b>Date</b>	If the quote received on the current request for quote has been accepted, this field shows the date on which the quote was accepted.
<b>Rejected</b>	If this field is marked, the current request for quote has been rejected. You reject a request for quote by selecting the action “Reject Request for Quote” in the window Requests for Quote. For further information on rejecting requests for quote, see the description of the corresponding field in the card part of the window Requests for Quote.
<b>Rejected by</b>	This field displays the name of the employee who rejected the current request for quote.
<b>Date</b>	This field displays the date on which the current request for quote was approved.
<b>Closed</b>	This field shows whether the request for quote is closed. If this field is marked, the request for quote is closed. To mark the field, select the action “Close Request for Quote” in the window Requests for Quote. For further information on closing requests for quote, see the description of the corresponding field in the card part of the window Requests for Quote.

Field	Description
<b>Closed by</b>	If the current request for quote has been closed, this field displays the name of the user who closed the request.
<b>Date</b>	If the current request for quote has been closed, this field displays the date on which it was closed.
<b>Popup 1-5</b>	In these fields, you can select a number of pop-up values for further specification of the vendor. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.
<b>Remarks 1-10</b>	In this field, you can enter any remarks you wish to make about the request for quote. Maconomy suggests the value from the corresponding field in the card part of the window Requests for Quote.

## Purchase Orders Workspace

Use this workspace to create and maintain purchase orders, which are orders for services or items that you plan to buy.

You can create purchase orders manually in this workspace, but you can also create them from job budgets in the Job Cost module or from requisitions or requests for quotes.

After a purchase order is approved, the purchase is considered a committed expense and is recorded in the commitment accounting system.

A purchase order is an order for services, items, or assets. Because you can use this workspace for purchasing items for your warehouses, parts of the functionality of this workspace overlap with the functionality of the Item Purchase Orders workspace in the Item Purchase module.

You can handle purchases that are assigned to jobs in the Job Cost module using the interaction between this workspace and the Invoice Allocation workspace. To do this, enter the relevant job number in the sub-tab of this workspace. When you later receive the vendor invoice, you can automatically allocate the invoice to the job by referring to the number of the purchase order, which corresponds to the vendor invoice.

Just as with job-related purchases, you can also handle purchases posted directly to the G/L module. These could be for office supplies and stationery, for example.

In addition, you can choose to accrue the cost of a vendor invoice over multiple periods.

You can create purchase orders manually in this workspace, but you can also create them from job budgets in the Job Cost module. This way, a person who is responsible for drawing up job budgets can start a purchase process from the Job Cost module, requesting certain services, and a purchaser can manage the actual purchase process in this workspace. This is done via the **Create Purchase Orders** action in the Job Budgets workspace in the Job Cost module. When you use this action, Maconomy creates a purchase order for each vendor that is specified on the selected job budget lines, copying the selected budget lines to the relevant purchase orders. Most of the information for purchase orders that are created from job budgets is inherited from the job budget lines in question, but you can edit that information in this workspace. For more information about the creation of purchase orders from job budgets, see "Create Purchase Orders" in the Job Cost module.

You can also create purchase orders from a requisition or a request for quote, causing information from the requisition or request for quote to be copied to the purchase order. For

further information on this, see the description of the **Create Purchase Order** action in the Requisitions workspace and the **Create Purchase Order** action in the Request for Quote workspace.

The tab displays standard information about the purchase order. When you have entered the information into the tab, press Return; Maconomy checks the information and opens the sub-tab. Here you enter purchase order lines that specify which items (goods or services) you want to buy. There are also a number of text fields for supplementary information.

When you create a purchase order, you can either choose to begin by entering the number of the vendor that is to supply the goods (or perform the services) on the purchase order, or you can choose to wait until it has been decided who is to supply the goods. When you enter the vendor, Maconomy retrieves information from the vendor information card. Maconomy then suggests this information in the purchase order fields. Thus you only need to enter or change the information that is different from what normally applies to the vendor.

If you choose not to enter a vendor on the purchase order right away, you must enter the vendor number when you receive an invoice from the vendor that was selected, since this is not transferred from the purchase order. Unless the vendor is blocked, the vendor number is transferred to the purchase order when the vendor invoice is posted.

You generally must submit and get approval of a purchase order before you can print it. However, you can choose to include unapproved purchase orders on the printout of this workspace by selecting the **Include Non-Approved** field in the Print Purchase Order workspace. Unapproved purchase orders are clearly marked on the printout to avoid unapproved purchase orders being sent to vendors by mistake. Approval of purchase orders can be performed in several levels by means of an approval hierarchy. You set up approval hierarchies in the Approval Hierarchies workspace in the Set-Up module. When a purchase order has been submitted, Maconomy checks whether the purchase order requires approval. The criteria that determine whether a purchase order requires approval and by whom the approval is to be performed can be, for example, the size of the purchase order's amount or the assigned job number. You must get approval by all required approvers before you can print the purchase order, assign it to a vendor invoice, and include it in the commitment accounts.

It is important to note whether the **Allow purchase order for multiple jobs** system parameter is selected. If you do not select this parameter, you can only create purchase order lines for the job that is specified in the tab of this workspace. If you select the parameter, you can enter different job numbers on the purchase order's lines. Selecting this parameter thus ensures that all lines on a purchase order are assigned to the same job when the lines are to be approved.

If you change a purchase order line to which an approved job accrual plan has been assigned, Maconomy cancels the approval of the job accrual plan in question. For more information about job accrual plans, see the description of the Job Accrual Plans workspace in the Job Cost module.

### Commitment Accounting

A company that creates a G/L budget in Maconomy can use the budget to control its expected income and expenses. On the expense side you compare the budgeted expenses to the actual expenses. An expense becomes actual when a vendor invoice or a general journal is posted. It is recommended that you use Maconomy's commitment accounting system to keep control of the amounts that are to be charged to the profit and loss accounts in the future.

You use the commitment accounting system in connection with the Budget module and purchase orders and vendor invoices in the A/P module.

After a purchase order is approved, Maconomy creates entries in the commitment accounting system, and updates the committed amount for the given account. The commitment accounting of a company gives you an overview of the amounts that you have committed to paying but have not yet paid. At an early stage in the process, this enables the company to evaluate whether the actual expenses are within the limits of the budget. In the Budget Control workspace in the Budget module, you can compare the budgeted, the committed, and the actual expenses divided into periods, and thereby get an overview of the amount that is committed for the rest of the fiscal year.

In addition, the commitment accounting system provides you with the ability to control purchase order entries against specific combinations of dimensions (company, account, and dimensions marked as relevant on the commitment rule) for which a budget is entered. Maconomy compares the budget for a dimension combination with the actuals in that dimension combination, the previous committed amount, and the actual registration. Using the commitment rules that you specify in the Commitment Rules workspace in the Budget module you can choose to use automatic control of the commitment accounting system and thereby control that the company's budget is not exceeded as regards creation and approval of purchase orders. See the description of the Budget Control, Commitment Rules, and Commitment Levels workspaces in the Budget module for more information about budget control, commitment accounting systems, and commitment rules and levels.

## Purchase Order Tab

This section includes the fields and descriptions for the Purchase Order tab.

### Purchase Order Island

Field	Description
<b>Purch. Order No.</b>	In this field you can enter a purchase order number, if the box "Manual Purchase Order Numbers" in the window System Parameters is checked. If you do not use manual numbering, or if you do not enter a number, Maconomy will automatically insert a number from the Purchase Order Numbers number series. Maconomy automatically allocates the next available purchase order number. The number cannot be changed here once the purchase order has been created.
<b>Requisition No.</b>	This field shows the number of the requisition to which the current order is assigned, if any. If the order was created from a requisition in the window Requisitions, the field shows the number of the requisition in question. If the order was created from a request for quote, the field shows the number of the requisition on which the request for quote was based.
<b>Request for Quote No.</b>	This field shows the number of the request for quote on which the current purchase order is based.
<b>Purchase Process Header</b>	This field shows the number and name of the purchase process of which the current purchase order is part.

Field	Description
<b>Our Ref.</b>	In this field, you enter the name of the person who created the purchase order. The name is printed on the purchase order. Then the vendor knows who to contact, if necessary. When you create a purchase order manually, Maconomy suggests the name from the vendor information card. If the field there is blank, Maconomy inserts the name of the current user. When creating a purchase order, you can change the name suggested by Maconomy, but you cannot leave the field blank.
<b>Buyer</b>	In this field, you can enter the name of the person who normally enters purchases from this vendor. When you create a purchase order manually, Maconomy suggests the name from the vendor information card, but you can select another.
<b>Requisitioner</b>	In this field, you can enter the number of the employee who requisitioned the items on the current purchase order. This field also shows the name of the specified requisitioner employee.
<b>Purchaser</b>	In this field, you can enter the number of the employee who is responsible for purchasing the items on the current purchase order. This field also shows the name of the specified purchaser employee.
<b>Time Unit</b>	By default, this field copies the value from the specified vendor's information. However, you can change the value up until a line is created in the purchase order. You can specify hours or days.
<b>Status</b>	In this pop-up field you select a status code for the purchase order. If the purchase order is manually closed due to lack of delivery or imperfect delivery from the vendor, you can enter the status in this field provided that these have been created as pop-up fields. In the field "Line Remarks," you can enter the reason for closure of the purchase order. By using the find menu, you are able to find all the purchase orders with the same type of status code.
<b>Purchase Transaction Type</b>	Use this field to select the type of the purchase transaction.

### Billing Address Island

Field	Description
<b>Vendor</b>	This is the number of the pay to vendor. The number is retrieved automatically from the vendor information card, but you can change it here. Furthermore, Maconomy checks that the vendor is not blocked. The two vendor numbers are not necessarily the same, since a delivery can come from one vendor and be paid to another. The other lines in this field show the vendor's name and address. When you create a purchase order manually, Maconomy suggests the information from the vendor information card, and it cannot be changed here.

Field	Description
<b>Attn.</b>	This field shows the vendor's attention person. When you create a purchase order manually, Maconomy suggests the name from the vendor information card, and it cannot be changed here.
<b>Country</b>	This is the vendor's country. It is retrieved from the vendor information card and cannot be changed here.

### Delivery Island

Field	Description
<b>Pref. Deliv. Date</b>	In this field, you enter your preferred delivery date, or the date you agreed with the vendor.
<b>Warehouse</b>	<p>Here you select the warehouse to which the items specified in the table part are to be shipped. Maconomy suggests the warehouse from the vendor information card, but you can change it.</p> <p>You can only order items for one warehouse in one purchase order. If you wish to order items for several warehouses from this vendor, you can direct them to the main warehouse and transfer them to your other warehouses after delivery using the window Inventory Change. Alternately, you can create one purchase order per warehouse.</p> <p>If you select a warehouse which is assigned to another company than the one specified in the island "Company," Maconomy will create intercompany balances when you post the item journal created as a result of the item receipt. In the intercompany balance, the company to which the warehouse is assigned will be the intercompany company.</p> <p>See the section "Multiple Companies" in the chapter "Introduction to the G/L Module" and the window Intercompany Accounts in the G/L module for a further description of the concept of responsible companies and intercompany balances.</p>
<b>Stock Location No.</b>	<p>In this field, you can specify the location in the selected warehouse at which you expect to receive the items. This location will apply to those lines in the table part where an item has been specified and the warehouse location field is left blank. If a warehouse location is specified on a given line, it overrules any location specified in this field. Maconomy suggests the standard receiving location specified for the current warehouse in the window Warehouse Information Card, but you can specify another location.</p> <p>It is not mandatory to enter location numbers in this window. However, the location information is also used in the window Purchase Receipt where the receipt of the items cannot be approved until you have either entered a location in the card part or on the individual item lines.</p>
<b>Delivery Mode</b>	In this field, you select how the items in the purchase order are to be delivered. When you create a purchase order manually, Maconomy suggests the value from the vendor information card. Delivery modes are maintained in the window Popup Fields in the Set-Up module.

Field	Description
<b>Delivery Terms</b>	In this field, you select the delivery terms. When you create a purchase order manually, Maconomy suggests the value from the vendor information card. Delivery terms are maintained in the window Popup Fields in the Set-Up module.
<b>Bill of Lading</b>	Here you can enter a text or number (for example, the way bill number) to later identify the delivery. Delivery information is normally given in the window Purchase Receipt. If this text or number is changed in the window Purchase Receipt, it is copied to this window next time the window is opened, but it can be changed.

### Price, Currency Island

Field	Description
<b>Currency</b>	In this field, you select the currency of the purchase order. When you create a purchase order manually, Maconomy suggests the value from the vendor information card, but you can select another. Currencies are maintained in the window Popup Fields in the Set-Up module.
<b>Item Price List</b>	<p>Here you select the price list from which to suggest prices for the items in the table part of the purchase order. Maconomy retrieves the price list from the Vendor Information Card in the Accounts Payable module, but you can select another. Price lists for items are created in the Price Lists window in the Inventory module.</p> <p>If you leave the field blank, Maconomy suggests the current warehouse's latest cost of each item in the table part.</p>
<b>Line Sum</b>	This is the sum of the prices in the purchase order lines (from the field "Price"), expressed in the currency of the purchase order. The value cannot be changed here.
<b>Invoice Discount %</b>	<p>Here you can enter an invoice discount percentage. When you create a purchase order manually, Maconomy suggests the value from the vendor information card, but you can change it.</p> <p>The invoice discount is deducted from the line sum, and this is shown on the purchase order printout. The vendor can then see how much you expect to be invoiced for.</p> <p>Note that an invoice discount % is added to any discount entered on individual purchase order table lines.</p>
<b>Invoice Discount</b>	In this field, you can enter an invoice discount amount, if the discount is specified as a fixed amount and not as a percentage. The amount will be allocated on the purchase order table lines when the purchase order is printed or allocated on an invoice. You cannot enter both a percentage in the field "Invoice Discount %" and an amount in this field. Note that an invoice discount is added to any discount entered on individual purchase order table lines.
<b>Expense %</b>	Here you can specify an expense percentage, for example, for a handling charge. You can enter an estimated expense percentage, based on previous charges.

Field	Description
	<p>Maconomy suggests the value from the Vendor Information Card, but you can change it.</p> <p>Expenses are added to the purchase order sum and apportioned to the individual lines, thus affecting the cost prices at item receipt and job accrual as well as in commitment accounts.</p> <p>If your company does not use purchase price lists, that is, if there are no purchase price lists in the system, the following applies to lines pertaining to items: Maconomy suggests the current warehouse's latest cost of the relevant items as unit price on each line, and this price includes any expense incurred when you last bought the item. This means that if you enter a figure in this field, Maconomy will calculate both expenses.</p>
<b>Delivery Costs</b>	<p>Here you can specify an amount representing expenses for items purchased on the current order, for example, for a handling charge. You can enter an estimated amount, based on previous charges.</p> <p>Expenses are added to the item sum and apportioned to individual items specified in the table part, when these are placed in the warehouse. This ensures costs are correct.</p> <p>If your company does not use purchase price lists for items, that is, if there are no purchase price lists for items in the system, the following applies to lines pertaining to items: Maconomy suggests the current warehouse's latest cost of the relevant item as unit price on each line pertaining to an item, and this price includes any expense incurred when you last bought the item. This means that if you enter a figure in this field, Maconomy will calculate both expenses.</p>
<b>Invoice Tax</b>	<p>This field displays the total invoice tax amount for the lines of the current purchase order.</p> <p>If multiple tax codes are enabled, the "Invoice Tax" field will be replaced by the following fields: "Invoice Tax Sum," "Invoice Tax, Level 1," "Invoice Tax, Level 2" and, if enabled, "Invoice Tax, Level 3." The "Invoice Tax Sum" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Invoice Amount</b>	<p>This field displays the total invoice amount including tax and discounts.</p>

### Vendor Information Island

Field	Description
<b>Department</b>	<p>In this field, you can enter the department which the purchase involves. When you create a purchase order manually, Maconomy suggests the value from the vendor information card, but you can select another.</p> <p>You maintain departments in the window Posting References in the G/L module.</p>

Field	Description
<b>Vendor Group</b>	This is the vendor group to which the vendor belongs. The value cannot be changed here, but you can change it in the vendor information card.
<b>Enterprise</b>	In this field, you can specify an enterprise. When you create a purchase order manually, Maconomy suggests the value for this field from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables. You maintain enterprises in the Popup Fields window in the Set-Up module.
<b>Segment</b>	In this field, you can specify a segment. When you create a purchase order manually, Maconomy suggests the value for this field from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables. You maintain segments in the Popup Fields window in the Set-Up module.
<b>Area</b>	In this field, you can specify an area. When you create a purchase order manually, Maconomy suggests the value for this field from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables. You maintain areas in the Popup Fields window in the Set-Up module.
<b>Tax No.</b>	In this field, you select the tax number for the purchase order. When you create a purchase order manually, Maconomy automatically suggests the value from the vendor information card in the window Payment Control, but you can change it here.
<b>Language</b>	In this field, you select the language of the purchase order. When you create a purchase order manually, Maconomy suggests the value from the vendor information card, but you can select another. The language code makes it possible to have Maconomy automatically print the purchase order in a layout matching the language of the vendor. You maintain languages in the window Popup Fields in the Set-Up module.
<b>Company Tax Code</b>	In this field, you must specify a company tax code created in the window Popup Fields. The field is used by Maconomy for determining the tax code to be used in the calculation of tax for the current purchase order, as the company tax code is part of the criteria for the selection of a tax code in the window Tax Tables in the G/L module. When selecting a tax code, Maconomy uses the tax table specified for the company responsible for the purchase order. However, the tax code is only selected from a tax table if you have chosen to use tax tables in the window System Information and if the company responsible for the current purchase order is assigned to a tax table. If no tax table is specified for the responsible company, if you use differentiated tax, and you do not use tax tables, Maconomy uses the tax code specified in the window Activities or Item Information Card for the activity or item on each purchase order line. If you use neither differentiated tax nor tax tables, Maconomy uses the standard tax code specified in the window System Information in the Set-Up module. If the purchase order is assigned to a vendor invoice, the reporting code is transferred to the vendor invoice. When the vendor invoice is posted, the

Field	Description
	<p>reporting code is used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if extended tax reporting has been selected in the window System Information.</p> <p>When you create a purchase order manually, Maconomy suggests the reporting code from the vendor's information card, but you can select another reporting code for the current purchase order.</p>

### Statistics to Tax Authorities Island

Field	Description
<b>Intrastat Reg.</b>	This field should be marked if the items delivered from the purchase order are to be included in the monthly report to Intrastat. If the "Intrastat Export Report" field in the System Information window is marked, Maconomy marks this field automatically if the vendor comes from another EU country and does not have a mark in the "Tax" field in the Payment Control window.
<b>Nature</b>	In this pop-up field, you select which type of transaction to report to Intrastat. The options are created in the Popup Fields window in the Set-Up module.
<b>EU Trade Type</b>	Here you select the trade type, which can be either "Normal" or "Triangulation." Triangulation implies that you are agent for a vendor in another EU country and an end customer in a third EU country. In this type of trade the invoice amount is not included in the EU purchases in your tax specification.

### Copying Island

Field	Description
<b>Purchase Order No.</b>	<p>In this field, you can enter the number of an existing purchase order, if you wish to use a copy of it. Depending on when you enter the number, Maconomy will react in one of two ways:</p> <p>If you enter a number before starting to complete a new purchase order, the information will be copied to the new purchase order. If you enter a vendor number, Maconomy will retrieve information from the vendor information card instead of from the old purchase order. Similarly, if you enter a job number, Maconomy copies the information from the job.</p> <p>If you enter a purchase order number in an already existing purchase order, the lines from the purchase order will be copied when you select "Copy Purchase Order" in the Action menu.</p>

### Approval Island

Field	Description
<b>Remarks</b>	In this field, you can enter a remark to the current approval line. However, a remark can only be entered by employees who have access to approving the current

Field	Description
	purchase order. The remark will be assigned to the current approval level. If the current purchase order has been closed and is being reopened, the contents of this field will be removed automatically by Maconomy. Note that the remark can always be seen on the current approval line in the table part of the window Approvals. See the description of the windows Approvals and Approval Hierarchies in the Set-Up module for further information on approval hierarchies.

**Status Island**

Field	Description
<b>Date Printed</b>	This field displays the date on which the purchase order was last printed. The date cannot be changed here.
<b>Quantity</b>	This field displays how many times the purchase order has been printed. The number does not include the number of copies selected in the computer's print dialog. The value cannot be changed here.
<b>Submitted</b>	This field displays whether the current purchase order has been submitted. The field is automatically marked by Maconomy upon selecting the action "Submit Purchase Order" in the Action menu. You cannot mark the field manually.
<b>Submitted by</b>	This field displays the name of the employee who submitted the current purchase order. The field is automatically filled in by Maconomy upon selecting the action "Submit Purchase Order" in the Action menu and cannot be changed manually.
<b>Date</b>	This field displays the date on which the current purchase order was submitted.
<b>Approved</b>	<p>If this field is marked, the current purchase order is fully approved. This is a sign that the amount on the purchase order lines is included in the commitment accounting system with the allocation combination entered on the line in question. You approve a purchase order by selecting the action "Approve Purchase Order." If approval hierarchies are used, you can also approve purchase orders in the window Approvals in the Set-Up module.</p> <p>However, this approval will automatically be cancelled by Maconomy if one or more fields on the line of importance to the value of the purchase order, such as quantity, balance and discount, are changed. If the purchase order line is changed, the purchase order must be reapproved. Nevertheless, it is possible to change the fields "Quantity Received," "Date Received" and "Line Remarks" without cancelling the approval of the purchase order in question.</p> <p>In the window Job Accruals in the Job/Cost module it is also possible to change fields on purchase order lines for job accruals, such as "For Accrual, Currency," "Quantity Received" and "Date Received" without cancelling the approval of the purchase order in question. If you change an approved purchase order line for job accruals, Maconomy will display a notification message. It is, however, still possible to make the correction and the changes can be inspected in the window Job Accruals in the Job/Cost module.</p>

Field	Description
<b>Approved by</b>	This field displays the name of the employee who performed the final approval of the current purchase order. If you use approval hierarchies for approval of purchase orders, and if the current purchase order has been approved by more than one employee, this field displays the name of the employee who made the latest approval of the purchase order.
<b>Date</b>	This field displays the date on which the current purchase order was fully approved.
<b>Closed</b>	This field shows whether the purchase order is closed. If this field is marked, the purchase order is closed. To mark the field, select the action "Close Purchase Order" in the Action menu. When the purchase order has been closed, you can no longer refer to it in the window Vendor Invoices. The mark in this field can only be removed by using the action "Reopen Purchase Order" in the Action menu. You can only use this action, if you have been given access to it in the window Actions in the Set-Up module.
<b>Closed by</b>	If the purchase order has been closed, this field displays the name of the user who closed the purchase order. The name in this field can only be removed by using the action "Reopen Purchase Order" in the Action menu. You can only use this action, if you have been given access to it in the window Actions in the Set-Up module.
<b>Date</b>	If the current purchase order has been closed, this field displays the date on which it was closed. If the purchase order is reopened by use of the action "Reopen Purchase Order," the date will automatically be removed from this field.

**Remarks Island**

Field	Description
<b>Remarks 1-10</b>	In this field, you can enter any remarks you wish to make about the purchase order.

**Vendor's Order Island**

Field	Description
<b>Order No.</b>	<p>In this field, you can enter the name of the sales order which corresponds to the purchase order. Often the buyer contacts the vendor before making the purchase order, to get a delivery date, and so on.</p> <p>In this situation, you are often asked to enter the vendor's sales order number on the purchase order. The number is printed on the purchase order.</p>
<b>Your Reference</b>	<p>In this field, you can enter the name of the person you dealt with, if, as above, you contacted the vendor before making the purchase order. The name is printed on the purchase order.</p> <p>When you create a purchase order manually, Maconomy suggests the name from vendor information card, but you can change it.</p>

Field	Description
<b>Our Cust. No.</b>	In this field, you can enter your company's customer number registered with the vendor. When you create a purchase order manually, Maconomy suggests the value from the vendor information card, but you can change it. The number is printed on the purchase order.

### Job Island

Field	Description
<b>Job No.</b>	<p>In this field, you can specify the number of a job in the Job Cost module, if the purchase order concerns a job. The job number can either be entered manually in this window or automatically by Maconomy, if the purchase order was created using the action "Create Purchase Order" in the window Job Budgets in the Job Cost module. If the purchase order was created from a requisition or request for quote on which a job was specified, this job number is also suggested in this field.</p> <p>If there is a job number here, it will automatically be suggested on the purchase order lines created in the table.</p> <p>If fixed exchange rate information has been specified for the job in question in the window Job Price Information, and the system parameter "Fixed exchange rates in budgets only" has not been marked, the currency conversion on the current purchase order is carried out according to the fixed exchange rate information specified for the job.</p> <p>If the system parameter "Allow purchase order for multiple jobs" has not been marked, the lines in the table part can only be assigned to the job specified in this field, and if this field is left blank, you cannot assign the purchase order lines to a job number. If the parameter has been marked, you can enter different job numbers on the purchase order lines.</p> <p>If the system parameter has been marked, changing the job number in this field will not influence existing purchase order lines. However, if the parameter has not been marked, the job number in this field must correspond to the field "Job No." in the table part of this window.</p>
<b>Job Name</b>	This field shows the name of the job specified in the field "Job No." above.
<b>Customer No.</b>	This field shows the number of the customer assigned to the job specified in the field "Job No." above, if any.
<b>Name</b>	This field shows the name of the customer shown in the field "Customer No." above, if any.

### Dispatching Address Island

Field	Description
<b>Vendor</b>	In this field, you enter the vendor number for the current purchase order. You can choose either to enter the vendor number when creating the purchase order or to create the purchase order without entering a vendor in case you have not yet decided

Field	Description
	<p>who is to deliver the goods. When you later receive and post a vendor invoice, the vendor will be transferred to the purchase order. Furthermore, Maconomy checks that the vendor is not blocked.</p> <p>You can change the vendor number on an existing purchase order as long as the purchase order has not been submitted. Please note that the information in a number of islands in the window will change if you change the specified vendor.</p> <p>The other lines in this field show the vendor's name and address. When you create a purchase order manually, Maconomy suggests the information from the vendor information card, but you can change it.</p>
<b>Attn.</b>	This field shows the vendor's attention person. When you create a purchase order manually, Maconomy suggests the name from the vendor information card.
<b>Country</b>	This is the vendor's country. When you create a purchase order manually, Maconomy suggests the vendor's state/country from the vendor information card.
<b>Phone</b>	This field shows the vendor's phone number. When you create a purchase order manually, Maconomy suggests the number from the vendor information card.
<b>Fax</b>	This field shows the vendor's fax number. When you create a purchase order manually, Maconomy suggests the number from the vendor information card.
<b>Telex</b>	This field shows the vendor's telex number. When you create a purchase order manually, Maconomy suggests the number from the vendor information card.
<b>E-mail</b>	In this field, you may enter the vendor's electronic mail address. This information is used for reference.

### Ship to Address Island

Field	Description
<b>Customer No.</b>	<p>In this field, you can enter the ship-to customer number. This is relevant if the purchase order is related to a job, and the vendor is delivering the items or services directly to your customer. When you enter a customer, Maconomy retrieves the customer's name and address from the customer information card. Name and address cannot be changed here.</p> <p>The Ship to Address can be added to the purchase order printout using Maconomy's layout editing tools.</p>
<b>Attn.</b>	Maconomy completes this field automatically if you enter a customer number in the field above. The name is taken from the customer information card and cannot be changed here.
<b>Country</b>	Maconomy completes this field automatically if you enter a customer number in the field above. The country is taken from the customer information card and cannot be changed here.

**Company Island**

Field	Description
<b>Company No.</b>	<p>In this field, you can enter the number of the company responsible for the request for quote. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>See the section “Multiple Companies” in the chapter “Introduction to the G/L Module” and the window Intercompany Accounts in the G/L module for a further description of the concept of responsible companies.</p> <p>This field also displays the name of the specified company.</p>
<b>Base Currency</b>	<p>This field displays the currency used as base currency in the company specified in the field “Company No.” above. See the field “Base Currency” in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.</p>

**Transaction Island**

Field	Description
<b>Transaction Type</b>	In this field, you can select the transaction type of the purchase order.

**Purchase Process Access Level Island**

Field	Description
<b>Name</b>	<p>In this field you can specify the name of an access level to apply to the purchase process to which the current request for quote is assigned. You only have access to the current purchase process and its requisition, requests for quote and purchase orders if you have been assigned to this level or a level above this in the window User Access Levels. This access control ensures that in other windows, you can only refer to and see information relating to purchase processes to which you have access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to purchase processes and its requisition, requests for quote and purchase orders may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section “Introduction to the Access Control System” in the Set-Up module.</p> <p>If no access level is specified, all users have access to the current purchase process.</p>
<b>Description</b>	This field shows a description of the access level specified in the field “Name” above.

### Payment Island

Field	Description
<b>Pmt. Terms</b>	<p>In this field, you select the payment terms. When you create a purchase order manually, Maconomy suggests the value from the vendor information card, but you can change it.</p> <p>You maintain payment terms in the window Popup Fields in the Set-Up module.</p>
<b>Self Invoice</b>	<p>By default, this check box copies the value from the specified vendor's information.</p> <p>If this field is selected and you click the <b>Create Self Invoice</b> action, a self-invoice is created from the purchase order.</p> <p>If this field is not selected, you can select it if you want to create a self-invoice from the PO when you click the action.</p>

### Dimensions Island

Field	Description
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, the standard value is transferred from the window System Parameters in the Set-Up module.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the purchase order in question. By assigning a document archive to a purchase order, you can keep track of the various documents related to the purchase. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.  This field also shows the description of the specified document archive.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.

**User Island**

See the chapter “Getting Started” for a description of the fields in the island User.

**Extra Fields Island**

Field	Description
<b>Popup 1-5</b>	In these fields, you can select a number of pop-up values for further specification of the vendor. When you create a purchase order or change the vendor number on an existing purchase order, Maconomy suggests the values from the vendor's information card, but you can change the values here. However, pop-up fields with a blank value on the information card of the vendor will not overwrite any manually specified value in this field. The options are created in the window Popup Fields in the Set-Up module.

**Purchase Order Lines Sub-Tab**

This section includes the fields and descriptions for the Purchase Order Lines sub-tab.

Field	Description
<b>Purchase Line Type</b>	Use this field to indicate the type of purchase the line represents. The available values are: <ul style="list-style-type: none"> <li>■ Fixed Asset</li> <li>■ Inventory</li> <li>■ Job Cost</li> <li>■ G/L</li> <li>■ Text Line</li> <li>■ Subcontractor Reconciliation</li> </ul>

Field	Description
<b>Job No.</b>	<p>In this field, you can enter the number of a job in the Job Cost module.</p> <p>If you capitalize at cost price, the purchase is debited the WIP (work in progress) account when you register the vendor invoice. If you are posting costs to profit and loss, the purchase is debited the P&amp;L account attached to the activity entered in the field "Activity No." in the table.</p> <p>Maconomy checks that the job exists, that it has order status, and that it is neither blocked nor closed. If you complete this field, you must complete the field "Activity No." and leave the field "Account No." blank.</p> <p>If employee control has been selected for the current job, you can only enter registrations for employees who appear in the latest revision of the planning budget of the current job. For more information about controlling employee registrations, please see the description of the window Jobs.</p>
<b>Activity No.</b>	<p>In this field, you enter the number of an activity in the Job Cost module, if the purchase order line is for a job. The number is copied to the field "Act. No." in the table part of the window Invoice Allocation if you enter the purchase order number when registering the vendor invoice in the window Vendor Invoices.</p> <p>Maconomy checks that the activity number exists, that it is an amount activity and that it is not blocked.</p> <p>If you have completed the field "Job No." in the card part of the window, you must enter an activity here and leave the field "Account No." blank.</p>
<b>Empl. No.</b>	<p>In this field, you can enter the number of the employee assigned to the purchase order line.</p> <p>The number is automatically transferred to the invoice allocation line if the purchase order is referenced in the window Vendor Invoices.</p>
<b>Account No.</b>	<p>In this field, you can enter an account number, if the purchase order is for items or services which you are posting directly to profit and loss, and which do not pertain to a job in the Job Cost module.</p> <p>The purchase is debited to the account when you enter the vendor invoice. The account number is transferred to the field "Account No." in the table part of the window Invoice Allocation, if you enter the purchase order number in the window Vendor Invoices.</p> <p>If you enter an account here, you cannot enter a job number in the field "Job No." in the card part or an activity in the field "Activity No." on the same line in the table.</p> <p>Maconomy checks that the account is an existing manual account and that it is not blocked.</p>
<b>Acct./Account Name</b>	<p>This field shows either the account text of the G/L account specified in the field "Account No.," or the text assigned to the activity entered in the field "Act. No." The text cannot be changed here.</p>
<b>Line Remarks</b>	<p>In this field, you assign a text to the purchase order line. It is printed on the purchase order. Maconomy suggests the text from the field "Acct./Activity Name," but you can change it.</p>

Field	Description
	The text here is transferred to the field “Entry Description” in the table part of the window Invoice Allocation if you refer to the purchase order number in the window Vendor Invoices.
<b>Item No.</b>	In this field, you can enter the item number of the item you wish to purchase. Maconomy verifies that the item number exists in the Item Information Card window. For items with inventory control, Maconomy will alert you if the vendor on the purchase order has not been registered as a vendor of the current item in the window Suppliers. Items with serial number registration at receipt cannot be ordered by means of this window. If you need to order such an item, you must do it using the window Item Purchase Orders in the Item Purchase module.
<b>Description</b>	If an item has been specified on the line, this field is used for entering a description of the item in question. Maconomy suggests the text from the Item Information Card in the Inventory module, but you can change it here.
<b>Quantity</b>	In this field, you enter the quantity of services or items ordered.
<b>Unit</b>	If an item has been specified on the line, this field shows the unit in which the item is registered in your warehouses. The value is retrieved from the “Unit, Purchase” field in the Item Information Card in the Inventory module. It cannot be changed here.
<b>Unit Price, Currency</b>	<p>In this field, you enter the unit price in the currency of the purchase order. You must enter an amount, and Maconomy checks that the amount is positive. The amount must be exclusive of tax.</p> <p>If the purchase order is created using the action “Create Purchase Orders” in the window Job Budgets, Maconomy updates the purchase order total on the corresponding line in the job budget, if the price is changed here.</p> <p>If the current line is assigned to an activity, Maconomy checks if the amount causes budget violations according to the rules set up in the job parameter attributes “Limit Purchase Amount to Budget,” “Limit Purchase on Sum or Line Level,” “Limit Purchase, Currency Margin” and “Limit Purchase, Percentage Margin” for the jobs specified on the individual lines. If the line causes a budget violation, an error message is displayed.</p>
<b>Pricing Unit</b>	If an item has been specified on the current line, this field shows the quantity of item units included in the unit price. The value is retrieved from the field “Unit, Purchase” on the Item Information Card and cannot be changed here.
<b>Discount %</b>	<p>In this field, you can specify a discount percentage applying to the current line. If you have specified an item on the line and if the conditions for getting a discount via an item discount agreement have been fulfilled on the current line, Maconomy suggests the percentage in question.</p> <p>You can change the suggested discount percentage in this field, but you cannot enter a percentage in this field as well as a discount amount in the field “Discount,” as these two fields are linked in such a way that the discount percentage is calculated on the basis of the discount amount.</p>

Field	Description
	If the current line is a text line, no value can be entered in this field.
<b>Discount, Currency</b>	<p>In this field you can enter a discount amount for the current purchase order line.</p> <p>If you also enter an invoice discount amount or an invoice discount % in the card part of the window, this discount will be added to the line discount. It is not possible to enter both an invoice discount amount and invoice discount % in the card part of the window.</p>
<b>Price, Currency</b>	<p>This field shows the price of the purchase order line in the currency of the purchase order. The amount is calculated as quantity times unit price less any discount. If you manually enter an amount in this field, Maconomy will recalculate the unit price based on the total amount in this field.</p> <p>If the current line is assigned to an activity, Maconomy checks if the amount causes budget violations according to the rules set up in the job parameter attributes "Limit Purchase Amount to Budget," "Limit Purchase on Sum or Line Level," "Limit Purchase, Currency Margin" and "Limit Purchase, Percentage Margin" for the jobs specified on the individual lines. If the line causes a budget violation, an error message is displayed.</p>
<b>Tax Code</b>	<p>In this field, you specify a G/L tax code for tax receivable to be used for calculation of tax on the current line. You can select another code or leave the field blank, if the invoice is not subject to tax.</p> <p>Maconomy suggests a tax code on the basis of the following procedure:</p> <p>If a G/L tax table has been specified in the window Company Information, a G/L tax code will be transferred from the G/L tax table on the basis of the information registered on the current purchase order and the current line. When searching for a line in the G/L tax table from which to derive a tax code, Maconomy searches for a match between the value in the field "Account No." on the tax table lines and a reference account which depends on whether an account, an activity or an item has been specified on the current line. If no line is found in the G/L tax table corresponding to the current line's registrations and the reference account, or if no G/L tax table has been specified for the current company, Maconomy will suggest the G/L tax code specified for the reference account in question in the window Account Information Card.</p> <p>As mentioned, the reference account depends on whether the current line contains an account number or an activity number. If the line contains an account number, the reference account is the account in question. If the line contains an activity, the reference account is the account specified as the P&amp;L account in the information card of the activity in question. If the line contains an item, the reference account will be the account specified as account for non-reconciled vendor entries in the A/P Control Account to which the current vendor is assigned. The references to these accounts are made by means of dimension combinations.</p> <p>You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters window. When multiple tax codes are enabled, the "Tax Code" field will be replaced by the</p>

Field	Description
	following fields: "Tax Code 1," "Tax Code 2" and, if enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Tax Amount, Currency</b>	This field displays the tax amount for the current purchase order line. If multiple tax codes are enabled, the "Tax Amount, Currency" field will be replaced by the following fields: "Total Tax Amount, Currency," "Tax Amount 1, Currency," "Tax Amount 2, Currency" and, if enabled, "Tax Amount 3, Currency." The "Total Tax Amount, Currency" field calculates the sum of the other individual tax amount fields. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Item Tax Code</b>	<p>In this field, you must specify an item tax code created in the window Popup Fields. The field is used by Maconomy for determining the tax code to be used in the calculation of tax for the current purchase order line, as the reporting code is part of the criteria for the selection of a tax code in the window Tax Tables in the G/L module. When selecting a tax code, Maconomy uses the tax table specified for the company responsible for the purchase order. However, the tax code is only selected from a tax table if you have chosen to use tax tables in the window System Information and if the company responsible for the current purchase order is assigned to a tax table. If no tax table is specified for the responsible company, if you use differentiated tax, and you do not use tax tables, Maconomy uses the tax code specified in the window Activities for the activity on each purchase order line. If you use neither differentiated tax nor tax tables, Maconomy uses the standard tax code specified in the window System Information in the Set-Up module.</p> <p>If the purchase order is assigned to a vendor invoice, the reporting code is transferred to the vendor invoice. When the vendor invoice is posted, the reporting code is used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if extended tax reporting has been selected in the window System Information.</p> <p>Maconomy suggests the reporting code from the account or activity, but you can select another reporting code for the current purchase order line.</p>
<b>Delivery Date</b>	In this field, you enter the delivery date.
<b>Confirmed Deliv. Date</b>	<p>The functionality of this field is mainly used in connection with item lines. If no item has been specified for the line, no value is suggested, and the field is for information only.</p> <p>If you have specified an item on the line, you can in this field enter the date which the supplier has confirmed as the day the items will be delivered. When you do so, the specified date is copied to the field "Expected Availability Date." If you change the confirmed delivery later, and the dates in this field and the field "Expected Availability Date" are identical, or if the confirmed delivery was blank before you entered a new date, the new confirmed delivery</p>

Field	Description
	<p>date will cause the expected availability date to be changed accordingly, as Maconomy will then assume that the items should be available on the confirmed delivery date. However, if you manually specified an expected availability date at the same time as entering a new confirmed delivery date, the manually entered expected delivery date is not overwritten.</p> <p>Note that you can manually specify another expected availability date in the field "Expected Availability Date," for instance if experience tells you that the supplier usually delivers earlier or later than he confirms, or if the items will not be at your disposal immediately after arrival.</p>
<b>Expected Availability Date</b>	<p>In this field, you can enter the date on which you expect the items or activities on the current line to be at your disposal. The functionality of the field is mainly used in connection with item lines. If no item has been specified for the line, no value is suggested, and the field is for information only.</p> <p>If you have specified an item which uses inventory profile, this date is used as the date on which the purchase volume represented by the current line will be added to the stock.</p> <p>When creating a line where an item number is specified, the date is determined as follows:</p> <p>If no preferred delivery date has been specified in the card part, Maconomy calculates a delivery date by checking the supplier's delivery time for the item to the current warehouse in the window Suppliers and adds it to today's date. If a week calendar has been specified in the vendor information card of the supplier, Maconomy also adds the number of days within the delivery time on which the vendor's business is closed, thus compensating for, for example, weekends and holidays. If a preferred delivery has been specified in the card part, Maconomy performs the same calculation and assigns this date unless the field "Deliv. Date" on the line contains a later date, in which case the later date is used. When the line has been created, you can change the date manually, for instance if the items will not be at your disposal immediately after arriving or if experience tells you that the supplier usually delivers earlier or later than stated. If you change the delivery date later, and the delivery date on the line is identical to the date in this field, or if the confirmed delivery was blank before you entered a new date, a change in the delivery date will cause the expected availability date to be changed accordingly, as Maconomy will then assume that the items should be available on the delivery date. However, if you manually specified an expected availability date at the same time as entering a new confirmed delivery date, the manually entered expected delivery date is not overwritten.</p> <p>Note that a manually entered expected availability date will not affect the delivery date.</p>
<b>Date Received</b>	In this field, you enter the date the delivery actually took place.
<b>Quantity Received</b>	In this field, you enter the quantity actually delivered.

Field	Description
<b>Registration Code</b>	In this field you can enter a registration code from the window Registration Codes in the G/L module. The registration code is used instead of manually entering a number of dimension values on the current line. See the description of the window Registration Codes for more information about registration codes.
<b>Company No.</b>	<p>When creating a purchase order line, Maconomy suggests the company from the Dimension island in the card part of the window. If the current purchase order line is entered for another company than the one suggested, you can enter its name here. The value in the card part of the window is derived either from the job or the user, depending on the priorities set up in the window Dimension Derivations in the G/L module.</p> <p>When creating purchase order lines, the value for the Company dimension of the previous line is suggested on the new line. The company name is however not suggested if a company name was entered manually on the line.</p>
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the field "Location" in the card part of the window.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Task</b>	For lines with a job number, it is here possible to enter a task. If you enter a value in the field, Maconomy checks that a task list has been assigned to the job and that the listing contains the specified task.
<b>Stock Location No.</b>	<p>In this field, you can specify a stock location number. If the current line does not contain an item number, the field is for information only.</p> <p>If you have specified an item on the current line, you can specify in this field the location in the selected warehouse at which you expect to receive the</p>

Field	Description
	<p>items. If you leave this field blank, the location number specified in the card part of the window will apply to the line.</p> <p>It is not mandatory to enter location numbers in this window. However, the location information is also used in the window Purchase Receipt where the receipt of the items cannot be approved until you have either entered a location in the card part or on the individual item lines.</p>
<b>Remarks</b>	In this field, you can enter a note related to the current line.
<b>Internal Desc.</b>	This field shows the internal description from the Item Information Card, if you have specified an item on the current line. You can change it here. If you have not specified an item on the line, you can enter a text in the field for information purposes.
<b>Discount Desc.</b>	<p>This field shows the discount description from a discount agreement, if you have specified an item on the line, and an item discount has been granted as a result of the line meeting the criteria in an item discount table. You can change the suggested text in this field.</p> <p>If you have manually entered a discount on the item line, you can enter a description of the discount in this field. The description is included on the printout of the item purchase order.</p> <p>If the current line is a text line, no value can be entered in this field.</p>
<b>Note No.</b>	<p>If a standard note has been specified for either the task or the activity entered on the line, a copy of the standard note from the task or activity in question is automatically created when creating a line, and the copy is assigned to the new line by means of this field. If a standard note has been specified for both the activity and the task, the setting of the system parameter "Standard note is derived from Activity before Task" determines which of the notes is to be used.</p> <p>In some cases, the information on a given task or activity is not specific enough, as certain details may change from order to order. For instance, if the activity is for a print job, the basic information about the activity is static, but each time a printing job is ordered, you may wish to also register such information as the paper quality, binding, and so on. It is therefore useful to add a number of fields so that a user ordering a print job is allowed to enter this information. Once the line has been created and this field has automatically been completed, you can enter the additional information by opening the window Notes in the Set-Up module, selecting the note in this field, and specifying the relevant data in the table part.</p> <p>For further information on the use and set-up of additional fields through notes, see the description of the system parameter "Standard note for purchase lines" in the Set-Up module.</p> <p>The information entered in the note is also printed on external documents.</p>
<b>Note Description</b>	This field shows a description of the note specified in the field "Note No." above.

Field	Description
<b>Price, Base</b>	This is the price in the field "Unit Price," converted into the base currency. The amount cannot be changed here.
<b>Tax Amount, Base</b>	This is the tax amount on the amount in the "Price, Base," expressed into the base currency. The amount cannot be changed here. If multiple tax codes are enabled, the "Tax Amount, Base" field will be replaced by the following fields: "Total Tax Amount, Base," "Tax Amount 1, Base," "Tax Amount 2, Base" and, if enabled, "Tax Amount 3, Base." The "Total Tax Amount, Base" field calculates the sum of the other individual tax amount fields. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Discount, Base</b>	The functionality of this field is similar to the functionality of the field "Price" above.
<b>Quantity Invoiced</b>	This field displays the number of vendor invoices on the current line that have been invoiced. Only invoices that have been registered in the window Vendor Invoices with a specification of a purchase order number will be included in the quantity.
<b>Invoiced, Currency</b>	This field shows the amount received in vendor invoices in the currency of the purchase order. The calculation only includes invoices registered in the window Vendor Invoices with a specification of purchase order number.
<b>Invoiced, Base</b>	This field shows the amount received in vendor invoices in the base currency. The calculation only includes invoices registered in the window Vendor Invoices with a specification of purchase order number.
<b>Number Accrued</b>	This field displays the number of items on the purchase order line that have been marked for accrual in the window Job Accruals. The field cannot be changed in this window.
<b>Accrued, Currency</b>	This field displays the collective value of the item on the purchase order line that has been marked for accrual in the window Job Accruals. The amount is displayed in the currency of the purchase order.
<b>Accrued, Base</b>	This field displays the collective value of the item on the purchase order line that have been marked for accrual in the window Job Accruals. The amount is displayed in the base currency of the purchase order.
<b>Closed</b>	You can mark this field to show that the purchase order line is closed. Maconomy automatically marks this field when the vendor invoice is posted, if you have marked the field "Close Purchase Order Line" in the window Invoice Allocation. The field cannot be changed on a closed purchase order. When you select the action "Close Purchase Order," this field will be marked on all lines on the purchase order. If the action "Reopen Purchase Order" is selected, this field will remain marked, regardless of its status before the purchase order was closed. You can then unmark the field individually as needed.

Field	Description
<b>Base Currency, Company</b>	This field displays the base currency of the company on the current line.
<b>Committed, Company</b>	This field displays the committed amount for the company on the current line. The amount is in base currency.
<b>Committed, Base</b>	This field shows the committed amount of the line in base currency. Once the vendor invoice which is created on the basis of the purchase order is posted, the amount in this field is deducted from the commitment accounting and the amount in this field is reduced by the same amount. If the purchase order or the purchase order line is closed, the amount is no longer included in the commitment accounts.
<b>Committed, Currency</b>	This field corresponds to the field "Committed, Base" in the table part of this window. The only difference is that the amount in this field is in the currency which is used for the transaction.
<b>Date Committed</b>	This field shows when the amount was included in the commitment accounts.
<b>Accrual Type</b>	If you mark this field, the cost will be accrued. You can only accrue a posting if a G/L account has been selected. If you select accrual, Maconomy will create a G/L entry on the specified G/L account for each G/L period specified in the fields "Period From" and "Period To." The amount is distributed evenly on the selected periods.
<b>Period From, Accrual</b>	In this field and the field "Period To" you can enter a range of dates. If you mark the field "Accrue" above, Maconomy will create a G/L entry on the specified G/L account for each G/L period specified in the fields "Period From" and "Period To." The amount is distributed evenly on the selected periods.
<b>Period To, Accrual</b>	See the field "Period From" above.
<b>Transaction Type</b>	In this field, you can enter the transaction type for the purchase order line. When creating a purchase order line, the transaction type will be copied from the header to the line, if both header and line have the same company number. Otherwise it will be derived.
<b>Job Name</b>	This field displays the name of the job specified in the field "Job No." on the line. The information is retrieved from the window Jobs and cannot be changed here.
<b>Task Description</b>	This field displays the description of the task entered in the field "Task" on the current reallocation line.

Field	Description
<b>Job Budget Line No.</b>	If the current line was created from a job budget line, this field shows the number of the budget line in question.
<b>Job Budget Line WBS Description</b>	This field summarizes the placement of the job budget lines in the job budget WBS (work breakdown structure).
<b>Employee Name</b>	This field displays the name of the employee specified in the field "Empl. No."
<b>Orig. Quantity</b>	In this field, you can enter the quantity that was originally ordered. When new purchase order lines are created, the value entered in the field "Ordered" is automatically copied to this field. The value can, however, be changed if this is required.
<b>Vendor Item No.</b>	If you have specified an item on the current line, you can specify in this field the vendor's item number. For items with inventory control, the value is automatically retrieved from the current combination of warehouse and vendor in the window Suppliers, but the number can be changed in this field. If you specify a value here, it is printed on the purchase order instead of your own item number. This makes it easier for the vendor to identify the item.
<b>Vendor Item Desc.</b>	If you have specified an item on the current line, you can specify in this field the vendor's description of the item. For items with inventory control, text is retrieved from the current combination of warehouse and vendor in the window Suppliers, but the text can be changed in this field. If you specify a text here, it is printed on the purchase order instead of your own item text.
<b>Price at Step 1</b>	If you have specified an item on the current line, this field shows the price of one unit of the item, if the order is assigned to a price list and the item is included in the price list. The value cannot be changed manually.
<b>Quantity Disc.</b>	If you have specified an item on the current line and the quantity ordered justifies a quantity discount according to the price list, this field shows the discount amount in question.
<b>Duty Code</b>	If you have specified an item on the current line, this field shows a code for the duty to be calculated if the vendor is from a foreign country. The duty code is transferred from the item information card in connection with the creation of a purchase order. The duty code in this field cannot be changed.
<b>Extra Text 1-10</b>	In these fields, you can enter supplementary text for a further description of the current line. If you have specified an item on the line, Maconomy suggests this value from the corresponding fields in the item information card. You can change the suggested texts.
<b>Popup 1-5</b>	In these fields, you can enter various information about the current purchase order line. If you have specified an item on the current line, Maconomy suggests the values selected in the corresponding fields on the current item's

Field	Description
	information card, but you can change the values for the current purchase order line in these fields. The options are created in the window Popup Fields the Set-Up module.
<b>Date 1-5</b>	In these fields, you can enter various dates related to the current purchase order line.
<b>To Be Invoiced</b>	<p>This field displays the amount allocated but not yet approved.</p> <p>Only after vendor invoice amounts are posted does Maconomy make the deduction from the amount displayed here.</p> <p>While this field is not displayed by default, you can customize the view to display it.</p>
<b>To Be Invoiced, Base</b>	<p>This field displays the amount available for invoicing in the base currency.</p> <p>Only after vendor invoice amounts are posted does Maconomy make the deduction from the amount displayed here.</p> <p>While this field is not displayed by default, you can customize the view to display it.</p>
<b>To Be Invoiced, Enterprise</b>	<p>This field displays the amount available for invoicing in the enterprise currency.</p> <p>Only after vendor invoice amounts are posted does Maconomy make the deduction from the amount displayed here.</p> <p>While this field is not displayed by default, you can customize the view to display it.</p>
<b>Activity Type</b>	<p>In this field, you can specify the type of activity, depending on the activity selected. You can specify amount or time.</p> <p>This field is only displayed by default if you set the purchase transaction type to "subcontractor" in the Purchase Order tab of this workspace, or in the equivalent wizard.</p>
<b>Agreement Type</b>	<p>In this field, you can specify the type of agreement. You can specify Fixed Price, or Time and Material.</p> <p>The default value is Time and Material.</p> <p>This field is only displayed by default if you set the purchase transaction type to "subcontractor" in the Purchase Order tab of this workspace, or in the equivalent wizard.</p>
<b>Period Start</b>	<p>In this field, you can specify the start of the period covered by the purchase order line.</p> <p>This field is only displayed by default if you set the purchase transaction type to "subcontractor" in the Purchase Order tab of this workspace, or in the equivalent wizard.</p> <p>If the <b>Period Start</b> and <b>Period End</b> fields are filled out, Maconomy uses their values to validate whether the PO line can be used in a time or expense sheet line.</p>

Field	Description
<b>Period End</b>	<p>In this field, you can specify the end of the period covered by the purchase order line.</p> <p>This field is not displayed by default, but you can customize the view to display it.</p> <p>If the <b>Period Start</b> and <b>Period End</b> fields are filled out, Maconomy uses their values to validate whether the PO line can be used in a time or expense sheet line.</p>

## Actions

This section shows the actions available in the Purchase Orders single dialog workspace.

### Purchase Order Tab

Field	Description
<b>Create Self Invoice</b>	<p>Click this action to create a self-invoice from the purchase order.</p> <p>The purchase order must be marked for self-invoicing.</p>

## Purchase Order Asset Drafts Workspace

Use this workspace to create or add asset drafts from purchase order lines.

An asset draft is used in the purchase process flow.

### Purchase Order Line Tab

This section includes the fields and descriptions for the Purchase Order Line tab.

### Purchase Order Line Island

Field	Description
<b>Date Committed</b>	This field displays the date the purchase order was committed.
<b>Delivery Date</b>	This field displays the date the purchase was delivered.
<b>Line Remarks</b>	This field displays line remarks.
<b>Job No.</b>	This field displays the job number.
<b>Activity No.</b>	This field displays the activity number.
<b>Account No.</b>	This field displays the account number.

Field	Description
<b>Act./Account Name</b>	This field displays the combined activity and account number.
<b>Company</b>	This field displays the name of the company.
<b>Purch. Order No.</b>	This field displays the purchase order number.
<b>Purchase Line Type</b>	<p>This field indicates the type of purchase that the line represents. The available values are:</p> <ul style="list-style-type: none"> <li>Fixed Asset</li> <li>Inventory</li> <li>Job Cost</li> <li>G/L</li> <li>Text Line</li> <li>Subcontractor Reconciliation</li> </ul>

#### Committed Amount Island

Field	Description
<b>Committed, Company</b>	This field displays the committed amount for the selected company.
<b>Base Currency, Company</b>	This field displays the base currency of the selected company.
<b>Committed, Currency</b>	This field displays the committed currency of the selected company.
<b>Unit Price Currency</b>	This field displays the unit price currency for the selected company.

#### Asset Draft Sub-Tab

This section includes the fields and descriptions for the Asset Draft sub-tab.

Field	Description
<b>Asset Group</b>	If Asset Number is filled, Asset Group will be automatically filled in. If no Asset Number is given, Asset Group is mandatory.
<b>Asset Sub-Group</b>	Use this field to enter an asset sub-group. This allows you to work with a sub-division of the traditional asset groups.
<b>Asset Transaction Type</b>	One of the following:

Field	Description
	<ul style="list-style-type: none"> <li>Acquisition: <ul style="list-style-type: none"> <li>You will need to enter Asset Group or Asset Number, the other fields are filled in, but can be changed.</li> </ul> </li> <li>Improvement: <ul style="list-style-type: none"> <li>Asset Number is mandatory</li> <li>Quantity = 1</li> </ul> </li> </ul> <p>Only the fields that also occur in Asset Entries are editable, except Asset Group that follows the asset number.</p>
<b>Number of Assets</b>	This field displays the number of assets in the draft.
<b>Employee No.</b>	This field displays the employee number if an employee number is selected.
<b>Asset No.</b>	This field is mandatory if adjustment is to an existing fixed asset; otherwise it is left blank.
<b>Description</b>	This field displays the description of the asset.
<b>Cost, Currency</b>	This field displays the acquisition price for the asset.
<b>Cost, Base</b>	The field displays the acquisition price for the asset in base currency
<b>Acquired</b>	This field displays the asset acquisition date.
<b>Acquisition Responsible</b>	This field displays the name of the person responsible for the asset acquisition.
<b>Depreciation Method</b>	This field displays the depreciation method used.
<b>Depreciation Period</b>	This field displays the depreciation period.
<b>Post Depreciation as Job Entry</b>	When depreciating an asset, if this value is set, a job entry is posted. When the asset draft is created it gets the value from the asset group. You can edit this field.
<b>Job No.</b>	The asset that is created gets this job number if the asset transaction type is acquisition and no asset number is on the asset draft. This field is read-only.
<b>Activity</b>	The asset that is created gets this activity if the asset transaction type is acquisition and no asset number is on the asset draft. This field is read-only.

Field	Description
<b>Task Name</b>	The asset that is created gets this task if the asset transaction type is acquisition and no asset number is on the asset draft. This field is read-only.
<b>Description</b>	This field displays the description of the asset.
<b>Model</b>	This field displays the asset model.
<b>Located</b>	This field displays the location of the asset.
<b>Responsible</b>	This field displays the person responsible for the asset draft.
<b>Serial No.</b>	This field displays the asset series number.
<b>Internal Serial No.</b>	This field displays the asset internal serial number.
<b>Manual Depreciation</b>	This field displays the manual depreciation.
<b>Company No.</b>	This field displays the company number.
<b>Location</b>	This field displays the value that you entered for the dimension Location.
<b>Entity</b>	This field displays the value that you entered for the dimension Entity.
<b>Project</b>	This field displays the value that you entered for the dimension Project.
<b>Purpose</b>	This field displays the value that you entered for the dimension Purpose.
<b>Spec. 1–3</b>	This field displays the value that you entered for the dimensions Spec. 1–3.
<b>Local Spec. 1–3</b>	This field displays the value that you entered for the dimensions Local Spec. 1–3.
<b>Technical Data 1–3</b>	These fields display any technical data relating to the asset acquisition.
<b>Remarks 1–10</b>	These fields display any remarks relating to the asset draft.

## Purchase Receipt Workspace

Use this workspace to record the receipt of services and items ordered via purchase orders.

A purchase order must be approved in the Purchase Orders workspace before you can record receipts against it.

The tab displays general information about the current purchase order. The sub-tab displays the individual items, activities, and account entries that were ordered on the purchase order. A purchase order must be approved in the Purchase Orders workspace before you can enter receipt here.

You can enter receipt of items as well as activities and purchases entered to accounts. The entry of receipt affects the item inventories (for item lines only) and provides a basis for easy invoice allocation when an invoice is received.

To record receipt, you first select the relevant purchase order in the tab of the workspace. Next, you specify how many units you received for each line. You cannot change any prices here. Prices are determined in the Purchase Orders workspace. After you enter the relevant number of units received for each line, you enter a packing slip number in the tab and use the **Approve Receipt** action to approve the receipt. When you approve the receipt, Maconomy enters items that have inventory control in their proper warehouses and warehouse locations and updates item costs as described for the **Approve Receipt** action. For lines that do not pertain to an item, the relevant number of units are merely entered as approved, because no cost price updating or inventory entries are done. You can thus use the receipt entries of such lines for lookup and reporting purposes.

When you approve a receipt, automatic backorder allocation regarding items received only happens if you select the **Automatic Back Order Receipt** field in the System Information workspace, and you use the **By Reservation** Back Order method. Backorder allocation occurs when an item is received. The quantity for packing on order and BOM lines is set at the number of items in backorder, and the new items thus do not count as available stock.

After you approve a receipt, you can use the delivery note number when entering the vendor invoice that covers the items and services entered as received. For more information, see the description of the **Packing Slip No.** field in the Vendor Invoices workspace.

In the Inventory Change workspace in the Inventory module, you can enter item receipts that are not related to any purchase order.

### Purchase Receipt Tab

This section includes the fields and descriptions for the Purchase Receipt tab.

#### Purchase Order Island

Field	Description
<b>Order No.</b>	This is the number of the purchase order. The value cannot be changed here.
<b>Requisition No.</b>	This field shows the number of the requisition on which the current purchase order is based.

Field	Description
<b>Request for Quote No.</b>	This field shows the number of the request for quote on which the current purchase order is based.
<b>Purchase Process Header</b>	This field shows the number and name of the purchase process of which the current purchase order is part.
<b>Our Ref.</b>	This field shows the name of the reference person on the purchase order.
<b>Buyer</b>	This field shows the name of the person who normally enters purchases from this vendor. This makes it possible for the vendor to know who to contact with matters concerning the purchase order.
<b>Handled by</b>	In this field, you can enter the name of the person who received the items or services or entered the receipt. Maconomy suggests the name of the current user. The field must be completed.
<b>Requisitioner</b>	This field shows the number of the employee who requisitioned the items and/or services on the current purchase order. This field also shows the name of the specified requisitioner employee.
<b>Purchaser</b>	This field shows the number of the employee who is responsible for purchasing the items and/or services on the current purchase order. Maconomy suggests the employee number assigned to the user who created the order if an employee has been specified for this user in the window Users. This field also shows the name of the specified purchaser employee.
<b>Status</b>	In this field, you can select a status code for the purchase order to indicate its current status. The options in the field are created as options in the pop-up field type "Requisition Status" in the window Popup Fields in the Set-Up module.

### Delivery Island

Field	Description
<b>Warehouse</b>	<p>This is the warehouse to which items specified in the table part are shipped. The warehouse is specified in the purchase order.</p> <p>Only one warehouse can be specified on each order. If you wish to, for example, buy items for several warehouses from this vendor, you must either create separate purchase orders for the individual warehouses in question or direct all the items to the main warehouse using one purchase order and transfer them to your other warehouses after delivery. You do this in the Inventory Change window.</p> <p>If you select a warehouse assigned to another company than the one shown in the field "Company No." in the island Company, Maconomy will automatically create intercompany balances when you post the item journal created as a result of the item receipt. In the intercompany balances, the</p>

Field	Description
	company to which the warehouse is assigned will be the intercompany company. See the section “Multiple Companies” in the chapter “Introduction to the G/L Module” and the window Intercompany Accounts in the G/L module for a further description of the company-specification on warehouses and intercompany balances.
<b>Stock Location No.</b>	In this field, you can specify the location in the current warehouse at which items in the table part are received. This location will apply to those lines in the table part where the warehouse location field is left blank. If a warehouse location is specified on a given line, it overrules any location specified in this field. Maconomy suggests the receiving location specified on the purchase order, but you can specify another location.
<b>Delivery Mode</b>	This field shows the delivery mode specified in the purchase order.
<b>Delivery Terms</b>	This field shows the delivery terms specified in the purchase order.
<b>Bill of Lading</b>	Here you can enter a text or number, for example, the bill of lading number, to later identify the delivery.

### Company Island

Field	Description
<b>Company</b>	<p>This field shows the number of the company responsible for the purchase order. If the warehouse on the purchase order is assigned to another company than the one shown in this field, Maconomy will automatically create intercompany balances at the posting of the item journal created as a result of the item receipt. In the intercompany balancing, the company in this field will be the responsible company. See the section “Multiple Companies” in the chapter “Introduction to the G/L Module” and the window Intercompany Accounts in the G/L module for a further description of the concept of responsible companies and intercompany balances.</p> <p>This field also shows the name of the specified company.</p>

### Receipt Island

Field	Description
<b>Date Received</b>	In this field, you can enter a date of receipt to be used for the receipt instead of today's date. At the creation of the item receipt, Maconomy suggests today's date and the field can then be adjusted to an earlier but not a future date. The field can only be adjusted if you have selected “Allow Back Dating” in the window System Information. For rules regarding back dating, see the description of the mentioned check box.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	This field shows the number of the document archive assigned to the current purchase order. This field also shows the description of the document archive.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.

**Vendor's Order Island**

Field	Description
<b>Order No.</b>	This field shows the number of the vendor's sales order. It is retrieved from the Purchase Orders window.
<b>Packing Slip No.</b>	Here you enter the number of the delivery note which accompanied the delivery. You must enter a value for reference. If the receipt includes any items, the delivery note number is printed on the item transaction created when you select the action "Approve Receipt."
<b>Your Reference</b>	This field shows the reference entered in the Purchase Orders window when the order was created, for example, the name of the person with whom the purchaser spoke about the order.
<b>Our Cust. No.</b>	This field shows your customer number with the vendor. It is retrieved from the purchase order.

**Job Island**

Field	Description
<b>Job No.</b>	This field shows the number of the job to which the current purchase is assigned.
<b>Job Name</b>	This field shows the name of the job specified in the field "Job No." above.

**Dispatching Address Island**

Field	Description
<b>Vendor</b>	This field shows the number of the vendor delivering the items and/or services in the purchase order. The other lines in this island show the vendor's name and address. The text cannot be changed here.
<b>Attn.</b>	This field shows the attention person at the vendor. The name of the person is transferred from the vendor information card and cannot be altered here.
<b>Zip Code</b>	This field shows the zip code for the address of the vendor.

### Price Island

Field	Description
<b>Currency</b>	This is the currency of the purchase order.
<b>Total</b>	This is the price total of the lines in the purchase order. The value cannot be changed manually.
<b>Invoice Discount %</b>	This is the invoice discount percentage specified in the purchase order. The value cannot be changed here. For lines with items, any invoice discount is deducted from the prices of the individual lines, before the items are placed in the warehouse. This ensures that costs are correct.
<b>Invoice Discount, Currency</b>	This is the invoice discount amount specified in the purchase order. The value cannot be changed here. For lines with items, any invoice discount is deducted from prices for the individual item lines, before the items are placed in the warehouse. This ensures that costs are correct.
<b>Expense %</b>	This is the expense percentage specified in the purchase order. The value cannot be changed here. For further information on the effects of the field, see the description of the corresponding field in the window Purchase Orders.
<b>Delivery Costs</b>	Here you can specify an amount representing expenses for the purchase, for example, for a handling charge. You can enter an estimated amount, based on previous charges. For further information on the effects of the field, see the description of the corresponding field in the window Purchase Orders.

### Extra Fields Island

Field	Description
<b>Popup 1-5</b>	These fields show various information entered in the corresponding fields in the window Purchase Orders.

### Purchase Receipt Lines Sub-Tab

This section includes the fields and descriptions for the Purchase Receipt Lines sub-tab.

Field	Description
<b>Item No.</b>	If the current line pertains to an item, this field shows the number of the item in question. The value cannot be changed here.
<b>Deliv. Item No.</b>	If the current line pertains to an item, this field shows the vendor's item number from the purchase order. The number probably also appears on the vendor's delivery note and invoice for which you are entering the receipt.

Field	Description
	Maconomy suggests the value from the corresponding field on the purchase order, but the value can be changed here.
<b>Account No.</b>	This field shows the number of the account specified on the current line, if the current line pertains to an account. The value cannot be changed here.
<b>Job No.</b>	This field shows the number of the job specified on the current line, if the current line pertains to the purchase of services in connection with a job. The value cannot be changed here.
<b>Activity No.</b>	This field shows the number of the activity specified on the current line, if the current line pertains to the purchase of services in connection with a job. The value cannot be changed here.
<b>Ordered</b>	This is the quantity ordered on the current line. The value cannot be changed here.
<b>Balance</b>	<p>This field shows how many units ordered have not yet been delivered. Maconomy updates the balance when you select the action "Approve Receipt" after entering receipt.</p> <p>When you close the purchase order (with the action "Close Purchase Order" in the Purchase Orders window), Maconomy clears any balance occurring here, and, in the case of lines containing item numbers, resets the value in the "Purchase" field in the Item Information Card and Item Information windows in the Inventory module. This only applies to orders which have been approved.</p>
<b>Currently Received</b>	<p>Here you can specify how many units you have received from the vendor. If you receive all, or almost all, of the items in a purchase order, you can use the action "Receive All." Maconomy then inserts the value from the "Balance" field in this field on all lines. You can then adjust the values, if not all the units were delivered.</p>
<b>Unit</b>	In this field, you can enter the unit in which the current item or service is purchased. Maconomy suggests the value from the corresponding field on the purchase order, but you can change the value here.
<b>Stock Location No.</b>	<p>In this field, you can specify a stock location in the selected warehouse. For lines containing an item number, this location is the one at which the items in question are received. If you leave this field blank, the location number specified in the card part of the window will apply to the line.</p> <p>If the line does not pertain to an item, the field is for information only.</p>
<b>Description</b>	If the current line pertains to an item, you can enter a description of the item in question in this field. Maconomy suggests the value from the corresponding field on the purchase order, but you can change the value here. If the line does not pertain to an item, you can specify a text for information only.
<b>Deliv. Item Text</b>	If the current line pertains to an item, you can enter the vendor's item text for the item in question in this field. The text probably also appears on the delivery note and invoice for which you are entering the receipt. Maconomy

Field	Description
	suggests the value from the corresponding field on the purchase order, but you can change the value here. If the line does not pertain to an item, you can specify a text for information only.
<b>Remarks</b>	In this field, you can enter a note related to the current line. Maconomy suggests the value from the corresponding field on the associated purchase order, but you can change the note here.
<b>Internal Desc.</b>	In this field, you can enter an internal description related to the current line. Maconomy suggests the value from the corresponding field on the purchase order, but you can change the value here.
<b>Note No.</b>	In this field, you can specify the number of a note used for further specification of the current order. For further information, see the description of the corresponding field in the window Purchase Orders.
<b>Note Description</b>	This field shows a description of the note specified in the field "Note No." above.
<b>Popup 1-5</b>	In these fields, you can enter various information about the current line. Maconomy suggests the values entered in the corresponding fields on the assigned purchase order, but you can change the values here.
<b>Deliv. Date</b>	This field shows the preferred delivery date specified for the current line in the window Purchase Orders. The date cannot be changed here. Maconomy automatically inserts the date from the field "Date Received."
<b>Pricing Unit</b>	For lines pertaining to an item, this field shows how many units of the item are included in the unit price. The value is determined in the Item Information Card and cannot be changed here. On lines that do not pertain to an item, the value is always 1 and the field has not functionality.
<b>Unit Price</b>	This is the unit price specified in the purchase order. The price cannot be changed here.
<b>Price</b>	This field shows the extended price calculated by multiplying the quantity ordered by the unit price and dividing this sum by the pricing unit. The extended price is included in the "Sum" field in the Price island in the card part of the window. The value cannot be changed manually.
<b>Duty Code</b>	This field only applies to lines on which an item number has been specified. In this field, you can enter a code for the duty to be calculated if the vendor's country is different from the company's country. The duty code is transferred from the Item Information Card at the creation of a purchase order line and cannot be changed in this field.
<b>Company No.</b>	This field shows the number of the company to which the current line pertains. The value is specified in the window Purchase Orders and cannot be changed here.
<b>Location</b>	The functionality of this field is similar to the functionality of the field "Company No." above.

Field	Description
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Company No." above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Company No." above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Company No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company No." above.
<b>Task</b>	This field shows the number of the task specified on the current line, if the current line pertains to the purchase of services in connection with a job. The value cannot be changed here.

## Purchase Order Line Overview Workspace

Use this workspace to review the committed expenses that are associated with purchase order lines.

You can display commitment entries for specified periods and allocation combinations. An allocation combination is a range of account numbers, locations, entities, and so on.

Maconomy sorts the commitment entries by company number. Within each company, they are sorted by purchase order number and purchase order line number.

This workspace provides you with an overview of all commitment entries within a specified period and with an allocation combination within the allocation ranges specified for the total balance of the period in question.

The commitment entries correspond to the lines of purchase orders created in the A/P module. These are the basis for the commitment accounts.

You enter allocation combinations as ranges of the 12 dimensions in the Entry Selection island. Each commitment entry, including the balance of the entries, is displayed in the sub-tab when you press Return.

The commitment entries are sorted by company number. Within each company they are sorted by purchase order number and purchase order line number. You cannot change the values of the fields in the sub-tab.

The Show Purchase Order Lines workspace also displays commitment entries, but only one at a time (see the description of the Show Purchase Order Lines workspace). A purchase order line cannot be displayed in the Show Purchase Order Lines workspace without being displayed in this workspace. This may, for example, be true for zero amounts on a purchase order line, if the amount is released from commitment when a vendor invoice is posted, or if you close the purchase order line manually.

## Purchase Order Line Overview Tab

This section includes the fields and descriptions for the Purchase Order Line Overview tab.

### Selection Criteria Island

Field	Description
<b>Company No.</b>	In these fields, you enter a range of company numbers. Only committed amounts to which a company number within this range is assigned will be shown in the table part.
<b>Account No.</b>	The functionality of these fields is similar to the functionality of the field "Company" above.
<b>Date Committed</b>	In these fields, you specify the period in which the commitment dates on purchase order lines should be displayed. If you do not specify a period, Maconomy does not consider these fields and will therefore display all entries in the system that fulfill the other selection criteria.

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of these fields is similar to the functionality of the field "Company" above.
<b>Entity</b>	The functionality of these fields is similar to the functionality of the field "Company" above.
<b>Project</b>	The functionality of these fields is similar to the functionality of the field "Company" above.
<b>Purpose</b>	The functionality of these fields is similar to the functionality of the field "Company" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company" above.

### Currency Island

Field	Description
<b>Reporting Currency</b>	In this field, you can specify in which currency the statement should be displayed. Amounts in the vendor open entry statement will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.

Field	Description
<b>Exchange Rate Date</b>	In this field, you can specify the date on which the exchange rate should be used for balance calculation. When converting amounts, Maconomy uses the exchange rates in the exchange rate tables. The exchange rate table for purchases is selected in the window System Information in the Set-Up module.

**Balance Island**

Field	Description
<b>Committed, Reporting</b>	This field displays the balance of the commitment entries with the selected allocation combination in enterprise currency. You cannot change the value in this field.

## Purchase Order Lines Sub-Tab

This section includes the fields and descriptions for the Purchase Order Lines sub-tab.

Field	Description
<b>Purch. Order No.</b>	This field displays the number of the purchase order from which the current purchase order line originates.
<b>Line No.</b>	This field displays the line number of the purchase order line on the original purchase order.
<b>Date Committed</b>	This field shows the date on which the commitment was made. The date is transferred from the corresponding purchase order line.
<b>Delivery Date</b>	This field shows the expected delivery date. The date is transferred from the corresponding purchase order line.
<b>Quantity</b>	This field shows the quantity of items ordered. The quantity is transferred from the corresponding purchase order line.
<b>Unit Price, Currency</b>	This field shows the price per unit in currency which appears on the corresponding purchase order line.
<b>Committed, Currency</b>	This field shows the committed amount in currency. The committed amount corresponds to the amount from the deduction of any posted vendor invoices or manually purchase order lines.
<b>Currency</b>	This field shows the currency registered on the current purchase order line.
<b>Committed, Company</b>	This field displays the committed amount for the company on the current line. The amount is in base currency.
<b>Base Currency, Company</b>	This field shows the committed amount in base currency. See the field "Committed, Currency" above.

Field	Description
<b>Line Remarks</b>	This field shows the line remarks which appear on the corresponding purchase order line.
<b>Job No.</b>	This field shows the job number on the purchase order line.
<b>Activity No.</b>	This field shows the activity number on the purchase order line.
<b>Account No.</b>	This field shows the account number on the purchase order line.
<b>Act./Account Name</b>	This field shows the text assigned to the specified activity or the account name.
<b>Company No.</b>	This field shows the company dimension value which is assigned to the current commitment entry.
<b>Location</b>	This field shows the location dimension value which is assigned to the current commitment entry.
<b>Entity</b>	This field shows the entity dimension value which is assigned to the current commitment entry.
<b>Project</b>	This field shows the project dimension value which is assigned to the current commitment entry.
<b>Purpose</b>	This field shows the purpose dimension value which is assigned to the current commitment entry.
<b>Spec. 1-3</b>	These fields show the specification dimension values which are assigned to the current commitment entry.
<b>Local Spec. 1-3</b>	These fields show the local specification dimension values which are assigned to the current commitment entry.

## Show Purchase Order Lines Workspace

Use this workspace to review the details of purchase order lines, one line at a time.

The workspace only displays purchase order lines that contain commitment amounts. You cannot make changes in this workspace.

Use this workspace to display details about purchase order lines.

You cannot change any values in this workspace. The workspace displays one commitment entry (purchase order line) at a time.

The sub-tab of the Purchase Order Line Overview workspace, also displays commitment entries. The Show Purchase Order Lines workspace may show lines that do not appear in the Purchase Order Line Overview workspace. This can occur when an amount has been released by posting a vendor invoice or when you close a purchase order line manually.

## Show Purchase Order Lines Tab

This section includes the fields and descriptions for the Purchase Order Lines tab.

### Purchase Order Line Island

Field	Description
<b>Date Committed</b>	This field shows the date on which the commitment was made. The date is transferred from the corresponding purchase order line.
<b>Delivery Date</b>	This field shows the expected delivery date. The date is transferred from the corresponding purchase order line.
<b>Line Remarks</b>	This field shows the line remarks which appears on the assigned purchase order line.
<b>Job No.</b>	This field shows the job number on the purchase order line.
<b>Activity No.</b>	This field shows the activity number on the purchase order line.
<b>Account No.</b>	This field shows the account number on the purchase order line.
<b>Act./Account Name</b>	This field shows the text assigned to the specified activity or the name of the entered account.
<b>Company</b>	This field shows the number and name of the company which is responsible for the creation of the purchase order line.
<b>Purchase Order No.</b>	This field shows the number of the purchase order to which the line is assigned.
<b>Purchase Line Type</b>	This field shows the type of purchase that the line represents. The available values are: <ul style="list-style-type: none"> <li>Fixed Asset</li> <li>Inventory</li> <li>Job Cost</li> <li>G/L</li> <li>Text Line</li> <li>Subcontractor Reconciliation</li> </ul>

### Committed Amount Island

Field	Description
<b>Committed, Company</b>	This field displays the committed amount for the company on the current line. The amount is in base currency.

Field	Description
<b>Base Currency, Company</b>	This field shows the base currency of the current company.
<b>Committed, Currency</b>	This field shows the committed amount in currency. See the field "Committed, Base" above.
<b>Currency</b>	This field shows the currency registered on the current purchase order line.

**Dimensions Island**

Field	Description
<b>Location</b>	This field shows the Location dimension value which is assigned to the current purchase order line.
<b>Entity</b>	This field shows the Entity dimension value which is assigned to the current purchase order line.
<b>Project</b>	This field shows the Project dimension value which is assigned to the current purchase order line.
<b>Purpose</b>	This field shows the Purpose dimension value which is assigned to the current purchase order line.
<b>Spec. 1-3</b>	These fields show the Specification 1-3 dimension values which are assigned to the current purchase order line.
<b>Local Spec. 1-3</b>	These fields show the Local Specification 1-3 dimension values which are assigned to the current purchase order line.

## Asset Drafts Workspace

Use this workspace to review asset drafts.

A user creating a purchase order with an asset purchase can create an asset draft link to the purchase order with information about the asset. This information is transferred to the vendor invoice, if the user creates a vendor invoice from the purchase order. The information can be changed in the vendor invoice.

The user can also choose to create an asset draft directly from the vendor invoice, if the vendor invoice is related to an asset purchase.

The user can also create the asset draft after the vendor invoice is posted, if the vendor invoice has an invoice allocation line of the fixed asset type, and the user has not created the asset drafts before posting the invoice.

## Asset Drafts Tab

This section includes the fields and descriptions for the Asset Drafts tab.

### Asset Draft Information Island

Field	Description
<b>Asset No.</b>	This field is mandatory if adjustment is to an existing fixed asset; otherwise it is left blank.
<b>Asset Group</b>	If Asset Number is filled, Asset Group will be automatically filled in. If no Asset Number is given, Asset Group is mandatory.
<b>Asset Sub-Group</b>	Use this field to enter an asset sub-group. This allows you to work with a sub-division of the traditional asset groups.
<b>Number of Assets</b>	This field displays the number of assets in the draft.
<b>Description</b>	This field displays a description of the assets.
<b>Model</b>	This field displays the asset model.
<b>Located</b>	This field displays the asset location.
<b>Serial No.</b>	This field displays the asset serial number.
<b>Internal Serial No.</b>	This field displays the asset internal serial number.

### Financial Information Island

Field	Description
<b>Assessed Value</b>	This field displays the asset value.
<b>Market Value</b>	This field displays the market value of the assets.
<b>Lien</b>	This field specifies whether or not there are any lien's on the assets.
<b>Insured Value</b>	This field displays the insured value of the assets.
<b>Policy No.</b>	This field displays the policy number.
<b>Internal Markup</b>	This field displays the internal markup amount.

Field	Description
<b>Internal Purchase</b>	Mark this field if this is an internal purchase.

**Job Information Island**

Field	Description
<b>Post Depreciation as Job Entry</b>	When depreciating an asset, if this value is set, a job entry is posted. When the asset draft is created it gets the value from the asset group. You can edit this field.
<b>Job No.</b>	The asset that is created gets this job number if the asset transaction type is acquisition and no asset number is on the asset draft. This field is read-only.
<b>Activity</b>	The asset that is created gets this activity if the asset transaction type is acquisition and no asset number is on the asset draft. This field is read-only.
<b>Task Name</b>	The asset that is created gets this task if the asset transaction type is acquisition and no asset number is on the asset draft. This field is read-only.

**Depreciation Information Island**

Field	Description
<b>Manual Depreciation</b>	Mark this field if this is purchase uses manual depreciation.
<b>Depreciation Method</b>	This field displays the depreciation method used.
<b>Depreciation Period</b>	This field displays the depreciation period.

**Technical Data Island**

Field	Description
<b>Technical Data</b>	This field displays any technical data relating to the asset draft.

**Remarks Island**

Field	Description
<b>Remarks</b>	This field displays any remarks relating to the asset draft.

**Contact Island**

Field	Description
<b>Responsible</b>	This field displays the name and employee number of the responsible person.
<b>Employee</b>	This field displays the name and employee number of the employee.

**Company Island**

Field	Description
<b>Company</b>	This field displays the name and number of the company.

**Dimensions Island**

Field	Description
<b>Location</b>	This field displays the value that you entered for the dimension Location.
<b>Entity</b>	This field displays the value that you entered for the dimension Entity.
<b>Project</b>	This field displays the value that you entered for the dimension Project.
<b>Purpose</b>	This field displays the value that you entered for the dimension Purpose.
<b>Spec. 1–10</b>	This field displays the value that you entered for the dimensions Spec. 1–10.
<b>Local Spec. 1–10</b>	This field displays the value that you entered for the dimensions Local Spec. 1–10.

**Acquisition Information Island**

Field	Description
<b>Asset Transaction Type</b>	<p>One of the following:</p> <ul style="list-style-type: none"> <li>■ Acquisition <ul style="list-style-type: none"> <li>■ You will need to enter Asset Group; the other fields are filled in, but can be changed.</li> </ul> </li> <li>■ Improvement: <ul style="list-style-type: none"> <li>■ Asset Number is mandatory.</li> </ul> </li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Quantity=1.</li> </ul> <p>Only the fields that also occur in Asset Entries are editable, except Asset Group that follows the asset number.</p>
<b>Cost, Currency</b>	This field displays the acquisition price for the asset.
<b>Cost, Base</b>	The field displays the acquisition price for the asset in base currency
<b>Cost, Asset Base</b>	The field displays the acquisition price for the asset in the asset base currency.
<b>Acquired</b>	Use this field to enter the date the asset was acquired. It is also the date the depreciation takes effect.
<b>Acquisition Responsible</b>	This field displays the name of the person responsible for the asset acquisition.

## A/P Open Entry Reconciliation Workspace

Use this workspace to reconcile open accounts payable entries, one vendor at a time, totally or in part.

These entries include payments, vendor credit memos, vendor invoices, and currency adjustment entries.

You can reconcile an open entry totally or in part.

A payment or vendor credit memo with information is displayed in the tab of this workspace, along with information about the relevant vendor. Any other open entries, for example, vendor invoices, currency adjustment entries, and other payments and credit memos of relevance to the current vendor, are displayed in the sub-tab of this workspace. A currency adjustment entry is a manually entered entry with a zero currency amount, because it only affects the vendor's balance in base currency. You can reconcile open entries with each other or against the payment/credit memo displayed in the tab. You can thus reconcile several payments and credit memos related to the same vendor in one operation.

When you have entered and approved a payment/credit memo, you can find the next payment/credit memo by using the search function. If other payments/credit memos exist for the current vendor, and these are not affected by the reconciliation that you just performed, they are displayed in the sub-tab of this workspace when you turn to the next payment. If all payments/credit memos for a specific vendor are reconciled, the first payment/credit memo for the next vendor is displayed.

Manual reconciliation of entries can lead to the creation of G/L entries that are ready for posting. These correspond to exchange rate variances and cash discounts, of which the former can occur if the rate of the two entries differs when the entries are reconciled with each other. A case like this is illustrated by the following example:

A vendor with standard currency DEM (German Mark) sends a vendor invoice of 100 DEM when the exchange rate is 380. At the time of payment, the rate has gone up to 385, which leads to an

exchange rate variance of 5 DEM. Posting information of exchange rate variance is accumulated in a vendor journal that can be posted from the Posting workspace in the G/L module. The posting reference to exchange rate variance accounts is specified by means of a dimension combination in the Posting References workspace in the G/L module. Exchange rate variance can be organized in departments.

If a vendor invoice is reconciled totally with a payment or a credit memo, and a difference between the remainder in standard currency and the amount reconciled in standard currency occurs as a result of this reconciliation, Maconomy creates a cash discount. The difference is transferred as a cash discount. The posting reference to cash differences is specified by means of a dimension combination in the Posting References workspace in the G/L module.

In the Posting workspace in the G/L module you can enter a specific vendor invoice for payment. If you do this, payment of the invoice automatically leads to the reconciliation and closing of the vendor invoice entry when it is posted.

### A/P Open Entry Reconciliation Tab

This section includes the fields and descriptions for the A/P Open Entry Reconciliation tab.

#### Vendor Island

Field	Description
<b>Vendor No.</b>	This field shows the vendor number. The first two lines show the name and address of the vendor, and these are transferred from the vendor information card and cannot be altered here.
<b>Attn.</b>	This field shows the attention person at the current vendor. The name of the person is transferred from the vendor information card and cannot be altered here.
<b>Block Payments</b>	If the payment/credit memo is blocked, this field is marked. You can block payment if the vendor has for instance delivered the wrong items and you wish to make sure that the right items are delivered before payment is initiated. You can alter the value in this field in the window Payment Control.

#### Company Island

Field	Description
<b>Company</b>	This field displays the name and company number of the company specified on the current vendor invoice or credit memo.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

**Entry Island**

Field	Description
<b>Entry Date</b>	This field shows the entry date of the payment or the credit memo.
<b>Entry Description</b>	This field shows the entry description of the payment. You can use this text and the amount below to check that the payment/credit memo currently shown is correct. You cannot alter the value in this field.
<b>Transaction</b>	This field shows the transaction number of the payment and the credit memo.
<b>Trans. Type</b>	This field shows the transaction type of the payment and the credit memo.

**Entry Amounts Island**

Field	Description
<b>Paid/debited, Currency</b>	This field shows the amount of the payment/credit memo. The amount is shown in standard currency and cannot be altered.
<b>Remainder, Currency</b>	<p>This field shows the amount of the original amount of the payment/credit memo remaining to be reconciled. You cannot reconcile a larger amount than the one shown in this field. The field is updated automatically by Maconomy at the approval of a reconciliation and cannot be altered manually.</p> <p>If the remaining amount does not cover the entire vendor invoice and you do not wish to post the difference as a cash discount, the invoice must be partially reconciled. If you enter an amount in the field "Reconciled in Standard" which exceeds the remaining amount, the difference will be shown as a positive number in the field "Balance" in the island Reconciliation.</p>
<b>Amount, Original</b>	This field shows the posted amount in the currency entered at the creation of the payment/credit memo. If the entry is a currency adjustment entry, the amount will be zero. You cannot alter the value in this field.
<b>Amount, Base</b>	This field shows the posted amount in the base currency of the payment/credit memo. You cannot alter the value in this field.

**Reconciliation Amounts Island**

Field	Description
<b>Debit, Currency</b>	This field shows the debit amount used for the reconciliation.
<b>Credit, Currency</b>	This field shows the credit amount used for the reconciliation.

Field	Description
<b>Cash Discount, Currency</b>	<p>This field shows a cash discount, if any. If a vendor invoice is reconciled with a payment or credit memo, the difference between the amounts in the fields "Rem. in Standard" and "Reconciled in Standard" will be transferred as a cash discount. When you approve an open entry reconciliation, Maconomy creates a vendor journal containing posting information about the cash discount. You can post the vendor journal in the window Posting in the G/L module.</p> <p>The posting reference to the cash discount account is specified by means of a dimension combination in the G/L module.</p>
<b>Difference, Currency</b>	<p>This field shows the difference between debit and credit amounts in the reconciliation, if any. If a larger amount than the actual payment is entered in the field "Reconciled in Standard," a positive amount will be shown in this field. When you approve the open entry reconciliation, Maconomy will regard the difference in amounts as a cash discount. A vendor journal with posting information about the cash discount is created, and the journal can be posted in the window Posting in the general ledger module.</p> <p>If the payment/credit memo is not used for reconciliation, the difference will be shown in this field as a negative amount. After approval of the reconciliation, the amount will be shown as a remainder in the field "Remaining Bal."</p>

#### Vendor Amounts Island

Field	Description
<b>Balance, Currency</b>	<p>This field shows the vendor's current balance in the currency of the vendor. Whenever you register information related to the vendor, the balance is updated.</p>
<b>Balance, Base</b>	<p>This field shows the vendor's current balance in the base currency of the vendor. When you post journals related to the vendor, this balance is updated.</p>

#### Reconciliation Island

Field	Description
<b>Entry Date</b>	<p>This field shows the entry date of the current reconciliation.</p>
<b>Transaction Type</b>	<p>In this field, you can select the transaction type for the reconciliation. If the transaction type for the vendor reconciliation is not specified and there is no default transaction type for the vendor journal, then the reconciliation will have the same transaction type as the vendor entry which is reconciled.</p>

## Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Invoice Date</b>	This field shows the invoice date of the current vendor invoice or vendor credit memo.
<b>Due Date</b>	This field shows the due date of the current entry. The calculation of the due date is based on the invoice date of the vendor invoice and the vendor's payment terms.
<b>Pay when Paid</b>	For vendor invoices, this field shows whether payment when paid applies to the invoice in question. For further information, see the description of the corresponding field in the window Vendor Invoices.
<b>Ready For Payment</b>	This field shows whether the current entry is ready for payment. For further information, see the description of the corresponding field in the window Change Payment Selection by Vendor.
<b>Entry Description</b>	This field shows the description of the entry.
<b>Trans. No.</b>	This field shows the transaction number of the entry.
<b>Trans. Type</b>	This field shows the transaction type of the vendor entry against which the vendor entry in the card part is reconciled.
<b>Debit, Currency</b>	If the entry is a debit entry, this field will show the original amount of the entry in the vendor's standard currency. You cannot alter the value in this field.
<b>Credit, Currency</b>	If the entry is a credit entry, this field will show the original amount in the vendor's standard currency. You cannot alter the value in this field.
<b>Remainder, Currency</b>	This field shows the amount which is yet to be reconciled. Amounts under payment are not included in the remaining amount. If the remainder is zero, the entry is totally reconciled. The field is automatically updated and therefore cannot be altered.
<b>Reconciled, Currency</b>	In this field, you enter an amount corresponding to the part of the entry that has yet to be reconciled. It is only possible to complete the field if the entry is partly reconciled with an amount less the outstanding amount. If the entry is totally reconciled, the amount automatically assumes the value of the remaining amount.  If the entry on the current line is a credit memo or a payment and you wish to reconcile part of this, you can enter the desired amount in this field.
<b>T/P</b>	In this field, you select whether the entry is to be totally or partly reconciled. If you wish to reconcile the entry totally, the field "Reconciled in Standard" will automatically be completed with the remaining amount from the current line. If the available part of the payment is less than this remaining amount,

Field	Description
	<p>the difference will be shown in the field "Balance" in the island Reconciliation. When you approve the reconciliation, the amount in this field will be suggested as a cash discount.</p> <p>If the entry is totally reconciled, and the amount entered in the field "Reconcile in Standard" is less than the remaining amount of the entry, the difference will automatically be suggested as a cash discount, which is shown in the field "Cash Discount."</p> <p>If you wish to reconcile the entry partly, the field "Reconciled in Standard" is completed with the available part of the payment until the remaining amount of the current line is reached. It is possible to enter an amount in the field "Reconcile in Standard" if you only want partial reconciliation of a specific part of the payment.</p> <p>If the entry on the current line is a payment or a credit memo, you can make the amount of the entry available for reconciliation by selecting the value "Totally."</p> <p>If the vendor's standard currency is different from the base currency, the reconciliation may result in an exchange rate variance if the two entries, which are reconciled with each other, are registered in different currencies. In that case, Maconomy will create a vendor journal with entry information about the variance. You can subsequently post the difference to the account for exchange rate variances specified by means of a dimension combination in the G/L module.</p>
<b>Approved</b>	In this field, you specify that an entry such as a vendor invoice or a credit memo is approved. Entries are approved in the field "Approved" in the window Approve Invoices.
<b>Being Paid, Currency</b>	This field shows the amount being paid.
<b>Debit, Base</b>	If the entry is a debit entry, this field will show the original amount in base currency.
<b>Credit, Base</b>	If the entry is a credit entry, this field will show the original amount in base currency.
<b>Remainder, Base</b>	This field shows the amount yet to be reconciled. The amount is shown in base currency. If the remaining balance is zero, the entry is totally reconciled. The field is automatically updated and cannot be changed manually.

## Vendor Subcontractor Reconciliation Workspace

Use this workspace to review vendor invoice lines that have been allocated or reallocated to vendor subcontractors.

Use this workspace to display Invoice Allocation Lines in the tab that are selected to be reallocated/allocated to a particular Vendor Invoice.

The sub-tab displays Job Entries that are linked to an Employee who has a Subcontractor Vendor Number assigned.

### Vendor Subcontractor Reconciliation Tab

This section includes the fields and descriptions for the Vendor Subcontractor Reconciliation tab.

#### Invoice Island

Field	Description
<b>Trans. No.</b>	This field shows the transaction number of the invoice or credit memo.
<b>Transaction Type</b>	This field shows the transaction type of the invoice or credit memo.
<b>Invoice No.</b>	This field shows the invoice number of the vendor invoice.
<b>Invoice Date</b>	This field shows the date of invoice or credit memo.
<b>Vendor Invoice Type</b>	This field shows whether the information in the window is for an invoice ("Credit") or a credit memo ("Debit").

#### Allocation Line Island

Field	Description
<b>Journal No.</b>	The number of the journal that the invoice on which the current allocation line is based belongs to.
<b>Journal Line No.</b>	This field shows the number of the line that the invoice on which the current allocation line is based occurs on in the journal shown in the field "Journal No."
<b>Line No.</b>	This field shows the number of allocation line in the current invoice.

#### Reconciled, Total Island

Field	Description
<b>Vendor Invoice Currency</b>	In this field, you select the currency of the invoice.
<b>Amount Excl. Tax</b>	This amount is negative for credit notes and positive for invoices.
<b>Total for Subcontractor Reconciliation</b>	This field specifies the sum of selected entries for the invoice allocation line.

Field	Description
<b>Total Difference</b>	This field specifies the difference between the sum of selected entries and the amount in the field Amount Excl. Tax.

#### Vendor Island

Field	Description
<b>Vendor</b>	This field shows the number of the vendor assigned to the invoice or credit memo.
<b>Pay to Vendor No.</b>	In this field, you can specify the number of the vendor who is to receive payment for the vendor invoice.

#### Selection Criteria Island

Field	Description
<b>Job No.</b>	In this field, you can define a Job Number that entries must match in order to be shown and selected. Changing the criteria triggers a warning and eventually clear entries that already are assigned to an Invoice Allocation Line
<b>Act. No.</b>	In this field, you can define an Activity Number that entries must match in order to be shown and selected. Changing the criteria triggers a warning and eventually clear entries that already are assigned to an Invoice Allocation Line
<b>Empl. No.</b>	In this field, you can define an Employee Number that entries must match in order to be shown and selected. Changing the criteria triggers a warning and eventually clear entries that already are assigned to an Invoice Allocation Line.
<b>Task</b>	In this field, you can define a Task Number that entries must match in order to be shown and selected. Changing the criteria triggers a warning and eventually clear entries that already are assigned to an Invoice Allocation Line.
<b>Date</b>	In this field, you can define a period of time that entries must match in order to be shown and selected. Changing the criteria triggers a warning and eventually clear entries that already are assigned to an Invoice Allocation Line.

#### Job Entries Sub-Tab

This section includes the fields and descriptions for the Job Entries sub-tab.

The fields in this sub-tab are similar to fields in the table part of the job card, except for the ones described below.

Field	Description
<b>Date</b>	This field displays the date of the subcontractor reconciliation.

Field	Description
<b>Selected for Subcontractor Reconciliation</b>	If this field is marked, it means that the Job Entry is assigned to a specific Invoice Allocation Line. You can only select entries that match vendor invoice's currency. A Job Entry can be deselected (disconnected from an Invoice Allocation Line) either manually or by using the action Unmark All for Reconciliations. The reference to an Invoice Allocation Line is also removed when an Invoice Allocation Line is deleted or the selection criteria of an already referred Invoice Allocation Line are narrowed down. Note that one Job Entry cannot be allocated to two Invoice Allocation Lines, because while a job entry is selected, it will only be visible for that particular invoice allocation line.
<b>Job No.</b>	This is the number of the job shown in the job card. This value cannot be changed manually, but you can retrieve other jobs using the search functions in the Find menu.
<b>Activity No.</b>	This is the number of the activity that the job entry involves. It cannot be changed here.
<b>Activity Name</b>	This field shows the name of the activity specified in the "Activity No." field.
<b>Employee No.</b>	This field shows the number of the employee who completed the activity described in the job entry. Only time activities show a value here. It cannot be changed.
<b>Employee Name</b>	This field shows the name of the employee specified in the "Employee No." field.
<b>Task</b>	The functionality of these fields is similar to that of the field "Company No." below.
<b>Task Description</b>	This is the entry text given when the job entry was entered. It cannot be changed here.
<b>Description</b>	This is the entry text given when the job entry was entered. It cannot be changed here.
<b>Quantity</b>	This is the quantity entered for the job entry. The quantity is number of hours for time activities. It cannot be changed here.
<b>Cost</b>	This field shows the cost value registered in the base currency of the job. The "Time," "Amount," and "Total" fields show the three cost sums from the "Cost, Entered" field on the lines in the table part. The three figures are the cost sums of time activities, amount activities, and a total for all lines.
<b>Total Cost</b>	This field shows the sum of the costs and billing prices in the table part of the window.
<b>Cost, Exec. Company</b>	This field shows the cost of one piece of the current activity in the executing company. If the responsible company is the same as the executing company, the cost in this field will be the same as the value in the field "Cost."

Field	Description
<b>Quantity Inv.</b>	This is the total number of units invoiced to the customer in this entry. The "Invoice No." field shows the invoice on which all or part of the entry is invoiced. The quantity cannot be changed here.
<b>Currency</b>	This is the job's currency. It is retrieved from the Job Information card and cannot be changed here.
<b>Billing Price</b>	This is the total registered job billing price in the job's currency.
<b>Standard Billing Price</b>	This field shows the standard billing price applied to the entry in question. The difference between the standard billing price, the billing price registered in windows such as Job Budgets and Job Journal, and the invoice billing price (as found in the Invoice Selection window) can be used for performance analyses. For more information, please see "Appendix A: Price Calculation in the Job Cost Module."
<b>Billing Price, Inv.</b>	This is the total invoiced billing price in the job currency. It cannot be changed here.
<b>Revenue Recognized</b>	This field shows the amount of revenue recognized on the job entry. The amount is displayed in the base currency of the job.
<b>Incl. in Fixed Price</b>	This field shows whether or not the entry is included in the fixed price of a fixed-price job. If this field is marked, the entry is included in the fixed price of a job. See the introduction of the Invoice Selection window for a description of how Maconomy determines whether or not entries are to be included in the fixed price of a job.
<b>Closed</b>	<p>This field shows whether or not the job entry is closed. If this field is marked, the entry is closed. A job entry is open until it is completely invoiced or closed.</p> <p>Entries to noninvoiceable activities and noninvoiceable jobs are automatically closed and there closed when the entry is made.</p> <p>If, when the entry is closed, you invoice a different quantity or a different billing price than the one registered, the difference is registered in the "Quantity, Up/Down" and "Billing Price, Up/Down" fields on the table line. This field's value cannot be changed here.</p>
<b>Exec. Company No.</b>	This field shows the number of the company that carried out the activity on the current job entry.
<b>Base Currency, Exec. Company</b>	This field shows the base currency selected for the executing company in the Company Information window.
<b>Trans. No.</b>	This field shows the transaction number of the job entry. Job entries are first sorted by entry date, then by transaction number. This value cannot be changed here.

Field	Description
<b>Trans. Type</b>	This field shows the transaction type of the entry. This field is for reference only and cannot be changed here.
<b>G/L Entry Date</b>	This field shows the transaction type of the entry. This field is for reference only and cannot be changed here.
<b>Origin</b>	<p>This field shows the origin of the individual job entry. When a job entry is posted, Maconomy assigns to the job entry information about the journal type from which the job entry was originally derived. This could, for example, be "Time Sheet" or "Job Accrual." Some entries are created without posting journals, for example, entries for direct invoicing. To such entries, the origin "Job" is assigned.</p> <p>The origin of a job entry never changes.</p>
<b>Entry Type</b>	<p>This field shows the entry type of the individual job entry. When a job entry is posted, Maconomy marks it as a certain type. The type will often be "Registration" (for example, time sheet and job journal entries). In the pop-up field "Entry Type" in the Selection Criteria island in the card part of this window, you can see the different entry types used by Maconomy.</p> <p>This is useful if a job entry changes type. If, for instance, a job entry is reallocated, the entry's origin will be preserved, but its type will be changed to "Reallocation" or "Reversal." This way, you can in this window see that a particular entry is, for example, a reallocated time sheet entry.</p>
<b>Quantity 1</b>	This field shows the quantity used in the current job entry. The value cannot be changed here.
<b>Quantity 2</b>	The functionality of this field is similar to that of the field "Quantity 1" above.
<b>Company No.</b>	This field shows the company assigned to the job entry. The value cannot be changed here.
<b>Location</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Spec. 1-3</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Local Spec 1-3</b>	The functionality of this field is similar to that of the field "Company No." above.

Field	Description
<b>Remarks</b>	The functionality of this field is similar to that of the field "Company No." above.

## Royalty Selection Workspace

Use this workspace to print out billing selections that are related to royalty agreements.

### Royalty Selection Tab

This section includes the fields and descriptions for the Royalty Selection tab.

#### Selection Criteria Island

Field	Description
<b>Vendor No.</b>	In these fields, you enter a range of vendor numbers. If a range is specified, the printout will only include billing selections with vendor numbers within the specified range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. If you enter a range, the royalty selection will be based on vendor entries with a settling company within the specified range.
<b>Item No.</b>	In these fields, you enter a range of item numbers. If you enter a range, the printout will only include billing selections with item numbers within the range.
<b>Statement Date</b>	In this field, you enter a statement date for the billing selection. If you enter a date, the billing selection will only include sales which are carried out before the specified date.

#### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

### Actions

This section shows the Actions available in the Royalty Selections workspace.

#### Top Tab

Field	Description
<b>Print</b>	Use this action to print billing selections in connection with royalty agreements.

## Royalty Billing Workspace

Use this workspace to print and approve multiple royalty agreements in one operation.

If you only want to approve one royalty agreement, use the Print Royalty Agreement workspace under the Royalty Agreements workspace.

### Royalty Billing Tab

This section includes the fields and descriptions for the Royalty Billing tab.

#### Selection Criteria Island

Field	Description
<b>Settlement No.</b>	In these fields, you enter a range of settlement numbers if you wish to limit the settlement to a specific group of settlements.
<b>Vendor No.</b>	In these fields, you specify a range of vendor numbers. If a range is entered, the printout will only include royalty billings with vendor numbers within the range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. If you enter a range, the royalty billing will be based on vendor entries with a settling company within the specified range.
<b>Item No.</b>	In these fields, you enter a range of item numbers if you wish to limit the settlement to a specific group of settlements.
<b>Settling Date</b>	In this field, you can enter a settling date. The date specified will be used as both settling date and posting date when royalty billings are approved. Maconomy suggests today's date as default, but the date can be changed.

#### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.
<b>Approve Selection</b>	Mark this field if you wish to approve billing selections. If the field is marked, all billings within the specified selection criteria will be approved.
<b>Reprint</b>	You mark this field if you wish to reprint the specified billing selections.

## Actions

This section shows the Actions available in the Royalty Billing workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print a number of royalty agreements in one operation.

## Purchase Order Overview Workspace

Use this workspace to review purchase processes and associated purchase orders.

### Purchase Order Overview Tab

This section includes the fields and descriptions for the Purchase Order Overview tab.

### Purchase Process Island

Field	Description
<b>Purchase Process No.</b>	This field shows the number of the purchase process of which the current purchase order is part.
<b>Description</b>	This field shows the description of the purchase process.
<b>Status</b>	This field displays the status of the requisition.
<b>Job No.</b>	This field shows the job number on the purchase order line.
<b>Job Name</b>	This field shows the name of the job specified in the "Job No." field.
<b>Requisitioner Employee No.</b>	In this field, you can enter the number of the employee who requisitioned the items on the current purchase process. Maconomy suggests the employee assigned to the user who created the requisition if an employee number has been specified for this user in the Users window.
<b>Name</b>	This field shows the name of the requisitioner employee specified above.
<b>Purchaser Employee No.</b>	In this field, you can enter the number of the employee who is responsible for purchasing the items in the current requisition.
<b>Name</b>	This field shows the name of the purchaser employee specified above.

### Company Island

Field	Description
<b>Company</b>	This field shows the company name and no. specified when the purchase process was created.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field you can specify the name of an access level to apply to the purchase process to which the current purchase order is assigned. You only have access to the current purchase process and its requisition, requests for quote, and purchase orders if you have been assigned to this level or a level above this in the User Access Levels window.</p> <p>This access control ensures that in other windows, you can only refer to information relating to purchase processes to which you have access, and you can only see information about purchase processes to which you have access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to purchase processes and its requisitions, requests for quote, and purchase orders may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see "Introduction to the Access Control System" in the Set-Up module.</p>

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

### Purchase Orders Sub-Tab

This section describes the Purchase Orders sub-tab.

### Copy to Come

Field	Description
<b>Purch. Order No.</b>	
<b>Enterprise</b>	<p>In this field, you can specify an enterprise. When you create a purchase order manually, Maconomy suggests the value for this field from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables.</p> <p>You maintain enterprises in the <b>Enterprises</b> field in the Popup Fields single dialog workspace under the Set-Up module.</p>

Field	Description
<b>Segment</b>	<p>In this field, you can specify a segment. When you create a purchase order manually, Maconomy suggests the value for this field from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables.</p> <p>You maintain segments in the <b>Segments</b> field in the Popup Fields single dialog workspace under the Set-Up module.</p>
<b>Area</b>	<p>In this field, you can specify an area. When you create a purchase order manually, Maconomy suggests the value for this field from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables.</p> <p>You maintain areas in the <b>Area</b> field in the Popup Fields single dialog workspace under the Set-Up module.</p>

## Purchase Processes Workspace

Use this workspace to review purchase processes.

### Purchase Process Header Tab

This section includes the fields and descriptions for the Purchase Process Header tab.

#### Purchase Process Island

Field	Description
<b>Purchase Process No.</b>	This field shows the number of the purchase process of which the current purchase order is part.
<b>Description</b>	In this field, you enter the name of the purchase process. The name is assigned to the purchase process when you create a purchase process from the action "Create new purchase process."
<b>Purchase Transaction Type</b>	Use this field to select the type of the purchase transaction.
<b>Access Level</b>	<p>In this field you can specify the name of an access level to apply to the purchase process to which the current purchase order is assigned. You only have access to the current purchase process and its requisition, requests for quote, and purchase orders if you have been assigned to this level or a level above this in the User Access Levels window.</p> <p>This access control ensures that in other windows, you can only refer to information relating to purchase processes to which you have access, and you can only see information about purchase processes to which you have</p>

Field	Description
	access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to purchase processes and its requisitions, requests for quote, and purchase orders may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see "Introduction to the Access Control System" in the Set-Up module.

#### Purchase Information Island

Field	Description
<b>Job</b>	This field shows the job number on the purchase process.
<b>Company</b>	This shows the company name and number specified when the purchase process was created..
<b>Requisitioner Employee No.</b>	In this field, you can enter the number of the employee who requisitioned the items on the current purchase order. Maconomy suggests the employee assigned to the user who created the requisition if an employee number has been specified for this user in the Users window.
<b>Purchaser Employee No.</b>	In this field, you can enter the number of the employee who is responsible for purchasing the items in the current requisition.

### Batch Self Invoicing Workspace

Use this workspace to perform batch self invoicing.

#### Batch Self Invoice Tab

This section includes the fields and descriptions for the Batch Self Invoice tab.

#### Selection Criteria Island

Field	Description
<b>Show Lines</b>	Select this check box to display the purchase orders that fall within the selection criteria you specify. Maconomy displays the lines in the Purchase Orders sub-tab.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The sub-tab will only display entries with company numbers that fall within the specified range.

Field	Description
<b>Purchase Order No.</b>	The functionality of these fields is similar to that of the <b>Company No.</b> fields.
<b>Job No.</b>	The functionality of these fields is similar to that of the <b>Company No.</b> fields.
<b>Vendor No.</b>	The functionality of these fields is similar to that of the <b>Company No.</b> fields.

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	In these fields, you can specify a range of locations. The sub-tab will only display entries for locations within the specified range.
<b>Entity</b>	The functionality of these fields is similar to that of the <b>Location</b> fields.
<b>Project</b>	The functionality of these fields is similar to that of the <b>Location</b> fields.
<b>Purpose</b>	The functionality of these fields is similar to that of the <b>Location</b> fields.
<b>Spec. 1 - 10</b>	The functionality of these fields is similar to that of the <b>Location</b> fields.
<b>Local Spec. 1 - 10</b>	The functionality of these fields is similar to that of the <b>Location</b> fields.

#### Purchase Orders Sub-Tab

This section includes the fields and descriptions for the Purchase Orders sub-tab.

Field	Description
<b>Purch. Order No.</b>	This field displays the number assigned to the purchase order.
<b>Company No.</b>	This field displays the number of the company to which the purchase order is assigned.
<b>Vendor</b>	This field displays the number of the pay to vendor.
<b>Name 1</b>	This field displays the name of the vendor.
<b>Job No.</b>	If a job is specified in the purchase order, this field displays the number of that job.
<b>Job Name</b>	If a job is specified in the purchase order, this field displays the name of that job.

Field	Description
<b>Transaction Type</b>	This field displays the purchase order's transaction type.

## Actions

This section shows the Actions available in the Batch Self Invoicing workspace.

### Batch Self Invoice Tab

Field	Description
<b>Create Self Invoices</b>	Click this action to create self invoices for all the purchase orders that fall within the selection criteria you specified.

## Vendor Remittance Email Logs Workspace

Use this workspace to view vendor remittance email logs and track all attempts to send the vendor remittance emails. You can view a history of previously sent vendor remittance emails and limit which log entries to show.

### Vendor Remittance Email Logs Tab

This section includes the fields and descriptions for the Vendor Remittance Email Logs tab.

### Selection Criteria Island

Field	Description
<b>Payment No.</b>	Enter the payment number to display in the Vendor Remittance Email Log sub-tab.
<b>Vendor No.</b>	Enter a range of vendor numbers that should display in the Vendor Remittance Email Log sub-tab.
<b>Company Number</b>	Enter the company number that should display in the Vendor Remittance Email Log sub-tab.
<b>Payment Date</b>	Enter an interval of payment dates. The Vendor Remittance Email Log sub-tab only shows entries with payment dates within this interval.
<b>Logged Date</b>	Enter a range of email log dates that should display in the Vendor Remittance Email Log sub-tab.
<b>Show successful attempts</b>	Select the check box to show the vendor remittance emails that Maconomy was able to send successfully.
<b>Show unsuccessful attempts</b>	Select the check box to show the vendor remittance emails that Maconomy was unable to send successfully.

## Vendor Remittance Email Log Sub-Tab

This section includes the fields and descriptions for the Vendor Remittance Email Log sub-tab.

Field	Description
<b>Logged Date</b>	This field shows the date when a user attempted to send the vendor remittance email.
<b>Logged Time</b>	This field shows the time when a user attempted to send the vendor remittance email.
<b>Logged By</b>	This field shows the user who sent the vendor remittance email.
<b>Failed, Missing Email</b>	This field specifies if the vendor remittance email failed.
<b>Payment No.</b>	This field shows the payment order's payment number.
<b>Payment Line No.</b>	This field shows the payment line number used as reference to a specific payment order.
<b>Payment Date</b>	This field shows the payment date of the payment order.
<b>Payment Group No.</b>	This field shows the payment group number, if you assigned a group to the payment order.
<b>Company No.</b>	This field shows the number of the customer.
<b>Vendor Number</b>	This field shows the payment order's payment vendor number.
<b>Name 1</b>	This field shows the name of the company vendor based on the origin of the payment line.
<b>Remittance Email Address</b>	This field shows the email address specified for a vendor linked to the payment selected for email.
<b>Currency</b>	This field shows the delivery vendor's currency.
<b>Paid in Standard</b>	This field shows the amount paid in the vendor's standard currency.

## Lookup Section

This section includes the fields and descriptions for the Lookup section workspaces.

### Vendor Open Entry Statement Workspace

Use this workspace to review a company vendor's open invoices.

Use this workspace to display all open entries of relevance to the vendor that is displayed in the tab.

You can use this workspace to get an overview of the status of a vendor if the vendor calls to ask about payments.

This workspace is for reference only; you cannot change any of the information.

#### Vendor Open Entry Statement Tab

This section includes the fields and descriptions for the Vendor Open Entry Statement tab.

#### Vendor Island

Field	Description
<b>Vendor No.</b>	This field shows the number of the vendor. The following fields show the first two lines of the name and address transferred from the vendor information card.
<b>Currency</b>	This field displays the currency that the current vendor uses as standard currency.

#### Balance Island

Field	Description
<b>Balance, Currency</b>	This field shows the vendor's current balance in standard currency. The balance is updated when you post journals involving the vendor. The field is automatically updated.
<b>Balance, Base</b>	This field shows the vendor's current balance in base currency. The balance is updated when you post journals involving the vendor. The field is automatically updated.

#### Company Island

Field	Description
<b>Company No.</b>	This field shows the company number of the current vendor.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in

Field	Description
	the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

## Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Due Date</b>	<p>This field shows the due date of the entry. The due date is calculated as follows, depending on the origin of the entry:</p> <ul style="list-style-type: none"> <li>Vendor Invoices — The due date is calculated from the invoice date and the vendor's payment conditions.</li> <li>Payment — The due date is equal to the posting date.</li> <li>General Journal — The due date is calculated from the invoice date and the vendor's payment conditions.</li> </ul>
<b>Pay when Paid</b>	<p>This field shows whether payment when paid applies to the entry in question. For further information, see the description of the corresponding field in the window Change Payment Selection by Vendor.</p>
<b>Ready for Payment</b>	<p>This field shows whether the current entry is ready for payment. For further information, see the description of the corresponding field in the window Change Payment Selection by Vendor.</p>
<b>Entry Date</b>	<p>This field shows the entry's date of posting in the modules Accounts Payable and General Ledger. The date also indicates the valid period of the entry.</p>
<b>Description</b>	<p>This field shows the description of the entry. The description depends on the place of origin:</p> <ul style="list-style-type: none"> <li>Vendor Invoices — The description is manually added when registration of the entry takes place.</li> <li>Payment — The description is automatically transferred from the posting description. Vendor payment is entered in the window Posting Description in the Set-Up module.</li> <li>General Journal — The description is manually added when registration of the entry takes place in the window General Journal.</li> </ul>
<b>Trans. No.</b>	<p>This field shows the number of the transaction. The transaction number depends on the place of origin:</p> <ul style="list-style-type: none"> <li>Vendor Invoice — The transaction number is manually entered when registration of the entry takes place.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Payment — The transaction number is automatically transferred from the system number series Vendor Payment in the window System Numbers in the Set-Up module.</li> <li>General Journal — The transaction number is manually entered when registration of the entry takes place in the window General Journal.</li> </ul>
<b>Trans. Type</b>	This field shows the transaction type of the vendor entry.
<b>Debit, Currency</b>	This field shows the debit amount in the vendor's standard currency if the entry is a debit entry.
<b>Credit, Currency</b>	This field shows the credit amount in the vendor's standard currency if the entry is a credit entry.
<b>Remainder, Currency</b>	This field shows the amount in standard currency yet to be reconciled.
<b>Amount Being Paid, Currency</b>	This field shows the amount being paid in the standard currency of the vendor.
<b>Original Currency</b>	This field shows the original currency of the entry.
<b>Amount, Original</b>	This field shows the amount in original currency.
<b>Journal No.</b>	This field shows the journal number of the posting journal in which the entry is registered.

## Periodic Vendor Statement Workspace

Use this workspace to review a company vendor's open and closed invoices for a specific period

Use this workspace to display all vendor entries, open and closed, for the specified period.

This workspace provides a quick overview if a vendor makes an inquiry about the vendor balance.

The workspace is for reference only; you cannot change any of the information.

## Periodic Vendor Statement Tab

This section includes the fields and descriptions for the Periodic Vendor Statement tab.

**Vendor Island**

Field	Description
<b>Vendor No.</b>	This is the vendor number. The field also shows the first two lines of the vendor's name and address. The information is transferred from the Vendor Information Card.
<b>Currency</b>	This field displays the currency that the current vendor uses as standard currency.

**Company Island**

Field	Description
<b>Company No.</b>	This field shows the company number of the current vendor.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

**Period Island**

Field	Description
<b>Month/Yr.</b>	In this field, you enter the month and year of the desired statement. The month must be entered in numbers, that is, "1" is for January, "2" is for February, and so on. The desired year must be entered in four figures, for example, 2002. By using the vendor number, the month, and the year, Maconomy transfers the balance and the activity of the month.
<b>Date</b>	In this field, you enter a date range. If the field "Month/Yr." is completed, the values in the field above will be overwritten by the months entered in this field.

**Balance Island**

Field	Description
<b>Balance, Currency</b>	This field displays the vendor's immediate balance in standard currency. The balance is updated when posting journals with entries for the current vendor.

Field	Description
<b>Balance, Base</b>	This field displays the vendor's immediate balance in base currency. The balance is updated when posting journals with entries for the current vendor.

**Period Balances: Opening/Closing Island**

Field	Description
<b>Balance, Currency</b>	This field shows the vendor's opening and ending balances in the given month, expressed in the vendor's standard currency. The balances are updated at posting.
<b>Balance, Base</b>	These are the vendor's opening and ending balances in base currency in the given month. The balances are updated at posting.

## Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Entry Date</b>	This is the entry date in the accounts payable and general ledger. The date identifies the posting period.
<b>Description</b>	This is the entry text. The text was entered where the entry was registered: <ul style="list-style-type: none"> <li>■ Vendor Invoice — The text is entered manually.</li> <li>■ Payment — The text is entered by Maconomy using the Vendor Payment subledger text from the Posting Descriptions window in the G/L module.</li> <li>■ General Journal — The text is entered manually.</li> </ul>
<b>Trans. No.</b>	This is the entry's transaction number. The transaction number was given where the entry was registered: <ul style="list-style-type: none"> <li>■ Vendor Invoice — The number is entered manually.</li> <li>■ Payment — The number is allocated by Maconomy from the Vendor Payment system numbers in the window System Numbers in the Set-Up module</li> <li>■ General Journal — The number is entered manually.</li> </ul>
<b>Trans. Type</b>	This field shows the transaction type of the vendor entry.
<b>Debit, Currency</b>	This is the debit entry amount in the vendor's standard currency.
<b>Credit, Currency</b>	This is the credit entry amount in the vendor's standard currency.

Field	Description
<b>Due Date</b>	<p>This is the entry's due date. The due date was calculated where the entry was registered:</p> <ul style="list-style-type: none"> <li>Vendor Invoice — The due date is calculated from the invoice date and the vendor's payment terms.</li> <li>Payment — The due date is the same as the posting date.</li> <li>General Journal — The due date is calculated from the invoice date and the vendor's payment terms.</li> </ul>
<b>Pay when Paid</b>	<p>This field shows whether payment when paid applies to the entry in question. For further information, see the description of the corresponding field in the window Change Payment Selection by Vendor.</p>
<b>Ready for Payment</b>	<p>This field shows whether the current entry is ready for payment. For further information, see the description of the corresponding field in the window Change Payment Selection by Vendor.</p>
<b>Debit, Base</b>	<p>This is the debit entry amount in the base currency.</p>
<b>Credit, Base</b>	<p>This is the credit entry amount in the base currency.</p>
<b>O/C</b>	<p>This field shows whether the entry is open or closed. The field will show "Open" or "Closed."</p> <p>A vendor invoice is shown as an open entry until it is paid or reconciled. When it is paid, it is "gone" and closed. A payment entry is always shown as a closed entry.</p> <p>A vendor balance is always the same as the sum of the open entries.</p>
<b>Invoice Date</b>	<p>This is the entry's invoice date from the vendor.</p>
<b>Invoice No.</b>	<p>This is the vendor invoice number from the vendor.</p>
<b>Approved</b>	<p>This field shows whether the invoice is approved. If the field is marked, the invoice has been approved. When an entry is approved, it can be selected for payment in the window Change Payment Selection by Vendor.</p> <p>Entries are approved in the window Approve Invoices.</p>
<b>Original Currency</b>	<p>This is the currency in which the entry was originally entered.</p>
<b>amount, Original</b>	<p>This is the original entry amount, expressed in the original currency.</p>
<b>Date Posted</b>	<p>This is the date the entry was posted to the accounts payable and general ledger.</p>
<b>Journal No.</b>	<p>This is the number of the journal to which the entry was posted.</p>

## Global Periodic Vendor Statement Workspace

Use this workspace to review a vendor's open and closed invoices for a specific period.

Use this workspace to display all vendor entries, open and closed, for the specified period. This workspace provides a quick overview if a vendor makes an inquiry about the vendor balance.

The workspace is for reference only; you cannot change any of the information.

### Entries Sub-Tab

This section describes the Entries sub-tab.

#### Copy to Come

### Global Periodic Vendor Statement Tab

This section describes the Global Periodic Vendor Statement tab.

#### Copy to Come

Field	Description

## Vendor Entry Analysis Workspace

Use this workspace to review information about vendor entries.

### Vendor Entry Tab

This section describes the Vendor Entry tab.

#### Copy to Come

Field	Description

## Show Delivery Vendor Payment Workspace

Use this workspace to review information about delivery vendor payments.

A vendor payment can include vendor entries for several delivery vendors. The vendor payment shows the total amount paid, while the delivery vendor payment shows the part reconciled or paid to the individual delivery vendors.

### Delivery Vendor Payment Tab

This section describes the Delivery Vendor Payment tab.

#### Copy to Come

Field	Description

## Show Vendor Invoices Workspace

Use this workspace to view all posted vendor invoices and credit memos for a specific vendor.

You can see invoice allocation lines, both allocated and reallocated, and both approved and unapproved. You can change an invoice if you reopen it.

The tab of this workspace displays information about the vendor invoice/credit memo in question. The sub-tab displays assigned invoice allocation lines that you created in the Invoice Allocation and Reallocate Invoices workspaces. The sub-tab also displays allocation lines assigned to reallocations that have not yet been approved. The fields that this workspace displays are to a similar to the information that the Reallocate Invoices workspace displays. You can change the information if you reopen the invoice. For more information, see the description of the Reallocate Invoices workspace.

### Show Vendor Invoices Tab

This section includes the fields and descriptions for the Show Vendor Invoices tab.

#### Invoice Island

Field	Description
<b>Type</b>	This field shows whether the information in the window is for an invoice ("Credit") or a credit memo ("Debit").
<b>Invoice No.</b>	This is the invoice number of the vendor invoice.
<b>Invoice Date</b>	This is the invoice date of the vendor invoice.
<b>Reference Date</b>	This field shows the reference date for the current vendor invoice.

Field	Description
<b>Packing Slip No.</b>	This field shows the packing slip number assigned to the vendor invoice.
<b>Due Date</b>	This is the due date of the vendor invoice.
<b>Amount Incl. Tax</b>	This is the amount inclusive tax registered on the vendor invoice. The amount is in the currency used on the current invoice.
<b>Amount Incl. Tax For Reconc.</b>	This is the invoice amount inclusive tax which has not been allocated in the window Invoice Allocation, but which might have been reallocated in the window Reallocate Invoices. The amount is in the currency of the current invoice.
<b>Tax</b>	This is the original tax amount on the invoice. The amount is in the currency of the current invoice.
<b>Tax Amount For Realloc.</b>	This is the invoice's tax amount which has not been allocated in the window Invoice Allocation, but which might have been reallocated in the window Reallocate Invoices. The amount is in the currency of the current invoice.
<b>Currency</b>	This field shows the currency of the invoice.
<b>Cash Discount Date</b>	This field displays a cash discount date, if any, assigned to the current vendor entry. The date displayed in this field is thus the latest date on which payment should take place if cash discount is to be granted for the current vendor invoice.
<b>Possible Cash Discount %</b>	In this field, you can view the cash discount percentage which can be gained by paying the vendor invoice by the cash discount date specified above.
<b>Possible Cash Discount</b>	In this field, you can view the cash discount which can be gained by paying the vendor invoice by the cash discount date specified above.
<b>Amount Excl. Discount</b>	This field shows the invoice amount minus the calculated cash discount that is possible.
<b>Attn.</b>	This field shows the name of the person who is specified as attention person on the invoice.
<b>Disclosable</b>	This field shows whether the vendor registered on the invoice has been marked as disclosable.
<b>Show Reallocated Entries</b>	Mark this field to also show entries that have been reallocated.

### Job Island

Field	Description
<b>Job No.</b>	If a job number was specified on the original vendor invoice, this field shows the job number in question. It also shows the name of the specified job.

### Entry Island

Field	Description
<b>Reallocation Date</b>	This is the reallocation date registered on the invoice.
<b>Entry Date</b>	This is the entry date registered on the invoice.
<b>Trans. No.</b>	This is the transaction number of the invoice. This number is used for all the entries in the journal.
<b>Trans. Type</b>	This field shows the transaction type of the invoice.
<b>Description</b>	This is the entry text assigned to the invoice.
<b>Posted</b>	This field shows whether or not the journal is posted.
<b>Date Posted</b>	This is the posting date of the invoice.
<b>Journal No.</b>	This is the journal number of the posting journal in which the invoice was originally registered.
<b>Line No.</b>	This is the journal line number on which the invoice was registered.

### Responsible Island

Field	Description
<b>Responsible</b>	This field shows the name and number of the employee responsible for approving the current invoice or credit memo.

### Pay to Vendor Island

Field	Description
<b>Vendor No.</b>	This is the number of the vendor who is to receive payment of the invoice. The island also shows the name of the vendor and the first two lines of the vendor's address. The information is retrieved from the vendor's information card.

### Payment Island

Field	Description
<b>Payment Mode</b>	This field shows the payment mode used for the current vendor invoice.
<b>Payer Identification</b>	This field shows the payer identification assigned to the vendor invoice. The payer identification is used by Maconomy to create payment files for the electronic payment of vendors. These payment files are created in the window Payment Files in the Banking module. This payer identification is entered in the field "Payer Identification" in the window Payment Control.
<b>Payment Description</b>	This field shows the code for the goods or services covered by the vendor invoice if the vendor invoice concerns import. Maconomy uses the payment description in the creation of payment files for electronic payment of vendors.
<b>Card Type Code</b>	This field shows the card type code used on the vendor invoice. The code is used by Maconomy to create payment files for the electronic payment of vendors. These payment files are created in the window Payment Files in the Banking module. If you enter neither a card type code nor a payer identification, the vendor's standard card type code is copied to the vendor entry when the invoice is posted. This card type code is entered in the field "Card Type Code" in the window Payment Control.
<b>Import Date</b>	In this field, you can enter the date on which the goods or services covered by the vendor invoice were imported. Maconomy uses the import date in the creation of payment files for electronic payment of vendors. These payment files are created in the window Payment Files in the Banking module.
<b>Giro</b>	This field shows the giro number entered on the vendor invoice. The information is for reference.
<b>Bank Acct. No.</b>	This field shows the bank account number entered on the vendor invoice. The information is for reference.
<b>Reg. No.</b>	This field shows the registration number entered on the vendor invoice. The information is for reference.
<b>Credit Card No.</b>	This field shows the credit card number entered on the vendor invoice. The information is for reference.
<b>CPC No.</b>	This field shows the CPC number entered on the vendor invoice. The information is for reference.

### Vendor Information Island

Field	Description
<b>Enterprise</b>	In this field, you can specify an enterprise. When you create a vendor invoice manually, Maconomy suggests the value for this field from the purchase order or (if there is no purchase order) from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables.

Field	Description
	You maintain enterprises in the <b>Enterprises</b> field in the Popup Fields single dialog workspace under the Set-Up module.
<b>Segment</b>	In this field, you can specify a segment. When you create a vendor invoice manually, Maconomy suggests the value for this field from the purchase order or (if there is no purchase order) from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables. You maintain segments in the <b>Segments</b> field in the Popup Fields single dialog workspace under the Set-Up module.
<b>Area</b>	In this field, you can specify an area. When you create a vendor invoice manually, Maconomy suggests the value for this field from the purchase order or (if there is no purchase order) from the vendor information card, but you can select another. This field is used when deriving a G/L tax code from G/L tax tables. You maintain areas in the <b>Area</b> field in the Popup Fields single dialog workspace under the Set-Up module.

### Vendor Island

Field	Description
<b>Vendor No.</b>	This is the number of the vendor assigned to the invoice. The island also shows the name and the first two lines of the vendor's address. The information is retrieved from the vendor's information card.

### Purchase Order Island

Field	Description
<b>Purchase Order No.</b>	This field displays the purchase order number registered, if any, on the current vendor invoice. The value in this field is retrieved from the field "Purchase Order No." in the table part of the window Vendor Invoices. If a value is shown in this field, a number of reallocation lines have been created automatically in the table part of the window, corresponding to the lines on the purchase order in question.

### Allocation, Currency Island

Field	Description
<b>Status</b>	This field shows the current status of the invoice displayed in the window. The field can show one of the following options: <ul style="list-style-type: none"> <li>▪ Awaits Allocation — The invoice journal has been submitted and approved for posting, but no invoice allocation line has yet been created for the invoice in question.</li> <li>▪ Allocation Started — Allocation lines have been created, but have not yet been submitted or fully allocated.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Awaits Approval — The invoice or the allocation has been submitted for approval and awaits approval for posting.</li> <li>Awaits Posting — The invoice journal has been approved, but has not yet been posted.</li> <li>Allocation Completed — The allocation has been fully approved and posted, and is thus completed.</li> </ul>
<b>Released for Posting</b>	This field shows whether the allocation of the invoice has been approved.
<b>Remainder Excl. Tax</b>	This field shows how much of the total amount, tax excluded remains to be allocated on the lines in the table part of the window.
<b>Remainder Tax</b>	This field shows how much of the total tax amount on the vendor invoice remains to be allocated on the lines in the table part of the window.
<b>Remainder Incl. Tax</b>	This field shows how much of the total amount inclusive tax remains to be allocated on the lines in the table part of the window.
<b>Responsible for Allocation</b>	This field shows the name and employee number of the person specified as responsible for allocating the invoice.

### Company Island

Field	Description
<b>Company</b>	This field displays the name and number of the company specified on the current vendor invoice.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.
<b>Global Location No.</b>	<p>If a global location number has been specified on the vendor invoice, you can enter the global location number here. Global location numbers are used in electronic invoices, and therefore this field will typically be completed automatically on electronically read vendor invoices.</p> <p>Global location numbers are set up in the window Company Locations in the G/L module and indicate the company, department, warehouse or other entity to receive the invoice. For further information about the concept of global location numbers, see the introduction to the window Company Locations in the G/L module.</p> <p>If you specify both a global location number and a company, the location number must belong to the specified company. If you specify only a global location</p>

Field	Description
	<p>number, the invoice is automatically assigned to the company with which the location number is associated.</p> <p>When a global location number is specified, any registration code and allocation responsible specified for the global location number are transferred to the invoice as if entered manually.</p>

### Copy Vendor Invoice Island

Field	Description
<b>Vendor No.</b>	This field displays the number of the vendor assigned to the invoice on the basis of which copying or reversion has been made.
<b>Invoice No.</b>	This field displays the number of the invoice on the basis of which copying or reversion has been made.
<b>Journal No.</b>	This field displays the number of the journal on the basis of which copying or reversion has been made.
<b>Journal Line No.</b>	This field displays the number of the journal line on the basis of which copying or reversion has been made.
<b>Reverse at Copying</b>	This field displays whether the current entry has reversed a given vendor entry. See the description of the island Copy Vendor Invoice in the window Invoice Allocation for more information.

### Currency Island

Field	Description
<b>Exchange Rate</b>	This field shows the exchange rate used when the invoice was posted.
<b>Fixed Exchange Rate at Payment</b>	If this field is marked, the exchange rate in which the entry is posted will be fixed when the payment is posted, even though the exchange rate may have changed according to the current exchange rate table.

### Document Archive Island

Field	Description
<b>Document Archive</b>	This field shows the number of a document archive assigned to the vendor invoice in question. This field also shows the description of the specified document archive.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.
<b>File Name</b>	This field shows the name of the file, if any, assigned to the invoice. The file can be displayed by a third party program, for example, Acrobat Reader or a browser by selecting the action "Show Document" in the Action menu of this

Field	Description
	window. See the description of the field "File Name" in the window Invoice Allocation for further information about assigning a file to an invoice.

#### Dimensions Island

Field	Description
<b>Location</b>	This is the location entered for the invoice or credit memo.
<b>Entity</b>	This is the entity entered for the invoice or credit memo.
<b>Project</b>	This is the project entered for the invoice or credit memo.
<b>Purpose</b>	This is the purpose entered for the invoice or credit memo.
<b>Spec. 1-3</b>	This is the specification 1-3 entered for the invoice or credit memo.
<b>Local Spec. 1-3</b>	This is the local specification 1-3 entered for the invoice or credit memo.

#### Remarks Island

Field	Description
<b>Remarks 1-5</b>	These fields show the remarks specified on the invoice.

#### Invoice Allocation Lines Sub-Tab

This section includes the fields and descriptions for the Invoice Allocation Lines sub-tab.

Field	Description
<b>Purchase Line Type</b>	<p>This field indicates the type of purchase the line represents. The available values are:</p> <ul style="list-style-type: none"> <li>■ Fixed Asset</li> <li>■ Inventory</li> <li>■ Job Cost</li> <li>■ G/L</li> <li>■ Text Line</li> <li>■ Subcontractor Reconciliation</li> </ul>

Field	Description
<b>Account No.</b>	This field shows the number of the account on which the amount on the line has been allocated.
<b>Job No.</b>	If the entry is registered on a job in the Job Cost module, this field shows the number of the job on which the amount on the line has been allocated.
<b>Act. No.</b>	If the entry is registered on a job in the Job Cost module, this field shows the number of the activity on which the amount on the line has been allocated.
<b>Empl. No.</b>	If the allocation line concerns a job specified in the field "Job No.," this field shows the number of an employee, if any, assigned to the invoice entry.
<b>Task</b>	This field shows the task to which the line might be assigned.
<b>Account/Activity Name</b>	This field shows the text assigned to the G/L account shown in the field "Account No." or the text assigned to the activity specified in the field "Act. No." on the line.
<b>Entry Description</b>	This field shows a description of the entry.
<b>Quantity</b>	This field shows the quantity registered on the line.
<b>Unit</b>	This field shows the unit that applies to the current line.
<b>Unit Price</b>	This field shows the unit price in the currency of the vendor invoice.
<b>Pricing Unit</b>	If an item has been specified on the current line, this field shows the quantity of item units included in the unit price. The value is retrieved from the field "Unit, Purchase" on the Item Information Card and cannot be changed here. However, if the line is based on a purchase order line, Maconomy will attempt to derive the pricing unit from the purchase order line in question before deriving it from the Item Information Card.
<b>Discount</b>	This field shows the discount in the currency of the vendor invoice.
<b>Amount Excl. Tax</b>	This field shows the price less tax of the line in the currency of the vendor invoice. The amount is calculated as quantity times unit price less tax and any discount.
<b>Item No.</b>	If the entry pertains to an item, this field shows the number of the item in question.
<b>Tax Code</b>	This field shows the G/L tax code, if any, used on the entry. If multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2," and, if three tax levels are enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."

Field	Description
<b>Tax</b>	This field shows the line's tax amount in the currency of the vendor invoice. If multiple tax codes are enabled, the "Tax" field will be replaced by the following fields: "Total Tax," "Tax 1," "Tax 2," and, if three tax levels are enabled, "Tax 3." The "Total Tax" field calculates the sum of the other individual tax amount fields. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Amount Incl. Tax</b>	This field shows the price of the line including tax in the currency of the vendor invoice. The amount is calculated as quantity times unit price less any discount.
<b>Item Tax Code</b>	<p>This field shows the item tax code created in the Popup Fields window. The field is used by Maconomy for determining the tax code to be used in the calculation of tax for the current vendor invoice, as the reporting code is part of the criteria for the selection of a tax code in the Tax Tables window in the G/L module. When selecting a tax code, Maconomy uses the tax table specified as the responsible company for the vendor invoice in the window Company Information. However, the tax code is only selected from a tax table if the company that is responsible for the current invoice is assigned to a tax table in the window System Information. If no tax table is specified for the responsible company or if you use differentiated tax, and you do not use tax tables, Maconomy will use the tax code of the account or activity specified when the vendor invoice is allocated or reallocated. If you use neither differentiated tax nor tax tables, Maconomy will use the standard tax code specified in the System Information window in the Set-Up module.</p> <p>When posting entries, the reporting code is used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if extended tax reporting has been selected in the window System Information.</p> <p>If you entered a purchase order number for the vendor invoice, Maconomy suggests the value from the field "Company Tax Code" in the card part of the purchase order, and if no purchase order has been specified, Maconomy suggests the value from the vendor's information card.</p>
<b>Reference Date</b>	This field shows the reference date for the current vendor invoice.
<b>Registration Code</b>	This field shows a registration code from the window Registration Codes in the G/L module. See the description of the window Registration Codes for more information about registration codes.
<b>Company No.</b>	This field shows the number of the company assigned to the current line. The number is transferred automatically from either the island Company in the card part of this window or through a selected registration code.
<b>Location</b>	This field shows the location to which the line might be assigned.

Field	Description
<b>Entity</b>	This field shows the entity to which the line might be assigned.
<b>Project</b>	This field shows the project to which the line might be assigned.
<b>Purpose</b>	This field shows the purpose to which the line might be assigned.
<b>Spec. 1-3</b>	These fields show the specification 1-3 to which the line might be assigned.
<b>Local Spec. 1-3</b>	These fields show the local specifications 1-3 to which the line might be assigned.
<b>Employee Name</b>	This field shows the name of the employee specified on the line.
<b>Job Name</b>	This field shows the name of the job to which the line might be assigned.
<b>Task Description</b>	This field displays the description of the task entered in the field "Task" on the current line.
<b>Customer No., Ref.</b>	Enter a reference customer number.
<b>Customer Name, Ref.</b>	This field displays the name of the customer specified in the "Customer No., Ref." field.
<b>Purch. Order No.</b>	This field shows the purchase order number for invoice allocation lines created by entering a purchase order number in the window Vendor Invoices. When the vendor invoice journal is posted, Maconomy will register the line as invoiced on the corresponding purchase order line. However, if the entry is a vendor credit memo, the amount is deducted from the invoiced amount.
<b>Line No.</b>	This field shows the number of the purchase order line on which the amount is registered as invoiced, when the vendor invoice journal was posted.
<b>Close Purchase Order Line</b>	This field shows whether the purchase order line was closed when the journal was posted. If all the purchase order lines are closed, the purchase order itself will also be closed.
<b>Packing Slip No.</b>	If the current line was created as a result of entering a purchase order number and a packing slip number on the vendor invoice displayed in the card part, this field shows the number of the packing slip in question.
<b>Inventory Change Transaction No.</b>	If the current line was created as a result of entering a purchase order number and a packing slip number on the vendor invoice displayed in the card part, this field shows the number of the inventory change transaction

Field	Description
	resulting from the approval of the purchase receipt to which the packing slip in question pertains. As allocation and reallocation lines created by entering a purchase order and packing slip number are based on inventory change transactions, this field thus shows the number of the inventory change transaction containing the transaction line on which the current line is based.
<b>Inventory Change Transaction Line No.</b>	<p>If the current line was created as a result of entering a purchase order number and a packing slip number on the vendor invoice displayed in the card part, this field shows the number of the inventory change transaction line on which the current line is based.</p> <p>As allocation and reallocation lines created by entering a purchase order and packing slip number are based on inventory change transactions, this field thus shows the number of the line in the table part of the inventory change transaction shown in the field "Inventory Change Transaction No." on which the current line is based.</p>
<b>Quantity 1</b>	This field shows an allocation line quantity. This field and the field "Quantity 2" are used for reporting and statistics.
<b>Quantity 2</b>	This field shows an allocation line quantity. See the field "Quantity" above.
<b>Tax Exempt</b>	In this field, you can specify whether the invoice line covers a tax exempt service. Maconomy suggests the value specified for the invoice allocation line when the allocation was posted.
<b>Accrual Type</b>	This field shows whether the cost on the line will be accrued. An entry can only be accrued if a G/L account has been selected for the current line. If accrual has been selected, Maconomy will create a G/L entry on the specified G/L account for each G/L period specified in the fields "Period From, Accrual" and "Period To, Accrual." The amount is distributed evenly on the selected periods.
<b>Period From, Accrual</b>	This field and the field "Period To, Accrual" show a range of accrual dates. If the field "Accrual Type" was marked, Maconomy will create a G/L entry on the specified G/L account for each G/L period specified in the fields "Period From, Accrual" and "Period To, Accrual." The amount is distributed evenly on the selected periods.
<b>Period To, Accrual</b>	See the field "Period From, Accrual" above.
<b>Created at reallocation</b>	This field shows whether the current line was created at reallocation. If this field is marked, the current line was created in the window Reallocate Invoices. If the field is blank, the line was created in the Invoice Allocation window.
<b>Reallocation Entry</b>	This field shows the reallocation entry if the current line was reallocated.

Field	Description
<b>Journal No.</b>	This field shows the journal number of the reallocation journal.
<b>Transaction Type</b>	This field shows the transaction type of the entry.

## Actions

This section shows the Actions available in the Show Vendor Invoices workspace.

### Top Tab

Field	Description
<b>Submit for Approval</b>	Use this action to submit an invoice allocation for approval.
<b>Approve for Posting</b>	Use this action approve an invoice allocation for posting. Approval is possible only if the sum of the allocated amounts, less any inventory purchase amounts, in the <b>Remainder, Tax</b> and <b>Remainder, Incl. Tax</b> fields is zero.

## Show Invoice Allocation Lines Workspace

Use this workspace to find and review specific invoice allocation lines.

### Show Invoice Allocation Lines Tab

This section includes the fields and descriptions for the Show Invoice Allocation Lines tab.

#### Vendor Island

Field	Description
<b>Vendor No.</b>	This field shows the number of the vendor assigned to the invoice. It includes the name and the first two lines of the vendor's address.

#### Invoice Island

Field	Description
<b>Trans. No.</b>	This field shows the invoice transaction number. This number is used for all the entries in the journal.
<b>Transaction Type</b>	This field shows the invoice transaction type.
<b>Invoice No.</b>	This field shows the vendor invoice number.

Field	Description
<b>Invoice Date</b>	This field shows the vendor invoice date.
<b>Vendor Invoice Type</b>	This field shows the vendor invoice type. The vendor invoice type can be Invoice or Credit Memo.
<b>Entry Description</b>	This field shows a description of the entry.
<b>Reference Date</b>	This field shows the current vendor invoice reference date.

**Company Island**

Field	Description
<b>Company</b>	This field shows the name and number of the company assigned to the current line.

**Account Island**

Field	Description
<b>Account</b>	This field shows the text and number of the account to which the amount on the line has been allocated.

**Customer Ref. Island**

Field	Description
<b>Customer</b>	This field shows the customer reference number and the name of the customer.

**Job Island**

Field	Description
<b>Job</b>	If the entry is registered on a job in the Job Cost module, this field shows the number of the job to which the amount on the line has been allocated.
<b>Activity</b>	If the entry is registered on a job in the Job Cost module, this field shows the number of the activity to which the amount on the line has been allocated.
<b>Task</b>	This field shows the task to which the line might be assigned.
<b>Employee</b>	If the allocation line concerns a job specified in the Job No. field, this field shows the number of an employee, if any, assigned to the invoice entry.

**Item Island**

Field	Description
<b>Item</b>	If the entry pertains to an item, this field shows the number and description of the item in question.

**Purchase Order Island**

Field	Description
<b>Purch. Order No.</b>	This field shows the purchase order number for invoice allocation lines created by entering a purchase order number in the Vendor Invoices window.
<b>Purchase Order Line No.</b>	This field shows the number of the purchase order line to which the amount was registered as invoiced when the vendor invoice journal was posted.
<b>Close Purchase Order Line</b>	This field specifies whether the purchase order line was closed when the journal was posted. If all the purchase order lines are closed, the purchase order itself will also be closed.

**Accrual Island**

Field	Description
<b>Accrual Type</b>	This field specifies whether the cost on the line will be accrued. An entry can only be accrued if a G/L account has been selected for the current line.
<b>Period From, Accrual</b>	This field shows a range of accrual dates.
<b>Period To, Accrual</b>	This field shows a range of accrual dates.

**Pay to Vendor Island**

Field	Description
<b>Pay to Vendor No.</b>	This field shows the number of the vendor who is to receive payment for the invoice. It also shows the name of the vendor and the first two lines of the vendor's address.

**Allocated Amount Island**

Field	Description
<b>Quantity</b>	This field shows the quantity registered on the line.
<b>Unit</b>	This field shows the unit that applies to the current line.

Field	Description
<b>Pricing Unit</b>	If an item has been specified on the current line, this field shows the quantity of item units included in the unit price.
<b>Unit Price</b>	This field shows the unit price in the currency of the vendor invoice.
<b>Discount</b>	This field shows the discount in the currency of the vendor invoice.
<b>Amount Excl. Tax</b>	This field shows the price of the line, excluding tax, in the currency of the vendor invoice. The amount is calculated as quantity times unit price less tax and any discount.
<b>Tax</b>	<p>This field shows the line's tax amount in the currency of the vendor invoice. If multiple tax codes are enabled, this field will be replaced by the following fields:</p> <ul style="list-style-type: none"> <li>▪ Total Tax</li> <li>▪ Tax 1</li> <li>▪ Tax 2</li> <li>▪ Tax 3</li> </ul> <p>The Total Tax field calculates the sum of the other individual tax amount fields.</p>
<b>Amount Incl. Tax</b>	This field shows the price of the line, including tax, in the currency of the vendor invoice. The amount is calculated as quantity times unit price less any discount.
<b>Quantity 1</b>	This field shows the quantity for period 1 for the current budget entry.
<b>Quantity 2</b>	This field shows the quantity for period 2 for the current budget entry.

#### Dimensions Island

Field	Description
<b>Location</b>	This field shows the location to which the line might be assigned.
<b>Entity</b>	This field shows the entity to which the line might be assigned.
<b>Project</b>	This field shows the project to which the line might be assigned.
<b>Purpose</b>	This field shows the purpose to which the line might be assigned.
<b>Spec. 1–3</b>	This field shows the specification 1–3 to which the line might be assigned.

Field	Description
<b>Local Spec. 1–3</b>	This field shows the local specifications 1–3 to which the line might be assigned.

**Tax Island**

Field	Description
<b>Tax Code</b>	This field shows the G/L tax code, if any, used in the entry.
<b>Item Tax Code</b>	This field shows the item tax code created in the Popup Fields window. Maconomy uses this field to determine the tax code to be used in the calculation of tax for the current vendor invoice, as the reporting code is part of the criteria for the selection of a tax code in the Tax Tables window in the G/L module.
<b>Tax Exempt</b>	This field specifies whether the invoice line covers a tax exempt service.

**Status Island**

Field	Description
<b>Posted</b>	This field specifies whether the invoice line has been posted.
<b>Reopened</b>	This field specifies that the invoice has been reopened.
<b>Reallocation Entry</b>	This field specifies whether the invoice line is a reallocation of a reopened invoice allocation line.
<b>Purchase Line Type</b>	This field shows the type of purchase the line represents.

## Show Vendor Reconciliation Workspace

Use this workspace to review vendor entries and the entries used to reconcile them (for example, to see an invoice and the payments and credit memos that reconciled it).

You can review vendor invoices, vendor credit memos, manual payments from a general journal, automatic payments from approval of payment selections, cash discounts, and exchange rate differences.

Use this workspace to display vendor entries and the entries that reconciled them.

The tab displays an entry, and the sub-tab displays how it is reconciled. You can use this workspace to track how an invoice was paid (for example, if your vendor says payment has not been received).

The vendor entries can be divided into the following categories: Vendor Invoices, vendor credit memos, manual payments from a general journal, automatic payments from approval of payment selections, cash discounts, and exchange rate differences.

- **Vendor Invoices**—When the entry in the tab is a vendor invoice, the sub-tab displays which payments and vendor credit memos reconciled it. The **Discount, Currency and Discount, Base** fields in the sub-tab display cash discounts.
- **Vendor Credit Memo** —When the entry in the tab is a vendor credit memo for which Maconomy created an automatic payment entry, the sub-tab displays the payment entry. If the credit memo was not reconciled by an automatic payment entry, the sub-tab displays which vendor invoices the credit memo has reconciled. It displays which vendor credit memos or manual payments were part of the reconciliation.
- **Manual Payment Entries**—When the entry in the tab is a manual payment from a general journal for which Maconomy created an automatic payment entry, the sub-tab displays the payment entry. If there is no automatic payment entry, the sub-tab displays which vendor invoices the manual payment has reconciled. The sub-tab also displays other vendor credit memos or manual payments that were part of the reconciliation.
- **Automatic Payment Entries, Cash Discounts or Exchange Rate Differences** —When the entry in the tab is an automatic payment, a cash discount, or exchange rate difference, the sub-tab displays which vendor invoice the entry reconciled. It also displays other payments and vendor credit memos that were part of the reconciliation.

### Show Vendor Reconciliation Tab

This section includes the fields and descriptions for the Show Vendor Reconciliation tab.

#### Vendor Island

Field	Description
<b>Vendor No.</b>	This is the vendor number and name which identify the vendor. The field also shows the vendor's name and address, which have been retrieved from the Vendor Information Card.
<b>Currency</b>	This field displays the currency that the current vendor uses as standard currency.

#### Remove Reconciliation Island

Field	Description
<b>Entry Date</b>	This is the date on which the entry was removed to the general ledger and accounts payable.

#### Company Island

Field	Description
<b>Company</b>	This field displays the name and number of the company specified in the current vendor entry.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in

Field	Description
	the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### Dimensions Island

Field	Description
<b>Location</b>	See the description of the field "Company No." and the description of the Locations window in the G/L module.
<b>Entity</b>	See the description of the field "Company No." and the description of the Entities window in the G/L module.
<b>Project</b>	See the description of the field "Company No." and the description of the Projects window in the G/L module.
<b>Purpose</b>	See the description of the field "Company No." and the description of the Purposes window in the G/L module.
<b>Spec. 1-3</b>	See the description of the field "Company No." and the description of the Specification 1-3 windows in the G/L module.
<b>Local Spec. 1-3</b>	See the description of the field "Company No." and the description of the Local Specification 1-3 windows in the G/L module.

### Payment Island

Field	Description
<b>Payment Mode</b>	This shows how the entry will be or has been paid.
<b>Check Book</b>	This field shows the check book used in connection with payment of the current vendor entry.
<b>Check No.</b>	This field shows the number of the check used for payment of the current vendor entry.
<b>Payment No.</b>	This field shows the number of the payment. The number is used as a reference to the windows Show Automatic Payment, Show Payment Remittance, and Show Payment Reconciliation in the Banking module. The number is used for tracing payment information on a vendor entry.
<b>Payment Group No.</b>	This field shows the number of the payment group used by some banks for grouping electronic payments.
<b>Payment Line No.</b>	This field shows the number of the payment line which refers to the specific payment order.
<b>Giro</b>	This field shows the giro number entered on the vendor invoice. The information is for reference.
<b>Bank Acct. No.</b>	This field shows the bank account number entered on the vendor invoice. The information is for reference.

Field	Description
<b>Reg. No.</b>	This field shows the registration number entered on the vendor invoice. The information is for reference.
<b>Credit Card No.</b>	This field shows the credit card number entered on the vendor invoice. The information is for reference.
<b>CPC No.</b>	This field shows the CPC number entered on the vendor invoice. The information is for reference.

### Pay to Vendor Island

Field	Description
<b>Vendor No.</b>	The vendor number is the sole and absolute identification of a vendor. The field also shows the vendor's name and address. The information is retrieved from the Vendor Information Card.

### Entry Information Island

Field	Description
<b>Entry Date</b>	This is the date on which the entry was entered to the general ledger and accounts payable. The date identifies the posting period.
<b>Description</b>	This is the entry text.
<b>Trans. No.</b>	This is the entry's transaction number.
<b>Trans. Type</b>	This is the entry's transaction type.
<b>Invoice Date</b>	This is the date of the vendor invoice or credit memo.
<b>Invoice No.</b>	This is the number of the vendor invoice or credit memo.
<b>Disclosable</b>	This field shows if the current vendor is disclosable.
<b>Open/Closed</b>	This field shows whether the entry is "Open" or "Closed." A vendor invoice or credit memo is open until it has been paid or reconciled. A payment, discount or exchange rate entry is always registered as closed. A vendor's balance is equal to the sum of the remainder of all open entries.
<b>Due Date</b>	This is the date the entry is due. The due date of payments is the date the payment was entered to the general ledger and accounts payable.

Field	Description
<b>Pay when Paid</b>	This field shows whether payment when paid applies to the invoice in question. For further information, see the description of the corresponding field in the window Change Payment Selection by Vendor.
<b>Ready For Payment</b>	This field shows whether the current entry is ready for payment. For further information, see the description of the corresponding field in the window Change Payment Selection by Vendor.
<b>Date Posted</b>	This is the date the entry was posted to the accounts payable and general ledger.
<b>Time Posted</b>	This field shows the time at which the journal/entry was posted. Maconomy uses the posting time internally only, for drilling in financial statements.
<b>Cash Discount Date</b>	This field displays a cash discount date, if any, assigned to the current vendor entry. The date displayed in this field is thus the latest date on which payment should take place if cash discount is to be granted for the current vendor invoice.
<b>Journal No.</b>	This is the number of the posting journal the entry was posted in.
<b>Approved</b>	This shows whether the entry is approved for payment. It only applies to invoices and credit memos.
<b>Responsible</b>	This shows who is responsible for approving the entry. It only applies to invoices and credit memos.
<b>Company of Origin</b>	This field displays the company which initiated the vendor entry displayed.

### Entry Island

Field	Description
<b>Debit, Currency</b>	This shows the payment, vendor credit memo, discount or currency gains in the vendor's standard currency.
<b>Credit, Currency</b>	This shows the vendor invoice or currency loss in the vendor's standard currency.
<b>Debit, Base</b>	This shows the payment, vendor credit memo, discount or currency gains in the base currency.
<b>Credit, Base</b>	This shows the vendor invoice or currency loss in the base currency.
<b>Remainder, Currency</b>	This shows any amount in the vendor's standard currency which has not been reconciled.
<b>Remainder, Base</b>	This shows any amount in the base currency which has not been reconciled.

Field	Description
<b>Original Currency</b>	This is the original currency of the entry, that is, the currency it was registered in. When it is posted, it will be converted to the vendor's standard currency.
<b>Amount, Original</b>	This is the entry amount in the original currency.

### Payment Selection Island

Field	Description
<b>Payment, Currency</b>	This field shows how much has been suggested for payment in the Change Payment Selection by Vendor window.
<b>Discount, Currency</b>	This shows any cash discount registered to the vendor invoice in the Change Payment Selection by Vendor window.
<b>Being Paid, Currency</b>	This shows how much has been selected from automatic payment in the window Payment Files in the Banking module.

### Vendor reconciliations Sub-Tab

This section includes the fields and descriptions for the Vendor reconciliations sub-tab.

Field	Description
<b>Entry Date</b>	This is the date the entry was posted to the general ledger and accounts payable. The date identifies the posting period.
<b>Trans. No.</b>	This is the entry's transaction number. If the entry is an invoice or credit memo, the number was given manually in the Vendor Invoices or General Journal window. If it is a payment, cash discount or exchange rate difference, the number was allocated by Maconomy from "Vendor Payment" system numbers when you approved the payment selection.
<b>Trans. Type</b>	This field shows the transaction type of the vendor entry against which the vendor entry in the card part was balanced.
<b>Description</b>	This is the entry text. If the entry is an invoice or credit memo, the text was entered manually in the Vendor Invoices or General Journal window. If it is a payment, cash discount or exchange rate difference, it was entered by Maconomy when you approved the payment selection.
<b>Debit, Currency</b>	This is the entry amount in the vendor's standard currency, if it is a debit entry.
<b>Credit, Currency</b>	This field shows the entry amount in the vendor's standard currency, if it is a credit entry.
<b>Reconciled, Currency</b>	This field shows how much of the entry has been reconciled, including cash discount. If the entry is fully reconciled, the amount here is the same as the amount in the "Debit in Standard" or "Credit in Standard" field. The

Field	Description
	amount is shown in the vendor's standard currency. An entry can also be reconciled in full by other reconciliations.
<b>Discount, Currency</b>	This field shows how much cash discount was given for the payment in this reconciliation. The amount is shown in the vendor's standard currency.
<b>Payment Mode</b>	This shows the payment mode, for example, check.
<b>Invoice No.</b>	This field shows the number of the invoice on which the entry appears.
<b>Check No.</b>	This field shows the number of the check used for payment of the current vendor entry.
<b>Payment No.</b>	This field shows the number of the payment. Together with the payment group number and the payment line number, the payment number refers to the windows Show Automatic Payment, Show Payment Remittance, and Show Payment Reconciliation in the Banking module. The number is used for tracing payment information on a vendor entry.
<b>Check Book</b>	This field shows the check book used in connection with payment of the current vendor entry.
<b>Payment Group No.</b>	This field shows the number of the payment group used by some banks for grouping electronic payments.
<b>Payment Line No.</b>	This field shows the number of the payment line which is used as reference to the current payment order.
<b>Type</b>	<p>This shows where the entry originated. The following types exist:</p> <ul style="list-style-type: none"> <li>■ Vendor Invoice, registered in the Vendor Invoices window.</li> <li>■ Vendor Credit Memo, registered in the Vendor Credit Memos window.</li> <li>■ Credit General Journal, credit entry registered in the General Journal window.</li> <li>■ Debit General Journal, debit entry registered in the General Journal window.</li> <li>■ Vendor Payment, payment selection approved in the Change Payment Selection by Vendor or Approve Payment Selection windows in the Banking module.</li> <li>■ Vendor Cash Discount, payment selection approved in the Change Payment Selection by Vendor or Approve Payment Selection windows in the Banking module.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Exchange Rate Difference, payment selection approved in the Change Payment Selection by Vendor or Approve Payment Selection windows in the Banking module.</li> </ul>
<b>Debit, Base</b>	This is the entry amount in the base currency, if it is a debit entry.
<b>Credit, Base</b>	This is the entry amount in the base currency, if it is a credit entry.
<b>Reconciled, Base</b>	<p>This shows how much of the entry has been reconciled, including cash discount. If the entry is fully reconciled, the amount here is the same as the amount in the "Debit in Standard" or "Credit in Standard" field. The amount is shown in the base currency.</p> <p>Note that the entry can be reconciled in full by other reconciliations.</p>
<b>Discount, Base</b>	This shows how much cash discount was given for the payment in this reconciliation. The amount is shown in the base currency.
<b>Amount, Original</b>	This is the entry's original currency amount in the original currency.
<b>Original Currency</b>	This is the currency the entry was originally entered in.
<b>Open/Closed</b>	<p>This field shows whether the entry is "Open" or "Closed."</p> <p>A vendor invoice or credit memo is open until it has been paid or reconciled. A payment, discount or exchange rate entry is always registered as closed.</p> <p>A vendor's balance is equal to the sum of the remainder of all open entries.</p>
<b>Due Date</b>	<p>This is the entry's due date. The due date of a vendor invoice is found from the invoice date and the vendor's terms of payment.</p> <p>The value is retrieved from the Vendor Invoices or General Journal window.</p>
<b>Date Posted</b>	This is the date the invoice was posted to the accounts receivable and general ledger.
<b>Journal No.</b>	This is the number of the journal the entry was posted in.
<b>Responsible</b>	This is the person responsible for approving invoice from the vendor. It is used for reference and is printed on the list of nonapproved vendor invoices, which is grouped in employees responsible for approving these invoices.
<b>Company of Origin</b>	This field displays the company which initiated the entry displayed.

Field	Description
<b>Company No.</b>	This field displays the value of the Company dimension specified for the current vendor entry. For a description of the "Company" dimension, please see the description of the Company Information window in the G/L module.
<b>Location</b>	See the description of the field "Company No." and the description of the Locations window in the G/L module.
<b>Entity</b>	See the description of the field "Company No." and the description of the Entities window in the G/L module.
<b>Project</b>	See the description of the field "Company No." and the description of the Projects window in the G/L module.
<b>Purpose</b>	See the description of the field "Company No." and the description of the Purposes window in the G/L module.
<b>Spec. 1-3</b>	See the description of the field "Company No." and the description of the Specification 1-3 windows in the G/L module.
<b>Local Spec. 1-3</b>	See the description of the field "Company No." and the description of the Local Specification 1-3 windows in the G/L module.

## Actions

This section shows the Actions available in the Show Vendor Reconciliation workspace.

### Top Tab

Field	Description
<b>Remove Reconciliation</b>	<p>When you select this action, the reconciliation of the current vendor entry is removed, and all reconciled amounts in the table part of the window will be reset to zero. When you remove a vendor reconciliation, the entries which were part of the reconciliation are all reestablished causing the vendor entries which were previously closed to be reopened.</p> <p>If the reconciliation caused any G/L entries such as exchange rate variances or cash discounts, Maconomy automatically creates a vendor reconciliation journal with offset entries for the G/L entries in question. If the system parameter "Automatic posting of Vendor Reconciliations" is marked, the journal will be posted automatically.</p> <p>The action can only be selected if reconciliations have been made against the current entry. For manually reconciled entries, the current entry must therefore be the entry, that is, the payment or the credit memo shown in the card part of the window A/P Open Entry Reconciliation when the reconciliation was made. For automatically reconciled entries, the current entry must be the payment entry created when the payment was approved. This action is not available for other entries.</p>

Field	Description
	After having removed a reconciliation, the open vendor entries can be reconciled again in the window A/P Open Entry Reconciliation or in the window General Journal in the G/L module.

## Show Vendor Subcontractor Reconciliation Workspace

Use this workspace to review finance entries associated with vendor invoice lines that have been allocated or reallocated to vendor subcontractors.

Use this workspace to research the origin of finance entries that belong to a journal of type Vendor Invoice.

Use this workspace for vendor subcontractor reconciliation.

This workspace is the lookup equivalent of the Vendor Subcontractor Reconciliation workspace.

This is needed in the Financial Analysis workspace.

This workspace displays an Invoice Allocation Line in the tab, similar to the information that the sub-tab of the Invoice Allocation workspace displays. The Invoice Allocation Line is selected for subcontractor reconciliation. The sub-tab displays the job entries that are reconciling the invoice allocation line, similar to the sub-tab of the Vendor Subcontractor Reconciliation workspace.

You can bind the Show Vendor Invoices and Show Vendor Subcontractor Reconciliation workspaces to get an overview of the vendor invoices reconciled against job entries. This shows by example the work (time entry) done by a vendor subcontractor, corresponding to a specific vendor invoice.

### Vendor Subcontractor Reconciliation Tab

This section includes the fields and descriptions for the Vendor Subcontractor Reconciliation tab.

#### Invoice Island

Field	Description
<b>Trans. No.</b>	This field shows the transaction number of the invoice or credit memo.
<b>Transaction Type</b>	This field shows the transaction type of the invoice or credit memo.
<b>Invoice No.</b>	This field shows the invoice number of the vendor invoice
<b>Invoice Date</b>	This field shows the date of invoice or credit memo.
<b>Vendor Invoice Type</b>	This field shows whether the vendor invoice involves a credit or a debit transaction.

**Allocation Line Island**

Field	Description
<b>Journal No.</b>	This field shows the number of the journal that the invoice on which the current allocation line is based belongs to.
<b>Journal Line No.</b>	This field shows the number of the line that the invoice on which the current allocation line is based occurs on in the journal shown in the field "Journal No."
<b>Line No.</b>	This field shows the number of allocation line in the current invoice.

**Vendor Island**

Field	Description
<b>Vendor</b>	This field shows the number of the vendor assigned to the invoice or credit memo.
<b>Pay to Vendor No.</b>	This field shows the number of the vendor who is to receive payment for the vendor invoice.

**Job Entry Sub-Tab**

This section includes the fields and descriptions for the Job Entry sub-tab.

Field	Description
<b>Date</b>	This field shows the date when the job entry was selected for reconciliation.
<b>Selected For Subcontractor Reconciliation</b>	This fields shows if the job entry is selected for reconciliation.
<b>Job No.</b>	This field shows the job number of the given job entry.
<b>Activity No.</b>	This field shows the activity number of the given job entry.
<b>Activity Name</b>	This field shows the activity name. The text is retrieved from the window Activities.
<b>Employee No.</b>	This field shows the employee number of the given job entry.
<b>Employee Name</b>	This field shows the name of the employee. The employee name appears in various windows in Maconomy, always with the employee number.

Field	Description
<b>Task</b>	This field shows the task on the given job entry.
<b>Task Description</b>	This field shows the task description which was entered when the task was created.
<b>Description</b>	This field shows the entry text. If the entry is an invoice or credit memo, the text was entered manually in the Vendor Invoices or General Journal window. If it is a payment, cash discount, or exchange rate difference, it was entered by Maconomy when the payment selection was approved.
<b>Quantity</b>	This field shows the quantity of items ordered for the entry.
<b>Cost</b>	This field shows the budgeted cost of the job in the base currency of the job's responsible company.
<b>Total Cost</b>	This field shows the total cost for the job entry.
<b>Cost, Exec. Company</b>	<p>This field shows the cost of 1 unit of the current activity in the executing company. If the responsible company is the same as the executing company, the cost in this field will be the same as the value in the field "Cost, Reg."</p> <p>The amount is shown in enterprise currency or base currency, depending on the currency type selected. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.</p>
<b>Quantity Inv.</b>	This field shows the total number of units invoiced to the customer in this entry. The "Invoice No." field shows the invoice on which all or part of the entry is invoiced.
<b>Currency</b>	This field shows the currency of the currency type selected in the field "Currency Type."
<b>Billing Price</b>	This field shows the sum of billing prices registered on time activities in the journal. The sum is shown in the company's base currency.
<b>Standard Billing Price</b>	This field shows the sum of the standard billing prices registered on the job: the opening balance, the change over the selected period, and the closing balance at the end of the selected period.
<b>Billing Price, Inv.</b>	This field shows the opening, changed and closing billing prices that have been invoiced on the job before and within the relevant period.
<b>Revenue Recognized</b>	This row shows the opening, changed and closing amounts that have been revenue recognized on the job before and within the relevant period.

Field	Description
<b>Incl. in Fixed Price</b>	This field shows whether or not the entry is included in the fixed price of a job. If the field is marked, the entry is not included in the fixed price of a job.
<b>Closed</b>	If this field is marked, the job has been closed.
<b>Exec. Company No.</b>	This field shows the number of the company which carried out the activity on the current job entry.
<b>Base Currency, Exec. Company</b>	This field shows the base currency selected for the executing company in the window Company Information.
<b>Trans. No.</b>	This field shows the transaction number of the job entry. Job entries are first sorted by entry date, then by transaction number.
<b>Trans. Type</b>	This field shows the transaction type of the entry.
<b>G/L Entry Date</b>	This field shows the date on which the current job entry was posted in the G/L module.
<b>Origin</b>	This field shows the origin of the individual job entry. When a job entry is posted, Maconomy assigns information about the journal type from which the job entry was originally derived, to the job entry. This could, for example, be "Time Sheet" or "Job Accrual." Some entries are created without posting journals, for example, entries for direct invoicing. To such entries, the origin "Job" is assigned.
<b>Entry Type</b>	<p>This field shows the entry type of the individual job entry. When a job entry is posted, Maconomy marks it as a certain type. The type will often be "Registration" (for example, time sheet and job journal entries). In the pop-up field "Entry Type" in the island Selection Criteria in the card part of this window, you can see the different entry types used by Maconomy.</p> <p>This is useful if a job entry changes type. If, for instance, a job entry is reallocated, the entry's origin will be preserved, but its type will be changed to "Reallocation" or "Reversal." This way, you can in this window see that a particular entry is, for example, a reallocated time sheet entry.</p>
<b>Quantity 1</b>	This field shows the quantity used in the current job entry.
<b>Quantity 2</b>	The functionality of this field is similar to that of the field "Quantity 1" above.
<b>Company No.</b>	This field shows the company assigned to the job entry.
<b>Location</b>	The functionality of this field is similar to that of the field "Company No." above.

Field	Description
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Spec. 1-3</b>	These fields show the values in the dimensions Specification 1-3 assigned to the current entry.
<b>Local Spec. 1-3</b>	These fields show the values in the dimensions Local Specification 1-3 assigned to the current entry.
<b>Remarks</b>	This field shows is the remarks assigned to the job entry.

## Show Purchase Transactions Workspace

Use this workspace to review all purchase transactions (open and closed) that you have permission to view.

Use this workspace to review all purchase vouchers that are accessible to a particular user.

This workspace is similar to the tab of Invoice Control workspace, with the exception that it includes closed vouchers.

### Purchase Transactions Tab

This section includes the fields and descriptions for the Purchase Transactions tab.

#### Vendor Island

Field	Description
<b>Vendor No.</b>	This field shows the vendor number. The first two lines show the name and address of the vendor, and these are transferred from the vendor information card and cannot be altered here.
<b>Price List</b>	This field shows the price list Maconomy uses for item purchase orders. Price lists are maintained in the Price Lists and Quantity Discounts windows in the Inventory module.

#### Company Island

Field	Description
<b>Company No.</b>	This field shows the company number of the current vendor.

Field	Description
<b>Name</b>	This field shows the company name of the current vendor.
<b>Base Currency</b>	This field shows the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### Invoice / Packing Slip, Base Island

Field	Description
<b>Inv. No./Purch. No.</b>	This field shows the number of the current vendor invoice or the number of the item purchase order from which the current packing slip derives. If the packing slip derives from a receipt registered in the window Purchase Receipt, the value is 0.
<b>Entry Date</b>	This field shows the date upon which the current invoice or packing slip is posted.
<b>Trans. No.</b>	This field shows the transaction number which is used in the window Invoice Reconciliation to refer to the current invoice or packing slip.
<b>Trans. Type</b>	This field shows the transaction type of the current invoice or packing slip.
<b>Debit</b>	This field shows the debit amount of the current invoice or packing slip.
<b>Credit</b>	This field shows the credit amount of the current invoice or packing slip.
<b>Balance</b>	If the window concerns a packing slip, the balance corresponds to the line price, calculated as "Quantity" x "New Price," for each of the item lines which are marked for approval. A balance will only occur if a new cost price is specified. In this case the value in this field cannot be changed. If the window concerns an invoice, the field can be changed. You can specify how great a part of the invoice should be reconciled at the invoice reconciliation. By default Maconomy shows the amount that remains to be reconciled on the current invoice.
<b>Cost Price Difference</b>	This field shows the difference between the item's registered price and any changed price. Differences are only displayed for item lines that are marked for approval.

## Show Vendor Payment Workspace

Use this workspace to review information about vendor payments.

A vendor payment can include vendor entries for several delivery vendors. The vendor payment shows the total amount paid, while the delivery vendor payment shows the part reconciled or paid to the individual delivery vendors.

## Vendor Payment Tab

This section includes the fields and descriptions for the Vendor Payment tab.

## Vendor Payment Island

Field	Description
<b>Vendor Payment No.</b>	This field displays the vendor payment number. The vendor payment number is an unique number assign to all vendor payments.
<b>Original Payment No.</b>	This field shows a link from a voided check to the original/main checks. A payment can be a check with the full amount and a number of voided check without an amount. The voided checks are only used for remittance information.
<b>Vendor No.</b>	Enter the vendor number for the vendor payment.
<b>Company No.</b>	This field shows the number of the company specified in the current vendor entry.
<b>Responsible</b>	This field shows who is responsible for approving the payment.
<b>Payment Mode</b>	This field specifies how the entry will be or has been paid.
<b>Error Reported Payment</b>	This field shows that the vendor payment has an error.
<b>Check No.</b>	This field shows the check number that was used for the vendor payment.
<b>Checkbook</b>	This field displays the check book used in connection with payment of the current vendor entry.

## Entry Information Island

Field	Description
<b>Entry Date</b>	This field displays the invoice's entry date.
<b>Posting Date</b>	This field displays the date on which the entry was posted to the accounts payable and general ledger.
<b>Journal No.</b>	This field displays the number of the posting journal to which the entry has been posted.
<b>Journal Line No.</b>	This field displays the number of the line on which the entry occurs in the journal shown in the field "Journal No."
<b>Transaction No.</b>	This field displays the vendor invoice transaction number.

Field	Description
<b>Transaction Type</b>	This field displays the transaction type of the vendor entry.

**Output Data Island**

Field	Description
<b>Output Data No.</b>	This field displays a unique reference number from the vendor payment to the payment order.
<b>Output Data Line No.</b>	copy to come
<b>Output Data Group No.</b>	copy to come

**Amounts Island**

Field	Description
<b>Total Reconciliation, Base</b>	This field shows the total amount paid, including the total discount, in base currency.
<b>Total Reconciliation, Currency</b>	This field shows the total amount paid, including the total discount in the currency of the vendor.
<b>Total Discount, Base</b>	This fields shows the cash discount, in base currency.
<b>Total Discount, Currency</b>	This fields shows the cash discount, in the currency of the vendor.
<b>Payment Currency</b>	This field shows the payment currency. The payment is always in the currency of the vendor.
<b>Exchange Rate Variance</b>	This field shows any exchange rate variance calculated by Maconomy for payments in foreign currency. The amount is shown in the base currency of the settling company. The amount corresponds to the difference between the base amount reconciled by the payment and the base amount actually paid, that is, the amount specified in the field "Paid, Base." A variance will occur if exchange rates have changed from the time that the vendor invoice was received and posted until the time that you pay it. Also, the fact that your bank uses another exchange rate than what is specified in Maconomy will result in differences that are reflected in this field.
<b>Amount Being Paid, Base</b>	This field shows the amount being paid in base currency.

Field	Description
<b>Amount Being Paid, Currency</b>	This field shows the amount being paid in the vendor's currency.
<b>Total Reconciliation, Enterprise</b>	This field shows the total amount paid, including the total discount, in enterprise currency.
<b>Total Discount, Enterprise</b>	This fields shows the cash discount in the enterprise currency.
<b>Amount Being Paid, Enterprise</b>	This field shows the amount being paid in enterprise currency.
<b>Exchange Rate Variance, Enterprise</b>	This field shows the exchange rate variance in enterprice currency. The exchange rate variance in enterprise currency is calculated (as a currency conversion) from the exchange rate variance in base currency.
<b>Exchange Rate Variance Balancing, Enterprise</b>	This field shows any exchange rate variance calculated by Maconomy for payments in foreign currency, in enterprise currency. The amount corresponds to the difference between the enterprise amount reconciled by the payment and the enterprise amount actually paid, and the exchange rate variance, in enterprise currency.

## Show Vendor Reconciliation History Workspace

Use this workspace to review all vendor reconciliations, including removed/reverted reconciliations.

This workspace is similar to the Show Vendor Reconciliation workspace with the exception that you cannot see removed/reverted reconciliations in the Show Vendor Reconciliation workspace.

### Show Vendor Reconciliation Tab

This section includes the fields and descriptions for the Show Vendor Reconciliation tab.

#### Vendor Island

Field	Description
<b>Vendor No.</b>	This is the vendor number that identifies the vendor. The field also shows the vendor's name and address, which have been retrieved from the Vendor Information Card.
<b>Currency</b>	This field displays the currency that the current vendor uses as standard currency.

### Company Island

Field	Description
<b>Company</b>	This field displays the number and name of the company specified in the current vendor entry.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company" above. See the field "Base Currency" in the Company Information window in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### Dimensions Island

Field	Description
<b>Location</b>	See the description of the field "Company" and the description of the Locations window in the G/L module.
<b>Entity</b>	See the description of the field "Company" and the description of the Locations window in the G/L module.
<b>Project</b>	See the description of the field "Company" and the description of the Locations window in the G/L module.
<b>Spec. 1-3</b>	See the description of the field "Company" and the description of the Locations window in the G/L module.
<b>Local Spec. 1-3</b>	See the description of the field "Company" and the description of the Locations window in the G/L module.

### Payment Island

Field	Description
<b>Payment Mode</b>	This field shows how the entry will be or has been paid.
<b>Check Book</b>	This field shows the check book used in connection with payment of the current vendor entry.
<b>Check No.</b>	This field shows the number of the check used for payment of the current vendor entry.
<b>Payment No.</b>	This field shows the number of the payment. This number is used as a reference to the Show Automatic Payment, Show Payment Remittance, and Show Payment Reconciliation windows in the Banking module. The number is used for tracing payment information on a vendor entry.
<b>Payment Group No.</b>	This field shows the number of the payment group used by some banks for grouping electronic payments.
<b>Payment Line No.</b>	This field shows the number of the payment line that refers to the specific payment order.

Field	Description
<b>Giro</b>	This field shows the giro number entered on the vendor invoice. The information is for reference.
<b>Bank Acct. No.</b>	This field shows the bank account number entered on the vendor invoice. The information is for reference.
<b>Reg. No.</b>	This field shows the registration number entered on the vendor invoice. The information is for reference.
<b>Credit Card No.</b>	This field shows the credit card number entered on the vendor invoice. The information is for reference.
<b>CPC No.</b>	This field shows the CPC number entered on the vendor invoice. The information is for reference.

### Payment Selection Island

Field	Description
<b>Payment, Currency</b>	This field shows how much has been suggested for payment in the Change Payment Selection by Vendor window.
<b>Discount, Currency</b>	This field shows any cash discount registered to the vendor invoice in the Change Payment Selection by Vendor window.
<b>Being Paid, Currency</b>	This field shows how much has been selected for automatic payment in the Payment Files window in the Banking module.

### Pay to Vendor Island

Field	Description
<b>Vendor No.</b>	The vendor number is the sole and absolute identification of a vendor. This field also shows the vendor's name and address. The information is retrieved from the Vendor Information Card.

### Entry Information Island

Field	Description
<b>Entry Date</b>	this is the date on which the entry was entered to the general ledger and accounts payable. The date identifies the posting period.
<b>Description</b>	This is the entry text.
<b>Trans. No.</b>	This is the entry's transaction number.
<b>Trans. Type</b>	This is the entry's transaction type.

Field	Description
<b>Invoice Date</b>	This is the date of the vendor invoice or credit memo.
<b>Invoice No.</b>	This is the number of the vendor invoice or credit memo.
<b>Disclosable</b>	This field shows whether the current vendor is disclosable.
<b>Open/Closed</b>	<p>This field shows whether the entry is "Open" or "Closed."</p> <p>A vendor invoice or credit memo is open until it has been paid or reconciled. A payment, discount, or exchange rate entry is always registered as closed.</p> <p>A vendor's balance is equal to the sum of the remainder of all open entries.</p>
<b>Due Date</b>	This is the date when the entry is due. The due date of payments is the date when the payment was entered to the general ledger and accounts payable.
<b>Pay when Paid</b>	This field shows whether payment when paid applies to the invoice in question. For further information, see the description of the corresponding field in the Change Payment Selection by Vendor window.
<b>Ready For Payment</b>	This field shows whether the current entry is ready for payment. For further information, see the description of the corresponding field in the Change Payment Selection by Vendor window.
<b>Date Posted</b>	This is the date when the entry was posted to the accounts payable and general ledger.
<b>Time Posted</b>	This is the time when the entry was posted to the accounts payable and general ledger.
<b>Cash Discount Date</b>	This field displays a cash discount date, if any, assigned to the current vendor entry. The date displayed in this field is thus the latest date on which payment should take place if a cash discount is to be granted for the current vendor invoice.
<b>Journal No.</b>	This is the number of the posting journal in which the entry was posted.
<b>Approved</b>	This field shows whether the entry is approved for payment. It only applies to invoices and credit memos.
<b>Responsible</b>	This field shows who is responsible for approving the entry. It only applies to invoices and credit memos.
<b>Company of Origin</b>	This field displays the company that initiated the vendor entry that is displayed.

**Entry Island**

Field	Description
<b>Debit, Currency</b>	This field shows the payment, vendor credit memo, discount, or currency gains in the vendor's standard currency.
<b>Credit, Currency</b>	This field shows the vendor invoice or currency loss in the vendor's standard currency.
<b>Debit, Base</b>	This field shows the payment, vendor credit memo, discount, or currency gains in the base currency.
<b>Credit, Base</b>	This field shows the vendor invoice or currency loss in the base currency.
<b>Remainder, Currency</b>	This field shows any amount that has not been reconciled in the vendor's standard currency.
<b>Remainder, Base</b>	This field shows any amount that has not been reconciled in the base currency.
<b>Original Currency</b>	This is the original currency of the entry, that is, the currency in which it was registered. When it is posted, it will be converted to the vendor's standard currency.
<b>Amount, Original</b>	This is the entry amount in the original currency.

## Vendor reconciliations Sub-Tab

This section includes the fields and descriptions for the Vendor reconciliations sub-tab.

Field	Description
<b>Removed Reconc. Date</b>	This is the date when the reconciliation was removed.
<b>Entry Date</b>	This is the date when the entry was posted to the general ledger and accounts payable. The date identifies the posting period.
<b>Trans. No.</b>	This is the entry's transaction number. If the entry is an invoice or credit memo, the number was given manually in the Vendor Invoices or General Journal window. If it is a payment, cash discount, or exchange rate difference, the number was allocated by Maconomy from "Vendor Payment" system numbers when you approved the payment selection.
<b>Trans. Type</b>	This field shows the transaction type of the vendor entry against which the vendor entry in the card part was balanced.
<b>Description</b>	This is the entry text. If the entry is an invoice or credit memo, the text was entered manually in the Vendor Invoices or General Journal window. If it is a payment, cash discount, or exchange rate difference, it was entered by Maconomy when you approved the payment selection.

Field	Description
<b>Debit, Currency</b>	This is the entry amount in the vendor's standard currency, if it is a debit entry.
<b>Credit, Currency</b>	This field shows the entry amount in the vendor's standard currency, if it is a credit entry.
<b>Reconciled, Currency</b>	This field shows how much of the entry has been reconciled, including cash discount. If the entry is fully reconciled, the amount here is the same as the amount in the "Debit in Standard" or "Credit in Standard" field. The amount is shown in the vendor's standard currency. An entry can also be reconciled in full by other reconciliations.
<b>Discount, Currency</b>	This field shows how much cash discount was given for the payment in this reconciliation. The amount is shown in the vendor's standard currency.
<b>Payment Mode</b>	This field shows the payment mode, for example, check.
<b>Invoice No.</b>	This field shows the number of the invoice on which the entry appears.
<b>Check No.</b>	This field shows the number of the check used for payment of the current vendor entry.
<b>Payment No.</b>	This field shows the number of the payment. Together with the payment group number and the payment line number, the payment number refers to the Show Automatic Payment, Show Payment Remittance, and Show Payment Reconciliation windows in the Banking module. The number is used for tracing payment information on a vendor entry.
<b>Check Book</b>	This field shows the check book used in connection with payment of the current vendor entry.
<b>Payment Group No.</b>	This field shows the number of the payment group used by some banks for grouping electronic payments.
<b>Payment Line No.</b>	This field shows the number of the payment line that is used as reference to the current payment order.
<b>Type</b>	<p>This field shows where the entry originated. The following types exist:</p> <ul style="list-style-type: none"> <li>▪ Vendor Invoice, registered in the Vendor Invoices window.</li> <li>▪ Vendor Credit Memo, registered in the Vendor Credit Memos window.</li> <li>▪ Credit General Journal, credit entry registered in the General Journal window.</li> <li>▪ Debit General Journal, debit entry registered in the General Journal window.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Vendor Payment, payment selection approved in the Change Payment Selection by Vendor or Approve Payment Selection window in the Banking module.</li> <li>Vendor Cash Discount, payment selection approved in the Change Payment Selection by Vendor or Approve Payment Selection window in the Banking module.</li> <li>Exchange Rate Difference, payment selection approved in the Change Payment Selection by Vendor or Approve Payment Selection window in the Banking module.</li> </ul>
<b>Debit, Base</b>	This is the entry amount in the base currency, if it is a debit entry.
<b>Credit, Base</b>	This is the entry amount in the base currency, if it is a credit entry.
<b>Reconciled, Base</b>	<p>This field shows how much of the entry has been reconciled, including cash discount. If the entry is fully reconciled, the amount here is the same as the amount in the "Debit in Standard" or "Credit in Standard" field. The amount is shown in the base currency.</p> <p>Note that the entry can be reconciled in full by other reconciliations.</p>
<b>Discount, Base</b>	This field shows how much cash discount was given for the payment in this reconciliation. The amount is shown in the base currency.
<b>Amount, Original</b>	This is the entry's original currency amount in the original currency.
<b>Original Currency</b>	This is the currency in which the entry was originally entered.
<b>Open/Closed</b>	<p>This field shows whether the entry is "Open" or "Closed."</p> <p>A vendor invoice or credit memo is open until it has been paid or reconciled. A payment, discount, or exchange rate entry is always registered as closed.</p> <p>A vendor's balance is equal to the sum of the remainder of all open entries.</p>
<b>Due Date</b>	This is the date when the invoice was posted to the accounts receivable and general ledger.
<b>Date Posted</b>	This is the date when the invoice was posted to the accounts receivable and general ledger.
<b>Journal No.</b>	This is the number of the journal in which the entry was posted.
<b>Responsible</b>	This is the person who is responsible for approving the invoice form the vendor. It is used for reference and is printed on the list of nonapproved vendor invoices, which is grouped by employees who are responsible for approving these invoices.

Field	Description
<b>Company of Origin</b>	This field displays the company that initiated the entry that is displayed.
<b>Company No.</b>	This field displays the value of the Company dimension that is specified for the current vendor entry. For a description of the "Company" dimension, please see the description of the Company Information window in the G/L module.
<b>Location</b>	See the description of the field "Company No." and the description of the Locations window in the G/L module.
<b>Entity</b>	See the description of the field "Company No." and the description of the Entity window in the G/L module.
<b>Project</b>	See the description of the field "Company No." and the description of the Projects window in the G/L module.
<b>Purpose</b>	See the description of the field "Company No." and the description of the Purpose window in the G/L module.
<b>Spec. 1-3</b>	See the description of the field "Company No." and the description of the Specification 1-3 window in the G/L module.
<b>Local Spec. 1-3</b>	See the description of the field "Company No." and the description of the Local Specification 1-3 window in the G/L module.

## Show Vendor Reconciliation Journals Workspace

Use this workspace to review reconciliation journal information.

A vendor reconciliation journal is created every time Maconomy changes the reconciliation of a vendor entry.

A reconciliation can be made in the A/P open entry reconciliation dialog where the user can reconcile a debit entry (typically a credit note or a manual payment) against a number of other vendor entries (normally a number of vendor invoices). A reconciliation can also be made when the user makes a payment, in which case the reconciliation is between the payment entry and the paid entries.

Maconomy also creates a vendor reconciliation journal if the user reopens a previously made reconciliation. In this case, Maconomy provides a link to the original vendor reconciliation journal.

### Vendor Reconciliation Journal Tab

This section includes the fields and descriptions for the Vendor Reconciliation Journal tab.

#### Vendor Reconciliation Journal Island

Field	Description
<b>Vendor No.</b>	This is the vendor number that identifies the vendor. This field also shows the vendor's name and address, which have been retrieved from the Vendor Information Card.

Field	Description
<b>Main Entry Line No.</b>	This field shows the Vendor Entry Line No. Together with the Vendor No., this is a unique reference to the vendor entry
<b>Reconciliation No.</b>	This field shows the reconciliation number.
<b>Journal No.</b>	This is the number of the journal in which the entry was posted.
<b>Journal Line No.</b>	This field displays the number of the line on which the entry occurs in the journal shown in the field "Journal No."
<b>Company No.</b>	This field displays the value of the Company dimension specified for the current vendor entry. For a description of the "Company" dimension, please see the description of the Company Information window in the G/L module.
<b>Entry Date</b>	This is the date on which the entry was entered to the general ledger and accounts payable. The date identifies the posting period.
<b>Trans. No.</b>	This is the entry's transaction number.
<b>Transaction Type</b>	This is the entry's transaction type.
<b>Posted</b>	This is the date when the entry was posted to the accounts payable and general ledger.
<b>Removed Reconciliation</b>	This field shows if this vendor reconciliation was removed/reverted from a previous reconciliation.
<b>Original Reconciliation No.</b>	This field only has a value if there is a removal. Together with the Vendor No. and Main Entry Line No., this field provides a unique reference to the reconciliation that has been removed.
<b>Pay to Vendor No.</b>	The vendor number is the sole and absolute identification of a vendor. This field also shows the vendor's name and address. This information is retrieved from the Vendor Information Card.
<b>Paym. No.</b>	This field shows the number of the payment. The number is used as a reference to the Show Automatic Payment, Show Payment Remittance, and Show Payment Reconciliation windows in the Banking module. The number is used for tracing payment information on a vendor entry.

## Amounts Island

Field	Description
<b>Total Cash Discount, Standard</b>	This field shows how much cash discount was given for the payment in the reconciliation. The amount is shown in the vendor's standard currency.
<b>Total Cash Discount, Base</b>	This field shows how much cash discount was given for the payment in the reconciliation. The amount is shown in the vendor's base currency.
<b>Total Cash Discount, Enterprise</b>	This field shows how much cash discount was given for the payment in the reconciliation. The amount is shown in the vendor's enterprise currency.
<b>Total Exchange Rate Variance, Base</b>	This field shows any exchange rate variance calculated by Maconomy for payments in foreign currency. The amount is shown in the base currency of the settling company. The amount corresponds to the difference between the base amount reconciled by the payment and the base amount actually paid, that is, the amount specified in the field "Paid, Base." A variance occurs if exchange rates have changed from the time that the vendor invoice was received and posted through the time that it is paid. Also, your bank using an exchange rate other than what is specified in Maconomy results in differences that are reflected in this field.
<b>Total Exchange Rate Variance, Enterprise</b>	This field shows the exchange rate variance, in enterprise currency. The exchange rate variance in enterprise currency is calculated (as a currency conversion) from the exchange rate variance in base currency.
<b>Exchange Rate Variance Balancing, Enterprise</b>	This field shows any exchange rate variance calculated by Maconomy for payments in foreign currency, in enterprise currency. The amount corresponds to the difference between the enterprise amount reconciled by the payment, the enterprise amount actually paid, and the exchange rate variance, in enterprise currency.
<b>Reconciled, Standard</b>	This field shows how much of the entry has been reconciled, including cash discount. If the entry is fully reconciled, the amount here is the same as the amount in the "Debit in Standard" or "Credit in Standard" field. The amount is shown in the vendor's standard currency. An entry can also be reconciled in full by other reconciliations.
<b>Reconciled, Base</b>	This field shows how much of the entry has been reconciled, including cash discount. If the entry is fully reconciled, the amount here is the same as the amount in the "Debit in Standard" or "Credit in Standard" field. The amount is shown in the vendor's base currency. An entry can also be reconciled in full by other reconciliations.
<b>Reconciled, Enterprise</b>	This field shows how much of the entry has been reconciled, including cash discount. If the entry is fully reconciled, the amount here is the same as the amount in the "Debit in Standard" or "Credit in Standard" field. The

Field	Description
	amount is shown in the vendor's enterprise currency. An entry can also be reconciled in full by other reconciliations.
<b>Unrealized Exchange Rate, Base</b>	This field shows the unrealized exchange rate, in base currency.
<b>Unrealized Exchange Rate, Enterprise</b>	This field shows the unrealized exchange rate, in enterprise currency
<b>Unrealized Balancing Exchange Rate, Enterprise</b>	This fields shows the change in unrealized exchange rate variance. The unrealized exchange rate variance is calculated as the difference between the exchange rate of the vendor invoice (the expected exchange rate at the time of posting) and the fixed job exchange rate from the allocation of the vendor invoice. The unrealized exchange rates reduce for every partial payment, so a fully paid invoice will not have any unrealized exchange rate.

## Reporting Section

This section includes the fields and descriptions for the Reporting Section workspaces.

### Print Invoice Status Workspace

Use this workspace to print a report of the current statuses of vendor invoices.

The report is divided into sections for entered, posted, approved, and paid vendor invoices. You can filter the report to include invoices for specific company numbers, vendors, pay-to vendors, invoice numbers, and entry dates.

This report provides information about which invoices still need processing in connection with payment of vendor invoices.

You can qualify the printed list to include only invoices within the given range of company numbers, vendors, pay-to vendors, invoice numbers, and entry dates.

#### Print Invoice Status Tab

This section includes the fields and descriptions for the Print Invoice Status tab.

#### Selection Criteria Island

Field	Description
<b>Company No.</b>	In these fields, you can specify a range of company numbers. Only vendor invoices with settling companies within the given range are included in the invoice status report.

Field	Description
<b>Vendor</b>	In these fields, you can specify a range of vendors. Only vendors within the given range are included in the current invoice status report.
<b>Pay to Vendor</b>	In these fields, you can specify a range of pay to vendors. Only pay-to vendors within the given range are included in the current invoice status report.
<b>Invoice No.</b>	In these fields, you can specify a range of invoices. Only invoices within the given range are included in the current invoice status report.
<b>Entry Date</b>	In these fields, you can specify a range of posting dates. Only invoices within the given range of posting dates are included in the current invoice status report.

### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify in which currency the vendor invoice amount should be displayed. Vendor invoice amounts will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates for purchases valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table for purchases selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table for purchases selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

## Actions

This section shows the Actions available in the Print Invoice workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print the list of the current status of vendor invoices.

## Print Approval List Workspace

Use this workspace to print a report of vendor invoices or vendor invoice lines that have not been approved.

The report is sorted by holder of approval.

The holder of approval can use this list to select invoices or invoice lines for approval.

When you use the Detailed layout, the printed approval lists is given a list number that you can use if you want to redisplay the approval list in the Approval Lists workspace, or if you want to reprint the same approval list.

### Print Approval List Tab

This section includes the fields and descriptions for the Print Approval List tab.

### Run Mode Island

Field	Description
<b>Create List</b>	If this box is checked, a list is created of the selected invoice lines from the selection criteria not yet attached to any list. The list number is transferred to the window Approval Lists for the invoice lines included in the same list through the selection criteria.

### Reprint Island

Field	Description
<b>List No.</b>	In these fields you can specify a range of list numbers, if you want to reprint existing lists. You cannot both specify a range of list numbers and check the "Include Prev. Lists" box. You can only reprint lists if you select the "Detailed" layout.

### Selection Criteria Island

Field	Description
<b>Responsible</b>	If you specify an employee number in this field, only invoices or invoice lines for the selected employee are included. If you do not fill in this field,

Field	Description
	invoices or invoice lines are included for all holders of approval who match the other selection criteria.
<b>Company No.</b>	If you specify a company number in this field, only invoices or invoice lines for the selected company are included. If you do not fill in this field, invoices or invoice lines are included for all companies which match the other selection criteria and to which the user has access.
<b>Vendor No.</b>	If you specify a vendor number in this field, only invoices or invoice lines for the selected vendor are included. If you do not fill in this field, invoices or invoice lines are included for all vendors who match the other selection criteria.
<b>Vendor Invoice No.</b>	This field is used together with the field "Vendor No." to select the invoice lines that are attached to the vendor invoice.
<b>Include Prev. List</b>	If you check this box, you specify that unapproved invoice lines from other lists that fall within the specified range are to be included in the current printout. The invoice lines are sorted on the printout by holder of approval and list number. You cannot both check this box and specify a list number or a range of list numbers in the Reprint island.

### Print Control Island

Field	Description
<b>Layout</b>	<p>In this field, you select the layout to be used in the printout. If you choose "Detailed," invoices and invoice lines are printed sorted by list number, holder of approval, vendor and vendor invoice date. If the "Include Prev. Lists" box is checked, the printout will contain unapproved invoices or invoice lines which fall within the range and which have been printed on previous lists.</p> <p>If you specify a list number or a range of list numbers in the Reprint island, only list numbers that match the entered range of list numbers are included. If you have neither specified list numbers for reprint nor checked the "Include Prev. Lists" box, only unapproved invoice lines that are not already attached to a list and that comply with the other selection criteria are printed. If you check the field "Create List" in this situation, the list is given a list number.</p> <p>If no layouts have been created using Maconomy's layout editing tools, "Standard" and "Detailed" are the only available layouts.</p>

## Actions

This section shows the Actions available in the Print Approval workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print a list of vendor invoices or vendor invoice lines that have not been approved.

## Print A/P Balance List Workspace

Use this workspace to print a balance list, including both credit and debit balances, for your company's vendors.

This report is sorted by vendor control account and can show the current open entry total or a sum of open entries at an earlier date. Use the report to balance your accounts payable with the general ledger.

This report displays a credit balance as a positive amount and a debit balance as a negative amount.

You cannot see a vendor's balance going back farther than the date on which you last deleted entries.

Note that the older the balance you want to see, the longer time it takes to generate the printout. It is recommended that you post all vendor journals before generating this printout so that the generated vendor balances are up-to-date.

### Print A/P Balance List Tab

This section includes the fields and descriptions for the Print A/P Balance List tab.

#### Selection Criteria Island

Field	Description
<b>Vendor No.</b>	In these fields, you enter a range of vendor numbers. The printout will only include balances for vendors within this range.
<b>Settling Company No.</b>	In these fields, you can specify a range of company numbers. The balances will only be based on vendor entries with settling companies within the specified range. Please note that Maconomy prints one line for each combination of company and vendor.
<b>Company of Origin No.</b>	In these fields, you can specify a range of company of origin numbers. The balances will only be based on vendor entries with companies of origin within the specified range.
<b>Dimension Comb. No.</b>	In these fields, you can enter a range of dimension combination numbers. The printout will only include dimension combinations with numbers that are within the specified range.

Field	Description
<b>Date</b>	<p>In this field, you enter the date of the balance you wish to see. Maconomy calculates the balance for this date, totaling the balances per control account. These can be balanced with the General Ledger, provided you have not deleted entries between the given date and today's date. The balances show the original base currency amount and, if applicable, the foreign currency amount, as well as a base currency amount based on the rate of exchange on the printout date.</p> <p>You cannot give a date forward in time. You must enter a value.</p>
<b>Vendor Group</b>	<p>In this field, you select a vendor group. The printout will only include vendors in this group.</p>
<b>Country</b>	<p>In this field, you select a country. The printout will only include vendors from this state/country.</p>
<b>Department</b>	<p>In this field, you select a department. The printout will only include vendors in this department.</p>
<b>Control Account</b>	<p>The control account is a reference to two G/L accounts - a Vendor control account and an account for non-balanced entries.</p> <p>All vendor entries are posted to the General Ledger, to the control account referred to here. Accounts payable is thus a specification of A/P control accounts in the General Ledger.</p> <p>You can use the control accounts to group your vendors in the General Ledger—for example, in foreign and domestic vendors.</p> <p>The account for non-balanced entries is used to manage your accounts when item deliveries and invoices are not received at the same time. When you approve item deliveries to the warehouse, the inventory value account is debited and the non-balanced entries account is credited. When the vendor invoices are registered at a later date, the items are credited to the Vendor control account and debited to the account for non-balanced entries. You thus avoid any accounting problems, when items are delivered in one posting period and the corresponding vendor invoice is received in another.</p> <p>References to control accounts are specified by means of dimension combinations in the window Popup fields in the Set-Up module.</p>
<b>Language</b>	<p>In this field, you designate the language of the vendor. The language is used for printouts and statistics.</p> <p>Language codes are maintained in the window Popup Fields window in the Set-Up module.</p>
<b>Currency</b>	<p>In this field, you select a currency. The statistics will only include vendors with this currency as standard currency.</p>
<b>Statistics 1-4</b>	<p>In these fields, you can specify a range of statistics codes in each of the four statistics categories. The statistics will only include vendors with statistics codes within the given range.</p>

**Selection Criteria, Dimensions Island**

Field	Description
<b>Location</b>	The functionality of these fields is similar to that of the field "Dimension Comb. No." above.
<b>Entity</b>	The functionality of these fields is similar to that of the field "Dimension Comb. No." above.
<b>Project</b>	The functionality of these fields is similar to that of the field "Dimension Comb. No." above.
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Dimension Comb. No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Dimension Comb. No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Dimension Comb. No." above.

**Currency Island**

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify in which currency the balance list amounts should be displayed. The balance list amounts will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates for purchases valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table for purchases selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table for purchases selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

**Print Control Island**

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" and "Detailed" are the only options. The

Field	Description
	<p>"Detailed" layout shows every entry per vendor that was open at the date selected.</p> <p>Unless you have added layouts with the Maconomy Layout Designer, the only option is "Standard."</p>
<b>Incl. Zero Balance Vendors</b>	If you check this box, you include vendors with a zero balance. If the box is not checked, the printout will include vendors with either a debit or credit balance. A credit balance is shown as a positive amount, a debit balance as a negative amount.

### Extra Fields Island

Field	Description
<b>Popup 1-5</b>	<p>In each of these fields, you can specify a vendor pop-up value.</p> <p>The printout will only include vendors for which the values in the fields "Popup 1-5" in the window Vendor Information Card correspond to the values specified here. However, if you leave a given pop-up field blank, vendors with any value in the field in question are included.</p>

### Actions

This section shows the Actions available in the Print A/P Balance List workspace.

#### Top Tab

Field	Description
<b>Print</b>	Use this action to print a balance list for your company's vendors.

## Print A/P Aging Report Workspace

Use this workspace to print an aging report for one or more vendors.

You can use the aging report to estimate your company's liquidity up to four months into the future. Aging is based on either the due date of the entries or the entry date of the entries. The report displays the balance due on the day that the report is generated, divided into a number of periods from a given start date.

In this workspace, you can specify whether you want to print the aging report based on the due date of the entries or the entry date of the entries. If you select to print based on entry date, the current entries are regarded as being due on the entry date. If, on the contrary, you select to print based on due date, the current entries are still regarded as being due on the due date that is specified on the current entries. The report always displays the balance due on the date that you create the report. Maconomy divides the balance into a number of periods from a given start date. These periods are defined by your selection criteria. The report displays the vendor's standard currency and whether payment to the vendor has been stopped. The printout information is

grouped according to company, and the collective total is displayed in the currency that you selected in the Currency island.

You can include vendors who have a negative balance. The amount limit that you specify applies to the debit balances on the date of the report.

### Print A/P Aging Report Tab

This section includes the fields and descriptions for the Print A/P Aging Report tab.

#### Selection Criteria Island

Field	Description
<b>Vendor No.</b>	In these fields, you select a range of vendor numbers. The print will only include vendors in this range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The aging report will only be based on vendor entries with settling companies within the specified range. Please note that Maconomy prints one line for each combination of company and vendor.
<b>Dimension Comb. No.</b>	In these fields, you can enter a range of dimension combination numbers. The printout will only include dimension combinations with numbers that are within the specified range.
<b>Statement Date</b>	In this field, you enter the date of the balance you wish to see. Maconomy calculates which balance your vendors have/had on this date, and sums up the balances per control account. You cannot specify a future date. You must enter a date.
<b>Vendor Group</b>	In this field, you select a vendor group. The report will only include vendors in this group.
<b>Department</b>	In this field, you select a department. The report will only include vendors in this department.
<b>Country</b>	In this field, you select a country. The report will only include vendors from this state/country.
<b>Currency</b>	In this field, you select a currency. The statistics will only include vendors with this currency as standard currency.
<b>Control Account</b>	The control account is a reference to two G/L accounts - a Vendor control account and an account for non-balanced entries. All vendor entries are posted to the General Ledger, to the control account referred to here. Accounts payable is thus a specification of A/P control accounts in the General Ledger. You can use the control accounts to group your vendors in the General Ledger—for example, in foreign and domestic vendors. The account for non-balanced entries is used to manage your accounts when item deliveries and invoices are not received at the same time. When you approve item deliveries to the warehouse, the inventory value account is

Field	Description
	debited and the non-balanced entries account is credited. When the vendor invoices are registered at a later date, the items are credited the Vendor control account and debited to the account for non-balanced entries. You thus avoid any accounting problems, when items are delivered in one posting period and the corresponding vendor invoice is received in another. References to control accounts are specified by means of dimension combinations in the window Popup fields in the Set-Up module.
<b>Language</b>	In this field, you designate the language of the vendor. The language is used for printouts and statistics.  Language codes are maintained in the window Popup Fields window in the Set-Up module.
<b>Statistics 1-4</b>	In these fields, you can specify a range of statistics codes in each of the four statistics categories. The statistics will only include vendors with statistics codes within the given range.

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of these fields is similar to that of the field "Dimension Comb. No." above.
<b>Entity</b>	The functionality of these fields is similar to that of the field "Dimension Comb. No." above.
<b>Project</b>	The functionality of these fields is similar to that of the field "Dimension Comb. No." above.
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Dimension Comb. No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Dimension Comb." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Dimension Comb. No." above.

#### Currency Island

Field	Description
<b>Reporting Currency</b>	In this field, you can specify in which currency the balance list amounts should be displayed. The balance list amounts will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.  When converting amounts into the selected currency, Maconomy uses the exchange rates for purchases valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table

Field	Description
	for purchases selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table for purchases selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

**Print Control Island**

Field	Description
<b>Aging Principle</b>	In this field, you can specify the aging principle to use.
<b>Start Date</b>	In this field, you enter the date from which to calculate the balance due.
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

**Limit Island**

Include only customers with a balance of more than Here you write an amount in the reporting currency. The report will only include vendors whose balance is larger than the given amount.

**Extra Fields Island**

Field	Description
<b>Popup 1-5</b>	In each of these fields, you can specify a vendor pop-up value. The printout will only include vendors for which the values in the fields "Popup 1-5" in the window Vendor Information Card correspond to the values specified here. However, if you leave a given pop-up field blank, vendors with any value in the field in question are included.

## Actions

This section shows the Actions available in the Print A/P Aging Report workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print an aging report for one or more vendors.

## Print Periodic Vendor Statement Workspace

Use this workspace to print one or more vendor account statements.

A vendor statement displays all of the vendor entries in a given period. You can use the workspace to print statements covering a period of one month or several months.

### Print Periodic Vendor Statement Tab

This section includes the fields and descriptions for the Print Periodic Vendor Statement tab.

#### Selection Criteria Island

Field	Description
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The statistics will only be based on vendor entries with settling companies within the specified range.
<b>Vendor No.</b>	In these fields, you specify a range of vendor numbers. The statistics will only include vendors within this range.
<b>Vendor Group</b>	In this field, you select a vendor group. The statistics will only include vendors in this group.
<b>Department</b>	In this field, you select a department. The statistics will only include vendors assigned to this department.
<b>Language</b>	In this field, you designate the language of the vendor. The language is used for printouts and statistics.  Language codes are maintained in the window Popup Fields window in the Set-Up module.
<b>Country</b>	In this field, you select a country. The statistics will only include vendors from this country.
<b>Control Account</b>	The control account is a reference to two G/L accounts - a Vendor control account and an account for non-balanced entries.  All vendor entries are posted to the General Ledger, to the control account referred to here. Accounts payable is thus a specification of A/P control accounts in the General Ledger.

Field	Description
	<p>You can use the control accounts to group your vendors in the General Ledger—for example, in foreign and domestic vendors.</p> <p>The account for non-balanced entries is used to manage your accounts when item deliveries and invoices are not received at the same time. When you approve item deliveries to the warehouse, the inventory value account is debited and the non-balanced entries account is credited. When the vendor invoices are registered at a later date, the items are credited to the Vendor control account and debited to the account for non-balanced entries. You thus avoid any accounting problems, when items are delivered in one posting period and the corresponding vendor invoice is received in another.</p> <p>References to control accounts are specified by means of dimension combinations in the window Popup fields in the Set-Up module.</p>
<b>Currency</b>	In this field, you select a currency. The statistics will only include vendors with this currency as standard currency.
<b>Statistic 1-4</b>	In these fields, you can specify a range of statistics codes in each of the four statistics categories. The statistics will only include vendors with statistics codes within the given range.

#### Derived Dimensions Island

Field	Description
<b>Dimension Comb.</b>	In these fields, you can specify a range of dimension combination numbers. The printout will only include vendors for which the field "Dimension Comb. No." in the window Vendor Information Card contains a value within the specified range.

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of these fields is similar to that of the field "Dimension Comb." above.
<b>Entity</b>	The functionality of these fields is similar to that of the field "Dimension Comb." above.
<b>Project</b>	The functionality of these fields is similar to that of the field "Dimension Comb." above.
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Dimension Comb." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Dimension Comb." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Dimension Comb." above.

**Period Island**

Field	Description
<b>Month/Yr.</b>	In this field, you enter the month and year of the desired statement. The month must be entered in numbers, that is, "1" is for January, "2" is for February, and so on. The desired year must be entered in four figures, for example, 2002. By using the vendor number, the month, and the year, Maconomy transfers the balance and the activity of the month.

**Currency Island**

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify in which currency the statistics should be displayed. Amounts in the statistics will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates for purchases valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table for purchases selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table for purchases selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

**Print Control Island**

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.
<b>Include Vendors Where Current Balance = 0</b>	With this check box you can indicate whether you want to include vendors with a balance of zero at the date of printing. If you check the box, all vendors are included. If you leave this field blank, the printout will only include vendors with a credit or debit balance. A credit balance is shown as a positive amount, and a debit balance is shown as a negative amount.

**Extra Fields Island**

Field	Description
<b>Popup 1-5</b>	In each of these fields, you can specify a vendor pop-up value. The printout will only include vendors for which the values in the fields "Popup 1-5" in the window Vendor Information Card correspond to the values specified here. However, if you leave a given pop-up field blank, vendors with any value in the field in question are included.

**Actions**

This section shows the Actions available in the Print Periodic Vendor Statement workspace.

**Top Tab**

Field	Description
<b>Print</b>	Use this action to print information about one or more periodic vendor account statements.

**Print A/P Statistics Workspace**

Use this workspace to print a report of monthly debit and credit amounts by vendor.

**Print A/P Statistics Tab**

This section includes the fields and descriptions for the Print A/P Statistics tab.

**Selection Criteria Island**

Field	Description
<b>Vendor No.</b>	In these fields, you specify a range of vendor numbers. The statistics will only include vendors within this range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The statistics will only be based on vendor entries with settling companies within the specified range.
<b>Year</b>	In these fields, you specify a range of years. The statistics will only include vendor movements within this range. You must fill in the field.
<b>Vendor Group</b>	In this field, you select a vendor group. The statistics will only include vendors in this group.
<b>Department</b>	In this field, you select a department. The statistics will only include vendors assigned to this department.
<b>Country</b>	In this field, you select a country. The statistics will only include vendors from this country.

Field	Description
<b>Currency</b>	In this field, you select a currency. The statistics will only include vendors with this currency as standard currency.
<b>Statistics 1-4</b>	In these fields, you can specify a range of statistics codes in each of the four statistics categories. The statistics will only include vendors with statistics codes within the given range.

### Currency Island

Field	Description
<b>Reporting Currency</b>	In this field, you can specify in which currency the statistics should be displayed. Amounts in the statistics will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.  When converting amounts into the selected currency, Maconomy uses the exchange rates for purchases valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table for purchases selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table for purchases selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

### Actions

This section shows the Actions available in the Print A/P Statistics workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print a list of vendor activity.

## Print Vendor Report Workspace

Use this workspace to print a report of income that is not taxable at the source.

For each vendor that is included in the report, the report displays vendor entries that are flagged as disclosable and provides total taxable and tax exempt amounts (within the invoice date range you specified).

The report is generated for a range of vendors. For each vendor within the range, the report displays the vendor entries that are marked as disclosable in the Vendor Invoices and Invoice Allocation workspaces. The report displays the name and address of the vendors as well as the total taxable and tax-exempt amounts. Information is sorted by company registration number.

### Print Vendor Report Tab

This section includes the fields and descriptions for the Print Vendor Report tab.

#### Selection Criteria Island

Field	Description
<b>Comp. Reg. No.</b>	In these fields, you can specify a range of company registration numbers. The report will only include vendors with company registration numbers within the specified range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The report will only be based on vendor entries with settling companies within the specified range.
<b>Vendor No.</b>	In these fields, you can specify a range of vendor numbers. The report will only include vendors with numbers within the specified range.
<b>Invoice Date</b>	In these fields, you can specify a range of dates. The report will only include vendors with A/P entries within the specified range.

#### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify in which currency the report should be displayed. Amounts in the vendor report will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates for purchases valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table for purchases selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>

Field	Description
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table for purchases selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

### Actions

This section shows the Actions available in the Print Vendor workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print information about income that is not taxable at source.

## Print A/P Suspense Overview Workspace

Use this workspace to print a report of A/P suspense postings for a range of company-specific vendors.

The report displays a list of unallocated vendor entries that have been posted to the A/P suspense account, grouped by vendor.

### Print A/P Suspense Overview Tab

This section includes the fields and descriptions for the Print A/P Suspense Overview tab.

### Selection Criteria Island

Field	Description
<b>Vendor No.</b>	In these fields, you can specify a range of vendor numbers. The report will only include vendors with numbers within the specified range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The report will only be based on vendor entries with settling companies within the specified range.
<b>Vendor Group</b>	In this field, you can select a vendor group. The report will only include entries pertaining to vendors within the selected group.

Field	Description
<b>Trans. No.</b>	In these fields, you can specify a range of transaction numbers. The report will only be based on vendor entries with transaction numbers within the specified range.
<b>Inv. No./Purchase No.</b>	In these fields, you can specify a range of invoice and purchase order numbers. The report will only be based on entries resulting from invoices with numbers within the specified range and entries resulting from purchase orders with numbers within the specified range.
<b>Statement Date</b>	In this field, you enter the date whose balance you wish to see. Maconomy calculates the balance of the A/P suspense account on this date. You cannot specify a future date. You must enter a date.

### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify in which currency the report should be displayed. Amounts in the vendor report will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates for purchases valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table for purchases selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table for purchases selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, Overview is the only option.

## Actions

This section shows the Actions available in the Print A/P Suspense Overview workspace.

### Top Tab

Field	Description
Print	Use this action to print an A/P suspense overview for a range of vendors.

## Set-Up Section

This section includes the fields and descriptions for the Set-Up section workspaces.

### Vendor Information Card Workspace

Use this workspace to enter and maintain information about vendors, including accounting information that Maconomy uses to process purchases and vendor invoices.

Vendors that you here are centralized, enterprise-wide vendors, and are the basis from which you create company-specific vendors. Use the Company Specific Vendor Information Card workspace to create company-specific vendors.

You can enter, change, and delete vendor information. However, you can only delete a vendor that has a zero balance, and for whom no entries were entered in the current or prior fiscal year.

In addition, you cannot delete a vendor if he is entered as vendor in the inventory information on an Item Information Card or Media Information Card, and for whom there are entries ready to be posted in the G/L module.

You create company-specific vendors in the Company Specific Vendor Information Card workspace. If you create a vendor using a given linking rule in the Parent Vendor island, the setup of that linking rule determines which information Maconomy copies to the new company-specific vendor and whether you can change this information. For the purpose of clarity, the descriptions of the fields in this workspace are therefore introduced by "In this field, you specify..." Whether or not it is possible to specify, change, or only view a value in each field depends on the setup of the linking rule assigned to the vendor, if any.

If Maconomy should copy information from a standard vendor that is specified in one of the System Information or Company Information workspaces to new vendors, you must specify this standard vendor as the parent vendor in one of those workspaces. To have Maconomy automatically copy the information from this standard vendor to new vendors, you must create a standard linking rule between the relations Creditor and Creditor in the Linking Rules workspace in the Set-Up module. You should create the linking rule with **Creditor** in the main relation and **Creditor** in the subordinate relation. In this linking rule, you also specify the fields that Maconomy should copy from the standard vendor to new vendors. When you flag this linking rule as **Standard Linking Rule**, Maconomy automatically applies the linking rule when you create vendors if you do not specify another linking rule when you create the current vendor. For more information about linking rules, see the description of the Linking Rules workspace in the Set-Up module.

You maintain financial data on vendors in the Payment Control workspace.

For auditing purposes you should print and file the Vendor Information Card every time that you make changes in this workspace or in the Payment Control workspace. To print this workspace, use the **Print This** function in the File menu.

### Vendor Information Card Tab

This section includes the fields and descriptions for the Vendor Information Card tab.

#### Vendor Island

Field	Description
<b>Vendor No.</b>	<p>In this field, you enter a unique vendor identification, referred to as the "Vendor Number." If you do not specify a number but you have specified a company number in the field "Company No.," the vendor number in this field will be derived from the company-specific number series "Vendor Series" belonging to the specified company. If you enter neither a number nor a company, the vendor number will be derived from the "global" number series belonging to the first company created in the system. When the vendor has been created, the vendor number can no longer be changed.</p> <p>You can also enter the vendor's name and address here. This information is used as reference, and it is shown on various printouts. As a minimum, you must complete the first line immediately below the vendor number.</p>
<b>Attn.</b>	In this field, you enter the name of the person to whom shipping and payment information is to be directed. This information is used on printouts.
<b>Country</b>	<p>In this field, you select the vendor's country. The information is for reference, and it can be used to generate statistics.</p> <p>Countries are maintained in the Popup Field window "Country" in the Set-Up module.</p>
<b>Phone</b>	In this field, you may enter the vendor's phone number. This information is used for reference.
<b>E-mail</b>	In this field, you may enter the vendor's electronic mail address. This information is used for reference.
<b>Fax</b>	In this field, you may enter the vendor's fax number. This information is used for reference.
<b>Telex</b>	In this field, you may enter the vendor's telex number. This information is used for reference.
<b>Giro</b>	In this field, you may enter the vendor's postal giro number. This information is used for reference.
<b>Remittance Email Address</b>	Specify the email address of the vendor linked to the payment where Maconomy sends the vendor remittance email.

### Settling Company Island

Field	Description
<b>Company</b>	<p>In this field, you can enter a value for the Company dimension. If you specify a company, that company will be the settling company on all vendor invoices, item purchase orders, and so on, where the current vendor is the pay to vendor.</p> <p>If you do not specify a settling company, the vendor is regarded as a global vendor. When a global vendor is specified on, for example, a vendor invoice, the settling company will be determined from the company responsible for the vendor invoice journal in question, as Maconomy will retrieve the value from the field "Vendor Settling Company" in the Company Information Card for the responsible company.</p> <p>For further information about the influence of the settling company and how such a company is determined, please see the section Multiple Companies in the chapter "Introduction to the G/L module."</p> <p>This field also shows the name of the specified company.</p>

### General Information Island

Field	Description
<b>Department</b>	<p>In this field, you enter the department that normally receives items purchased from this vendor.</p> <p>The field determines the G/L accounts for cash discounts and exchange rate differences. These can occur when you pay invoices. G/L references to cash discounts and exchange rate differences are specified by means of dimension combinations in the window Posting References in the G/L module.</p>
<b>Language</b>	<p>In this field, you designate the language of the vendor. The language is used for printouts and statistics.</p> <p>Language codes are maintained in the Popup Fields window in the Set-Up module.</p>
<b>Currency</b>	<p>In this field, you select the vendor's standard currency. All vendor transactions are converted into the vendor's standard currency, and this currency is also the currency used when paying the current vendor. This means you can print and send account statements in the vendor's own currency.</p> <p>All vendor transactions are registered in the following currencies:</p> <ul style="list-style-type: none"> <li>Standard Currency — The currency the vendor has requested to use and the currency in which payments to the vendor are usually made.</li> <li>Company Base Currency — The currency selected as base currency for the company responsible for a given transaction.</li> <li>Enterprise Currency — The currency selected as enterprise currency in the window System Information in the Set-Up module.</li> <li>Original Currency — The original currency of a given transaction, for example, FFR, if the German vendor is paid in French Francs.</li> </ul> <p>The field "Currency" cannot be changed if entries have been posted or are ready to be posted to the vendor. This is a precaution against inconsistencies.</p>

Field	Description
	Currencies are maintained in the Popup Fields window in the Set-Up module.
<b>Vendor Group</b>	<p>In this field, you select the group to which the vendor belongs. This field is used to classify vendors (for example, by trade).</p> <p>Vendor groups are maintained in the window Popup Fields in the Set-Up module.</p>
<b>Enterprise</b>	<p>In this field, you can specify an enterprise. The specified value is used by default when a purchase order or a vendor invoice is created.</p> <p>You maintain enterprises in the <b>Enterprises</b> field in the Popup Fields single dialog workspace under the Set-Up module.</p>
<b>Segment</b>	<p>In this field, you can specify a segment. The specified value is used by default when a purchase order or a vendor invoice is created.</p> <p>You maintain segments in the <b>Segments</b> field in the Popup Fields single dialog workspace under the Set-Up module.</p>
<b>Area</b>	<p>In this field, you can specify an area. The specified value is used by default when a purchase order or a vendor invoice is created.</p> <p>You maintain areas in the <b>Area</b> field in the Popup Fields single dialog workspace under the Set-Up module.</p>
<b>BACS No.</b>	In this field, you can enter the vendor's number for automated clearing service. The number is used for reference and electronic payment.
<b>Comp. Reg. No.</b>	<p>In this field you enter the vendor's company registration number if the vendor is a company. If you enter a number which is already in use, Maconomy will display a warning.</p> <p>If you have entered company registration number validation rules for the vendor's country in the window Rules of Validation in the Set-Up module, Maconomy will verify that the company registration number complies with these validation rules. The completion of this field is optional.</p>
<b>CNR No.</b>	<p>In this field you enter the vendor's CNR number (or social security/federal ID number) if the vendor is a person. If you enter a CNR number which is already in use, Maconomy will display a warning.</p> <p>If you have entered CNR number validation rules for the vendor's country in the window Rules of Validation in the Set-Up module, Maconomy will verify that the CNR number complies with these validation rules. The completion of this field is optional.</p>
<b>Disclosable</b>	<p>In this field, you can specify whether the current vendor should be disclosable. If a vendor has been marked as disclosable, the mark will be transferred to the field "Disclosable" in the windows Vendor Invoices and Invoice Allocation, when you make an invoice for the vendor in question.</p> <p>When reporting to tax authorities, you distinguish between disclosable and tax exempt services for disclosable invoices. If you wish to mark a vendor as disclosable, the vendor's information card must contain a CNR or Corporate Registration Number.</p>

Field	Description
<b>Status</b>	Active or Inactive. If the vendor is active, then they can be used in all areas stipulated by the Allow fields. If inactive, the vendor cannot be used for anything.
<b>First Activation Date / Active Period</b>	When the Status field is set to Active, this field name is First Activation Date and it displays the date that the vendor was first made active. When the Status field is set to Inactive, this field name is Active Period and it displays the date interval that the vendor was active.
<b>Standard Allocation Code</b>	In this field, you can specify a standard allocation code to apply to the vendor. The allocation code specified is automatically used when creating vendor invoices for the vendor in question, if no other allocation code has been manually entered at the creation of an invoice.
<b>Week Calendar No.</b>	<p>In this field, you can specify a week calendar which contains information about days on which the vendor is closed (that is, days where the number of working hours is 0 according to the specified week calendar). This information is used in the calculation of delivery dates, as only the number of days where the vendor is open are counted as part of the delivery time.</p> <p>If you do not specify a week calendar, all days are counted as part of the delivery time.</p> <p>For further information on the week calendar's influence on the calculation of delivery dates, please see the description of the field "Deliv. Date" in the table part of the window Item Purchase Orders in the Item Purchase module.</p> <p>Week calendars are created in the window Week Calendars in the Set-Up module.</p>
<b>Holiday Calendar Name</b>	In this field, you can specify a holiday calendar to use for the vendor. This information is used in the calculation of delivery dates, in a way similar to the way that the week calendar is used (described above.)

### Employee

Field	Description
<b>Employee</b>	In this field you can enter an employee number. If you enter an employee number, the vendor will be assigned to the employee as outlay settlement vendor. The field is only available if Employee-Vendor linking is enabled.
<b>Linking Rule</b>	In this field you can enter a linking rule that describes the linking from the template employee to vendor.

**Extra Fields Island**

Field	Description
<b>Popup 1-5</b>	In these fields, you can select a number of pop-up values for further specification of the current vendor. The options are created in the window Popup Fields in the Set-Up module.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the vendor in question. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.

**Purchase Orders Island**

Field	Description
<b>Default to Self Invoices</b>	Select this check box so that when users create purchase orders for the vendor, Maconomy marks the PO for self-invoicing.
<b>Reference Mandatory on Time Sheet Lines</b>	<p>Select this check box to require the vendor to refer to a purchase order line in time sheet lines. This applies to vendors who are subcontractors with employee credentials.</p> <p>When creating time sheet lines, the vendor can only refer to subcontractor reconciliation purchase order lines.</p> <p>If you select this check box and only one purchase order line is open for the vendor, Maconomy automatically fills out the following fields in any time sheet lines that the vendor creates:</p> <ul style="list-style-type: none"> <li>▪ <b>Purchase Order Number</b></li> <li>▪ <b>Purchase Order Line</b></li> <li>▪ <b>Job No.</b></li> <li>▪ <b>Job Name</b></li> <li>▪ <b>Act. No.</b></li> <li>▪ <b>Task</b></li> </ul> <p>When the vendor posts these time sheet lines, Maconomy automatically fills out the <b>Cost</b> field in the job entry. Maconomy copies the value from the purchase order specified in the posted time sheet line.</p>

Field	Description
<b>Reference Mandatory on Expense Sheet Lines</b>	<p>Select this check box to require the vendor to refer to a purchase order in expense sheet lines. This applies to vendors who are subcontractors with employee credentials.</p> <p>When creating expense sheet lines, the vendor can only refer to subcontractor reconciliation purchase order lines.</p> <p>If you select this check box and only one purchase order line is open for the vendor, Maconomy automatically fills out the following fields in any expense sheet lines that the vendor creates:</p> <ul style="list-style-type: none"> <li>▪ <b>Purchase Order Number</b></li> <li>▪ <b>Purchase Order Line</b></li> <li>▪ <b>Job No.</b></li> <li>▪ <b>Job Name</b></li> <li>▪ <b>Act. No.</b></li> <li>▪ <b>Task</b></li> <li>▪ <b>Unit Price, Base</b></li> </ul>

### Allowed Use Island

While a vendor is in the creation process, you may not want users to be able to use them in all areas; however, you may want to allow vendor use in certain areas right away. The Allow fields control the areas where the vendor can be used and the approval hierarchy controls how Allow fields are set. You might decide to set up the approval hierarchy to change all the Allow fields to Yes after all steps in the approval workflow are complete. Alternatively, you may want to set it up to change specific Allow fields to Yes after certain approval steps have been completed.

For example, you may have set up approval hierarchy to change the Allow Payments field value from Yes to Requested if the payment information for a vendor is changed after the vendor has been approved. This prevents payments from being made to the vendor until the new information has been approved. You can then set up the system to change the Allow Payments field value back to Yes after the new information is approved.

The Allow fields have three possible settings:

- **Yes** — This allows users to use the vendor in the specified area.
- **No** — This disallows users from using the vendor in the specified area.
- **Requested** — If the *Allow Users to Manually Set Allow Fields on Vendors to Yes* system parameter is not set, you cannot manually change an Allow field to Yes. If you want to be able to use a vendor in a certain area, you can set an Allow field to Requested.

If Maconomy has been setup to include a line on the Changes on Approve tab to change this field from Requested to Yes, then, at a specified step in the approval process, the field will change and the user will be able to use the vendor in that area of the product.

The following are the vendor Allow fields:

- **Allow for use as Subcontractor** — Use this field to specify whether the vendor can be linked to a subcontractor. This is validated when the vendor is selected or changed on the employee, and when a time sheet or expense sheet is approved.
- **Allow for use as Outlay Vendor** — Use this field to specify whether the vendor can be used as an outlay vendor. This is validated when the vendor is selected or changed on the employee, and when an expense sheet is approved.
- **Allow for use as Inter Company Vendor** — Use this field to specify whether the vendor can be used as an intercompany vendor. This is validated when the vendor is selected or changed on the company information card or on an outlay account. It is also validated when the intercompany invoice is created.
- **Allow for use as Item Supplier** — Use this field to specify whether the vendor can be used as an item supplier. Maconomy validates when a vendor is selected as an item supplier. Maconomy will also validate when an item purchase order is created or changed, and when the item purchase order quote is approved.
- **Allow Company Vendor Creation** — Use this field to specify whether a company specific vendor can be created based on this vendor. A company specific vendor can either be created manually or automatic when a user makes a registration on a vendor in a new company. This is only validated at the time of creation.
- **Allow Budgets** — Use this field to specify whether the vendor can be used in a G/L or job budget. Maconomy validate when the budget line is created or changed, and when the G/L budget is approved.
- **Allow Registrations** — Use this field to specify whether the vendor can be used in a general journal or in bank reconciliation. Maconomy validate when the line is created or changed, and when the journal is posted or the bank reconciliation is approved.
- **Allow Requisitions and Request for Quotes** — Use this field to specify whether the vendor can be used on a requisition or request for quote. Maconomy validate when the requisition or request for quote is created or changed, and when the requisition or request for quote is approved or copied.
- **Allow Purchase Orders** — Use this field to specify whether the vendor can be used on a purchase order. Maconomy validate when the purchase order is created or changed, and when the purchase order is approved.
- **Allow Vendor Invoices** — Use this field to specify whether the vendor can be used on a vendor invoice. Maconomy validate when the vendor invoice is created or changed, and when the vendor invoice is approved.
- **Allow Payments** — Use this field to specify whether the vendor can be used for payments. This means you can make a payment selection. Changing the setting to No or Requested will result in the resetting of payment selections created for the current vendor. Such payment selections can be seen in the Change Payment Selection by Vendor window in the Banking module.
- **Allow Reporting** - Use this field to specify whether the vendor can be included in standard vendor reports. Maconomy ignores vendors not allowed for reporting in the following reports where the user has selected Vendor as dimension.
  - A/P aging

- A/P balance list
- A/P Suspense Overview
- Open Entry Statement
- Periodic Statement
- A/P Statistics
- Vendor Information
- G/L report lines
- **Allow for use as Template/Parent Vendor** — In this field you can specify if it allowed using this vendor as a template or parent vendor. A template vendor can be entered in system information or company information. Maconomy will suggest the template vendor as parent vendor when a new vendor is created. Maconomy validate when the new vendor is created.

You can set default values for the Allow fields using a vendor template which can be used whenever a new vendor is created. When you create a new vendor, this template vendor is added in the Parent Vendor island on the Vendor Information card.

You can set up the system not to use approval hierarchy for vendors but still make use of the Allow fields.

### Dimension Combination Island

Field	Description
<b>Dim. Comb.</b>	<p>In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the window Dimension Combinations. The field "Description" to the right of this field displays the description of the entered dimension combination.</p> <p>If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the current vendor. However, any dimension derivation values specified in this island will be used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the vendor information card.</p>

### Derived Company Island

Field	Description
<b>Company</b>	<p>In this field you can enter a dimension value for the Company dimension if you want this value to be derived from the current vendor. If you also want the value entered to overwrite any existing value for the dimension, you need to check the "Overwrite" box. If you choose not to do so, the dimension value will only be transferred to a table entry which is being created if no entry has been made in the field "Company" in the table entry, either manually or through a registration code.</p> <p>Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used rather than the value (if any) found</p>

Field	Description
	<p>for this dimension in the dimension combination in question. This means that the dimension combination only applies to this dimension if you have not entered a value in this field.</p> <p>Please note that if a dimension combination has been specified in the field "Dim. Comb. No.," a mark in the field "Overwrite" will only have effect if you have also entered a dimension value. If you mark the field "Overwrite" but you do not enter a dimension value in this field, the "Overwrite" field is ignored, as dimension values and overwriting specification are always retrieved together from the same dimension derivation island, dimension combination or dimension combination line.</p> <p>The field "Description" to the right of this field displays the description of the entered dimension combination.</p> <p>For more information on derived dimensions, please see the chapter "Introduction to the G/L Module" and the description of the windows Dimension Derivations and Dimension Combinations in the G/L module.</p>

### Derived Dimensions Island

Field	Description
<b>Location</b>	<p>The functionality of this field is similar to the functionality of the field "Company No." above.</p> <p>Furthermore, the value of this field is suggested when entering vendor entries in the vendor invoice journal or the general journal. When posting a vendor journal which is created automatically, for example, a cash discount or a rate variance in connection with a payment, Maconomy will transfer the value of the field Location to the ledger entries in question. This occurs at the time of posting.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec.1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

### Print Control Island

Field	Description
<b>Statistics 1-4</b>	In these fields, you can enter an option created in the window Option Lists in the Set-Up module. This value can be used for making various statistics as, for example, 1099 reporting (in the US) and B-income tax (in Denmark) in

Field	Description
	connection with support of disclosable tax. As a vendor can be assigned to a specific 1099 type, these types can be created in the window Option Lists in the Set-Up module. See the description of the window Option Lists in the Set-Up module for further information on the use of option lists.

### Remarks Island

In these fields, you can enter any remarks about the vendor.

### Pay to Vendor Island

Field	Description
<b>Pay to Vendor</b>	<p>In this field, you enter a Pay to Vendor number, if a different vendor is to receive payment for the delivery. The Pay to Vendor number indicates to which address payment is sent. The "original" (delivery) vendor is debited by the amount.</p> <p>Maconomy verifies that the Pay to Vendor number exists in the system.</p> <p>Payment might be directed to the Pay to Vendor if the delivery vendor uses a factoring company.</p> <p>If you leave this field blank, the Pay to Vendor is automatically the same as the delivery vendor.</p> <p>When using linking rules, please note that it is not possible to create a field specific linking rule for the field "Pay to Vendor" between the relations Creditor and Company Creditor in the window Linking Rules in the Set-Up module. This limitation ensures that company-specific vendors always have the same bill to customer as the global vendor to which they are assigned.</p> <p>Maconomy also shows the name and address of the Pay to Vendor. The information appears when you press Return. It cannot be changed here.</p>
<b>Attn.</b>	This is the Pay to Vendor's attention person; that is, the person to whom payment information directed. Maconomy inserts the name when you press Return. You cannot change it here.
<b>Country</b>	This is the vendor's country. The field is completed when you press Return, and it cannot be changed.
<b>Phone</b>	This is the vendor's phone number. The field is completed when you press Return, and it cannot be changed.
<b>E-mail</b>	In this field, Maconomy shows the Pay to Vendor's electronic mail address. The field is filled in when you press Return, and it cannot be changed here.

### Parent Vendor Island

Field	Description
<b>Parent Vendor</b>	In this field you can enter the number of the vendor to be the parent vendor of the current vendor. By entering a parent vendor in this field and a linking rule in the field "Linking Rule" below, information can be copied from the parent vendor to the new vendor. This avoids the entering of similar information on several vendors. If a

Field	Description
	<p>template/standard vendor has been specified in one of the windows System Information or Company Information, this field will be provided with the number of the template/standard vendor when creating a vendor. After having entered a name of the new vendor, and if you have specified a standard linking rule between the relations Creditor and Creditor in the window Linking Rules, you can now press "Enter" and the information specified in the Linking Rule will be copied from the template/standard vendor to the new vendor. If you do not wish to apply information from the template/standard vendor to new vendors, the vendor number can be changed manually.</p> <p>This field also displays the name of the specified parent vendor.</p>
<b>Linking Rule</b>	<p>In this field, you can specify the linking rule that you want to use between the parent vendor and the new vendor. If you have specified a parent vendor in the field "Vendor No." above and you do not specify a linking rule in this field, Maconomy will use a standard linking rule created between the relations Creditor and Creditor in the window Linking Rules in the Set-Up module, if any. If no standard linking rule has been created, Maconomy will display an error message asking you to create a linking rule. Linking rules contain information about what information should be copied from a parent vendor to the current vendor. Linking rules are maintained in the window Linking Rules in the Set-Up module. For further information about linking rule creation and usage and rules concerning the copying of field information from parent vendors, see the description of the window Linking Rules in the Set-Up module.</p>

### Purchase Information Island

Field	Description
<b>Our Cust. No.</b>	This field shows your company's customer number with the vendor. You refer to this number when you contact the vendor. Maconomy transfers the number to your item purchase orders.
<b>Buyer</b>	The buyer is responsible for contact with and purchases from the vendor. The name is transferred to requests for quote, purchase orders, and item purchase orders created for the current vendor.
<b>Price List</b>	In this field, you select the price list Maconomy uses for item purchase orders. Price lists are maintained in the Price Lists and Quantity Discounts windows in the Inventory module.
<b>Keep Price</b>	In this field, you can specify whether unit prices and discount percentages on item purchase order lines pertaining to the current vendor should be recalculated when changing the quantity. The value in this field is transferred to the card part of item purchase orders pertaining to the current vendor, but can be changed for each order.
<b>Expense %</b>	<p>In this field, you enter the expense percentage you normally incur when buying items from the vendor.</p> <p>Alternatively, you can enter the fixed expenses amount on the actual item purchase order.</p>

Field	Description
	<p>When items are shipped to the warehouse, the expenses are added to the item total and apportioned to item prices to give correct cost prices.</p> <p>Note, if your company does not use purchase price lists, that is, if there are no purchase price lists in the system, Maconomy suggests the last cost price used at the warehouse in question as unit price on every item line. This price includes any expense incurred when you last bought the item for the warehouse selected in the field "Warehouse." If you then enter a figure in this field, Maconomy calculates both expenses.</p>
<b>Invoice Discount %</b>	<p>Here you enter the invoice discount percentage rate you normally receive from the vendor.</p> <p>Alternatively, you can enter the invoice discount amount on the actual item purchase order.</p> <p>When the items are shipped to the warehouse, the invoice discount is deducted from the prices to give the correct cost price.</p> <p>Note, if your company does not use purchase price lists, that is, if there are no purchase price lists in the system, Maconomy suggests the last cost price used at the warehouse in question as unit price on every item line. This price includes any invoice discount received when you last bought the item for the warehouse selected in the field "Warehouse." If you then enter a figure in this field, Maconomy calculates the invoice discount twice.</p>
<b>Your Ref.</b>	In this field, you enter the name of the vendor contact person. This is the person who deals with your orders.
<b>Our Ref.</b>	In this field, you enter your company's reference. This is the vendor's reference to one of your company's employees or departments, for example.
<b>Time Unit</b>	In this field, you can specify the time unit for the vendor. The value for this field is used when you specify the vendor in any requisition, purchase order, or vendor invoice that you create.

**Requisition Type Island**

Field	Description
<b>Requisition Type</b>	In this field, you select the requisition type.

**Warehouse Information Island**

Field	Description
<b>Warehouse</b>	<p>In this field, you select the warehouse to which items from this vendor are normally shipped. The information is used when you enter item purchase orders. The items must be assigned to the same warehouse in the Item Information Card in the Inventory module.</p> <p>Inventories are maintained in the Warehouse Information Card in the Inventory module.</p>

Field	Description
<b>Delivery Terms</b>	In this field, you select which delivery terms normally apply to deliveries from the vendor. The field is used when you enter item purchase orders.  Delivery Terms are maintained in the Popup Fields window in the Set-Up module.
<b>Delivery Mode</b>	In this field, you select which delivery mode normally applies to deliveries from the vendor. The field is used when you enter item purchase orders.  Delivery Modes are maintained in the Popup Fields window in the Set-Up module.

### Access Level Island

Field	Description
<b>Name</b>	In this field you can specify the name of an access level. You only have access to the current vendor if you have been assigned to this level or a level above this in the window User Access Levels. This access control ensures that when working with for instance a purchase order, you can only enter a vendor to which you have access, and you can only see the vendor information cards of vendors to whom you have access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to vendors may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.  If no access level is specified, all users have access to the current vendor as long as they have access to the vendor's settling company.

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

### Actions

This section shows the Actions available in the Vendor Information Card workspace.

### Top Tab

Field	Description
<b>Attach Document</b>	This action allows you to attach a document to the vendor.

## Payment Control Workspace

Use this workspace to maintain information related to vendor payments, including the outstanding vendor balance.

You can only enter information for one vendor at a time. You create vendors in the Vendor Information Card workspace.

## Payment Control Tab

This section includes the fields and descriptions for the Payment Control tab.

### Vendor Island

Field	Description
<b>Vendor No.</b>	This field displays the number of the current vendor. The value cannot be changed.  The other lines in this field show the name and address of the vendor. The information is retrieved from the Vendor Information Card, but can be changed here.
<b>Attn.</b>	This is the vendor attention person the person to whom payment information is directed. The information is retrieved from the Vendor Information Card, but can be changed here.
<b>Country</b>	In this field, you can select the country the vendor comes from. It is used for reference and statistics.  If you alter the country code in this window, Maconomy will check that any validation rule for tax and social security/federal ID numbers in the window Rules of Validation are observed.
<b>Phone</b>	This is the vendor's phone number. The information is retrieved from the Vendor Information Card, but can be changed here.
<b>Fax</b>	This is the vendor's fax number. The information is retrieved from the Vendor Information Card, but can be changed here.
<b>Telex</b>	This is the vendor's telex number. The information is retrieved from the Vendor Information Card, but can be changed here.
<b>Our Cust. No.</b>	This is your company's customer number with the vendor. The information is retrieved from the Vendor Information Card, but can be changed here.
<b>Currency</b>	This field displays the currency that the current vendor uses as standard currency.

### Payment Status Island

Field	Description
<b>Selected for Payment</b>	This field shows whether the vendor is selected for payment. Maconomy marks the field when you make a payment selection. Payment selections are entered in the Payment Selection and Change Payment Selection by Vendor windows in the Banking module. The value cannot be changed.
<b>No. Entries Selected</b>	This field shows how many entries are selected for payment. Maconomy enters the value automatically. It cannot be changed.

Field	Description
<b>No. of Entries Being Paid</b>	This field shows the number of vendor entries being paid. This field is automatically completed by Maconomy and cannot be changed. An entry is under payment if it is included in a payment file created in the Payment Files window, or if a check has been printed out in the Print Check window. The entry is no longer under payment when it has been approved.

#### Bank Island

Field	Description
<b>Address</b>	In this field, you can enter the address of the vendor's bank. It is used for electronic payment to foreign vendors.
<b>SWIFT</b>	In this field, you can enter a SWIFT code. The SWIFT code is used for electronic payment to foreign vendors.

#### Pay to Vendor Island

Field	Description
<b>Pay to Vendor</b>	<p>In this field, you enter a pay to vendor number, if a different vendor is to receive payment for deliveries from the current vendor. The Pay to Vendor number indicates the vendor to which payment is to be sent. The "original" (delivery) vendor is debited by the amount.</p> <p>Payment might be directed to the Pay to Vendor if the delivery vendor uses a factoring company.</p> <p>The Pay to Vendor is transferred from the vendor information card, but you can change the pay to vendor in this window.</p> <p>Maconomy also shows the name and address of the Pay to Vendor.</p>

#### Balance Island

Field	Description
<b>Balance, Currency</b>	This field displays the vendor's balance in the standard currency of the vendor. If one or more company-specific vendors are assigned to the vendor in question, this field displays the balance of all entries registered on the assigned company-specific vendors and the parent vendor in question. However, you should note that if one or more of the assigned company-specific vendors use a currency which is different from the standard currency of the parent vendor, Maconomy sums the balance of the entries irrespective of the assigned currencies, and the amount in this field will not be a valid figure. The balance in this field is updated when you post journals with vendor entries
<b>Balance, Enterprise</b>	This is the vendor's balance in your base currency. Maconomy updates the balance when you post journals with vendor entries. See also the description of the above field "Balance, Currency."

## Payment Control Island

Field	Description
<b>Block Payments</b>	<p>If you mark this field, you block payments to the vendor. This means you cannot make a payment selection.</p> <p>You can block payments if, for example, you wish to delay payment for a wrong delivery until it is corrected.</p> <p>Marking of this field will also result in the resetting of payment selections created for the current vendor. Such payment selections can be inspected in the window Change Payment Selection by Vendor in the Banking module.</p> <p>For further information about payment selections, see the description of this window in the Banking module.</p>
<b>Payment Mode</b>	<p>In this field, you select how you normally pay the vendor. The payment mode is used partly to point to a G/L account, partly to select which payment form to use and to control automatic payment. The payment mode is used when you register vendor invoices. It can always be changed on individual vendor invoices in the Vendor Invoices and Change Payment Selection windows in the Banking module.</p> <p>When you approve a payment selection, Maconomy uses the vendor invoice's payment mode to find the G/L account and other dimensions to which the payment should be posted, that is, from where payment is taken.</p> <p>Payment modes are changed in the Payment Modes window in the Banking module.</p>
<b>Pmt. Terms</b>	<p>In this field, you enter which payment terms normally apply to the vendor. The payment terms are used to calculate the invoice due date when you enter vendor invoices. Invoices are entered in the Vendor Invoices window.</p>
<b>Cash Discount Payment</b>	<p>In this field, you can select a cash discount condition to be assigned to the current vendor. The selected cash discount condition is used by Maconomy when paying vendor invoices. If you do not select a condition, cash discount will not be calculated for the current vendor. Cash discount conditions are created in the pop-up type "Cash Discount Codes" in the window Popup Fields in the Set-Up module. Please see this window for further information on cash discount conditions.</p>
<b>Giro No.</b>	<p>If the vendor is from a state country with a regional or national giro system, you can specify the vendor's giro account number here. The information is for reference.</p>
<b>Reg. No.</b>	<p>In this field, you can enter the vendor's bank registration number.</p> <p>The number is used for reference and electronic payment.</p>
<b>Bank Acct. No.</b>	<p>In this field, you can enter the vendor's bank account number. The number is used for reference and electronic payment.</p>
<b>BACS No.</b>	<p>In this field, you can enter the vendor's number for automated clearing service. The number is used for reference and electronic payment.</p>
<b>CPC No</b>	<p>In this field, you can enter the vendor's common payment card number, if applicable. The number is used for reference and electronic payment.</p>

Field	Description
<b>Card Type Code</b>	In this field, you can enter a card type code. The code is transferred to vendor invoices when they are entered. However, you can change it for individual invoices in the Vendor Invoices and Change Payment Selection windows in the Banking module. The code is used for electronic payment.
<b>Payer Identification</b>	Here you can enter a payer identification. It is transferred to vendor invoices when they are entered. However, you can change it for individual invoices in the Vendor Invoices and Change Payment Selection windows. The identification is used for electronic payment.
<b>Tax</b>	<p>In this field, you specify whether to calculate tax on vendor invoices from this vendor on a normal basis. If you mark the field, Maconomy will automatically calculate tax for vendor invoices. You can, however, change the mark during invoice registration.</p> <p>You should normally mark the field for vendors in your own country. The field should not be marked for vendors from other EU countries. You have to settle tax for items bought in other EU countries, but the tax is calculated rather than lifted from the invoice amount.</p>
<b>Company Tax Code</b>	<p>In this field, you can specify a company tax code created in the window Popup Fields in the Set-Up module. The field is used by Maconomy for determining the tax code to be used in the calculation of tax for the current vendor, as the reporting code is part of the criteria for the selection of a G/L tax code in the window G/L Tax Tables if such a table has been specified for the company responsible for the registration. The G/L tax code is specified for a company in the window Company Information in the G/L module. When selecting a tax code, Maconomy uses the tax table specified for the responsible company of the vendor invoice in the window Company Information. However, the tax code is only selected from a tax table if the company that is responsible for the current invoice is assigned to a tax table in the window System Information.</p> <p>When posting entries, the reporting code is used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if extended tax reporting has been selected in the window System Information.</p>
<b>EU Trade Type</b>	<p>In this field, you can enter either "Normal" or "Triangulation" to indicate the EU trade type. Triangulation means you act as agent for a vendor in another EU country and a customer in third EU country. Triangulation sales are not included in the EU sales part of the tax specification. The trade type can be changed during order processing.</p> <p>Maconomy transfers the value to any item purchase orders you make to the vendor, but you can change it there.</p>
<b>Tax No.</b>	In this field, you enter the vendor's tax number. If you have entered tax number validation rules for the vendor's country in the window Rules of Validation in the Set-Up module, Maconomy will verify that the tax number complies with these validation rules.

Field	Description
<b>Control Account</b>	<p>The control account is a reference to two G/L accounts - a Vendor control account and an account for non-balanced entries.</p> <p>All vendor entries are posted to the General Ledger, to the control account referred to here. Accounts payable is thus a specification of A/P control accounts in the General Ledger.</p> <p>You can use the control accounts to group your vendors in the General Ledger—for example, in foreign and domestic vendors.</p> <p>The account for non-balanced entries is used to manage your accounts when item deliveries and invoices are not received at the same time. When you approve item deliveries to the warehouse, the inventory value account is debited and the non-balanced entries account is credited. When the vendor invoices are registered at a later date, the items are credited to the Vendor control account and debited to the account for non-balanced entries. You thus avoid any accounting problems, when items are delivered in one posting period and the corresponding vendor invoice is received in another.</p> <p>References to control accounts are specified by means of dimension combinations in the window Popup fields in the Set-Up module.</p>
<b>Responsible</b>	<p>In this field, you enter the employee responsible for approving invoices from the vendor. The name is for reference and is used to sort lists of non-approved vendor invoices.</p> <p>Responsible employees must be created as employees in the Maconomy system. Employees are created in the window Employees in the Set-Up module.</p> <p>Non-approved vendor invoices are printed in the window Print Approval List. This field also displays the name of the specified responsible employee.</p>
<b>Auto. Approval</b>	<p>In this field, you specify whether invoices and invoice allocation lines from this vendor should be approved automatically. If the field is marked, all invoices from the vendor are automatically approved for payment. However, you can remove the mark for individual invoices. Invoices are paid in either the window Change Payment Selection by Vendor or the window Approve Payment Selection in the Banking module.</p>

## Company Specific Vendor Information Card Workspace

Use this workspace to enter and maintain information about company-specific vendors; this is accounting information that is used to process purchases and vendor invoices.

You identify a company-specific vendor by a combination of vendor number (set up in the Vendor Information Card workspace) and company number. Certain information about the vendor is unique to the vendor/company combination.

A company-specific vendor is a split-up of a vendor number, meaning that you can make certain information about this vendor dependent on which company in Maconomy is responsible for the vendor in question. This means that there can be a company-specific vendor for each combination of vendor number and settling company number, and you can thus change certain information for each company-specific vendor on the associated information card, so that, for

example, one payment mode is used in connection with purchase from company A at vendor X, whereas another payment mode is used in connection with purchase from company B at the same vendor. In this way, all companies can use a common vendor number for an arbitrary number of company-specific vendors, only each of these company-specific vendors is assigned to its own specific settling company. Maconomy thus does not distinguish company-specific vendors by their vendor numbers, but by the combination of vendor number and settling company.

This is especially useful if vendors that you create using the Vendor Information Card can be thought of as "enterprise vendors" that you can use as a kind of template for company-specific vendors that you create in the associated settling companies. You can use a vendor as a template if no settling company has been specified for "the enterprise vendor" in the Vendor Information Card workspace. However, although a settling company has been specified on the "enterprise vendor," you can still use this vendor as a template for creating company-specific vendors; however, the settling company is inherited from the "enterprise vendor," insofar as you do not specify a settling company for each company-specific vendor.

This workspace is thus especially relevant for users who, for example, are associated with a specific settling company, and are responsible for the day-to-day administration of the company's own vendors, called "company-specific vendors" in Maconomy.

The following is an example of the use of this workspace:

Two settling companies want the information from an "enterprise vendor's" information card, but also need to enter various data in certain data fields, for example, **Attn.**, **Phone**, or **Delivery Terms**. By creating company-specific vendors that are linked to an existing vendor (the "enterprise vendor"), the two settling companies can access a large amount of information inherited from the existing vendor; however, they can only change the data fields that they need to change. The company-specific vendors thus have the same vendor number as the "enterprise vendor," but the settling company number and the contents of certain fields, such as **Attn.** and **Phone**, are different.

In addition, the setup of linking rules in the Linking Rules workspace in the Set-Up module is decisive for defining what information is inherited from vendors to company-specific vendors and also for defining what information users can change in this workspace. For example, if you create a linking rule from the relation **Creditor** to the relation **CompanyCreditor** that specifies that all vendor information, except for a few fields such as **Attn.** and **Phone**, should be inherited by company-specific vendors with the standard linking method **Full**, Maconomy copies the relevant information to the company-specific vendor's information cards using this linking rule. The selected linking rule therefore determines which fields are changeable on the company-specific vendor's information card. Whether or not you can specify, change, or only view a value in each field depends on the setup of the linking rule that you assigned to the vendor, if any. For more information about linking rules, see the description of the Linking Rules workspace in the Set-Up module.

The creation of company-specific vendors in this workspace, however, depends on whether you select the **Centralized vendor creation only** system parameter in the Set-Up module. If you select this system parameter, you can only create company-specific vendors, if you have already created them as vendors in the Vendor Information Card workspace. If you do not select this parameter, there are no restrictions on the creation of company-specific vendors in this workspace. The creation of a company-specific vendor automatically results in the creation of a vendor with the same information as the company-specific vendor, if this vendor does not already exist.

Additionally, if you select the **Aut. company-specific vendor creation** system parameter Maconomy automatically creates company-specific vendors when you try to enter information about such non-existing company-specific vendors. If you do not select this parameter and someone makes an entry on a non-existing company-specific vendor, Maconomy displays an error message. You must then create the company-specific vendor manually in the Company Specific Vendor Information Card workspace before you try to enter any more information.

You maintain financial information about company-specific-vendors in the Company Specific Payment Control workspaces. In some cases, however, Maconomy copies this information from the Vendor Information Card and Payment Control workspaces.

For auditing purposes, it is recommended that you print and file the Company Specific Vendor Information Card each time that you change information here or in the Payment Control workspace. To print the Company Specific Vendor Information Card, use the **Print this** function in the File menu.

### Company Specific Vendor Information Card Tab

This section includes the fields and descriptions for the Company Specific Vendor Information Card tab.

#### Vendor Island

Field	Description
<b>Vendor No.</b>	<p>In this field, you enter a unique company-specific vendor identification number, referred to as the "Vendor Number." If a number is not entered, Maconomy will automatically transfer the vendor number from the number series assigned to vendors. Manual typing is required however if the number in the number series has been entered as zero. The number series are specified in the window Number Series in the Set-Up module. When the vendor has been created, the vendor number can no longer be changed.</p> <p>If the system parameter "Centralized vendor creation only" has been marked, company-specific vendors can only be created, if these have already been created as vendors in the window Vendor Information Card. You can use the function "Find customer" in the Find menu to display a list of existing vendors and select a vendor that you want to use as company-specific vendor. If the parameter has not been marked, you are free to enter a customer number in this field.</p> <p>You can also enter the vendor's name and address here. This information is used as reference, and it is shown on various printouts. As a minimum, you must complete the first line immediately below the vendor number.</p>
<b>Attn.</b>	In this field, you enter the name of the person to whom shipping and payment information is to be directed. This information is used on printouts.
<b>Country</b>	<p>In this field, you select the company-specific vendor's country. The information is for reference, and it can be used to generate statistics.</p> <p>Countries are maintained in the Popup Field window "Country" in the Set-Up module.</p>

Field	Description
<b>Phone</b>	In this field, you may enter the company-specific vendor's phone number. This information is used for reference.
<b>E-mail</b>	In this field, you may enter the company-specific vendor's electronic mail address. This information is used for reference.
<b>Fax</b>	In this field, you may enter the company-specific vendor's fax number. This information is used for reference.
<b>Telex</b>	In this field, you may enter the company-specific vendor's telex number. This information is used for reference.
<b>Giro</b>	In this field, you may enter the company-specific vendor's postal giro number. This information is used for reference.
<b>Remittance Email Address</b>	Specify the email address of the vendor linked to the payment where Maconomy sends the vendor remittance email.

### Settling Company Island

Field	Description
<b>Company No.</b>	<p>In this field, you can enter a value for the Company dimension. If you specify a company, that company will be the settling company on all company-specific vendor invoices, item purchase orders, and so on, where the current vendor is the pay to vendor.</p> <p>If you do not specify a settling company, the vendor is regarded as a global vendor. When a global vendor is specified on, for example, a vendor invoice, the settling company will be determined from the company responsible for the vendor invoice journal in question, as Maconomy will retrieve the value from the field "Vendor Settling Company" in the Company Information Card for the responsible company.</p> <p>The value of the field also determines the users who have access to the vendor. In the window Company Information in the G/L module, it is possible to assign each company to an access level. Users only have access to see information about a vendor if they have been assigned to the same or a higher access level. A user will, for example, only be able to see the vendor information card of a given vendor and refer to the vendor in question on, for example, vendor invoices if the vendor's settling company has been assigned an access level to which the user also has access. In addition, the user must have access to the access level specified in the island Access Level in order to have access to the current vendor. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to vendors may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.</p>

Field	Description
	<p>For further information about the influence of the settling company and how such a company is determined, please see the section Multiple Companies in the chapter "Introduction to the G/L module."</p> <p>This field also shows the name of the specified company.</p>
<b>Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above.

### General Information Island

Field	Description
<b>Department</b>	<p>In this field, you enter the department that normally receives items purchased from this vendor.</p> <p>The field determines the G/L accounts for cash discounts and exchange rate differences. These can occur when you pay invoices. G/L references to cash discounts and exchange rate differences are specified by means of dimension combinations in the window Posting References in the G/L module.</p>
<b>Language</b>	<p>In this field, you designate the language of the vendor. The language is used for printouts and statistics.</p> <p>Language codes are maintained in the window Popup Fields window in the Set-Up module.</p>
<b>Currency</b>	<p>In this field, you select the vendor's standard currency. All vendor transactions are converted into the vendor's standard currency, and this currency is also the currency used when paying the current vendor. This means you can print and send account statements in the vendor's own currency.</p> <p>All vendor transactions are registered in the following currencies:</p> <ul style="list-style-type: none"> <li>■ The Standard Currency, which is the currency the vendor has requested to use and the currency in which payments to the vendor are usually made.</li> <li>■ The Company Base Currency, which is the currency selected as base currency for the company responsible for a given transaction.</li> <li>■ The Enterprise Currency, which is the currency selected as enterprise currency in the window System Information in the Set-Up module.</li> <li>■ The Original Currency, which is the original currency of a given transaction, for example, FFR, if the German vendor is paid in French Francs.</li> </ul> <p>The field "Currency" cannot be changed, if entries have been posted or are ready to be posted to the vendor. This is a precaution against inconsistencies. Currencies are maintained in the Popup Fields window in the Set-Up module.</p>
<b>Vendor Group</b>	In this field, you select the group to which the vendor belongs. This field is used to classify vendors (for example, by trade).

Field	Description
	Vendor groups are maintained in the Popup Fields window in the Set-Up module.
<b>Comp. Reg. No.</b>	<p>In this field you enter the vendor's company registration number if the vendor is a company. If you enter a number which is already in use, Maconomy will display a warning.</p> <p>If you have entered company registration number validation rules for the vendor's country in the window Rules of Validation in the Set-Up module, Maconomy will verify that the company registration number complies with these validation rules. The completion of this field is optional.</p>
<b>CNR No.</b>	<p>In this field you enter the vendor's CNR number (or social security/federal ID number) if the vendor is a person. If you enter a CNR number which is already in use, Maconomy will display a warning.</p> <p>If you have entered CNR number validation rules for the vendor's country in the window Rules of Validation in the Set-Up module, Maconomy will verify that the CNR number complies with these validation rules. The completion of this field is optional.</p>
<b>Disclosable</b>	<p>In this field, you can specify whether the current vendor should be disclosable. If a vendor has been marked as disclosable, the mark will be transferred to the field "Disclosable" in the windows Vendor Invoices and Invoice Allocation, when you make an invoice for the vendor in question.</p> <p>When reporting to tax authorities, you distinguish between disclosable and tax exempt services for disclosable invoices. If you wish to mark a vendor as disclosable, the vendor's information card must contain a CNR or Corporate Registration Number.</p>
<b>Blocked</b>	If this box is checked, it will be impossible to enter vendor invoices, item purchase orders, purchase orders, and general journals for the vendor.
<b>Standard Allocation Code</b>	In this field, you can specify a standard allocation code to apply to the company-specific vendor. The allocation code specified is automatically used when creating vendor invoices for the vendor in question, if no other allocation code has been manually entered at the creation of an invoice.
<b>Week Calendar No.</b>	<p>In this field, you can specify a week calendar which contains information about days on which the vendor is closed (that is, days where the number of working hours is 0 according to the specified week calendar). This information is used in the calculation of delivery dates, as only the number of days where the vendor is open are counted as part of the delivery time.</p> <p>If you do not specify a week calendar, all days are counted as part of the delivery time.</p> <p>For further information on the week calendar's influence on the calculation of delivery dates, please see the description of the field "Deliv. Date" in the table part of the window Item Purchase Orders in the Item Purchase module.</p> <p>Week calendars are created in the window Week Calendars in the Set-Up module.</p>

Field	Description
<b>Holiday Calendar Name</b>	In this field, you can specify the name of the holiday calendar used by the current company-specific vendor.

**Extra Fields Island**

Field	Description
<b>Popup 1-5</b>	In these fields, you can select a number of pop-up values for further specification of the current company-specific vendor. The options are created in the window Popup Fields in the Set-Up module.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the vendor in question. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.

**Purchase Orders Island**

Field	Description
<b>Default to Self Invoices</b>	Select this check box so that when users create purchase orders for the vendor, Maconomy marks the PO for self-invoicing.
<b>Reference Mandatory on Time Sheet Lines</b>	<p>Select this check box to require the vendor to refer to a purchase order line in time sheet lines. This applies to vendors who are subcontractors with employee credentials.</p> <p>When creating time sheet lines, the vendor can only refer to subcontractor reconciliation purchase order lines.</p> <p>If you select this check box and only one purchase order line is open for the vendor, Maconomy automatically fills out the following fields in any time sheet lines that the vendor creates:</p> <ul style="list-style-type: none"> <li>■ <b>Purchase Order Number</b></li> <li>■ <b>Purchase Order Line</b></li> <li>■ <b>Job No.</b></li> <li>■ <b>Job Name</b></li> <li>■ <b>Act. No.</b></li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li><b>Task</b></li> </ul> <p>When the vendor posts these time sheet lines, Maconomy automatically fills out the <b>Cost</b> field in the job entry. Maconomy copies the value from the purchase order specified in the posted time sheet line.</p>
<b>Reference Mandatory on Expense Sheet Lines</b>	<p>Select this check box to require the vendor to refer to a purchase order in expense sheet lines. This applies to vendors who are subcontractors with employee credentials.</p> <p>When creating expense sheet lines, the vendor can only refer to subcontractor reconciliation purchase order lines.</p> <p>If you select this check box and only one purchase order line is open for the vendor, Maconomy automatically fills out the following fields in any expense sheet lines that the vendor creates:</p> <ul style="list-style-type: none"> <li><b>Purchase Order Number</b></li> <li><b>Purchase Order Line</b></li> <li><b>Job No.</b></li> <li><b>Job Name</b></li> <li><b>Act. No.</b></li> <li><b>Task</b></li> <li><b>Unit Price, Base</b></li> </ul>

### Dimension Combination Island

Field	Description
<b>Dim. Comb. No.</b>	<p>In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the window Dimension Combinations. The field "Description" to the right of this field displays the description of the entered dimension combination.</p> <p>If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the current company-specific vendor. However, any dimension derivation values specified in this island will be used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the company-specific vendor information card.</p>

### Derived Company Island

Field	Description
<b>Company No.</b>	<p>In this field you can enter a dimension value for the Company dimension if you want this value to be derived from the current company-specific vendor. If you also want the value entered to overwrite any existing value for the dimension, you need</p>

Field	Description
	<p>to check the "Overwrite" box. If you choose not to do so, the dimension value will only be transferred to a table entry which is being created if no entry has been made in the field "Company" in the table entry, either manually or through a registration code.</p> <p>Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used rather than the value (if any) found for this dimension in the dimension combination in question. This means that the dimension combination only applies to this dimension if you have not entered a value in this field.</p> <p>Please note that if a dimension combination has been specified in the field "Dim. Comb. No.," a mark in the field "Overwrite" will only have effect if you have also entered a dimension value. If you mark the field "Overwrite" but you do not enter a dimension value in this field, the "Overwrite" field is ignored, as dimension values and overwriting specification are always retrieved together from the same dimension derivation island, dimension combination or dimension combination line.</p> <p>The field "Description" to the right of this field displays the description of the entered dimension combination.</p> <p>For more information on derived dimensions, please see the chapter "Introduction to the G/L Module" and the description of the windows Dimension Derivations and Dimension Combinations in the G/L module.</p>

### Derived Dimensions Island

Field	Description
<b>Location</b>	<p>The functionality of this field is similar to the functionality of the field "Company No." above.</p> <p>Furthermore, the value of this field is suggested when entering vendor entries in the vendor invoice journal or the general journal. When posting a vendor journal which is created automatically, for example, a cash discount or a rate variance in connection with a payment, Maconomy will transfer the value of the field Location to the ledger entries in question. This occurs at the time of posting.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

**Print Control Island**

Field	Description
<b>Statistic 1-4</b>	In these fields, you can enter an option created in the window Option Lists in the Set-Up module. This value can be used for making various statistics as, for example, 1099 reporting in connection with support of disclosable tax. See the description of the window Option Lists in the Set-Up module for further information on the use of option lists.
<b>List 1-4</b>	In these fields, you can enter an option list created in the window Option Lists in the Set-Up module. If you enter a value in this field, the option specified in the corresponding Statistics field must belong to the specified option list. This value can be used for making various statistics as, for example, 1099 reporting in connection with support of disclosable tax. See the description of the window Option Lists in the Set-Up module for further information on the use of option lists.

**Remarks Island**

In these fields, you can enter any remarks about the company-specific vendor.

**Pay to Vendor Island**

Field	Description
<b>Pay to Vendor</b>	<p>In this field, you enter a Pay to Vendor number, if a different vendor is to receive payment for the delivery. A pay to vendor can, for example, be used if the vendor uses a factoring company. The pay to vendor number indicates the address to which payments are sent. The “original” (delivery) vendor is debited by the amount paid.</p> <p>A company-specific vendor created on the basis of an existing global vendor must always have the same pay to vendor as the global vendor. Maconomy therefore overwrites any manually specified vendor number in this field with the pay to vendor number of the parent vendor. If you do not enter a vendor number manually, the pay to vendor is set to the vendor number of the new vendor or the pay to vendor of the parent vendor.</p> <p>Maconomy also shows the name and address of the Pay to Vendor. The information appears when you press Return. It cannot be changed here.</p>
<b>Attn.</b>	This is the Pay to Vendor’s attention person; that is, the person to whom payment information is directed. Maconomy inserts the name when you press Return. You cannot change it here.
<b>Country</b>	This is the vendor’s country. The field is completed when you press Return, and it cannot be changed.
<b>Phone</b>	This is the vendor’s phone number. The field is completed when you press Return, and it cannot be changed.
<b>E-mail</b>	In this field, Maconomy shows the Pay to Vendor’s electronic mail address. The field is filled in when you press Return, and it cannot be changed here.

**Parent Vendor Island**

Field	Description
<b>Parent Vendor</b>	<p>In this field, you can specify the number of the vendor which should be the parent vendor of the current company-specific vendor's vendor. The field is only to be filled in if you want to create a vendor on the basis of the company-specific vendor. However, this functionality is only accessible if you have not marked the system parameter "Centralized vendor creation only." If you specify a parent customer in this field, you also have to specify linking rules in the fields "Linking Rule" and "Company Specific Linking" below. If you do not specify linking rules, Maconomy will use standard linking rules, insofar as some have been created between the relations Creditor and Creditor and Creditor and Company Creditor in the window Linking Rules in the Set-Up module. On the basis of these choices and the entering of a company number in the island "Settling Company," you may then create a company-specific vendor with the number that you have entered in the field "Vendor No." in the island Vendor and a vendor with the same number in the window Vendor Information Card. This corresponds to the procedure of first creating a vendor in the "normal" vendor information card on the basis of the information entered in the fields "Vendor No." and "Linking Rule," and in this window then creating a company-specific vendor with the indicated company-specific link. What information is copied to the different vendor information cards will depend on the indicated linking rule.</p> <p>If you want to create a company-specific vendor, and if a parent vendor has already been specified for the vendor whose number is entered in the field "Vendor No." in the island Vendor, the fields "Vendor No." and "Linking Rule" in this island will automatically be filled in with the information specified on the information card of the vendor's parent vendor.</p> <p>Please note that if a template/standard vendor has been specified in one of the windows System Information or Company Information, this field will be provided with the number of the template/standard vendor when creating a company-specific vendor. The number can be changed manually. For further information on parent vendors and rules for the copying of field information from vendors, see the description of the window Linking Rules in the Set-Up Module.</p> <p>This field also displays the name of the specified parent vendor.</p>
<b>Linking Rule</b>	<p>In this field, you can specify the linking rule that you want to use between the vendor specified in the field above and this vendor's parent vendor. The parent vendor of a vendor is specified on the information card of the vendor specified in the field "Vendor No." above. The linking rule used in this field must be created between the relations Creditor and Creditor in the window Linking Rules in the Set-Up module. If you have specified a parent customer in the field "Vendor No." above and you do not specify a linking rule in this field, Maconomy will use a standard linking rule created between the relations Creditor and Creditor in the window Linking Rules in the Set-Up module, if any. If no standard linking rule has been created, Maconomy will display an error message asking you to create a usable linking rule. Linking rules contain information about what information should be copied from one kind of vendor to another kind of vendor. Linking rules are maintained in the window Linking Rules in the Set-Up module.</p>

Field	Description
<b>Company Specific Linking Rule</b>	In this field, you can specify the linking rule that you want to use between the current company-specific vendor and its parent vendor. If you do not complete this field and a linking rule has been created between the relations Creditor and Company Creditor, which is used as a standard linking rule, the field is completed automatically with the name of the associated standard linking rule. If no standard linking rule has been created, Maconomy will display an error message asking you to create a usable linking rule.

### Purchase Information Island

Field	Description
<b>Our Cust. No.</b>	This field shows your company's customer number with the company-specific vendor. You refer to this number when you contact the vendor. Maconomy transfers the number to your item purchase orders.
<b>Buyer</b>	The buyer is responsible for contact with and purchases from the company-specific vendor. The name is transferred to item purchase orders.
<b>Price List</b>	In this field, you select the price list Maconomy uses for item purchase orders. Price lists are maintained in the Price Lists and Quantity Discounts windows in the Inventory module.
<b>Keep Price</b>	In this field, you can specify whether unit prices and discount percentages on item purchase order lines pertaining to the current vendor should be recalculated when changing the quantity. The value in this field is transferred to the card part of item purchase orders pertaining to the current vendor, but can be changed for each order.
<b>Expense %</b>	<p>In this field, you enter the expense percentage you normally incur when buying items from the company-specific vendor.</p> <p>Alternatively, you can enter the fixed expenses amount on the actual item purchase order.</p> <p>When items are shipped to the warehouse, the expenses are added to the item total and apportioned to item prices to give correct cost prices.</p> <p>Note, if your company does not use purchase price lists, that is, if there are no purchase price lists in the system, Maconomy suggests the last cost price used at the warehouse in question as unit price on every item line. This price includes any expense incurred when you last bought the item for the warehouse selected in the field "Warehouse." If you then enter a figure in this field, Maconomy calculates both expenses.</p>
<b>Invoice Discount %</b>	<p>Here you enter the invoice discount percentage rate you normally receive from the company-specific vendor.</p> <p>Alternatively, you can enter the invoice discount amount on the actual item purchase order.</p> <p>When the items are shipped to the warehouse, the invoice discount is deducted from the prices to give the correct cost price.</p>

Field	Description
	Note, if your company does not use purchase price lists, that is, if there are no purchase price lists in the system, Maconomy suggests the last cost price used at the warehouse in question as unit price on every item line. This price includes any invoice discount received when you last bought the item for the warehouse selected in the field "Warehouse." If you then enter a figure in this field, Maconomy calculates the invoice discount twice.
<b>Your Ref.</b>	In this field, you can enter the name of the company-specific vendor's contact person. This is the person who deals with your orders.
<b>Our Ref.</b>	In this field, you enter your company's reference. This is the company-specific vendor's reference to one of your company's employees or departments, for example.
<b>Time Unit</b>	In this field, you can specify the time unit for the vendor. The value for this field is used when you specify the vendor in any requisition, purchase order, or vendor invoice that you create.

#### Warehouse Information Island

Field	Description
<b>Warehouse</b>	In this field, you select the warehouse to which items from this company-specific vendor are normally shipped. The information is used when you enter item purchase orders. The items must be assigned to the same warehouse in the Item Information Card in the Inventory module.  Inventories are maintained in the Warehouse Information Card in the Inventory module.
<b>Delivery Terms</b>	In this field, you select which delivery terms normally apply to deliveries from the company-specific vendor. The field is used when you enter item purchase orders.  Delivery Terms are maintained in the Popup Fields window in the Set-Up module.
<b>Delivery Mode</b>	In this field, you select which delivery mode normally applies to deliveries from the company-specific vendor. The field is used when you enter item purchase orders.  Delivery Modes are maintained in the Popup Fields window in the Set-Up module.

#### Access Level Island

Field	Description
<b>Name</b>	In this field you can specify the name of an access level. You only have access to the current company-specific vendor if you have been assigned to this level or a level above this in the window User Access Levels. This access control ensures that when working with for instance a purchase order, you can only enter a vendor to which you have access, and you can only see the vendor information cards of vendors to whom you

Field	Description
	<p>have access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to vendors may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section “Introduction to the Access Control System” in the Set-Up module.</p> <p>If no access level is specified, all users have access to the current vendor as long as they have access to the vendor’s settling company.</p>

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

### Actions

This section shows the Actions available in the Company Specific Vendor Information workspace.

### Top Tab

Field	Description
<b>Attach Document</b>	This action allows you to attach a document to the company-specific vendor.

## Company Specific Payment Control Workspace

Use this workspace to maintain information related to company-specific vendor payments, including the company-specific outstanding vendor balance.

If you create a company-specific vendor from an enterprise-wide vendor, Maconomy populates the company-specific vendor's payment information automatically, using information from the enterprise-wide vendor's Payment Control workspace.

The information that is inherited and whether these pieces of information are changeable, depends on the linking rule assigned to the company-specific vendor in question.

Whether or not you can specify, change, or only view a value in each field depends on the setup of the linking rule that you assigned to the company-specific vendor, if any. For more information about linking rules, see the description of the Linking Rules workspace in the Set-Up module.

It is recommended that you print the company-specific payment control and field each time that you change information in this workspace or in the Company Specific Vendor Information Card workspace. You print the current payment information by using the **Print this** action in the File menu in the Company Specific Vendor Information Card workspace.

## Company Specific Payment Control Tab

This section includes the fields and descriptions for the Company Specific Payment Control tab.

### Vendor Island

Field	Description
<b>Vendor No.</b>	<p>This field displays the number of the current company-specific vendor. The value cannot be changed.</p> <p>The other lines in this field show the name and address of the vendor. The information is retrieved from the Company Specific Vendor Information Card, but can be changed here.</p>
<b>Attn.</b>	<p>This is the company-specific vendor attention person; that is, the person to whom payment information is directed. The information is retrieved from the Company Specific Vendor Information Card, but can be changed here.</p>
<b>Country</b>	<p>In this field, you can select the country to which the company-specific vendor is assigned. It is used for reference and statistics.</p> <p>If you alter the country code in this window, Maconomy will check that any validation rule for tax and social security/federal ID numbers in the window Rules of Validation are observed.</p>
<b>Phone</b>	<p>This is the company-specific vendor's phone number. The information is retrieved from the Company Specific Vendor Information Card, but can be changed here.</p>
<b>Fax</b>	<p>This is the company-specific vendor's fax number. The information is retrieved from the Company Specific Vendor Information Card, but can be changed here.</p>
<b>Telex</b>	<p>This is the company-specific vendor's telex number. The information is retrieved from the Company Specific Vendor Information Card, but can be changed here.</p>
<b>Our Cust. No.</b>	<p>This is your company's customer number with the company-specific vendor. The information is retrieved from the Company Specific Vendor Information Card, but can be changed here.</p>
<b>Currency</b>	<p>This field displays the currency that the current company-specific vendor uses as standard base currency.</p>

### Settling Company Island

Field	Description
<b>Company No.</b>	<p>In this field, you can enter a value for the Company dimension. If you specify a company, that company will be the settling company on all company-specific vendor invoices, item purchase orders, and so on, where the current vendor is the pay to vendor.</p> <p>If you do not specify a settling company, the vendor is regarded as a global vendor. When a global vendor is specified on, for example, a vendor invoice, the settling company will be determined from the company responsible for the vendor invoice journal in question, as Maconomy will retrieve the value from the</p>

Field	Description
	<p>field "Vendor Settling Company" in the Company Information Card for the responsible company.</p> <p>The value of the field also determines the users who have access to the vendor. In the window Company Information in the G/L module, it is possible to assign each company to an access level. Users only have access to see information about a vendor if they have been assigned to the same or a higher access level. A user will, for example, only be able to see the vendor information card of a given vendor and refer to the vendor in question on, for example, vendor invoices if the vendor's settling company has been assigned an access level to which the user also has access. In addition, the user must have access to the access level specified in the island Access Level in order to have access to the current vendor. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to vendors may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>For further information about the influence of the settling company and how such a company is determined, please see the section Multiple Companies in the chapter "Introduction to the G/L module."</p>
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.
<b>Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above.

### Payment Status Island

Field	Description
<b>Selected for Payment</b>	This field shows whether the company-specific vendor is selected for payment. Maconomy marks the field when you make a payment selection. Payment selections are entered in the Payment Selection and Change Payment Selection by Vendor windows in the Banking module. The value cannot be changed.
<b>No. Entries Selected</b>	This field shows how many entries are selected for payment. Maconomy enters the value automatically. It cannot be changed.
<b>No. of Entries Being Paid</b>	This field shows the number of entries being paid. The field is automatically completed by Maconomy and cannot be altered. An entry is under payment if it is included in a payment file created in the window Payment Files, or if a check has been printed out in the window Print Check. The entry is no longer under payment when it has been approved.

### Bank Island

Field	Description
<b>Address</b>	In this field, you can enter the address of the company-specific vendor's bank. It is used for electronic payment to foreign vendors.
<b>SWIFT</b>	In this field, you can enter a SWIFT code. The SWIFT code is used for electronic payment to foreign vendors.

### Pay to Vendor Island

Field	Description
<b>Pay to Vendor</b>	<p>In this field, you enter a pay to vendor number, if the vendor who is to receive payment for deliveries is different from the one delivering the items. The pay to vendor number indicates the vendor to which payment is to be sent. The "original" (delivery) company-specific vendor is debited by the amount paid.</p> <p>Payment might be directed to the Pay to Vendor if the delivery vendor uses a factoring company.</p> <p>The Pay to Vendor is transferred from the company-specific vendor information card, but you can change the pay to vendor in this window.</p> <p>Maconomy also shows the name and address of the Pay to Vendor. The information appears when you press Return. It cannot be changed here.</p>

### Balance Island

Field	Description
<b>Balance, Currency</b>	This field displays the company-specific vendor's immediate balance in standard currency. The balance is updated when journals with entries for the current vendor are posted. The field is filled in automatically and cannot be changed.
<b>Balance, Base</b>	This field displays the company-specific vendor's balance in base currency. Maconomy updates the balance when you post journals with vendor entries. It cannot be changed.

### Payment Control Island

Field	Description
<b>Block Payments</b>	<p>If you mark this field, you block payments to the company-specific vendor. This means you cannot make a payment selection.</p> <p>You can block payments if, for example, you wish to delay payment for a wrong delivery until it is corrected.</p> <p>Marking of this field will also result in the resetting of payment selections created for the current vendor. Such payment selections can be inspected in the window Change Payment Selection by Vendor in the Banking module. For further information about payment selections, see the description of this window in the Banking module.</p>

Field	Description
<b>Payment Mode</b>	<p>In this field, you select how you normally pay the company-specific vendor. The payment mode is used partly to point to a G/L account, partly to select which payment form to use and to control automatic payment. The payment mode is used when you register vendor invoices. It can always be changed on individual vendor invoices in the Vendor Invoices and Change Payment Selection windows in the Banking module.</p> <p>When you approve a payment selection, Maconomy uses the vendor invoice's payment mode to find the G/L account to which the payment will be posted, that is, from where payment is taken.</p> <p>Payment modes are created in the window Payment Modes in the Banking module.</p>
<b>Pmt. Terms</b>	<p>In this field, you enter which payment terms normally apply to the company-specific vendor. The payment terms are used to calculate the invoice due date when you enter vendor invoices.</p> <p>Invoices are entered in the Vendor Invoices window.</p>
<b>Cash Discount Payment</b>	<p>In this field, you can select a cash discount condition to be assigned to the current vendor. The selected cash discount condition is used by Maconomy when paying vendor invoices. If you do not select a condition, cash discount will not be calculated for the current vendor. Cash discount conditions are created in the pop-up type "Cash Discount Codes" in the window Popup Fields in the Set-Up module. Please see this window for further information on cash discount conditions.</p>
<b>Giro No.</b>	<p>If the company-specific vendor is from a state country with a regional or national giro system, you can specify the vendor's giro account number here. The information is for reference.</p>
<b>Reg. No.</b>	<p>In this field, you can enter the company-specific vendor's bank registration number. The number is used for reference and electronic payment.</p>
<b>Bank Acct. No.</b>	<p>This is the company-specific vendor's bank account number. The number is used for reference and electronic payment.</p>
<b>BACS No.</b>	<p>In this field, you can enter the vendor's number for automated clearing service. The number is used for reference and electronic payment.</p>
<b>CPC No.</b>	<p>In this field, you can enter the company-specific vendor's common payment card number, if applicable. The number is used for reference and electronic payment.</p>
<b>Card Type Code</b>	<p>In this field, you can enter a card type code. The code is transferred to vendor invoices when they are entered. However, you can change it for individual invoices in the Vendor Invoices and Change Payment Selection windows in the Banking module. The code is used for electronic payment.</p>
<b>Payer Identification</b>	<p>Here you can enter a payer identification. It is transferred to vendor invoices when they are entered. However, you can change it for individual invoices in the Vendor Invoices and Change Payment Selection windows. The identification is used for electronic payment.</p>

Field	Description
<b>Tax</b>	<p>In this field, you specify whether to calculate tax on vendor invoices from this vendor on a normal basis. If you mark the field, Maconomy will automatically calculate tax for vendor invoices. You can, however, change the mark during invoice registration.</p> <p>You should normally mark the field for vendors in your own country. The field should not be marked for vendors from other EU countries. You have to settle tax for items bought in other EU countries, but the tax is calculated rather than lifted from the invoice amount.</p>
<b>Company Tax Code</b>	<p>In this field, you can specify a company tax code created in the window Popup Fields in the Set-Up module. The field is used by Maconomy for determining the tax code to be used in the calculation of tax for the current company-specific vendor, as the reporting code is part of the criteria for the selection of a G/L tax code in the window G/L Tax Tables if such table has been specified for the company responsible for the registration. The G/L tax code is specified for a company in the window Company Information in the G/L module. When selecting a tax code, Maconomy uses the tax table specified for the responsible company of the vendor invoice in the window Company Information. However, the tax code is only selected from a tax table if the company that is responsible for the current invoice is assigned to a tax table in the window System Information.</p> <p>When posting entries, the reporting code is used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if extended tax reporting has been selected in the window System Information.</p>
<b>EU Trade Type</b>	<p>In this field, you can enter either "Normal" or "Triangulation" to indicate the EU trade type. Triangulation means you act as agent for a vendor in another EU country and a customer in third EU country. Triangulation sales are not included in the EU sales part of the tax specification. The trade type can be changed during order processing.</p> <p>Maconomy transfers the value to any item purchase orders you make to the vendor, but you can change it there.</p>
<b>Tax No.</b>	<p>In this field, you enter the company-specific vendor's tax number. If you have entered tax number validation rules for the vendor's country in the window Rules of Validation in the Set-Up module, Maconomy will verify that the tax number complies with these validation rules.</p>
<b>Control Account</b>	<p>The control account is a reference to two G/L accounts; that is, a Vendor control account and an account for non-balanced entries.</p> <p>All vendor entries are posted to the General Ledger, to the control account referred to here. Accounts payable is thus a specification of A/P control accounts in the General Ledger.</p> <p>You can use the control accounts to group your vendors in the General Ledger—for example, in foreign and domestic vendors.</p>

Field	Description
	<p>The account for non-balanced entries is used to manage your accounts when item deliveries and invoices are not received at the same time. When you approve item deliveries to the warehouse, the inventory value account is debited and the nonbalanced entries account is credited. When the vendor invoices are registered at a later date, the items are credited to the Vendor control account and debited to the account for non-balanced entries. You thus avoid any accounting problems, when items are delivered in one posting period and the corresponding vendor invoice is received in another.</p> <p>References to control accounts are maintained in the window Popup fields in the Set-Up module.</p>
<b>Responsible</b>	<p>In this field, you enter the employee responsible for approving invoices from the company-specific vendor. The name is for reference and is used to sort lists of non-approved vendor invoices.</p> <p>Responsible employees must be created as employees in the Maconomy system. Employees are created in the window Employees in the Set-Up module.</p> <p>Non-approved vendor invoices are printed in the window Print Approval List. This field also displays the name of the specified responsible employee.</p>
<b>Auto. Approval</b>	<p>In this field, you specify whether invoices and invoice allocation lines from this vendor should be approved automatically. If the field is marked, all invoices from the vendor are automatically approved for payment. However, you can remove the mark for individual invoices. Invoices are paid in either the window Change Payment Selection by Vendor or the window Approve Payment Selection in the Banking module.</p>

## HOLDERS of Approval Workspace

Use this workspace to assign a holder of approval to an allocation combination.

An allocation combination is a range of account numbers, locations, entities, and so on. Holders of approval are the people who are responsible for approving invoices or invoice lines for payment.

When you post a vendor invoice, Maconomy automatically transfers the vendor invoice and the individual invoice allocation lines to a holder of approval, according to the allocation combination of the invoice or invoice allocation line. When a holder of approval needs to approve invoices and invoice lines in the Approval Lists workspace, it is easy to find just those invoices and invoice lines that apply to him or her.

The tab displays the range that determines the sub-tab lines that are displayed. For every sub-tab line, you can assign a holder of approval to an allocation combination. You specify allocation combinations as a range of, for example, account numbers, locations, entities, and so on. If an allocation combination in a vendor invoice corresponds to more than one of the combinations displayed in the sub-tab, Maconomy selects the first holder of approval that matches the combination.

## Holders of Approval Tab

This section includes the fields and descriptions for the Holders of Approval tab.

### Selection Criteria Island

Field	Description
<b>Show Lines</b>	If you check this box, the window will display the table lines that match the selection criteria.
<b>Responsible</b>	In this field you can enter the number of the employee holding approval. In the following, the terms "responsible" and "holder of approval" are used interchangeably. Only those allocation combinations for which the responsible employee holds approval are displayed in the table part of the window.
<b>Company No.</b>	In this field you can enter a company number. Only those allocation combinations in which the company number is a part are displayed in the table part of the window. If you do not enter a company number, all companies are displayed if the other criteria are met.
<b>Vendor No.</b>	The functionality of this field is similar to the functionality of the field "Company No."
<b>Account No.</b>	The functionality of this field is similar to the functionality of the field "Company No."

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to the functionality of the field "Company No."
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Company No."
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Company No."
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Company No."
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company No."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company No."

## Holders of Approval Lines Sub-Tab

This section includes the fields and descriptions for the Holders of Approval Lines sub-tab.

Field	Description
<b>Line No.</b>	<p>In this field you can enter the number of the current line. When Maconomy finds a holder of approval in relation to the allocation combination for a vendor invoice or an invoice allocation line, the first line that matches the combination for the holder of approval is selected. When entering information in the window it is important to number the lines with a mind to this, so as to allow later additions between existing line numbers.</p> <p>Note that the fewer ranges used in the table part, the wider the search criterion for a holder of approval. Usually the top holder of approval in a company will not be subjected to any limitations, and consequently he or she will always be selected if no other holder of approval matches an allocation combination.</p>
<b>Responsible</b>	In this field you can specify the employee number of the holder of approval assigned to the allocation combination displayed on the current line.
<b>Company No. From</b>	Together with the field "Company No. To," this field forms a range of company numbers which along with the ranges that may be specified for the other dimensions constitute the valid allocation combination for the current holder of approval. If the range of company numbers is not filled in, the range comprises all companies.
<b>Company No. To</b>	The functionality of this field is similar to the functionality of the field "Company No. From."
<b>Vendor No. From</b>	The functionality of this field is similar to the functionality of the field "Company No. From."
<b>Vendor No. To</b>	The functionality of this field is similar to the functionality of the field "Company No. From."
<b>Account No. From</b>	The functionality of this field is similar to the functionality of the field "Company No. From."
<b>Account No. To</b>	The functionality of this field is similar to the functionality of the field "Company No. From."
<b>Location From</b>	The functionality of this field is similar to the functionality of the field "Company No. From."
<b>Location To</b>	The functionality of this field is similar to the functionality of the field "Company No. From."
<b>Entity From</b>	The functionality of this field is similar to the functionality of the field "Company No. From."
<b>Entity To</b>	The functionality of this field is similar to the functionality of the field "Company No. From."

Field	Description
<b>Project From</b>	The functionality of this field is similar to the functionality of the field "Company No. From."
<b>Project To</b>	The functionality of this field is similar to the functionality of the field "Company No. From."
<b>Spec. 1-10 From</b>	The functionality of this field is similar to the functionality of the field "Company No. From."
<b>Spec. 1-10 To</b>	The functionality of this field is similar to the functionality of the field "Company No. From."
<b>Local Spec. 1-10 From</b>	The functionality of this field is similar to the functionality of the field "Company No. From."
<b>Local Spec. 1-10 To</b>	The functionality of this field is similar to the functionality of the field "Company No. From."

## Royalty Agreements Workspace

Use this workspace to create and maintain information that is related to royalty agreements (for example, an agreement with a writer to pay royalties on a book).

You can choose either of two types of royalty agreements: royalty billing based on turnover, or royalty billing based on the number of copies sold.

In addition, you can create and approve a billing selection directly from this workspace.

Maconomy calculates royalties when items are invoiced in the Sales Orders workspace, or when you enter an invoice manually in the Invoices workspace in the Sales Orders module.

In the tab, you enter information about each company-specific vendor; in the sub-tab you enter information about the vendor's royalty agreement. In the sub-tab you can enter two ranges; the first range describes the validity period of the agreement, and the second range describes a number range. The number range represents the range of copies that must be sold if payment of the agreed-to royalty occurs.

When you create a royalty billing selection, Maconomy updates the billing selection by updating royalties that have already been paid in accordance with other settlements and the specified number range for the current royalty agreement. You can cancel a royalty billing by changing the agreement in the sub-tab.

### Royalty Agreements Tab

This section includes the fields and descriptions for the Royalty Agreements tab.

#### Vendor Island

Field	Description
<b>Vendor No.</b>	This field shows the number of the company-specific vendor.

Field	Description
	The other fields show the vendor's name and address. The name and address are transferred from the company-specific vendor information card.
<b>Attn.</b>	This field shows the attention person.
<b>Country</b>	This field shows the company-specific vendor's country.
<b>Phone</b>	This field shows the company-specific vendor's phone number.
<b>Fax</b>	This field shows the company-specific vendor's fax number.
<b>Telex</b>	This field shows the company-specific vendor's telex number.
<b>E-mail</b>	This field shows the company-specific vendor's e-mail address.
<b>Language</b>	This field shows the company-specific vendor's language.
<b>Vendor Group</b>	This field shows the company-specific vendor group to which the vendor has been assigned.
<b>Department</b>	This field shows the department to which the company-specific vendor has been assigned.

### Settling Company Island

Field	Description
<b>Company No.</b>	This field displays the number of the company billed by the current vendor. The value in the field is transferred from the field Settling Company in the company-specific vendor's information card. If you create a company-specific vendor using the action "Create Company Specific Vendor," enter in this field the number of the settling company to which the new company-specific vendor should be assigned. When you press Return, a new company-specific vendor is created, and you can change the vendor information in the window Company Specific Vendor Information Card.
<b>Name</b>	This field displays the name of the company specified in the field "Company No." above.

### Payment Island

Field	Description
<b>Payment Mode</b>	This field shows the payment mode for the current company-specific vendor.

Field	Description
<b>Payment Terms</b>	This field shows company-specific vendor's the payment terms.
<b>Currency</b>	This field shows the currency which is used when billing the company-specific vendor.
<b>Tax</b>	If this field is marked, tax is calculated.
<b>Tax No.</b>	If tax is calculated, this field shows the company-specific vendor's tax number.

**Extra Fields Island**

Field	Description
<b>Popup 1-5</b>	These fields show any pop-up values selected for the current company-specific vendor. The values are retrieved from the information card of the vendor and cannot be changed here.

**Remarks Island**

These fields show any remarks entered on the company-specific vendor information card.

**Pay to Vendor Island**

Field	Description
<b>Pay to Vendor</b>	This field shows the number of the payment vendor. The number will correspond to the number of the delivery vendor, unless payment is made to another vendor than the delivery vendor. The information in this field determines the receiver of payment. The amount is credited the delivery vendor. The field also contains information about the vendor's name and address.
<b>Attn.</b>	This field shows attention person at the payment vendor.
<b>Country</b>	This field shows the payment vendor's country.
<b>Phone</b>	This field shows the payment vendor's phone number.
<b>E-mail</b>	This field shows the payment vendor's e-mail address.

**Billing Selection Island**

Field	Description
<b>Statement Date</b>	In this field, you can enter a statement date. If you enter a date, the royalty billing will only include sales of goods carried out before the entered date. Maconomy suggests today's date as default, but the date can be changed.
<b>Settling Date</b>	In this field, you can enter a settling date. The date specified will be used as both settling date and posting date for the current agreement when you select the action "Approve Billing Selection." Maconomy suggests today's date as default, but the date can be changed.

**Company Island**

Field	Description
<b>Company No.</b>	This field displays the company number from the island Derived Dimensions on the vendor information card. Note that when dimension values are derived to the table part, the value in this field will be used as a context value for the dimension Company No., and thus in some cases be transferred to table lines. For a description of the term "context values" and the cases where context values are derived, see the section concerning Derived Dimensions in the introduction to the General Journal module.

**Dimensions Island**

Field	Description
<b>Location</b>	The functionality of this field is similar to the functionality of the field "Company No." above.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Company No." above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Company No." above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Company No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company No." above.

## Royalty agreements Sub-Tab

This section includes the fields and descriptions for the Royalty agreements sub-tab.

Field	Description
<b>Item No.</b>	In this field, you enter the number of the item which is included in the royalty agreement.
<b>Start Date</b>	In this field, you enter the starting date of the royalty agreement. The two date fields "Start Date" and "Closing Date" form the valid period of the royalty agreement. Only royalty agreements within the stated period are included when billing selections are made.
<b>Closing Date</b>	See the description of the field "Start Date."
<b>No. From</b>	In this field, you enter a number. The two number fields "No. From" and "No. To" form the range of items used when royalties billing takes place. Only the part of the sold items which are within the number range are included in the billing selection.
<b>No. To</b>	See the description of the field "No. From."
<b>Pricing Unit</b>	This field shows the price unit which is to be used in connection with the royalty agreement. The value corresponds to the number of item units which are included in the unit price for the item. The unit price is transferred from the inventory module.
<b>Percentage</b>	In this field, you enter a percentage if you want the royalty amount to be based on turnover. If you enter a percentage in this field, you cannot enter a value in the field "Amount per Price Unit."
<b>Amount per Price Unit</b>	In this field, you enter an amount if you want the royalty amount to be based on the number of sold items instead of a fixed percentage of the turnover. If you enter an amount in this field, you cannot enter a value in the field "Percentage."
<b>Quantity Invoiced</b>	This field shows the number of items which are already invoiced within the valid period of the royalty agreement. The field is updated whenever a new billing selection is made.
<b>Billing Price Total</b>	This field shows the total sale within the specified period and the number range of the agreement.
<b>Billed Amount</b>	This field shows the amount which has already been paid within the valid period of the royalty agreement.
<b>Amount for Billing</b>	This field shows the amount yet to be settled. The suggested amount will be based on information which is retrieved when a billing selection is made.

Field	Description
<b>Approved</b>	If you mark this field, you approve the current royalty agreement. You can only create a billing selection if the agreement is approved.
<b>Closed</b>	If you mark this field, you close the current royalty agreement.
<b>Company</b>	This field displays the company number from the Dimensions island in the card part of the window. You can change the value manually.
<b>Location</b>	The functionality of this field is similar to the functionality of the field "Company No."
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Company No."
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Company No."
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Company No."
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company No."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company No."
<b>Popup 1-5</b>	These fields show any pop-up values selected for the current item. The values are retrieved from the information card of the item and cannot be changed here.

## Actions

This section shows the Actions available in the Royalty Agreements workspace.

### Top Tab

Field	Description
<b>Create Billing Selection</b>	When you select this action, a billing selection will be created for the current vendor. For the billing selection to be created, the royalty agreement must be approved but not closed. The calculation of the billing selection is based on the information registered for each royalty agreement and on prior billing selections. The billing selection is a proposal for the amount which is to be paid in royalty to the current vendor.
<b>Approve Billing Selection</b>	When you select this action, settlement and approval of the royalty agreement is made. The calculation of the billing selection is based on the information registered for each royalty agreement. The approved and billed amount is registered. Furthermore, a posting journal is created for the royalty billing. If you wish to approve more than one billing selection at a time, you can use the window Print Royalty Billing.

## Requisition Types Workspace

Use this workspace to set up requisition types, which are used for employee requisitions.

Use the sub-tab to enter the vendors that an employee can use when ordering a service or item of the given requisition type.

### Requisition Type Tab

This section includes the fields and descriptions for the Requisition Type tab.

#### Requisition Type Island

Field	Description
<b>Name</b>	In this field, you can specify the name of the requisition type.

#### Access Level Island

Field	Description
<b>Access Level</b>	In this field, you can specify the name of an access level. You only have access to the current requisition type if you have been assigned to the same or a higher level in the window User Access Levels. This field also shows the description of the selected access level.

#### Options List Island

Field	Description
<b>Option List 1-10</b>	The option lists can be used in the express purchase order layout for the requisition type..

## Delete Section

This section includes the fields and descriptions for the Delete section workspaces.

## Delete Purchase Orders Workspace

Use this workspace to delete purchase orders that have been closed before a given date.

This process removes all of the information about the purchase orders from the Maconomy database and affects the Item Purchase and Job Cost modules. You cannot delete a purchase order if it has outstanding lines that were created in the Job Budgets workspace.

Before you delete purchase orders, print copies of the purchase orders and make a backup copy of your database.

Maconomy prints out a list of the deleted purchase orders.

When you delete a purchase order, all of the information about that purchase order disappears from Maconomy. You cannot view it in any workspaces or on any printouts. Before you delete the purchase orders, Maconomy reminds you that you should first print them for auditing purposes.

Even if a purchase order is closed, Maconomy does not delete it if it has lines that were created in the Job Budgets workspace, and the job (job budget line) is still in the system when you try to delete the purchase order.

## Delete Purchase Orders Tab

This section includes the fields and descriptions for the Delete Purchase Orders tab.

### Selection Criteria Island

Field	Description
<b>Company No.</b>	In these fields, you enter a range of company numbers. Only vendor entries with settling companies within the specified range are deleted.
<b>Closed Before</b>	In this field, you enter a date. Maconomy will delete all purchase orders closed before this date. You must enter a date.

## Actions

This section shows the Actions available in the Delete Purchase Orders workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print a list of the deleted purchase orders.

## Banking Overview

This chapter describes the Banking module. You use the banking module to handle payments, customer payments, petty cash accounts, and bank reconciliations.

This section includes:

- Introduction
- Payment
- Customer Payment
- Bank Reconciliations
- Set-Up

See “Introduction to Electronic Payment” and “Introduction to Electronic Customer Payment ” for more information about Maconomy’s facilities for payment and customer payment. Electronic payment and electronic customer payment are both add-on modules that you must purchase separately.

### Payment Section

This section includes the fields and descriptions for the Payment Section workspaces.

#### Payment Selection Single Dialog Workspace

Use this workspace to create and approve payment selections for several vendors at the same time.

When you create a payment selection, Maconomy processes all entries that match the selection criteria. Maconomy selects an entry for payment if all of the following are true:

- The vendor entry is approved for payment.
- The due date is on or before the calculation date, or the cash discount date is on or before the calculation date. The cash discount date is considered only if the **Include Cash Discount** option is selected in this workspace.
- The vendor is active and allows payments.

When Maconomy selects an entry, its balance is selected for payment.

Previous payment selections for entries that are not included in the selection criteria are not affected when you create a payment selection.

When you run the payment selection, Maconomy groups vendor entries by company-specific vendor first and then by payment line. You can choose to include any remittance lines that are specified for the entries. Maconomy displays the total amount of payments to each company-specific vendor.

You can view and modify payment selections in the Change Payment Selection and Change Payment Selection by Vendor workspaces.

## Payment Selection Tab

This section includes the fields and descriptions for the Payment Selection tab.

### Selection Criteria Island

Field	Description
<b>Pay to Vendor No.</b>	Here you enter a range of vendor numbers. Maconomy will only make and approve payment selections for vendors within this range.
<b>Supplier No.</b>	In these fields, you can specify a range of supplier numbers. The payment file will only include suppliers within the specified range.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. The payment selection created and printed will only include vendors assigned to companies within the specified range. Maconomy prints one line per combination of company and vendor.
<b>Company of Origin</b>	In this field, you can specify a range of company numbers. The payment file will only include entries where the company of origin is within this range.
<b>Control Account</b>	In this field, you can select an A/P control account. The payment file will only include entries using this account.
<b>Vendor Group</b>	In this field, you can select a vendor group. The payment file will only include entries from this vendor group.
<b>Transaction Type</b>	Here you can enter a transaction type. The payment file will only include entries with this transaction type.
<b>Payment Agent</b>	Here you select a payment agent. The payment selection created and printed will only be for entries with this payment agent.
<b>Payment Mode</b>	Here you select a payment mode. The payment selection created and printed will only be for entries with this payment mode.
<b>Check Book</b>	Here you select a check book. The table part will only show entries concerning the specified check book.
<b>Card Type</b>	In this field, you can enter a range of card types. The payment file will only include entries with a card type within this range.

### Payment Selection Island

Field	Description
<b>Create Selection</b>	Mark this field to create and print a new payment selection. If the field is not marked, Maconomy prints the last, possibly edited, payment selection you created, only printing entries within the selection criteria.
<b>Latest Due Date</b>	Here you enter the cut-off date for selection of entries for payment. If an entry's due date is on or before this date, it will be selected for payment. If the entry is not approved, it will not be selected. You must enter a date.

Field	Description
<b>Blanket Payment Date</b>	In this field, you can specify the payment date to be applied to all of the payments included in the payment selection, both blanket payments and separate payments.
<b>Overwrite Existing</b>	<p>Mark this field if you want to include entries which have already been selected for payment. An entry is selected for payment when the "Payment, Currency" or "Cash Discount, Currency" field is completed in the window Change Payment Selection by Vendor.</p> <p>If the field is marked, earlier payment selections and changes to these will be overwritten when you create a new payment selection. This only applies to credit entries within the selection criteria.</p> <p>If you remove the mark, Maconomy only takes the credit entries within the selection criteria which have not been selected for payment.</p>
<b>Overwrite Settled</b>	<p>If this field is marked, settled entries will be included in the payment selection, and entries already settled will be canceled.</p> <p>Entries can be selected for settlement in the window A/P Open Entry Reconciliation. If this field is not marked, entries for reconciliation will not be included.</p>
<b>Include Cash Discount</b>	<p>If this field is marked, the current payment selection will include any cash discounts granted in accordance with the cash discount terms indicated on the vendor invoices in question.</p> <p>A cash discount is automatically calculated by Maconomy if the calculation date is later than the cash discount date for the current vendor invoice, and if today's date is before this cash discount date. Note that if tax adjustment has been selected on the current vendor's cash discount term, the cash discount amount displayed on the print of this window will include tax. If tax adjustment has not been selected, the cash discount amount will be exclusive of tax.</p> <p>Terms for cash discounts inclusive of adjustment of tax are entered in the pop-up field "Cash Discount Codes" in the Set-Up module. The print of the selection also shows a detailed specification of any discount granted.</p>
<b>Remittance Text</b>	Here you can enter a remittance text. For a more detailed description, see the document on automatic payment for the selected payment format and the description of the window Show Payment Remittance.

### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which the payment selection should be displayed. The payment selection will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table for</p>

Field	Description
	purchases selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table for purchases selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

### Print Control Island

Field	Description
<b>Print Remittance</b>	This field allows you to select whether the remittance lines specified for the printed entries should be printed as well. If you check the field, the remittance lines will be printed.
<b>Show All Overdue Entries</b>	<p>Mark this field if you want all overdue entries in the selection criteria which are not included in the payment selection, to be shown on the printout.</p> <p>There are a number of situations in which an entry can be overdue without being selected for payment:</p> <ol style="list-style-type: none"> <li>1. Payment to the vendor has been stopped as the field "Block Payments" has not been marked in the Payment Control window.</li> <li>2. The payment has been removed manually after the payment selection has been made. This only occurs when you reprint a payment selection.</li> <li>3. The entry has not been approved in the Approve Invoices window.</li> <li>4. The remaining balance is under automatic payment, that is, a payment order has been sent to the payment agent or a check has been sent via Maconomy, and payment has not yet been effected.</li> </ol>
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

## Change Payment Selection Single Dialog Workspace

Use this workspace to create, edit, approve, and view vendor entries to be paid.

This workspace enables you to easily change information for a group of vendor entries (for example, when the payer ID or card type code does not match the selected payment mode). You can also change the due date, payment mode, payment description, and import date in this workspace, using the **Transfer New Registration** action.

Entries are included in the payment file if they match the selection criteria.

You can add or delete vendor entries to be paid. For example, if you receive a vendor invoice and a vendor credit memo that add up to zero, some payment agents cancel out the two entries and do not send any remittance text about the cancellation to the vendor. To avoid this, the invoice and credit memo must be in separate payment files. If they both appear in this workspace, you can remove one of them, create the payment file, then run another payment selection that includes the entry that you removed. Then both entries will appear on statements from the payment agent to the vendor.

## Change Payment Selection Tab

This section includes the fields and descriptions for the Change Payment Selection tab.

### Selection Criteria Island

Field	Description
<b>Pay to Vendor No.</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Supplier No.</b>	In these fields, you can specify a range of supplier numbers. The payment file will only include suppliers within the specified range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. Only vendor entries for which companies within the specified range are responsible are shown in the table part when the field "Show Entries" is marked.
<b>Company of Origin</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>A/P Control Account</b>	In this field you can select a control account. The table part will only show entries concerning this account.
<b>Vendor Group</b>	In this field you can select a vendor group. The table part will only show entries concerning this vendor group.
<b>Card Type Code</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Due Date</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Payment Agent</b>	In this field, you can select a payment agent. The table part will only show entries concerning the specified payment agent when the field "Show Entries" is marked.
<b>Payment Mode</b>	In this field, you can select a payment mode. The table part will only show entries concerning the specified payment mode when the field "Show Entries" is marked.
<b>Check Book</b>	In this field, you can select a check book. The table part will only show entries concerning the specified check book.
<b>Transaction Type</b>	The functionality of this field is similar to that of the field "Company No." above.

Field	Description
<b>Show Only Entries without Payer Id.</b>	If you mark this field, the table part will only show entries for which no payer identification has been specified. Using a combination of this field and the field "Payment Mode," you can thus identify all entries where the payment identification is blank, but the payment mode of the entry requires a payer ID.
<b>Show Only Entries without Card Type Code</b>	If you mark this field, the table part will only show entries for which no card type code has been specified. Using a combination of this field and the field "Payment Mode," you can thus identify all entries where the card type code is blank, but the payment mode of the entry requires a card type code.
<b>Show Only Entries Selected for Payment</b>	If you mark this field, only entries selected for payment are shown in the table part when the field "Show Entries" is marked.
<b>Do Not Show Entries Being Paid</b>	If you mark this field, entries being paid are not shown in the table part when the field "Show Entries" is marked.
<b>Show Entries</b>	When you mark this field, the vendor entries matching the selection criteria specified in the window are shown in the table part. When you open this window, the field is unmarked by default.

### Statistics Island

Field	Description
<b>Total, Vendor Entries</b>	This field shows the total number of vendor entries shown in the table part, along with the sum of the amounts on these entries. Credit memo amounts are deducted from the sum total.
<b>Due</b>	This field shows how many of the entries shown in the table part are due, along with the sum of the amounts on these entries. Credit memo amounts are deducted from the sum total.
<b>Being Paid</b>	This field shows how many of the entries shown in the table part are being paid, along with the sum of the amounts on these entries. Credit memo amounts are deducted from the sum total.
<b>Selected for Payment</b>	This field shows how many of the entries shown in the table part are selected for payment, along with the sum of the amounts on these entries. If a cash discount is granted for the current entry, the discount has been deducted from the amount in this field. Credit memo amounts are deducted from the sum total.

### New Registration Island

Field	Description
<b>Payment Mode</b>	In this field, you can select a payment mode for a new registration of the selected vendor entries. When you select the action "Transfer New

Field	Description
	Registration,” the selected payment mode is copied to all vendor entries shown in the table part. The payment mode is also changed, even if the new payment mode belongs to another payment agent than originally specified on the vendor entries. If you do not specify a payment mode, the vendor entries keep their current payment mode.
<b>Card Type Code</b>	In this field, you can select a card type code for a new registration of the selected vendor entries. When you select the action “Transfer New Registration,” the specified card type code is copied to all vendor entries shown in the table part. If you do not specify a card type code, the vendor entries keep their current card type codes.
<b>Due Date</b>	In this field, you can specify a due date for a new registration of the selected vendor entries. When you select the action “Transfer New Registration,” the selected due date is copied to all vendor entries shown in the table part. If you do not specify a due date, the vendor entries keep their current due dates.
<b>Payment Description</b>	In this field, you can specify a payment description for a new registration of the selected vendor entries. When you select the action “Transfer New Registration,” the specified payment description is copied to all vendor entries shown in the table part. If you do not specify a payment description, the vendor entries keep their current payment descriptions.

### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which the amounts in this island should be shown. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field “Exchange Rate Date” below, and the exchange rate table used is the exchange rate table for purchases selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table for purchases selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field “Reporting Currency.”

**Payment Selection Island**

Field	Description
<b>Latest Due Date</b>	Here you enter the cut-off date for selection of entries for payment. If an entry's due date is on or before this date, it will be selected for payment. If the entry is not approved, it will not be selected. You must enter a date.
<b>Blanket Payment Date</b>	In this field, you can specify the payment date to be applied to all of the payments included in the payment selection, both blanket payments and separate payments.
<b>Overwrite Settled</b>	If this field is marked, settled entries will be included in the payment selection, and entries already settled will be canceled. Entries can be selected for settlement in the window A/P Open Entry Reconciliation. If this field is not marked, entries for reconciliation will not be included.
<b>Include Cash Discount</b>	<p>If this field is marked, the current payment selection will include any cash discounts granted in accordance with the cash discount terms indicated on the vendor invoices in question.</p> <p>A cash discount is automatically calculated by Maconomy if the calculation date is later than the cash discount date for the current vendor invoice, and if today's date is before this cash discount date. Note that if tax adjustment has been selected on the current vendor's cash discount term, the cash discount amount displayed on the print of this window will include tax. If tax adjustment has not been selected, the cash discount amount will be exclusive of tax. Terms for cash discounts inclusive of adjustment of tax are entered in the pop-up field "Cash Discount Codes" in the Set-Up module. The print of the selection also shows a detailed specification of any discount granted.</p>
<b>Remittance Text</b>	Here you can enter a remittance text. For a more detailed description, see the document on automatic payment for the selected payment format and the description of the window "Show Payment Remittance."

**Entries Sub-Tab**

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Supplier No.</b>	This field shows a range of supplier numbers. Maconomy will only print checks for suppliers within this range.
<b>Supplier Name</b>	This field shows the name of the supplier.
<b>Invoice No.</b>	This field shows the number of the current invoice. The number is the vendor invoice number and is retrieved from the window Vendor Invoices. It cannot be changed here.
<b>Due Date</b>	This is the entry's due date. The due date is calculated from the invoice date and the vendor's payment terms. The date determines whether the entry is selected for payment when you create payment selections. The

Field	Description
	<p>entry is selected if the due date is on or before the due date in the card part of the window.</p> <p>The value was specified when the vendor invoice was registered. It can be changed here.</p>
<b>Currency</b>	This field shows the currency in which the vendor invoice is to be paid. The value is transferred from the vendor information card.
<b>Debit, Currency</b>	This is the debit entry amount in the vendor's currency. Debit entries are created when you register vendor credit memos in a vendor invoice journal or a general journal.
<b>Credit, Currency</b>	This is the credit entry amount in the vendor's currency. Credit entries are created when you register vendor invoices in a vendor invoice journal or a general journal.
<b>Remainder, Currency</b>	<p>This field shows how much of the original amount of the entry is yet to be paid or reconciled. If a discount is specified on the line, Maconomy automatically deducts the discount amount from the remainder in this field.</p> <p>The field is maintained by Maconomy and cannot be changed manually.</p>
<b>Payment, Currency</b>	This field shows how much of the entry is selected for payment. If payment is selected automatically, Maconomy will transfer the amount from the field "Balance" to this field. In manual selection, you must enter an amount here. The amount in this field may not exceed the balance amount.
<b>Discount %</b>	<p>Here you can specify a cash discount percentage. When you press Return, Maconomy calculates the discount amount and shows it in the field "Cash Discount, Currency."</p> <p>If a cash discount percentage was specified when the vendor invoice was entered, this discount percentage is suggested.</p> <p>If the vendor is selected to pay tax in the field "Tax" in the window Payment Control, the cash discount is deducted from the invoice before the tax is added. The invoice amount, excluding tax, is calculated from the tax rate in the standard tax code (specified in the window System Information).</p> <p>If you only complete the field "Cash Discount Currency," Maconomy will calculate the corresponding percentage rate and will then show it here, when you press Enter.</p> <p>If you enter values in both this field and the field "Cash Discount Currency," Maconomy will use the field "Cash Discount, Currency" to calculate the discount, and will then show the corresponding discount percentage in this field, when you press Enter.</p>
<b>Cash Discount, Currency</b>	In this field you enter a cash discount in the vendor's currency. If Maconomy has calculated the cash discount on the basis of the cash discount terms entered for the current vendor invoices, and if tax adjustment has been selected in the current vendor's cash discount term, the amount in this field will include tax. If tax adjustment has not been selected in the applied cash discount term, the amount is shown in this field, exclusive of tax.

Field	Description
	The reference to the cash discount account is retrieved through a dimension combination in the window Posting References in the G/L module.
<b>Cash Discount Date</b>	This field shows a cash discount date, if any, for the current vendor entry. The date in this field is the latest date that will trigger the allowance of a cash discount for the vendor entry. The date is calculated on the basis of the cash discount term entered on the vendor invoice in question.
<b>Being Paid, Currency</b>	This field shows how much of the entry is being paid. The amount is shown in the vendor's currency. An entry is being paid from the time it is included in a payment file created in the window Payment Files until it is approved as paid.
<b>Pay to Vendor</b>	This field shows the number of the pay-to vendor registered on the current vendor invoice.
<b>Payment Mode</b>	In this field, you can choose how to pay the invoice. For further information about payment modes, see the description of the window Payment Modes.
<b>Pay when Paid</b>	<p>In this field, you can specify whether payment when paid functionality should apply to the current invoice entry. Maconomy suggests the value from the corresponding field on the vendor invoice to which the current entry pertains. The field can only be marked if the system parameter "Enable Payment when Paid" has been marked.</p> <p>Payment when paid functionality is used for ensuring that vendor invoices are not paid until they are allocated, and that vendor invoices allocated to jobs are not paid until you have received payment from the customer of the job in question.</p> <p>If you do not mark the field, the field "Ready for Payment," which must be marked for the entry to be included in the payment selection, is marked if the invoice is simply approved, that is, the field "Approved" has been marked.</p> <p>If you mark the field, the field "Ready for Payment" is only marked if the invoice is approved and the field "Paid by Customer" is marked. This means that the entry is only included in the payment selection if the invoice has been allocated. Furthermore, if the invoice is allocated to one or more jobs, the entry is only included in the payment selection if the job entries created as a result of the allocation have all been invoiced and paid, or otherwise closed (for example, written off). When the field is marked, the due date does not determine whether the entry is selected for payment. Payment when paid entries are selected for payment as soon as they are ready for payment.</p>
<b>Paid by Customer</b>	<p>This field only applies to invoice entries assigned to a job entry created as a result of allocating the vendor invoice to a job. The field shows whether the customer of the job in question has paid the amount due for the job entry.</p> <p>This means that the field is only marked if all job entries created as a result of the allocation of the vendor invoice have all been invoiced and paid, or otherwise closed (for example, written off).</p>

Field	Description
	<p>Along with the fields “Approved” and “Pay when Paid,” this field determines whether the field “Ready for Payment” is marked, and the entry is therefore ready to be paid.</p> <p>If the field “Pay when Paid” is marked on the line, the field “Ready for Payment” is only marked if both this field and the field “Approved” are marked. If the field “Pay when Paid” is not marked on the line, only the field “Approved” needs to be marked for the field “Ready for Payment” to be marked.</p>
<b>Ready for Payment</b>	<p>This field shows whether the current entry is ready for payment and will thereby be included in the payment selection.</p> <p>If the field “Pay when Paid” is marked on the line, the field is only marked if both the field “Paid by Customer” and the field “Approved” are marked. If the field “Pay when Paid” is not marked on the line, only the field “Approved” needs to be marked for this field to be marked. However, if the entry is approved, it is possible to select it for payment manually.</p> <p>Please note that if this field is marked on a line on which the field “Pay when Paid” is also marked, the due date does not determine whether the entry is selected for payment. Payment when paid entries are selected for payment as soon as they are ready for payment.</p>
<b>Approved</b>	<p>This field shows whether the invoice has been approved. The field only applies if the current line shows an invoice and not a credit memo. An invoice must be approved to be selected for payment. The field cannot be changed here.</p> <p>Invoices are approved manually in the window Approve Invoices, where it is also possible to cancel an approval.</p>
<b>Card Type Code</b>	<p>This field shows the card type code entered in the window Vendor Invoices when registering the entry. If you have not entered a code in that window, Maconomy uses the code from the window Payment Control. You can change the suggested value. The code is used by Maconomy when creating payment files in the window Payment Files.</p>
<b>Payer Identification</b>	<p>This field shows the payer identification entered in the window Vendor Invoices when the entry was created. If you have not entered a code in that window, Maconomy will use the payer identification from the window Payment Control. You can change the suggested value here. The information is used when creating payment files in the window Payment Files to identify the vendor entry associated with the current payment.</p>
<b>Giro</b>	<p>This field shows the giro number assigned to the pay-to vendor.</p> <p>Bank Acct. No. This field shows the bank account number assigned to the pay-to vendor.</p>
<b>Reg. No.</b>	<p>This field shows the registration number assigned to the pay-to vendor.</p>
<b>Credit Card No.</b>	<p>This field shows the credit card number assigned to the pay-to vendor.</p>

Field	Description
<b>CPC No.</b>	This field shows the CPC number assigned to the pay-to vendor.
<b>Payment Description</b>	This field shows the payment description entered in the window Vendor Invoices when registering the entry. You can change the suggested value here. The code is used by Maconomy when creating payment files in the window Payment Files.
<b>Entry Date</b>	This is the entry date in the general ledger. The date identifies the posting period. The date cannot be changed.
<b>Trans. No.</b>	<p>This is the entry's transaction number. The number was entered on the vendor invoice. It cannot be changed.</p> <p>When the entry is paid, this number is not the one shown on the payment. Instead, Maconomy allocates a unique payment transaction number. Payment transaction numbers are maintained in the window System Numbers in the Set-Up module.</p>
<b>Trans. Type</b>	This field shows the transaction type of the vendor entry.
<b>Entry Description</b>	<p>This is the entry description. The text was entered on the vendor invoice, and it cannot be changed here.</p> <p>When the entry is paid, this text is not shown on the payment. Instead, Maconomy retrieves a text from the window Posting Descriptions in the G/L module.</p>
<b>Original Amount</b>	This is the original invoice amount, expressed in the entry's original currency. It was specified on the vendor invoice and cannot be changed here.
<b>Original Currency</b>	This is the currency in which the invoice was registered. It was specified on the vendor invoice and cannot be changed.
<b>Responsible</b>	This is the employee responsible for approving invoices and credit memos for the vendor. The name is used partly for reference, partly on the printout of unapproved vendor invoices, which is sorted by 'responsible.' The name cannot be changed.
<b>Date Posted</b>	This is the date the entry was posted. It cannot be changed.
<b>Import Date</b>	This field shows the import date entered in the window Vendor Invoices when registering the entry. You can change the value here. The code is used by Maconomy when creating payment files in the window Payment Files.
<b>Payment Agent</b>	This field shows the name of the payment agent assigned to the payment mode of the current vendor entry.
<b>Check Book</b>	This field shows the name of the check book assigned to the payment mode of the current vendor entry.

Field	Description
<b>Company No.</b>	This field shows the number of the company registered as the settling company of the current vendor entry, that is, the company to pay the vendor in question.
<b>Company of Origin</b>	This field shows the number of the company which received and registered the vendor invoice.
<b>Disclosable</b>	This field shows whether the current entry is disclosable. This can be due to the fact that the vendor invoice represents income to the customer which is not taxed at source.

## Actions

This section shows the Actions available in the Change Payment Selection workspace.

### Top Tab

Field	Description
<b>Transfer New Registration</b>	If you select this action, the payment mode, card type code, due date, and payment description are changed for all entries shown in the table part, according to the information entered in the island New Registration. If you have not entered a new value in one or more of the fields in the island New Registration, the original value remains unchanged in the corresponding fields on the entries in the table part.
<b>Create Payment Selection</b>	Use this action to create a payment selection.
<b>Create Payment File</b>	Use this action to create a payment file from the selection.
<b>Approve Conventional Payment</b>	When you select this action, you approve the payment selection for the vendor. If you wish to approve a payment selection for all or a range of vendors, use the Print Payment Selection window. See the Introduction to this chapter for a detailed description. Use this function to remove the selection.
<b>Remove Payment Selection</b>	Use this function to remove the selection.

## Change Payment Selection by Vendor Single Dialog Workspace

Use this workspace to select vendor entries for payment for a single payment vendor.

You can do this either automatically, by creating a payment selection that is effective on a given due date, or by selecting entries manually. You can specify how much of an entry you want to pay.

The sub-tab shows all vendor entries.

You can select a vendor credit memo for payment only if a vendor invoice exists in Maconomy. The total amount for payment cannot be negative. Maconomy performs an open entry reconciliation if a vendor invoice and vendor credit memo for the same amount are selected for payment.

You can review only one vendor at a time in this workspace. To select all or a range of vendors for payment, use the Change Payment Selection workspace.

### Change Payment Selection by Vendor Tab

This section includes the fields and descriptions for the Vendor tab.

#### Vendor Island

Field	Description
<b>Vendor No.</b>	This is the vendor number. The field also shows the vendor's name and address. The information is retrieved from the Vendor Information Card.

#### Company Island

Field	Description
<b>Company No.</b>	This field shows the company number of the current vendor.

#### Balance Island

Field	Description
<b>Balance, Currency</b>	This field shows the vendor's balance in the vendor's currency. The balance is updated when you post journals with vendor entries. The value in this field is automatically entered by Maconomy and cannot be changed manually.
<b>Balance, Base</b>	This is the vendor's balance in the base currency shown in the field "Base Currency" below. The balance is updated when you post journals with vendor entries. The value in this field is automatically entered by Maconomy and cannot be changed manually.

#### Selection Criteria Island

Field	Description
<b>Latest Due Date</b>	<p>In this field you enter the cut-off date from which entries are selected. When you select the action "Create Payment Selection," an entry is selected for payment if the due date of the entry is on or before this date, or if the calculated date is after the cash discount date entered on the current vendor invoice, and if the date of today is before this cash discount date.</p> <p>Non-approved entries will not be selected, even if their due date is on or before the date specified above. You must enter a value.</p>

**Payment Island**

Field	Description
<b>Selected for Payment</b>	This field shows whether the vendor has been selected for payment. If you select just one entry from a vendor, it means that the vendor is selected, and the field is automatically marked. This is shown by a mark in the field. Maconomy enters the value automatically. It cannot be changed.
<b>No. Entries Selected</b>	This field shows how many of the vendor's entries have been selected for payment. Maconomy enters the value automatically. It cannot be changed. Note that if an entry is being paid, it is also counted as selected for payment.
<b>Payment, Currency</b>	This is the sum of the entries selected for payment. The amount is displayed in the vendor's currency. The value in this field is automatically entered by Maconomy and cannot be changed manually.
<b>Discount, Currency</b>	This is the discount sum of the entries selected for payment. The amount is displayed in the vendor's currency. The value in this field is automatically entered by Maconomy and cannot be changed manually.
<b>Entries being paid</b>	This field shows the number of vendor entries being paid. The field is automatically completed by Maconomy and cannot be altered. An entry is under payment if it is included in a payment file created in the window Payment Files, or if a check has been printed out in the window Print Check. The entry is no longer under payment when it has been approved.

**Payment Control Island**

Field	Description
<b>Block Payments</b>	<p>This field shows whether you can select the vendor for payment. If the field is marked, the vendor is blocked, and you cannot make a payment selection.</p> <p>If you have created a payment selection for a vendor, and this vendor is blocked for payment by means of the window Payment Control in the A/P module, all selected payment selections for the vendor in question are cancelled. Furthermore, the field "Selected for Payment" will be unmarked for the vendor. Once blocked, a vendor can only be selected for payment again if the field "Block Payments" is unmarked in the window Payment Control in the A/P module.</p> <p>You can block payments if, for example, you wish to delay payment for a wrong delivery until it is corrected.</p>
<b>Responsible</b>	This field shows the person in your company who is usually responsible for approving invoices from this vendor. You can change the name for individual entries.
<b>Payment Terms</b>	<p>This field shows the payment terms which normally apply to the vendor. Payment terms are used for calculating invoice due dates.</p> <p>Payment terms are selected in the Payment Control window.</p>

Field	Description
<b>Cash Discount Terms</b>	This field shows the cash discount term selected for the current creditor in the window Payment Control. The cash discount terms are used for calculating any cash discount for a given vendor invoice.
<b>Automatic Approval</b>	Here you specify whether invoices from this vendor should be approved for payment automatically. If the field is marked, all invoices from the vendor are approved automatically. However, you can remove the mark on individual invoices in the Approve Invoices window, and you can remove the mark for the vendor in the Payment Control window.

### Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Invoice No.</b>	This field shows the number of the current invoice. The number is the vendor invoice number and is retrieved from the Vendor Invoices window. It cannot be changed here.
<b>Supplier No.</b>	This field shows a range of supplier numbers. Maconomy will only print checks for suppliers within this range.
<b>Due Date</b>	<p>This is the entry's due date. The due date is calculated from the invoice date and the vendor's payment terms. The date determines whether the entry is selected for payment when you select the action "Create Payment Selection." The entry is selected if the due date is on or before the due date in the card part of the window.</p> <p>The date in this field was specified when the vendor invoice was registered, but can be changed here.</p>
<b>Debit, Currency</b>	This is the debit entry amount in the vendor's currency. Debit entries are created when you register vendor credit memos in a vendor invoice journal or a general journal.
<b>Credit, Currency</b>	This is the credit entry amount in the vendor's currency. Credit entries are created when you register vendor invoices in a vendor invoice journal or a general journal.
<b>Remainder, Currency</b>	<p>This field shows how much of the original entry amount still needs to be paid or reconciled.</p> <p>Maconomy automatically adjusts the balance with any discount specified on the line.</p> <p>If you select the action "Create Payment Selection," the balance amount is selected for payment and transferred to the field "Payment."</p> <p>The "Balance, Currency" field is automatically updated by Maconomy and cannot be changed.</p>

Field	Description
<b>Payment, Currency</b>	This field shows how much of the entry is selected for payment. If payment is selected automatically, Maconomy will transfer the amount from the "Balance" field to this field. In manual selection, you must enter an amount here. The amount must not exceed the balance.
<b>Discount %</b>	<p>In this field, you can specify a cash discount percentage. When you press Return, Maconomy calculates the discount amount and shows it in the field "Cash Discount." If a cash discount term has been specified for the vendor in question in the window Company Specific Payment Control, Maconomy automatically fills in this field when creating a payment selection, if the vendor is to be granted a cash discount. Whether or not an entry is automatically assigned a cash discount is determined by the cash discount term specified for the vendor in question and the cash discount date specified in the field "Cash Discount Date" on the line.</p> <p>If the vendor is selected to pay tax in the field "Tax" in the window Company Specific Payment Control, the cash discount is deducted from the invoice before the tax is added. The invoice amount, excluding tax, is calculated from the tax rate in the standard tax code (specified in the window System Information).</p> <p>If you only fill in the field "Cash Discount" on the line, Maconomy will calculate the corresponding percentage rate and show it here, when you press Return.</p> <p>If you enter values in both fields, Maconomy will use the discount amount to calculate a discount percentage.</p>
<b>Cash Discount, Currency</b>	<p>In this field, you enter any cash discount as an amount in the vendor's currency. If Maconomy has automatically calculated the cash discount on the basis of the cash discount date on the line and the cash discount term specified for the current vendor, and if tax adjustment has been selected in the applied cash discount term, the amount in this field includes tax. If tax adjustment has not been selected in the applied cash discount term, the amount is shown in this field exclusive of tax.</p> <p>Alternatively, you can enter a discount percentage as described in the field "Discount %."</p> <p>The cash discount is posted on the cash discount account which is stated by means of a dimension combination in the window Posting References in the G/L module.</p> <p>The cash discount is posted separately in the General Ledger.</p>
<b>Being Paid, Currency</b>	This field shows how much of the entry is being paid. It is shown in the vendor's currency. An entry is counted as being paid from the time it is included in a payment file created in the window Payment Files until it is approved as paid.
<b>Currency</b>	This field shows the currency of the vendor.
<b>Payment Mode</b>	Here you choose how to pay the invoice. Maconomy suggests the payment mode selected when the vendor invoice entry was posted, but you can

Field	Description
	change the payment mode here. The payment mode is a reference to a G/L account. When you approve the payment selection, the payment mode points to the G/L account to which the payment is being offset, that is, from which payment is taken. The reference is made by means of a dimension combination in the window Payment Modes.
<b>Pay when Paid</b>	<p>In this field, you can specify whether payment when paid functionality should apply to the current invoice entry. Maconomy suggests the value from the corresponding field on the vendor invoice to which the current entry pertains. The field can only be marked if the system parameter "Enable Payment when Paid" has been marked.</p> <p>Payment when paid functionality is used for ensuring that vendor invoices are not paid until they are allocated, and that vendor invoices allocated to jobs are not paid until you have received payment from the customer of the job in question.</p> <p>If you do not mark the field, the field "Ready for Payment," which must be marked for the entry to be included in the payment selection, is marked if the invoice is simply approved, that is, the field "Approved" has been marked.</p> <p>If you mark the field, the field "Ready for Payment" is only marked if the invoice is approved and the field "Paid by Customer" is marked. This means that the entry is only included in the payment selection if the invoice has been allocated. Furthermore, if the invoice is allocated to one or more jobs, the entry is only included in the payment selection if the job entries created as a result of the allocation have all been invoiced and paid, or otherwise closed (for example, written off). When the field is marked, the due date does not determine whether the entry is selected for payment. Payment when paid entries are selected for payment as soon as they are ready for payment.</p>
<b>Paid by Customer</b>	<p>This field only applies to invoice entries assigned to a job entry created as a result of allocating the vendor invoice to a job. The field shows whether the customer of the job in question has paid the amount due for the job entry.</p> <p>This means that the field is only marked if all job entries created as a result of the allocation of the vendor invoice have all been invoiced and paid, or otherwise closed (for example, written off).</p> <p>Along with the fields "Approved" and "Pay when Paid," this field determines whether the field "Ready for Payment" is marked, and the entry is therefore ready to be paid.</p> <p>If the field "Pay when Paid" is marked on the line, the field "Ready for Payment" is only marked if both this field and the field "Approved" are marked. If the field "Pay when Paid" is not marked on the line, only the field "Approved" needs to be marked for the field "Ready for Payment" to be marked.</p>
<b>Ready for Payment</b>	This field shows whether the current entry is ready for payment and will thereby be included in the payment selection.

Field	Description
	<p>If the field "Pay when Paid" is marked on the line, the field is only marked if both the field "Paid by Customer" and the field "Approved" are marked. If the field "Pay when Paid" is not marked on the line, only the field "Approved" needs to be marked for this field to be marked. However, if the entry is approved, it is possible to select it for payment manually.</p> <p>Please note that if this field is marked on a line on which the field "Pay when Paid" is also marked, the due date does not determine whether the entry is selected for payment. Payment when paid entries are selected for payment as soon as they are ready for payment.</p>
<b>Approved</b>	<p>This field shows whether the invoice has been approved. An invoice must be approved to be selected for payment. The field cannot be changed here. Invoices are approved manually in the Approve Invoices window, where it is also possible to cancel an approval. Invoices are approved automatically if the "Automatic Approval" field is marked for the vendor in question. The "Automatic Approval" field is changed in the window Payment Control.</p>
<b>Card Type Code</b>	<p>This field shows the card type code entered in the window Vendor Invoices when registering the entry. If you have not entered a code in that window, Maconomy uses the code from the window Payment Control. You can change the suggested value. The code is used by Maconomy to create a payment file in the window Payment Files.</p>
<b>Payer Identification</b>	<p>This field shows the payer identification entered in the window Vendor Invoices when the entry was created. If you have not entered a code in that window, Maconomy will use the payer identification from the window Payment Control. You can change the suggested value here. The information is used when a payment file is created in the window Payment Files to identify the vendor entry related to the current payment.</p>
<b>Giro</b>	<p>This field shows the giro number assigned to the pay-to vendor.</p> <p>Bank Acct. No. This field shows the bank account number assigned to the pay-to vendor.</p>
<b>Reg. No.</b>	<p>This field shows the registration number assigned to the pay-to vendor.</p>
<b>Credit Card No.</b>	<p>This field shows the credit card number assigned to the pay-to vendor.</p>
<b>CPC No.</b>	<p>This field shows the CPC number assigned to the pay-to vendor.</p>
<b>Payment Description</b>	<p>This field shows the payment description entered in the window Vendor Invoices when registering the entry. You can change the suggested value here. The code is used by Maconomy to create a payment file in the window Payment Files.</p>
<b>Entry Date</b>	<p>This is the entry date in the General Ledger. The date identifies the posting period. The date cannot be changed.</p>

Field	Description
<b>Trans. No.</b>	<p>This is the entry's transaction number. The number was entered on the vendor invoice. It cannot be changed.</p> <p>When the entry is paid, this number is not the one shown on the payment. Maconomy allocates a unique payment transaction number. These numbers are maintained in the window System Numbers in the Set-Up module.</p>
<b>Trans. Type</b>	This field shows the transaction type of the vendor entry.
<b>Description</b>	<p>This is the entry description. The text was entered on the vendor invoice, and it cannot be changed.</p> <p>When the entry is paid, this text is not shown on the payment. Maconomy retrieves a text from the window Posting Descriptions in the G/L module.</p>
<b>Original Amount</b>	This is the original invoice amount, expressed in the entry's original currency. It was specified on the vendor invoice and cannot be changed.
<b>Original Currency</b>	This is the currency in which the invoice was registered. It was specified on the vendor invoice and cannot be changed.
<b>Responsible</b>	This is the employee responsible for approving invoices and credit memos for the vendor. The name is used partly for reference, partly on the printout of unapproved vendor invoices, which is sorted by 'responsible.' The name cannot be changed.
<b>Cash Discount Date</b>	This field shows a cash discount date for the vendor entry in question. The date in this field is the latest date that will trigger the allowance of a cash discount for the current vendor entry. The date is calculated on the basis of the cash discount term displayed in the island Payment Control and the posting date for the current vendor invoice. However, you can change the date in this field manually.
<b>Date Posted</b>	This is the date the entry was posted. It cannot be changed.
<b>Import Date</b>	This field shows the import date entered in the window Vendor Invoices when registering the entry. You can change the value here. The code is used by Maconomy to create a payment file in the window Payment Files.

## Actions

This section shows the Actions available in the Change Payment Selection by Vendor workspace.

### Top Tab

Field	Description
<b>Create Payment Selection</b>	When you select this action, Maconomy creates a payment selection for the vendor. If an entry is both ready for payment and due for payment on or before the selected due date, or if the calculation date is before any cash

Field	Description
	<p>discount date which may be indicated on the current vendor invoice, and if today's date is before this cash discount date, the entry is selected for payment. Furthermore, if the field "Pay when Paid" is marked for a given entry which is ready for payment, the due date does not determine whether the entry is selected for payment. Payment when paid entries are selected for payment as soon as they are ready for payment.</p> <p>When an entry is selected, the remaining amount is selected for payment and "Remainder" is set to zero.</p> <p>If a cash discount term has been entered for the current vendor, Maconomy will suggest the cash discount to be granted in accordance with the cash discount terms in question. The cash discount term is shown in the island Payment Control.</p> <p>Note that if a vendor's cash discount term has been set to adjusted tax, the cash discount amount displayed in the field "Cash Discount, Currency" will include tax. If tax adjustment has not been selected, the cash discount amount will be exclusive of tax. Terms for cash discounts including adjustment of tax are entered in the pop-up field Cash Discount Codes in the Set-Up module.</p> <p>All previous selections and changes will be overwritten. If you only wish to recalculate the vendor entries which have not already been selected for payment, you have to use the Payment Selection window and remove the mark in the "Overwrite Existing" field.</p> <p>You can change the payment selection after it has been made. You might want to withdraw various entries, for example.</p> <p>You approve conventional payment entries by selecting the action "Approve Conventional Payment."</p>
<b>Approve Conventional Payment</b>	<p>When you select this action, you approve the payment selection for the vendor. If you wish to approve a payment selection for all or a range of vendors, use the Print Payment Selection window.</p> <p>See the Introduction to this chapter for a detailed description.</p>
<b>Remove Payment Selection</b>	<p>When you select this action, all the amounts in the "Payment" field are cleared and the amount in the "Balance" field is reinserted. You cannot remove any previously approved payments.</p>

## Vendor Entries Single Dialog Workspace

Use this workspace to view and edit payment information about vendor entries.

## Vendor Entry Tab

This section includes the fields and descriptions for the Vendor Entry tab.

### Payment Selection Island

Field	Description
<b>Latest Due Date</b>	Enter the cut-off date for selection of entries for payment. If an entry's due date is on or before this date, it will be selected for payment. If the entry is not approved, it will not be selected. You must enter a date.
<b>Blanket Payment Date</b>	Enter the payment date to be applied to all of the payments included in the payment selection, both blanket payments and separate payments.
<b>Overwrite Settled</b>	If this field is marked, settled entries will be included in the payment selection, and entries already settled will be canceled. Entries can be selected in the window A/P Open Entry Reconciliation. If this field is not marked, entries for reconciliation will not be included.
<b>Include Cash Discount</b>	<p>If this field is marked, the current payment selection will include any cash discounts granted in accordance with the cash discount terms indicated on the vendor invoices in question.</p> <p>A cash discount is automatically calculated by Maconomy if the calculation date is later than the cash discount date for the current vendor invoice, and if today's date is before this cash discount date. Note that if tax adjustment has been selected on the current vendor's cash discount term, the cash discount amount displayed on the print of this window will include tax. If tax adjustment has not been selected, the cash discount amount will be exclusive of tax. Terms for cash discounts inclusive of adjustment of tax are entered in the pop-up field "Cash Discount Codes" in the Set-Up module. The print of the selection also shows a detailed specification of any discount granted.</p>
<b>Remittance Text</b>	In this field you can enter a remittance text. For a more detailed description, see the document on automatic payment for the selected payment format and the description of the window Show Payment Remittance.

### Selected for Payment Island

Field	Description
<b>Remainder, Approved</b>	This field displays any approved amount that has not yet been paid.
<b>Payment</b>	This field displays the payment.
<b>Being Paid</b>	This field displays the amount being paid.
<b>Discount</b>	This field displays the discount amount.

Field	Description
<b>Discount %</b>	This field displays the percentage used to calculate the discount amount.

**Entry Island**

Field	Description
<b>Debit, Currency</b>	This is the debit entry amount in the vendor's currency. Debit entries are created when you register vendor credit memos in a vendor invoice journal or a general journal.
<b>Credit, Currency</b>	This is the credit entry amount in the vendor's currency. Credit entries are created when you register vendor invoices in a vendor invoice journal or a general journal.
<b>Debit, Base</b>	This field displays the debit entry amount in the base currency.
<b>Credit, Base</b>	This field displays the credit entry amount in the base currency.
<b>Remainder, Currency</b>	This field displays how much of the original amount of the entry is yet to be paid or reconciled. If a discount is specified on the line, Maconomy automatically deducts the discount amount from the remainder in this field. The field is maintained by Maconomy and cannot be changed manually.
<b>Remainder, Base</b>	This field displays any amount in the vendor's standard currency that has not been reconciled.
<b>Original Amount</b>	This field displays the original amount of the entry.
<b>Possible Cash Discount, Original</b>	This field displays any cash discount that can be gained by paying the vendor invoice by the cash discount date in the original currency of the entry.
<b>Possible Cash Discount %</b>	This field displays any cash discount percentage that can be gained by paying the vendor invoice by the cash discount date.

**Vendor Island**

Field	Description
<b>Vendor No.</b>	This field shows the number of the vendor.
<b>Vendor Name</b>	This field shows the name of the vendor.
<b>Pay to Vendor No.</b>	This field shows the vendor number.

Field	Description
<b>Currency</b>	This field shows the delivery vendor's currency which is the same as the currency of the settling-company specific vendor.

**Remarks Island**

This field displays any remarks regarding the current collection order.

**Invoice Island**

Field	Description
<b>Invoice No.</b>	This field displays the number of the current invoice. The number is the vendor invoice number and is retrieved from the window Vendor Invoices. It cannot be changed here.
<b>Invoice Date</b>	This field displays the invoice date of the current invoice.
<b>Entry Date</b>	This field displays the invoice's entry date.
<b>Description</b>	This field displays a description of the invoice.
<b>Trans. No.</b>	This field displays the invoice transaction number.
<b>Transaction Type</b>	This field displays the transaction type of the vendor entry.

**Entry Information Island**

Field	Description
<b>Journal No.</b>	This field displays the number of the posting journal to which the entry was posted.
<b>Journal Line No.</b>	This field displays the number of the line on which the entry occurs in the journal shown in the field "Journal No."
<b>Entry Type</b>	This field displays the entry type of the individual entry, such as "Expense Sheet."
<b>Approved</b>	This check box indicates whether the entry has been approved.
<b>Approved By</b>	This field displays the name of the person who approved the entry.
<b>Approved Date</b>	This field displays the date on which the entry was approved, if it has been approved.

Field	Description
<b>Disclosable</b>	This field specifies whether there is an obligation of disclosure attached to the entry. This field is used, for example, if the vendor is a person for whom special taxation rules apply.
<b>Open/Closed</b>	This field specifies whether the entry is open or closed. A vendor invoice or credit memo is open until it has been paid or reconciled. A payment, discount, or exchange rate entry is always registered as closed.
<b>Due Date</b>	<p>This is the entry's due date. The due date is calculated from the invoice date and the vendor's payment terms. The date determines whether the entry is selected for payment when you create payment selections. The entry is selected if the due date is on or before the due date in the card part of the window.</p> <p>The value was specified when the vendor invoice was registered. It can be changed here.</p>
<b>Date Posted</b>	This field displays the date on which the entry was posted to the accounts payable and general ledger.
<b>Time Posted</b>	This field displays the time at which the entry was posted to the accounts payable and general ledger.
<b>Cash Discount Date</b>	This field displays a cash discount date, if any, assigned to the current vendor entry. The date shown in this field is the latest date on which a payment should take place if a cash discount is to be granted for the current vendor invoice.
<b>Responsible</b>	This field displays the name of the person who is responsible for approving the entry.
<b>Company of Origin</b>	This field displays the company that initiated the displayed vendor entry.

#### Company Island

Field	Description
<b>Company No.</b>	This field displays the settling company number of the vendor entry's settling-company specific vendor.
<b>Company Name</b>	This field shows the name of the settling company of the vendor entry's settling-company specific vendor.
<b>Base Currency</b>	This field shows the currency of the settling company of the vendor entry's settling-company specific vendor.

#### Payment Island

Field	Description
<b>Vendor Payment No.</b>	This field displays the vendor payment number.

Field	Description
<b>Pay when Paid</b>	This check box indicates whether payment when paid applies to the invoice in question.
<b>Paid by Customer</b>	This check box indicates whether the customer of the job in question has paid the amount due for the job entry. This field is only marked if all job entries created as a result of the allocation of the vendor invoice have all been invoiced and paid, or otherwise closed (for example, written off).
<b>Ready for Payment</b>	This check box indicates whether the current entry is ready for payment.
<b>Payment Mode</b>	Select the payment mode, for example, check.
<b>Check Book</b>	This field displays the check book used in connection with payment of the current vendor entry.
<b>Payment Agent</b>	This field displays the customer payment agent whose format you want to use for the current entry.
<b>Payment Form</b>	This field displays the payment form selected for this entry.
<b>Fixed Exchange Rate at Payment</b>	This field displays the prevailing currency exchange rate at the time of payment.
<b>Payment Description</b>	Enter a code for the goods or services covered by the vendor invoice. Maconomy uses the payment description in the creation of payment files for electronic payment of vendors.
<b>Import Date</b>	Enter the date on which the goods or services covered by the vendor invoice were imported. Maconomy uses the import date in the creation of payment files for electronic payment of vendors. These payment files are created in the Payment Files window in the Banking module.
<b>Card Type Code</b>	Enter the vendor invoice card type code. It is used by Maconomy to create payment files for the electronic payment of vendors. These payment files are created in the Payment Files window in the Banking module. If you enter neither a card type code nor a payer identification, the vendor's standard card type code is copied to the vendor entry when the invoice is posted. This card type code is entered in the "Card Type Code" field in the Payment Control window.
<b>Payer Identification</b>	Enter the vendor invoice's payer identification. It is used by Maconomy to create payment files for electronic payment of vendors. These payment files are created in the Payment Files window in the Banking module. If you enter neither a card type code or payer identification, the vendor's standard payer identification is copied to the vendor entry when the invoice is posted. This payer identification is entered in the "Payer Identification" field in the Payment Control

Field	Description
	window. Maconomy checks that the value entered is a correct payer identification.
<b>Giro</b>	Enter the giro number assigned to the pay-to vendor.
<b>Bank Acc. No.</b>	Enter the bank account number assigned to the pay-to vendor.
<b>Reg. No.</b>	Enter the registration number assigned to the pay-to vendor.
<b>Credit Card No.</b>	Enter the credit card number assigned to the pay-to vendor.
<b>CPC No.</b>	Enter the CPC number assigned to the pay-to vendor.
<b>Credit Memo Due Date</b>	This field displays the due date assigned to the credit memo. The due date is calculated from the credit memo date and the customer's payment terms.
<b>Amount Being Paid, Base</b>	This field shows the amount being paid in base currency.
<b>Amount Being Paid, Enterprise</b>	This field shows the amount being paid in enterprise currency.
<b>Reconciliation Date</b>	This field shows the latest entry date for the current entry and all the entries that have been reconciled against the current entry.
<b>Entry Reconciliation Date</b>	This field shows the date for when the entry was reconciled.
<b>Debit, Enterprise</b>	This is the debit entry amount in the enterprise currency. Debit entries are created when you register vendor credit memos in a vendor invoice journal or a general journal.
<b>Credit, Enterprise</b>	This is the credit entry amount in the enterprise currency. Credit entries are created when you register vendor invoices in a vendor invoice journal or a general journal.
<b>Remainder, Enterprise</b>	This field displays how much of the original amount of the entry is yet to be paid or reconciled, in enterprise currency. If a discount is specified on the line, Maconomy automatically deducts the discount amount from the remainder in this field. This field is maintained by Maconomy and cannot be changed manually.
<b>Tax, Base</b>	This field shows the Tax amount from the vendor invoice in base currency. The amount is only having a value on vendor entries created from a vendor invoice.

Field	Description
<b>Tax, Enterprise</b>	This field shows the Tax amount from the vendor invoice in enterprise currency. The amount is only having a value on vendor entries created from a vendor invoice.
<b>Tax, Original</b>	This field shows the Tax amount from the vendor invoice in currency of the vendor invoice. The amount is only having a value on vendor entries created from a vendor invoice.

## Payment Files Single Dialog Workspace

Use this workspace to create a payment file for automatic payments. Maconomy automatically prints a specification of all payments when you create the payment file. This workspace is part of the "Electronic Payment" add-on.

Maconomy creates a payment order for each payment that you want the payment agent to make.

**Note:** If a given payment fulfills the terms for a cash discount, use the cash discount date as the date of payment when you create payment orders. You can specify cash discount terms when you create vendor invoices or assign them to each vendor in the Payment Selection and Company-Specific Payment Selection workspaces.

The Show Payment Orders workspace shows all of the payment orders that you create from this workspace. The Show Payment Reconciliation workspace shows the vendor entries that belong to a specific payment order. You can use these two workspaces to trace how your vendor entries were paid if a vendor claims that payment was not made.

If you choose to send remittance information to payees, you can use the Show Payment Remittance workspace to review and edit the information. Remittance information is included in the payment file if you select the **Notify Payment Recipient** field for the specified payment mode.

## Payment Files Tab

This section includes the fields and descriptions for the Payment Files tab.

### Run Mode Island

Field	Description
<b>Create Payment File</b>	If you mark this field, Maconomy will create a payment file. In reprints, the mark should be removed, as Maconomy will otherwise create a new file. The file is created when you select the action "Create Payment File."
<b>Preferred Payment Date</b>	In this field, you can specify the payment date to be applied to the payment orders in the file created when you select the "Create Payment File" action. If you do not specify a date, the payment date for each entry being paid will be the one applied to the entry in the payment selection.

### Selection Criteria Island

Field	Description
<b>Payment Agent</b>	In this pop-up field you select a payment agent whose format you want to use for the current payment list. The list will only show entries being paid by this payment agent.
<b>Payment Mode</b>	Here you select a payment mode. The list will only show entries being paid using this payment mode.
<b>Pay to Vendor No.</b>	Here you can enter a range of vendor numbers. Maconomy will only include payments to delivery vendors within this range.
<b>Supplier No.</b>	Here you can specify a range of supplier numbers. The payment file will only include suppliers within the specified range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The payment file will only include companies within the specified range.
<b>Company of Origin</b>	In this field, you can specify a range of company numbers. The payment file will only include entries where the company of origin is within this range.
<b>A/P Control Account</b>	In this field, you can select an A/P control account. The payment file will only include entries using this account.
<b>Vendor Group</b>	In this field, you can select a vendor group. The payment file will only include entries from this vendor group.
<b>Card Type Code</b>	In this field, you can enter a range of card type codes. The payment file will only include entries with a card type code within this range.
<b>Payment Date</b>	In this field, you can enter a range of dates. The payment file will only include entries with a payment date within this range.
<b>Transaction Type</b>	In this field, you can enter a transaction type. The payment file will only include entries with this transaction type.

### Payment Information Island

Field	Description
<b>File Name</b>	In this field, you must specify the name of the file which will contain the payment file when you select the action "Create Payment File." The file is formatted in accordance with the format of the payment agent you have selected in the field "Payment Agent." The file is placed in your Maconomy client folder.
<b>Reporting Currency</b>	In this field, you can specify the currency in which the payment entry should be displayed. The payment entries in the current payment file will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.  For the purpose of converting the chosen currency into another currency, Maconomy uses the valid exchange rates specified in the exchange rate table

Field	Description
	for purchases on the date entered in the field "Exchange Rate Date" below. The exchange rate table to be used for purchases is specified in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.
<b>Exchange Rate Date</b>	In this field, you can specify the date which should be used when converting amounts into the chosen reporting currency. Maconomy uses the valid exchange rates specified in the exchange rate table for purchases selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."
<b>Security Code 1</b>	Here you can enter a security code. For a more detailed description, see the document on automatic payment for the selected payment format.
<b>Security Code 2</b>	Here you can enter a security code. For a more detailed description, see the document on automatic payment for the selected payment format.

### Reprint Island

Field	Description
<b>Paym. No.</b>	If you specify a previously run payment number in this field, the payment list will be written to a file again when you select the function "Create Payment File" in the Action menu. If you want to do this, the field "Create Payment File" in the island Run Mode must not be marked. The file is created when you select the action "Create Payment File."

### Actions

This section shows the Actions available in the Payment Files workspace.

#### Top Tab

Field	Description
<b>Create Payment File</b>	<p>When you select this action, Maconomy creates an automatic payment file with the name specified in the field "File Name" and prints a specification of the entries included in the payment.</p> <p>When a payment file for the bank is created, a payment journal containing the entries under payment is also created. You can verify the information in this journal before you post it in the window Payment Journal. You can alter the posting date as well as the posted amount in currency when it concerns foreign payments. However, if the system parameter "Automatic Posting of Payment Journals" is marked, the payment journal is posted automatically.</p>

Field	Description
	<p>The action is also used if you wish to reprint a payment specification and when you have chosen not to create a payment file.</p> <p>If the creation of a payment file causes an error that prevents Maconomy from completing the file, Maconomy will reset all entries to their status before you tried to create the payment file. The incomplete payment file is named "\$delete" by Maconomy and will automatically be deleted from the server.</p>

## Print Check Single Dialog Workspace

Use this workspace to print out checks.

When you print checks, Maconomy automatically creates a payment journal for entries being paid. Maconomy automatically posts this journal if you select the **Automatic Posting of Payment Journals** system parameter.

You can review payment orders in the Show Payment Orders workspace. You can review vendor entries that are included on a specific payment order in the Show Payment Reconciliation workspace. If you select the **Notify Payment Receiver** option in the Payment Modes workspace, you can use any specification that you create while paying entries as a remittance line on the check.

### Print Check Tab

This section includes the fields and descriptions for the Print Check tab.

#### Selection Criteria Island

Field	Description
<b>Check Book</b>	In this field, you select a check book. Once you have selected a check book, you can only print out checks belonging to that check book.
<b>Payment Mode</b>	In this field, you select a payment mode. Maconomy will verify that the number of the checks being printed corresponds to the next number defined for the current check book. If you print out more than one check, the check numbers will therefore be consecutive.
<b>Pay to Vendor No.</b>	Here you enter a range of vendor numbers. Maconomy will only print checks for vendors within this range.
<b>Supplier No.</b>	In these fields, you can specify a range of supplier numbers. Maconomy will only print checks for suppliers within this range.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. Maconomy will only print checks for vendors assigned to companies within this range.
<b>Company of Origin</b>	In this field, you can specify a range of company numbers. Maconomy will only print checks where the company of origin is within this range.
<b>Control Account</b>	In this field, you can select an A/P control account. Maconomy will only print checks for this control account.

Field	Description
<b>Vendor Group</b>	In this field, you can select a vendor group. Maconomy will only print checks from this vendor group.
<b>Transaction Type</b>	Here you can enter a transaction type. Maconomy will only print check for this transaction type.
<b>Card Type</b>	In this field, you can enter a range of card types. Maconomy will only print checks for entries with a card type within this range.
<b>Payment Date</b>	Here you enter a range of dates. Maconomy will only print checks where the payment date is in this range.

**Payment Control Island**

Field	Description
<b>Check No.</b>	<p>In this field, you enter the number of the next check to be printed from the current check book. Only checks to which the selected payment mode and vendor entries are assigned will be printed. It is only possible to enter one check book and payment mode at a time.</p> <p>If the system parameter "Consecutive Check Numbers Required" has been marked in the "System Parameters" window, you can only enter a number corresponding to the next check number according to the check book setup in the Pop-up Fields window.</p>
<b>Preferred Payment Date</b>	This field allows you to enter the date on which the payment selection or payment report in question should be processed.
<b>Place of Issue</b>	In this field, you enter the place of issue of the current check.

**Print Control Island**

Field	Description
<b>Test Print</b>	If you mark this field, one test check will be printed so you can test printer alignment and so on. The amount on the printed test check will be zero, and the text on the check will indicate that this is a test print.
<b>Layout</b>	<p>In this field, you select the layout that you wish to use for the checks.</p> <p>The written amounts on a check can be printed either with or without spaces, for example, "One thousand" or "Onethousand," depending on whether the field "Spaces in Written Amounts" has been marked for the selected check book in the window Pop-up fields in the Set-Up module.</p> <p>If further layouts have been added, the written amounts may also be available in other formats and languages.</p>

## Read Payment Status Single Dialog Workspace

Use this workspace to read files from a payment agent.

The files contain payment statuses for the payment orders that you sent to the payment agent. When Maconomy reads a file, it also transfers the statuses to the payment orders in Maconomy, ensuring that the statuses that the payment agent entered correspond to those that were entered in Maconomy.

You can also use this workspace to reprint information about payment statuses that Maconomy read on earlier occasions.

**Note:** You can specify the status of a payment order manually in the Payment Reporting workspace. See the description of that workspace for more information.

### Read Payment Status Tab

This section includes the fields and descriptions for the Read Payment Status tab.

#### Read Control Island

Field	Description
<b>Payment Agent</b>	In this field, you can specify the payment agent who supplied the payment status file to be read.
<b>Read File</b>	In this field, you can choose whether a new payment status file is to be read, if you wish to restart a reading which was aborted or if you wish to reprint a status file which has already been read. If you mark this field, you must specify the file to be read.

#### Reprint Island

Field	Description
<b>Run No.</b>	If you wish to reprint information about a payment status read on an earlier occasion, enter the run number of the status reading to be reprinted in this field.

#### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

## Show Read Payment Status Single Dialog Workspace

Use this workspace to view the payment statuses for a number of payment orders with a given payment agent.

This workspace shows information about each entry in the payment status file that Maconomy read. This workspace is for information only, so you cannot change any of the information that it shows. However, you can print the information about the status of each payment order.

### Show Read Payment Status Tab

This section includes the fields and descriptions for the Show Read Payment Status tab.

#### Payment Status References Island

Field	Description
<b>Run No.</b>	This field shows the number of the run in which the current status was read.
<b>Line No.</b>	This field shows the number of the line from which the current payment status was read in the payment status file.
<b>Paym. No.</b>	This field shows the payment number of the current payment order.
<b>Payment Group No.</b>	This field shows the number of the payment group if the payment order is assigned to a payment group.
<b>Payment Line No.</b>	This field shows the line number of the current payment order.
<b>Register No.</b>	This field shows the register number of the customer entry. The register number is an internal reference in the payment agent's system.
<b>Transfer Date</b>	This field shows the date on which the current payment order was transferred.

#### Error Island

Field	Description
<b>Error Entry</b>	This field shows if the payment order has been error reported.
<b>Error Message</b>	If the payment order resulted in an error, any error message from the payment agent is shown in this field.

#### Account Information Island

Field	Description
<b>External Account No.</b>	This field shows the company's account number in the payment agent's database.

Field	Description
<b>Internal Account No.</b>	This field shows the company's internal G/L account in Maconomy, corresponding to the external account number in the payment agent's database.

#### Payment Status Information Island

Field	Description
<b>Amount, Currency</b>	This field shows the amount of the payment order. The amount is shown in the currency shown in the field "Currency."
<b>Amount, Base</b>	This field shows the amount of the payment order. The amount is shown in base currency.
<b>Paid</b>	This field shows if the payment order has been paid.
<b>Rejected</b>	This field shows if the payment order has been rejected.

## Payment Reporting Single Dialog Workspace

Use this workspace to view all unfinished automatic payment orders-that is, payment orders that are not yet approved as paid, reversed, or erroneous.

For each payment order line in the sub-tab, you can select whether the payment order is to be paid, reversed, or error-reported.

### Paid Entries

If you specify that a payment order should be paid, the assigned vendor entry is also marked as paid when you use the **Approve Entries** action. Maconomy creates a payment journal with journal entries that correspond to all approved payment entries. You can use the Payment Journal workspace to check the journal entries before posting them. You can change the posting date and, for foreign payments, the posted amount in base currency. The journal is automatically posted if you select the **Automatic Posting of Payment Journals** system parameter.

### Error-Reported Entries

To report an automatic payment order as having errors, select the **Error Reported** field in the sub-tab of the Payment Reporting workspace. When you approve the error report, Maconomy updates the matching vendor entry. You can now select the vendor entry for payment again.

### Reversed Entries

You can also report errors by selecting the **Errors Reported** field, then reversing a payment order. Mark the **Reversed** field, then use the **Approve Entries** action to approve the entry.

The entry will be error-reported and will be selected for payment, so that you can easily create a new check or payment file. This approach is useful if you are printing a large number of checks, the printing fails, and you have to reprint all the checks.

## Payment Reporting Tab

This section includes the fields and descriptions for the Payment Reporting tab.

### Selection Criteria Island

Field	Description
<b>Payment Date</b>	Here you can enter a range of payment dates. The table will only show payment orders with a payment date within this range.
<b>Vendor No.</b>	Here you can enter a range of numbers of vendors who are responsible for payment. The table will only show payment orders for vendors numbered within this range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The table will only show payment orders concerning companies within this range.
<b>Supplier No.</b>	In these fields, you can specify a range of supplier numbers. The table will only show payment orders concerning suppliers within this range.
<b>Paym. No.</b>	Here you can enter a range of payment numbers. The table will only show payment orders numbered within this range.
<b>Check No.</b>	Here you enter a range of check numbers. Only payment orders with a check number within the selected range will be shown in the table part of this window.
<b>Check Book</b>	Here you select a check book. Only payment orders with the selected check book will be shown in the table part of this window.
<b>Payment Agent</b>	Here you can select a payment agent. The table will only show payment orders with the chosen payment agent.
<b>Payment Mode</b>	Here you can select a payment mode. The table will only show payment orders with the chosen payment mode.
<b>Origin</b>	Here you select the origin of the payment order. Only payment orders with the selected origin will be shown in the table part of this window.
<b>Show Entered</b>	If you mark this field, the table will show payment orders registered as having been received by the payment agent.
<b>Show Paid</b>	If you mark this field, the table will show payment orders registered as having been paid by the payment agent.

### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which the totals in the statistic island should be displayed. The amount from the vendor entry will be converted into and displayed in this currency.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the current date and the exchange rate table used is the</p>

Field	Description
	exchange rate table for purchases selected in the window System Information in the Set-Up module.  If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.

**Status Island**

Field	Description
<b>Reg.</b>	By using the action "Transfer Status," the value in this field can be transferred to the payment orders shown in the table part of this window.
<b>Paid</b>	The functionality of this field is similar to that of the field "Reg." above.
<b>To Be Canceled</b>	The functionality of this field is similar to that of the field "Reg." above.
<b>Error Reported</b>	The functionality of this field is similar to that of the field "Reg." above.
<b>Reversed</b>	The functionality of this field is similar to that of the field "Reg." above. If a payment order is transferred and the vendor entry assigned to this order is selected for reconciliation, the reconciliation of the vendor entry will be canceled. This means that the amount selected for reconciliation will be reset to zero.

**Statistics Island**

Field	Description
<b>Quantity</b>	In this column, the number of payment orders grouped by the fields "Total Payments," "Reg.," "Paid," "Canceled," "Errors Reported," and "Reversed" is shown.
<b>Amount</b>	In this column, the total amount of payment orders grouped by the fields "Total Payments," "Reg.," "Paid," "Canceled," "Errors Reported," and "Reversed" is shown.
<b>Total Payments</b>	This row shows the total number of payment orders shown in the table part as well as the total amount of these.
<b>Reg.</b>	This row shows the number of registered payment orders shown in the table part as well as the total amount of these.
<b>Paid</b>	This row shows the number of payment orders in the table part registered as paid by the payment agent. The total amount for paid orders is also shown.
<b>Errors Reported</b>	This row shows the number of payment orders in the table part registered as erroneous. The total amount of erroneous orders is also shown.

Field	Description
<b>Reversed</b>	This row shows the number of payment orders in the table part registered as reversed by the payment agent. The total amount of reversed orders is also shown.
<b>Reporting Currency</b>	In this pop-up field, you can specify the currency in which the amounts in this island should be shown. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.

### Automatic Payment Lines Sub-Tab

This section includes the fields and descriptions for the Automatic Payment Lines sub-tab.

Field	Description
<b>Payment Date</b>	This field shows the payment order's payment date.
<b>Vendor No.</b>	This field shows the payment order's billing vendor number.
<b>Supplier No.</b>	This field shows the supplier's billing number.
<b>Paym. No.</b>	This field shows the payment order's payment number. Maconomy allocates a number from the window System Numbers when you make a payment from the Automatic Payment window. The number is given to all the payment orders being transferred.
<b>Paid, Currency</b>	This field shows the payment order amount in the delivery vendor's currency.
<b>Currency</b>	This field shows the delivery vendor's currency.
<b>Paid, Base</b>	This field shows the payment order amount in the base currency.
<b>Base Currency</b>	This field shows the base currency of the company which carried out the current payment.
<b>Entered</b>	You can mark this field to show that the payment order is registered, that is, that the payment agent has received and accepted the order.
<b>Paid</b>	You can mark this field to show that the payment order has been paid, that is, that the payment agent has registered the payment as paid. If an automatic payment is registered as paid, the matching vendor entry will be registered as paid when the registration is approved.
<b>Error Reported</b>	You can mark this field to show that the payment order has an error. When you approve the error report, Maconomy updates the matching vendor entries.

Field	Description
<b>Reversed</b>	In this field, you mark the payment order if it has been reversed. By approving the reversion, the assigned vendor entries are updated in the same way as erroneous entries, but the reversed amount will furthermore be selected for payment on the assigned vendor entries.
<b>Customer No.</b>	This field shows the number of the customer to which the current payment order is assigned.
<b>G/L Account No.</b>	This field shows the number of the G/L account at which the current payment order is posted.
<b>Payer Identification</b>	This field shows the payer identification of the payment order.
<b>Payment Agent</b>	This field shows the payment agent chosen for the payment order in question.
<b>Payment Mode</b>	This field shows the payment mode chosen for the payment order in question.
<b>Company No.</b>	This field shows the number of the customer to which the current payment order is assigned.
<b>Origin</b>	This field shows the origin of the payment order.
<b>Check Book</b>	This field shows the check book assigned to the current payment order.
<b>Check No.</b>	This field shows the check number assigned to the payment order. You can change the number in this field. If you do not change the number here, it will correspond to the original check number.
<b>Original Check No.</b>	This field shows the check number used in connection with printouts of the check assigned to the current payment order. You cannot change the value in this field.
<b>Changed by</b>	This is the name of the user who last changed the payment order. The field is updated automatically. If you have not made any changes, the field shows who created the payment order.
<b>Changed on</b>	This is the date the payment order was last changed. It is updated automatically. If you have not made any changes, the field shows the date on which the payment order was created.

## Actions

This section shows the Actions available in the Payment Reporting workspace.

### Top Tab

Field	Description
<b>Transfer Status</b>	When you select this action, the entered status in the card part of this window is transferred to all payment orders shown in the table part of this window.
<b>Approve Entries</b>	<p>When you select this action, the entered status in the card part of this window is transferred to all payment orders shown in the table part of this window.</p> <p>When you select this action, all entries are approved with the specifications made in the fields "Paid," "Canceled," "Error Reported," or "Reversed" in the table part of this window.</p> <p>Payment orders which do not involve vendor payments will be canceled if their status is either paid, erroneous, or reversed. In these cases, no payment journal will be created.</p>

## Print Out Payment Listing Single Dialog Workspace

Use this workspace to approve payment selections for manual payment of one or more vendors at a time. You can also reprint information about previously approved payments.

To approve a payment selection for one vendor, you can use the **Approve Conventional Payment** action in the Change Payment Selection by Vendor workspace.

### Print out Payment Listing Tab

This section includes the fields and descriptions for the Print out Payment Listing tab.

### Run Mode Island

Field	Description
<b>Approve Selection</b>	Here you specify whether to approve a payment selection or reprint a payment report. If the field is checked, you approve a payment selection.
<b>Show Entries</b>	If you check this box, a list of the vendor entries that make up the payment selection will be printed for each approved payment.
<b>Preferred Payment Date</b>	This field allows you to enter the date on which the payment selection or payment report in question should be processed.

**Selection Criteria Island**

Field	Description
<b>Fields</b>	In these fields, you can specify values or ranges of values (when appropriate) that will define the target group. The criteria that you enter are cumulative.

**Print Control Island**

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

**Reprint Island**

Field	Description
<b>Paym. No.</b>	In this field you can enter the payment number of a payment report. Please note that you cannot enter a payment number if you have checked the "Approve Selection" field in the Run Mode island to reprint a payment report.

## Payment Journal Single Dialog Workspace

Use this workspace to view unposted vendor journals. Maconomy creates a payment journal for each approved payment selection, every check printed, and every payment file.

You can change the entry date. You can also change the amount in base currency if the entry uses foreign currency.

When you approve a conventional payment selection, Maconomy uses the current date as the entry date for the payment entries. When you approve an automatic payment selection and payment by check, Maconomy suggests the date of the payment order as the entry date.

For payments in foreign currency, when you use automatic payment selection, Maconomy uses your current exchange rate table for purchases to convert the foreign currency amount to base currency.

When you use the manual payment process, you enter the amount in base currency. You can also use the Import Payment Status workspace to import this information.

**Note:** If you select the **Automatic Posting of Payment Journals** system parameter, Maconomy posts payment journals automatically, so that information does not appear in this workspace.

## Payment Journal Tab

This section includes the fields and descriptions for the Payment Journal tab.

### Journal Island

Field	Description
<b>Journal No.</b>	This is the number of the journal. The number is taken from the "Journal" number series in the window System Numbers in the Set-Up module.
<b>Created by</b>	This is the name of the user who created the journal. It cannot be changed here.
<b>Date</b>	This is the date on which the journal was created. It is only for reference, and it cannot be changed here.
<b>Post</b>	Mark this field to release the journal for posting. The journal will then be posted the next time you post vendor journals in the window Posting or Print Posting Journal. If it is not marked, you have to mark the field "Post" next to the journal in the window Posting before you can post it.

### Posting Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use when the journal is posted. The layout "Standard" includes detailed information on each entry. The layout "Journal Overview" shows summary information with totals for the journal, including any resulting intercompany journals.

## Payments Sub-Tab

This section includes the fields and descriptions for the Payments sub-tab.

Field	Description
<b>Vendor No.</b>	This is the number of the delivery vendor the payment is for. It cannot be changed.
<b>Entry Date</b>	<p>This is the payment's entry date.</p> <p>When you approve a conventional payment, Maconomy suggests the current date as the entry date for the payment journal.</p> <p>When you approve an automatic payment, Maconomy suggests the date of the payment order.</p> <p>If you want the possibility to balance Maconomy's vendor statement with a bank statement, for example, you can postpone the posting of the vendor journal until you have received notice of the payment date from the bank. The entry date can then be changed, and you can post the journal.</p>
<b>Trans. No.</b>	This is the payment's transaction number. It is taken from the Vendor Payment system number series in the Set-Up module and cannot be changed.

Field	Description
<b>Trans. Type</b>	This field shows the transaction type of the vendor payment.
<b>Paid, Base</b>	<p>This is the base amount which is paid. Maconomy calculates this amount using the current exchange rate table for purchases. You can only change it if a payment is in a foreign currency.</p> <p>To post the base amount which you have to pay for the foreign currency, you can postpone the posting of the vendor journal until the bank has notified you of the exchange rate it has used for the payment. You can then adjust the base amount in this window and post the journal.</p> <p>If the payment journal has been posted before you noticed that the paid amount differs from the base amount calculated by Maconomy, you should correct this with a currency adjustment entry in the window General Journal in the G/L module.</p>
<b>Currency</b>	This field shows the vendor's currency. You can only change the "Paid, Base" amount if the value here is not the base currency.
<b>Paid, Currency</b>	This field shows the amount paid in the vendor's currency, that is, the currency used for payment. You cannot change the value in this field.
<b>Exchange Rate Variance, Base</b>	This field shows any exchange rate variance calculated by Maconomy for payments in foreign currency. The amount is shown in the base currency of the settling company. The amount corresponds to the difference between the base amount reconciled by the payment and the base amount actually paid, that is, the amount specified in the field "Paid, Base." A variance will occur if exchange rates have changed from the time the vendor invoice was received and posted until the time you pay it. Also, the fact that your bank uses another exchange rate than what is specified in Maconomy will give rise to differences which are reflected in this field.
<b>Being Paid, Base</b>	This field shows the amount being paid in base currency.
<b>Being Paid, Currency</b>	This field shows the amount being paid in the vendor's currency.

## Actions

This section shows the Actions available in the Payment Journal workspace.

### Top Tab

Field	Description
<b>Post</b>	When you select this action, Maconomy posts the payment journal currently shown in the window.

## Print Payment Overview Single Dialog Workspace

Use this workspace to print an overview of payments made to external accounts. The report sorts the entries under each external account by payment mode and payment date.

### Print Payment Overview Tab

This section includes the fields and descriptions for the Print Payment Overview tab.

#### Selection Criteria Island

Field	Description
<b>Company No.</b>	In these fields, you can enter a range of company numbers if you want to limit the printout to only include certain companies.
<b>Payment Agent</b>	In this field, you can select a payment agent if you want the printout to only contain entries assigned to this agent. If no payment agent is specified, the printout will not be affected by which payment agent the payments are assigned to.
<b>Reg. No.</b>	In these fields, you can enter a range of bank registration numbers if you want to limit the printout to only include entries registered on certain registration numbers.
<b>Bank Acc. No.</b>	In these fields, you can enter a range of bank account numbers if you want to limit the printout to only include entries registered on certain bank account numbers.
<b>Due Date</b>	In these fields, you can enter a range of due dates if you want to limit the printout to only include entries registered with certain due dates.

#### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which payment overview should be printed. The payment overview will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table for purchases selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>

Field	Description
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table for purchases selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.
<b>Show Entries</b>	If you mark this field, the printout will contain a specification of each open entry registered on the external accounts included on the printout. If you do not mark this field, the printout will show one page per external account grouped by payment modes showing a total for each day, a total for each payment mode and a grand total for each external account included on the printout.

## Show Payment Orders Single Dialog Workspace

Use this workspace to view a list of payment orders.

This workspace sub-tab shows only the payment orders that match the selection criteria that you specify in the tab.

If a vendor claims that you did not make a payment, use this workspace and the Show Payment Reconciliation workspace to research the issue.

### Show Payment Orders Tab

This section includes the fields and descriptions for the Show Payment Orders tab.

### Selection Criteria Island

Field	Description
<b>Payment Date</b>	Here you can enter an interval of payment dates. The table will only show payment orders with payment dates within this interval.
<b>Vendor No.</b>	Here you can enter a range of vendor numbers. The table will only show payment orders for payment vendors numbered within this range.
<b>Supplier No.</b>	In these fields, you can specify a range of supplier numbers. Maconomy will only show payment orders with suppliers within this range.

Field	Description
<b>Company No.</b>	In these fields, you can specify a range of company numbers. Only payment orders with an assigned company number within this range will be shown in the table part of the window.
<b>Paym. No.</b>	Here you can enter a range of payment numbers. The table will only show payment orders numbered within this range.
<b>Payer Identification</b>	Here you can enter a range of payer identifications. The table will only show payment orders with a payer identification within this range.
<b>Check No.</b>	Here you can enter a range of check numbers. The table will only show payment orders with a check number within this range.
<b>Check Book</b>	Here you can select a check book. The table will only show payment orders with the selected check book.
<b>Payment Agent</b>	Here you can select a payment agent. The table will only show payment orders related to the selected payment agent.
<b>Payment Mode</b>	Here you can enter a range of payment modes. The table will only show payment orders that are related to the chosen payment mode.
<b>Origin</b>	Here you can select that a payment must be of a specific origin. The table part will only show payment orders of the selected origin.
<b>Payment Form</b>	Here you can select a payment form. The table will only show payment orders with the selected payment form.
<b>Show Paid</b>	If you mark this field, payment orders already paid will be included in the table part.
<b>Show Error Reported/ Reversed</b>	If you mark this field, erroneous, reversed, or canceled payment orders will be included in the table part.
<b>Show Non-closed</b>	If you mark this field, closed payment orders will not be included in the table part.
<b>Show Zero-balanced Payment Order</b>	If you mark this field, payment orders with a zero-balance will be included in the table part.
<b>Show Payment Selection</b>	If you mark this field, payment selections will be included in the table part.

### Payment Orders Sub-Tab

This section includes the fields and descriptions for the Payment Orders sub-tab.

Field	Description
<b>Payment Date</b>	This field shows the date the payment date of the payment order.

Field	Description
<b>Vendor No.</b>	This field shows the payment order's payment vendor number.
<b>Supplier No.</b>	This field shows the number of the supplier.
<b>Company No.</b>	This field shows the number of the customer.
<b>Paym. No.</b>	This field shows the payment order's payment number. It is taken from the window System Numbers every time you make a payment in the Automatic Payment window and is given to all the payment orders in the payment round.
<b>Paid, Currency</b>	This field shows the payment order amount in the delivery vendor's currency.
<b>Discount, Currency</b>	This field shows how much discount was given in the vendor's currency.
<b>Currency</b>	This field shows the delivery vendor's currency.
<b>Paid, Base</b>	This field shows the payment order amount in base currency.
<b>Discount, Base</b>	This field shows how much discount was given in the company's base currency.
<b>Payment Mode</b>	This field shows the payment mode.
<b>Payment Form</b>	This field shows the payment form of the current payment order. This field shows the payment agent used for the payment.
<b>Payment Agent</b>	This field shows the payment agent used for the payment.
<b>Card Type Code</b>	This field shows the payment order's card type code. This field shows the payment order's payer identification.
<b>Payer Identification</b>	This field shows the payment order's payer identification.
<b>Transaction Serial No.</b>	This field shows the transaction serial number of the payment order.
<b>Payment Description</b>	This field shows the payment description.
<b>Import Date</b>	This field shows the payment order's import date.
<b>Check Book</b>	This field shows the check book assigned to the current payment order.

Field	Description
<b>Check No.</b>	This field shows the number of the check used in connection with the payment order.
<b>Reference Check No.</b>	This field shows the reference number of the check. If a number of payments by check are made using a payment mode with combined payment and remittance to the receiver of the amount, a check will be printed out with the full amount and any assigned remittance lines. If the number of remittance lines take up more space than allocated on the check, a number of checks will be printed out to match the space needed for the remittance lines. The extra checks all contain a zero amount and a reference check number which corresponds to the number of the original check.
<b>Origin</b>	This field shows the origin of the payment order.
<b>Payment Selection</b>	This field shows whether the payment order has been selected for payment.
<b>Entered</b>	This field shows whether the payment order has been registered, that is, that the payment agent has acknowledged receipt of the amount.
<b>Paid</b>	This field shows whether the payment order has been paid, that is, that the payment agent has registered it as paid.
<b>Closed</b>	This field shows whether the payment order has been closed. It is closed when it has been approved as paid, closed, or error reported.
<b>Canceled</b>	This field shows whether the payment order has been canceled.
<b>Error Reported</b>	This field shows whether the payment order has been error reported.
<b>Reversed</b>	This field shows whether the payment order has been reversed.
<b>Changed By</b>	This is the name of the user who last changed the payment order information. The field is updated by Maconomy every time a change is entered in the Payment Reporting window. If you have not changed the order, it shows the name of the user who created the payment order.
<b>Changed On</b>	This is the date on which the payment order information was last changed. The field is updated by Maconomy every time a change is entered in the Payment Reporting window. If you have not changed the order, it shows the date on which the payment order was created.

## Show Payment Reconciliation Single Dialog Workspace

Use this workspace to review the payment orders that Maconomy creates in the automatic payment process. The tab shows the payment order that will be sent to the payment agent, and the sub-tab list the vendor entries covered by the payment.

If a vendor claims that you did not make a payment, use this workspace and the Show Automatic Payment workspace to research the issue.

If a payment selection exists for the current payment order, as indicated in the Payment Status island, you can edit the individual vendor entries in the sub-tab to change the amount to be paid or the discount amount.

You can also add or delete vendor entries. For example, if you receive a vendor invoice and a vendor credit memo that add up to zero, some payment agents cancel out the two entries and do not send any remittance text about the cancellation to the vendor. To avoid this, the invoice and credit memo must be in separate payment files. If they both appear in this workspace, you can remove one of them, create the payment file, then run another payment selection that includes the entry that you removed. Then both entries will appear on statements from the payment agent to the vendor.

### Show Payment Reconciliation Tab

This section includes the fields and descriptions for the Show Payment Reconciliation tab.

#### Payment Island

Field	Description
<b>Vendor No.</b>	This field shows the payment order's payment vendor number.
<b>Name 1 – 3</b>	These fields show the name of the company customer or company vendor, depending on the origin of the payment line.
<b>Supplier No.</b>	This field shows the number of the supplier.
<b>Customer No.</b>	This field shows the number of the customer.
<b>Giro</b>	This field shows the giro number assigned to the pay-to vendor.
<b>Credit Card No.</b>	This field shows the credit card number assigned to the pay-to vendor.
<b>CPC No.</b>	This field shows the CPC number assigned to the pay-to vendor.
<b>Reg. No.</b>	This field shows the registration number assigned to the pay-to vendor.
<b>Account No.</b>	This field displays the account number of the current company.

Field	Description
<b>G/L Account No.</b>	This field shows the number of the G/L account at which the amount is posted.
<b>Payment Date</b>	This field shows the payment order's payment date.
<b>Currency</b>	This field shows the delivery vendor's currency.
<b>Paid, Currency</b>	This field shows the payment order amount in the vendor's currency.
<b>Discount, Currency</b>	This field shows how much discount was given in the delivery vendor's currency.
<b>Base Currency</b>	This field shows the currency used as base currency in the company the payment has been made to. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of company base currency and enterprise currency.
<b>Paid, Base</b>	This field shows the amount paid in the base currency.
<b>Discount, Base</b>	This field shows how much discount was given in the base currency.

### User Island

See the "Getting Started" topic for a description of the fields in the island User.

### Payment Information Island

Field	Description
<b>Paym. No.</b>	This field shows the payment order's payment number. Maconomy allocates a number from the window System Numbers when you make a payment from the Automatic Payment window. The number is given to all the payment orders being transferred.
<b>Payment Group No.</b>	If a payment group is assigned to the payment order, this field will show the number of the payment group.
<b>Payment Line No.</b>	This field shows the number of the current payment order. This field shows the payment order's payment mode.
<b>Payment Mode</b>	This field shows the payment order's payment mode.
<b>Payment Form</b>	This field shows the payment order's payment form. This field shows the payment agent used for payment.
<b>Payment Agent</b>	This field shows the payment agent used for payment.

Field	Description
<b>Check Book</b>	This field shows the selected check book if the payment is made by check.
<b>Check No.</b>	This field shows the number of the check used for the payment.
<b>Reg. No.</b>	This field shows the registration number used for the payment order.
<b>Account No.</b>	This field shows the account number used for the payment order.
<b>Card Type Code</b>	This field shows the card type code used for the payment order.
<b>Payer Identification</b>	This field shows the payment order's payer identification.
<b>Origin</b>	This field shows the origin of the payment order.
<b>Payment Description</b>	This field shows the payment description given.
<b>Import Date</b>	This field shows payment order's import date.
<b>Transaction Serial No.</b>	This field shows the transaction serial number of the payment order.

#### Payment Status Island

Field	Description
<b>Payment Selection</b>	If this field is marked, a payment file has been created for the payment order, or the manual payment order has been approved.
<b>Entered</b>	This field shows whether the payment order has been entered, that is, that the payment agent has acknowledged receipt of the amount.
<b>Paid</b>	This field shows whether the payment order has been paid, that is, that the payment agent has registered it as paid.
<b>Closed</b>	This field shows whether the payment order has been closed. It is closed when it has been approved as paid, closed, or error reported.
<b>Canceled</b>	This field shows whether the payment order has been canceled.
<b>Error Reported</b>	This field shows whether the payment order has been error reported.
<b>Reversed</b>	This field shows whether the payment order has been reversed.

## Payment Reconciliation Sub-Tab

This section includes the fields and descriptions for the Payment Reconciliation sub-tab.

Field	Description
<b>Invoice No.</b>	This field shows the vendor entry's invoice number.
<b>Trans. No.</b>	This field shows the vendor entry's transaction number.
<b>Trans. Type</b>	This field shows the transaction type of the vendor entry.
<b>Invoice Date</b>	This field shows the vendor entry's invoice date.
<b>Entry Description</b>	This field shows the vendor entry's entry text.
<b>Debit, Currency</b>	This field shows the debit amount in currency on the current vendor entry.
<b>Credit, Currency</b>	This field shows the credit amount in currency on the current vendor entry.
<b>Discount, Currency</b>	This field shows how much discount was given in the vendor's currency in this reconciliation.
<b>Paid, Currency</b>	This field shows how much of the vendor entry was paid in the vendor's currency.
<b>Remainder, Currency</b>	This field shows the remainder of the vendor entry in the vendor's currency.
<b>Paid, Base</b>	This field shows the amount paid by the vendor entry. The amount is stated in the vendor's base currency.
<b>Discount, Base</b>	This field shows how much discount the vendor has been granted. The amount is stated in the vendor's currency.
<b>Supplier No.</b>	This field shows the number of the supplier whom the current entry concerns.
<b>Entry Line Number</b>	This field shows the line number of the current vendor entry.

## Show Payment Remittance Single Dialog Workspace

Use this workspace to review the payment orders that Maconomy creates in the automatic payment process. The tab shows a payment order that will be sent to a payment agent, and the sub-tab shows the remittance information that will be sent to the vendor with each payment.

Maconomy creates the information that you see in this workspace when you make a payment selection in the Payment Selection workspace. You can change and delete the automatically

created remittance lines or create additional lines. If you select the **Create Remittance Lines** option for a payment mode, Maconomy includes the lines in the payment file that it subsequently creates in the Payment Files workspace.

When a payment for a vendor contains many entries, it might exceed the maximum number of remittance lines for the vendor allowed by the payment agent. Maconomy resolves this problem by splitting the payment into multiple payment lines. For example, if a maximum of four remittance lines are allowed per payment, and you select six entries for payment to a vendor, Maconomy splits the payment into two payments, one with four entries and one with two entries.

## Show Payment Remittance Tab

This section includes the fields and descriptions for the Show Payment Remittance tab.

### Payment Island

Field	Description
<b>Vendor No.</b>	This field shows the payment order's payment vendor number.
<b>Name 1 – 3</b>	These fields show the name of the company customer or company vendor, depending on the origin of the payment line.
<b>Supplier No.</b>	This field shows the number of the supplier.
<b>Customer No.</b>	This field shows the number of the customer.
<b>Giro</b>	This field shows the giro number assigned to the pay-to vendor.
<b>Credit Card No.</b>	This field shows the credit card number assigned to the pay-to vendor.
<b>CPC No.</b>	This field shows the CPC number assigned to the pay-to vendor.
<b>Reg. No.</b>	This field shows the registration number assigned to the pay-to vendor.
<b>Account No.</b>	This field displays the account number of the current company.
<b>Customer No.</b>	This field shows the number of the customer.
<b>G/L Account No.</b>	This field shows the number of the G/L account at which the payment mode is posted.
<b>Payment Date</b>	This field shows the payment order's payment date.
<b>Currency</b>	This field shows the delivery vendor's currency.

Field	Description
<b>Paid, Currency</b>	This field shows the payment order amount in the vendor's currency.
<b>Discount, Currency</b>	This field shows how much discount was given in the delivery vendor's currency.
<b>Paid, Base</b>	This field shows the payment order amount in the base currency.
<b>Discount, Base</b>	This field shows how much discount was given in the base currency.

### Remittance Island

**Max. Characters Per Line** If the payment order's payment form allows you to give remittance to the payee, this field shows how many characters you can use on each remittance line. If a remittance text in the table is longer than the maximum length, Maconomy will cut it off in the payment file.

Field	Description
<b>Max. No. of Lines</b>	If the payment order's payment form allows you to give remittance to the payee, this field shows how many remittance lines are available in each payment order.

### User Island

See the "Getting Started" topic for a description of the fields in the island User.

### Payment Information Island

Field	Description
<b>Paym. No.</b>	This field shows the payment order's payment number. Maconomy allocates a number from the window System Numbers when you make a payment from the Automatic Payment window. The number is given to all the payment orders being transferred.
<b>Payment Group No.</b>	This field shows the number of the payment group if a group is assigned to the payment order.
<b>Payment Line No.</b>	This field shows the line number of the current payment order. This field shows the payment order's payment mode.
<b>Payment Mode</b>	This field shows the payment order's payment mode.
<b>Payment Form</b>	This field shows the payment order's payment form.
<b>Payment Agent</b>	This field shows the payment agent used for the payment.

Field	Description
<b>Check Book</b>	This field shows the check book if payment is made by check.
<b>Check No.</b>	This field shows the number of the check if payment is made by check.
<b>Reg. No.</b>	This field shows the registration number used for the payment order.
<b>Account No.</b>	This field shows the account number used for the payment order.
<b>Card Type Code</b>	This field shows the card type code used for the payment order.
<b>Payer Identification</b>	This field shows the payment order's payer identification.
<b>Origin</b>	This field shows the origin of the payment order.
<b>Payment Description</b>	This field shows the payment description given.
<b>Import Date</b>	This field shows payment order's import date.
<b>Transaction Serial No.</b>	This field shows the transaction serial number of the payment order.

**Payment Status Island**

Field	Description
<b>Payment Selection</b>	If this field is marked, a payment file has been created for the payment order, or the manual payment order has been approved. This means that if you change the lines in this window, you will need to reprint the payment file or reapprove the manual payment selection.
<b>Closed</b>	This field shows whether the payment order has been closed. It is closed when it has been approved as being paid, closed, or error reported.
<b>Entered</b>	This field shows whether the payment order has been entered, that is, that the payment agent has acknowledged receipt of the amount.
<b>Paid</b>	This field shows whether the payment order has been paid, that is, that the payment agent has registered it as paid.
<b>Error Reported</b>	This field shows whether the payment order has been error reported.
<b>Reversed</b>	This field shows whether the payment order has been reversed.

## Remittance Lines Sub-Tab

This section includes the fields and descriptions for the Remittance Lines sub-tab.

Field	Description
<b>Line No.</b>	This field shows the line number of the remittance.
<b>Line Type</b>	In this field, you can select the line type to be assigned to the current remittance line. You can choose between the types "Header," "Invoice Text" and "Footer." Headers and footers are only printed once per payment order, whereas the invoice text is printed per invoice and credit memo.
<b>Remittance Text</b>	In this field, you can enter or edit the remittance text which will be transferred to the payee.
<b>No. of Characters</b>	This field shows the length of the remittance text.
<b>Paid, Currency</b>	<p>In this field, you can enter or edit how much will be paid for the invoices or credit memos the remittance lines are for.</p> <p>Maconomy only uses this information if the payment format has a separate field for the amount.</p>

## Show Vendor Entry Payment Single Dialog Workspace

Use this workspace to view how an entry was paid. The tab shows a vendor entry and the sub-tab shows payments made against the entry, including error-reported and reversed payments.

This workspace is read-only and has no actions.

### Example

For example, assume that:

1. You have a vendor invoice for \$1,000 USD.
2. You select the entry for payment and print a \$1,000 check.
3. You decide to cancel the check.
4. You select the entry for partial payment and print a check for \$600.
5. You select the entry again and print a check for the \$400 balance.

In the tab, you can see the vendor entry. In the sub-tab, you see three entries:

- A cancelled payment of \$1000.
- A payment of \$600.
- A payment of \$400.

For information about the fields in the tab, see the help for the fields in the sub-tab of the Change Payment Selection workspace.

For information about the fields in the sub-tab, see the help for the fields in the tab of the Show Payment Reconciliation workspace.

### Show A/P Entry Payment Tab

This section describes the Show A/P Entry Payment tab.

#### Copy to Come

Field	Description

### Payment Reconciliations Sub-Tab

This section describes the Payment Reconciliations sub-tab

#### Copy to Come

Field	Description

## Customer Payment Section

This section includes the fields and descriptions for the Customer Payment Section workspaces.

### Collection Selection Single Dialog Workspace

Use this workspace to create and print collection selections for multiple customers at a time. When Maconomy selects an entry, it designates the Remainder amount for collection.

When you create a collection selection, all entries within the specified selection criteria are evaluated. Maconomy selects an entry for collection if:

- The **Electronic Collection** field is selected for the entry.
- The due date for the entry is before or equal to the specified collection date.

You can choose to select only those entries that are not already selected for collection. To do this, deselect the **Overwrite Existing** check box.

You can choose to select only those entries that are not being reconciled in the Customer Open Entry Reconciliation workspace. To do this, deselect the **Overwrite Settled** check box.

## Collection Selection Tab

This section includes the fields and descriptions for the Collection Selection tab.

## Selection Criteria Island

Field	Description
<b>Company No.</b>	In these fields, you can enter a range of companies. If you enter a range, the printout will only contain collection selections for customers attached to companies within the range. If you do not specify a range, the companies do not affect which collection selections are printed.
<b>Customer No.</b>	In these fields, you can enter a range of customer numbers. Collection selections are only made and printed for customers within the specified range.
<b>Customer Group</b>	In these fields, you can select a customer group. Collection selections are only made and printed for customers within the specified customer group.
<b>Cust. Payment Mode</b>	In these fields, you can select a customer payment mode. Collection selections are only made and printed for entries with the selected customer payment mode.

## Collection Selection Island

Field	Description
<b>Create Selection</b>	In this field you can specify if you want to create a new collection selection. If you check the box, a new collection selection is made and printed. If you do not check the box, the latest and possibly revised collection selection is printed, however only for entries within the ranges of the selection criteria.
<b>Overwrite Existing</b>	In this field, you specify whether entries already selected for collection should be processed when creating the collection selection. An entry is selected for collection if the field "Collection" in the table part of the window Change Collection Selection is completed.  If the field is marked, previously created collection selections and any changes to these will be overwritten when a new collection selection is created. This is however only true for A/R entries within the entered range of selection criteria. If you unmark this field, Maconomy will only process those A/R entries within the entered range of selection criteria which are not already selected for collection.
<b>Collection Date</b>	In this field, you enter a cut-off date for the entries you select for collection. If the due date of the individual entry is before or on the collection date specified, the entry is selected for collection. The field is mandatory.

**Currency Island**

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which collection selections should be displayed. The current collection selection will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table for sales selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	<p>In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table for sales selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."</p>

**Print Control Island**

Field	Description
<b>Layout</b>	<p>In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.</p>

## Change Collection Selection Single Dialog Workspace

Use this workspace to select entries for collection for a specific customer.

You can make a selection automatically by creating a collection selection from a given due date in the Collection Selection workspace, or by manually selecting the individual entries in this workspace. In this workspace, you can also specify how many of the individual entries to collect.

This workspace tab includes credit memos for the customer; Maconomy reconciles them when you create and approve collection selections. Maconomy reconciles and closes an invoice and a credit memo of identical amounts when you create the collection file.

You can change an existing collection selection, regardless of whether you created it in this workspace or the Collection Selection workspace. You can, for example, deselect some entries after Maconomy makes its suggestion.

If you want to create collection selections for all or a range of customers at one time, use the Collection Selection workspace.

When you complete the collection and post the journal, you can go to the Show Customer Reconciliation workspace in the A/R module to see which invoices the collection covers.

## Change Collection Selection Tab

This section includes the fields and descriptions for the Change Collection Selection tab.

### Customer Island

Field	Description
<b>Customer No.</b>	This field shows the customer number. The customer name and address information is also displayed. The information is retrieved from the customer information card.

### Company Island

Field	Description
<b>Settling Company</b>	This field shows the name of the company registered as settling company for the current customer.

### Balance Island

Field	Description
<b>Balance, Currency</b>	This field shows the current balance of the customer in currency. The balance is updated when posting journals which contain entries that pertain to the current customer. The field is updated automatically and cannot be changed.
<b>Balance, Base</b>	This field shows the customer's current balance in base currency. The balance is updated when posting journals which contain entries that pertain to the current customer. The field is updated automatically and cannot be changed.

### Calculation of Collection Selection Island

Field	Description
<b>Latest Due Date</b>	This is a cut-off date for the selection of entries for collection. If the due date of the individual entry is before or on the specified date, the entry is selected for collection when you select the action "Create Collection Selection."

### Collection Island

Field	Description
<b>Selected for Collection</b>	This box shows if the customer has been selected for collection. If only one entry is selected for collection, the customer is regarded as having been selected for collection, and the box is checked. The box is checked or unchecked automatically by Maconomy and cannot be changed.
<b>No. Entries Selected</b>	In this field Maconomy shows how many entries pertaining to the current customer are selected for collection. The field is updated

Field	Description
	automatically and cannot be changed. If an entry is currently being collected, it is regarded as being selected for collection.
<b>Collected in Standard Currency</b>	This field shows the sum of the entries selected for collection. The amount is displayed in the currency of the customer. The field is updated automatically and cannot be changed.
<b>Show Electronically Collected Only</b>	If you check this box, the table part of this window will only display entries which are to be collected electronically.

### Payment Control Island

Field	Description
<b>Cust. Payment Mode</b>	In this field you select the mode in which the customer will normally be paying. The customer payment mode is used for selecting the customer payment mode and the payment agent and is transferred when you create invoices and credit memos. The customer payment mode can, however, be changed on the individual invoice or credit memo or in the window Change Payment Selection in the Banking module. The customer payment mode is furthermore used for calculating the customer's payer ID. Payment modes are maintained in the window Payment Modes in the Banking module.
<b>Collection Agreement</b>	In this field, you can enter the agreement number that the current customer has been assigned at the payment agent who is connected to the selected customer payment mode. The field is only used for electronic customer payment modes.
<b>Collection Group No.</b>	In this field, you can specify the collection group number to which the current customer belongs. The collection group number is supplied by the payment agent. If the payment mode of the customer is electronic, you must specify a collection group number in this field.

### A/R Entries Sub-Tab

This section includes the fields and descriptions for the A/R Entries sub-tab.

Field	Description
<b>Invoice No.</b>	This field shows which invoice is being collected. The field shows the customer's invoice number, derived from the invoice which was created in the window Invoices or in the window Sales Orders in the Sales Orders module. This field cannot be changed.
<b>Trans. Type</b>	This field shows the transaction type of the customer entry.
<b>Due Date</b>	This field shows the entry's due date. The due date is calculated from the invoice date and the customer's terms of payment. The date determines whether the entry is selected for collection when you select the action

Field	Description
	<p>“Create Collection Selection.” The entry is selected if the date is before or on the cut-off date specified in the card part of the window. The value derives from the invoice in the window Invoices in the Sales Orders module and cannot be changed here.</p>
<b>Debit, Currency</b>	<p>This field shows the amounts of the individual debit entries. The amount is displayed in the customer’s currency. Debit entries are derived from the entry of invoices in either an invoice journal or in a general journal.</p>
<b>Credit, Currency</b>	<p>This field shows the amounts of the individual credit entries.</p> <p>The amount is displayed in the customer’s currency. Credit amounts are derived from the entry of credit memos in either an invoice journal or in a general journal.</p>
<b>Remainder, Currency</b>	<p>This field shows how great a portion of the original entry amount to be collected or reconciled.</p> <p>If you enter a discount on the line, Maconomy will automatically adjust the amount in this field with the discount amount. The field is updated automatically by Maconomy and cannot be changed.</p> <p>If you use the action “Create Collection Selection,” the amount in this field will be collected, that is, the balance amount is transferred to the field “Collection.”</p>
<b>Collection, Currency</b>	<p>In this field, you can indicate how great a portion of the entry you want to collect. Amounts are only selected for collection if electronic collection is used. If collection selections are created automatically, Maconomy will always select the full balance amount for collection.</p>
<b>Being Collected, Currency</b>	<p>In this field, Maconomy shows how great a portion of the entry is being collected. The amount is displayed in the customer’s currency. An entry is considered as being collected from the moment it is included in a collection file created in the window Collection Files, until it is approved as having been collected in the window Customer Payment Reporting.</p>
<b>Cust. Payment Mode</b>	<p>In this field, you select how the invoice is to be collected. The customer payment mode contains a reference to a G/L account against which the customer payment should be offset, or in other words to which G/L account the customer payment should be made. The account reference is made by means of a dimension combination in the window External Accounts.</p>
<b>Global Location No.</b>	<p>If the customer has requested that you use a specific global location number on collections, you can specify the location number in question here. Maconomy suggests the global location number from the invoice on which the current collection line is based, but you can change it here.</p> <p>For further information about the concept of global location numbers, see the introduction to the window Company Locations in the G/L module.</p>
<b>Original Due Date</b>	<p>This field shows the original due date.</p>

Field	Description
<b>Electronic Collection</b>	If this field is filled, the entry is collected electronically.
<b>Entry Description</b>	This field shows the entry description of the invoice. The description derives from the entry of invoices and cannot be changed.
<b>Original Amount</b>	This field shows the invoice's original amount in currency. The value derives from the entry of invoices and cannot be changed.
<b>Original Currency</b>	This field shows the currency in which the invoice was entered. The value derives from the entry of invoices and cannot be changed.
<b>Date Posted</b>	This field shows the date upon which the entry was posted. The date cannot be changed.
<b>Entry Date</b>	This field shows the entry date entered in the window Invoices when registering the entry. You can change the date in this window. The information is used when creating a collection file in the window Collection Files.
<b>Payer Identification</b>	This field show the customer's payer ID as entered in the corresponding field in the window Payment Information in the A/R module. You can change the value in this window. The Payer ID is used when creating a collection file in the window Collection Files so that the customer can identify which customer entry a given collection concerns.

## Actions

This section shows the Actions available in the Change Collection Selection workspace.

### Top Tab

Field	Description
<b>Create Collection Selection</b>	<p>When this action is selected, a collection selection is automatically created for the current customer. All entries are processed, and if the due date is before or on the cut-off date specified, the entry is selected for collection. The balance amount is used as the amount to be collected, and the field "Balance" is reset to zero.</p> <p>All previous selections and any changed selections are overwritten. If you only wish to recalculate customer entries not already selected for collection, you should instead use the window Collection Selection and unmark the field "Overwrite Existing."</p>
<b>Remove Collection Selection</b>	When this action is selected, all amounts in the field "Collection" will be changed to zero, and the amounts in the field "Balance" will be restored.

## Collection Files Single Dialog Workspace

Use this workspace to generate a collection file for electronic collections.

When you generate the collection file, Maconomy creates a collection order based on the selection criteria that you enter.

When you create the collection file, Maconomy prints a specification of all of the entries included in the collection file.

To create a collection file, you must, at a minimum, select the **Create Collection File** field and enter a file name before you select the Create Collection File action.

Maconomy also creates a Collection journal that you can post in the Posting workspace in the G/L module.

If you choose to use remittances with a payment mode, use the Customer Payment Mode workspace to see the information that the payment agent will send to the customer. Maconomy creates the remittance lines when you create the collection file. If you change the remittance, the changes take effect the next time that you create a collection file using the payment mode.

### Collection Files Tab

This section includes the fields and descriptions for the Collection Files tab.

#### Run Mode Island

Field	Description
<b>Create Collection File</b>	With this box you indicate whether you want to create a collection file. You can only choose not to create a collection file when reprinting previously created collection selections.

#### Selection Criteria Island

Field	Description
<b>Payment Agent</b>	In this field, you select a payment agent. Collections are only included for entries to be collected using the payment agent specified.
<b>Cust. Payment Mode</b>	Here you select a customer payment mode. Collections are only included for entries using the specified customer payment mode.
<b>Company No.</b>	In these fields, you can enter a range of companies. Collections are only included for companies within the given range.
<b>Customer No.</b>	In these fields, you can enter a range of customers. Collections are only included for payment customers within the given range.

**Collection Information Island**

Field	Description
<b>File Name</b>	In this field, you enter the name of the collection file to be created.
<b>Same Collection Date</b>	In this field, you can choose whether all collections are to be made on the date specified in the field "Collection Date" or on the due date of the customer entries.
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which the collection should be displayed. The current selection will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table for sales selected in the window System Information in the Set-Up module. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window.</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table for sales selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."
<b>Collection Date</b>	If the "Same Collection Date" box is checked, this field can be used for specifying a date upon which the collections should be made.
<b>Entry Date</b>	Enter a date other than the default current date when importing from a file. Set the entry date of the journal when creating a collection file and approving an automatic collection.
<b>Remittance Text</b>	In this field, you can enter an optional text. The text is a general text added to all collections. Any remittance text specified for the customer payment mode is also added to all the collections.

**Reprint Island**

Field	Description
<b>Collection No.</b>	If you are reprinting collections, you specify the collection number you wish to reprint in this field.

## Actions

This section shows the Actions available in the Collection Files workspace.

### Top Tab

Field	Description
<b>Create Collection File</b>	<p>When this action is selected, a collection file with the name specified in the field "File Name" is automatically generated. At the same time, a specification of all entries included in the current run will be printed. Maconomy assigns a control list with the address of the payment agent and the address of your company and company registration number to the printout. This control list can be used as an enclosure to be sent along with the disc to the payment agent. This action should also be used if you wish to reprint a collection specification, even if you have selected not to create a collection file in the card part of the window.</p> <p>When collection files are created, a collection journal is also created with the entries being collected. The journals can be posted in the window Posting in the G/L module.</p>

## Read Customer Payments Single Dialog Workspace

Use this workspace to read a file that contains customer payments that you receive from the payment agent.

When Maconomy reads the file, it automatically prints a specification of the entries that it read. Maconomy creates one or more Automatic Customer Payment journals, ready for posting, based on the entries that it read. Maconomy distributes the customer payments to a number of journals so that the journals only contain entries from the same period.

Maconomy creates a customer payment entry and an offset entry for each customer payment. If the payment agent charges you for collections made from your customers, and this information is included in the customer payment file, Maconomy creates a charge entry and an offset entry for each charge.

The customer payment import process reads the file and creates journals for posting. During the import process, Maconomy reads the customer payment lines and displays a message showing how many lines remain to be imported. After the import is completed, Maconomy processes the lines that it read and creates journals for posting.

Maconomy enters all offset entries jointly so that entries to the same account, on the same day, with the same dimension values, become one entry when posting. If you select the **Automatic Posting of Automatic Payments** system parameter, the journals that Maconomy creates are automatically posted upon import. However, the automatic posting only takes place if the payment agent has been set up so that a separate journal is created to receive error entries.

### Interrupted Reading

If reading is interrupted, Maconomy must read the file again, either in its entirety or from where the reading was interrupted. To read the entire file, select the **Read File** option as you would normally do to read customer payment files. To continue the reading, do not select the **Read File** option or enter a run number in the **Run No.** field.

If an error occurred during the previous reading, you receive a warning that you need to convert entries. If you ignore this message, the entries are overwritten.

### Error Messages

If you receive the error message "Wrong number of digits" when reading a file, the format of the customer payment file is incorrect. Check that you selected the correct file, then check that you selected the correct customer payment mode in the Customer Payment Modes workspace.

You may also see one of these messages:

- "Wrong record type in line X" or "Closing record missing" - The format of the customer payment file is incorrect. Usually this error occurs because you selected the wrong file. If you selected the correct file, check that you selected the correct customer payment mode in the Customer Payment Modes workspace.
- "Error in import file. Control no. X" or "Error in expression: ..." - Maconomy cannot validate the import file because it does not contain the correct number of entries or the sum of the paid amounts is wrong. In most cases, an error occurred during transmission of the import file or the import file was edited before Maconomy read it. Contact the payment agent.
- "Error in Get(CustomerPaymentFormat)" - You did not import the format description of the selected customer payment mode. Import format descriptions using the Import Customer Payment Forms program.

Errors can occur that are not related to the format of the file, such as when Maconomy encounters an unknown payer ID for a customer. These entries are called error entries. If you selected the **Create Error Entries** option in the Payment Agents workspace for the payment agent, these entries are sent to a Customer Payment journal. You must reconcile them in the Customer Open Entry Reconciliation workspace in the A/R module before you post the journal.

### Review Previously Read Customer Payments

Use the Show Customer Payments workspace to view or reprint previously read customer payments.

#### Read Customer Payments Tab

This section includes the fields and descriptions for the Read Customer Payments tab.

#### Journal Information Island

Field	Description
<b>Payment Agent</b>	Select the payment agent who supplied the current file in this field.
<b>Trans. No.</b>	Enter a transaction number in this field. If the "Consecutive Trans. No." box in the window Payment Agents is not checked, all G/L and customer entries created will have the transaction number you enter here. If the "Consecutive Trans. No." box in the window Payment Agents is checked, the transaction number will be raised by 1 every time a customer payment is read.

Field	Description
	<p>If you have not checked the box "Reuse Trans. No." in the window System Information in the Set-Up module, Maconomy checks that the transaction number has not already been used for a journal entry in an unposted general or vendor invoice journal belonging to the company applying to the current line or for an already posted G/L entry belonging to the company applying to the current line.</p> <p>If the system parameter "Company specific transaction number check" has been marked, Maconomy checks that the transaction number has not already been used for a journal entry in an unposted general, asset, customer payment or vendor invoice journal belonging to the company applying to the current line or for an already posted G/L entry belonging to the company applying to the current line. If the parameter has not been marked, Maconomy checks that the number has not been used on any other manual transaction in the system, regardless of company number.</p>
<b>Trans. Type</b>	In this field you can enter the transaction type for all customer entries created while reading the customer payments from a file.
<b>Entry Description</b>	<p>In this field, you enter the entry description to be transferred to the G/L and customer entries created when you read the customer payments. See also the description of the "Transfer Customer Payment Date" in the window Payment Agents.</p> <p>If the field "Use Name as Entry Reference" is marked in the window System Information in the Set-Up module, the name of the customer will be used as the entry description when reading new customers.</p>
<b>Common Entry Date</b>	<p>In this field, you can enter an entry date. Maconomy checks that the date specified is within the open posting date range. If you enter a date in this field, the entry date of each of the G/L and customer entries will be set to this date, regardless of the entry date read from the file.</p> <p>If you do not specify a date, Maconomy will use the entry date from the customer payment file.</p>

### Reprint Island

Field	Description
<b>Run No.</b>	When reprinting you must enter the number of the run you want to reprint in this field.

### Run Mode Island

Field	Description
<b>Read File</b>	In this field, you can choose if you want to read new customer payments from a file, if you want to restart an interrupted run, or if you want to reprint previously read customer payments. If you mark the field, you must select the file containing the new customer payments.

Field	Description
	<p>Depending on the payment agent chosen, the customer payment file may contain a delivery number. If you select a file with a delivery number which has already been read by Maconomy, you will be given a warning. You are, however, permitted to read the file anyway, as files with the same payment agent run date can have the same delivery number. Contact your payment agent if you have questions about this.</p> <p>If you want to restart an interrupted run, do not check this box, and do not fill in the field "Run No.." If you want to reprint customer payments previously read, do not check this box either, but fill in the field "Run No." with the number of the run you want to reprint."</p>

### Print Control Island

Field	Description
<b>Layout</b>	<p>In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" and "Detailed" are the only options.</p> <ul style="list-style-type: none"> <li>▪ A standard print comprises one or two lines per customer payment for every payment read. Only two lines per customer payment are printed if the customer payment read contains errors.</li> <li>▪ A detailed print comprises all information regarding the customer payments read.</li> </ul> <p>Maconomy's customer payment module is a general module and that some fields in the printout are not supported by all payment agents. For more information about the fields displayed in the printout, please see the description of the window Show Customer Payments.</p>

## Show Customer Payments Single Dialog Workspace

Use this workspace to view and print all customer payments that Maconomy has read.

**Note:** Not all payment agents support all of the fields in this report .

### Show Customer Payments Tab

This section includes the fields and descriptions for the Show Customer Payments tab.

### Remittance Island

Field	Description
<b>Run No.</b>	This field displays the number of the run mode. The mode number is transferred from the window System Numbers. The number is transferred when you read a file in the window Read Customer Payments, and is

Field	Description
	automatically assigned to all customer payment entries in the current run mode.
<b>Line No.</b>	This field displays the line number of the customer payment entry in the import file. The customer payment file often contains additional lines which are only used for validating the file. These additional lines are not displayed in this window.
<b>Card Type</b>	This field shows the card type code of the customer payment. The card type code is the code of the means of remittance used by the customer to make the payment.
<b>Payer Id.</b>	This field displays the payer ID assigned to the customer payment. The Payer ID is either a unique identification of the customer who paid an amount or an identification of the invoice which was paid.
<b>Register No.</b>	This field displays the file number of the customer payment entry. the file number is an internal reference in the payment agent's system.
<b>Code Serial No.</b>	This field shows the code serial number of the customer payment entry. The code serial number is an internal reference in the payment agent's system.
<b>Customer Payment Date</b>	This field shows the date upon which the amount was transferred from the customer's account.
<b>Vendor No.</b>	This field shows your customer's vendor number in the payment agent's system.

### Entry Island

Field	Description
<b>Amount, Currency</b>	This field shows the amount of the customer payment in currency.
<b>Amount, Base</b>	This is the amount of the customer payment in base currency.
<b>Currency</b>	This is the currency of the customer payment, for example, USD.
<b>Base Currency</b>	This field shows the currency used as base currency in the company that the payment has been made to. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of company base currency and enterprise currency.
<b>Charge Amount, Base</b>	This is a charge amount in base currency, if applicable. Charge Amount, Currency This is a charge amount in currency, if applicable.
<b>Charge Code</b>	This field shows the charge code, if a charge was made for collection your customers. For a description of charge codes, contact your payment agent.

Field	Description
<b>Reverse Amount</b>	This field shows if the entry is a normal customer payment or a reversal of a previous payment. If it is a reverse amount, a customer entry corresponding to a payment is created.
<b>Quantity</b>	This is any registered quantity.
<b>Reverse Quantity</b>	This field shows if the entry is a normal entry or a reversal of a previously registered quantity.

### Error Island

Field	Description
<b>Error Entry</b>	If this field is marked, the customer payment entry is an error entry.
<b>Description</b>	If an error was encountered when reading the current customer payment, this field contains a description of the error. For a description of the individual error messages, please see the description of the field "Create Error Entries" in the window Payment Agents.

### Account Information Island

Field	Description
<b>External Account No.</b>	This field shows the external account number from which the amount was paid.
<b>G/L Account No.</b>	This field shows the G/L account in Maconomy into which the amount is paid.
<b>Account No., Ext. Charge</b>	This field shows the external account number from which a charge was transferred, if applicable.
<b>Charge Account No.</b>	This field shows the G/L account number in Maconomy upon which a charge is entered, if applicable.

### Entry Information Island

Field	Description
<b>Customer No.</b>	This field shows the number of the customer in question.
<b>Reconciliation Type</b>	This field shows if the customer payment concerns an invoice, an interest notice, a reminder, or a statement of accounts.
<b>Reconcil. Trans. No.</b>	This field shows the transaction number of the invoice, the interest notice, or the reminder to which the customer payment pertains.
<b>Entry Date</b>	This field shows the entry date of the entry created in Maconomy.

Field	Description
<b>Entry Description</b>	This field shows the entry description of the entry created in Maconomy.
<b>Trans. No.</b>	This field shows the transaction number of the entry created in Maconomy.
<b>Trans. Type</b>	This field shows the transaction type of the entry.
<b>Journal No.</b>	This field shows the journal number of the posting journal in which the entries created are posted.
<b>Journal Line No.</b>	This field shows the line number of the customer entry in the posting journal of which the entry is a part.

### Collection Island

Field	Description
<b>Agreement No.</b>	This field shows the agreement number of the customer with the payment agent. The agreement number is transferred from the field "Collection Agreement" in the window Payment Information in the A/R module.
<b>Completed</b>	If this box is checked, the customer payment has been completed by the payment agent.
<b>Rejected</b>	If this box is checked, the customer payment has been rejected by the customer.
<b>Cancelled</b>	If this box is checked, the customer payment has been canceled by the payment agent or the customer.

## Customer Payment Reporting Single Dialog Workspace

Use this workspace to manually process collections that you created in connection with a collection file.

If you generated a collection file and subsequently received and read customer payments for the collections that were sent to the payment agent, you do not need to use this workspace, because Maconomy enters all of the collections automatically.

You do, however, need to use this workspace if you want to manually record whether a collection order's status is entered, completed, or error-reported by the payment agent.

In the workspace tab, you can limit which collection orders are to be displayed in the sub-tab. In the sub-tab, you can indicate, on each collection order line, whether the order is entered, completed, or error-reported.

When you use the **Approve Entries** action to approve an entry, Maconomy updates the corresponding customer entries accordingly.

If a collection order is marked as being completed and you select the **Approve Entries** action, Maconomy creates an Automatic Customer Payment journal. When you post this journal,

Maconomy creates an offsetting customer entry. If the collection includes several invoices for the same customer, Maconomy creates one offsetting entry for the total invoiced amount.

**Note:** If you select the **Create Error Entries** field for a payment agent, Maconomy imports any error entries in a journal of the Customer Payment type, which you must reconcile manually before you post.

## Customer Payment Reporting Tab

This section includes the fields and descriptions for the Customer Payment Reporting tab.

### Selection Criteria Island

Field	Description
<b>Collection Date</b>	In these fields, you can enter a range of collection dates. If you enter a range, the table part will only include collection orders with a collection date within the specified range.
<b>Company No.</b>	In these fields, you can enter a range of companies. If you enter a range, the table part will only include collection orders with bill-to customers attached to companies within the specified range.
<b>Customer No.</b>	In these fields, you can enter a range of customer numbers. If you enter a range, the table part will only include collection orders with bill-to customers within the specified range.
<b>Collection No.</b>	In these fields, you can enter a range of collection numbers. If you enter a range, the table part will only include collection orders with collection numbers within the specified range.
<b>Payment Agent</b>	Here you can select a payment agent. If you select a payment agent, the table part will only include collection orders with the selected payment agent.
<b>Cust. Payment Mode</b>	Here you can select a customer payment mode. If you select a customer payment mode, the table part will only include collection orders with the selected customer payment mode.
<b>Show Entered</b>	If you check this box, collection orders which are registered as having been received by the payment agent are shown in the table part of this window.
<b>Show Completed</b>	If you check this box, collection orders which are registered as having been completed by the payment agent are shown in the table part of this window.

### Currency Island

Field	Description
<b>Reporting Currency</b>	In this field, you can specify the currency in which the totals in the statistic island should be displayed. The amount from the vendor entry will be converted into and displayed in this currency.

Field	Description
	<p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the current date and the exchange rate table used is the exchange rate table for sales selected in the window System Information in the Set-Up module.</p> <p>If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p>

### Statistics Island

Field	Description
<b>Total Collections</b>	This line shows both the total number of collection orders displayed in the table part and their total amount.
<b>Reg.</b>	This line shows both how many collection orders were registered by the payment agent and their total amount.
<b>Completed</b>	This line shows both how many of the collection orders were completed by the payment agent and their total amount.
<b>Error Reported</b>	This line shows both how many of the collection orders were error reported and their total amount.
<b>Reporting Currency</b>	In this pop-up field, you can specify the currency in which the amounts in this island should be displayed.

### Collections Sub-Tab

This section includes the fields and descriptions for the Collections sub-tab.

Field	Description
<b>Collection Date</b>	This field displays the collection date of the collection order.
<b>Customer No.</b>	This field displays the bill-to customer number of the collection order.
<b>Collection No.</b>	This field displays the number of the collection order. Maconomy automatically increments the number by one for every new collection generated.
<b>Collected, Currency</b>	This field displays the amount of the collection order in the currency of the bill-to customer.
<b>Collected, Base</b>	This field displays the amount of the collection order in base currency.
<b>Currency</b>	This is the currency of the bill-to customer.

Field	Description
<b>Entered</b>	In this field, you can specify if the collection order has been registered, that is, the payment agent has received and acknowledged the collection order. If you fill in this field, the corresponding customer entries will be updated when you select the action "Approve Entries."
<b>Completed</b>	In this field, you can specify if the collection order has been completed by the payment agent. If you fill in this field, the corresponding customer entries will be updated when you select the action "Approve Entries."
<b>Error Reported</b>	In this field, you can specify if errors have been reported for the collection order. If you fill in this field, the corresponding customer entries will be updated when you select the action "Approve Entries."
<b>Remarks</b>	This field displays the any remarks regarding the current collection order.
<b>Payment Agent</b>	This is the name of the payment agent selected for the current collection order.
<b>Entry Description</b>	This field displays any entry description for the current customer payment.
<b>Ingoing Cust. Payment Transaction No.</b>	This field displays the transaction number used in connection with the current customer payment.
<b>Ingoing Cust. Payment Transaction Type</b>	This field displays the transaction type used in connection with the current customer payment.

## Actions

This section shows the Actions available in the Customer Payment Reporting workspace.

### Top Tab

Field	Description
<b>Approve Entries</b>	When this action is selected, those collection orders in the table part which are registered, completed or error reported are approved. If the field "Create Error Entries" has been marked for the current payment agent in the window Payment Agents, error entries will be added to a journal of the type "Customer Payment" instead of the type "Automatic Customer Payment." This journal then has to be reconciled before it can be posted in the G/L module.

## Show Collection Orders Single Dialog Workspace

Use this workspace to review the collection orders that you created by generating a collection file or by manually entering them in the Change Collection Selection workspace.

The sub-tab shows collection orders based on the selection criteria that you enter.

If a customer claims that a collection never occurred, you can use this workspace and the Show Customer Reconciliations workspace in the A/R module to research the issue.

### Show Collection Orders Tab

This section includes the fields and descriptions for the Show Collection Orders tab.

#### Selection Criteria Island

Field	Description
<b>Collection Date</b>	In these fields, you can enter a range of collection dates. If you enter a range, the table part will only include collection orders with a collection date within the specified range.
<b>Company No.</b>	In these fields, you can enter a range of companies. If you enter a range, the table part will only include collection orders with customers assigned to companies within the specified range.
<b>Customer No.</b>	In these fields, you can enter a range of customer numbers. If you enter a range, the table part will only include collection orders with customers within the specified range.
<b>Collection No.</b>	In these fields, you can enter a range of collection numbers. If you enter a range, the table part will only include collection orders with collection numbers within the specified range.
<b>Payment Agent</b>	Here you can select a payment agent. If you select a payment agent, the table part will only include collection orders with the selected payment agent.
<b>Cust. Payment Mode</b>	Here you can select a customer payment mode. If you select a customer payment mode, the table part will only include collection orders with the selected customer payment mode.
<b>Cust. Payment Form</b>	Here you can select a customer payment form. If you select a customer payment form, the table part will only include collection orders with the selected customer payment form.
<b>Show Completed</b>	If you check this box, collection orders registered as completed by the payment agent are included in the table part of this window. When a collection order is completed, it is also closed.
<b>Show Error Reported</b>	If you check this box, collection orders registered as having errors by the payment agent are included in the table part of this window. When a collection order is reported with errors, it is also closed.

Field	Description
<b>Show Non-closed</b>	<p>If you check this box, the table part of this window will include collection orders not yet closed. If the box is not checked, the table part of this window will not include open collection orders, that is, collection orders not registered as either completed or error reported.</p> <p>If you neither check the fields "Show Completed," "Show Error Reported," nor "Exclude Closed," the table part will not show any collection orders.</p>

### Collection Orders Sub-Tab

This section includes the fields and descriptions for the Collection Orders sub-tab.

Field	Description
<b>Collection Date</b>	This field displays the collection date of the collection order.
<b>Customer No.</b>	This field displays the bill-to customer number of the collection order.
<b>Collection No.</b>	This field displays the number of the collection order.
<b>Collected, Currency</b>	This field displays the amount of the collection order in the currency of the bill-to customer.
<b>Currency</b>	This is the currency of the bill-to customer.
<b>Collected, Base</b>	This field displays the amount of the collection order in base currency.
<b>Cust. Payment Mode</b>	This field displays the customer payment mode of the collection order.
<b>Cust. Payment Form</b>	This is the customer payment form specified for the current collection order.
<b>Payment Agent</b>	This is the name of the payment agent selected for the current collection order.
<b>Collection Description</b>	This is the description of the collection order.
<b>Origin</b>	This field displays the origin of the collection order.
<b>Entered</b>	This field shows if the collection order has been registered, that is, the payment agent has received and acknowledged the collection order.
<b>Completed</b>	This field shows if the collection order has been completed, that is, the payment agent has received the payment from your customer.

Field	Description
<b>Error Reported</b>	This field shows if errors have been reported for the current collection order.
<b>Closed</b>	This field shows if the current collection order has been closed. A collection order is closed if the order is approved as having been completed or error reported.
<b>Changed By</b>	This field displays the name of the user who last changed information in the current collection order. The field is updated automatically by Maconomy when changes are made in the window Customer Payment Reporting. If no changes have been made, the name of the user who created the collection order is displayed.
<b>Changed On</b>	This field displays the date of the latest change in the current collection order. The field is updated automatically by Maconomy when changes are made in the window Customer Payment Reporting. If no changes have been made, the creation date of the collection order is displayed.

## Show Output Data Single Dialog Workspace

Use this workspace to view information about any bank related export of payment files and collection files.

### Output Data Header Tab

This section includes the fields and descriptions for the Output Data Header tab.

#### Output Data Island

Field	Description
<b>Output Data No.</b>	This field shows the number of the output data format.
<b>Number Of Entries</b>	This field shows the number of records in the current payment file.
<b>Number Of Amount Entries</b>	This field shows the number of amount records (payments) in the current payment file.
<b>Amount</b>	This field shows the sum of the amounts contained in the current payment file.
<b>Payment Agent</b>	This field shows the payment agent used when creating the current payment file.
<b>Payment Format</b>	This field shows which payment format was used when creating the current payment file.

Field	Description
<b>Production Date</b>	This field shows the date on which the file was created.
<b>System Number 1 - 3</b>	This fields shows the system number used when creating the current payment files. The system number is created based on the setup of the current payment agent.
<b>Account Number Sum</b>	This show a total of all bank account number. This field will only have a value if the functionality is support by the current payment format
<b>Customer Payment Format</b>	This field shows the name of the existing output data format for the customer payment form.
<b>Output Data Format</b>	This field shows the output data format used in the current outgoing payment format. Output data formats are created in the window Specification of Output Data Formats.
<b>Input Data Format</b>	This field shows the name of the input data format used in the current outgoing payment format. Input data format are created in the window Specification of Input Data Formats. This format is used when importing payment status files in the window Read Payment Status in the Banking module.
<b>File Name</b>	This field shows the name of the created data file
<b>Currency</b>	<p>This field show the currency in which all total will be shown. The reporting currency is both used when printing the payment selection and when printing the payment reports.</p> <p>When converting amounts into the selected currency, Maconomy uses the exchange rates valid on the date specified in the field "Exchange Rate Date," and the exchange rate table used is the exchange rate table for purchases selected in the window System Information in the Set-Up module.</p>
<b>Exchange Rate Date</b>	This field shows the exchange rate date. When converting amounts into the reporting currency, Maconomy uses the exchange rates valid on this date according to the exchange rate table for purchases selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Currency."
<b>Last Group Number</b>	This field shows the used number of groups in the current payment file. The grouping depend on the setup of the payment format.
<b>Remittance incomplete</b>	This fields shows that there is payments with incomplete remittance information. The remittance information must be updated before the payment can be approved.
<b>Error in Payment Order</b>	This field shows that there is an error in the payment file due to a manual change of the selected entries. The problem can be found by reprinting the payment selection.

Field	Description
<b>Origin</b>	This field shows the origin of the payment order.
<b>Preferred Payment Date</b>	This field shows the preferred payment date specified when the payment file was created.

## Bank Reconciliations Section

This section includes the fields and descriptions for the Bank Reconciliations section workspaces.

### Petty Cash Accounts Workspace

Use this workspace to create and maintain petty cash accounts.

A petty cash account is a petty cash box or an account in, for example, a public institution. Decentralized public institutions typically use petty cash accounts to enter small purchases that they enter in the general journal, using one of the reconciliation accounts of the petty cash account, such as cash or a checking account, as the offsetting account. To control the cash content of the petty cash account, you specify minimum and maximum funds limits that determine how large the amount of cash on hand can be.

#### Petty Cash Accounts Tab

This section includes the fields and descriptions for the Petty Cash Accounts tab.

#### Petty Cash Account Island

Field	Description
<b>Name</b>	In this field, you enter the name of the current petty cash account.
<b>Company No.</b>	In this field, you enter the number of the company to which the current petty cash account is assigned.
<b>Offset Company No.</b>	In this field, you enter the name of the central company which follows up on the current petty cash account.
<b>Currency</b>	In this field, you can select the currency of the petty cash account.
<b>Blocked</b>	If this box is checked, no follow-up can be performed on the current petty cash account.

#### Petty Cash Account Refill Island

Field	Description
<b>Min. Cash Funds</b>	In this field, you specify the minimum amount that should be available in the petty cash account at any given time.

Field	Description
<b>Customer No.</b>	In this field, you specify the number of the customer that will refill the petty cash account. The offset company is a customer in the current company when the refill is performed.
<b>Vendor No.</b>	In this field, you specify the number of the vendor to which the refill is transferred. The company to which the petty cash account is assigned is a vendor in the offset company when the refill is performed.
<b>Payment Mode</b>	In this field, you can choose which payment mode to use when refilling the current petty cash account.

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

### Cash Level Island

Field	Description
<b>Posted Balance</b>	This field displays the posted balance of the petty cash account. The balance is the sum of the posted balance for each of the reconciliation accounts assigned to the petty cash account
<b>Approved Balance</b>	This field displays the approved balance of the petty cash account. The balance is the sum of the approved balances of each reconciliation account assigned to the petty cash account.
<b>Ideal Cash Funds</b>	In this field, you enter the ideal cash funds for the current petty cash account. When the petty cash account has been followed up, the actual cash funds will equal the amount specified in this field.
<b>Last Follow-Up</b>	This field displays the date upon which the last follow-up was made.
<b>Being Followed Up</b>	This field displays whether a petty cash account is in the process of being followed up. If this box is checked, funds are currently being transferred to or from the petty cash account. The field cannot be changed here.

### Transfer From Petty Cash Account Island

Field	Description
<b>Max. Stock</b>	In this field, you specify the maximum amount that should be available in the petty cash account at any given time.
<b>Customer No.</b>	In this field, you specify the number of the customer from whose petty cash account the transfer should be made. The company to which the petty cash account is assigned is a customer belonging to the offset company when a transfer is made from a petty cash account.
<b>Vendor No.</b>	In this field, you specify the number of the vendor to whom the transfer should be made. The offset company is a vendor belonging to the current company when a transfer is made.

Field	Description
<b>Payment Mode</b>	In this field, you can choose which payment mode to use when making a transfer from the current petty cash account.

### Bank Account Sub-Tab

This section includes the fields and descriptions for the Bank Account sub-tab.

Field	Description
<b>Payment Agent</b>	This field displays the name of the payment agent used in connection with a follow-up.
<b>Bank Reg. No.</b>	This field displays the registration number of the bank.
<b>Bank Acc. No.</b>	This field displays the account number of the current bank.
<b>Account No.</b>	This field displays the account number of the current company.
<b>Approved Balance</b>	This field displays the approved balance of the current company.
<b>Posted Balance</b>	This field displays the posted balance of the current company.
<b>Company No.</b>	This field displays the number of the current company.
<b>Location</b>	This field displays a value for the Location dimension.
<b>Entity</b>	This field displays a value for the Entity dimension.
<b>Project</b>	This field displays a value for the Project dimension.
<b>Purpose</b>	This field displays a value for the Purpose dimension.
<b>Spec. 1 - 10</b>	These fields display a value for the Specification 1-10 dimensions.
<b>Local Spec. 1 - 10</b>	These fields display a value for the Local Specification 1-10 dimensions.

## Print Follow-Up Selection Workspace

Use this workspace to create and print follow-up selections for one of multiple petty cash accounts at one time.

When you create a follow-up selection, Maconomy processes all of the petty cash accounts in the specified range.

### Print Follow-Up Selection Tab

This section includes the fields and descriptions for the Print Follow-Up Selection tab.

#### Selection Criteria Island

Field	Description
<b>Petty Cash Account</b>	In these fields, you can specify a range of petty cash accounts. The follow-up selection will only affect petty cash accounts within this range.

#### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

## Bank Reconciliations Single Dialog Workspace

Use this workspace to review your bank accounts to ensure that postings to your bank account and G/L accounts correspond, and that postings made by the bank (charges, interest, and so on) are posted to G/L accounts.

You can also use this workspace to reconcile entries, one-by-one, with the bank statement, looking for discrepancies.

If there is a discrepancy in the balances of the statement and the G/L accounts when they are reconciled, Maconomy issues a warning. Do not complete the reconciliation. However, if the bank statement contains erroneous entries that should not be posted to G/L accounts, you can complete the reconciliation.

The tab of this workspace shows the external accounts to be reconciled and the sub-tab shows entries that you have not yet reconciled.

You can sort the entries by entry date or amount. To show entries up to the closing date of the bank statement, enter the closing date in the **Statement Date** field.

If the statement shows that entries (for example, bank charges or interest) remain to be posted to a G/L account, you can create these entries here.

When you approve the reconciliation of the bank statement, Maconomy creates a bank reconciliation journal to be posted from the Posting Journal or Print Posting Journal workspace.

You can view approved bank statements in the Show Bank Reconciliation workspace.

## Bank Reconciliations Tab

This section includes the fields and descriptions for the Bank Reconciliations tab.

### Bank Account Island

Field	Description
<b>Payment Agent</b>	This field displays the name of the payment agent.
<b>Reg. No.</b>	This field displays the registration number of the bank account assigned to the G/L account.
<b>Account No.</b>	This field displays the account number of the bank account assigned to the G/L account.

### New Account Statement Island

Field	Description
<b>Statement Date</b>	Here you must enter the statement date of the new statement.
<b>Statement No.</b>	Here you must enter the statement number of the new statement.
<b>Closing Balance</b>	Here you can enter the closing balance stated on the new statement.

### Account Island

Field	Description
<b>Account No.</b>	This field shows the account number assigned to the external bank account.

### Dimensions Island

Field	Description
<b>Location</b>	This field shows the location assigned to the external bank account.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1 – 3</b>	The functionality of these fields is similar to that of the field "Location" above.

Field	Description
<b>Local Spec. 1 - 3</b>	The functionality of these fields is similar to that of the field "Location" above.

### Petty Cash Account Island

Field	Description
<b>Petty Cash Account</b>	<p>In this field, you can specify a petty cash account. If you specify a petty cash account, the external bank account indicated in the card part will be assigned to the petty cash account as the current petty cash account's reconciliation account.</p> <p>If a petty cash account is specified, the company in the island Dimensions must correspond to the company specified for the current petty cash account.</p>

### G/L Account Island

Field	Description
<b>Calculation Date</b>	All calculations are made on this date. The calculation date will be set to the statement date in the New Account Statement island. If this field is empty, the calculation date will be set to today's date.
<b>Posted Account Balance</b>	This field shows the posted balance on the calculation date.
<b>Unposted bank reconciliations, Current statement</b>	This field shows the sum of unposted entries with an entry date before the calculation date. This could either be manual entries created in this window, or it could be vendor payments that have been approved but not paid.
<b>Unposted bank reconciliations, Previous statements</b>	This field shows the sum of unposted entries with an entry date before the calculation date that have been reconciled on a previous bank statement.
<b>Corrected Posted Balance</b>	This field shows the account balance when all unposted entries have been posted. This is the sum of the three previous fields.
<b>Non settled entries before calculation date</b>	This field shows the sum of entries with an entry date before the calculation date, that is, entries that could have been on the current statement.
<b>Settled entries after calculation date, Current statement</b>	This field shows the sum of entries selected for reconciliation with an entry date after the calculation date. That is: entries that should not have been on this statement if you look at the G/L entry date.

Field	Description
<b>Settled entries after calculation date, Previous statements</b>	This field shows the sum of entries selected for reconciliation with an entry date after the calculation date. Entries that should not have been reconciled on a previous statement if you look at the G/L entry date.
<b>Calculated Closing Balance</b>	This field shows the ((corrected posted balance) - (due entries not selected) + (non-due entries selected)). This should be the same as the closing balance for the bank statement.

#### Selection Criteria Island

Field	Description
<b>Show Later Entries</b>	If you mark this field, the table part in the window will also show entries with an entry date that is later than the statement date of the new statement. This option can be useful when you wish to reconcile such entries with the account statement. If you browse to an account with entries for reconciliation after the statement date, Maconomy will mark the field automatically.
<b>Sort by</b>	In this field, you can choose the way in which the lines in the table part are to be sorted. You can choose between "By Date" and "By Amount."

#### Previous Account Statement Island

Field	Description
<b>Statement Date</b>	This field shows the date of the previous account statement.
<b>Statement No.</b>	This field shows the statement number of the last statement.
<b>Closing Balance</b>	This field shows the closing balance of the last statement.

#### Reconciliation Island

Field	Description
<b>Opening Balance</b>	This field shows the opening balance for the current statement (and this will be the same as the closing balance for the previous statement.)
<b>Selected for reconciliation</b>	This field shows the sum of all entries that are currently selected for reconciliation.
<b>Closing Balance, Calculated</b>	This field shows the calculated closing balance. This number is calculated as the sum of the opening balance and the movement (the entries currently selected for reconciliation.)

Field	Description
<b>Closing Balance, Registered</b>	This field shows the closing balance entered by the user in the New Account Statement island.
<b>Difference</b>	This field shows the difference between the registered and the calculated closing balance.
<b>Entries selected for reconciliation</b>	This island shows the number of entries that are currently selected for reconciliation.

### Transaction Numbering Island

Field	Description
<b>Transaction Type</b>	In this field, you can enter a transaction type. By default, the field shows the default transaction type for the bank reconciliation journal.
<b>Number Series</b>	In this field, you can select a transaction number series. By default, the field shows the transaction number series for the transaction type.

### Company Island

Field	Description
<b>Company No.</b>	This field displays the number of the company to which the current bank reconciliation is assigned.
<b>Name</b>	This field displays the name of the company.

### Reconciliation lines Sub-Tab

This section includes the fields and descriptions for the Reconciliation lines sub-tab.

Field	Description
<b>Entry Date</b>	This field shows the entry date. You cannot change the value of posted entries. If you create a new line in the window, it is necessary to enter an entry date. The date must be within the G/L open posting period of the company performing the bank reconciliation. This period can be found in the "Posting Period Setup" window. The transaction type to look for is the one specified in the field "Transaction Types," on the line.
<b>Trans. No.</b>	This field shows the transaction number of the entry. You cannot change the value of posted entries. If you create a new line in the window, you cannot enter a transaction number. Maconomy will automatically enter a transaction number on the entry at the approval of the reconciliation. The transaction number is ignored in the number series "Bank Reconciliation."

Field	Description
<b>Trans. Type</b>	In this field, you can enter a transaction type. By default, the field shows the transaction type selected in the card part. You cannot change the value of posted entries. Also, all entries with the same Trans. No. must have the same Trans. Type.
<b>Description</b>	This field shows the description of the entry. You cannot change the value of posted entries. If you create a new line in the window, it is necessary to enter an entry description.
<b>Debit</b>	This field shows the entry's amount in the G/L account's currency, provided that the entry is a debit entry. You cannot change the value of posted entries. If you create a new line in the window, it is necessary to enter either a debit or a credit amount. Note that a debit entry on the G/L account normally appears as a credit entry on the account statement.
<b>Credit</b>	This field shows the amount of the entry in the currency of the G/L account, provided that the entry is a credit entry. You cannot change the value of the posted entries. If you create a new line in the window, it is necessary to enter either a debit or a credit amount. Note that a credit entry on the G/L account normally appears as a debit entry on the account statement.
<b>Balance</b>	This field shows the current balance of the G/L account.
<b>To Reconcile</b>	In this field, you can specify that the entry is reconciled on approval. If you create new entries in the window, they must be reconciled. In this case, this field is automatically checked and cannot be changed.
<b>Comment</b>	In this field, you can attach a comment to the entry, for instance the entry date of the bank.
<b>Date Posted</b>	This field shows the date posted to the account. If you create a new entry in the window, this field will remain blank and cannot be changed.
<b>Journal No.</b>	This field shows the journal number posting journal to which the entry has been posted. If you create a new entry, this field will remain blank and cannot be changed.
<b>Offset Account No.</b>	If you create a new entry, this field requires that you enter the account number of the offset entry. If the new entry is a debit entry on the G/L account, and this entry is reconciled with the account statement, Maconomy will credit the offset account and vice versa.
<b>Offset Account Text</b>	This field shows the offset account text assigned to the offset account.
<b>Location</b>	In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If

Field	Description
	<p>no value can be derived, Maconomy transfers the value from the field "Location" in the card part of the window, and if no value has been entered in the card part, the standard value is transferred from the window System Parameters in the Set-Up module.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivations for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1 – 10</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1 – 10</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Tax Code</b>	<p>If you create a new entry, you can enter a tax code in this field. Maconomy will automatically suggest that the tax code be assigned to the offset account information card. This can be changed when the line has been created.</p> <p>You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters window. When multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2" and, if enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Currency Direction</b>	If the currency of the account is different from the base currency, you must enter a currency direction in this field. The currency direction specifies which currency table is to be used for the entry. If the currency direction is sales, the currency table for sales should be used and vice versa for purchases.
<b>Check No.</b>	This field shows the check number if payment is made by check.
<b>Check Book</b>	This field shows the check book that can be assigned to a check.
<b>Payment No.</b>	This field shows the number of the payment if payment is made by check or electronically.

Field	Description
<b>Payment Group No.</b>	This field shows the number of the payment group if payment is made by check or electronically.
<b>Payment Line No.</b>	This field shows the number of the payment line if payment is made by check or electronically.
<b>Job No.</b>	Enter the job number that is related to the bank reconciliation line.
<b>Job Name</b>	This field shows the name of the job that is related to the bank reconciliation line.
<b>Activity</b>	Enter the activity number that is related to the bank reconciliation line.
<b>Activity Name</b>	This field shows the name of the activity that is related to the bank reconciliation line.
<b>Task</b>	Enter the task that is related to the bank reconciliation line.
<b>Task Description</b>	This field shows the description of the task that is related to the bank reconciliation line.
<b>Employee No.</b>	Enter the employee number that is related to the bank reconciliation line.
<b>Employee Name</b>	This field shows the name of the employee that is related to the bank reconciliation line.
<b>Customer No.</b>	Enter the customer number for the customer payment.
<b>Customer Name</b>	This field shows the name of the customer who is paying.
<b>Reconc. Invoice No.</b>	Enter the invoice number to be reconciled against the customer payment that you are creating. You can only enter a reconciliation invoice number if you entered a value for Customer No.
<b>Vendor No.</b>	Enter the vendor number for the vendor payment.
<b>Vendor Name</b>	This field shows the name of the vendor that you are paying.
<b>Reconc. Vendor Invoice No.</b>	Enter the vendor invoice number to be reconciled against the vendor payment that you are creating.
<b>Currency</b>	Enter the original currency for the vendor payment.
<b>Currency Amount</b>	Enter the vendor payment, in original currency.

Field	Description
<b>Entry No.</b>	This field shows the entry number for the bank reconciliation line.

## Actions

This section shows the Actions available in the Bank Reconciliations workspace.

### Top Tab

Field	Description
<b>Approve Reconciliation</b>	<p>When you select this action, the entries marked with "To Reconcile" will be reconciled with the new account statement. Approved reconciliations can later be viewed in the window Show Bank Reconciliation.</p> <p>If new entries have been made during the reconciliation, Maconomy will furthermore create a bank reconciliation journal which can be posted from the windows Posting and Print Posting Journal. At the posting, the entries are created and marked as reconciled with the account statement. The transaction numbers of these entries are ignored in the number series "Bank Reconciliation." All new entries are assigned the same transaction number.</p> <p>If you try to approve a reconciliation, and both values in the fields "Balance" (G/L Account) and "Balance" (Bank) are not zero, Maconomy will issue a warning.</p>
<b>Mark All for Reconciliation</b>	When you select this action, all lines in the table part will be marked for reconciliation.
<b>Unmark All for Reconciliation</b>	When you select this action, all lines in the table part will be unmarked for reconciliation, except lines that have been created manually in this window: such lines are not unmarked.

## Show Bank Reconciliation Single Dialog Workspace

Use this workspace to reopen and examine the most recently approved bank reconciliation. You cannot reopen older bank reconciliations.

You approve bank reconciliations in the Bank Reconciliations workspace.

The tab shows bank statements and the sub-tab shows entries to the corresponding G/L account that have been reconciled with each bank statement. Maconomy sorts the entries by entry date.

## Show Bank Reconciliation Tab

This section includes the fields and descriptions for the Show Bank Reconciliation tab.

**Bank Account Island**

Field	Description
<b>Payment Agent</b>	This field shows the name of the payment agent who effects the payment.
<b>Reg. No.</b>	This field shows the registration number of the bank account assigned to the reconciled account statement.
<b>Account No.</b>	This field shows the account number of the reconciled account statement.

**Account Statement Island**

Field	Description
<b>Statement Date</b>	This field shows the date of the current account statement. If the reconciliation has a wrong date, it can be changed here.
<b>Statement No.</b>	This field shows the number of the current account statement. If the reconciliation has a wrong number, it can be changed here.
<b>Opening Bal.</b>	This field shows the opening balance of the current account statement.
<b>Closing Bal.</b>	This field shows the closing balance of the current account statement.

**Reconciliation Island**

Field	Description
<b>Reconciliation Variance</b>	If you have approved a reconciliation in the window Bank Reconciliations even though the account statement and the G/L account have not been fully reconciled, the balance is shown in this field.
<b>Approved</b>	This field shows whether the reconciliation has been approved.
<b>Reopened</b>	This field shows whether the reconciliation has been reopened.

**Petty Cash Account Island**

Field	Description
<b>Petty Cash Account</b>	This is the name of a petty cash account, if the bank reconciliation concerns amounts from a petty cash account.

### Account Island

Field	Description
<b>Account No.</b>	This field shows the account number assigned to the external bank account.

### Company Island

Field	Description
<b>Company No.</b>	This field shows the number of the company to which the current bank reconciliation pertains.

### Dimensions Island

Field	Description
<b>Location</b>	This field shows the value assigned to the external bank account for the Location dimension.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1 - 3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1 - 3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

### Reconciliation lines Sub-Tab

This section includes the fields and descriptions for the Reconciliation lines sub-tab.

Field	Description
<b>Entry Date</b>	This field shows the entry date.
<b>Trans. No.</b>	This field shows transaction number of the entry.
<b>Trans. Type</b>	This field shows the reconciliation transaction type.
<b>Description</b>	This field shows the description of the entry which was reconciled.

Field	Description
<b>Debit</b>	This field shows the entry's amount in the G/L account's currency, provided that the entry is a debit entry.
<b>Credit</b>	This field shows the amount of the entry in the currency of the G/L account, provided that the entry is a credit entry.
<b>Balance</b>	This field shows the current balance of the G/L account.
<b>To Reconcile</b>	This field shows if the entry is reconciled on approval.
<b>Comment</b>	This show comments, if any.
<b>Date Posted</b>	This field shows the date posted to the account.
<b>Journal No.</b>	This field shows the journal number posting journal to which the entry has been posted.
<b>Offset Account No.</b>	This field shows the account number of the offset entry.
<b>Offset Account Text</b>	This field shows the offset account text assigned to the offset account.
<b>Location</b>	This field shows the dimension Location.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1 - 3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1 - 3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Tax Code</b>	This field can show a tax code.
<b>Currency Direction</b>	This field shows the currency direction.
<b>Check No.</b>	This field shows the check number if payment is made by check.
<b>Check Book</b>	This field shows the check book that can be assigned to a check.

Field	Description
<b>Payment No.</b>	This field shows the number of the payment if payment is made by check or electronically.
<b>Payment Group No.</b>	This field shows the number of the payment group if payment is made by check or electronically.
<b>Payment Line No.</b>	This field shows the number of the payment line if payment is made by check or electronically.
<b>Job No.</b>	The field shows the job number that is related to the bank reconciliation.
<b>Job Name</b>	This field shows the name of the job that is related to the bank reconciliation.
<b>Activity</b>	This field shows the activity number that is related to the bank reconciliation.
<b>Activity Name</b>	This field shows the name of the job that is related to the bank reconciliation.
<b>Task</b>	This field shows the task that is related to the bank reconciliation.
<b>Task Description</b>	This field shows the description of the task that is related to the bank reconciliation.
<b>Employee No.</b>	Enter the employee number that is related to the bank reconciliation line.
<b>Employee Name</b>	This field shows the name of the employee that is related to the bank reconciliation line.
<b>Customer No.</b>	This field shows the customer number for the customer payment.
<b>Customer Name</b>	This field shows the name of the customer who is paying.
<b>Reconc. Invoice No.</b>	This field shows the invoice number to be reconciled against the customer payment that you are creating. You can only enter a reconciliation invoice number if you entered a value for Customer No.
<b>Vendor No.</b>	This field shows vendor number for the vendor payment.
<b>Vendor Name</b>	This field shows the name of the vendor that you are paying.
<b>Reconc. Vendor Invoice No.</b>	This field shows the vendor invoice number to be reconciled against the vendor payment that you are creating.
<b>Currency</b>	This field shows the original currency for the vendor payment.

Field	Description
<b>Currency Amount</b>	This field shows the vendor payment, in original currency.
<b>Entry No.</b>	This field shows the entry number for the bank reconciliation. The entry number is a unique number series for each external account.

## Actions

This section shows the Actions available in the Show Bank Reconciliation workspace.

### Top Tab

Field	Description
<b>Reopen Reconciliation</b>	When you select this action, the reconciliation is reopened. It is only possible to reopen the latest approved bank statement.

## Show Bank Reconciliation Lines Single Dialog Workspace

This workspace shows the same information as the sub-tab of the Show Bank Reconciliation workspace.

## Bank Reconciliation Line Tab

This section includes the fields and descriptions for the Bank Reconciliation Line tab.

### Bank Reconciliation Line Island

Field	Description
<b>Payment Agent</b>	This field shows the payment agent.
<b>Reg. No.</b>	This field shows the registration number associated with the reconciliation.
<b>Account No.</b>	This field shows the account number associated with the reconciliation.
<b>Entry No.</b>	This field shows the entry number for the bank reconciliation. The entry number is a unique number series for each external account.
<b>Reconciliation No.</b>	This field shows the reconciliation number.
<b>Entry Date</b>	This field shows the entry date of the entry which was reconciled.
<b>Description</b>	This field shows the description of the entry which was reconciled.

Field	Description
<b>Journal No.</b>	This field shows the journal number of the entry which was reconciled.
<b>Trans. No.</b>	This field shows the transaction number of the Entry that was reconciled.
<b>Transaction Type</b>	This field shows the reconciliation transaction type.
<b>Debit</b>	This field shows the amount that was debited for the reconciliation.
<b>Credit</b>	This field shows the amount that was credited for the reconciliation.
<b>To Reconcile</b>	This field shows if the entry is marked for reconciliation. It is more relevant in the Bank Reconciliations window than here.
<b>Reconciled</b>	This field shows whether or not the reconciliation has been completed.
<b>Comment</b>	This field includes any comments relating to the entry that was reconciled.
<b>Posted</b>	This field shows whether or not the entry that was reconciled has been posted.
<b>Date Posted</b>	This field shows the date on which the entry that was reconciled was posted.
<b>Offset Account No.</b>	This field shows the offset account number relating to the bank reconciliation.
<b>Offset Account Text</b>	This field shows any offset account text relating to the bank reconciliation.
<b>Currency Direction</b>	The currency direction shows which currency table is to be used for the entry. If the currency direction is sales, the currency table for sales should be used and vice versa for purchases.

#### Check Island

Field	Description
<b>Check No.</b>	This field shows the check number that was used for the bank reconciliation.
<b>Check Book</b>	This field shows the number of the check book that was used for the bank reconciliation.

### Output Data Island

Field	Description
<b>Payment No.</b>	This field shows the number of the payment.
<b>Payment Group No.</b>	This field shows the group number to which the Payment No. above belongs.
<b>Payment Line No.</b>	This field shows the line number to which the Payment No. above belongs.

### Company Island

Field	Description
<b>Company No.</b>	This field shows the company number.

### Account Island

Field	Description
<b>Account No.</b>	This field shows the company account number.

### Dimensions Island

Field	Description
<b>Location</b>	This field shows the value of the dimension Location.
<b>Entity</b>	This field displays the value of the dimension Entity.
<b>Project</b>	This field displays the value of the dimension Project.
<b>Purpose</b>	This field displays the value of the dimension Purpose.
<b>Spec. 1 – 3</b>	These fields display the values of the dimensions Spec. 1 – Spec. 3.
<b>Local Spec. 1 – 3</b>	These fields display the values of the dimensions Local Spec. 1 – Local Spec. 3.

## Set-Up Section

This section includes the fields and descriptions for the Set-Up section workspaces.

### Payment Agents Single Dialog Workspace

Use this workspace to maintain information about the payment agents that you use for customer and vendor payments.

You also use the Payment Agents workspace to enter information about payment agents used with the Payment and Customer Payment modules. Payment agents are used for electronic payment of vendors and electronic collection from customers.

**Note:** Maconomy's electronic payment module is a general module. Not all payment agents support all of the fields in this module. For more detailed information, see the documentation that your payment agent provides.

For auditing purposes, it is important that you print and file information about your payment agents every time that you make changes in this workspace.

#### Payment Agents Tab

This section includes the fields and descriptions for the Payment Agents tab.

#### Payment Agent Island

Field	Description
<b>Name</b>	This is the name of the payment agent.
<b>Address</b>	Here you can enter the address of the payment agent.
<b>Your Phone</b>	Here you can enter the phone number of the payment agent.
<b>Your Contact</b>	Here you can enter the name of the payment agent's contact person.
<b>Our Phone</b>	Here you can enter your company's phone number. It is printed on the control list which is sent to the payment agent when you make automatic payments. Normally, you would only send a control list to the payment agent if the payment orders are sent by diskette.
<b>Our Contact</b>	Here you can enter the name of your company's contact person. It is printed on the control list which is sent to the payment agent when you make automatic payments. Normally, you would only send a control list to the payment agent if the payment orders are sent by diskette.
<b>Currency</b>	In this field, you can select which currency to use in connection with the current payment agent. The currency in this field is used if the payment

Field	Description
	agent did not indicate a currency when sending electronic information in connection with collections or customer payments.
<b>Bank Registration No.</b>	Use this field for specifying the registration number of the payment agent. If the payment agent does not usually indicate his registration number when you receive electronic information from him, this field can be used as a default field. This means that the registration number that you specify here is used for all account numbers.

### Payment Control Island

Field	Description
<b>Payment Format</b>	In this field, you can select which payment format to use when using the current payment agent to make vendor payments.

### Customer Payment Control Island

Field	Description
<b>Customer Payment Format</b>	In this field, you can select which customer payment format to use when reading customer payments using the current payment agent.
<b>Entry Description</b>	In this field, you can specify an entry description to be used when a customer payment is made.
<b>Charge Account</b>	In this field, you can specify a dimension combination of the type Posting Reference referring to a G/L account number. The account must exist in Maconomy's chart of accounts and must be a posting account. If the customer payment file contains information about charges incurred in connection with the customer payment, the charge is debited to this account and credited to the bank account related to the customer payment.
<b>Transaction Type</b>	In this field, you can enter the default transaction type for the payment agent. You can select from all transaction types registered in the system (there is no validation.)
<b>Transaction Number Series</b>	In this field, you can select the transaction number series to be used when creating automatic and manual customer payment journals for posting and when receiving electronic information from the payment agent.
<b>Consecutive Trans. No.</b>	When reading a customer payment file, you need to specify a transaction number. The transaction number is used when G/L and Customer entries are created. If you check this box, the transaction number will be increased by one every time a customer payment is read.
<b>Calculate Entry Date</b>	If the customer payment file does not contain an entry date, and no summary entry date is specified when reading the file, the entry date is calculated from the date of payment. If you do not mark this field, the entry date is made

Field	Description
	equal to the date of payment. If you mark this field, the entry date is calculated as the date of collection plus two working days. Please note that bank holidays are not taken into account.
<b>Transfer Registration Date</b>	If you mark this field, the entry text entered in the field "Entry Description" in the window Read Customer Payments is used for the G/L and Customer entries that are made when reading the customer payment file. Apart from that, the date of the current customer payment is transferred. This date is the date upon which the paid amount is drawn from the customer's account.
<b>Transfer Dimensions</b>	If you mark this field, the customer's dimensions are transferred from the customer's information card to the entry lines created when reading the customer payment file.
<b>Create Error Entries</b>	<p>When reading the customer payment file, Maconomy checks the file's contents. If this is marked, Maconomy will create a customer payment with the available but not complete information. The missing information must be entered/changed before the related customer payment journal can be posted.</p> <p>There will not be created a customer payment, If the field is not marked. The user must then manually create the erroneous payments.</p> <ul style="list-style-type: none"> <li>Unknown Payer ID: No customer or customer entry with the payer ID exists. The text "Unknown Payer ID" is transferred to the field "Remarks" in the customer payment. To reconcile the amount against an open customer entry, open the window Show Customer Payments and find the error entry and make a note of the transaction number listed there. Then open the window Customer Open Entry Reconciliation in the A/R module, search for the transaction number, and see if you can reconcile the paid amount manually. If you cannot do that, you can call the bank for more information about the entry.</li> <li>No collection order found: A customer payment was made, but the corresponding collection order cannot be found. In this case, the amount is entered in a journal of the type "Customer Payment" (instead of "Automatic Customer Payment") with the text "No Collection Order Found" entered in the field "Remarks." To reconcile the amount, follow the procedure outlined above in the discussion of the error "Unknown Payer ID."</li> <li>Entry date is outside the open posting period: In this case, the entry date is changed to today's date.</li> </ul>
<b>Separate Journal for Error Entries</b>	When reading the customer payment file, Maconomy checks the file's contents. If an error is encountered, and the field "Create Error Entries" has been marked, Maconomy will create a customer payment with the available but not complete information. If this field is not marked, the erroneous entries are added to the automatic customer payment journal along with the correct entries, which cannot be posted until the errors have been resolved. If the field is marked, the erroneous entries are added to a separate customer

Field	Description
	payment journal which can then be resolved without delaying the posting of the correctly registered payments.

### Payment Information Island

Field	Description
<b>Last Production Date</b>	This field shows the date which indicates when the last file was created.
<b>Last Payment Date</b>	This field shows the date of the last payment file.
<b>Next System No. 1 - 3</b>	The payment format may specify that one or several system numbers must be included in the payment file. Each number can be specified to increment in a different way, for example, starting over every day, month, or year. Maconomy will keep track of the system numbers, but if you need to set the number manually (for example, to set an initial value), you can do so in these fields.

### Customer Payment Information Island

Field	Description
<b>Last Production Date</b>	This field shows the date which indicates when the last customer payment file was created.
<b>Last Import Date</b>	This field shows the date on which the last customer payment file was imported.
<b>Last Collection No.</b>	This field shows the number of the last collection file created.
<b>Next System No. 1 - 3</b>	The customer payment format may specify that one or several system numbers must be included in the customer payment file. Each number can be specified to increment in a different way, for example, starting over every day, month, or year. Maconomy will keep track of the system numbers, but if you need to set the number manually (for example, to set an initial value), you can do so in these fields.

### Access Level Island

Field	Description
<b>Access Level</b>	Here you can enter the name of the access level. Users only have access to information about the current payment agent if they have been assigned to this or a higher access level in the User Access Levels window in the Set-Up module. This means that a user can only specify the payment agent on, for example, payment modes and external accounts if he has access to the payment agent. In addition, a user can only see information of payment agents to which he has access. Please note that this access control model only applies

Field	Description
	if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to payment agents may depend on other factors. For further information about the standard access control configuration, please see "Introduction to the Access Control System" in the Set-Up module.
<b>Description</b>	This field displays a description of the access level.

### User Island

See the "Getting Started" topic for a description of the fields in the island User.

## External Accounts Single Dialog Workspace

Use this workspace to enter and maintain external accounts that you use in connection with payments, customer payments, and bank reconciliation.

This workspace's tab provides information about the external account, and the sub-tab contains information about the payment modes and G/L accounts that are attached to the external account.

### External Accounts Tab

This section includes the fields and descriptions for the External Accounts tab.

### Bank Account Island

Field	Description
<b>Payment Agent</b>	In this field, you enter the name of a payment agent, for example, a bank, to which the external account is assigned.
<b>Reg. No.</b>	Enter the bank's registration number in this field. If the external account is a manual account, you can enter a text instead of an account number.
<b>Account No.</b>	Enter the bank's account number in this field. If the external account is a manual account, you can enter a text instead of an account number.
<b>Description</b>	In this field, you can enter a description of the external account specified in the field "Account No." above. Information entered in this field is included on printouts of external accounts.
<b>IBAN Account No.</b>	Enter the bank's IBAN account number in this field. The information is available when printing Job Invoices, A/R statements, Interest Notes and Reminders.
<b>SWIFT</b>	Enter the bank's Swift account number in this field. The information is available when printing Job Invoices, A/R statements, Interest Notes and Reminders.

Field	Description
<b>Bank Reconciliation</b>	If you check this box, bank reconciliation lines will be created when you post on the account specified in the Dimensions island. Bank reconciliation is done in the window Bank Reconciliations in the Banking module.

### Selection Criteria Island

Field	Description
<b>Currency</b>	<p>Use this field to specify the currency on the external accounts for both invoicing (it is matched against the invoicing currency), and for vendor payments (it is matched against the payment currency).</p> <ul style="list-style-type: none"> <li>External accounts with a currency selected are used for all invoices (for the assigned customer payment modes) and all payments (for the assigned vendor payment modes) in that currency.</li> <li>External accounts without a currency selected are used for all invoices (for the assigned customer payment modes) and all payments (for the assigned vendor payment modes) for all currencies where there is no external account for the given currency.</li> </ul> <p><b>Example</b></p> <p>A company may have a number of bank accounts in different currencies. A UK company may have a bank account in GBP (its main account), but could also have a bank account in USD and EUR. It will use the USD and EUR bank accounts for all transactions in these currencies, so it does not have to pay a currency exchange fee to the bank, and the GBP account for all other currencies.</p> <p>This company will have to select USD on the external account belonging to the USD bank account, so that Maconomy uses this account for all dollar transactions. It will also select EUR on the external account belonging to the EUR bank account, so that Maconomy use this account for all euro transactions. It will not select a currency on the external account belonging to the GBP account, so that this account will be used for all transaction except transactions in USD and GBP.</p>

### User Island

See the “Getting Started” topic for a description of the fields in the island User.

### Company Island

Field	Description
<b>Company No.</b>	In this field, you enter the number of the company to which the external account is attached.
<b>Name</b>	This field shows the name of the company above.

**Account Island**

Field	Description
<b>Account No.</b>	In this field, you can specify the G/L account number that you want to use for the external account.

**Dimensions Island**

Field	Description
<b>Location</b>	In this field, you can specify the Location that you want to use for the external account.
<b>Entity</b>	The functionality of this field is similar to that of "Location" above.
<b>Project</b>	The functionality of this field is similar to that of "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of "Location" above.
<b>Spec. 1 - 3</b>	The functionality of these fields is similar to that of "Location" above.
<b>Local Spec. 1 - 3</b>	The functionality of these fields is similar to that of "Location" above.

## Assignments Sub-Tab

This section includes the fields and descriptions for the Assignments sub-tab.

Field	Description
<b>Payment Mode</b>	In this field, you specify a payment mode if you want to enter a G/L account to be used for entries being paid.
<b>Posting Reference, Being Paid</b>	In this field, you enter the number of a dimension combination containing the G/L account to be used on entries being paid. The dimension combination can also contain other dimension values to be used in this connection. If any other payment mode than Manual Payment is specified, you need to specify an account in this field.  Cust. Payment Mode In this field, you specify a customer payment mode if you want to enter a G/L account to be used for entries being collected.
<b>Posting Reference, Being Collected</b>	In this field, you enter the number of a dimension combination containing the G/L account to be used for entries being collected. If any other customer payment mode than Manual Payment is specified, you need to specify an account in this field.
<b>Spec. 1 – 3</b>	The functionality of these fields is similar to that of "Payment Agent" above.

Field	Description
<b>Local Spec. 1 – 3</b>	The functionality of these fields is similar to that of “Payment Agent” above.

## Payment Modes Single Dialog Workspace

Use this workspace to create the payment modes that you can select in the **Payment Mode** field elsewhere in Maconomy. A payment mode determines how a vendor is paid.

You create a payment mode with a name, a description, and a payment form that specifies whether it is manual or automatic.

If you want to send remittances to recipients for this payment mode, you must fill in the fields in the sub-tab. This is where you define line types, prefixes, suffixes, and margins for remittance text.

Maconomy uses the fields in the Electronic Payment Control island and the last four fields in the Remittance island to create headings for electronic payments. For auditing purposes, it is important that you print and file your payment mode information every time that you make changes in this workspace.

### Payment Modes Tab

This section includes the fields and descriptions for the Payment Modes tab.

#### Payment Mode Island

Field	Description
<b>Name</b>	Here you enter the name of the new payment mode you are creating. Maconomy checks that the name is not already used.
<b>Description</b>	Here you can enter a detailed description of the payment mode. Maconomy shows the text with the name when you use the payment mode.
<b>Payment Form</b>	Here you choose the payment form you wish to use. All payment forms except “Conventional payment” are electronic payment forms. Payment formats and payment forms can be created by importing formats using the program Import Payment Forms. For further information, please see the detailed description of the current electronic payment format.
<b>Payment Agent</b>	You must select a payment agent in this field. Maconomy will verify that the payment agent supports the selected payment form. Payment agents are created in the window Payment Agents.
<b>Check Book</b>	Provided that you use checks, you can assign your checks to a check book in this field. Check books are created in the window Pop-up Fields in the Set-Up module.
<b>Card Type Code</b>	In this field, you can specify the card type code with which the current payment mode is usually applied. The field is for information only and does not limit the use of the payment mode to the specified card type code.

**Payment Control Island**

Field	Description
<b>Blanket Payment</b>	If you mark this field, a blanket (combined) payment will be made despite the fact that more payments may be involved. Please note that the selected payment form determines if you can mark this field. Blanket payment means that payments with identical pay to vendor, delivery vendor, and due date are combined into a single payment. See also the field "Blanket Payment by Deliv. Vendor" below.
<b>Calculate Sum per Payment Order</b>	<p>This field is only used if the fields "Blanket Payment" and "Notify Payment Recipient" are marked as well.</p> <p>If you mark this field, all payment orders will contain an amount which corresponds to the total amount of the assigned remittance lines. If you do not mark this field, the total amount will be assigned to the first payment order, and any payment order which may be created for remittance-related reasons will contain a zero-amount in this field.</p>
<b>Blanket Payment by Deliv. Vendor</b>	This field applies if you have selected blanket payment in the field "Blanket Payment" above. If you mark this field, Maconomy will group blanket payments by delivery vendor, that is, the vendor which delivered the goods or services. This means that a blanket payment to a pay to vendor will be divided into one payment order per delivery vendor. If you do not mark this field, Maconomy does not take the delivery vendor into consideration when creating blanket payments.
<b>Blanket Payment by Company of Origin</b>	This field applies if you have selected blanket payment in the field "Blanket Payment" above. If you mark this field, Maconomy will group blanket payments by company of origin, that is, the company to which a vendor invoice is sent. This means that a blanket payment to a vendor will be divided into one payment order per company of origin. If you do not mark this field, Maconomy does not take the company of origin into consideration when creating blanket payments.
<b>Include Payment Orders with 0 Balance</b>	If you mark this field, payment orders with a balance of zero will be printed out. You can only mark this field if the current payment form allows zero-balance payment orders to be printed out.
<b>Reconcile Payment Orders with 0 Balance</b>	If you mark this field, Maconomy will suggest that payment orders with a balance of 0 are automatically reconciled with corresponding open entries when the payment selection is created. This situation can, for example, arise if a vendor invoice and a vendor credit memo for the same amount exist. If you do not mark this field, Maconomy will only select entries for payment if the amount is greater than 0 when creating a payment selection. However, you can change this manually in the windows Change Collection Selection and Change Payment Selection by Vendor.
<b>Allow Invoices</b>	If you mark this field, the current payment mode can be used for paying invoices for a vendor. If this field is not marked, it is not possible to choose

Field	Description
	this payment mode when entering an invoice on a vendor, for example, in the window Vendor Invoices. The default is that the field is marked.
<b>Allow Credit Memos</b>	If you mark this field, the current payment mode can be used for paying or offsetting credit memos for a vendor. If this field is not marked, it is not possible to choose this payment mode when entering a credit memo (a debit entry) on a vendor, for example, in the window Vendor Invoices.
<b>Allow Passed Payment Dates</b>	If this field is marked, a payment date can be in the past. The payment date is normally set to the due date, but Maconomy changes the payment date to the current date if the due date is in the past - but only when this field is not marked.
<b>Mandatory Credit Memo Reference</b>	If this field is marked, then a credit memo must be linked to a vendor invoice. This will ensure correct reconciliation. The reference is set up in the Reference Invoice island on the vendor invoice.
<b>Omit Payment Reporting</b>	<p>If you mark this field, the payment orders will automatically be approved. If you mark neither this field nor the field "Create Entries Being Paid" below, the automatic printing of checks will result in the creation of a payment line which can then be approved or error reported in the window Payment Reporting.</p> <p>When the payment journal from an automatically printed check or a manually created check is posted, a number of entries are created on both the bank account and the A/P control account - and thus also on the vendor in question. If you use bank reconciliation, a bank reconciliation line is also created.</p> <p>If a payment is reconciled in the window Bank Reconciliations, the payment line in question is approved and can thus be seen in the window Payment Reporting. If the payment of such a payment line is approved in the window Payment Reporting, the line will be marked as processed, and will thus no longer be available in the window Payment Reporting.</p> <p>However, if the payment is error reported, a general journal is automatically created. This journal will set off the bank account by the check amount, including any exchange rate variance and cash discount. Furthermore, an entry is made on the vendor for each vendor invoice or credit memo covered by the payment. Please note that the bank reconciliation line is not deleted. Instead, a new line with the sign inverted is created, ensuring the consistency between the G/L entries and the statement.</p>
<b>Aut. Appr. of Read Payment Status</b>	If you mark this field, the registration of a read payment status is automatically approved, and the necessary journals are created by Maconomy. If you do not mark the field, read payment statuses must be approved manually.
<b>Create Entries Being Paid</b>	When a company sends payment orders to a payment agent, the company can choose to debit certain accounts by the amounts until the payment agent has reported the amounts which are actually being withdrawn from the bank accounts. If you mark the field, a number of entries are posted to the account "Being paid" specified in the pop-up field "A/P Control Account" and on the

Field	Description
	<p>account "Account, Being Paid" specified in the table part of the window External Accounts. When the payment agent has reported the specified payment orders, the entries can be transferred from these suspense accounts to the relevant G/L accounts.</p> <p>If you do not mark the field, entries are automatically made on both bank account and A/P control account - and thus also on the vendor in question. If you use bank reconciliation, a bank reconciliation line is also created. For further information about this functionality, please see the description of the field "Omit Payment Reporting" above.</p>

### Electronic Payment Control Island

The fields in this island are defined in the payment format. When a payment format is imported into Maconomy, values defined by the format may be shown in this window. For more information, please see the detailed description of the current electronic payment format.

Field	Description
<b>Description</b>	The text in these fields is defined in the payment format. For more information, please see the detailed description of the current electronic payment format.
<b>Popup</b>	The values of these pop-up fields are defined in the payment format. The type of information you select here and the value you enter in the fields "Value 1-10" may be transferred to the payment files created using the current payment mode. For more information about the specific values, please see the detailed description of the current electronic payment format.
<b>Value</b>	The values that you enter in these fields may be transferred to the payment files created using the current payment mode. For more information, please see the detailed description of electronic payment in the selected payment format.

### Remittance Island

Field	Description
<b>Notify Payment Recipient</b>	<p>If you mark this field, the recipient of the payment will receive remittance when payment is carried out.</p> <p>It is only possible to create remittance lines if the current payment form supports remittance. Recipient notification is always allowed for payment by check. For more information, please see the detailed description of electronic payment in the selected payment format.</p>
<b>Create Remittance Lines</b>	<p>In connection with check printing, you can choose how to notify the recipient. If you mark this field, every payment order will result in remittance lines containing a specification of the vendor invoices included in the current payment order. The contents of the remittance lines are defined in the table part of this window. The advantage of this form of remittance is that you can freely choose which information should be included in the remittance, and the information can depend on the payment mode selected. If you do not mark this field, you must use Maconomy's layout tools to add fields to the check</p>

Field	Description
	<p>layout. However, an advantage of using a layout created using Maconomy's layout editing tools, is that you can format the remittance freely, for example, using proportionally spaced fonts.</p> <p>If you mark the field "Blanket Payment" in the island Payment Control, Maconomy will automatically create more payment orders if the number of vendor invoices and credit memos exceeds the number of allowed lines on a payment order.</p>
<b>Multiple Fields per Line</b>	If the length of the remittance text is less than the maximum characters allowed (as given in the field "Max. Characters per Line"), you can choose that the remittance lines should contain information about more than one vendor invoice. Maconomy calculates the number of invoices allowed on each remittance line. Note that you cannot have multiple fields per line if you use footers in your remittance text.
<b>Print Two Remittance Blocks</b>	This field is only used in connection with payment by check. If you mark the field, all remittance lines are printed out in two consecutive blocks.
<b>Max. Number of Lines per Payment Order</b>	If the selected payment form allows remittance, this field will show the maximum number of remittance lines allowed for the assigned payment order. In connection with payment by check, you can enter the maximum number of remittance lines which fit on a check. Maconomy will automatically create new payment orders if the remittance lines do not fit on one check. If, for instance, 10 vendor invoices are to be paid by check and the remittance text takes up 7 lines, but the check can only hold 4 lines, Maconomy will break the payment order in two and print two checks which together constitute the full amount.
<b>Max. Characters per Line</b>	If the selected payment form allows remittance, this field will show the maximum number of characters allowed on a remittance line. If you are paying by check and have marked the field "Create Remittance Lines" above, you should enter a maximum number of characters on a remittance line in this field. For more information about what happens if this number of characters is exceeded, please see the description of the field "Length" in the table part.
<b>Text for Void Checks</b>	In this field, enter the text you wish to use on void checks. A check is void if the amount is zero.
<b>Remittance 1-4</b>	<p>These fields are used in connection with automatic payment. The actual field names depend on the specification of the current electronic payment format. A maximum of four remittance fields are available.</p> <p>The remittance text is selected in the pop-up field. The text selected here is usually used by the payment agent for account statements which are returned to you. In some cases, however, the text selected here is sent to the recipient of the payment. This depends on the specification of the current electronic payment format.</p> <p>The options in the pop-up field roughly correspond to fields in the window Change Payment Selection by Vendor. Please see the description of that</p>

Field	Description
	<p>window for a description of the content of each of the selectable options. Furthermore, it is possible to transfer information about the company of origin (the pay to vendor) in the remittance by selecting the following options: "Company of Origin Name," "Company of Origin Number," "Name 1-5," and "Company of Origin Phone Number."</p> <p>In the table part of the window you can specify the appearance of the remittance lines.</p>

### Access Level Island

Field	Description
<b>Access Level</b>	<p>Here you can enter the name of the access level. Users only have access to information about the current payment mode if they have been assigned to this or a higher access level in the User Access Levels window in the Set-Up module. This means that a user can only specify the payment mode on, for example, vendors if he has access to the payment mode. In addition, a user can only see information of payment modes to which he has access. In addition, the user must have access to the access level specified for the payment mode's payment agent to have access to the current payment mode. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to payment modes may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see "Introduction to the Access Control the Set-Up module."</p>
<b>Description</b>	This field displays the description of the access level.

### User Island

See the "Getting Started" topic for a description of the fields in the island User.

### Payment Remittances Sub-Tab

This section includes the fields and descriptions for the Payment Remittances sub-tab.

Field	Description
<b>Line Type</b>	<p>In this field, you can select the line type to be assigned to the current remittance line. You can choose between the types "Header," "Invoice Text" and "Footer." Headers and footers are only printed once per payment order, whereas the invoice text is printed per invoice and credit memo.</p>
<b>New Remittance Line</b>	<p>If you mark this field, Maconomy will create a new remittance line starting with the field assigned to this table line.</p>

Field	Description
<b>Left Margin</b>	In this field, you can enter the number of blank characters of which the left margin should consist. If the remittance text stretches over several remittance lines, the margin specified in this field will apply to all lines. However, this margin will only be included on a printout if the relevant field is the first on a remittance line.
<b>Prefix</b>	In this field, you can enter a text which will be put in front of a remittance field. The text entered in this field is printed each time the table line is printed. If, for example, the current line is of the type "Header," the prefix entered in this field could be "Invoice No." or "Amount."
<b>Remittance Field</b>	In this field, you can choose among a number of remittance field options and thereby choose which type of information to give the payee. If you have selected a line of the type "Header" on the first line of the table and specified that the prefix on that line should be "Invoice No.," you could on the subsequent line select the line type "Invoice Text" and select the remittance field "Invoice No." By doing so, the remittance will contain a header with the name "Invoice No." with the actual invoice numbers placed below this header. The options in the pop-up field are described in the field "Remittance 1-4" in the card part.
<b>Suffix</b>	In this field, you can enter a text which will be appended to the remittance field.
<b>Right Margin</b>	In this field, you can enter the number of blank characters of which the right margin should consist. If the remittance text stretches over several remittance lines, the margin specified in this field will apply to all lines. However, this margin will only be included on a printout if the relevant field is the first on a remittance line.
<b>Length</b>	In this field, you can enter the total length of the fields "Prefix," "Remittance Field" and "Suffix." The length defined in this field must be exclusive of the margins defined in the fields "Left Margin" and "Right Margin." If a certain field exceeds more than one remittance line, it will be split into more lines. The number of lines is thus not fixed, but depends on the lengths of the above-mentioned fields. If, for example, the length of a field is specified to be 150 and a line can contain maximum 30 characters (as specified in the field "Max. Characters per Line" in the island Remittance), the field will be split over five lines.
<b>Alignment</b>	In this field, you can specify whether the current field should be aligned to the right or the left. Amount fields are normally aligned to the right, while other fields are aligned to the left.
<b>Fill Character</b>	In this field, you can enter a fill character. If the length of the text you are transferring is less than the value entered in the field "Length," Maconomy repeats the character entered here to fill in the space. If you leave the field blank, the remittance text will be filled in with blanks.

## Customer Payment Modes Single Dialog Workspace

Use this workspace to create the customer payment modes that you want to refer to in the **Customer Payment** field in other workspaces in Maconomy.

The customer payment mode determines a number of factors in connection with customer payments.

You create a customer payment mode in this workspace; you give it a name, a description, and a customer payment form. The customer payment form indicates whether the customer payment mode is manual or automatic.

Maconomy uses the fields in the Collection Control island and the last four fields in the Remittance island to create labels for electronic collections.

If you want to send remittances to your customers about electronic payment collections, select **Notify Recipient** and specify which types of information should be included.

For auditing purposes, it is important that you print and file your customer payment mode information every time that you make changes in this workspace.

### Customer Payment Modes Tab

This section includes the fields and descriptions for the Customer Payment Modes tab.

#### Cust. Payment Mode Island

Field	Description
<b>Name</b>	In this field, enter a name for the customer payment mode, if you are creating a new customer payment mode. Maconomy checks that the entered name is not already in use.
<b>Description</b>	In this field, you can enter a description of the customer payment mode.
<b>Cust. Payment Form</b>	In this field, select a customer payment form. Select a customer payment form which is supported by the payment agent you have chosen to use. The customer payment form describes the customer payment file format and sets up the guidelines for the use of customer identification. Customer payment forms are created using the Import Format Description program.
<b>Payment Agent</b>	If the current customer payment mode is electronic, select a payment agent in this field.

#### Remittance Island

Field	Description
<b>Notify Recipient</b>	If you mark this field, the customer will receive a notification along with the collection.
<b>Incl. Headings</b>	If you have chosen to notify the recipient, you can use this box to select whether the text entered in the field "Heading" should be transferred to the

Field	Description
	collection recipient along with the description of which invoices are included in the collection.
<b>Multiple Fields per Line</b>	If the length of the remittance text as shown in the field "Characters per Line" is less than the maximum number of characters shown in the field "Max. Number of Characters per Line," you can choose to let the remittance lines sent to the customer contain information about multiple invoices. Maconomy will calculate how many invoices can be shown per remittance line.
<b>Number of Lines per Collection Order</b>	If you have chosen to notify the recipient, this field shows the maximum number of lines you can attach to a collection order. Maconomy will calculate how many collection orders must be printed for all the lines to appear on the printout.
<b>Characters per Line</b>	If you have chosen to notify the recipient, you can see how many characters are available per remittance line. If a remittance text is defined in the table part of this window which is longer than the maximum length, the remittance text will be truncated when Maconomy creates the collection file.
<b>Max. Number of Characters per Line</b>	If you have chosen to notify the recipient, you can see the maximum number of characters that are available per remittance line. If a remittance text is defined in the table part of this window which is longer than the maximum length, the remittance text will be truncated when Maconomy creates the collection file.
<b>Remittance 1-4</b>	<p>These fields are used in connection with automatic customer collection. The actual field name depends on the specification of the current electronic collection format.</p> <p>The remittance text is selected in the pop-up field. The text selected here is usually used by the payment agent for statements which are returned to you. In some cases, however, the text selected here is sent to the recipient of the collection. This depends on the specification of the current electronic collection format.</p> <p>The options in the pop-up field correspond to fields in the window Customer Open Entry Reconciliation. Please see the description of that window for a description of the content of each of the selectable options.</p> <p>In the table part of the window you can create further remittance specifications.</p>

### Electronic Collection Island

Field	Description
<b>Description</b>	These fields show the fixed text fields specified on the associated output data form. Each non-empty description indicates that either a pop-up or a value must be specified for this customer payment mode to work.
<b>Popup</b>	For each non-empty description, either a pop-up or a value must be specified. If both a pop-up and a value are specified, the pop-up takes precedence. These

Field	Description
	values are used when, for example, creating payment records where an output data field refers to these fields on a customer payment mode.
<b>Value</b>	For each non-empty description, either a pop-up or a value must be specified. If both a pop-up and a value are specified, the pop-up takes precedence. These values are used when, for example, creating payment records where an output data field refers to these fields on a customer payment mode.

### Collection Control Island

Field	Description
<b>Electronic Collection</b>	This field is automatically checked if the customer payment form supports electronic collection.
<b>Blanket Collection</b>	If you mark this field, multiple A/R entries with identical due dates are collected together for the same customer.
<b>Include Collections with Balance = 0</b>	If you mark this field, collections with a balance of zero are included when you create a collection selection for the current customer payment mode.
<b>Print Invoice</b>	Interest and reminder notes are printed for interest and reminder principles using the Customer Payment Mode.

### Customer Payment Control Island

Field	Description
<b>Cash Payment</b>	<p>In this field, you can specify that the payment mode represents cash payment. The field can only be marked for manual payment modes. The payment mode can be used on invoices where the goods are paid cash, for instance when selling goods directly from the warehouse. When you post an invoice with this payment mode, Maconomy automatically creates an offset entry to the invoice. This means that Maconomy creates an extra customer entry and a G/L entry to the A/R control account, representing payment. Maconomy also makes an entry to the account assigned to the current payment mode in the window External Accounts. When you use a payment mode of this type, you therefore do not have to manually enter a cash payment in the general journal.</p> <p>If you post a credit memo with this type of payment mode, offset entries are made in the same way as when you post invoices. However, the amounts have inverted signs.</p>
<b>Calculate Customer Payer Id.</b>	If this field is not marked Maconomy will not calculate a payer identification on the company customer. Maconomy will calculate new payer identification if the field is marked.

**Export Island**

Field	Description
<b>Export Entries</b>	If this field is marked, customer entries with this customer payment mode can be exported from the Export Customer Entries window.

**Access Level Island**

Field	Description
<b>Access Level</b>	Here you can enter the name of the access level. Users only have access to information about the current customer payment mode if they have been assigned to this or a higher access level in the User Access Levels window in the Set-Up module. This means that a user can only specify the customer payment mode on, for example, customers if he has access to the customer payment mode. In addition, a user can only see information of customer payment modes to which he has access. In addition, the user must have access to the access level specified for the customer payment mode's payment agent to have access to the current customer payment mode. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to customer payment modes may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see "Introduction to the Access Control System" in the Set-Up module.
<b>Description</b>	This field displays the description of the access level.

**User Island**

See the chapter "Getting Started" for a description of the fields in the island User.

## Inventory Overview

This chapter describes the Inventory module. Items in Maconomy are classified into groups, at which level most of the related information is maintained.

In this module you assign items to warehouses, make price lists (optionally in various currencies), define discount levels, and create item-related discount agreements. The Sales Orders module uses all of this information.

If you have Maconomy Bill of Materials, you can create bills of materials (BOMs) in this module. These are then sold in the Sales Orders module, where prices and inventory control are processed in the same way as for standard items. You can create BOMs in an unlimited number of levels.

### Registration Section

This section includes the fields and descriptions for the Registration Section workspaces.

#### Inventory Change Single Dialog Workspace

Use this workspace to enter manual changes to the inventory and inventory value of warehouses.

The Inventory Changes tab displays general information about an inventory change transaction. The Items sub-tab displays the actual inventory changes.

You can enter the receipts of and shipments from a warehouse as well as transfers between warehouses. To allow backorder allocation when receiving or transferring, use the backorder method **By Reservation**, and provide a value for the **Aut. Back Order Allocation** field in the System Information workspace.

You also use this workspace when you enter miscellaneous losses and manual cost price adjustments. You can also enter the changes in stock as a result of an inventory count. However, you normally use the Inventory Count workspace in connection with inventory counts.

When you make changes to items that have serial number control, you can enter the serial numbers that the inventory change affects in the Serial Number Movement workspace. The setup of each item indicates whether this entry of serial numbers at receipt or shipping, respectively, is mandatory or optional. Serial numbers that you provide on entries that cause the automatic creation of inventory changes automatically flow to the inventory change, so that you do not need to enter serial numbers for automatically created transactions.

In the Items sub-tab, Maconomy converts item prices into the base currency of the company of the transaction if the cost is retrieved from the item information card or if a FIFO transaction is in question, and the cost price is retrieved from a warehouse that is assigned to another company than the one specified in the Company island in the Inventory Changes tab.

After you enter all of the inventory changes in a transaction, use the **Approve Transaction** action to approve it. Maconomy then updates inventories and costs. The item transaction is automatically printed, and Maconomy generates an item journal for posting in the G/L module. Transactions that Maconomy creates automatically from registrations in other modules are automatically approved as part of the entry process; you cannot approve these transactions manually. You can browse through both approved and non-approved transactions.

If you have Maconomy Bill of Materials, you can enter BOM inventory changes here. This requires that the BOM has inventory control, indicated in the **Inventory Control** field in the Bill of

Materials Information Card. A BOM inventory change does not affect the inventory values of the individual BOM parts.

### Documentation through Inventory Change Transactions

In addition to making manual movement entries, you also use this workspace to document the item movements that happen as a result of sales, crediting, purchases, and production in other modules. This documentation consists of a number of automatically created and approved inventory change transactions with information from, for example, the sales order or item purchase order that caused the inventory change. The main purpose of these inventory change transactions is documentation. Maconomy maintains the transactions in the background, meaning that although you can use them for reporting purposes, you do not need to include them in your processes. You can view automatically created inventory change transactions in this workspace; they have the exact same functionality as manually created transactions, but you cannot change the information here. This section describes how all changes in stock and stock value are documented by means of inventory change transactions.

### Transactions Created from Sales and Crediting

When you create a warehouse transaction for a sales order, Maconomy automatically creates an inventory change transaction with information that corresponds to that of the warehouse transaction. The inventory change transaction is of the type **Shipment**, and you cannot change it manually. Maconomy copies any serial numbers that you entered in the Serial Number Entry workspace before you created the warehouse transaction into the Serial Number Movement workspace. Similarly, when you create a packing list for an order without first creating a warehouse transaction, Maconomy automatically creates an inventory change transaction with information that corresponds to the information on the packing list, copying any specified serial numbers.

When you create a packing slip for the order later in the process-perhaps without being printed, but as part of the process of printing an invoice, as described in the **Print Invoice** action in the Sales Orders workspace-Maconomy updates the inventory change transaction with the information from the packing slip and approves the transaction.

A similar process takes place when you approve an invoice in the Invoices workspace. Maconomy creates an inventory change transaction with information that corresponds to the invoice and immediately approves the transaction.

If you enter a credit order, Maconomy creates and approves an inventory change transaction when a credit memo is printed from the credit order. Maconomy copies any serial numbers that you enter in the Serial Number Entry workspace before the credit memo was printed into the Serial Number Movement workspace. Similarly, if you create a credit memo in the Credit Orders workspace, Maconomy creates and approves an inventory change transaction when the credit memo is printed. In both cases, the transaction is of the type **Receipt** and enters the receipt of the quantity that is returned and the cost prices from the sub-tab of the item information card.

### Inventory Change Transactions Created from Purchases

To enable you to trace the exact movements and G/L entries that happen as a result of purchases, Maconomy creates an automatic inventory change transaction for each item receipt that you enter in the Item Receipt and Purchase Receipt workspaces. The inventory change transactions are for documentation purposes only; Maconomy maintains them in the background,

meaning that although you can use the transactions for reporting purposes, you do not need to include them in your item purchase order processes.

When you approve an item receipt in the Item Receipt and Purchase Receipt workspaces, Maconomy creates an inventory change transaction with information that corresponds to the purchase and immediately approves the transaction. Transactions that you create from item purchase orders and purchase orders are of the type **Receipt**. Maconomy copies any serial numbers that you enter in the Serial Number Receipt workspace before you approve the item receipt into the Serial Number Movement workspace. Maconomy transfers the cost prices from the purchase order/item purchase order in question.

### Inventory Change Transactions Created from Productions

To enable you to trace the exact movements and G/L entries that happen as a result of BOM production, Maconomy creates an automatic inventory change transaction for each production transaction that you enter in the BOM Production workspace. The inventory change transactions are for documentation purposes only. Maconomy maintains them in the background, meaning that although you can use the transactions for reporting purposes, you do not need to include them in your production processes.

When you approve a production transaction in the BOM Production workspace, Maconomy creates an inventory change transaction with information that corresponds to the production transaction and immediately approves the inventory change transaction. Transactions created from production transactions are of the type **Receipt**. Maconomy either calculates or retrieves the cost prices from the BOM information card, depending on whether you select the **From Raw Materials** field for the production in question. For more information about the cost prices on productions, see the description of the **From Raw Materials** field in the BOM Production workspace.

### Inventory Changes Tab

This section includes the fields and descriptions for the Inventory Changes Tab.

#### Transaction Island

Field	Description
<b>Trans. No.</b>	This is the transaction number. It is automatically assigned as the next available number in the transaction number series. You cannot change the number here, but you can determine how numbers are assigned in the window Number Series in the Set-Up module.
<b>Trans. Type</b>	This is the transaction type of the movement voucher. If the field is left empty, Maconomy will set it to the default transaction type in the Item journal (for the specific company and user.)
<b>Created by</b>	This is the name of the user who created the transaction. The name cannot be changed. If the transaction was created automatically from a registration such as a sales order, item purchase order or production, this field shows the name of the user who selected the action that caused the creation of the transaction. For further information on the actions that can cause the creation of a transaction, see the introduction to this window.

Field	Description
<b>Date</b>	This is the date the transaction was created. This is not necessarily the entry date, which is the date of the inventory change. The date cannot be changed.
<b>Approved</b>	This field shows whether the transaction is approved. Transactions are approved using the action "Approve Transaction." However, a transaction created as a result of a registration such as a sales order, item purchase order or production is approved automatically when certain actions are selected. For further information about the actions that can cause the approval of a transaction, see the introduction to this window. The mark cannot be removed.
<b>Approved by</b>	This is the name of the user who approved the transaction. The name cannot be changed. If the transaction was approved automatically from a registration such as a sales order, item purchase order or production, this field shows the name of the user who selected the action that caused the approval of the transaction. For further information about the actions that can cause the approval of a transaction, see the introduction to this window.
<b>Date</b>	This is the date on which the transaction was approved. The date cannot be changed.

#### Rates Island

Field	Description
<b>Cost Total</b>	This is the sum of the costs specified on the item lines in the transaction, shown in the currency of the transaction (shown in the field "Currency" below). The value cannot be changed. Maconomy uses it to calculate transaction expenses, if you enter a figure in the "Cost, %" field.
<b>Hereof Duty</b>	This field shows the total duty applying to the items in the table part, specified in the currency of the transaction (shown in the field "Currency" below). The duty is calculated according to the individual duty codes specified on the information cards of the items.
<b>Expenses</b>	<p>Here you enter an expense amount, such as vendor charges for a delivery recorded manually in this window. The amount should be specified in the currency of the transaction (shown in the field "Currency" below). A value can only be entered for transactions of the type "Receipt."</p> <p>If the expense is added as a percentage, Maconomy calculates the expense amount from the values in the "Cost Sum" and "Expenses in %" fields.</p> <p>Expenses are apportioned to the item lines in the transaction, to ensure that the items are assessed at correct costs in the warehouse. The value in this field applies independently of any value in the corresponding fields in the Sales Orders and Item Purchase modules. You cannot enter data in both this field and the "Expenses in %" field.</p>
<b>Cost, %</b>	Here you enter an expense percentage, for example, a vendor charge in the currency of the transaction (shown in the field "Currency" below). Maconomy calculates the expense amount from the value here and the value in the field "Cost Sum." A value can only be entered for transactions of the type "Receipt."

Field	Description
	Expenses are apportioned to the item lines in the transaction, to ensure that the items are assessed at correct costs in the warehouse. The value in this field applies independently of any value in the corresponding fields in the Sales Orders and Item Purchase modules. You cannot enter data in both this field and the "Expenses" field.
<b>Currency</b>	This field shows the currency of the transaction. For manually created transactions, you can specify the desired currency at creation. For transactions relating to purchase orders and item purchase orders, this currency derives from the currency of the purchase order. For all other transactions, the currency is the base currency of the company to which the transaction belongs.
<b>Total Cost, Base</b>	This is the sum of the costs specified on the item lines in the transaction, shown in the base currency of the company responsible for the transaction.
<b>Hereof Duty, Base</b>	This field shows the total duty applying to the items in the table part, shown in the base currency of the company responsible for the transaction. The duty is calculated according to the individual duty codes specified on the information cards of the items.

#### Sales Island

Field	Description
<b>Order No.</b>	If the current transaction was created as a result of a sales order in the Sales Orders module, this field shows the number of the sales order in question.
<b>Packing Slip No.</b>	If the current transaction was created as a result of a sales order in the Sales Orders module, this field shows the number of the packing slip created when the items were shipped. If the items on the order have not yet been shipped, this field shows a zero. If the order has partial delivery and items are delivered in separate shipments, an inventory change transaction is created for each shipment, and on each of these transactions, this field shows the packing slip number related to the shipment in question.
<b>Invoice No.</b>	If the current transaction was created as a result of a manual invoice or credit memo in the Sales Order module, this field shows the Invoice No./Credit Memo No.

#### Remarks Island

Field	Description
<b>Remarks 1-5</b>	In these fields, you can specify a number of remarks about the current transaction.

**Changes Island**

Field	Description
<b>Type</b>	<p>Here you enter the type of change that applies to the transaction as a whole. Select between the following six types in the pop-up field:</p> <ul style="list-style-type: none"> <li>■ <b>Receipt</b> — is used to manually enter item receipts, instead of using the Item Purchase module. It is also used to establish your company's opening inventory balance when you set up Maconomy.</li> <li>■ <b>Shipment</b> — is used to record extraordinary warehouse withdrawals, not related to sales or miscellaneous losses.</li> <li>■ <b>Transfer</b> — is used to transfer items from one warehouse to another. For example, a temporary exhibition warehouse may be established, in which case you transfer items from the main warehouse and back again using this facility.</li> <li>■ <b>Inventory Count</b> — is used to record an inventory count. You record the variance (positive or negative) and not the actual inventory value. You must suspend order handling while the inventory is being counted, but it can resume before the count is recorded here.</li> <li>■ <b>Cost Adjustment</b> — is used to adjust costs, such as when cost variances occur upon receipt of items in the Item Purchase module. If items are delivered unaccompanied by an invoice, the items are recorded according to your estimated costs. If the invoice quotes a different value, you need to adjust your costs.</li> <li>■ <b>Misc. Losses</b> — is used to record miscellaneous losses in the warehouse. These losses are recorded as a positive quantity of units. Maconomy then removes them from the warehouse.</li> </ul> <p>The windows Inventory Count Listing, Inventory Count and Approve Count also relate to inventory counts and the associated entries.</p> <p>Depending on the type of movement being recorded, you must enter data in various other fields in the window. The procedures are described in the fields below.</p> <p>On transactions created automatically from registrations such as sales orders, item purchase orders or production transactions, the transaction type is selected automatically, depending on the type of registration in question. For further information on the transaction type resulting from different registration types, see the introduction to this window.</p>
<b>Transaction Mode</b>	<p>In this field, you can select a transaction mode for further specification of the item movement, for example, the reason for the transaction of items. The options are created in the window Popup Fields in the Set-Up module.</p>
<b>From Warehouse</b>	<p>Here you select from which warehouse the items are moved. The field is used for the following types of movement: "Shipment," "Transfer," "Inventory Count" and "Misc. Losses." Inventory count variances are recorded to the warehouse in this pop-up field, regardless of whether you specify a negative or a positive figure.</p>

Field	Description
	<p>If the change type is "Transfer," and the field "To warehouse" contains a warehouse which is assigned to a different company than the warehouse in the field "From warehouse," intercompany entries are created when the inventory journal is posted. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company. The inventory journal is created when the inventory transaction is approved. The intercompany entries are posted on the accounts assigned to the intercompany transaction type "Inventory Journal" which are entered by means of dimension combinations in the window Intercompany Accounts in the G/L module. For each intercompany entry, the responsible company will be the one defined in the field "From Warehouse."</p> <p>Warehouses are created and assigned to a company in the window Warehouse Information Card.</p>
<b>Shipment Loc.</b>	<p>In this field, you can specify the location in the current warehouse from which the items are to be shipped. The field can only be completed for transactions of the types "Shipment," "Transfer," "Inventory Count," and "Misc. Losses." This location will apply to those lines in the table part where the source location field is left blank. If a source location is specified on a given line, it overrules any location specified in this field.</p>
<b>To Warehouse</b>	<p>Here you select to which warehouse the items are moved. The field is used for the following types of movement: "Receipt," "Transfer" and "Cost Adjustment."</p> <p>If the change type is "Transfer," and the field "From warehouse" contains a warehouse which is assigned to a different company than the warehouse in the field "To warehouse," intercompany entries are created when the inventory journal is posted. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company. The inventory journal is created when the inventory transaction is approved. The intercompany entries are posted on the accounts assigned to the intercompany transaction type "Inventory Journal" entered by means of dimension combinations in the window Intercompany Accounts in the G/L module. For each intercompany entry, the responsible company will be the one defined in the field "To Warehouse."</p> <p>Warehouses are created and assigned to a company in the window Warehouse Information Card.</p>
<b>Receipt Loc.</b>	<p>In this field, you can specify the location in the current warehouse at which the items are to be received. The field can only be completed for transactions of the types "Receipt" and "Transfer." This location will apply to those lines in the table part where the target location field is left blank. If a target location is specified on a given line, it overrules any location specified in this field.</p>
<b>Entry Date</b>	<p>In this field, you can specify an entry date to be used on the G/L and item entries created when the transaction is approved. If you do not specify a date, Maconomy uses today's date as the entry date.</p>

Field	Description
<b>Entry Description</b>	<p>Here you enter a descriptive entry text. For example: "Discarded" or "Transfer from main warehouse to exhibition warehouse." Entry text is specified for all types of inventory changes, and there is no limit to how many characters you can type here.</p> <p>If you do not enter a text, Maconomy allocates a standard entry text from the window Posting Descriptions in the G/L module.</p>

### Purchase Orders Island

Field	Description
<b>Vendor</b>	Here you enter a vendor number if the movement is a "Receipt," and if the shipment is a vendor's delivery. Maconomy verifies that the vendor has not been blocked, that is, that the field "Blocked" has not been completed on the information card of the vendor in question. If the current transaction was created automatically as a result of an item receipt in the Item Purchase module, this field shows the number of the vendor who delivered the items.
<b>Requisition</b>	Here you enter a Requisition No.
<b>Purch. Order No.</b>	Here you enter the vendor's packing slip number, invoice number or other reference. For transactions created automatically as a result of a receipt registered in the window Purchase Receipt in the A/P module, the field shows the number of the purchase order to which the receipt pertains. For all other transactions, the field is purely for reference on the item transaction printout.
<b>Auto. Trans. No.</b>	This field shows whether the item transaction was created from another type of registration such as a sales order, item purchase order or the approval of an inventory count list. You cannot change the field value. For further information on the automatic creation and maintenance of transactions as a result of registrations in other modules, see the introduction to this window.
<b>Item Purchase Order No.</b>	If the current transaction was created as a result of an item receipt in the Item Purchase module, this field shows the number of the item purchase order to which the item receipt pertains.
<b>Packing Slip No.</b>	If the current transaction was created as a result of an item receipt in the Item Purchase module, this field shows the number of the packing slip, entered in the window Item Receipt before the receipt was approved.
<b>List No.</b>	If the current transaction was created as a result of an inventory count, this field shows the number of the count list in question.

### Production Island

Field	Description
<b>Trans. No.</b>	If the current transaction was created as a result of a BOM production, this field shows the number of the production transaction in question.

**Company Island**

Field	Description
<b>Company No.</b>	This field shows the number of the company responsible for the current inventory transaction. If you do not enter a value, Maconomy will try to derive a value in accordance with the order of priority which is defined in the window Dimension Derivations in the G/L module. If no value can be derived from this window, the standard value is copied from the window System Parameters in the Set-Up module.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

**Items Sub-Tab**

This section includes the fields and descriptions for the Items Sub-Tab.

Field	Description
<b>Item No.</b>	Here you enter the number of the item in the transaction. Maconomy verifies that the number exists, that is, that it is created in the Item Information Card window. Maconomy also verifies that the item is assigned to the specified Receipt and Shipment warehouses. Maconomy alerts you if the item has been discontinued.
<b>Unit</b>	This is the item unit recorded in the warehouse. It cannot be changed here. If the warehouse transaction was created from one of the registration types in the islands Purchase, Sales or Production in the card part, the unit is retrieved from the registration line on which the current warehouse transaction line is based.
<b>Quantity</b>	Here you enter the quantity of items moved. You must enter a value for every type of movement except "Cost Adjustment," for which Maconomy makes a number of adjustments, depending on whether you enter a quantity. This is described in more detail in the field "Cost." An inventory count records the inventory variance (positive or negative), and not the quantity counted. Maconomy verifies that the amount is larger than 0 for movements of the type "Receipt," "Shipment," "Transfer" and "Misc. Losses." The field cannot be changed on automatically created transactions. If the type is "Count," a positive figure indicates the missing quantity of the item, while a negative figure indicates the extra of items found compared to what was expected.
<b>Shipment Loc.</b>	In this field, you can specify the location in the From Warehouse from which the items on the current line are to be shipped. When you create a new line on a shipment or transfer transaction, Maconomy checks if a standard picking location has been specified in the table part of the item's information card on a line pertaining to the warehouse specified on the current transaction line. If a

Field	Description
	<p>standard picking location has been specified and if this location is also marked as a shipping location in the window Warehouse Information Card, the item's standard picking location is suggested in this field, but the value can be changed manually. If no standard picking location has been specified for the item or if the item has a standard picking location for the warehouse but it is not a shipping location, Maconomy suggests a blank value in this field.</p> <p>If the field is blank, the location number specified in the card part of the window will apply to the line. The field can only be completed for transactions of the types "Shipment," "Transfer," "Inventory Count," and "Misc. Losses."</p>
<b>Receipt Loc.</b>	<p>In this field, you can specify the location in the To Warehouse at which the items on the current line are received. When you create a new line for a receipt or transfer transaction, Maconomy checks if a standard storage location has been specified in the table part of the item's information card on a line pertaining to the warehouse specified on the current transaction line. If a standard storage location has been specified and if this location is also marked as a receipt location in the window Warehouse Information Card, the item's standard storage location is suggested in this field, but the value can be changed manually. If no standard storage location has been specified for the item or if the item has a standard storage location for the warehouse but it is not a receipt location, Maconomy suggests a blank value in this field. When this field is blank, the stock location number specified in the card part of the window will apply to the line. The field can only be completed for transactions of the types "Receipt" and "Transfer."</p>
<b>Cost</b>	<p>Here you specify the cost per pricing unit in the currency of the transaction, that is, the currency shown in the field "Currency" in the card part. The field applies to movements of the type "Receipt" and "Cost Adjustment." Maconomy verifies that the price per pricing unit is 0 or higher. For "Receipt" movements, Maconomy suggests the last cost in the "From Warehouse" (found in the table part of the item information card) if you leave the field blank. The field cannot be changed on automatically created transactions.</p> <p>When you enter an inventory change of the type "Cost Adjustment," you can use this field to correct the cost per pricing unit, regardless of the costing method your company is using. The costing method is maintained in the Item Group Information Card. If you do not enter a quantity in the "Quantity" field, the item's cost in the "To Warehouse" will be changed to the value entered here. If you enter a quantity in the "Quantity" field, Maconomy records that the quantity has been received at the new cost instead of the cost in table part of the Item Information Card. The last cost entered for the item at the "To Warehouse" is replaced with the cost entered here. This facility makes it possible to adjust the cost of the last shipment of items.</p> <p>For items with a FIFO costing method, a cost adjustment can only be carried out for one item batch at a time, and you can therefore not enter a quantity. If you want to regulate the cost price for a total volume of such an item in a given warehouse, you must create a line for each item batch. The item batch number is entered in the field "FIFO Batch No."</p>

Field	Description
	Cost price adjustment is used, among other things, to adjust the variances recorded to the account to which the dimension combination in the field "Cost and Quantity Variances" on the warehouse in question refers.
<b>Cost, Base</b>	This field shows the amount in the field "Cost" above, converted into the base currency of the company responsible for the current transaction.
<b>Pricing Unit</b>	This field shows how many item units are included in the unit price. This applies to sales prices, costs, weight and volume. The value cannot be changed here.
<b>FIFO Batch No.</b>	If the item on the line is provided with the costing method FIFO, shipment (of the inventory change type "Shipment," "Transfer" and "Misc. Losses"), a cost adjustment can be made for a specific item batch entered in this field. If you do not enter an item batch number at a cost adjustment, Maconomy will adjust the cost price of the earliest created item batch in the selected warehouse. The field cannot be changed on automatically created transactions.
<b>Description</b>	This is the item text from the field "Description Lang. 1" in the item's information card. The text cannot be changed here.
<b>Allocate Back Order</b>	<p>If you mark this field on a line on an inventory change for receipt or transferal, the items received will automatically be reserved and set for packing on sales orders on which there are units of the current item on back order. This happens when the inventory change is approved. Even if the inventory change is assigned to an item purchase order which in turn is assigned to a sales order, the items are reserved for packing on back orders rather than the sales order for which the items were intended. If there are more units on back order than received, Maconomy allocates the items to the back orders with the earliest delivery date as the first priority.</p> <p>If this field is not marked, the items are not reserved and set for packing on back orders. If the inventory change is assigned to an item purchase order which in turn is assigned to a sales order, the items are therefore transferred to that sales order, and any remainder is not reserved. The field can only be marked if the back order method "By Reservation" has been selected in the window System Information in the Set-Up module.</p>

## Actions

This section shows the Actions available in the Inventory Change workspace.

### Top Tab

Field	Description
<b>Create Warehouse Transaction</b>	When you select this action, Maconomy creates a warehouse transaction for the current inventory change. The action can only be selected for manually created inventory change transactions. For changes of the type "Receipt," the action cannot be used until the inventory change transaction has been approved. For changes of the type "Shipment," the action can only be used before the approval of the inventory change transaction.

Field	Description
	<p>In the case of receipts, the warehouse transaction acts as a request for moving the received items away from the location at which they were received. In the case of shipments, it acts as a request for moving the items to the location from which they should be shipped, and for transferal, the action is first used for moving items to the shipping location, and after the approval of the inventory change, it can be used again for moving the items away from the receiving location at the target warehouse.</p> <p>For each item line on the inventory change transaction, the warehouse transaction will contain a corresponding line with similar information. However, items without inventory control are not included on the warehouse transaction.</p> <p>The locations transferred to the warehouse transaction depend on the type of inventory change transaction. If the change type is "Receipt," the receiving location applying to each inventory change line is used as the source location on the warehouse transaction lines to indicate that the items should be moved away from the location at which they were received at the 'To warehouse'. The target location will be blank on the warehouse transaction lines. If the change type is "Shipment," the shipment location applying to each inventory change line is used as the target location on the warehouse transaction lines to indicate that the items should be moved to the location from which they should be shipped at the 'From warehouse'. The source location will be blank on the warehouse transaction lines. If the change type is "Transfer" and the inventory change has not yet been approved, the functionality of the action corresponds to that of an inventory change of the type "Shipping." If you select the action after approving the inventory change, the functionality corresponds to that of an inventory change of the type "Receipt." This means that you can use the action for moving the items to the shipping location in the 'From warehouse', and once the items have been transferred, you can move them away from the receiving location in the 'To warehouse' using the same action. It is possible to use the action on transfers both before and after approval.</p> <p>The quantity on each resulting warehouse transaction line is transferred from the field "Quantity" on the inventory change line. For non-approved transactions of the type "Shipment" or "Transferral," Maconomy checks if there are closed picking lists assigned to the inventory change transaction. If so, the quantity on each line on the warehouse transaction will be the quantity on the inventory change line less the quantity already reported picked for the inventory change line on closed picking lists. This can, for example, be the case if you have increased the quantity on a line after starting a picking procedure, and therefore need additional units moved to the shipping location. In the case of transfers, the quantities picked when moving items to the shipping location before the items are transferred does not influence the number of units to be moved away from the receiving location at the 'To warehouse' after the transfer. For transactions of the type "Receipt" and for approved transfers, this action can only be selected once.</p> <p>If the item on a line has serial number control and you have entered serial numbers for that line in the window Serial Number Movement before the warehouse transaction is created, the warehouse transaction will contain a line for each combination of serial number and location entered in the serial number</p>

Field	Description
	<p>movement window. These lines will contain both the serial number and the quantity corresponding to the serial number movements entered. If the total quantity of the serial numbers entered for the line in question is lower than the quantity on the inventory change line itself, the warehouse transaction will also contain a line with a blank serial number line and the quantity that remains to be allocated on serial numbers. This allows you to enter in advance any serial numbers that should be affected by the change, and have the warehouse personnel move exactly those serial numbers, whereas serial numbers on the units to move for which no serial numbers have been specified in advance can be decided upon by the warehouse personnel.</p> <p>It is only possible to have one open warehouse transaction per inventory change transaction at a time. If you make changes to the inventory change that should be reflected on a warehouse transaction that was already created, you must approve and close the transaction in the window Warehouse Transactions, and create a new one using this action.</p> <p>In order to create warehouse transactions, you need access to print packing lists. This is given by marking the field "Print Picking and Packing Lists" in the window Actions in the Set-Up module.</p>
<b>Print Picking List</b>	<p>When you select this action, Maconomy creates a picking list for the current inventory change. The action can only be selected for inventory change transactions created manually. For changes of the type "Receipt," the action cannot be used until the inventory change transaction has been approved. For changes of the type "Shipment," the action can only be used before the approval of the inventory change transaction. In all cases, the action can only be selected if there are no other picking lists for the same inventory change transaction that have not been closed in the Picking Lists window.</p> <p>In the case of receipts, the picking list is an internal message to the warehouse that the received items should now be moved away from the location at which they were received to the relevant storage locations. In the case of shipments, it acts as an internal message to the warehouse that the items should be moved to the shipping location for shipping, and for transferal, the action is first used for moving items to the shipping location, and after the approval of the inventory change, it can be used again for moving the items away from the receiving location at the target warehouse.</p> <p>A picking list is always created on the basis of a warehouse transaction assigned to the current inventory change transaction. Therefore, if no open warehouse transaction exists for the inventory change transaction (as a result of selecting the action "Create Warehouse Transaction"), Maconomy creates one in the same way as described for the action "Create Warehouse Transaction," and automatically approves it before creating, approving, and printing a picking list from it. For a description on how the locations and quantities are determined on the automatically created warehouse transaction, see the description of the action "Create Warehouse Transaction" above. Lines with a quantity of zero are not included on the picking list. When the picking list is created from the warehouse transaction, Maconomy suggests a location from where to pick the items on each line, and sometimes creates several picking list lines for each</p>

Field	Description
	<p>item line, if the desired quantity is not available at one location. For further information on this process, see the description of the action "Print Picking List" in the window Warehouse Transactions. Thus, you can skip the step of warehouse transaction creation by selecting this action.</p> <p>If an open warehouse transaction already exists for the current order, this transaction is approved, and the picking list is created from that warehouse transaction, using the quantities and locations specified there.</p> <p>When the action is selected on a shipment transaction or a transferal transaction that has not yet been approved, it applies for itemized BOMs without inventory control that only the BOM parts on the highest level with inventory control are included.</p> <p>When the items have been picked, the warehouse personnel reports the actual quantities and various other information in the window Picking Lists.</p> <p>In order to print a picking list, you need access to printing packing lists. This is given in the window Actions in the Set-Up module.</p>
<b>Approve Transaction</b>	<p>Select this action to approve the transaction in the window. Maconomy marks the field "Approved" in the card part of the window and updates the field "Stock on Hand" and the cost fields for the relevant warehouses in the windows Item Information Card and Item Information. The action can only be selected if no open warehouse transactions or picking lists exist for the transaction.</p> <p>Based on this approval, Maconomy creates an item journal in the G/L module. The G/L inventory value account specified in the field "Inventory Value" on the Warehouse Information Card by means of a dimension combination is updated when the item journal is posted in the windows Posting or Print Posting Journal. The following entries are created in the item journal, depending on the type of change recorded.</p> <p>When you enter a "Receipt," the total cost of the receipt and any expenses are debited to the account for Inventory Value and credited to the manual offset account referred to by means of a dimension combination in the "Shipments and Receipts" field of the receiving warehouse. If the items are shipped to the warehouse at a cost that is different from the current cost, Maconomy generates entries for cost adjustments for every warehouse to which the item is assigned. The accounts used for these adjustments, "Inventory Value" and the Auto Write Up/Down account "For Purchase," are specified by means of dimension combinations on the warehouse information card. Maconomy does not automatically create and post a vendor invoice when you enter item receipts in this window.</p> <p>When you enter a "Shipment," the transaction's total cost is credited to the Inventory Value account and debited to the Manual Offset Account specified by means of a dimension combination in the field "Shipments and Receipts" in the shipping Warehouse Information Card.</p> <p>If Maconomy makes an automatic cost adjustment due to the rounding up of amounts, the adjustment is posted to the account specified by means of a dimension combination in the field "For Sale" in the island Auto. Write Up/Down on the Warehouse Information Card.</p>

Field	Description
	<p>When you enter a "Transfer," the transaction's total cost is credited to the Inventory Value account for the shipping warehouse and debited to the Inventory Value account for the receiving inventory.</p> <p>If Maconomy makes an automatic cost adjustment due to the rounding up of figures, the adjustment is posted to the account for manual cost adjustments specified by means of a dimension combination on the Warehouse Information Card.</p> <p>When you enter an "Inventory Count," the transaction's total cost is either debited or credited to the Inventory Value account, depending on whether the result is positive or negative. The offsetting amount is posted to the "Inventory Count" account specified by means of a dimension combination in the Warehouse Information Card.</p> <p>If Maconomy makes an automatic cost adjustment due to the rounding up of figures, the adjustment is posted to the account for manual cost adjustments.</p> <p>When you enter "Cost Adjustment," Maconomy makes entries to the Inventory Value account of the warehouse in question. Depending on whether the cost is adjusted up or down, Maconomy creates a debit or credit entry to the Inventory Value account of the warehouse in question. The amount corresponds to the change in value caused by the cost adjustment. The offsetting entry is posted to the manual offset account given by means of a dimension combination in the "Cost Adjust." field in the information cards of the relevant warehouse.</p> <p>When you enter "Misc. Losses," the transaction's total cost is credited to the Inventory Value account for the shipping warehouse and debited to the Manual Offset Account specified by means of a dimension combination in the field "Misc. Losses" on the shipping Warehouse Information Card.</p> <p>If Maconomy makes an automatic cost adjustment due to the rounding up of figures, the adjustment is posted to the account for manual cost adjustments.</p> <p>If the item in an inventory change is under serial number control, the change types "Shipment," "Receipt," "Transfer," and "Misc. Losses" require serial number information in the window Serial Number Movement.</p>

## Serial Number Movement Single Dialog Workspace

Use this workspace to enter information that is related to the individual serial numbers when you create manual inventory changes for items that have serial number control in the Inventory Change workspace.

This workspace also displays serial number information for inventory changes that Maconomy creates automatically from sales orders, item purchase orders, and credit orders. However, you cannot manually change the information on such transactions here; you must enter it in the Serial Number Entry or Serial Number Receipt workspace, depending on the entry type in question.

Serial number entry for shipping in this workspace is mandatory for items that have the serial number control type **Full Ser. No. Reg.** or **Serial No. Reg. at Shipping** set up in the Item Information Card workspace. For receipts, serial number entry is mandatory for items that have the serial number control type **Full Ser. No. Reg.** or **Serial No. Reg. at Receipt**. For transfers, serial number entry is mandatory for items with any of the previous control types. If serial number

entry is mandatory for an item in the transaction, you cannot approve the transaction until you have entered a serial number for every single unit of the item in this workspace. If you are shipping a serial number that you have not created in Maconomy—for example, because the item does not use the **Ser. No. Reg. at Receipt** serial number control method—you must create a line with the serial number in the Serial Number Information workspace before you can enter the number on a transaction for shipment or transfer.

You typically provide serial numbers that are related to shipments or transfers in this workspace when the items are shipped, but you can also do it at the time of entry, if you are planning to ship particular serial numbers. You can specify some of the serial number units at the time of entry and enter the rest when the items are picked and moved to the shipping location. You enter serial numbers that are related to items in receipts when the items are received.

The Serial Number Movements tab displays information about the inventory change; in the Serial Number Movements sub-tab you enter information about the individual serial numbers. You can also specify where the items should be moved to for shipment or where they are received, depending on whether you are working with a shipment, transfer, or receipt.

If the transaction is a shipment or transfer, and you are using a picking list to move the items to the shipping location, the warehouse personnel can enter the serial numbers that they move on the picking list. This can result in Maconomy automatically creating serial number lines in this workspace.

Inventory changes of the change type **Inventory Count** require a specification of the difference between the stock volume and the number of items counted.

## Serial Number Movements Tab

This section includes the fields and descriptions for the Serial Number Movements Tab.

### Item Island

Field	Description
<b>Item No.</b>	This field shows the item number, which is affected by the movement.
<b>Description</b>	This field shows the description of the inventory change.
<b>Quantity</b>	This field shows the quantity of items in the inventory change.
<b>Unit</b>	This field shows the unit, in which the item in the current movement is registered.
<b>Pricing Unit</b>	This field shows the value, which corresponds with the number of item units. This applies to sales prices as well as cost, weight, and volume.
<b>Price</b>	This field shows the cost of the item, as registered in the window Inventory Change.
<b>Currency</b>	This field shows which currency is used as the base currency in the company specified in the field “Company No.” above. For further information about the concepts of company base currencies and enterprise currency, please see the

Field	Description
	description of the field “Base Currency” in the window Company Information in the G/L module.

**Company Island**

Field	Description
<b>Company No.</b>	This field shows the number of the company responsible for the current item movement.

**Transaction Island**

Field	Description
<b>Trans. No.</b>	This field shows the transaction number in question.
<b>Trans. Type</b>	This field shows the transaction type of the serial number movement.
<b>Approved</b>	This field shows whether or not the transaction in question has been approved. An unapproved transaction can be approved by using the action “Approve Transaction” in the window Inventory Change.

## Serial Number Movements Sub-Tab

This section includes the fields and descriptions for the Serial Number Movements Sub-Tab.

Field	Description
<b>Serial No.</b>	In this field, you enter the relevant serial number of the inventory change.
<b>Quantity</b>	In this field, the quantity of the current serial number is shown. At the creation of a line, the value of the field is set to 1. If the type is “Count,” specify a positive figure to indicate the missing quantity of the item, or a negative figure to indicate the extra number of units found compared to what was expected.
<b>Shipment Loc.</b>	This field shows the location from which the current serial number should be shipped if the transaction is a shipment or transfer. Maconomy suggests the shipment location specified on the transaction line for which the serial number is being entered, but you can specify another location for each individual line.
<b>Receipt Loc.</b>	This field shows the location at which the current serial number is received if the transaction is a receipt or transfer. Maconomy suggests the receipt location specified on the transaction line for which the serial number is being entered, but you can specify another location for each individual line.

Field	Description
<b>Production Date</b>	In this field, you can enter a production date for the current serial number. The date is for information only and can only be assigned to inventory changes of the type "Receipt."
<b>Sell-by Date</b>	In this field, you can enter a sell-by date for the current serial number. The date is for information only and can only be assigned to inventory changes of the type "Receipt."
<b>Expiry Date</b>	In this field, you can enter an expiry date for the current serial number. The date is for information only and can only be assigned to inventory changes of the type "Receipt."
<b>Serial No. Text 1-5</b>	In these fields, you can enter various information about the current serial number. The texts are for information only and can only be assigned to inventory changes of the type "Receipt."

## Warehouse Transactions Single Dialog Workspace

Use this workspace to create warehouse transactions for planning the movement of items from one location to another.

You can view a warehouse transaction as a request for items to be moved from one location to another within the same warehouse.

The purpose of warehouse transactions is to enable you to focus on the goal of the relocation and let Maconomy fill in the details. For instance, if you want to move 50 units of item 1241 to the location where you normally pick items to prepare them for packing because it is running empty, you may not be concerned with where the items are moved from, as long as they are moved to the correct location. Similarly, if you need to clear a location for an incoming shipment, you may not be concerned with where the items at that location are moved to, as long as they are moved away from the location in question.

To plan an internal relocation, create a warehouse transaction and specify the quantity of items that you want to move and where they should be moved to or from. Next, approve the warehouse transaction and create a picking list using functions in the Action menu. Maconomy then creates a picking list with a suggestion of where to pick or place the items, depending on whether you specify a source or a target location.

You can specify on a warehouse transaction both where the items should be moved from and where they should be moved to. Maconomy transfers this information to the picking list that you create later in the process, but if you know both where the items should be moved from and where they should be moved to, you can create a picking list directly in the Picking Lists workspace instead.

You can also create warehouse transactions automatically as a result of, for example, sales orders or productions. Using an action in, for example, the Sales Orders workspace, you can create a warehouse transaction that specifies where the items in question should be moved to the shipping location of the order and with a blank source location number that indicates that the location from which the items are picked is irrelevant. For detailed planning, you can then either specify a source location, split a line into several lines to move the items from several locations to the target location, or just create a picking list and let Maconomy suggest the necessary source locations. You can also automatically create a similar transaction from an item purchase order by

using the **Create Warehouse Transaction** action in the Item Receipt workspace. This action creates a warehouse transaction that requests that the received items be moved from the receiving location to storage locations within the warehouse. On this type of warehouse transaction, you have the same planning options as on transactions that belong to sales orders.

In some cases, Maconomy automatically performs the warehouse transaction step. For instance, you can print a picking list directly in the Sales Orders workspace. Then Maconomy automatically creates and approves a warehouse transaction before creating and printing a picking list for it. Even if you create a warehouse transaction in this way, you can still view it in this workspace.

## Warehouse Transactions Tab

This section includes the fields and descriptions for the Warehouse Transactions Tab.

### Warehouse Transaction Island

Field	Description
<b>Transaction No.</b>	This field shows the number of the current transaction. When a transaction is created, it is automatically assigned a number from the number series "Warehouse Transaction" set up in the window System Numbers in the Set-Up module.
<b>Warehouse</b>	This field shows the warehouse in which the re-location of items is to take place. When creating a transaction, specify the relevant warehouse in this field. Once the transaction has been created, this field can no longer be changed.
<b>Open Picking Lists</b>	This field shows whether there is an open picking list assigned to the current warehouse transaction. If the field is marked, an open picking list currently exists for the warehouse transaction. When this field is marked it is not possible to change the table part.
<b>Create Picking List Failed</b>	This field is automatically marked if you have attempted to create a picking list for the current warehouse transaction, but the procedure failed, for example, because Maconomy was not able to find a source or target location for one of the lines. This means that you manually have to specify the source and target locations in the table part of the warehouse transaction before a picking list can be created.
<b>Approved</b>	This field is automatically marked when the warehouse transaction is approved. A warehouse transaction can be approved by selecting the action "Approve Warehouse Transaction" in this window. However, in the case of transactions created automatically from, for example, sales orders and item movements, the warehouse transaction is approved upon creation.  The approval is an indication that you have completed the line entry, and the transaction is ready for further processing. A warehouse transaction must be approved to create a picking list.
<b>Approved by</b>	This field shows the name of the user who approved the current warehouse transaction. If the transaction was approved by selecting an action that results in the automatic creation and approval of a warehouse transaction, this field shows the name of the user who selected that action.

Field	Description
<b>Closed</b>	<p>This field shows whether the current warehouse transaction has been closed. The closing of a warehouse transaction indicates that no more of the relocations on the transaction are to be carried out. This can be due to the fact that all of the lines have been fully implemented on the picking lists created from the transaction, but a transaction can also be closed if only part of it (or none of it) has been implemented but you want to stop the processing of the transaction, for example, due to lack of available items or major changes which would need a completely new warehouse transaction. It is not possible to change the table part of a closed warehouse transaction.</p> <p>A warehouse transaction can be closed manually by selecting the action "Close Transaction" or by closing a related picking list. When you close a picking list which results in the full implementation of the warehouse transaction to which the picking list is assigned, the warehouse transaction is automatically closed. A warehouse transaction is fully implemented when all of the items on it have been moved to or from the locations specified on each line in the correct quantities, according to the closed picking lists assigned to the transaction.</p> <p>If you close a picking list which does not result in the full implementation of the transaction, the transaction is not approved. This allows you to decide whether a new picking list should be created for the remainder or if the transaction should be closed manually, thus accepting that not all items were moved as requested.</p> <p>However, if the field "Implicit Warehouse Transactions" has been marked for the current warehouse in the window Warehouse Information Card, Maconomy closes a warehouse transaction when a related picking list is closed, even if the warehouse transaction was not fully implemented.</p>
<b>Closed by</b>	<p>This field shows the name of the user who closed the current warehouse transaction. If the transaction was closed as a result of closing a picking list as described in the field "Closed" above, this field shows the name of the user who closed the picking list.</p>

### Company Island

Field	Description
<b>Company No.</b>	<p>This field shows the number of the company responsible for the current warehouse transaction. Maconomy automatically assigns the transaction to the company to which the current warehouse is assigned as specified in the window Warehouse Information Card.</p>
<b>Name</b>	<p>This field shows the name of the company specified in the field "Company No." above.</p>

**References Island**

Field	Description
<b>Order No.</b>	If the warehouse transaction has been created from a sales order, this field shows the number of the order in question. It is not possible to manually assign a warehouse transaction to an order. For further information about how warehouse transactions are created from orders, see the descriptions of the actions in the window Sales Orders in the Sales Orders module.
<b>Item Purchase Order No.</b>	If the warehouse transaction has been created from an item purchase order, this field shows the number of the order in question. It is not possible to manually assign a warehouse transaction to an item purchase order. For further information about how warehouse transactions are created from item purchase orders, see the descriptions of the actions in the window Item Receipt in the Item Purchase module.
<b>Production Transaction No</b>	This field is not used in the current version of Maconomy.
<b>Inventory Change Transaction No.</b>	If the warehouse transaction has been created from a movement voucher, this field shows the number of the voucher in question. It is not possible to manually assign a warehouse transaction to a movement voucher. For further information about how warehouse transactions are created from movement vouchers, see the descriptions of the actions in the window Inventory Change.

**User Island**

See the chapter “Getting Started” for a description of the fields in the island User.

As an exception, the version number in the field “Version” in this island is only increased every time the warehouse transaction is unapproved, that is, when a change is made to the transaction after its approval.

**Remarks Island**

Field	Description
<b>Remarks</b>	In these fields, you can specify a number of remarks about the current warehouse transaction.

**Warehouse Transaction Lines Sub-Tab**

This section includes the fields and descriptions for the Warehouse Transaction Lines Sub-Tab.

Field	Description
<b>Item</b>	In this field, you can specify the number of the item to be moved.

Field	Description
<b>Quantity</b>	In this field, you can specify how many units of the current item should be moved. If you change this field after the approval of the transaction, the approval is cancelled.
<b>Being Moved</b>	This field shows the number of units of the item set to pick on open picking list lines assigned to the current warehouse transaction line. When such a picking list assigned to the current warehouse transaction is closed, this field is set to zero, and the quantity reported as moved on the picking list lines created from the current transaction line is deducted from this field and added to the field "Moved."
<b>Moved</b>	This field shows how many units of the current item have been moved. The field thus shows the total number of units reported as moved on closed picking list lines assigned to the current transaction line.
<b>Unit</b>	This field shows the unit in which the item is to be moved. If the warehouse transaction has been created manually, the unit is always the sales unit, retrieved from the field "Unit, Sales" in the window Item Information Card. If the warehouse transaction was created from one of the registration types in the island "References" in the card part, the unit is retrieved from the registration line on which the current warehouse transaction line is based. The unit cannot be changed here.
<b>Source Loc.</b>	<p>In this field, you can specify the location from which the items on the current line are to be moved. If the warehouse transaction was created automatically from an item purchase order, an inventory change of the type "Receipt" or a request for moving finished items away from the production location upon completed production, Maconomy suggests in this field the location applying to the registration line on which the current warehouse transaction line is based. If the warehouse transaction was created from a sales order, an inventory change for shipment or a request for moving raw materials to a production location, Maconomy suggests a blank value in this field.</p> <p>If this field is blank when a picking list is created for the current warehouse transaction, Maconomy will find a source location for the picking list line(s) created from the current warehouse transaction line. The source location is found by means of the procedure described for the action "Print Picking List."</p>
<b>Target Loc.</b>	<p>In this field, you can specify the location to which the items on the current line are to be moved. If the warehouse transaction was created automatically from a sales order, an inventory change for shipment or a request for moving raw materials to a production location, Maconomy suggests in this field the location applying to the registration line on which the current warehouse transaction line is based. If the warehouse transaction was created from an item purchase order, an inventory change of the type "Receipt" or a request for moving finished items away from the production location upon completed production, Maconomy suggests a blank value in this field.</p> <p>If this field is blank when a picking list is created for the current warehouse transaction, Maconomy will find a target location for the picking list line(s) created from the current warehouse transaction line. The target location is found by means of the procedure described for the action "Print Picking List."</p>

Field	Description
<b>Serial No.</b>	<p>If the items to be moved should have a certain serial number, you can specify that serial number here. The field can only be completed for items with serial number control, and if you enter a serial number, it must exist in the system.</p> <p>If the current line is based on a serial number entry line entered in the window Serial Number Entry for sales orders or Serial Number Receipt for item purchase orders, this field shows the serial number in question. The serial number can also derive from a closed picking list line on which a serial number was specified. For further information on the automatic creation of warehouse transaction lines for items with serial number control based on different registrations, see the descriptions of the action “Create Warehouse Transaction” in the windows Sales Orders, Item Purchase Orders, and Inventory Change, as well as the action “Approve Picking List” in the window Picking Lists.</p>
<b>Remarks</b>	In this field, you can enter any remarks about the current line.

## Actions

This section shows the Actions available in the Warehouse Transactions workspace

### Top Tab

Field	Description
<b>Approve Transaction</b>	When you select this action, the current warehouse transaction is approved as an indication that you are done creating lines on the transaction and it is ready for further processing. A warehouse transaction must be approved before picking lists can be created for it. Transactions created automatically from, for example, sales orders and item movements are approved upon creation.
<b>Print Transaction</b>	When you select this action, the current transaction is printed.
<b>Close Transaction</b>	<p>When you select this action, the current transaction is closed.</p> <p>The closing of a warehouse transaction indicates that no more of the relocations on the transaction are to be carried out. A transaction is automatically closed when all of the lines have been fully implemented on the picking lists created from the transaction, but you can close a transaction manually using this action if only part of it (or none of it) has been implemented but you want to stop the processing of the transaction, for example, due to lack of available items or major changes which would need a completely new warehouse transaction. However, a warehouse transaction cannot be closed if a picking list related to the warehouse in question exists.</p> <p>Please note that if the field “Implicit Warehouse Transactions” has been marked for the current warehouse in the window Warehouse Information Card, Maconomy closes a warehouse transaction when a related picking list is closed, even if the warehouse transaction was not fully implemented. For</p>

Field	Description
	<p>information about the full implementation of a warehouse transaction line, please see the description of the field "Closed" in the card part.</p> <p>It is not possible to change the table part of a closed warehouse transaction.</p>
<b>Create Picking List</b>	<p>When you select this action, Maconomy creates and prints a picking list from the information on the current warehouse transaction. You can only print a picking list if the warehouse transaction has been approved and there are no other picking lists for the same warehouse transaction that have not been closed in the Picking Lists window.</p> <p>On the picking list, Maconomy will attempt to complete the location fields that have been left blank on warehouse transaction lines. This sometimes means that Maconomy creates several picking list lines from the same warehouse transaction line, for instance if the source location has been left blank on the warehouse transaction and the desired quantity is not available at any one location.</p> <p>If the warehouse transaction is assigned to an order which has been blocked, a picking list cannot be printed out until you revoke the blocking of the order in the window Unblocking. Nor can a picking list be printed out if the customer has been blocked or blocked for delivery.</p> <p>To print a picking list, you need access to print packing lists. This is given by marking the field "Print Picking and Packing Lists" in the window Actions in the Set-Up module.</p>
<b>Print Packing List</b>	<p>This action can only be selected if the warehouse transaction is closed and assigned to an order which has been approved, and there are no open picking or packing lists assigned to the current order. When you select this action, Maconomy creates and prints a packing list for the order to which the warehouse transaction in the window is assigned. If the field "Combined Packing List" in the System Information window is marked, the printed packing list will also include older order lines to the customer, which have not yet been delivered, except orders with a preferred delivery date later than the current date. However, although the printed packing list may contain several orders, the items packed must be reported separately for each order. The packing list is a list of items to be packed and delivered with an indication of the locations at which they can be found.</p> <p>Maconomy creates a packing list line for each order line. If one of the items is an itemized BOM without inventory control, the printed packing list shows those item lines in the Order Lines window that have a quantity greater than zero in the "For Packing" field on the order and represent the highest level with inventory control on the BOM. The "For Packing" value for the BOM header has no significance. BOM parts have two line numbers on the printed packing list: The first is the number of the BOM header line in this window's table part; the second is the number of the BOM part's line in the Packing List Lines window where you report the quantity actually packed.</p> <p>The quantity in the field "Packed" on each packing list line is based on the information on all closed warehouse transactions assigned to the order in question. It is possible to have several closed warehouse transactions for the</p>

Field	Description
	<p>same order, for instance if the items were moved to the shipping location at different times. As described in the action "Approve Picking List" in the window Picking Lists, the information on each warehouse transaction is updated when items are picked. Each warehouse transaction line is assigned to an order line, and is automatically assigned to the packing list line resulting from each order line. The information about the quantities already picked at the time when the packing list is created thus flows indirectly to the packing list. This functionality ensures that the quantity suggested to be packed for each order line is the same as what has been moved to the shipping location at the time when the packing list is created even for individual serial numbers. The amount suggested to be packed on each packing list line is found by means of the following procedure where only closed warehouse transactions assigned to the current order are included. The process is carried out for each packing list line created:</p> <p>The quantity moved on warehouse transaction lines assigned to the current packing list line even on different warehouse transactions are added up. The total quantity moved on these lines is suggested in the field "Packed" on the packing list line in question. This procedure is also used on the items created in the window Packing List Lines.</p> <p>For items with serial number control, a similar procedure is used, but Maconomy also updates and creates lines in the window Serial Number Entry. The process is as follows:</p> <p>The quantity moved on warehouse transaction lines assigned to the same packing list line and with identical serial numbers even on different warehouse transactions are summed. For each combination of serial number and packing list line (on warehouse transaction lines), Maconomy checks if a serial number entry line with the same serial number already exists for the packing list line in question in the window Serial Number Entry. If so, the total quantity moved on the warehouse transaction lines is suggested in the field "Packed" on that serial number entry line. If no such line exists, Maconomy creates a serial number entry line for the current packing list line, using the serial number in question and transferring the total quantity moved to the field "Quantity" on the new line. If the same serial number has already been entered on several serial number entry lines for the same packing list line, Maconomy selects one of these serial number entry lines at random and suggests the total quantity moved in the field "Quantity." However, if the total quantity moved exceeds the quantity remaining to be suggested for packing (the quantity set for packing on the packing list line less the quantity already entered on other serial number entry lines belonging to the same packing list line), Maconomy only suggests the quantity remaining to be suggested for packing on the packing list line. Any extra units moved are either distributed to other serial number entry lines with the same serial number, or used on new serial number entry lines created for the current packing list line. This procedure is also used on items with serial number control in the window Packing List Lines. When all warehouse transaction lines assigned to the current packing list line have been processed, Maconomy adds the quantities on the serial number entry lines assigned to the</p>

Field	Description
	<p>packing list line and suggests the total quantity in the field “Packed” on that line.</p> <p>For packing list lines where the item does not have inventory control, the quantity set for packing on the order line is suggested in the field “Packed” on the corresponding packing list line.</p> <p>If the field “Blanket Order” is marked on the order to which the warehouse transaction is assigned, Maconomy will transfer the back orders registered to the ship-to customer, before creating a packing list. The packing list will then show order lines for these back orders.</p> <p>If you wish to reprint a packing list, remove the mark in the “Printed” field in the Packing List island in the Order Status window in the Sales Orders module. However, a packing list can also be printed any number of times by selecting the action “Print Packing List” in the window Packing Lists.</p> <p>If the order to which the warehouse transaction is assigned has been blocked as a result of exceeding the customer’s credit limit, a packing list cannot be printed out until you revoke the blocking of the order in the window Unblocking. Nor can a packing list be printed out if the customer has been blocked or blocked for delivery.</p> <p>Maconomy verifies that you have user access to print packing lists. This is given in the window Actions in the Set-Up module.</p>
<b>Print Packing Slip</b>	<p>This action can only be selected if the warehouse transaction is closed and assigned to an order for which an open packing list exists. When you select this action, you print a packing slip for the order to which the warehouse transaction is assigned to confirm that the items have been shipped from the warehouse. The information used on the packing slip is the information in the windows Packing and Packing List Lines in the Sales Orders module. The functionality of the action corresponds to the action “Print Packing Slip” in the window Packing. For a description of this functionality, please see the description of the action there.</p>

## Picking Lists Single Dialog Workspace

Use this workspace to enter the movement of items from one location to another, thus keeping the stock of each location up-to-date.

Warehouse employees use this workspace to confirm the items and quantities that have been moved and the locations they were moved to and from.

The Picking Lists tab displays general information about the picking list. Maconomy retrieves some of the information on automatically generated picking lists from the entry that produced the picking list. The Picking List Lines sub-tab displays how many items are supposed to be picked; you can enter the quantity actually picked, and where they were moved to and from.

You can create picking lists manually or automatically. You can use a manual picking list for planning and entering rearrangements in the warehouse. You can create automatic picking lists as a result of a number of different types of registrations, such as sales orders, item purchase orders, and BOM productions, for instance as a message that items should be moved to a

shipping location for packing (in the case of sales orders). You can create automatic picking lists in a number of different workspaces, depending on the type of registration.

Maconomy always creates picking lists that result from other types of entries from a warehouse transaction, which in turn was created from the entry in question. For instance, a picking list assigned to an item purchase order is based on a warehouse transaction that was originally created from the item purchase order in question. You can skip the middle step of warehouse transactions by creating a picking list directly from the entry (sales order, item purchase order, and so on). For information about the creation of picking lists from warehouse transactions or directly from entries, see the descriptions of the **Create Warehouse Transaction** action in the Sales Orders, Item Purchase Orders, and Inventory Change workspaces, as well as the **Print Picking List** action in the Sales Orders workspace.

When you are done entering the items that were moved, you can close the picking list, and Maconomy updates the stock of the items in question on the individual locations in the warehouse, as well as information on any warehouse transaction to which the picking list is assigned. However, because these movements are internal, Maconomy does not change the inventory value or create journals. Next, if the picking list is assigned to a sales order, you can create and print a packing list from the picking list, as a message to the packing function that the items have been moved to the requested packing locations and should be packed and shipped.

## Picking Lists Tab

This section includes the fields and descriptions for the Picking Lists Tab.

### Picking List Island

Field	Description
<b>Picking List No.</b>	This field shows the number of the current picking list. When a new picking list is created, it is automatically assigned a number from the system number series Picking List. The number cannot be changed manually.
<b>Warehouse</b>	This field shows the warehouse in which the picking is to take place. When creating a picking list manually, you can select a warehouse in this field, but the field cannot be changed once you have pressed Return.
<b>Approved</b>	<p>This field is automatically marked when the picking list is approved. A picking list can be approved by selecting the action "Approve Picking List" in this window. However, in the case of picking lists created from warehouse transactions (which may themselves have been created from, for example, sales orders, item purchase orders or item movements), the picking list is approved upon creation.</p> <p>The approval is an indication that you have completed the line entry, and the picking list is ready for further processing. A picking list must be approved to be printed or closed.</p>
<b>Approved by</b>	This field shows the name of the user who approved the current picking list. If the picking list was approved by selecting in another window an action that results in the automatic creation and approval of a picking list, this field shows the name of the user who selected that action.

Field	Description
<b>Closed</b>	<p>This field shows whether the current picking list has been closed. The closing of a picking list indicates that you have now reported the items actually moved, along with the actual quantities and the source and target locations. It is not possible to change the table part of a closed picking list.</p> <p>A picking list can be closed manually by selecting the action "Close Picking List." When you close a picking list which is assigned to a warehouse transaction, and the picking list results in the full implementation of the warehouse transaction in question, the warehouse transaction is automatically closed. A warehouse transaction is fully implemented when all of the items on it have been moved to or from the locations specified on each line in the correct quantities, according to the closed picking lists assigned to the transaction. However, if the field "Implicit Warehouse Transactions" has been marked for the current warehouse in the window Warehouse Information Card, Maconomy always closes a warehouse transaction when a related picking list is closed, even if the warehouse transaction was not fully implemented.</p>
<b>Closed by</b>	This field shows the name of the user who closed the picking list.

**Company Island**

Field	Description
<b>Company No.</b>	This field shows the number of the company responsible for the warehouse to which the picking list is assigned.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

**Remarks Island**

Field	Description
<b>Remarks</b>	In this field, you can specify any remarks about the current picking list.

**References Island**

Field	Description
<b>Order No.</b>	If the current picking list is related to a sales or credit order, this field shows the number of the order in question. The value in this field cannot be changed manually.
<b>Item Purchase Order No.</b>	If the current picking list is related to an item purchase order, this field shows the number of the item purchase order in question. The value in this field cannot be changed manually.

Field	Description
<b>Production Transaction No.</b>	If the current picking list is related to a BOM production, this field shows the number of the production transaction in question. The value in this field cannot be changed manually.
<b>Transaction No.</b>	If the current picking list was created from a warehouse transaction, this field shows the number of the transaction in question. Please note that if a picking list is related to any of the other registration types in this island, it is also related to a warehouse transaction.

### User Island

See the “Getting Started” topic for a description of the fields in the island User.

### Picking List Lines Sub-Tab

This section includes the fields and descriptions for the Picking List Lines Sub-Tab.

Field	Description
<b>Item</b>	This is the number of the item to be moved.
<b>Quantity</b>	This field shows how many item units are to be moved. If the picking list was created manually, you can specify the desired quantity to be moved here. If the picking list was created from a warehouse transaction, the value cannot be changed here.
<b>Moved</b>	Here you enter the quantity of items actually moved. Maconomy automatically suggests the value from the “Quantity” field. You can change the suggested value, for instance if the physical inventory is short of items. Maconomy verifies that the amount you enter is divisible by the item’s minimum sales unit.
<b>Unit</b>	This field shows the unit in which the items should be moved. If the picking list was created manually, the value is transferred from the information card of the item. If the picking list was created from a warehouse transaction, the value is transferred from the warehouse transaction line on which the current picking list line was based. The value cannot be changed here.
<b>Source Loc., Planned</b>	<p>In this field, you can enter the location from which you expect to move the items on the line. If the items are actually picked elsewhere, you can specify the actual source location in the field “Source Location” on the current line.</p> <p>If the picking list was created from a warehouse transaction, the value in this field is copied from the field “Source Location” on the transaction line on which the current picking list line was based. However, if no source location was specified on that warehouse transaction line, the value in this field is derived through a procedure which is described in detail in the description of the action “Print Picking List.”</p> <p>When the picking list has been approved, the value can only be changed here if the picking list was created manually.</p>

Field	Description
<b>Target Loc., Planned</b>	<p>In this field, you can enter the location to which you expect to move the items on the line. If the items are actually moved to another location, you can specify the actual target location in the field "Target Loc." on the current line.</p> <p>If the picking list was created from a warehouse transaction, the value in this field is copied from the field "Target Loc." on the transaction line on which the current picking list line was based. However, if no target location was specified on that warehouse transaction line, the value in this field is derived through a procedure which is described in detail in the description of the action "Print Picking List."</p> <p>When the picking list has been approved, the value can only be changed here if the picking list was created manually.</p>
<b>Source Loc.</b>	<p>In this field, you can specify the location from which the items on the line were actually moved. When the picking list is approved, Maconomy suggests the planned source location from the field "Source Loc., Planned" but you can specify another location here if the items were picked from another location, for example, because they were not actually available at the planned source location.</p>
<b>Target Loc.</b>	<p>In this field, you can specify the location to which the items on the line were actually moved. When the picking list is approved, Maconomy suggests the planned target location from the field "Target Loc., Planned" but you can specify another location here if the items were moved to another location, for example, because there was no room available at the planned target location.</p>
<b>Serial No., Planned</b>	<p>If the items to be moved should have a certain serial number, you can specify that serial number here. The field can only be completed for items with serial number control, and the serial number must exist in the system. If the picking list was created from a warehouse transaction, the value in this field is copied from the field "Serial No." on the transaction line on which the current picking list line was based.</p> <p>If a line has an item with a serial number control but you need to pick the items in several different locations and report the individual serial numbers on separate lines, you can use the field "Quantity on Split Lines" or "No. of Split Lines" and the action "Split Line" to split the current line. This allows you to specify separate locations and quantities for each serial number picked.</p> <p>When the picking list has been approved, the value can only be changed here if the picking list was created manually.</p>
<b>Serial No.</b>	<p>In this field, you can specify the serial number of the line's item units actually moved. The field can only be completed for items with serial number control. When the picking list is approved, Maconomy suggests the planned serial number from the field "Serial No., Planned" if a serial number was specified there. However, you can specify another serial number here if the serial numbers of the items moved were not the same as the planned ones, for example, because the planned serial numbers were not actually available at the planned source location. If the item on the line uses the serial number control principle "Complete Serial No. Reg." as set up in the window Item Information Card, you must enter a serial number in this field.</p>

Field	Description
	<p>If the picking list is assigned to a sales order and you wish to specify the serial number moved, but that serial number has not been created in the system, for example, because the item does not use the serial number control method "Ser. No. Reg. at Receipt" and the system number therefore was not entered when the items were received you must create a line with the serial number in the window Serial Number Information before you can enter the number here.</p> <p>To register serial numbers, you must use one line for each serial number picked. If a line has an item with serial number control but you need to specify the individual serial numbers or perhaps also have to pick the items in several different locations, you can use the field "Quantity on Split Lines" or "No. of Split Lines" and the action "Split Line" to split the current line into the desired number of lines. This allows you to specify separate locations and quantities for each serial number picked.</p>
Remarks	In this field, you can enter supplementary remarks for a further description of the current line.
Quantity on split lines	<p>In this field, you can specify the quantity which you want to move from the current line to a new line. The quantity must be divisible by the item's minimum sales unit. If you specify a quantity in this field and select the action "Split Line," Maconomy will create a line with the quantity specified in this field, and write down the quantity on the current line accordingly.</p> <p>The value in the field is not reset when you select the action "Split Line." This allows you to easily split the line into several lines with the same quantity by simply selecting the action the desired number of times.</p>
No. of split lines	<p>In this field, you can specify the number of lines into which you want to split the current line. If you specify a number in this field and select the action "Split Line," Maconomy will split the line into the number of lines specified in this field. The lines will be identical to the current line, but the quantity on each line will be the quantity on the current line divided by the number in this field. However, Maconomy adjusts the quantity to a number that can be divided by the item's minimum sales unit. If this results in a remainder, Maconomy creates an extra line with the remainder. For instance, let us say the item on the line has a minimum sales unit of 0.25 and the quantity on the line is 3.25. If you specify 5 in this field, Maconomy will divide the quantity by 5, and the result would be 0.65. As this is not divisible by 0.25, Maconomy rounds down to the nearest figure divisible by 0.25, namely 0.5. In addition, Maconomy creates a line with the remainder, 0.75. As illustrated in the example, the remainder line may be assigned a quantity which is greater than the one on the "real" split lines, and you may therefore also have to split the remainder line.</p>

## Actions

This section shows the Actions available in the Picking Lists workspace.

### Top Tab

Field	Description
<b>Approve Picking List</b>	<p>When you select this action, the picking list in the window is approved.</p> <p>When a picking list is approved, it becomes possible to enter the quantities actually picked and the locations to and from which they were moved, while the fields used for specifying the planned quantities and locations are locked for changes.</p>
<b>Print Picking List</b>	<p>When you select this action, you print the picking list shown in the window.</p> <p>You can reprint a picking list any number of times using this action.</p>
<b>Close Picking List</b>	<p>When you select this action, the picking list in the window is closed.</p> <p>When you close the picking list, Maconomy updates the stock of each location to and from which items were moved. However, as the picking list only represents an internal re-location of items, no G/L entries are created and the inventory value of the warehouse remains the same.</p> <p>If the picking list was created from a warehouse transaction, Maconomy updates the transaction in question with the quantities moved on each line. For each picking list line that matches a line in the warehouse transaction from which the picking list was created, Maconomy updates that warehouse transaction line with the quantity reported moved on the picking list line in question. A match occurs if the item number and the source and target locations on a picking list line correspond to those specified on a line in the warehouse transaction. If the source location on a warehouse transaction line is blank, a picking list is considered a match if just the item number and the target location is the same as on the warehouse transaction line. Similar functionality applies if the target location is blank on a warehouse transaction line. If a picking list line matches several warehouse transaction lines, Maconomy updates the top line where there is a match.</p> <p>For items with serial number control, a match occurs if the criteria described above are met, and the serial number on the picking list line is the same as the one on the warehouse transaction line. If there are no such warehouse transaction lines, Maconomy checks if there is a warehouse transaction line where the serial number is blank and the item number and locations match the picking list line as described above. If this is the case, you can say that this line represents a number of units that should be moved to a given location, but at the time when the warehouse transaction was created, the serial numbers to be moved were unknown. The picking list line with the same item number and locations and with a serial number thus means that the serial numbers are known at the time when the picking list is closed. To update the warehouse transaction in this case, Maconomy creates a warehouse transaction line with the item number and locations in question, transferring from the picking list line the serial number and quantity. At</p>

Field	Description
	<p>the same time, Maconomy reduces both the field “Quantity” and the field “Being Moved” on the warehouse transaction line with the blank serial number field by the quantity which was transferred to the new line. As a result, the quantity for which the serial number is now known is now on a separate warehouse transaction line, and the quantity on the line representing unknown serial numbers corresponds to the remainder of unknown serial numbers. When the quantity on this line reaches zero because of other picking list lines matching the scenario described above, the line is removed from the warehouse transaction as an indication that all serial numbers for that item to be moved to that location are now known.</p> <p>Picking list lines that do not meet the criteria described above do not result in the update of any warehouse transaction lines, but the available stock of the locations on the lines are updated all the same, as the items are considered moved.</p> <p>When a warehouse transaction line is updated, the quantity reported moved on the picking list line is transferred to the field “Moved” on the warehouse transaction line while the field “Being Moved” is reset to zero. The field “Moved” is updated to a maximum value corresponding to the value in the field “Quantity” on the same warehouse transaction line. Any extra units moved are distributed to other lines on the warehouse transaction matching the same picking list line. Any remainder after all matching lines have been updated this way does not cause further updates to the warehouse transaction.</p> <p>When you close a picking list which results in the full implementation of the warehouse transaction to which the picking list is assigned, the warehouse transaction is automatically closed. A warehouse transaction is fully implemented when all of the items on it have been moved to or from the locations specified on each line in the correct quantities, according to the closed picking lists assigned to the transaction. If you close a picking list which does not result in the full implementation of the transaction, the transaction remains open, allowing you to decide whether a new picking list should be created for the remainder or if the transaction should be closed manually, thus accepting that not all items were moved as requested. However, if the field “Implicit Warehouse Transactions” has been marked for the current warehouse in the window Warehouse Information Card, Maconomy closes a warehouse transaction when a related picking list is closed, even if the warehouse transaction was not fully implemented.</p>
<b>Print Packing List</b>	<p>This action can only be selected if the picking list is closed and assigned to an order which has been approved, and there are no open warehouse transactions or packing lists assigned to the current order. When you select this action, Maconomy creates and prints a packing list for the order in the window. If the field “Combined Packing List” in the System Information window is marked, the printed packing list will also include older order lines to the customer, which have not yet been delivered, except orders with a preferred delivery date later than the current date. However, although the printed packing list may contain several orders, the items packed must be reported separately for each order. The packing list is a list of items to be packed and delivered with an indication of the locations at which they can be found.</p> <p>Maconomy creates a packing list line for each order line. If one of the items is an itemized BOM without inventory control, the printed packing list shows those item</p>

Field	Description
	<p>lines in the window Order Lines that have a quantity greater than zero in the “For Packing” field on the order and represent the highest level with inventory control on the BOM. The “For Packing” value for the BOM header has no significance. BOM parts have two line numbers on the printed packing list: The first is the number of the BOM header line in this window’s table part; the second is the number of the BOM part’s line in the Packing List Lines window where you report the quantity actually packed.</p> <p>The quantity in the field “Packed” on each packing list line is based on the information on all closed warehouse transactions assigned to the order in question. It is possible to have several closed warehouse transactions for the same order, for instance if the items were moved to the shipping location at different times. As described in the action “Approve Picking List” in the window Picking Lists, the information on each warehouse transaction is updated when items are picked. Each warehouse transaction line is assigned to an order line, and is automatically assigned to the packing list line resulting from each order line. The information about the quantities already picked at the time when the packing list is created thus flows indirectly to the packing list. This functionality ensures that the quantity suggested to be packed for each order line is the same as what has been moved to the shipping location at the time when the packing list is created even for individual serial numbers. The amount suggested to be packed on each packing list line is found by means of the following procedure where only closed warehouse transactions assigned to the current order are included. The process is carried out for each packing list line created:</p> <p>The quantities moved on warehouse transaction lines assigned to the current packing list line even on different warehouse transactions are added up. The total quantity moved on these lines is suggested in the field “Packed” on the packing list line in question. This procedure is also used on the items created in the window Packing List Lines.</p> <p>For items with serial number control, a similar procedure is used, but Maconomy also updates and creates lines in the window Serial Number Entry. The process is as follows:</p> <p>The quantities moved on warehouse transaction lines assigned to the same packing list line and with identical serial numbers even on different warehouse transactions are summed. For each combination of serial number and packing list line (on warehouse transaction lines), Maconomy checks if a serial number entry line with the same serial number already exists for the packing list line in question in the window Serial Number Entry. If so, the total quantity moved on the warehouse transaction lines is suggested in the field “Packed” on that serial number entry line. If no such line exists, Maconomy creates a serial number entry line for the current packing list line, using the serial number in question and transferring the total quantity moved to the field “Quantity” on the new line. If the same serial number has already been entered on several serial number entry lines for the same packing list line, Maconomy selects one of these serial number entry lines at random and suggests the total quantity moved in the field “Quantity.” However, if the total quantity moved exceeds the quantity remaining to be suggested for packing (the quantity set for packing on the packing list line less the quantity already entered on other serial number entry lines belonging to the same</p>

Field	Description
	<p>packing list line), Maconomy only suggests the quantity remaining to be suggested for packing on the packing list line. Any extra units moved are either distributed to other serial number entry lines with the same serial number, or used on new serial number entry lines created for the current packing list line. This procedure is also used on items with serial number control in the window Packing List Lines. When all warehouse transaction lines assigned to the current packing list line have been processed, Maconomy adds the quantities on the serial number entry lines assigned to the packing list line and suggests the total quantity in the field "Packed" on that line.</p> <p>For packing list lines where the item does not have inventory control, the quantity set for packing on the order line is suggested in the field "Packed" on the corresponding packing list line.</p> <p>If the field "Blanket Order" is marked on the order to which the picking list is assigned, Maconomy will transfer the back orders registered to the ship-to customer, before creating a packing list. The packing list will then show order lines for these back orders.</p> <p>If you wish to reprint a packing list, remove the mark in the "Printed" field in the Packing List island in the window Order Status in the Sales Orders module. However, a packing list can also be printed any number of times by selecting the action "Print Packing List" in the window Packing Lists.</p> <p>If the order to which the picking list is assigned has been blocked as a result of exceeding the customer's credit limit, a packing list cannot be printed out until you revoke the blocking of the order in the window Unblocking. Nor can a packing list be printed out if the customer has been blocked or blocked for delivery.</p> <p>Maconomy verifies that you have user access to print packing lists. This is given in the window Actions in the Set-Up module.</p>
<b>Print Packing Slip</b>	<p>This action can only be selected if the picking list is closed and assigned to an order for which an open packing list exists. When you select this action, you print a packing slip for the order to which the warehouse transaction is assigned to confirm that the items have been shipped from the warehouse. The information used on the packing slip is the information in the windows Packing Lists and Packing List Lines in the Sales Orders module. The functionality of the action corresponds to the action "Print Packing Slip" in the window Packing Lists. For a description of this functionality, please see the description of the action there.</p>
<b>Split Line</b>	<p>When this action is selected, Maconomy splits the lines on which a figure has been specified in the field "Quantity on Split Lines" or "No. of Split Lines." For a description of the methods by which the lines are split, see the descriptions of the fields "Quantity on Split Lines" and "No. of Split Lines."</p>

## Print Picking List Single Dialog Workspace

Use this workspace to print picking lists in batches.

You can only print picking lists for orders that have been approved, and for which there are no other open picking lists.

In the Sales Orders workspace, you can print a picking list immediately after you create or change a sales order by using the **Print Picking List** action. This enables you to move the items to the respective shipping locations on short notice. The creation of a picking list for an order happens as described for the **Print Picking List** action.

If you handle many sales orders every day, it is convenient to print the picking lists in one operation. You can do this by entering a range of order numbers in this workspace.

You can also print picking lists for order lines to be delivered within a range of delivery dates. This means that you can create warehouse transactions and picking lists for those lines on each order that are to be delivered within a given range of dates, while giving ample notice to warehouse employees, who can then schedule work shifts accordingly.

In the Selection Criteria island, you can specify a range of existing picking lists to be printed, and whether certain types of transactions should be taken into consideration. If you want to create picking lists from sales orders, specify in the Selection Criteria island a range of orders for which picking lists should be created. However, this range is only relevant if you choose to create warehouse transactions and/or picking lists in the Print Control island.

If you cannot print picking lists for a given sales order, Maconomy ignores it. For instance, Maconomy ignores picking lists for blocked sales orders, and you cannot print them until you revoke the blocking the Unblocking workspace in the Sales Orders module. Similarly, Maconomy ignores picking lists for orders with blocked lines and orders concerning customers who have been blocked or blocked for delivery.

## Print Picking List Tab

This section includes the fields and descriptions for the Print Picking List Tab.

### Selection Criteria Island

Field	Description
<b>Warehouse</b>	In this field, you can select a warehouse. When printing existing picking lists, the printout will only include picking lists assigned to this warehouse.
<b>Picking List No.</b>	If you are reprinting existing picking lists, you can specify in this field a range of picking list numbers, and the printout will only include existing picking lists with numbers within the specified range.
<b>Company No.</b>	If you are reprinting existing picking lists, you can specify in this field a range of company numbers, and the printout will only include existing picking lists with a responsible company within the specified range.
<b>Order No.</b>	If you mark the checkbox, the printout will include the orders encompassed by the range specified here and in the island Selection Criteria, Sales Orders. When creating picking lists and/or warehouse transactions, this means that new lists and transactions are created for the sales orders matching the range in these fields and in the island Selection Criteria, Sales Orders. When reprinting picking lists, the printout will include all lists assigned to the sales orders that match the range in these fields and in the island Selection Criteria, Sales Orders. To include all orders, mark the checkbox and do not specify a range of sales order numbers.

Field	Description
	If you do not mark the check box, the printout will not include any picking lists and/or warehouse transactions assigned to sales orders.
<b>Item Purchase Order No.</b>	<p>If you mark the field, the printout will include the item purchase orders matched by the range specified here. This means that when printing existing picking lists, the printout will include lists assigned to an item purchase order within the range specified here. It is not possible to create and print warehouse transactions and picking lists for item purchase orders. To include all orders, mark the field and do not specify a range of item purchase order numbers.</p> <p>If you do not mark the field, the printout will not include any picking lists and/or warehouse transactions assigned to item purchase orders.</p>
<b>Production Transaction No.</b>	This field is not used in the current version of Maconomy.
<b>Manual Inv. Change Trans. No.</b>	<p>If you mark the checkbox, the printout will include the manually created inventory change transactions encompassed by the range specified here. This means that when printing existing picking lists, the printout will include lists assigned to a manually created inventory change transaction within the range specified here. It is not possible to create and print transactions and picking lists for manually created inventory change transactions. To include all manual inventory transactions, mark the checkbox and do not specify a range of transaction numbers.</p> <p>If you do not mark the checkbox, the printout will not include any picking lists assigned to manually created inventory transactions.</p>
<b>Transaction No.</b>	<p>If you mark the checkbox, the printout will include the warehouse transactions encompassed by the range specified here. This means that when printing existing picking lists, the printout will include lists assigned to a warehouse transaction within the range specified here. To include all manual inventory transactions, mark the checkbox and do not specify a range of transaction numbers.</p> <p>If you do not mark the check box, the printout will not include any picking lists assigned to warehouse transactions.</p>
<b>Manual Picking Lists</b>	Mark this field if you want the printout to include manually created picking lists. The field can only be marked when reprinting picking lists.

#### Selection Criteria, Sales Orders Island

Field	Description
<b>Company No.</b>	In this field, you can specify a range of company numbers. Maconomy will only create and print warehouse transactions and picking lists for sales orders with responsible companies within the specified range. The range in this field only applies if the checkbox "Sales Orders" has been marked in the island Selection Criteria. Whether warehouse transactions, picking lists, or

Field	Description
	both should be created and printed depends on whether the fields “Create Picking Lists” and “Create Warehouse Transactions” have been marked in the island Print Control.
<b>Picking Date</b>	In this field, you can specify a range of picking dates. Maconomy will only create and print warehouse transactions and picking lists for sales orders assigned to a consignment with a picking date within this range. The range in this field only applies if the checkbox “Sales Orders” has been marked in the island Selection Criteria. Whether warehouse transactions, picking lists, or both should be created and printed depends on whether the fields “Create Picking Lists” and “Create Warehouse Transactions” have been marked in the island Print Control.
<b>Consignment No.</b>	In these fields, you can specify a range of consignment numbers. Maconomy will only create and print warehouse transactions and picking lists for sales orders assigned to a consignment within the specified range. The range in this field only applies if the checkbox “Sales Orders” has been marked in the island Selection Criteria. Whether warehouse transactions, picking lists, or both should be created and printed depends on whether the fields “Create Picking Lists” and “Create Warehouse Transactions” have been marked in the island Print Control.
<b>Destination No.</b>	In these fields, you can specify a range of destination numbers. Maconomy will only create and print warehouse transactions and picking lists for sales orders with a destination number within the specified range. The range in this field only applies if the checkbox “Sales Orders” has been marked in the island Selection Criteria. Whether warehouse transactions, picking lists, or both should be created and printed depends on whether the fields “Create Picking Lists” and “Create Warehouse Transactions” have been marked in the island Print Control.
<b>Consignment Date</b>	In these fields, you can specify a range of consignment dates. Maconomy will only create and print warehouse transactions and picking lists for sales orders assigned to consignments with a consignment date within the specified range. The range in this field only applies if the checkbox “Sales Orders” has been marked in the island Selection Criteria. Whether warehouse transactions, picking lists, or both should be created and printed depends on whether the fields “Create Picking Lists” and “Create Warehouse Transactions” have been marked in the island Print Control.
<b>Delivery Date</b>	In these fields, you can specify a range of delivery dates. For the orders matching the other selection criteria in this island, Maconomy will only create and print warehouse transactions and picking lists for lines with a delivery date within the specified range. This allows you to create warehouse transactions and picking lists for parts of an order if the order has partial delivery. The range in this field only applies if the checkbox “Sales Orders” has been marked in the island Selection Criteria. Whether warehouse transactions, picking lists, or both should be created and printed depends on whether the fields “Create Picking Lists” and “Create Warehouse Transactions” have been marked in the island Print Control.

Field	Description
<b>Delivery Mode</b>	In this field, you can select a delivery mode. Maconomy will only create and print warehouse transactions and picking lists for sales orders with the selected delivery mode. The range in this field only applies if the checkbox "Sales Orders" has been marked in the island Selection Criteria. Whether warehouse transactions, picking lists, or both should be created and printed depends on whether the fields "Create Picking Lists" and "Create Warehouse Transactions" have been marked in the island Print Control.
<b>Delivery Terms</b>	In this field, you can select a code for delivery terms. Maconomy will only create and print warehouse transactions and picking lists for sales orders with the selected delivery terms. The range in this field only applies if the checkbox "Sales Orders" has been marked in the island Selection Criteria. Whether warehouse transactions, picking lists, or both should be created and printed depends on whether the fields "Create Picking Lists" and "Create Warehouse Transactions" have been marked in the island Print Control.
<b>Carrier</b>	In this field, you can select a carrier. Maconomy will only create and print warehouse transactions and picking lists for sales orders with the selected carrier. The range in this field only applies if the checkbox "Sales Orders" has been marked in the island Selection Criteria. Whether warehouse transactions, picking lists, or both should be created and printed depends on whether the fields "Create Picking Lists" and "Create Warehouse Transactions" have been marked in the island Print Control.
<b>Order Mode</b>	In this field, you can enter an order mode. Maconomy will only create and print warehouse transactions and picking lists for sales orders with the selected order mode. The range in this field only applies if the checkbox "Sales Orders" has been marked in the island Selection Criteria. Whether warehouse transactions, picking lists, or both should be created and printed depends on the values in the fields "Create Picking Lists" and "Create Warehouse Transactions" have been marked in the island Print Control.
<b>Consignment Type</b>	In this field, you can select a consignment type. Maconomy will only create and print warehouse transactions and picking lists for sales orders with the selected consignment type. The range in this field only applies if the checkbox "Sales Orders" has been marked in the island Selection Criteria. Whether warehouse transactions, picking lists, or both should be created and printed depends on whether the fields "Create Picking Lists" and "Create Warehouse Transactions" have been marked in the island Print Control.
<b>Main Order No.</b>	In these fields, you can specify a range of order numbers. Maconomy will only create and print warehouse transactions and picking lists for sales orders linked to a main order whose order number is within the specified range. The range in this field only applies if the checkbox "Sales Orders" has been marked in the island Selection Criteria. Whether warehouse transactions, picking lists, or both should be created and printed depends on whether the fields "Create Picking Lists" and "Create Warehouse Transactions" have been marked in the island Print Control.

**Print Control Island**

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.
<b>Print Closed Picking Lists</b>	In this field, you can specify whether to print closed picking lists. If you select "Yes," the printout will only include picking lists which have been closed and match the specified selection criteria. If you select "No," the printout will only include picking lists which have not been closed. If you do not select a value, the printout will include both open and closed picking lists.
<b>Reprint Picking Lists</b>	In this field, you can specify whether to reprint picking lists which have already been created and printed. If you select "Yes," the printout will only include picking lists which have previously been printed and match the specified selection criteria. If you select "No," the printout will only include picking lists which have not previously been printed. If you do not select a value, the printout will include both types of picking lists.
<b>Create Warehouse Transactions</b>	If you mark this field, Maconomy will create warehouse transactions for the sales orders and sales order lines matching the selection criteria specified in the islands Selection Criteria and Selection Criteria, Sales Orders. However, the printout also includes existing picking lists and new picking lists matching the selection criteria. The warehouse transaction created for each order is created as explained in the description of the action "Create Warehouse Transaction" in the Sales Orders module.
<b>Create Picking Lists</b>	If you mark this field, Maconomy will create and print picking lists from the warehouse transactions matching the selection criteria specified in the island Selection Criteria. If the field "Create Warehouse Transactions" is marked, picking lists are also created for warehouse transactions created in the current processing. The printout also includes existing picking lists matching the selection criteria. Each picking list is created and printed as explained in the window Sales Orders' description of the action "Print Picking List." If you do not mark the field "Create Warehouse Transactions," the printout will only create picking lists for existing warehouse transactions. In the description of the action "Print Picking Lists" in the window sales order, this corresponds to printing picking lists for orders for which a warehouse transaction already exists. If you mark this field, it is not possible to specify selection criteria on picking list numbers. You cannot mark this field if you have selected "Yes" in the field "Reprint Picking Lists" or "Print Closed Picking Lists."

**Inventory Count Listing Single Dialog Workspace**

Use this workspace to create or reprint inventory count listings.

You use these lists in connection with an inventory count of all or some of the items in your warehouses, for example, a status count. You can print the inventory count listing with different layouts depending on whether you want the list sorted by location and item number or by location and serial number.

When you create an inventory count listing, Maconomy creates an inventory count listing for each item and a serial number inventory count line for each serial number. If the current inventory count results in counting at more than one location for just one of the items that are included in the selection criteria that you specified in the New Count Listing island, Maconomy creates a main listing that contains one line per item. On these lines, the **Location** field is blank, which indicates that it can count one or more items at more than one location. You must subsequently make the inventory count on assigned sublistings on which Maconomy automatically fills in the **Location** field for each item and from which Maconomy consolidates results on the main listing.

If you only need to do an inventory count at one location for each item specified in the selection criteria, Maconomy creates a main listing that contains one line per item and a specification of the expected location in the **Location** field on each line. You can subsequently enter the inventory count on this main listing.

After you perform a count, you can enter actual volumes in the Inventory Count workspace. For items that have serial number control you can enter the inventory count of all serial numbers in either the Inventory Count by Stock Location workspace or the Serial No. Count workspace. These two workspaces only display items that have serial number control. However, the Inventory Count by Stock Location workspace displays the serial numbers sorted by location, while the Serial No. Count workspace displays the serial numbers sorted by item number. When you have entered the counted quantities, Maconomy automatically consolidates them on the assigned listing in this workspace. You can reprint an inventory count listing that shows only items with stock deviation between the inventory recorded in Maconomy and the actual inventory volumes over a certain size.

When you complete an inventory count and enter it in the Inventory Count workspace, you approve the list in the Approve Count workspace. Maconomy then creates and prints an item transaction that shows item movements for each item on the inventory count listings. The number on the item movement corresponds to the deviation found between the actual counted number and the stock volume registered in Maconomy before the count.

Maconomy also creates an item journal to update the relevant inventory accounts in the G/L module. You must then post the item journal in the Posting or Print Posting Journal workspaces in the G/L module.

For items that have serial number control, Maconomy also creates a number of serial number movement lines in such a way that the quantity of the current serial number is also updated. Note that for items that have serial number control you must perform a serial number count of the various serial numbers. If you do not enter a serial number count, when you approve the count it results in a 100% deviation, and Maconomy resets the quantity of serial numbers.

An item can only appear in one inventory count main listing at a time, but it can appear on several inventory count sublistings at a time. You must either approve or delete the list before an item can appear in a new inventory count main listing.

You can handle an item in the order system and carry out inventory changes while the item is being printed in an unapproved inventory count list. However, the list always compares the manually entered item volume with Maconomy's volume when you create the list in this workspace.

If you make inventory changes after you create the inventory count list and before you do the manual, the manually counted figures must include these inventory changes.

Item movements that you perform after the manual count has occurred and before you enter the figures in the Inventory Count workspace do not influence the inventory count.

If in the Approve Count workspace you enter a posting date that is before the printing date of the count list; that is, if you take out stock before you print the counting list, you must take into consideration any inventory changes that take happen between the stock taking and the printout. Inventory changes that happen between the printout of the count list and the time when you enter the actual figures in the Inventory Count workspace have no influence on the inventory count.

## Inventory Count Listing Tab

This section includes the fields and descriptions for the Inventory Count Listing Tab.

### Run Mode Island

Field	Description
<b>Layout</b>	<p>In this field, you select the layout of the list. You can choose among the layouts "Inventory Count Listing," "Inventory Count Result" and "Serial No. Count."</p> <p>If you select "Inventory Count Listing," Maconomy prints one line per item with room for you to manually write the physical inventory volume. The items are sorted by stock location and item number.</p> <p>For items with serial number control, one line for each serial number is printed below the line with the item number. This layout can, for example, be used if the inventory count is to be made by item number. For each item with serial number control you can enter the counted quantity of each item's serial number in the window Serial No. Count. The serial number quantities can also be registered in the window Inventory Count by Stock Location, but in the window Serial No. Count the serial numbers are shown pr. item number, and are therefore sorted in the same way as on the count listing.</p> <p>If the layout "Serial No. Count" is selected, only items with serial number control are printed. On the printout, the items are primarily sorted by the location specified for the current serial number and secondly by serial number. This layout can, for example, be used if the inventory count is to be made by serial number, for example, because the serial numbers are used for location control.</p> <p>In this window, you can enter the counted quantity of each serial number on the count listing. The serial number quantities can also be registered in the window Serial No. Count, but in the window Inventory Count by Stock Location the serial numbers are shown by location as well as by serial number, and are therefore sorted in the same way as on the count listing.</p> <p>If you select "Inventory Count Result," Maconomy prints one line per item, stating the item volume recorded in Maconomy, the manual count recorded in the Inventory Count window, variance in quantity and variance in %. The items are sorted by stock location and item number. For items with serial number control, one line for each serial number is furthermore printed below the line with the item number.</p> <p>If you have marked the field "Generate Listing," you can only use the layout "Inventory Count Listing."</p>
<b>Generate Listing</b>	<p>Mark this field if you wish to make an inventory count list. Maconomy will subsequently create a list for the inventory and items specified in the island New Inventory Count List.</p>

Field	Description
	If you do not mark the field, Maconomy reprints existing lists, as specified in the island Existing Inventory Count Listing. In this case, you cannot enter new information in the island New Inventory Count Listing.
<b>Include unexpected items</b>	<p>If you mark this field, and you have selected one or more specific stock locations in the island "New Inventory Count Listing," Maconomy will print a listing of the items in the specified stock locations first, and then all other items (which are not supposed to be in the specified stock location). This way, it is easy to mark any items found in the specified location which do not belong there. However, the printout may be very long if you have many items.</p> <p>If you do not mark the field, and you have selected one or more specific stock locations in the island "New Inventory Count Listing," Maconomy will print a listing of the items in the specified stock locations only.</p>

### New Inventory Count Listing Island

Field	Description
<b>Remarks</b>	<p>Here you must enter a note about the inventory count list you are making. It is printed on the list and shown in the windows Inventory Count, Inventory Count by Stock Location and Approve Count.</p> <p>You can only enter a note when making a new inventory count list.</p>
<b>Warehouse</b>	Here you select which warehouse to make an inventory count list for. The list will only include items in this warehouse. The list will only make an inventory count for this warehouse.
<b>Stock Location</b>	<p>Here you can enter a range of stock locations. The list will only include items located within this range, if the field "Include unexpected items" in the island Run Mode is not marked. The stock location must be for the warehouse selected in the "Warehouse" field. The list sorts the items by stock location and item number.</p> <p>You can only enter a range if you are making a new inventory count list.</p>
<b>Item No.</b>	<p>Here you enter a range of item numbers. The list will only show items in the range. The items must be in the warehouse selected in the "Warehouse" field. The list sorts the items by stock location and item number.</p> <p>You can only enter a range if you are making a new inventory count list.</p>
<b>Item Group</b>	<p>Here you can select an item group. The list will only include items in this group. You can only select an item group if you are making a new inventory count list.</p>
<b>Item Type</b>	Here you can select an item type. The list will only include items of this type.
<b>Statistics 1-4</b>	<p>Here you can enter four statistic code ranges. The list will only include items with statistic codes in these ranges.</p> <p>You can only complete these fields if you are making a new list.</p>

Field	Description
<b>System-filled Serial Number Quantity</b>	<p>When you mark this field, Maconomy creates inventory count listings on which the quantities of serial numbers are completed in advance with the quantity currently registered in the system. This way, you only need to enter figures for those items whose serial number stock does not match the one registered in the system. The serial number count lines are displayed in the window Serial No. Count.</p> <p>Note that if the current inventory count gives rise to counting at more than one location for just one of the serial numbers included in the count listing, Maconomy creates a main listing containing one line per item. On these lines, the field "Location" will be blank indicating that one or more items can be counted at more than one location. In order to have the window Serial No. Count display the system-filled quantities for each serial number, you must create a sublisting on which the field "Location" is automatically filled in for each item's location. In this way, you can now inspect and edit the system-filled figures in the window Serial No. Count or you can enter the number of serial numbers counted on the sublisting in question. The figures entered are automatically consolidated on the main listing.</p> <p>If inventory count is only to be made at one location for each item's serial numbers, Maconomy creates a main listing containing one line per item and a specification of the expected location in the field "Location" on each line. In such situations, you do not have to create a sublisting to see and edit the system-filled serial number quantities in the window Serial No. Count.</p>
<b>Complete Serial Number Count</b>	<p>If you mark this field, Maconomy creates a count line for each serial number registered in the system. This means that when performing inventory counts for the relevant items, the individual serial numbers at each location and their quantities must be counted. If you have marked this field, entering the total number of units of the items found at each location does thus not suffice, as you must also specify the quantity of each serial number. Serial number quantities are specified in the window Serial No. Count.</p> <p>A list created with a mark in this field can only be approved if the number of serial numbers counted on a certain location is identical to the inventory count made on the same location. Note that if you mark this field, you cannot enter a range of locations in the fields "Location" in this island.</p>

### Existing Inventory Count Listing Island

Field	Description
<b>List No.</b>	In these fields, you can specify a range of inventory count listing numbers if you want to reprint existing inventory count listings or new inventory count sublistings. New inventory count listings are numbered according to the serial number series "Inventory Count Listing" in the window System Numbers in the Set-Up module.
<b>Minimum Variance, %</b>	Here you enter a percentage and an amount limit, so that the list will only show items with a variance of at least this size. The percentage variance

Field	Description
	<p>regards quantity. The amount variance shows the quantity variance expressed in cost per item number.</p> <p>The inventory count listing only makes a calculation based on the information in this field if you have selected the “Inventory Count Result” layout. An item must meet both the percentage and the amount condition.</p>
<b>Minimum Variance, Currency</b>	<p>Here you enter a percentage and an amount limit, so that the list will only show items with a variance of at least this size. The percentage variance regards quantity. The amount variance shows the quantity variance expressed in cost per item number.</p> <p>The inventory count listing only makes a calculation based on the information in this field if you have selected the “Inventory Count Result” layout. An item must meet both the percentage and the amount conditions.</p>
<b>Include Approved</b>	<p>You can mark this field if you wish to also reprint approved inventory count lists. You can only mark the field when you are reprinting. If you do not mark it, Maconomy will only print existing inventory count lists which have not yet been approved in the Approve Count window.</p> <p>Once an inventory count list has been deleted before or after approval, you cannot reprint it.</p>
<b>Do not Include Sublistings</b>	<p>In this field, you can mark whether to include any sublistings on the printout of a range of existing lists. If you do not mark the field, the printout will include the sublistings assigned to each of the inventory count main listings printed.</p>

## Inventory Count Single Dialog Workspace

Use this workspace to display the inventory count listings that you created in the Inventory Count Listing workspace and the sublistings that you create in this workspace.

The Inventory Count tab displays information about the inventory count list, and the Inventory Count Lines sub-tab displays the individual items on the list. You can choose to see only some of the items in a list.

When your company wants to perform an inventory count, print an inventory count list in the Inventory Count Listing workspace. If several people need to work on the same inventory count list at the same time, you can create sublistings based on an existing main list. This allows the people who are involved to work on separate sublistings whose results are automatically consolidated on the main listing. Create sublistings using the **Create Sublisting** action in this workspace. They are shown in the same way as normal inventory count listings in this workspace. For more information about inventory count sublistings, see the description of the **Create Sublisting** action.

You count the inventory volumes manually and record the result in the inventory count list in this workspace. This entry is the basis of any inventory adjustments that happen after the list is approved in the Approve Count workspace. Note that for items that have serial number control you must count the relevant serial numbers and enter them in either the Serial No. Count workspace or in the Inventory Count by Stock Location workspace. If you do not enter any serial number count results, the approval of the count results in a 100% deviation, and Maconomy resets the quantity of serial numbers. However, it is not necessary to enter the total number of

items as well as the counted number of serial numbers in this workspace. When you enter a quantity number on a serial number count line, Maconomy checks whether the counted number of the item in this workspace corresponds to the total number of counted item serial numbers. If this is the case, Maconomy automatically updates the line in this workspace with the latest counted number, and in this way this workspace always displays the total number of counted serial numbers. If the counted number in this workspace and the serial number total do not correspond—for example, if items have been counted on item number level as well as serial number level—Maconomy does not update the inventory count line in this workspace.

You can reprint an inventory count list in the Inventory Count Listing workspace, and you can print quantity and cost variances for each item number.

When you print an item in an inventory count list that has not yet been approved, you can perform movements for it. If you perform inventory changes after you create a list and before you do the manual count, include the inventory changes in the manually recorded figures.

Item movements that happen after you have done the manual count and before you enter the figures in the Inventory Count workspace do not influence the inventory count.

If in the Approve Count workspace you enter a posting date that is before the printing date of the count list—that is, you take out stock before you print out the counting list—you must also take into consideration any inventory changes that happen between the stock-taking and the printout. Inventory changes that happen between the printout of the count list and the time when you enter the actual figures in the Inventory Count workspace have no influence on the inventory count.

You can always delete an inventory count listing. In the Approve Count workspace, you can delete a listing on approval. If you do not delete the list on approval, you must delete the list in this workspace. An item can only appear on one non-approved inventory count main listing for a given warehouse at a time. If you want to create a count listing to replace an existing, non-approved listing, you must first delete the existing list in this workspace.

## Inventory Count Tab

This section includes the fields and descriptions for the Inventory Count Tab.

### Inventory Count Listing Island

Field	Description
<b>List No.</b>	This is the number of the list shown in the window. Inventory count lists are given a number from the “Inventory Count” number series in the window Number Series in the Set-Up module. You cannot change the number.
<b>Entry Date</b>	This is the date any inventory movements and G/L entries for an approved inventory count list are entered. The entry date is always the same as the date an inventory count list is approved. If the field is blank, the list has not been approved.
<b>Number of Sublistings</b>	This field shows the number of sublistings created for the current inventory count listing.
<b>Main Listing No.</b>	If the listing currently shown in the window is a sublisting, this field shows the number of the main listing to which the sublisting is assigned. If the listing

Field	Description
	shown in the window is a main listing, this field shows the same number as the field "List No."
<b>Remarks</b>	<p>This field shows a remark describing the inventory count listing.</p> <p>The remark was entered in the window Inventory Count Listing when the listing was created. You can change the content of this field on both main listings and sublistings.</p>
<b>Variances</b>	<p>This field shows the number of items currently displayed in the table part of the window for which a variance has been registered between Maconomy's inventory count, that is, the registered number of items, and your manual inventory count. In the island Show Lines, you can select which items to be displayed in the table part of the window.</p> <p>If you want to see the size of the variances, you can reprint the inventory count list using the "Inventory Count Result" layout.</p> <p>Maconomy suggests zero as the manually counted figure until you enter another value. The window will therefore show many variances, if the list comprises many items with an inventory volume different from zero.</p>
<b>Variances, Total</b>	<p>This field shows the number of items on the current count listing for which a variance has been registered between Maconomy's inventory count, that is, the registered number of items, and your manual inventory count.</p> <p>If you want to see the size of the variances, you can reprint the inventory count list using the "Inventory Count Result" layout.</p> <p>Note that Maconomy suggests zero as the manually counted figure until you enter something else. The window will therefore show many variances, if the list comprises many items with an inventory volume different from zero.</p>
<b>Complete Serial Number Count</b>	<p>This field is marked, if the field "Complete Serial No. Count" was marked in the window Inventory Count Listings when the current list was created. If the field is marked, Maconomy has created a count line for each serial number registered in the system. When performing inventory counts for the relevant items, the individual serial numbers at each location and their quantities must be counted in the window Serial No. Count or Inventory Count by Stock Location. The results entered are automatically consolidated on the main count listing.</p> <p>A list created with a mark in this field can only be approved if the number of serial numbers counted on a certain location is identical to the inventory count made on the same location. At approval of such a list, Maconomy creates an item movement on which the deviations, if any, between the registered number of serial numbers and the counted number of serial numbers are registered.</p>

### Show Lines Island

Field	Description
<b>Show Lines</b>	If you mark this field, the table will show the item lines in the list. If the field is not marked, no items are shown in the table part. If the field is marked, the table will

Field	Description
	<p>show the items specified by the selection criteria fields in this island. If you want to create a sublisting from the main listing currently shown in the window, this field must be marked in order for any item lines to be copied to the new sublisting.</p> <p>An item must be shown in the table part before you can record its actual inventory volume, that is, the result of your manual count.</p>
<b>Keep Sel. Crit.</b>	<p>In this field, you can mark whether Maconomy should keep the selection criteria specified when you browse through other inventory count listings. This way, you can specify a range of item numbers in the island Show Lines, mark this field, and then browse through the inventory count listings where Maconomy will now only show information about the specified range of items.</p> <p>If you do not mark this field, the selection criteria specified are reset each time you select another inventory count listing.</p>
<b>Stock Location</b>	<p>Here you can enter a range of stock locations. The table will only show items located within this range. The lines are sorted by stock location and item number.</p> <p>If a stock location range is specified, and you create an inventory count sublisting, the sublisting created will only contain items registered on locations within this range.</p> <p>The table will only show the items in the inventory count list if you mark the "Show Lines" field.</p>
<b>Item No.</b>	<p>Here you can enter a range of item numbers. The table will only show items numbered within this range. The lines are sorted by stock location and item number.</p> <p>If an item number range is specified, and you create an inventory count sublisting, the sublisting created will only contain items within this range.</p> <p>The table will only show the items in the inventory count list if you mark the "Show Lines" field.</p>
<b>Line No.</b>	<p>Here you can enter a range of line numbers. The lines in the inventory count list are numbered by stock location and item number. The table will only show lines numbered within this range.</p> <p>If a line number range is specified, and you create an inventory count sublisting, the sublisting created will only contain items on inventory count listing lines within this range.</p> <p>The table will only show the items in the inventory count list if you mark the "Show Lines" field.</p>

### Selection Criteria Island

Field	Description
<b>Warehouse</b>	<p>This field shows the warehouse that relates this inventory count list. The list will only include items in this warehouse. All inventory volumes in the list are for this warehouse alone. If a sublisting is currently shown in the window, the value in this field is retrieved from the main listing to which the sublisting in question is assigned.</p>

Field	Description
	The warehouse was entered in the Inventory Count Listing window when the list was created.
<b>Stock Location</b>	This is the stock location range entered in the Inventory Count Listing when the list was created. If a main listing is currently shown in the window, the values in these fields cannot be changed here. If a sublisting is currently shown, the range of location numbers can be changed, and the table part will then only show those lines in the sublisting which pertain to items registered on stock locations within the specified range.
<b>Item No.</b>	This is the item number range entered in the Inventory Count Listing when the list was created. If a main listing is currently shown in the window, the values in these fields cannot be changed here. If a sublisting is currently shown, the range of item numbers can be changed, and the table part will then only show those lines in the sublisting which pertain to items within the specified range.
<b>Item Group</b>	This is the item group selected in the Inventory Count Listing when the list was created.
<b>Item Type</b>	This is the item type selected in the Inventory Count Listing when the list was created. If the window shows an inventory count sublisting, the value in this field is retrieved from the main listing to which the sublisting is assigned.
<b>Statistics 1-4</b>	These are the statistics ranges entered in the Inventory Count Listing when the list was created. If the window shows an inventory count sublisting, the value in this field is retrieved from the main listing to which the sublisting is assigned.

### Company Island

Field	Description
<b>Company No.</b>	This field shows the name of the company to which the current warehouse is assigned.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.
<b>Base Currency</b>	This field shows which currency is used as the base currency in the company specified in the field "Company No." above. For further information about the concepts of company base currencies and enterprise currency, please see the description of the field "Base Currency" in the window Company Information in the G/L module.

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

**Status Island**

Field	Description
<b>Approved</b>	This field is marked if the count list has been approved in the Approve Count window. If it is marked, you can no longer make inventory volume registrations in this window's table. However, you can make a new inventory list for the items in the approved list. If the window shows an inventory count sublisting, the value in this field is retrieved from the main listing to which the sublisting is assigned. If the field is not marked, you can make manual volume registrations in the table.
<b>Approved by</b>	This is the name of the user, who approved the inventory count list in the Approve Count window. If the list has not yet been approved, the field is blank. If the window shows an inventory count sublisting, the value in this field is retrieved from the main listing to which the sublisting is assigned.
<b>Date</b>	This field shows the date the count list was approved in the Approve Count window. If it has not been approved, the field is blank. If the window shows an inventory count sublisting, the value in this field is retrieved from the main listing to which the sublisting is assigned.

## Inventory Count Lines Sub-Tab

This section includes the fields and descriptions for the Inventory Count Lines Sub-Tab.

Field	Description
<b>Line No.</b>	This shows the line's line number. Lines are numbered by item stock location and item number. The table only shows items specified in the Show Lines island.
<b>Stock Location</b>	This field shows the stock location of the item on the line. If just one of the items included on the current main listing can be counted on more than one location, this field is blank. In order to have the different locations for each item displayed, you must therefore create a sublisting. On such a sublisting, this field displays all locations at which the items are located. On sublistings, you cannot change the locations displayed in this field. If you need to register an inventory count of an item found at a location which is not currently specified on the lines in the table part, you can create a line. However, the location specified on such a line must be within the range of locations specified in the listing's selection criteria. Note that if you add a line which applies to an item with serial number control, you must also enter or change the relevant information in the windows Serial No. Count or Serial No. Count by Stock Location.  If all items included on the main listing can be counted at only one location each, this field displays the location of each item. In this case, the inventory counting can be registered directly on the main listing. You cannot change the location in this field once a quantity has been entered on this line or on an assigned serial number count line. If you create a sublisting on the basis of such a main listing, the values in this field are blanked on the main listing. The location numbers are hence displayed on the assigned sublisting. The values entered on the sublisting are subsequently consolidated on the main listing.

Field	Description
	When created, sublistings are sorted by stock location and item number, but you can add lines anywhere in the table part of sublistings, regardless of this sorting. The warehouse to which the location is assigned is shown in the field "Warehouse" in the island Selection Criteria.
<b>Item No.</b>	This is the number of the item on the line. The lines are sorted by stock location and item number. Item number cannot be changed here.
<b>Unit</b>	This is the unit recorded for the item in the item information card. It cannot be changed here.
<b>Description</b>	This is the text specified for the item in the field "Description Lang. 1" in the window Item Information Card. It cannot be changed here.
<b>Carton Size</b>	In this field, you can specify the number of item units included in a carton. When performing an inventory count, you only have to count the entire cartons plus the number of units in opened cartons.
<b>Number of Cartons</b>	In this field, you can enter the number of counted cartons of the current item.
<b>No. of Units in Carton</b>	<p>In this field, you can further to the number in whole cartons enter the number of items counted.</p> <p>For items with serial number control, the relevant serial numbers have to be entered in either the window Serial No. Count or in the window Inventory Count by Stock Location. However, it is not necessary to enter the total number of items as well as the counted number of serial numbers in this window. When you enter a quantity number on a serial number count line, Maconomy checks if the counted number of the item in this field corresponds to the total number of counted item serial numbers. If this is the case, the field is automatically updated with the latest counted number of serial number units, and in this way the total number of counted serial numbers is always shown in this window. When updating, an entered number of cartons will be reset in such a way that the total counted number is displayed in this field. If the counted number in this field and the total number of serial numbers do not correspond, for example, if items have been counted on item number level as well as serial number level, the inventory count line is not updated in this window. Please note that when entering numbers manually in this field, no serial number count lines are updated.</p>
<b>Total Counted</b>	<p>This field shows the total number of units counted of the current item. The value in the field is calculated as carton size multiplied by the number of cartons plus number of units on the current line. If there is a variance between the actual inventory and the inventory at the time the inventory count list was created,</p> <p>Maconomy automatically marks the field "Variance." This field cannot be changed on neither an inventory count main listing if a result has been entered for the item in question on one or several of the sublistings assigned to the main listing, nor can the field be changed manually on sublistings.</p>

Field	Description
	<p>This window does not show the inventory volume recorded by Maconomy. It can be printed in the Inventory Count Listing window and will show the variance in quantity and percentage on the basis of the volume you enter here.</p> <p>You can change the value entered here until the inventory count list is approved in the Approve Count window. Once it is approved you cannot change it, and the “Approved” field will automatically be marked.</p>
<b>Var.</b>	<p>This field is marked if there is a variance between the manually entered inventory volume in the field “Total Counted” and the inventory volume recorded by Maconomy at the time the inventory count list was created in the window Inventory Count Listing. If the total counted number corresponds to the stock quantity recorded by Maconomy, this field is automatically unmarked.</p> <p>At the approval of an inventory count listing, Maconomy creates inventory change transactions for all items on the count listing so that the quantity of the current item number is updated with the counted quantity. If there is no deviation for an item, the number on the serial number movement for the current item will be zero. For items with serial number control, Maconomy also creates a number of serial number movement lines in order for the quantity of all serial numbers to be updated with the counted quantity. If no deviation is registered on a given serial number, the quantity recorded on the serial number movement line will be zero.</p> <p>If there is a mark in this field, the line will be included in the figures for the “Variances” and “Total Variances” fields.</p>

## Serial No. Count Single Dialog Workspace

Use this workspace to enter the counted quantity of the relevant serial numbers.

When you create an inventory count listing, Maconomy automatically creates a serial number count line for each serial number entered on the current item. In this workspace, the Serial No. Count tab displays a line from a main inventory count or a sublisting. The Serial Number Count Lines sub-tab displays the serial numbers entered for the item on the current inventory count line, sorted in stock location order. This means that you can enter the counted quantity of each serial number in this workspace.

You can understand the serial number count as a specification of which serial numbers of a given item there are actually to be found in the warehouse. Therefore, the functionality of this workspace is closely connected to that of the Inventory Count workspace, where you enter the counted units of each item number. When you enter a quantity on a serial number line, Maconomy checks whether the counted number of the item in the Inventory Count workspace corresponds to the total number of counted item serial numbers in this workspace. If this is the case, Maconomy automatically updates the line in the Inventory Count workspace with the latest counted number; thus, the Inventory Count workspace always displays the total number of counted serial numbers. For items that have serial number control you do not need to manually enter the total counted number in the Inventory Count Listing workspace. If the counted number in the Inventory Count workspace does not correspond to the total counted number of serial numbers—for example, if you have counted items on both the item number level and the serial

number level—Maconomy does not update the inventory count line in the Inventory Count workspace.

If you approve an inventory count listing and select the **Complete Serial No. Count** field, Maconomy creates a serial number movement line for each serial number for control of the quantity of serial numbers. The quantity on these lines corresponds to the deviation between the quantities counted and the quantities entered in the Serial Number Information workspace. Maconomy performs a similar control for all items that have the property **Complete Serial No. Reg.**, even if you do not select the **Complete Serial No. Count** field on the current listing. Maconomy does not perform this control in other cases, even if you enter serial number counts. However, Maconomy does control the entry of the serial number stock on various locations on which you report serial number counts.

### Serial No. Count Tab

This section includes the fields and descriptions for the Serial No. Count Tab.

#### Inventory Count Listing Island

Field	Description
<b>List No.</b>	This field displays the number of the inventory count listing to which the line displayed is assigned. You cannot change the number of an inventory count listing.
<b>Line No.</b>	This field displays the number of the line on the inventory count listing currently shown in the window. The table part displays the serial number lines assigned to the current line.

#### Company Island

Field	Description
<b>Company No.</b>	This field shows the number of the company responsible for the current warehouse as specified in the window Warehouse Information Card.
<b>Name</b>	This field shows the name of the company specified in the field "Company No." above.
<b>Base Currency</b>	This field shows which currency is used as the base currency in the company specified in the field "Company No." above. For further information about the concepts of company base currencies and enterprise currency, see the description of the field "Base Currency" in the window Company Information in the G/L module.

#### Item Island

Field	Description
<b>Item No.</b>	This field displays the number of the item assigned to the current inventory count listing line.
<b>Description</b>	This field displays the item text assigned to the current item.

Field	Description
<b>Warehouse</b>	This field displays the name of the warehouse for which the inventory count listing has been printed. Only items stocked in the selected warehouse are included on the inventory count listing. All stocks taken on the current inventory count listing only concern this warehouse.
<b>Stock Location</b>	This field displays the stock location in which the current item is located. The value is transferred from the Item Information Card.
<b>Unit</b>	This field displays the unit in which the current item is inventoried and order processed. The unit is specified on the Item Information Card. The information cannot be changed in this field.
<b>Counted</b>	<p>This field displays the total number of counted units of the current item. The value is transferred from the field "Total Counted" on the relevant inventory count listing line in the window Inventory Count.</p> <p>In this window, you cannot see the stock quantity in Maconomy. This quantity can be printed from the window Inventory Count Listing, where deviation in number and percentages are reported on the basis of the information in this field.</p>
<b>Serial Nos. Counted</b>	This field displays the total number of counted units of the current item. The value in the field is calculated as the sum of the values in the field "Total Counted" on the serial number count lines in the table part.
<b>Deviation</b>	This field displays a possible deviation between the counted number of the item and the total counted quantity of the serial numbers. Thus, the field shows the difference between the fields "Counted" and "Serial Nos Counted."

### Serial Number Count Lines Sub-Tab

This section includes the fields and descriptions for the Serial Number Count Lines Sub-Tab.

Field	Description
<b>Serial No.</b>	This field displays the relevant current number.
<b>Stock Location</b>	This field displays the stock location in which the current serial number is registered. The value is transferred from the window Serial Number Information when the serial number count is performed and the value can therefore not be changed in this field.
<b>Carton Size</b>	In this field, you can specify the number of item units that are included in a carton. When performing an inventory count, you only have to count the entire cartons plus the number of units in opened cartons.
<b>Number of Cartons</b>	In this field, you can enter the number of counted cartons of the current item.

Field	Description
<b>No. of Units in Carton</b>	In this field, you can further to the number in whole cartons enter the number of items counted. If the field “System-filled Serial No. Count” was marked when creating the listing displayed in the card part of the window, the quantities of serial numbers are completed in advance on the lines with the quantity currently registered in the system. This way, you only need to enter figures for those items whose serial number stock does not match the one registered in the system.
<b>Total Counted</b>	<p>This field shows the total number of units counted of the current item. The value in the field is calculated as carton size multiplied by the number of cartons plus number of units on the current line. When the value in this field changes, Maconomy checks if the counted number of the item in the field “Total Counted” in the window Inventory Count corresponds to the number shown in this field. If this is the case, the field “Number of Units” on the line in the window Inventory Count is automatically updated with the latest counted number, and therefore always displays the latest total counted serial numbers. Thus, it is not necessary manually to enter the total counted number in the window Inventory Count Listing. If the counted number in the window Inventory Count does not correspond to the total counted number of serial numbers, for example, if items have been counted on item number level as well as serial number level, the inventory count line is not updated in the window Inventory Count.</p> <p>If the field “System-filled Serial No. Count” was marked when creating the listing displayed in the card part of the window, the quantities of serial numbers are completed in advance on the lines with the quantity currently registered in the system.</p>
<b>Var.</b>	This field is marked if there is a variance between the manually entered serial number volume in the field “Total Counted” and the inventory volume recorded by Maconomy at the time the inventory count list was created in the Inventory Count Listing window. If a manually counted serial number volume is registered as corresponding to the volume specified in the window Serial No. Information, this field is automatically unmarked.
<b>Production Date</b>	<p>This field displays the production date of the current serial number. The date is transferred from the window Serial No. Information and cannot be changed here.</p>
<b>Sell-by Date</b>	<p>This field displays the sell-by date of the current serial number.</p> <p>The date is transferred from the window Serial No. Information and cannot be changed here.</p>
<b>Expiry Date</b>	<p>This field displays the expiry date of the current serial number.</p> <p>The date is transferred from the window Serial No. Information and cannot be changed here.</p>
<b>Serial No. Text 1-5</b>	These fields show various information about the current serial number entry line. The date is transferred from the window Serial No. Information and cannot be changed here.

## Inventory Count by Stock Location Single Dialog Workspace

Use this workspace to enter the counted quantity of the relevant serial numbers.

When you create an inventory count listing, Maconomy automatically creates a serial number count line for each serial number entered on items that have serial number control. In this workspace, the Inventory Count by Stock Location tab displays information about the inventory count listing. The Serial Number Count Lines sub-tab displays the serial numbers entered for the items on the current inventory count listings, sorted in stock location order. This means that you can enter the counted quantity of each serial number in this workspace. You can select to have only a part of the listings' serial numbers shown in the sub-tab.

You can understand the serial number count as a specification of the serial numbers within a given item that are actually to be found in the warehouse. Therefore, the functionality of this workspace is closely connected to that of the Inventory Count workspace, where you enter the counted units of each item number. When you enter a quantity on a serial number line, Maconomy checks whether the counted number of the item in the Inventory Count workspace corresponds to the total number of counted item serial numbers in this workspace. If this is the case, Maconomy automatically updates the line in the Inventory Count workspace with the latest counted number; thus, the workspace always displays the total number of counted serial numbers. For items that have serial number control, you are not required to enter the total counted number in the Inventory Count Listing workspace manually. If the counted number in the Inventory Count workspace does not correspond to the total counted number of serial numbers—for example, if you count the items on both the item number level and the serial number level—Maconomy does not update the inventory count line in the Inventory Count workspace.

If you approve an inventory count listing and select the **Complete Serial No. Count** field, Maconomy creates a serial number movement line for each serial number for control of the quantity of serial numbers. The quantity on these lines corresponds to the deviation between the quantities counted and the quantities entered in the Serial Number Information workspace. Maconomy performs a similar control for all items that have the property **Complete Serial No. Reg.**, even if you do not select the **Complete Serial No. Count** field on the current listing. Maconomy does not perform this control in other cases, even if you enter serial number counts. However, Maconomy does control the entry of the serial number stock on various locations on which you report serial number counts.

### Inventory Count by Stock Location Tab

This section includes the fields and descriptions for the Inventory Count by Stock Location Tab.

#### Inventory Count Listing Island

Field	Description
<b>List No.</b>	This field displays the number of the current inventory count listing line. Warehouse No. This field displays the warehouse number for which the inventory count listing has been printed
<b>Entry Date</b>	This field displays the date any inventory movements and G/L entries for an approved inventory count list are entered. The entry date is always the same as the date an inventory count listing is approved.

Field	Description
	If the field is blank, the listing has not been approved.
<b>Remarks</b>	This field displays the note assigned to the current inventory count listing. The note is entered in the Inventory Count Listing window and cannot be changed here.

### Selection Criteria Island

Field	Description
<b>Show Lines</b>	<p>If you mark this field, the table will show the serial numbers on the current inventory count listing. If the field is not marked, there will be serial numbers in the table.</p> <p>If the field is marked, the table will show the serial numbers specified by the other selection criteria fields in this island.</p>
<b>Stock Location</b>	In these fields, you can enter a range of stock locations. The table will only show serial numbers with a location specification within this range. The lines are sorted by stock location and serial number.
<b>Item No.</b>	In this field, you can enter a range of item numbers. The table will only show items numbered within this range. The lines are sorted by stock location and item number.
<b>Serial No.</b>	In this field, you can enter a range of serial numbers. Only serial numbers included in this range are shown in the table part of the window.
<b>Line No.</b>	Here you can enter a range of line numbers. The lines in the inventory count list are numbered by stock location and item number. The table will only show lines numbered within this range.

### Company Island

Field	Description
<b>Company No.</b>	This field shows the number of the company responsible for the current warehouse as specified in the window Warehouse Information Card.
<b>Name</b>	This field shows the name of the company specified in the field "Company No." above.
<b>Base Currency</b>	This field shows which currency is used as the base currency in the company specified in the field "Company No." above. For further information about the concepts of company base currencies and enterprise currency, see the description of the field "Base Currency" in the window Company Information in the G/L module.

## Serial Number Count Lines Sub-Tab

This section includes the fields and descriptions for the Inventory Count by Stock Location Sub-Tab.

Field	Description
<b>Stock Location</b>	This field displays the stock location on which the relevant serial number is registered. The value is transferred from the window Serial Number Information, when the serial number count is performed and the value can therefore not be changed in this field.
<b>Serial No.</b>	This field displays the relevant serial number.
<b>Line No.</b>	This field displays the number of the line on which the serial number's item number appears on the inventory count listing.
<b>Item No.</b>	This field displays the number of the item to which the current serial number is assigned.
<b>Carton Size</b>	In this field, you can specify the quantity of serial numbers that are included in a carton. When performing an inventory count, you only have to count the entire cartons plus the number of units in opened cartons.
<b>Number of Cartons</b>	In this field, you can enter the number of counted cartons of the current serial number.
<b>No. of Units in Carton</b>	In this field, you can apart from the number in whole cartons enter the number of items counted.
<b>Total Counted</b>	This field shows the total number of units counted of the current serial number. The value in the field is calculated as carton size multiplied by the number of cartons plus number of units on the current line. When the value in this field changes, Maconomy controls if the counted number of the item in the field "Total Counted" in the window Inventory Count corresponds to the number specified in this field. If this is the case, the line in the window Inventory Count is automatically updated with the latest counted number, and therefore always displays the latest total counted serial numbers. Thus, it is not necessary to enter the total counted number in the window Inventory Count Listing manually. If the counted number in the window Inventory Count does not correspond to the total counted number of serial numbers, for example, if items have been counted on item number level as well as serial number level, the inventory count line is not updated in the window Inventory Count.
<b>Var.</b>	This field is marked if there is a variance between the manually entered serial number volume in the field "Total Counted" and the inventory volume recorded by Maconomy at the time the inventory count list was created in the Inventory Count Listing window. If a manually counted serial number

Field	Description
	volume is registered as corresponding to the volume specified in the window Serial No. Information, this field is automatically unmarked.
<b>Description</b>	This field displays the item text for the item to which the current serial number is assigned. The text is transferred from the Item Information Card and cannot be changed here.
<b>Production Date</b>	This field displays the production date of the current serial number. The date is transferred from the window Serial No. Information and cannot be changed here.
<b>Sell-by Date</b>	This field displays the sell-by date of the current serial number. The date is transferred from the window Serial No. Information and cannot be changed here.
<b>Expiry Date</b>	This field displays the expiry date of the current serial number. The date is transferred from the window Serial No. Information and cannot be changed here.
<b>Serial No. Text 1-5</b>	These fields show various information about the current serial number entry line. The information is transferred from the window Serial No. Information and cannot be changed here.
<b>Cost</b>	This field displays the cost of the current serial number at the warehouse in question. The cost is transferred from the window Serial No. Information and cannot be changed here.

## Approve Count Single Dialog Workspace

Use this workspace to approve and delete inventory count lists.

The Approve Count tab displays how many lists are ready to be approved and deleted. The Inventory Count listings sub-tab displays each of these lists. In the sub-tab, you can select the lists that you want to approve and delete. You can only approve those lists whose **Approved** field is selected via the **Approve** action.

When you want to do an inventory count, you first use the Inventory Count Listing workspace to create a list of the items that you want to count. You can write down actual volumes on the printed list. You then record the actual volumes in one or more of the Inventory Count, Serial No. Count, or Inventory Count by Stock Location workspaces. You can specify a posting date for the counting. Thus, for example, you can enter an inventory that you did in December after the New Year, but use the original date of the inventory as the posting date.

In this workspace, you approve the count with the data entered on the current inventory count listing. This workspace does not display inventory count sublistings, because the figures that you enter on a sublisting are consolidated on the assigned main listing.

If you approve an inventory count listing and select the **Complete Serial No. Count** field, Maconomy creates a serial number movement line for each serial number for control of the quantity of serial numbers. The quantity on these lines corresponds to the deviation between the quantities counted and the quantities entered in the Serial Number Information workspace. Maconomy performs a similar control for all items that have the property **Complete Serial No.**

**Reg.**, even if you do not select the **Complete Serial No. Count** field on the current listing. Maconomy does not perform this control in other cases, even if you enter serial number counts. However, Maconomy does control the entry of the serial number stock on various locations on which you report serial number counts.

Use the **Approve** action in this workspace to approve an inventory count list. When you approve an inventory count list, Maconomy creates inventory change transactions for all of the items on the list, updating the volume of each item number with the counted volume. If this causes the volume of a given item to be increased, it can result in backorder allocation if you select the **Aut. Back-Order Allocation** field in the System Information workspace of the Set-Up module. If you do not enter any deviation for an item, the number of the inventory change for the current item is zero. For items that have serial number control, Maconomy also creates a number of serial number transaction lines so that the quantity of all serial numbers is updated with the counted quantity. If you do not enter any deviation for a serial number, the quantity on the serial number transaction line for the current serial number is also zero.

Before you approve an inventory count listing, make sure that the **Balance Loc., Inv. Count** field has a value on the information card of the warehouse for which you are performing the count. Maconomy automatically uses the balance location specified to enter, sum, and offset variances between the entries in the system and the counted items. In this way, items that are missing in one location, but that have been found in another location, are offset and are thus not entered as shipment from or receipt at the warehouse. When all stock variances have been offset, the deficiency or the surplus of the items entered on the balance location results in item movements by means of a shipment to or a receipt at the warehouse in question. Maconomy automatically creates and approves picking lists and an inventory change transaction, and the balance location is no longer effective.

Maconomy also creates an item journal to update the relevant inventory accounts in the G/L module. You must then post the item journal in the Posting or Print Posting Journal workspaces in the G/L module.

If you do not want to approve an inventory count listing, for example because of too-large deviations, you can reprint the inventory count listing. You do this in the Inventory Count Listing workspace, where you can limit the printout to include only inventory count lines that have deviations that exceed a given limit in terms of amount or quantity.

If you enter a posting date that is before the printing date of the count list—that is, if you take stock before you print out the counting list—you must also take into consideration any inventory changes that happen between the stock-taking and the printout. Inventory changes that happen between the printout of the count list and the time when you enter the actual figures in the Inventory Count workspace have no influence on the inventory count.

## Approve Count Tab

This section includes the fields and descriptions for the Approve Count Tab.

### Statistics Island

Field	Description
<b>No. Lists to Approve</b>	This field shows how many of the inventory count lists in the table you have marked for approval. Lists are approved with the action “Approve.”

Field	Description
<b>No. to be Deleted</b>	This field shows how many of the inventory count lists in the table you have marked for deletion. These will be deleted when they are approved.

## Inventory Count Listings Sub-Tab

This section includes the fields and descriptions for the Inventory Count Listings Sub-Tab.

Field	Description
<b>List No.</b>	This is the number of the inventory count list on the line. Inventory count lists are automatically given a number from the "Inventory Count" number series in the Numbers window. You cannot change it.
<b>Remarks</b>	This shows the note entered for the list in the Inventory Count Listing when the list was created. It cannot be changed here.
<b>Warehouse</b>	<p>This field shows which warehouse the inventory list is for. The list will only include items in this warehouse.</p> <p>The warehouse was chosen in the Inventory Count Listing window and it cannot be changed here.</p>
<b>Cost Var.</b>	<p>This shows the total cost of the volume variances in the list. The costs are found from the cost at the warehouse in question and the costing method of the individual items. These data are in the item information card.</p> <p>When the inventory count list is approved with the action "Approve," Maconomy creates an item journal, which is ready to be posted in the G/L module. The entry text is retrieved from the "Item Inventory Count" entry type in the window Posting Descriptions in the G/L module. If the amount is positive, the inventory value account will be debited, and the inventory count account credited. If the amount is negative, the inventory value account will be credited, and the inventory count account debited.</p> <p>The inventory value account is specified by means of a dimension combination in the field "Inventory Value" in the window Warehouse Information Card and the inventory count account is specified by means of a dimension combination in the field "Inventory Count" in the island Manual Inventory Value Changes in the window Warehouse Information Card.</p>
<b>Variances</b>	<p>This field shows how many item numbers there are variances for in the list.</p> <p>If you wish to see how great the variances are, print the "Inventory Count Result" in the Inventory Count Listing window.</p>
<b>Approve</b>	<p>You can mark this field if you wish to approve the list when you select "Approve" in the Action menu. When approving a list, Maconomy will create an item transaction for all items on the inventory count listing with the inventory adjustments and an item journal in the G/L module, which is ready to be posted.</p> <p>If the field is not marked, the list is not approved when you select "Approve" in the Action menu.</p>

Field	Description
	Once an inventory count list has been approved, it will no longer be shown in this window. However, you can still see it in the Inventory Count window and reprint it in the Inventory Count Listing window.
<b>Delete</b>	<p>You can mark this field if you wish to delete the list when you approve it. If the field is marked, the list will be deleted next time you select "Approve" in the Action menu. You can only mark this field if the "Approve" field is also marked.</p> <p>If the field is not marked, the list is not deleted when you select "Approve" in the Action menu. If the list is approved, you can no longer see it in this window's table. However, you can see it in the Inventory Count window or reprint it in the Inventory Count Listing window.</p>
<b>Entry Date</b>	In this field, you can enter a posting date to be used on the G/L entries made when the counting is posted. Thus, the actual date of stock taking can be maintained, regardless of when the counting list was printed and when the actual figures were entered into the window Inventory Count. If the field is not completed, Maconomy uses today's date. The field can only be completed if the field "Allow Back Dating" has been marked in the window System Information in the Set-Up module.

## Actions

This section shows the Actions available in the Approve Count workspace.

### Top Tab

Field	Description
<b>Approve</b>	<p>When you select this action, you approve the lists in the table which have a mark in the "Approve" field. You also delete the lists which have a mark in the field "Delete," provided these also have a mark in the field "Approve."</p> <p>When you approve a list, Maconomy creates an item journal with inventory change transactions for all items on the list in such a way that the quantity of the current item number is updated with the counted quantity. If no deviation is registered for an item, the number of the inventory change for the current item will be zero. For items with serial number control, Maconomy also creates a number of serial number transaction lines in such a way that the quantity of all serial numbers is updated with the counted quantity. If no deviation is registered for a serial number, the quantity on the serial number transaction line for the current serial number will also be zero.</p> <p>The item journal is posted in the window Posting or Print Posting Journal in the G/L module. If the cost variance in the field "Cost Variance" is positive, the inventory value account will be debited, and the inventory count account credited. If the variance is negative, the inventory value account will be credited, and the inventory count account debited. Maconomy inserts today's date as entry date and item journal date.</p> <p>The entry text is retrieved from the entry type "Item Inventory Count" in the window Posting Descriptions in the G/L module.</p> <p>The inventory value account is specified by means of a dimension combination in the field "Inventory Value" in the window Warehouse Information Card, and the inventory</p>

Field	Description
	<p>count account is specified by means of a dimension combination in the field "Inventory Count" in the island Manual Inventory Value Changes of the Warehouse Information Card.</p> <p>Once an inventory count list has been approved, it will no longer be shown in this window's table part.</p>

## Production Selection Single Dialog Workspace

Use this workspace to create production selections for Bills of Materials (BOMs) with production control.

You use production selections in the BOM Production workspace.

Maconomy's BOMs are produced in the following way: The BOM header (the BOM itself) is referred to as the finished item, and the BOM parts are referred to as the raw materials. The BOM is thus a kind of recipe. If you want to create recipes at several levels, you must create a production transaction for every level. You can place finished items and raw materials in the same warehouse or in different warehouses, but all raw materials must be in the same warehouse. In addition, you must assign both the raw materials warehouse and the finished items warehouse to the same company. The recipe can contain raw materials that do not have inventory control.

When you create a production selection, Maconomy checks that the inventory volume of the finished item, minus the order and backorder volumes, including existing production volume, plus an item purchase order volume, in the selected inventory is below or at the reorder point. If it is, Maconomy suggests a production to bring volumes up to the maximum inventory volume for the given item in the given warehouse. Maconomy always suggests a quantity that is divisible by the item's smallest production unit.

If the **Inventory Profile** field has a value in the sub-tab of the information card of an item, Maconomy calculates the available stock as the current stock plus entered receipts minus entered shipments in the period from today to the end of the delivery horizon. Maconomy calculates the delivery horizon as today's date plus the time of delivery specified for the item in question in the sub-tab of the Item Information Card workspace. Maconomy considers the inventory profile when you create a production selection. Maconomy suggests producing the quantity needed for the item to be at the maximum stock level at the end of the delivery horizon, thus avoiding the production of items for orders that are delivered after the delivery horizon. Maconomy always suggests a quantity that is divisible by the minimum production unit of the item.

If you select the **Discontinued** field on an item information card, the item in question is not included in the production selection.

A production selection consists of a production transaction that has not been approved and for which you have not reserved raw materials. The production volume is not added up until you reserve the items in the BOM Production workspace.

A production transaction can include several finished items, but you can only complete the production if all of the finished items in the transaction are being produced. If you want to handle the production of a finished item separately, you can create one transaction per finished item.

The company to which the finished items warehouse is assigned is automatically specified as responsible for the production transactions that are created as a result of the production selection. Therefore, Maconomy automatically assigns to each transaction the next available

number in the transaction number series specified for the company of the finished items warehouse.

When you click **OK**, Maconomy creates a production transaction for the target group.

### Production Selection Tab

This section includes the fields and descriptions for the Production Selection Tab.

#### Finished Items Island

Field	Description
<b>Warehouse</b>	<p>Here you select the warehouse for which the selection is to be made. It is the stock in this warehouse that determines whether a selection will be made. The finished item must have production control in the warehouse. The selection will only apply to this warehouse.</p> <p>Maconomy will make a production selection if the inventory volume of the finished item, less order and back order volumes and including existing production volume, plus an item purchase order volume, is below or at the reorder point.</p> <p>The company to which the finished items warehouse is assigned will automatically be specified as responsible for the production transactions created as a result of the production selection. You can only select a warehouse which is assigned to the same company as the raw materials warehouse.</p>
<b>Item No.</b>	<p>Here you can enter a range of item numbers. Maconomy will only create production selections for items in this range and which are marked in the "Production Control" field in the table part of the item information card for the selected warehouse.</p>
<b>Item Group</b>	<p>Here you can select an item group from the window Item Group Information Card. Maconomy will only create production selections for items in this group.</p>
<b>Item Type</b>	<p>Here you can select a pop-up field of the type "Item Types," which is defined in window Popup Fields in the Set-Up module. Maconomy will only create production selections for items of this type.</p>
<b>One item per transaction</b>	<p>You can mark this field if you wish to create a separate production transaction for every finished item for which Maconomy makes a production selection. If you do not mark this field, Maconomy makes one production transaction containing all the items.</p> <p>A production is carried out by approving a production transaction in the BOM Production window. If a particular finished item is not being produced or cannot be produced due to lack of raw materials, you will be unable to produce the other items in the transaction. It is then useful to have only one item per transaction.</p>

**Raw Materials Island**

Field	Description
<b>Warehouse</b>	<p>Here you select from which warehouse to take the raw materials. Raw materials are BOM parts at level one and the BOM header is the finished item. Raw materials with inventory control must be in the warehouse selected here. If they are not, Maconomy cannot make a production selection.</p> <p>Maconomy does not check that the raw materials are available in sufficient numbers. You can check this in the Print Requirement Analysis window or as the raw materials are reserved by the production transaction in the BOM Production window.</p> <p>A raw material can also be a BOM produced from raw materials. It is then a semi-finished item, which must be produced in a separate production transaction. You cannot produce the semi-finished item at the same time as you produce the finished item of which it is part.</p> <p>You can only select a warehouse which is assigned to the same company as the finished items warehouse.</p>

**Cost Calculation Island**

Field	Description
<b>From Raw Mat.</b>	<p>You mark this field if the costs of the finished items in the production selection are to be found from the costs of the raw materials or are to be determined by the finished item. The value is transferred to the production selections and can be changed on the individual production transactions in the BOM Production window. See also the description of the "From Raw Materials" field for the BOM Production window.</p>

## BOM Production Single Dialog Workspace

Use this workspace to generate Bills of Materials (BOM).

Manufacturing companies that produce finished items from the raw materials in stock typically use the BOM Production feature. The BOM item is called the finished item, and the BOM component parts are typically the raw materials. Maconomy uses the list of item parts in the Bill of Materials Information Card as the basic recipe for the finished item. Work hours, which represent a cost, are a valid raw material in the production. You create work hours as a BOM part without inventory control.

You can either create a production transaction directly in this workspace, or you can create it from a production selection in the Production Selection workspace.

In the BOM Production tab of this workspace, you specify general information about the production transaction (that is, the production itself), such as its number, inventories, and cost principle. In the Production Lines sub-tab you enter how many finished items to produce. You can produce several different finished items at the same time.

You can also choose between normal or reverse production. Reverse production refers to the disassembly of production items, for example, the disassembly of a table into a table top and four legs. When you approve a reverse production, Maconomy splits up the finished items in question

into a number of raw materials that are then added to the stock of the raw materials warehouse. Maconomy calculates the cost of the raw materials from the cost of the finished item, using the price ratios that you specify on the BOM. However, you can change the price ratios in the Production Reports workspace.

Maconomy calculates the cost either as the sum of the raw material costs or as specified beforehand. Raw materials and finished items must exist in the system before you can produce a BOM here. You can assign them to the same warehouse, or you can separate them into inventories for raw materials and finished items. You must assign all raw materials that have inventory control to the same warehouse.

You complete a production by first selecting **Reserve Raw Materials**. If some of the raw materials that have inventory control are not available, Maconomy alerts you. Before you approve the production transaction, and before you complete the production—that is, before you update inventories—you can create a report of the actual raw materials usage in the Production Reports workspace.

You can use the Print Requirement Analysis workspace to find out whether there are enough raw materials on stock to perform the production, before you reserve any raw materials.

When the production is complete, Maconomy deducts the raw materials from the warehouse of raw materials and adds the finished items to the warehouse of finished goods. Maconomy creates an item journal of all the financial transactions, which is ready to be posted.

## BOM Production Tab

This section includes the fields and descriptions for the BOM Production Tab.

### Transaction Island

Field	Description
<b>Trans. No.</b>	This is the number of the production transaction. Maconomy automatically allocates the next available number in the transaction number series specified for the company responsible for the transaction. You cannot change the number here, but you determine how numbers are allocated in the window System Numbers in the Set-Up module.
<b>Trans. Type</b>	This is the transaction type of the production transaction. If the field is left empty, Maconomy will set it to the default transaction type in the Item journal (for the specific company and user.)
<b>Created by</b>	This is the name of the user who created the transaction. The name cannot be changed.
<b>Date</b>	This is the date the transaction was created. It is not necessarily the date of the production, which is the date when the transaction is approved. The date cannot be changed.
<b>Reserved</b>	This field shows whether you have reserved any raw materials for the production in the table part. If this field is marked, you have used the action "Reserve Raw Materials" for the production transaction, and the relevant order volume, back order volume and available volume for the raw materials have been updated in the warehouse selected in the field "Raw Materials."

Field	Description
	Before reserving raw materials, you can use the Print Requirement Analysis to find out whether there are enough raw materials available for the production.
<b>Approved</b>	This field shows whether the transaction has been approved, that is, whether the production has been completed. Only the quantity specified in the field "Number to End Report" is approved when the action "Approve Production" is selected. Thus, it is possible to only approve part of a production. When the number of units specified in the field "Quantity" has been approved, it is no longer possible to make changes to the current production in this window. Units can only be approved for production once.
<b>Approved by</b>	This is the name of the user who approved the transaction, using the action "Approve Production." The name cannot be changed.
<b>Date</b>	This is the date the production transaction was approved. This is the date Maconomy registers all transactions involved in the production. The date cannot be changed.
<b>Closed</b>	This field shows whether the current production transaction has been fully closed, that is, if the number of items shown in the field "Number End Reported" corresponds to the number shown in the field "Quantity." When the last unit on the production transaction is end reported using the action "Approve Production," the production transaction is automatically closed, and no further changes can be made to the transaction in this window. The field is only used on production transaction with positive production direction, and it cannot be completed manually.

### Production Island

Field	Description
<b>Raw Materials</b>	Here, you select the raw materials warehouse. When the production is approved, the raw materials are removed from the warehouse if they have inventory control. The corresponding inventory value is registered when you post the item journal. If none of the raw materials have inventory control, this field cannot be used. You can only select a warehouse which is assigned to the same company as the finished goods warehouse.
<b>Raw Material Loc.</b>	In this field, you can specify the location in the current warehouse from which the raw materials are taken. This location will apply to those lines in the table part of the window Production Reports where the raw material location field is left blank. If a raw material location is specified on a given production report line, it overrules any location specified in this field. When you create a production transaction, Maconomy suggests the standard production location specified for the selected warehouse, but you can specify another location. If no standard production location has been specified for the warehouse, Maconomy suggests a blank value.
<b>Finished Goods</b>	Here, you select the warehouse of finished goods. When the production is approved, the finished items are placed in this warehouse. When you post the item journal, the corresponding inventory value is added to the inventory value

Field	Description
	account for finished items. If cost is calculated from the cost of the raw materials, and a variance occurs, Maconomy will adjust the cost of the finished item in the finished goods warehouse. You can only select a warehouse which is assigned to the same company as the raw materials warehouse.
<b>Finished Goods Loc.</b>	In this field, you can specify the location in the current warehouse from which the raw materials should be taken. This means that the stock of the items should be decreased for this location when the production is complete. This location will apply to those lines in the table part where the location field is left blank. If a location is specified on a given line in the table part, it overrules any location specified in this field. When you create a production transaction, Maconomy suggests the standard production location specified for the selected warehouse, but you can specify another location. If no standard production location has been specified for the warehouse, Maconomy suggests a blank value.
<b>Entry Description</b>	Here you enter an entry text. The text appears on all G/L entries related to the production. If you leave this field blank, Maconomy allocates a standard text from the Posting Descriptions window in the G/L module.

### Cost Calculation Island

Field	Description
<b>From Raw Mat.</b>	<p>Here you specify how to calculate costs. If this field is marked, the cost of one finished item is calculated as the sum of the costs of its raw materials. In other words: Costs of the BOM parts, multiplied by the quantity of each BOM part, divided by the pricing unit of the BOM part, produces the cost of the BOM header.</p> <p>You can also read this amount in the "Cost" field in the card part of the BOM information card of the finished item. However, this requires that the BOM composition has not been changed after the finished item is entered in the production transaction.</p> <p>If you leave this field blank, the finished item is inventoried at its registered cost. This cost is retrieved from the BOM Information Card window. If there is a difference between this cost and the sum of the costs of the raw materials, the difference is posted to the production account specified by means of a dimension combination in the warehouse information card of the warehouse of finished goods.</p>

### Company Island

Field	Description
<b>Company No.</b>	In this field, you can enter the number of the company responsible for the current production transaction. If you do not enter a value, the company to which the finished goods warehouse is assigned is automatically transferred to this field.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

## Production Lines Sub-Tab

This section includes the fields and descriptions for the Production Lines Sub-Tab.

Field	Description
<b>Item No.</b>	<p>Here you enter the number of the finished item you wish to produce. The item must be a BOM with inventory control. When you press Return, Maconomy creates a production recipe, that is, a list of the BOM component parts.</p> <p>If you change the composition of the BOM in the BOM Information Card window before starting production (that is, approving it), the production recipe will not be changed accordingly.</p> <p>You can print the production recipe using the print functions in the File menu.</p> <p>If you cannot remember the number of an item, you can use the search functions in the Find menu.</p>
<b>Quantity</b>	<p>Here you specify how many units of the finished item you wish to produce. When you approve production, this quantity of finished items will be added to the warehouse of finished goods.</p>
<b>Unit</b>	<p>This is the item unit registered in the warehouse. It cannot be changed here.</p>
<b>Description</b>	<p>This is the item text from the "Description Lang. 1" field in the Item Information Card. The text cannot be changed here.</p>
<b>Production Date</b>	<p>Here you enter the date of the production. Maconomy suggests the current date, but you can change it.</p> <p>If you have reserved raw materials, Maconomy alerts you if the production date is earlier than the last delivery date of the raw materials.</p>
<b>Production Direction</b>	<p>In this field, you can specify whether the production is positive or reverse. By reverse production is meant the disassembly of production items, for example, the disassembly of a table into a table top and four legs. Positive production direction represents normal production where raw materials are processed and become finished goods.</p> <p>When you select the action "Reserve Raw Materials" on a reverse production transaction, the quantity in order is increased by the number in production in the finished goods warehouse, and the quantity of raw materials increases in the raw materials warehouse. When the action "Approve Production" is selected, the finished goods are split into a number of raw materials which are then added to the stock of the raw materials warehouse. As in the case of positive production, the approval is only made for one BOM level at a time. In reverse production, the cost of the raw materials is calculated from the cost of the finished item, using the price ratios specified on the BOM. However, the price ratios can be changed in the window Production Reports.</p> <p>Reverse production can only be selected if the raw materials have inventory control.</p>
<b>Delivery Date</b>	<p>This field shows the date on which the finished item was reserved for reverse production. The field is blank on positive production transactions.</p>

Field	Description
<b>Stock Location No.</b>	<p>In this field, you can specify the location in the selected warehouse at which the finished goods items on the current line are to be registered.</p> <p>If this field is left blank, the finished goods location specified in the card part of the window will apply to the line. When the BOM production is approved, the finished goods are registered at this location, updating the stock of the location in question by the quantity of finished goods. In the case of reverse production, the items being disassembled are removed from this location instead when the production is approved.</p>
<b>Number to End Report</b>	<p>In this field, you can enter the number of items to be end reported. The field can only be completed on positive production transactions. Maconomy automatically suggests the number specified in the field "Quantity" but the field can be changed manually. Once the number of units specified in the field "Quantity" has been end reported, the field "Closed" in the card part of the window will automatically be completed, and the current line can no longer be changed.</p>
<b>Number End Reported</b>	<p>This field shows the number of finished items which have already been end reported, that is, the raw materials have been reserved using the action "Reserve Raw Materials" and the production has been approved using the action "Approve Production." The field can only be used for positive production transactions.</p>
<b>Number Used Hitherto</b>	<p>This field shows how many of the finished items on the transaction you have so far been disassembled. The field can only be used for reverse production transactions. The value in this field does not necessarily correspond to the number of finished items which would theoretically be needed to obtain the quantity of raw materials registered in the table part, as some parts of the finished item may be not be in working order after the disassembly, resulting in fewer raw materials. The actual quantity of raw materials gained is registered in the window Production Reports.</p>
<b>Control %</b>	<p>This field shows the sum of the price ratio percentages specified for the raw materials in the window Production Reports. The control percentage on reverse production transactions must be 100 before you can approve the production.</p>

## Actions

This section shows the Actions available in the BOM Production workspace.

### Top Tab

Field	Description
<b>Reserve Raw Materials</b>	<p>When you select this action, Maconomy reserves all the raw materials needed for the production in the production transaction. The raw materials are reserved in the "Raw Materials" warehouse.</p>

Field	Description
	<p>When a raw material is reserved, Maconomy increases the order volume and/or back order volume in the item information card of the raw material and decreases the available inventory of the item correspondingly.</p> <p>If there are not sufficient raw materials for the production, Maconomy alerts you. If your company uses the "By Reservation" back order method, the unavailable raw materials will be put on back order in the item information card. If you use the "By Picking" back order method, the unavailable items will be put on order in the item information card. Back order principle is selected in the System Information window in the Set-Up module.</p> <p>When you select this action on a reverse production transaction, the quantity on order is increased by the number in production in the finished goods warehouse, and the quantity of raw materials increases in the raw materials warehouse. When the action is selected, the field "Reserved" in the card part of the window is automatically completed.</p>
<b>Approve Production</b>	<p>When you select this action, you approve the production of the finished items in the window's table part. Before a production can be approved, you must reserve the raw materials. You can also make a report of the actual raw material usage in the Production Reports window. When you approve a production, Maconomy carries out the following:</p> <p>The BOM parts that are part of the raw materials in the production and that have inventory control are taken out of the raw materials warehouse. The quantity of raw materials and the composition of finished items can be reported in the Production Reports window. The production recipe can hereby be changed.</p> <p>The quantity of raw materials included in the finished items multiplied by the number of finished items produced is removed from the warehouse. If this quantity is not available, Maconomy alerts you. However, the production can be completed, although it leaves a negative inventory for the raw materials. The raw materials are removed from their inventories at current cost.</p> <p>The finished items are added to the warehouse of finished goods. They are added at a cost calculated from the raw materials or at the cost specified for the finished goods warehouse in the table part of the item information card. Cost calculation is selected in the "Cost Calculation" island.</p> <p>Maconomy creates an item journal specifying the reductions and increases in the inventory value accounts affected by the production. If the cost calculation reveals a cost variance, the journal registers the cost adjustment for the finished item in the finished goods warehouse.</p> <p>A cost variance can also occur if some of the component raw materials are without inventory control. This difference is posted to the production account specified by means of a dimension combination in the warehouse information card of the warehouse of finished goods.</p> <p>In reverse production, the finished goods are split into a number of raw materials which are then added to the stock of the raw materials warehouse. The cost of the raw materials is calculated from the cost of the finished item in the finished goods warehouse, using the price ratios specified on the BOM. However, the price ratios can be changed in the window Production Reports.</p>

## Production Reports Single Dialog Workspace

Use this workspace to create a report of a production, so that you can get a report of the actual raw material usage before you approve the production.

The Production Reports tab displays information about the finished item. The Raw materials sub-tab displays the production recipe. You can enter the actual usage of raw materials in the sub-tab, and you can change the composition of the finished item by deleting or adding raw materials. The sub-tab displays information about the raw materials.

This workspace can also handle reverse production. Reverse production means the disassembly of production items, for example, the disassembly of a table into a table top and four legs. In reverse production, Maconomy splits the finished items in question into a number of raw materials that it then adds to the stock of the raw materials warehouse. Maconomy calculates the cost of the raw materials from the cost of the finished item, using the price ratios that you specify on the BOM. However, you can change the price ratios in this workspace.

You can retrieve a finished item in this workspace after you enter a production transaction in the BOM Production workspace, and after you create a production selection in the Production Selection workspace.

You can change the quantity of raw materials before you reserve the items in the BOM Production workspace. Thus, you only reserve the necessary amount of raw materials.

### Production Reports Tab

This section includes the fields and descriptions for the Production Reports Tab.

#### Production Line Island

Field	Description
<b>Trans. No.</b>	This is the number of the production transaction for the finished item. It cannot be changed.
<b>Trans. Type</b>	This is the transaction type of the production transaction for the finished item. It cannot be changed.
<b>Line No.</b>	This is the line number in the production transaction the finished item is on. The production line is in the table of the BOM Production window. It cannot be changed.
<b>Production Date</b>	This field shows the date on which the transaction is planned for production. The date is transferred from the window BOM Production. It cannot be changed here.
<b>Production Direction</b>	This field shows whether the direction of the production transaction is positive or reverse. By reverse production is meant the disassembly of production items, for example, the disassembly of a table into a table top and four legs. Positive production direction represents normal production where raw materials are processed and become finished goods. The value in the field is transferred from the window BOM Production.

Field	Description
<b>Reserved</b>	<p>This field shows whether raw materials have been reserved for the production. If this field is marked, the raw materials in the table have been reserved. The reservation is made in the BOM Production window.</p> <p>If this field is not marked, raw materials have not been reserved. You can then change both the composition of the finished item and the quantity of raw materials in the table, for example, if the production recipe is incorrect. The reservation will then only include the necessary raw materials.</p> <p>After reserving the items, you can report the actual raw material usage in this window before approving the production.</p>
<b>Stock Location No.</b>	<p>This field shows the finished goods stock location number of the current production line. The location is originally specified in the table part of the window BOM production but can be changed here, causing the line in the window BOM production to be updated.</p>
<b>Approved</b>	<p>This field shows whether the production transaction has been approved. If it is marked, the production transaction has been approved and is completed. You can then no longer change the production of the finished item.</p> <p>If the transaction is not approved, that is, the field is blank, you can make a production report. You can then also change the raw materials in the table.</p> <p>A production transaction is approved in the BOM Production window and includes all the finished items in the transaction. The quantity of raw materials actually used in the production is shown in the "Usage" field in the table in this window.</p>
<b>Closed</b>	<p>This field shows whether the current production transaction has been fully closed, that is, the production of the total number of items has been approved using the action "Approve Production" in the window BOM Production. The field cannot be changed here.</p>

### Company Island

Field	Description
<b>Company No.</b>	<p>This field shows the number of the company responsible for the current production transaction</p>
<b>Name</b>	<p>This field shows the name of the company shown in the field "Company No." above.</p>
<b>Base Currency</b>	<p>This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.</p>

**Reverse Production Island**

Field	Description
<b>Sales Orders</b>	<p>This field shows how many units of the finished item you have placed on order as a result of the reservation of raw materials for the current reverse production. If the back order method "By Picking" is used, the number in this field will always correspond with the number in the field "Quantity" in the island Finished Item when the raw materials have been reserved.</p> <p>If the back order method "By Reservation" is used, the reservation of raw materials will cause the number in this field to be equal to the number of units of the item available at the time of reservation. However, the number in this field will never be higher than the number in the field "Quantity" in the island Finished Item. Thus, the number in this field shows how many units of the finished item are available for disassembly in the reverse production.</p> <p>The back order method is selected in the window System Information. However, the method can only be changed as long as no order volume or back order volume is registered in the system.</p>
<b>Balance</b>	<p>This field shows how many units of the finished item you have placed in back order as a result of the reservation of raw materials for the current reverse production. If the back order method "By Picking" is used, the number in this field will always be zero after the reservation as no back order volume is calculated.</p> <p>If the back order method "By Reservation" is used, the reservation of raw materials will cause the number in this field to be equal to the number of units of the item unavailable at the time of reservation. Thus, the number in this field shows how many extra units of the finished item are needed in the finished items warehouse for the completion of the reverse production.</p> <p>The back order method is selected in the window System Information. However, the method can only be changed as long as no order volume or back order volume is registered in the system.</p>
<b>Usage</b>	<p>In this field, you can specify the number of the finished item actually spent in the disassembly. Maconomy automatically suggests the number in the field "Quantity" in the island Finished Item.</p> <p>When the reverse production is approved in the window BOM Production, the number of finished items in the finished items warehouse is reduced by the number in this field.</p>
<b>Number Used Hitherto</b>	<p>This field shows how many of the finished items on the transaction you have so far disassembled. The value in this field does not necessarily correspond with the number of finished items which would theoretically be needed to obtain the quantity of raw materials registered in the table part, as some parts of the finished item may be not be in working order after the disassembly, resulting in fewer raw materials.</p>
<b>Pricing Unit</b>	<p>This field shows the pricing unit of the finished item. The pricing unit is the number of units of the item covered by the unit price of the item. The pricing unit applies to sales price, cost, weight, and volume.</p>
<b>Cost</b>	<p>This field shows the cost per pricing unit of the finished item in the card part of the window. The cost and costing method are specified on the information card of the</p>

Field	Description
	<p>item. The cost in this field is used in the calculation of the total cost value of the reverse production as Maconomy gets the current cost from the finished goods warehouse in the table part of the item information card when the reverse production is approved in the window BOM Production.</p> <p>When a reverse production transaction is created in the window BOM Production, the cost on each line in this window is calculated from the cost of the finished item in the finished goods warehouse, using the price ratios specified on the BOM.</p>
<b>Delivery Date</b>	<p>In this field, you can enter a delivery date for the finished item. If the number of units needed is not available, Maconomy will calculate a delivery date, using the time of delivery specified for the item in the window Item Information Card. If inventory profile is used on the item, the delivery date calculated will be the first day on which the quantity needed is available.</p>
<b>Control %</b>	<p>This field shows the sum of the price ratio percentages in the table part of the window. The control percentage on reverse production transactions must be 100 before you can approve the production in the window BOM Production. The value is calculated by Maconomy and the field cannot be changed manually.</p>

### Finished Item Island

Field	Description
<b>Item No.</b>	<p>This is the number of the finished item, whose production recipe is shown in the table. The finished item is produced when you approve the production transaction in the BOM Production window.</p> <p>A finished item consists of a BOM header with inventory control. The BOM parts at level 1 are the raw materials, and these are shown in the table. A BOM is created in the BOM Information Card window.</p> <p>The item number is retrieved from the Item Information Card window.</p>
<b>Description</b>	<p>This is the item text from the "Description Lang. 1" field from the item information card of the finished item. It cannot be changed here, but you can change it in the item information card.</p>
<b>Quantity</b>	<p>This is the quantity of the finished item you are producing in the production transaction. When the transaction is approved, the production is carried out. The warehouse of the finished item is shown in the "Finished Item Warehouse" field in the card part of the BOM Production window. If the production transaction was made from a production selection, the finished item warehouse was given in the "Warehouse" field in the Finished Items island in the Production Selections window.</p> <p>You can change the production recipe in the table and you can make a report of which and how many raw materials are actually used. Note, however, that it will always produce the quantity in this field.</p>
<b>Unit</b>	<p>This is the unit the finished item is stocked and sold in. It is entered in the item information card and cannot be changed here.</p>

## Raw Materials Sub-Tab

This section includes the fields and descriptions for the Raw Materials Sub-Tab.

Field	Description
<b>Item No.</b>	<p>This field shows the number of the raw material for the production of the finished item. The raw material is usually a BOM part at level 1, and the finished item is the BOM header. The raw material is removed from the warehouse in the "Warehouse" field on the line in the quantity given in the "Usage" field.</p> <p>When you enter a new raw materials line, you must enter the number of the raw material here. You can use the search functions in the Find menu to find the right item. The raw material must be in the "Raw Materials" warehouse given in the BOM Production window or in the "Warehouse" given in the Raw Materials island in the Production Selections window. The raw materials warehouse is also shown in the "Warehouse" field on all existing raw material lines.</p> <p>If the "Reserved" field is marked, Maconomy will reserve the new raw material in the quantity given in the "Total" field. If not all the raw materials are available, Maconomy will alert you.</p>
<b>Total</b>	<p>This field shows the number of units of the raw material will be used in the production of the finished item in the card part. The quantity is found by multiplying the number of finished items in the "Quantity" field in the card part by the number of raw materials per finished item, which is given in the "No. per Finished Item" field and in the "Quantity" field in the table part of the BOM Information Card window.</p> <p>You can change the quantity until the production has been approved. The selection value in the "Usage" field will also be changed. If you have not yet reserved raw materials, the reservation will only cover the quantity given here.</p> <p>When you enter a new raw material line, you must enter a quantity here. If the "Reserved" field is marked, Maconomy will reserve the new raw material in the quantity given here. Maconomy alerts you if the raw materials are not all available.</p>
<b>Sales Orders</b>	<p>This shows how many raw materials are put on order (and thereby reserved) when raw materials were reserved for the production. If you have selected the "By Picking" back order method in the System Information window, the quantity here will after the reservation always be the same as the "Total" field.</p> <p>If you use the "By Reservation" back order method, the quantity here will be the available quantity at the time of the reservation. However, it will never exceed the quantity in the field "Total." The quantity here tells you how many of the raw material are available for production.</p>
<b>Balance</b>	<p>This field shows how much of the raw material was put on back order at the time of the reservation. If you use the "By Picking" back order method, the quantity here will always be 0.</p> <p>If you use the "By Reservation" back order method, the quantity will be the same as the quantity unavailable at the time the items were reserved. The</p>

Field	Description
	quantity therefore shows how much of the raw material should be added to the warehouse before the production can be completed.
<b>Usage</b>	<p>Here you can enter how much of the raw material was actually used in the production of the finished item in the card part.</p> <p>Maconomy suggests the quantity in the production recipe in the “Total” field.</p> <p>When the production is approved in the BOM Production window, Maconomy removes the quantity of the raw material given here.</p> <p>Note that when you approve a production transaction, the production is completed and the quantity here has therefore been used.</p>
<b>Description</b>	This is the text for the raw material, retrieved from the “Description Lang. 1” field in the item information card. It cannot be changed here.
<b>No. per Finished Item</b>	This is the quantity of raw materials used for one unit of the finished item. It is found by dividing the value in the “Quantity” field in the card part by the value in the “Total” field on the raw material line.
<b>Extra Text</b>	<p>Here you can enter an extra text to describe the raw material.</p> <p>Maconomy suggests the text from the “Extra Text” in the BOM Information Card.</p>
<b>Cost</b>	<p>This is the cost per pricing unit of the raw material. Cost principle is retrieved from the card part of the item information card, while cost is retrieved from the raw material warehouse in the table part of the item information card. The cost is used to calculate the total cost of the production. Maconomy retrieves the cost from the item information card at the time the production is approved.</p> <p>When a reverse production transaction is created in the window BOM Production, the cost on each line in this window is calculated from the cost of the finished item in the finished goods warehouse, using the price ratios specified on the BOM.</p>
<b>Pricing Unit</b>	<p>This is the pricing unit, that is, the quantity included in the unit price.</p> <p>This applies to sales prices, costs, weight and volume.</p>
<b>Price Ratio %</b>	On reverse production transactions, this field shows the current raw material item’s price ratio percentage from the BOM of the finished item. However, the value can be changed. The price ratio percentage is used for calculating the cost of the items obtained as a result of the reverse production. If the field “Cost from Raw Materials” has been marked in the window BOM Production, the cost of the finished item is allocated onto the raw materials, based on the price ratios specified in this field.
<b>Bill of Materials</b>	This field is marked if the raw material is a BOM.
<b>Inventory Control</b>	This field is marked if the raw material has inventory control. If it does, Maconomy removes the quantity of the raw material in the “Usage” field from the inventory when the production is approved. The value of the raw materials inventory is decreased by the cost of the raw material line.

Field	Description
	If the item does not have inventory control, the total cost of the raw material line will be included in the total cost of the production, while the value of the raw material inventory is not reduced.
<b>Warehouse</b>	<p>This is the raw material warehouse. When the production is approved, the raw materials are removed from this warehouse if they have inventory control.</p> <p>The raw material warehouse was selected in the “Raw Materials” warehouse when the production transaction was created in the BOM Production window or in the “Warehouse” field in the Raw Materials island in the Production Selection window.</p>
<b>Stock Location No.</b>	<p>In this field, you can specify the location in the selected warehouse from which the raw materials should be taken.</p> <p>If this field is left blank, the raw material location number specified in the card part of the window BOM Production will apply to the line. When the BOM production is approved, the stock of the raw material items is decreased for this location by the relevant quantities. In the case of reverse production, the disassembled parts are added to the stock of this location in the relevant quantities.</p>
<b>Delivery Date</b>	This shows the delivery date of the raw material. If you have selected the back order method “By Picking,” Maconomy will calculate a delivery date here, if the raw material is not available at the time of reservation and if the raw material has a delivery time in its item information card. The date here is then the delivery time added to the date on which the raw materials are reserved.
<b>Number to End Report</b>	In this field, you can enter the number of units of the current item to be added to the stock of the raw materials warehouse as a result of the disassembly of the finished item shown in the card part of the window. The items are not end reported until the action “Approve Production” is selected in the window BOM Production.
<b>Number End Reported</b>	This field shows the number of units of the current item which has so far been end reported by selecting the action “Approve Production” in the window BOM Production.
<b>Number Used Hitherto</b>	This field shows how many of the finished items on the transaction you have so far disassembled. This field can only be used for reverse production transactions. The value in this field does not necessarily correspond to the number of finished items that would theoretically be needed to obtain the quantity of raw materials registered in the table part, as some parts of the finished item may not be in working order after the disassembly, resulting in fewer raw materials. The actual quantity of raw materials gained is registered in the window Production Reports.

## Update Item Reservations Single Dialog Workspace

Use this workspace to update delivery information about sales and backorder lines in the Sales Orders module, based on the latest inventory and availability information.

Using this workspace, you can run the actions that are in the Sales Orders, Back Order Register, and Item Purchase Orders workspaces on a number of order lines, thus ensuring that the orders contain realistic delivery dates, and that as many units as possible are delivered as soon as possible.

Only lines that contain items that have inventory control are affected by the actions in this workspace. In addition, Maconomy ignores lines on orders where you select the **Urgent** field.

When you update delivery dates on a single line at a time—for example, in the Sales Orders workspace—Maconomy treats that line as if it were being created, while all other item reservations stay the same and thereby have first priority. However, when you change delivery dates for several lines in a batch using this workspace, Maconomy re-reserves all of the affected lines and prioritizes lines related to the same item based on their current delivery dates. Using this workspace to update a range of lines therefore results in a fairer re-reservation, because lines that have earlier delivery dates are more likely to benefit from items received earlier than expected.

If an error occurs during the update process, Maconomy cancels the whole update, including lines that were processed before the error was encountered. However, you can select the **Allow Partial Update** field if you want Maconomy to skip erroneous lines and update all lines that do not contain errors. Maconomy keeps a log of any errors that it encounters in the update process. The log is printed at the end of each process. The log is also saved, meaning that log information from previous processes is also printed. However, you can delete all previous log information by selecting the **Delete Log Information** field.

### Update Item Reservations Tab

This section includes the fields and descriptions for the Update Item Reservations Tab.

#### Selection Criteria Island

Field	Description
<b>Warehouse</b>	In this field, you can select a warehouse. Only sales and back order lines on which this warehouse is specified are included in the update.
<b>Item No.</b>	In these fields, you can specify a range of item numbers. Only sales and back order lines concerning items within this range are included in the update.
<b>Delivery Date</b>	In these fields, you can specify a range of delivery dates. Only sales and back order lines with delivery dates within this range are included in the update.
<b>Order No.</b>	In these fields, you can specify a range of sales order numbers. For sales order lines, this means that only lines on orders whose number lies within this range are included in the update. For back order lines, the update only includes lines whose latest assignment to a sales order was to an order whose number lies within this range.

Field	Description
<b>Item Purchase Order No.</b>	<p>In these fields, you can specify a range of item purchase order numbers. You can only specify a range in this field if the field "From Item Purchase Orders" is marked.</p> <p>When a range is specified, Maconomy only updates order lines concerning the items present on the item purchase orders within the specified range.</p> <p>As described above, part of this field's functionality is to specify a range of items, but you can also enter a range of items in the "Item No." fields. If you do so in addition to specifying a range of item purchase orders, the update will include only the items matching both criteria.</p>
<b>From Item Purchase Orders</b>	<p>If you mark this field, the range of items to be included in the update will be indicated by the field "Item Purchase Order No." as well as the field "Item No.," as Maconomy will only update order lines concerning the items present on the item purchase orders within the specified range. If you do not mark the field, you cannot enter a range of item purchase order numbers. For a description of the effects of entering a selection of items through both a range of item purchase orders and item numbers, please see the field "Item Purchase Order No."</p>
<b>Incl. Quotes</b>	<p>If you mark this field, the table part will display both quotes and sales orders assigned to the current consignment. If this field is not marked, the table part will only display sales orders. Please note that if the number of lines in the table part is changed because you mark or unmark this field, the figures in the island Order Total will be recalculated from the lines currently displayed in the table part.</p>

### Update Island

Field	Description
<b>Update Item Reservations</b>	<p>Mark this field if you want to update delivery dates.</p> <p>The delivery dates are updated as described for the action "Update Delivery Dates" in the window Sales Orders in the Sales Orders module and the window Item Purchase Orders in the Item Purchase module. However, instead of just updating and re-reserving one line at a time causing each line to lose its current reservation priority, all affected lines are re-reserved, and lines concerning the same item are prioritized based on their current delivery dates. This results in a fairer re-reservation, as lines with earlier delivery dates are more likely to benefit from items received earlier than expected. Please note, however, that lines that are not covered by the selection criteria keep their current reservation.</p>
<b>Split Order Lines</b>	<p>Mark this field if you want Maconomy to split order lines to obtain the soonest possible delivery of as many items as possible. For each line matching the selection criteria, the split-up is carried out as described for the action "Split Line" in the window Sales Orders in the Sales Orders module. If you also mark the field "Update Item Reservation," the split is based on the recalculated delivery date. The action is only carried out on lines assigned to orders that use partial delivery.</p>

Field	Description
	<p>Please note that even if you do not mark this field, Maconomy still runs the split-up procedure on lines belonging to orders where the field "Split Lines" is marked.</p> <p>You can define the default value of this field in the system parameter "Split order lines automatically."</p>
<b>Assign to Consignment</b>	<p>Mark this field if you want Maconomy to assign the affected order lines to consignments. For each line matching the selection criteria, Maconomy tries to find a suitable consignment as described for the action "Assign to Consignment" in the window Sales Orders in the Sales Orders module. Only lines on orders on which a destination has been specified are considered for this action. The action is carried out after recalculating delivery dates and splitting lines if one or both of the fields "Update Item Reservations" and "Split Order Lines" are marked. Maconomy therefore also tries to assign lines resulting from the split-up process to consignments, provided that they match the selection criteria.</p> <p>You can define the default value of this field in the system parameter "Automatically assign order line to consignment."</p>
<b>Reactivate Order Lines</b>	<p>Mark this field if you want Maconomy to find a solution to blocked lines so that the orders in question can be delivered as soon as possible. For each blocked line matching the selection criteria, Maconomy runs the process described for the action "Activate Lines" in the window Sales Orders in the Sales Orders module. The action is carried out after recalculating delivery dates, splitting lines, and assigning to consignment if any of the fields "Update Item Reservations," "Split Order Lines," and "Assign to Consignment" are marked. Maconomy therefore also tries to activate any blocked lines resulting from those procedures (including new lines created in the split-up process), provided that they match the selection criteria.</p>
<b>Allow Partial Update</b>	<p>In this field, you can specify whether an error in the updating process should cause the update to be cancelled, thus also cancelling the updates made up to the point where the error occurred, or if Maconomy should continue the update, skipping the places where the errors occurred.</p> <p>Any errors encountered are recorded in a log which is printed at the end of the process. Maconomy only allows you to run an update with this field marked if the Maconomy server supports so-called rollback functionality which is used for cancelling updates.</p>
<b>Delete Log Information</b>	<p>In this field, you can specify whether Maconomy should delete log information from previous updating processes before starting the new update. If you mark the field, the previous log information is deleted and the log printed at the end of the process will only include information pertaining to the current process. If you do not mark the field, the log printed will also include information from processes run since the last time the log was deleted.</p>

## Item Substitution Single Dialog Workspace

Use this workspace to change the number of an item in an item line in the Sales Orders and Quotes workspaces in the Sales Orders module.

Maconomy only changes an item number if you have not printed a packing list or delivered the items, and only if you enter the new item number as a new item number in the **New Item No.** field in the item information card for the item whose number you are changing. The new item must also be in the warehouse that you entered in the quotes or sales orders in which the old number is being replaced.

When you change an item number, the reservation of the old item number is canceled, and the new item number is reserved.

- If you use the **By Picking** backorder method, and there are not enough available items to cover the quotes or sales orders, Maconomy calculates a delivery date of the item line using the delivery time entered in the item information card. If the delivery date is later than the order line's delivery date, Maconomy changes the order line's delivery date. If the order does not have partial delivery and is approved, Maconomy also changes the delivery date on all of the other lines on the order.
- If you use the **By Reservation** backorder method, and there are not enough available items to cover the quotes or sales orders, Maconomy creates a backorder for the items. Maconomy does not change the delivery date of the order line. You select the backorder method in the System Information workspace.

If a sales order or a quote has partial delivery, Maconomy changes the delivery dates of all of the items to the delivery date stated for the latest available batch of items on the current order or quote.

Maconomy does not recalculate sales prices for the item line when you substitute an item, nor does Maconomy change the line discount, quantity discount, and price step. When the new item is delivered, Maconomy records the cost of the new item at the warehouse in question.

When you click **OK**, Maconomy performs the item substitution specified in the workspace.

### Item Substitution Tab

This section includes the fields and descriptions for the Item Substitution Tab.

#### Selection Criteria Island

Field	Description
<b>From Item No.</b>	Here you enter the number of the item you wish to substitute on all quote line and unprocessed sales order lines in the Sales Orders module. Credit order and item purchase order lines are not affected by an item substitution.
<b>To Item No.</b>	Here you enter the number of the item you are substituting the item in the "From Item No." with. The number must be entered in the "New Item No." field in the item information card of the item that is being substituted.

## Lookup Section

This section includes the fields and descriptions for the Lookup workspaces.

### Inventory Overview Single Dialog Workspace

Use this workspace to view selected information from the Item Information Card in a tabular format.

The purpose of this workspace is to provide an overview of stock items and to let you edit the most important item texts.

#### Inventory Overview Tab

This section includes the fields and descriptions for the Inventory Overview Tab.

#### Selection Criteria Island

Field	Description
<b>Show Items</b>	If you mark this field, the table will show the items selected in the item range field below. The field is not marked when you open the window so that the window opens quickly and is not required to perform any searches until you specify the target criteria.
<b>Item No.</b>	Here you can enter a range of item numbers to determine those items that will be shown in the table.

#### Items Sub-Tab

This section includes the fields and descriptions for the Items Sub-Tab.

Field	Description
<b>Item No.</b>	This is the item number.
<b>Description, Lang. 1</b>	Here you can enter an item text.
<b>Description, Lang. 2</b>	Here you can enter an item text in the second language in your list of language codes.
<b>Description, Lang. 3</b>	Here you can enter an item text in the third language in your list of language codes.
<b>Internal Desc.</b>	Here you can enter an internal description of the item. It is printed in the packing list and is thus suitable for messages to your warehouse staff, for example, that the item must be handled and packaged in a particular way. The text is not shown on external printouts from the Sales Orders module.

Field	Description
<b>Extra Text 1-10</b>	Here you can enter supplementary texts to describe the item.

## Item Information Single Dialog Workspace

Use this workspace to view selected information from the Item Information Card.

You can only change the weight, stock location, and volume of the items, so that you can gain quick access to the most frequently used information.

The information that you typically need to create a sales order, for example, is much easier to look up in this workspace than in the Sales Orders workspace.

This workspace enables your sales representatives to access relevant sales information without having to open the Item Information Card, which shows costs and other sensitive data.

### Item Information Tab

This section includes the fields and descriptions for the Item Information Tab.

#### Item Island

Field	Description
<b>Item No.</b>	This is the item number. You can use the search functions in the Find menu to retrieve items.
<b>Description</b>	This is the item text from the "Description Lang. 1" field.
<b>Internal Desc.</b>	This is the internal item text. The text is printed on the packing list, and is suitable for internal messages to warehouse employees. You can, for example, specify how the item is to be handled and packed. The text is not printed on external documents.
<b>BOM</b>	This field shows whether the item is a BOM or a standard item. If the field is marked, the item is a BOM.

#### Information Island

Field	Description
<b>Unit, Sales</b>	This is the item unit (kg, liter, gallon, and so on) used in sales.
<b>Minimum Sales Unit</b>	This is the item's minimum sales unit. You can change it.
<b>Pricing Unit, Sales</b>	This shows how many item units are included in the unit price. This applies to sales price, cost, weight and volume.
<b>Unit, Purchase</b>	This is the unit used when the item is purchased in the window Item Purchase Orders.

Field	Description
<b>Minimum Purchase Unit</b>	This is the item's minimum purchase unit.
<b>Pricing Unit, Purchase</b>	This shows how many units of the item are included in the unit price of the item for purchases.
<b>Sales/Purchase Unit</b>	This shows how many sales units are included in one purchase unit.
<b>Gross Weight</b>	This is the item's gross weight per pricing unit. You can change it.
<b>Volume</b>	This is the item's volume per pricing unit. You can change it.
<b>Item Type</b>	This is the item type.
<b>Item Group</b>	This is the item group to which the item is assigned.
<b>Pricing Combination</b>	This is the pricing combination to which the item is assigned.
<b>Discontinued</b>	This field shows whether the item has been taken out of your company's item assortment. If the field is marked, the item is discontinued, which means you cannot sell more than what remains in the warehouse. The value in this field is transferred to the Sales Orders module.
<b>Inventory Control</b>	This field shows whether the item has inventory control. For further information on inventory control on items, please see the field "Inventory Control" in the windows Item Groups and Item Information Card.
<b>Primary Warehouse</b>	In this field you can select the primary warehouse of a given item. The warehouses specified on the item lines in the table part of this window are independent of the warehouse in the card part of the window Sales Orders. The primary warehouse is used if the same item exists in several warehouses. The value of this field is blank by default and can only be changed to a warehouse to which the item has already been assigned.
<b>Tax Code</b>	<p>This field shows one or more tax rates. These tax rates are added to an order line for a customer paying tax.</p> <p>If multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2" and, if three tax levels are enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p>

## Warehouses Sub-Tab

This section includes the fields and descriptions for the Warehouses Sub-Tab.

Field	Description
<b>Warehouse</b>	This field shows to which warehouse the item is assigned.
<b>Deliv. Time</b>	This is the item's delivery time in days. This information is used in the Sales Orders module to inform a customer of an expected delivery date, if the item is temporarily out of stock. Maconomy then calculates a delivery date based on the delivery time.
<b>Stock On Hand</b>	This is the current stock on hand, expressed in item units.
<b>Quotes</b>	This field shows how many item units are under quote. Items under quote are not reserved in the warehouse.
<b>Sales Orders</b>	This field shows the current volume of sales orders. If you have Maconomy Bill of Materials, and if this item is a raw material, the order volume here will include the quantity of units reserved in the BOM Production window.
<b>Available</b>	This field shows how many item units are available in the warehouse. If your company uses the "By Picking" back order method, the available inventory is calculated as the current inventory, less sales orders and back orders. If your company uses the "By Reservation" back order method, the available inventory is calculated as the current inventory, less sales orders. The available inventory cannot be negative.
<b>Back Orders</b>	This field shows the volume of back orders item units. If you have Maconomy Bill of Materials, and if this item is a raw material, the back order volume here will include the quantity of units on back order in the BOM Production window.
<b>Purchase Orders</b>	This field shows how many item units are currently on order from the vendor.
<b>Production</b>	This field shows how many units of the item are used in a production in the BOM production window. An item is used in production if it is a BOM part with inventory control that is in a production transaction for which raw materials are reserved.
<b>Stock Location</b>	This is the item's location in the warehouse. You can change it.

## Item Assortment Single Dialog Workspace

Use this workspace to view a list of the items sold to a customer, referred to as the customer's item assortment.

This information provides a profile of the customer. You can use it as the basis for order lists and other printouts, which can be custom made.

When you invoice a sales order, Maconomy updates the item assortment, including price, quantity, and date. You can enter items and delete them manually in this workspace. Maconomy does not update the item assortment with invoices created directly in the Invoices workspace in the Sales Orders module.

### Item Assortment Tab

This section includes the fields and descriptions for the Item Assortment Tab.

#### Customer Island

Field	Description
<b>Customer No.</b>	This is the customer number. It cannot be changed. If you cannot remember the number of a customer, you can use the Find function.  The island also shows the name and address of the customer. These are retrieved from the customer information card.

#### Selection Criteria Island

Field	Description
<b>Item No.</b>	Enter a range of item numbers. The table will only show items in this range.
<b>Show Lines</b>	If you mark this field, the table will show the items specified in the "Item No." field above. The field is not marked when you open the window, so that the window opens quickly.

### Item Assortments Sub-Tab

This section includes the fields and descriptions for the Item Assortments Sub-Tab.

Field	Description
<b>Item No.</b>	This is the item number. You can enter new items to the item assortment.
<b>Description</b>	This is the item text.
<b>Pricing Combination</b>	This field is marked if the items is in a pricing combination.

Field	Description
<b>Price at Previous Invoicing</b>	This is the unit price in the previous invoice to the customer. When you enter an item manually to the item assortment, the value will be 0.
<b>Previous Invoicing Date</b>	This is the date the customer was last invoiced for the item. When you enter an item manually, the field will be blank.
<b>Quantity at Previous Invoicing</b>	This field shows how many units of the item were last invoiced to the customer. When you enter an item manually, the value will be 0.

## Inventory Profiles Single Dialog Workspace

Use this workspace to view an Inventory Profile, or the expected change in stocking applicable to items that have inventory control.

This workspace displays the profile for one item at a time. It is only for reference purposes, and you cannot make changes here.

The Inventory Profiles tab displays selected data from the Item Information Card, as well as the current stock of the item. The Inventory Changes sub-tab displays the expected change in stock based on the sales, purchase, and production orders in the system.

Maconomy uses the inventory profile when reserving items for sales and production, as well as when making item purchase orders.

When you reserve items, Maconomy uses the profile to calculate the earliest possible delivery date. Maconomy calculates the date so that the inventory is always sufficient to cover the recorded reservations. However, Maconomy does not take into account reservations that happen after the delivery horizon, that is, the current date plus the delivery time for the item. Such reservations are covered by new purchases or production.

When Maconomy makes item purchase selections, it uses the profile to calculate purchase quantities. This is calculated so that the inventory reaches the desired maximum after you make the recorded shipments and receipts. In other words, Maconomy does not take into account any reservations that happen after the delivery horizon, since these are covered by new purchases and production.

### Inventory Profiles Tab

This section includes the fields and descriptions for the Inventory Profiles Tab.

#### Inventory Profiles Island

Field	Description
<b>Item No.</b>	This is the number of the item shown in the window. You can use the Find menu to search for other items. It is only possible to see items marked in the "Inventory Profile" field in the Item Information Card window.
<b>Description</b>	This is the text from the "Description Lang. 1" field in the Item Information Card window. It cannot be changed here.

Field	Description
<b>Internal Desc.</b>	This is the text from the “Internal Desc.” field in the Item Information Card window. It cannot be changed here.
<b>Unit</b>	This field shows the sales unit of the current item, for example, ‘piece’.

### Selection Criteria Island

Field	Description
<b>Warehouse</b>	<p>In this field, you can select the warehouse for which you wish to see the registered sales, purchase, and production orders in the table part. Sales and item purchase orders are always assigned to a specific warehouse, while a production order can be assigned to, for example, one warehouse for the shipment of raw materials and another for the receipt of the finished goods.</p> <p>If the field “Inventory Profile” of the warehouse in question has not been marked, no lines are shown.</p>
<b>Date</b>	In this field, enter the range of dates within which you wish to see registrations in the table part.

### Warehouse Information Island

Field	Description
<b>Inventory Profile</b>	This field shows whether an inventory profile is assigned to the current item for the warehouse selected in the island Selection Criteria. The information is retrieved from the table part of the item information card.
<b>Delivery Horizon</b>	<p>This field shows the expected delivery date for the item if it was selected for purchase on the current date. The date is calculated as the current date + the number of days in the “Deliv. Time” field for the inventory in the table part of the Item Information Card window.</p> <p>When the inventory profile is used to calculate delivery dates and quantities for purchase, Maconomy only takes into account the shipments and receipts expected until this date. For example, when items are reserved in a sales order, it is assumed that from this date any number of units of the item can be delivered.</p>
<b>Stock On Hand</b>	This is the current inventory, expressed in units of the item in the warehouse. The value is the same as the one in the “Stock on Hand” field for the warehouse in the table part of the Item Information Card window.
<b>Reorder Level</b>	This is the value from the “Reorder Level” field for the warehouse in the table part of the Item Information Card window.
<b>Max. Stock</b>	This is the value from the “Max. Stock” field for the warehouse in the table part of the Item Information Card window.

## Inventory Changes Sub-Tab

This section includes the fields and descriptions for the Inventory Changes Sub-Tab.

Field	Description
<b>Date</b>	<p>This is the expected delivery or production date for the given sales, purchase or production order line.</p> <p>For sales orders, it is the date in the “Deliv. Date” field in the order line in the Sales Orders window. For item purchase orders, it is the date in the “Expected Availability Date” field on the item purchase order line in the Item Purchase Orders window.</p> <p>For raw materials shipment for a production order, it is the date in the “Delivery Date” field in the raw materials line in the “Production Reporting” window. For finished item receipts, it is the date in the “Production Date” field in the production line in the BOM Production window.</p>
<b>Sales Orders</b>	This field shows whether the line is from a sales, purchase or production order.
<b>Order No.</b>	This is the number of the sales, purchase or production order.
<b>Receipt</b>	This shows the quantity expected to be delivered/produced on the given date, if the line is for a purchase or production order.
<b>Shipment</b>	This shows the quantity expected to be delivered/used on the given date, if the line is for a sales or production order.
<b>Balance</b>	This field shows the expected inventory, that is, the current inventory plus the expected receipts, minus the expected shipments up to the given date.
<b>Drop Ship</b>	You mark this field for item purchase order lines, which are to be delivered directly. The field will never be marked for sales order lines as these can have partial direct delivery and partial delivery from warehouse.

## Reporting Section

This section includes the fields and descriptions for the Reporting workspaces.

### Print Understock List Single Dialog Workspace

Use this workspace to order a printout of the understock list.

This workspace provides an overview of the company's stocks when the current stock level of items, less order volume and backorders, plus item purchase orders, is at or below the reorder level. Maconomy suggests the purchase of each item up to its maximum stock in each warehouse. If you use an inventory profile, Maconomy bases the understock list on that profile.

This listing is one of several functions designed to assist in the purchasing function. The listing includes information about the selected stock items, including the value of the suggested purchase, derived from costs of the selected items in the selected warehouse.

The understock list includes items for which you have created a production order, which means that there is a production volume in the Item Information Card workspace. You can only create production orders using Maconomy Bill of Materials.

## Print Understock Tab

This section includes the fields and descriptions for the Print Understock Tab.

### Selection Criteria Island

Field	Description
<b>Warehouse</b>	Here you can select a warehouse. The understock list will then only include items in the specified warehouse.
<b>Company No.</b>	In this field, you can enter a range of company numbers. The understock list will only include items assigned to warehouses whose company lies within the specified range.
<b>Item No.</b>	Here you can enter a range of item numbers. The understock list will then only include items within the specified range.
<b>Item Group</b>	In this field, you can select an item group. The understock list will then only include items belonging to the specified group.
<b>Item Type</b>	In this field, you can select an item type. The understock list will then only include items of the specified type.
<b>Statistics 1-4</b>	In these fields, you can specify a range of statistics codes. The understock list will then only include items with statistic codes within the specified range.
<b>Vendor</b>	Here you can enter a range of vendor numbers. The understock list will then only include items from vendors within this range.
<b>Buyer</b>	Here you can enter a range of buyers. The understock list will then only include items from vendors with buyers within this range.

### Print Control Island

Field	Description
<b>Show Underst. Only</b>	If this field has been marked, the understock list will only contain an overview of the items whose order volume is larger than the total stock. In other words, the printout will only contain a list the items in order, which outnumber the same items in stock.
<b>Layout</b>	Here you select the layout of the shortage list. The layout determines how the information in the list is sorted. The pop-up field has two options: "Sorted by Warehouse" and "Vendor," which sorts by vendor number.

## Print Inventory Journal Single Dialog Workspace

Use this workspace to print inventory journals or listings of all inventory changes in a given posting range.

Specify the printout in the selection criteria fields.

### Print Inventory Journal Tab

This section includes the fields and descriptions for the Print Inventory Journal Tab.

#### Selection Criteria Island

Field	Description
<b>Warehouse</b>	Here you can select a warehouse. The journal printout will only include inventory changes in the specified warehouse.
<b>Company No.</b>	In this field, you can enter a range of company numbers. The journal printout will only include inventory changes in warehouses assigned to companies within the specified range.
<b>Item No.</b>	Here you enter a range of item numbers. The journal printout will only include inventory changes for items within the specified range.
<b>Entry Date</b>	In these fields, you can enter a range of dates. The journal printout will only include inventory changes entered within the specified range.
<b>Change Type</b>	Here you can select a change type. The inventory journal will only include inventory changes of a type in the specified range.  The following types of changes are recorded: Purchase, Cost Adjustment, Manual, Transfer, Production, Sale and Misc. Losses. The printout shows the movement type as well as direction, that is, shipment or receipt.
<b>Transaction Mode</b>	In this field, you can select a transaction mode. The journal printout will only include inventory changes with the specified transaction mode.

#### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. The layout determines how the information in the list is sorted. You can choose <b>In Date Order</b> or <b>Item</b> .  If you want to add more layouts for the printout, you can do this using the Print Layout workspace in the Set-Up module. By default, <b>Standard</b> is the only option offered in the Print Layout workspace.

## Print Inventory Balance Listing Single Dialog Workspace

Use this workspace to print inventory balance lists.

Inventory balance lists display all stocked items, specifying the individual serial numbers for items that are under serial number control. Maconomy includes only items that have inventory control in the printout. You can limit the printout by entering or choosing information in the selection criteria.

For every warehouse, the printout shows total shipments/receipts in the specified month, total shipments/receipts year-to-date, current inventory, inventory value, and other information. The inventory values of the individual items and the totals for each warehouse are shown in the base currency of the company to which the warehouse in question is assigned. In addition, the total inventory value of each warehouse and the grand total of all warehouses are shown in enterprise currency.

You can always print out a historical inventory balance list that calculates costs effective in the specified historical period. Maconomy records all cost adjustments.

If you delete a warehouse assignment for an item, Maconomy also deletes all information about item entries, item periods, item batches, and related vendors for the current warehouse assignment. When you print a historical inventory balance list, this information is thus not available for the deleted warehouse assignments, resulting in the inventory balance list not showing the posted inventory value.

For auditing purposes, it is good practice to print out and file inventory balance lists at the end of each period.

### Print Inventory Balance Listing Tab

This section includes the fields and descriptions for the Print Inventory Balance Listing Tab.

#### Period Island

Field	Description
<b>Month/Yr.</b>	Here you specify the month and year of the inventory list. Months are specified by numbers (from "1" to "12"). The inventory value is calculated for the last day of the given period.

#### Selection Criteria Island

Field	Description
<b>Warehouse</b>	Here you select one of your warehouses. The printout will only include the specified warehouse.
<b>Company No.</b>	In this field, you can enter a range of company numbers. The printout will only include warehouses assigned to companies within the specified range.
<b>Item No.</b>	Here you specify a range of item numbers. The inventory list will only include items within the specified range.
<b>Item Group</b>	In this field, you can select an item group. The inventory list will then only include items belonging to the specified group.

Field	Description
<b>Item Type</b>	In this field, you can select an item type. The inventory list will then only include items of this type.
<b>Statistics 1-4</b>	In these fields, you can specify a range of statistics codes. The inventory list will then only include items with statistic codes within the specified range.

### Print Control Island

Field	Description
<b>Inventory Method</b>	<p>Here you select the inventory method. You can select between the following five: "Average Cost," "Last Cost," "Standard Cost," "Item Cost" and "Lowest Cost." "Item Cost" is the only calculation method which produces the same inventory value as the current value recorded in the G/L module.</p> <p>If you select "Average Cost," Maconomy uses the average cost in the individual warehouses for every item, regardless of whether some items are priced according to other methods.</p> <p>If you select "Last Cost," Maconomy uses the last cost in the individual warehouses for each item, regardless of whether some items are priced according to other methods.</p> <p>If you select "Standard Cost," Maconomy uses the standard cost in the individual warehouses for each item, regardless of whether some items are priced according to other methods.</p> <p>If you select "Item Cost," Maconomy uses the current cost in the individual warehouses for each item.</p> <p>If you select "Lowest Cost," Maconomy uses the lowest of the three costs recorded for each item in the warehouse in question. For items with a costing method different from FIFO, the lowest among "Standard," "Average," and "Last" will be used. For items with the FIFO costing method, the cost of the oldest batch will also be included in the evaluation of the lowest cost.</p>
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.
<b>Include Items not in Stock</b>	Here you can specify whether to include items with zero physical inventory. If you leave the field blank, you only include items with a positive stock. And if you mark the field "Incl. Items with Negative Stock," you also include items with a negative stock.
<b>Incl. Items with Negative Stock</b>	Here you can specify whether you wish to include any negative stocks in the inventory count. Unless otherwise specified for the warehouse in question, Maconomy allows a negative item stock if you carry out direct invoicing in the Sales Orders or the Item Purchase modules, despite the fact that the registered current stock is not adequately large to match the invoiced quantity. In certain situations, it may be essential to include such negative stocks to generate an inventory value which is as correct as possible. It is possible to reconcile the inventory with the equivalent inventory account in the G/L module provided that negative stocks are included in the inventory count.

Field	Description
<b>Show FIFO Batches</b>	This field applies to items with the FIFO costing method. You can thus indicate whether you wish to include information about the item batches making up the inventory.

## Print Inventory Listing Single Dialog Workspace

Use this workspace to order a printout of an inventory listing.

This workspace provides an overview of the total quantity of items in the company's warehouses. You can limit the printout by entering or choosing information in the selection criteria.

### Print Inventory Listing Tab

This section includes the fields and descriptions for the Print Inventory Listing Tab.

#### Selection Criteria Island

Field	Description
<b>Warehouse</b>	In this field, you can enter a warehouse with the result that the inventory listing only includes items stocked in the warehouse in question.
<b>Company No.</b>	In this field, you can enter a range of company numbers. The inventory listing will only include warehouses assigned to companies within the specified range.
<b>Item No.</b>	In this field, you can enter a range of item numbers with the result that the inventory listing only includes items within that range.

#### Print Control Island

Field	Description
<b>Incl. Items not in Stock</b>	In this field, you can specify whether items with a physical stock of zero are to be included in the inventory listing. If the field is not marked, only items with a positive stock will be included.
<b>Show Serial Numbers</b>	In this field, you can choose whether or not to print out information about individual serial numbers (serial number and quantity) for items under serial number control. If the field is not marked, no serial number information will be included in the inventory listing.
<b>Only Show Ser. Nos. in Stock</b>	In this field, you can choose whether serial numbers with a physical stock of zero are to be included in the inventory listing. If the field is not marked, only serial numbers with a positive stock will be included. The field is activated by marking the field "Show Serial Numbers."
<b>Layout</b>	Here, you can choose the layout to be used for printing out the inventory listing. The layout determines the sorting of the information in the inventory listing. You can choose between two layouts in this pop-up field: "Sorted by Warehouse," in which the items are sorted by warehouse and "Sorted by Item," in which the items are sorted by serial number.

## Print Requirement Analysis Single Dialog Workspace

Use this workspace to print a requirement analysis to find out whether all of the raw materials are available before you start a production.

If there is a shortage, you can buy or produce the necessary items or reduce the total production. You can also use it to transfer certain raw materials from other inventories.

The analysis is divided into inventories and shows how much of each raw material in the target group you require. The requirement is divided into production transactions and finished items with inventory sum. The available stock is shown for comparison. The printout only includes production transactions for which you have not already reserved raw materials.

### Print Requirement Analysis Tab

This section includes the fields and descriptions for the Print Requirement Analysis Tab.

#### Selection Criteria Island

Field	Description
<b>Raw Materials</b>	Here you can select which raw material warehouse to make a requirement analysis for. The requirement analysis will only include raw materials from this warehouse in the production transaction.
<b>Finished Goods</b>	Here you can select which finished item warehouse to make a requirement analysis for. The requirement analysis will only include raw materials for a finished item in this warehouse in the production transaction.
<b>Company No.</b>	In this field, you can enter a range of company numbers. The requirement analysis will only include production transactions on which the responsible company is within the specified range.
<b>Trans. No.</b>	Here you can enter a range of transaction numbers. The requirement analysis will only include production transactions within the specified range.
<b>Raw Materials No.</b>	Here you can enter a range of raw material numbers. The requirement analysis will only include raw materials within the specified range.
<b>Finished Item No.</b>	Here you can enter a range of finished item numbers. The requirement analysis will only include finished items within the specified range.
<b>Time Limit</b>	In this field, you can enter a date which functions as a time limit. The requirement analysis will only include raw materials which have inventory profile and whose delivery horizon lies before the specified date.
<b>Incl. Items Without Invent. Control</b>	If you mark this field the requirement analysis will also include raw materials without inventory control. The available quantity will be zero. If you do not mark this field, the requirement analysis will only include items with inventory control.

**Print Control Island**

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

**Print Item Statistics Single Dialog Workspace**

Use this workspace to print inventory statistics for one or more items.

The statistics show monthly item purchases, item sales, and gross margin figures per item.

**Print Item Statistics Tab**

This section includes the fields and descriptions for the Print Item Statistics Tab.

**Selection Criteria Island**

Field	Description
<b>Item No.</b>	Here you specify a range of item numbers. The statistics will only include items within this range.
<b>Year</b>	Here you specify a range of years. The statistics will only include item movements within this range. You must fill in the field.
<b>Company No.</b>	Here you enter a range of company numbers. The statistics will only include item entries which are created on the basis of transactions with a responsible company number within the specified range.
<b>Item Group</b>	Here you specify a range of item numbers. The statistics will only include items within this range.
<b>Item Type</b>	Here you select an item type. The statistics will only include items of this type.
<b>Statistics 1-4</b>	Here you can specify a range of statistics codes in each of the four statistics categories. The statistics will only include items with statistics codes within the given range.

**Print Control Island**

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

## Print Item Group Statistics Single Dialog Workspace

Use this workspace to print monthly sales and gross margin statistics per item group.

The statistics show sales, gross margin, and gross margin percentage for a given month and year to date.

### Print Item Group Statistics Tab

This section includes the fields and descriptions for the Print Item Group Statistics Tab.

#### Selection Criteria Island

Field	Description
<b>Item No.</b>	Here you specify a range of item numbers. The statistics will only include items within this range.
<b>Item Group</b>	Here you select an item group. The statistics will only include items in this group.
<b>Item Type</b>	Here you select an item type. The statistics will only include items of this type.
<b>Warehouse</b>	Here you select a warehouse. The statistics will only include items assigned to this warehouse.
<b>Company No.</b>	Here you enter a range of company numbers. The statistics will only include item entries which are created on the basis of transactions with a responsible company number within the specified range.
<b>Statistics 1-4</b>	Here you can specify a range of statistics codes in each of the four statistics categories. The statistics will only include items with statistics codes within the given range.

#### Print Control Island

Field	Description
<b>Show Info. by Item</b>	You mark this field if you wish to see sales and gross margins per item. If the field is not marked, the printout shows a total figure per item group.
<b>Include Inactive Items</b>	Here you specify whether to include items for which there are no sales in the given month. If the field is marked, the printout includes such inactive items. Note that this only applies if you mark the "Show Info. by Item" field.
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

**Period Island**

Field	Description
Month	Here you specify the month for which to make statistics. You enter "1" for January, "2" for February, and so on. You must fill in the field.
Year	Here you specify the year of the monthly statistics. You must fill in the field.

**Set-Up Section**

This section includes the fields and descriptions for the Set-Up workspaces.

## Warehouse Information Card Single Dialog Workspace

Use this workspace to manage information about your company's warehouses.

Each warehouse can include an address and references to accounts in the general ledger. You must create warehouses in this workspace before you can assign items to them in the Item Information Card and before you can select them in your customer and vendor information cards.

Specify the posting references on the warehouse information card by using dimension combinations that refer to the accounts and any other dimension values to be used when you post various types of item activity in Maconomy. For example, if the inventory value changes as result of a cost adjustment, Maconomy posts the offsetting entry for the inventory value change to the account to which a dimension combination specified on the warehouse information card refers. This makes it easier to trace and to reconcile variances and adjustments that result from various kinds of item transactions. See the description of the Inventory Change workspace for more information.

In the Stock Locations sub-tab, you can set up different locations in the current warehouse. Locations can, for example, be shelf numbers, drawers, or warehouse areas. Maconomy uses locations for keeping closer track of exactly where the items are placed in the warehouse. This makes it easier to plan a picking route when items are to be moved or shipped. When items are received, you specify the location at which they are placed, and Maconomy keeps track of the stock that is available at each location. Items can be moved around the warehouse locations by means of warehouse transactions and picking lists, causing Maconomy to update each location's current stock.

In the Warehouse Information Card tab, you can set up a number of rules for the operation of the warehouse to skip parts of the planning details involved in item sales, simplifying the sales flow.

For auditing purposes, it is recommended that you print and file the Warehouse Information Card every time that you change it. To print the card, select **Print This** in the File menu.

Note that you cannot delete a warehouse after you create it. However, you can change the name of the warehouse.

You can specify for each warehouse whether you can make entries that cause the stock of a given item in the warehouse in question to become negative—that is, shipping more units of an item than are available according to the entered stock. In some cases, a supplier can deliver a number of units that are shipped before they are entered as received. While this is normal practice, you may want to disallow negative stock volumes. You can therefore prevent deliveries that would cause a negative stock for each warehouse.

## Warehouse Information Card Tab

This section includes the fields and descriptions for the Warehouse Information Card Tab.

## Warehouse Island

Field	Description
<b>Name</b>	Enter the name of the warehouse here. This name identifies the warehouse and must be unique. You must enter a name, but you can change it later.
<b>Address</b>	Enter the address of the warehouse in these four text fields. The information is printed on item purchase orders created in the Item Purchase module, provided the order is not delivered directly (or drop-shipped) to a customer (this will be marked in the item purchase order in the "Direct Delivery" field). Because standard item purchase order printouts in Maconomy include only these four text fields, your company name must be entered in the first line of the address if it is to be included on the item purchase order.
<b>Attn.</b>	Enter the name of the employee responsible for this warehouse.
<b>Phone</b>	In this field, you enter the warehouse's phone number.
<b>Fax</b>	In this field, you enter the warehouse's fax number.
<b>Telex</b>	In this field, you enter the warehouse's telex number.

## Selection Criteria Island

Field	Description
<b>Show Stock Locations</b>	When you check this box, the table part of the window will display the locations matching the selection criteria specified in this island. For performance reasons, it is advisable not to check the box until after you have entered the selection criteria.
<b>Stock Location No.</b>	In these fields, you can specify a range of location numbers. When the field "Show Stock Locations" is marked, the table part will only show locations with numbers within the specified range.
<b>Storage Locations</b>	If you select "Yes" in this field, the table part will only show locations with a mark in the field "Storage Loc." when the field "Show Stock Locations" is marked. If you select "No," the table part will only show locations where the field "Storage Loc." is not marked. If you leave the field blank, both storage locations and non-storage locations are shown.
<b>Picking Locations</b>	If you select "Yes" in this field, the table part will only show locations with a mark in the field "Picking Loc." when the field "Show Stock Locations" is marked. If you select "No," the table part will only show locations where the

Field	Description
	field "Picking Loc." is not marked. If you leave the field blank, both picking locations and nonpicking locations are shown.
<b>Blocked for Receipt</b>	If you select "Yes" in this field, the table part will only show locations marked as blocked for receiving in the field "Blocked for Receipt" in the table part when the field "Show Stock Locations" is marked. If you select "No," the table part will only show locations that are not marked as blocked for receipt. If you leave the field blank, both blocked and non-blocked locations are shown.
<b>Blocked for Picking</b>	If you select "Yes" in this field, the table part will only show locations marked as blocked for picking in the field "Blocked for Picking" in the table part when the field "Show Stock Locations" is marked. If you select "No," the table part will only show locations that are not marked as blocked for picking. If you leave the field blank, both blocked and non-blocked locations are shown.
<b>Empty Locations</b>	If you select "Yes" in this field, the table part will only show locations at which no items are currently stored when the field "Show Stock Locations" is marked. If you select "No," the table part will only show locations currently containing items. If you leave the field blank, locations both with and without a current stock are shown.

### Standard Locations Island

Field	Description
<b>Receipt Loc.</b>	In this field, you can specify the location at which items going into the current warehouse are usually received. When you create an item purchase order or a movement voucher for receipt, Maconomy will suggest this location in the card part of the window Item Purchase Orders or Inventory Change, respectively, causing this location to be the default receiving location for the items on each line. The location can be changed, however, in the card part as well as on the individual lines. For further information on the effects of locations in the card and table parts of item purchase orders and movement vouchers, please see descriptions of the actions in the window Item Receipt in the Item Purchase module and the window Inventory Change.
<b>Shipment Loc.</b>	In this field, you can specify the location at which items going out of the current warehouse are usually packed, checked, and shipped. When you create a quote or sales order or a movement voucher for transfer or shipping, Maconomy will suggest this location in the card part of the window Quote, Sales Orders or Inventory Change, respectively, causing this location to be the default shipment location for the items on each line. The location can be changed, however, in the card part as well as on the individual lines. For further information on the effects of locations in the card and table parts of sales orders, please see the descriptions of the actions in the window Sales Orders in the Sales Orders module.
<b>Storage Loc.</b>	In this field, you can specify the location to which items in the current warehouse are usually moved when items are moved from one location to another. When picking lists are created from warehouse transactions

Field	Description
	concerning the current warehouse and no target location has been specified on a line, this location is used in the process of finding a target location for the resulting picking list line. For further information on this process, please see the description of the action "Print Picking List" in the window Warehouse Transactions.
<b>Picking Loc.</b>	In this field, you can specify the location from which items in the current warehouse are usually picked when they are being moved to other locations. When picking lists are created from warehouse transactions concerning the current warehouse and no source location has been specified on a line, this location is used in the process of finding a source location for the resulting picking list line. For further information on this process, please see the description of the action "Print Picking List" in the window Warehouse Transactions.
<b>Production Loc.</b>	In this field, you can specify the location at which item production from BOMs usually take place. When you create a production transaction, Maconomy will suggest this location in the card part of the window BOM Production, causing this location to be the default location on each line.
<b>Balancing Loc., Inventory Count</b>	In this field, you can specify the name you want to normally use for the balancing location created when creating inventory count listings for the current warehouse. This name will be used for the balancing location on count listings in the window Inventory Count Listing. For further information on the functionality of balancing locations, see the description of the window Approve Count. As a balancing location is not an actual, physical location, and is only created temporarily during inventory counts, you cannot enter the number of a location assigned to the current warehouse in the table part of this window.

### Production Island

Field	Description
<b>Balance</b>	In this field, enter the number of the dimension combination containing a reference to the account on which you want Maconomy to register the variance between raw materials costs and the costs of finished items (from BOM Production). The dimension combination can also contain other dimension values to be used in this connection. The inventory value account is specified by means of a dimension combination in the field "Inventory Value". Be sure to verify that the number you enter here refers to the warehouse in the window and that you have not created a warehouse with the same posting reference. When you produce a BOM, and the finished item is inventoried at the cost assigned to the finished item in the warehouse in question (or if you are using non-inventoried items in the production) you may incur a variance between the accumulated costs of the raw materials and the cost value of the finished item. This variance will be posted to the account to which the dimension combination in this field refers. The entry is made to the warehouse of the finished item.

**Auto. Write Up/Down Island**

Field	Description
<b>For Sale</b>	<p>In this field, enter the number of the dimension combination containing a reference to the account on which you want Maconomy to set off automatic cost adjusting entries to the inventory value account, as a result of sales. The dimension combination can also contain other dimension values to be used in this connection. The inventory value account is specified by means of a dimension combination in the field "Inventory Value."</p> <p>This posting reference is used when you post an item journal that was produced in the following way:</p> <ul style="list-style-type: none"> <li>■ An item with Sales Price Costing (costing from sales price) is removed, and the calculated cost is different from the current cost at the warehouse in question in the table part of the item information card.</li> <li>■ An item with the FIFO costing method is removed and as a result of rounding amounts to the nearest currency unit, the decrease in the inventory value will vary.</li> </ul>
<b>For Purchase</b>	<p>In this field, enter the number of the dimension combination containing a reference to the account on which you want Maconomy to set off automatic cost adjusting entries to the inventory value account as a result of item receipts in the Item Purchase module, or manual item receipt in the Inventory Change window. The dimension combination can also contain other dimension values to be used in this connection. The inventory value account is specified by means of a dimension combination in the field "Inventory Value."</p> <p>The posting reference is used when you post an item journal that was produced in one of the following ways:</p> <ul style="list-style-type: none"> <li>■ An item receipt is approved in the Item Receipt window in the Item Purchase module.</li> <li>■ An item transaction is created and approved in the Inventory Change window using the type "Receipt"</li> </ul>
<b>For Production</b>	<p>In this field, enter the number of the dimension combination containing a reference to the account on which you want Maconomy to set off automatic cost adjusting entries to the inventory value account, as a result of the production of a BOM. The dimension combination can also contain other dimension values to be used in this connection. The inventory value account is specified by means of a dimension combination in the field "Inventory Value."</p> <p>The posting reference is used when you post an item journal that was produced in the following way:</p> <ul style="list-style-type: none"> <li>■ Production of a BOM is completed by approving a production transaction in the window BOM Production which produces a cost adjustment.</li> <li>■ Production of a BOM is completed by approving a production transaction in the window BOM Production, in which 1) the bills of materials contain</li> </ul>

Field	Description
	items with the FIFO costing method and 2) the calculated cost varies as a result of rounding amounts to the nearest currency unit in the decrease of the inventory value.

### Invoice Reconciliation Island

Field	Description
<b>Balance</b>	<p>In this field, enter the number of the dimension combination containing a reference to the account on which you want Maconomy to set off certain entries to the Unreconciled Vendor Entries account. (This is specified by means of a dimension combination in the pop-up field "A/P Control Accounts" in the window Popup Fields in the Set-Up module.)</p> <p>The account to which the dimension combination in this field refers is used if you reconcile an invoice in the Invoice Reconciliation window in the Accounts Payable module with a variance between the item receipt transaction amount and the vendor invoice amount. The account balance thus reflects the variance between the expected cost of purchased items, and the actual cost invoiced by the vendor.</p> <p>If you wish to adjust your inventory costs in accordance with the vendor invoices, you must do it in the Inventory Change window. Such an adjustment will affect inventory value and the account given specified by means of a dimension combination in the field "Cost Adj." (typically a profit &amp; loss account). The variance from the account referred to in this field must be manually posted to the Cost Adjustment account. However, if the posting reference here is identical to the posting reference in the field "Cost Adj.," this manual posting is unnecessary.</p>

### Access Level Island

Field	Description
<b>Name</b>	<p>Here you can enter the name of the access level. Users only have access to seeing information about the current warehouse and referring to it in other windows if they have been assigned to this or a higher access level in the window User Access Levels in the Set-Up module. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to warehouses may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If you do not specify an access level, all users will have access to see information about the current warehouse.</p>
<b>Description</b>	This field shows the description of the access level specified in the field above.

**Control Principles Island**

Field	Description
<b>One Location</b>	<p>If you mark this field, only one location can be created in the table part, meaning that the complete stock of the warehouse is registered on the same location, and this is the only location allowed on any registration. As a consequence, this also disallows the movement of items between locations in the warehouse. Mark this field if you do not wish to register separate location stocks or if your warehouse procedures do not include reporting where items were picked and where in the warehouse they are currently stored.</p> <p>The field can only be marked if the warehouse has only one location assigned to it.</p> <p>If you select this operation mode, the field “Fixed Picking” is automatically marked, and all fields in the island Standard Locations, with the exception of the field “Balancing Loc., Inventory Count,” are assigned the name of the unique location created for the warehouse.</p> <p>You can remove the mark in this field any time to allow the creation of multiple locations in the warehouse.</p>
<b>Fixed Picking</b>	<p>If you mark this field, a standard picking location must be entered on lines in the table part of the window Item Information Card pertaining to the current warehouse, unless a standard picking location is specified in the information card of the current warehouse.</p> <p>Select this operation mode if each item is always picked at the same location or if you usually pack directly at the picking location instead of moving it to a packing location first. This can, for example, be the case if the same people that pick the items are also responsible for packing them. This process can be supported, as the set-up resulting of a mark in this field ensures that you can skip both picking lists and warehouse transactions. This is possible as either a warehouse specific or an item specific location is always transferred to a packing list when a packing list is created in the window Sales Orders without first creating a picking list or a warehouse transaction.</p>
<b>Implicit Warehouse Trans.</b>	<p>If you mark this field, the approval of a picking list regarding the current warehouse will automatically close any warehouse transaction from which the picking list was created even if the quantities of items that were reported picked on the picking list do not match those on the warehouse transaction from which the list was created.</p> <p>This operation mode is useful if you do not want to make new attempts at creating picking lists from warehouse transactions when the warehouse personnel already reported that the items were not available at the specified picking location. This can, for example, be due to the fact that you are using fixed picking locations or because you want the picking reporting to be the final indication of whether the items could be picked.</p>
<b>Allow Incomplete picking lists</b>	<p>Mark this field if picking list lines with only a source location or a target location should be allowed. This ensures that the creation of a picking list never fails. When a picking list line is to be created from a warehouse transaction line for which only a source or target location, respectively, has been specified, and the</p>

Field	Description
	other location cannot be found in the process described for the action "Print Picking List," the warehouse transaction line will result in a picking list line identical to the warehouse transaction line, as the system could not suggest a source or target location. If this field has not been marked for the warehouse in question, the picking list creation procedure would fail if a source or target location cannot be found.

### Posting References Island

Field	Description
<b>Inventory Value</b>	<p>In this field, enter the number of the dimension combination containing a reference to the G/L account on which the inventory value should be updated. If you use more than one inventory value account, be sure to verify that the number you enter here refers to the warehouse currently shown in the window and that you have not created a warehouse with the same posting reference.</p> <p>The account to which the specified dimension combination refers is updated each time items are shipped from or received by this warehouse, and each time costs are adjusted. When items are shipped, this account is credited by the value of the shipment. When items are received, it is debited by the value of the received goods.</p>
<b>COGS Suspense</b>	<p>In this field, enter the number of the dimension combination containing a reference to the G/L account for COGS Suspense. This is an account used for tracking goods removed from inventory and printed on a packing slip, but that have not yet been invoiced to the customer and booked as a sale. Be sure to verify that this account refers to the warehouse currently shown in the window and that you have not created another warehouse with a reference to the same account.</p> <p>In the below description of the posting reference, the term "account" is used about posting references in the form of dimension combinations from which an account number and possibly other dimension values are found.</p> <p>The purpose of this account is to secure that the value of your physical stock is always reflected in the inventory value account. This is relevant when there is a difference in time from when goods are shipped to when the sale is invoiced, since cost of sales is not posted before invoicing.</p> <p>When goods are shipped, the cost of sales is debited to this account and when the shipment is invoiced, the cost of sales is credited to this account.</p> <p>This account is not used when printing packing slips for orders marked as "Invoice in Job Cost." Cost of sales for these orders is debited through the Job Cost module, either to the P/L account for the activity or to the job's account for WIP, depending on whether the job is capitalized.</p>

**Manual Inventory Value Changes Island**

Field	Description
<b>Shipments and Receipts</b>	<p>In this field, enter the number of the dimension combination containing a reference to the G/L account on which you want Maconomy to set off entries that affect the inventory value, (registered on the account for inventory value) generated by manual item shipments and receipts in the Inventory Change window. This dimension combination can also contain values for other dimensions to be used in this connection. The account for inventory value is specified by means of a dimension combination in the field "Inventory Value."</p> <p>This offset posting reference is used when you post an item journal that was produced in the following way:</p> <ul style="list-style-type: none"> <li>■ An item transaction is created and approved in the Inventory Change window by a "Receipt" or a "Shipment."</li> <li>■ For an item with the FIFO costing method, Maconomy generates and approves an inventory transaction of the change type "Transfer." As a result of rounding amounts to the nearest currency unit, the amounts to be debited/credited the inventory value account for 'To Warehouse' and 'From Warehouse' will differ.</li> </ul>
<b>Cost Adjustment</b>	<p>In this field, enter the number of the dimension combination containing a reference to the account on which you want Maconomy to set off entries for cost adjustments to the inventory value account generated by manual cost adjustments, or automatic cost adjustments resulting from miscellaneous losses, transfers or inventory counts. This dimension combination can also contain values for other dimensions to be used in this connection.</p> <p>Cost adjustments can occur as a result of rounding amounts to the nearest currency unit.</p> <p>This posting reference is used when you post an item journal that was produced in one of the following ways:</p> <ul style="list-style-type: none"> <li>■ An item transaction is created and approved in the Inventory Change window by a "Cost Adjustment."</li> <li>■ An item transaction is created and approved in the Inventory Change window by a "Transfer," "Inventory Count" or "Misc. Losses," where costs are adjusted automatically after amounts are rounded up.</li> <li>■ An inventory count list is approved with volume variances in the Approve Count window, and costs are automatically adjusted after figures are rounded up.</li> </ul>
<b>Inventory Count</b>	<p>In this field, enter the number of the dimension combination containing a reference to the account on which you want Maconomy to set off entries that adjust the balance of the inventory value account, in the form of a write-up or write-down as a result of an inventory count. The dimension combination can also contain other dimension values to be used in this connection. The inventory value account is specified by means of a dimension combination in the field "Inventory Value."</p>

Field	Description
	<p>This posting reference is used when you post an item journal that was produced in one of the following ways:</p> <ul style="list-style-type: none"> <li>▪ An item transaction is created and approved in the Inventory Change window by an "Inventory Count."</li> <li>▪ An inventory count list is approved with volume variances in the Approve Count list.</li> </ul>
<b>Misc Losses</b>	<p>In this field, enter the number of the dimension combination containing a reference to the account on which you want Maconomy to set off entries to the inventory value account as a result of miscellaneous losses. The dimension combination can also contain other dimension values to be used in this connection. The inventory value account is specified by means of a dimension combination in the field "Inventory Value."</p> <p>This posting reference is used when you post an item journal that was produced in the following way:</p> <ul style="list-style-type: none"> <li>▪ An item transaction is created and approved in the Inventory Change window by "Misc. Losses."</li> </ul>

### Company Island

Field	Description
<b>Company No.</b>	<p>In this field, you can enter a value for the dimension Company, thus assigning the warehouse to the company which owns it. If another company creates transactions causing item movements on the warehouse, Maconomy will automatically create intercompany balances on the accounts specified for the intercompany transaction type "Inventory Journal" in the window Intercompany Accounts in the G/L module. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>Furthermore, the balance of the warehouse is represented in the chart of accounts of the company in this field. This means that when entries are created as a result of the posting of item journals, the value in this field will be transferred to those entries which concern the current warehouse.</p> <p>Once an item, an entry or a transaction has been made for the warehouse, it is no longer possible to change the value in this field.</p> <p>If you do not enter a value in this field when creating a warehouse, Maconomy transfers the standard value for the dimension Company from the window System Information.</p>
<b>Name</b>	<p>This field shows the name of the company specified in the field "Company No." above.</p>

Field	Description
<b>Base Currency</b>	This field shows which currency is used as the base currency in the company specified in the field "Company No." above. For further information about the concepts of company base currencies and enterprise currency, please see the description of the field "Base Currency" in the window Company Information in the G/L module.

### User Island

See the "Getting Started" topic for a description of the fields in the island User.

### Stock Locations Sub-Tab

This section includes the fields and descriptions for the Stock Locations Sub-Tab.

Field	Description
<b>Stock Location No.</b>	In this field, you can specify a number or name for the current location. Once the line has been created, you can no longer change the location number.
<b>Storage Loc.</b>	<p>In this field, you can specify whether the current location is intended for use as a storage location. A storage location is a location at which you normally store items after they have been checked upon receipt and until they are to be shipped or moved to other locations.</p> <p>This field is used in the procedure for finding target locations when picking lists are created from warehouse transactions. When you create picking lists from warehouse transactions regarding the current warehouse Maconomy attempts to find a target location for those lines on which no target location was specified on the warehouse transaction for instance because it was created from an item receipt. To find a target location, Maconomy runs through a procedure which is described in detail in the description of the action "Print Picking List," part of which consists of running through locations marked as storage locations. If a location does not have a mark in this field, it is discounted in step 4 of the procedure for finding a target location, even if there are units of the item in question stored at it.</p>
<b>Picking Loc.</b>	<p>In this field, you can specify whether the current location is intended for use as a picking location. A picking location is a location from which you usually pick items to prepare them for packing even though the items stored at the picking location are also stored at other locations in the warehouse. This can, for example, be due to the fact that the picking location is situated closer to the packing area.</p> <p>When you create picking lists from warehouse transactions regarding the current warehouse Maconomy attempts to find a source location for those lines on which no source location was specified on the warehouse transaction for instance because it was created from a sales order. To find a source location, Maconomy runs a procedure which is described in detail in the description of the action "Print Picking List," part of which consists of checking all locations marked as picking locations. If a location does not have a mark in this field, it is discounted in step 4</p>

Field	Description
	of the procedure for finding a source location, even if there are units of the item in question stored at it.
<b>Shipment Loc.</b>	In this field, you can specify whether the current location is intended for use as a shipping location. A shipping location is a location to which you normally move items to pack and ship them. If you do not mark the field, Maconomy will display a warning if you specify the current location as the shipping location on, for example, an order or a quote, or if you specify it as a standard shipping location for the warehouse.
<b>Receipt Loc.</b>	In this field, you can specify whether the current location is intended for use as a receiving location. A receiving location is a location at which you normally register the receipt of items and check them before moving them to their respective storage locations. If you do not mark the field, Maconomy will display a warning if you specify the current location as the receiving location on, for example, an item purchase order or an inventory change for receipt, or if you specify it as a standard receiving location for the warehouse.
<b>Blocked for Picking</b>	If you mark this field, the current location is ignored in the procedures for finding a source location for a picking list line being created. However, the location is not ignored in those steps in the procedure where Maconomy tries to find a standard picking location for the warehouse or item in question. This means that a blocked location can be used as a source location if it has been specified as the standard picking location on a warehouse or an item. A blocked location can also be specified manually as the source location on picking lists and warehouse transactions.
<b>Blocked for Receipt</b>	If you mark this field, the current location is ignored in the procedures for finding a target location for a picking list line being created. However, the location is not ignored in those steps in the procedure where Maconomy tries to find a standard storage location for the warehouse or item in question. This means that a blocked location can be used as a target location if it has been specified as the standard storage location on a warehouse or an item. A blocked location can also be specified manually as the target location on picking lists and warehouse transactions.
<b>Empty Loc.</b>	This field is marked if no items are currently registered as stored at the current location.
<b>Text 1-5</b>	In these fields, you can write any extra remarks about the current location.
<b>Weight</b>	Here you enter the net weight in kilos of the item entry. The weight will be rounded off to the nearest whole kilo, 1 kg being the smallest possible value. When you enter a new item entry, the net weight per unit is retrieved from the "Net Weight (kg.)" field in the item information card.
<b>Volume</b>	Here you enter the item's volume per pricing unit.

## Actions

This section shows the Actions available in the Warehouse Information Card workspace.

### Top Tab

Field	Description
<b>Create Inventory Profiles</b>	Select this action to start inventory profile control for all items in the warehouse. The effect is the same as manually marking each "Inventory Profile" field on the warehouse line in each of the Item Information Cards.
<b>Delete Inventory profiles</b>	Select this action to stop inventory profile control for all the items in the warehouse. The effect is the same as manually removing the mark in each "Inventory Profile" field on the warehouse line in each of the Item Information Cards.

## Item Group Information Card Single Dialog Workspace

Use this workspace to manage various item groups.

In the Item Group Information Card tab, enter general information about the group. In the Departments sub-tab, enter references to G/L accounts if you want to book sales and cost of sales by item group. The Departments sub-tab displays one line for every department created in the Posting References workspace in the G/L module.

Maconomy divides inventory items into a number of logical groupings. You must create these groups in this workspace before you can set up items in the Item Information Card workspace, because you must attach items to a group. Maconomy distinguishes item groups from one another by costing method, inventory control, tax codes, and other information, all of which is transferred to the Item Information Card when you assign an item to a group.

You can change the information for an existing item group after items have been assigned to it, but the new information does not affect the items that are already in the group. Changes only affect new items assigned to the group.

### Item Group Information Card Tab

This section includes the fields and descriptions for the Item Group Information Card Tab.

#### Item Group Island

Field	Description
<b>Name</b>	Enter the name of the item group here. This name identifies the group and must be unique. You can change the name of an existing item group. You must complete the field.

**Buyer Island**

Field	Description
<b>Buyer</b>	In this field, you can specify the name of the person typically responsible for buying items in the current group. You can enter any text. The information in this field is used when running item purchase selections, where you can set up criteria where the buyer information on each item and the item group to which it pertains determines whether the item in question is to be included in the selection. In this process, the buyer on the item group is only used if a buyer has been specified neither for the warehouse for which items are being purchased nor in the card part of the item in question. For further information on this process, see the description of the field "Buyer" in the window Item Purchase Orders in the Item Purchase module.

**Inventory Island**

Field	Description
<b>Inventory Control</b>	<p>If you mark this field, you apply inventory control to the items in the item group. Inventory control means that you can enter information such as storage location, delivery times, and so on, in the table part of the window Item Information card. Maconomy also calculates average and last cost prices for items with inventory control, and keeps track of item volumes for each warehouse. For items without inventory control, only limited warehouse specific information, such as preferred vendor and standard cost, can be entered.</p> <p>If you do not mark this field, then select "Standard" in the "Costing Method" field, since average and last costs are not updated for items without inventory control. When an item has inventory control, both the average and last costs are updated when there are inventory changes, regardless of which costing method you have selected.</p> <p>You can change the value of the field for an existing item group, but the change will not affect items already assigned to the group. It will only be effective for new items assigned to the group after the change. You cannot change the inventory control method for existing items.</p>

**Sales Order Island**

Field	Description
<b>Tax Code</b>	<p>Here you can specify the tax code to be suggested for items in this group on order lines. The tax code(s) can be changed on individual order lines or determined by a tax table from the Tax Tables window in the G/L module. Tax is only added if the customer to whom the item is sold pays tax.</p> <p>You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters window. When multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2" and, if enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p>

Field	Description
	<p>You can change the value for an existing item group, but it will not affect items already assigned to the group. The change will only be effective for items that are assigned to the group after the change.</p> <p>Tax codes are defined in the Tax Codes window in the G/L module.</p>
<b>Markup % of Cost</b>	<p>Here you enter the GM % for calculating gross margin, if an item is not in a price list. The sales price is then calculated from the cost plus whichever gross margin – from this field or the “GM % Sales Price” field – is greater than zero; otherwise, it uses zero.</p> <p>You can change the value for an existing item group, but it will not affect items already assigned to the group. The change will only be effective for items assigned to the group after the change. You can change the GM % for items individually in the Item Information Card window.</p>

### Costs Island

Field	Description
<b>Costing Method</b>	<p>Select one of four values, “Average,” “Last,” “Standard,” and “FIFO,” to be used for determining the inventory value of items in the group. This selection is also used in the calculation of sales prices on order lines if the item is not priced in a price list and if costs are not calculated from sales prices.</p> <p>You can change the costing method for an existing item group, but it will not affect items already assigned to the group.</p> <p>Changes will only affect new items assigned to the group after the change. You cannot change costing method for an existing item.</p> <p>Use the “Standard” costing method if you leave the “Inventory Control” field unmarked. Since Maconomy does not keep track of item batches for items without inventory control, the average cost always corresponds to the cost of the last item purchase. This makes the Average and Last costing methods irrelevant for an item without inventory control. If an item is under inventory control, both the average and last costs will be updated when there are inventory changes, regardless of the costing method you have applied.</p> <p>Only if the field “Inventory Control” has been marked are you allowed to create an item group with the FIFO costing method. By the FIFO method (First In First Out) is meant that items are shipped from the inventory at the same price as at their receipt. The stock of any given item in a given warehouse is therefore divided into a number of item batches corresponding with the item receipts which form the stock of the warehouse. Each item batch is described by a quantity of items which is equivalent to their part of the total stock, a date of receipt, and the cost. Items are shipped from stock at the price of the oldest item batch in the warehouse in question. Each warehouse has its own FIFO queue. Thus, each item batch is identified by an item number, a warehouse, and an item batch number. Item batches are numbered consecutively for each combination of item and warehouse. For items with FIFO control, it is not sufficient to calculate the inventory value on the basis of stock times cost. It is thus necessary to calculate it on the basis of the</p>

Field	Description
	<p>total value of the individual batches. For each batch, this value is calculated from the batch's cost times the stock on hand at the warehouse in question.</p> <p>The control of the FIFO queue involves the cost of the items only and thus not physical item numbers. At shipment, the inventory value account will be credited the cost of the oldest receipt. However, there is no verification that the serial numbers shipped are the exact same numbers which were once entered at the particular cost.</p> <p>For items under inventory control, shipment from a single item line on an item with FIFO control can take place from different batches and thus at more than one cost at the same time. The value of the cost of sales is thus a total of the value of the batches, and it is this value which is credited the inventory value account. The cost of sales is calculated as follows:</p> $\text{cost of sales} = \text{number}_1 \times \text{cost}_1 + \dots + \text{number}_n \times \text{cost}_n$ <p>However, in the invoicing procedure, it is more beneficial to operate with only one cost per packing slip line.</p> <p>Therefore, an average cost of the items shipped from a given warehouse is calculated to be used on the item entry and for further invoicing. The average cost is calculated as follows:</p> $\text{cost}' = \frac{\text{number}_1 \times \text{cost}_1 + \dots + \text{number}_n \times \text{cost}_n}{\text{number}_1 + \dots + \text{number}_n}$ <p>As the amount calculated has been rounded to the nearest currency unit, a difference may occur between the cost of sales posted and the value registered on the packing slip line.</p> $\text{cost of sales}' = \text{number} \times \text{cost}'$ <p>The difference between cost of sales - cost of sales', is posted to:</p> <ol style="list-style-type: none"> <li>1. The inventory account for automatic write-ups and write-downs in connection with sales and the creation of packing slips,</li> <li>2. The inventory account for automatic write-ups and write-downs in connection with the production of bills of materials, or</li> <li>3. The inventory's manual offset accounts for receipts and shipments in connection with item carry-over.</li> </ol> <p>For items with FIFO control, it thus applies that the cost cannot be determined until at the time of shipment. In certain functions in Maconomy, the cost of an item is used without a concomitant shipment (for instance in the case of order lines in which the cost at the warehouse in question is used to calculate the sales price if no sales price list is used and if no sales price costing is used). These functions therefore require a selection as to a suitable cost. If the cost is used in connection with an expected shipment, the cost of the oldest item batch in the warehouse in</p>

Field	Description
	question is used. If the cost is to be used in connection with an expected receipt, the last cost should be used.
<b>Order Item</b>	In this field, you can specify whether the field "Order Item" should automatically be marked on new items created in the current item group. For further information on the functionality of order items, see the description of the field "Order Item."
<b>Sales Price Costing</b>	By marking this field, costs of items in this group will be calculated from sales prices, when they are sold on an order.  This facility can be used when you must use a vendor's suggested retail prices. The gross margin is thus determined by the discount you receive from the vendor.  You can change the value of this field for an existing item group, but the change will not affect items already assigned to the group. It will only be effective for new items assigned to the group after the change. You cannot change the value for existing items.
<b>GM % Sales Price</b>	Here you can enter the GM % if your company uses the Sales Price Costing for the items in this group. If the Sales Price Costing is not used, Maconomy uses that which is greater than zero of the GM % from this field or the "Markup % of Cost." Otherwise it uses zero.  You can change the value for an existing item group, but it will not affect items already assigned to the group. The change will only be effective for items assigned to the group after the change. You can change the GM % for items individually in the Item Information Card window.

### User Island

See the "Getting Started" topic for a description of the fields in the island User.

### Departments Sub-Tab

This section includes the fields and descriptions for the Departments Sub-Tab.

Field	Description
<b>Department</b>	Here you select a department in your company. The table part of the window is used for departmental posting references to the item group. If you mark the "Post per Item Group" field in the System Information window in the Set-Up module, Maconomy creates a line for every department. Then all you do is enter the posting references. If you later create a department, you must enter it in the table part manually.  Departments are maintained in the Posting References window in the G/L module.
<b>Sales, Taxable</b>	In this field, enter the number of the dimension combination containing a reference to the account on which you want Maconomy to post taxed sales from the item group. Sales are only posted per item group if you mark the "Post per Item Group" field in the System Information window in the Set-Up

Field	Description
	module. The dimension combination can also contain other dimension values to be used in this connection.
<b>Sales, Nontaxable</b>	In this field, enter the number of the dimension combination containing a reference to the account on which you want Maconomy to post item group sales without tax (that is, "blank" tax code). Sales are only posted per item group if you mark the "Post per Item Group" field in the System Information window in the Set-Up module. The dimension combination can also contain other dimension values to be used in this connection.
<b>Sales, Export</b>	In this field, enter the number of the dimension combination containing a reference to the account on which you want Maconomy to post item group export sales. Sales are only posted per item group if you mark the "Post per Item Group" field in the System Information window in the Set-Up module. The dimension combination can also contain other dimension values to be used in this connection.
<b>Cost of Sales</b>	In this field, enter the number of the dimension combination containing a reference to the account on which you want Maconomy to post item group cost of sales. Cost of sales are only posted per item group if you mark the "Post per Item Group" field in the System Information window in the Set-Up module. The dimension combination can also contain other dimension values to be used in this connection.

## Pricing Combinations Single Dialog Workspace

Use this workspace to create assorted item groups that Maconomy uses to calculate combination quantity discounts in the Quotes, Sales Orders, and Credit Orders workspaces.

Assign items to these groups using the **Pricing Combinations** field in the Item Information Card workspace.

When you select **Calculate Quantity Discount** in the Quotes, Sales Orders, or Credit Orders workspace, Maconomy recalculates the price of each item that is attached to a pricing combination. For each item line, Maconomy selects a price step that is based on the total number of items on the order that belong to the same pricing combination as the item on the given line.

Maconomy uses the assorted quantity discount as a supplement to quantity discounts, which are only given for items that have the same item number.

Maconomy does not recalculate prices of itemized bills of materials or on orders for which items have already been delivered.

## Pricing Combinations Tab

This section includes the fields and descriptions for the Pricing Combinations Tab.

### Pricing Combination Island

Field	Description
<b>Name</b>	Here you enter the name of the pricing combination. Maconomy verifies that the name is not used already. You can use the Find function to retrieve existing pricing combinations.  You cannot change the name of an existing group, but you can delete it if there are no items attached to it in the Item Information Card window.
<b>Description</b>	Here you enter a detailed description of the group.

### User Island

See the “Getting Started” topic for a description of the fields in the island User.

## Item Information Card Single Dialog Workspace

Use this workspace to maintain information about your company's individual warehouse items.

The Item Information Card tab contains general and account information about an item. After you enter data and press Return, Maconomy verifies the information. You can then create warehouse assignment lines in the Warehouses sub-tab, thus indicating that the item is related to these warehouses. You also specify delivery time, maximum stock, usual storage location, and so on, for each warehouse. You can only make entries for an item in a given warehouse for items that you assigned to the warehouse in question on a line in this workspace.

If you have Maconomy Bill of Materials, Maconomy operates with two kinds of items: Standard items and bills of materials (BOMs). Use the BOM field to specify whether an item is one or the other. BOM items have a supplementary information card in the BOM Information Card workspace.

If you specify a standard item, you can transfer the values for this standard to a new item. You maintain standard items in the System Information workspace of the Set-Up module.

For auditing purposes, it is recommended that you print and file the Item Information Card every time that you change it. To print the card, select the **Print This** action in the File menu.

You can only delete an item if all of the fields related to quantity in the item's warehouses contain zero, if there have been no item changes in the last year and the current year, and if you have not made any item discount agreements for the item.

If you have Maconomy Bill of Materials, and if the item is part of such a bill, you cannot delete the item. If you delete a warehouse assignment for an item in the Warehouses sub-tab, Maconomy deletes all of the information about item entries, item periods, item batches, and related vendors for the current warehouse assignment. When you print a historical inventory balance list, this information is thus not available for the deleted warehouse assignments, which results in the inventory balance list not showing the posted inventory value.

## Item Information Card Tab

This section includes the fields and descriptions for the Item Information Card Tab.

## Item Island

Field	Description
<b>Item No.</b>	<p>Here, you enter a new item number. This number is the sole and absolute identification of the item. There is no limit to how many characters you can type here, and you can mix letters and numbers. However, Maconomy standard printouts only include the first 16 characters. You cannot change the number of an existing item. Maconomy verifies that the number does not already exist.</p> <p>To retrieve an existing item, use the search functions in the Find menu.</p>
<b>Item Group</b>	<p>Here you select the group the item is in. The pop-up field shows existing item groups created in the Item Group Information Card. Various information from the item group is then transferred to the item information card. The item information that is managed at item group level, such as cost method, sales price costing and inventory control, cannot be changed at item level.</p> <p>You can change the item group of an existing item, but the information for the new item group is not transferred to the item information card. If you are posting per item group, which is determined in the System Information window in the Set-Up module, your sales of the item will be recorded to the new item group. Maconomy posts in accordance with the item group an item is assigned to at the time an order line is created.</p>
<b>Pricing Combination</b>	<p>Here, you can attach the item to a pricing combination. Pricing combinations are created in the Pricing Combinations window.</p> <p>Pricing combinations offer the option of giving your customers assorted quantity discounts in quotes and sales orders.</p>
<b>Item Type</b>	<p>Here, you select the item type. Item types are used for statistics.</p> <p>You define item types in the Popup Fields window in the Set-Up module.</p>
<b>Buyer</b>	<p>In this field, you can specify the name of the person typically responsible for buying the current item. You can enter any text. The information in this field is used when running item purchase selections, where you can set up criteria where the buyer information on each item determines whether the item in question is to be included in the selection.</p> <p>You can also specify a buyer on each line in the table part, thus indicating warehouse specific buyers. When you create an item purchase selection for a given warehouse, Maconomy checks the buyer on the line pertaining to the warehouse in question to see if it matches the selection criteria specified of the purchase selection. If no buyer has been specified on the line pertaining to the warehouse in question, the buyer in the card part is checked instead.</p> <p>Similarly, you can specify a buyer for the item group to which the current item is assigned, and the buyer of the item group will thus be checked against the selection criteria of a given item purchase selection if a buyer has been</p>

Field	Description
	specified neither on the relevant line in the table part of the item information card nor in the card part of the item information card. For further information on this process, see the description of the field “Buyer” in the window Item Purchase Orders in the Item Purchase module.
<b>Bill of Materials</b>	<p>Here, you specify whether the item is a BOM (Bill of Materials) or a standard item. If it is a BOM, you itemize its components in the Bill of Materials Information Card.</p> <p>You cannot change the value in this field once the item has been created.</p> <p>This field only applies to Maconomy Bill of Materials.</p>
<b>Duty Code</b>	<p>Here, you can use assign a duty code to the item. In the window Popup Fields in the Set-Up module, you can define the duty codes to be shown in this pop-up field.</p> <p>The duty code in this field will be transferred to the item purchase order line when you create an item purchase order with the current item. If the item is not purchased from the standard country in Maconomy, a duty will be calculated at item receipt. The duty is calculated, based on the duty rate of the duty code. The total duty will affect the inventory value, and a purchase transaction is automatically created for the vendor specified in the island “Tax Office” in the window System Information in the Set-Up module.</p>

### Description Island

Field	Description
<b>Description, Lang. 1</b>	<p>Here you enter a descriptive item text in the primary language of the system. The primary language is the one appearing on the first table line for the pop-up type “Languages” in the table part of the window Popup Fields.</p> <p>The text is used in the “Description” field on order lines, and in the “External Desc.” field, if the order is assigned to the primary language.</p> <p>The text you enter is furthermore created as an entry in the window Language Texts in the Set-Up module. It is then possible to assign translations of the item description in the languages used in Maconomy. This makes it possible, for example, to send an invoice to a German company with the item descriptions in German. In those cases where no translation of the item description has been made in the language used in a given context for instance on the printout of an order confirmation, Maconomy uses the description in this field instead. For more information about item descriptions in other languages, please see the description of the window Language Texts in the Set-Up module.</p>
<b>Description, Lang. 2</b>	<p>Here you enter the item text in the secondary language of the system. The secondary language is the one appearing on the second table line for the pop-up type “Languages” in the table part of the window Popup Fields in the Set-Up module.</p> <p>The text is used in foreign language external documents, such as quotes, orders and invoices where the text is transferred to the “External Desc.” field, if the quote, order, invoice, and so on, is assigned to the secondary language.</p>

Field	Description
	<p>If you enter a text here, a line will automatically be created in the window Language Texts, where the specified text is used as a translation into the secondary language of the system. Similarly, if a language text translation line is created for the item into the secondary language, the translation will appear in this field. Subsequent changes in either of the windows will cause the update to be reflected in the other window.</p> <p>The item text can be inserted in price lists using Maconomy's layout editing tools.</p>
<b>Description, Lang. 3</b>	<p>Here you enter the item text in the tertiary language in the system. The tertiary language is the one appearing on the third table line for the pop-up type "Languages" in the table part of the window Popup Fields.</p> <p>The text is used in foreign language external documents, such as quotes, orders and invoices where the text is transferred to the "External Desc." field, if the quote, order, invoice, and so on, is assigned to the tertiary language.</p> <p>If you enter a text here, a line will automatically be created in the window Language Texts, where the specified text is used as a translation into the tertiary language of the system. Similarly, if a language text translation line is created for the item into the tertiary language, the translation will appear in this field. Subsequent changes in either of the windows will cause the update to be reflected in the other window.</p> <p>The item text can be inserted in price lists using Maconomy's layout editing tools.</p>
<b>Internal Desc.</b>	<p>Here you can enter an internal item text. The text is printed on the picking list, and is suitable for internal messages to inventory employees. You can, for example, specify how the item is to be handled and packed. The text is not printed on external documents.</p>
<b>Extra Text 1-10</b>	<p>In these fields you can enter a supplementary text to describe the item. The text is transferred to the Sales Orders and Item Purchase modules, and you can use Maconomy's layout editing tools to insert them in order documents as well as price list printouts.</p>
<b>Picture File Reference</b>	<p>In this field, you can specify the path to an image file containing a picture of the current item. In the Maconomy Procurement Portal module, this picture will be displayed in the Item Home component and other item related components, provided that a placeholder for the picture is included in the component layout.</p> <p>The file reference must be specified as a valid URL, either as a full path specification starting with "http://" or relative to the web server. For instance, if you specify "/Images/Furniture/LSofa1.jpg," it means that the file is placed in the folder "Furniture" which is a subfolder to "Images," which again is a subfolder directly below the root level of the web server.</p>

**Costs Island**

Field	Description
<b>Costing Method</b>	<p>This field shows the costing method to be used for the calculation of the value of the item inventory.</p> <p>The value is retrieved from the item's Item Group Information Card, and it cannot be changed here.</p>
<b>Order Item</b>	<p>When the field "Order Item" is marked on the information card of an item, the field "Transfer Cost" in the window Sales Order to Item Purchase Orders in the Item Purchase module will automatically be marked on lines concerning the item in question. The purchase price of an order item on an item purchase order line created from a sales order line corresponds to the last cost price of the item in the warehouse in question. However, for an order item using sales price costing, the purchase price corresponds to the cost price calculated from the price on the sales order. On purchase order lines created from sales order lines containing an order item with sales price costing, the field "Keep Price" is automatically marked. Furthermore, the cost and the item description from the item purchase order will be transferred to the sales order line when the item is received.</p>
<b>Sales Price Costing</b>	<p>This field shows whether cost is calculated from sales price.</p> <p>The value is retrieved from the item's Item Group Information Card, and it cannot be changed here.</p>
<b>GM % Sales Price</b>	<p>Here you specify a gross margin percentage, if you use the Sales Price Costing. If the item is not assigned to Sales Price Costing, Maconomy uses whichever percentage from this field and the "Markup % of Cost" field is greater than 0, otherwise it uses 0.</p> <p>Maconomy automatically suggests the value specified in the item's Item Group Information Card, but you can select another.</p> <p>If an order line does not have a sales price, Maconomy suggests a sales price based on the following algorithm:</p> <p>Sales price = Cost / (100 - GM %) x 100.</p>
<b>Enterprise Currency</b>	<p>This field shows the enterprise currency of the system. The enterprise currency is specified in the field "Enterprise Currency" in the window System Information and cannot be changed in this field.</p>
<b>Total Inventory Value</b>	<p>This field shows the item's current inventory value. The field shows the sum of the inventory values of the individual warehouses in the table part, converted into enterprise currency.</p>

**Access Level Island**

Field	Description
<b>Name</b>	<p>Here you can enter the name of an access level. Users only have access to seeing information about the current item and referring to it in other windows if they have been assigned to this or a higher access level in the window User</p>

Field	Description
	<p>Access Levels in the Set-Up module. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to items may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section “Introduction to the Access Control System” in the Set-Up module.</p> <p>If you do not specify an access level, all users will have access to see information about the current item.</p>
<b>Description</b>	This field shows the description of the access level specified in the field above.

### Document Archive Island

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

### Template Note Island

Field	Description
<b>Template Note No.</b>	<p>In this field, you can specify the number of a note created in the window Notes in the Set-Up module. The field is used for adding a number of extra fields in which the user can enter information if the current item is a template item. A template item is an item where the generic item information is not specific enough, as certain details may change from order to order. An example of a template item is a business card where the basic information about the card such as the paper type and background color is static, but each time a batch of cards is ordered, the title, name and address to be printed on the card are different. It is therefore important that a number of additional fields are made available so that a user ordering a business card is allowed to enter this information. You may have many types of template items in your system, and most likely they do not all require the same additional information. Therefore Maconomy allows you to set up any item as a template item with any number of additional fields attached.</p> <p>A template item is created by assigning the item to a note where the headings in the table part represent the additional fields in which the user should enter specific information on the item ordered. Whenever someone orders an item on which a template note number has been specified, a copy of the note specified on the item is automatically created and assigned to the quote or order line in question. In the window Notes, the user can then enter the required information</p>

Field	Description
	<p>in the table part of the note assigned to the quote or order line. The information entered in the note will also appear on external order printouts.</p> <p>The following method is used for setting up additional fields for a template item:</p> <ul style="list-style-type: none"> <li>■ Create a note type with the headings to be used as field names.</li> <li>■ Create a note containing the headings to be used as field names.</li> <li>■ Set up items to use the fields set up in the above steps.</li> </ul> <p><b>Create a Note Type with the Headings to be used as Field Names</b></p> <p>In the window Note Types, create a note type. In the table part of the note type, create a line for each additional field required for the template item. In the field "Heading," specify the desired field name. In the field "Format," specify the data type of the field in question, thus ensuring that the correct type of data is always entered. See the description of the field "Format" in the table part of the window Note Types in the Set-Up module for further information.</p> <p><b>Create a Note Containing the Headings to be used as Field Names</b></p> <p>In the window Notes, create a note of the type you created earlier in the process. In the table part of this note, create a line for each of the headings in the note type. If you want the fields to contain default values, specify these values in the field "Value."</p> <p><b>Set up Items to use the Fields Defined in the above Steps</b></p> <p>In the window Item Information Card, enter the number of the note which you created in the previous step in the field "Template Note No." The fact that the item has a template note assigned to it is what identifies the item as a template item. This means that whenever someone orders an item on which a template note number has been specified, a copy of the note specified on the item is automatically created and assigned to the quote or order line representing the item. In the window Notes, the user can then enter the required information in the table part of the note assigned to the order line.</p> <p>You can assign the same note to any number of items, for instance if you have several items for different business card models, but they all require the user to enter the same type of information.</p>
<b>Description</b>	This field shows a description of the note specified in the field "Template Note No." above.

### Dimension Combination Island

Field	Description
<b>Dim. Comb. No.</b>	<p>In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the window Dimension Combinations.</p> <p>If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the current item. However, any dimension derivation values specified in this island will be used instead of those specified for the same dimensions in the dimension combination. This means</p>

Field	Description
	that the dimension combination only applies to the dimensions for which no value has been entered on the item information card.

### Derived Dimensions Island

Field	Description
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location if you want a value to be derived from the current item. If you also want the specified value to overwrite existing values for the dimension, complete the field "Overwrite." If you do not choose overwriting, the dimension value will only be derived if the dimension field for which derivation is taking place has neither been completed manually nor by entering a registration code.</p> <p>Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used rather than the value (if any) found for this dimension in the dimension combination in question. This means that the dimension combination only applies to this dimension if you have not entered a value in this field.</p> <p>Please note that if a dimension combination has been specified in the field "Dim. Comb. No.," a mark in the field "Overwrite" will only have effect if you have also entered a dimension value. If you mark the field "Overwrite" but you do not enter a dimension value in this field, the "Overwrite" field is ignored, as dimension values and overwriting specification are always retrieved together from the same dimension derivation island, dimension combination or dimension combination line.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L Module" as well as the description of the windows Dimension Derivations and Dimension Combinations in the G/L module for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

**Service Island**

Field	Description
<b>Return To</b>	Here you can enter the name of the customer or vendor to whom the item is to be returned after it has been serviced or repaired. The field is for reference, and you can enter an optional text, which can be used to search for the item in the database.
<b>Repairable</b>	You can mark this field if the item can be repaired in event of damage. The field is for reference and can be used to search for the item in the database.
<b>Obsolete</b>	You can mark this field if the item is obsolete. You can use it to assess whether or not the customer can return the item to you. The field is for reference and can be used to search for the item in the database.

**Extra Fields Island**

Field	Description
<b>Popup 1-5</b>	In these five fields, you can specify various information about the item. The values available in these pop-up fields are created in the pop-up type "Item Popup 1-5" in the window Popup Fields in the Set-Up module. The values in these fields are transferred to order lines, invoice lines, packing slip lines, and so on, where they can be used for specifying a status for the item on the transaction in question. The fields can also be used for grouping items.

**User Island**

See the "Getting Started" topic for a description of the fields in the island User.

**Remarks Island**

Here you can enter additional remarks.

**Warehouse Island**

Field	Description
<b>Discontinued</b>	Here you can specify whether the item is discontinued permanently or temporarily. Therefore you cannot sell more than the available item quantity in the warehouse (stock on hand) plus any purchase and production volumes minus any order and back order volumes. Once an item has been discontinued, you can no longer create sales order lines and invoice lines with the item in question in the Sales Orders module. If the item is only temporarily discontinued, you just remove the mark when item is back in stock.
<b>Item Status</b>	Here you can enter a status for the item. It is purely for reference and can be used in reports.

Field	Description
<b>Inventory Control</b>	<p>This field shows whether the item has inventory control. This is determined in the item's Item Group Information Card, and the value cannot be changed here.</p> <p>If the item has inventory control, you can specify storage locations, delivery time and other inventory-related data, which Maconomy automatically uses to update inventory fields, as shown in the table.</p> <p>If an item has inventory control, both the average and last costs will be updated when there are inventory changes, regardless of which costing method you have selected.</p> <p>If the item does not have inventory control, only limited information, such as preferred vendor and standard cost, can be entered for each warehouse in the table part.</p>
<b>Serial No. Control</b>	<p>Mark this field if you want to allow serial number registration of units of the current item. If you mark this field, it is possible to register serial numbers going into and out of the warehouses in the system and the units moved between different locations in the warehouses. Only items with inventory control can have serial number control.</p> <p>In the fields "Serial No. Reg. at Receipt," "Serial No. Reg. at Shipping," and "Complete Serial Number Registration," you can specify the strictness of the serial number registration by marking the situations in which the registration of serial numbers is mandatory.</p> <p>When items are received, you can enter the serial numbers in question in the window Serial Number Receipt in the Item Purchase module or in the window Serial Number Movement, depending on the type of registration causing the receipt. When items are leaving a warehouse, you can register the serial numbers in question in the window Serial Number Entry in the Sales Orders module or in the window Serial Number Movement, depending on the type of registration causing the shipment.</p>
<b>Serial No. Reg. at Receipt</b>	<p>If you mark this field, you specify that when units of the current item go into a warehouse, you must report the serial numbers of the units in question. Units can, for example, go into the warehouse as a result of item purchase order receipt or item movements. The serial numbers in question are specified in the window Serial Number Receipt or Serial Number Movement, depending on the type of transaction causing the movement.</p>
<b>Serial No. Reg. at Shipping</b>	<p>If you mark this field, you specify that when units of the current item leave a warehouse, you must report the serial numbers of the units in question. Units can, for example, leave the warehouse as a result of order delivery or item movements. The serial numbers in question are specified in the window Serial Number Entry or Serial Number Movement, depending on the type of transaction causing the movement.</p>
<b>Complete Serial No. Reg.</b>	<p>If you mark this field, you specify that when units of the current item leave or go into a warehouse, you must report the serial numbers of the units in question. Furthermore, when moving units of the item between locations in a warehouse, you must specify which units are moved. As this type of</p>

Field	Description
	<p>registration encompasses both serial number registration at shipping and at receipt, you must also mark the fields “Serial No. Reg. at Shipping” and “Serial No. Reg. at Receipt” when this field is marked.</p> <p>If you mark this field, it is also made mandatory that when performing inventory counts for the current item, the individual serial numbers at each location and their quantities must be counted. This means that it is not possible to just enter the total number of units of the items found at each location their serial numbers must be specified as well.</p>
<b>Primary Warehouse</b>	<p>In this field you can select the primary warehouse of a given item. The warehouses specified on the item lines in the table part of this window are independent of the warehouse in the card part of the window Sales Orders. The primary warehouse is used if the same item exists in several warehouses. The value of this field is blank by default and can only be changed to a warehouse to which the item has already been assigned.</p>

### Units Island

Field	Description
<b>Unit, Sales</b>	<p>You can maintain unit descriptions in the Popup Fields window in the Set-Up module.</p> <p>Note: You cannot select units corresponding to hours or days.</p>
<b>Minimum Sales Unit</b>	<p>Here you specify the item's minimum sales unit. A box of 12 pencils, for example, has “12” as minimum sales unit, if you only sell the pencils in boxes.</p>
<b>Pricing Unit, Sales</b>	<p>Here you enter how many item units are included in the unit price. This applies to sales price, cost, weight and volume. If the unit price covers all 12 pencils from the above example, the pricing unit is 12. You cannot change the value in this field once the item is created.</p>
<b>Unit, Purchase</b>	<p>Here you can enter the unit used when the item is purchased in the Item Purchase Orders window.</p> <p>Note: You cannot select units corresponding to hours or days.</p>
<b>Minimum Purchase Unit</b>	<p>Here you can enter the item's minimum purchase unit. It must be greater than 0.</p>
<b>Pricing Unit, Purchase</b>	<p>Here you can enter how many units of the item are included in the unit price of the item for purchases.</p>
<b>Sales/Purchase Unit</b>	<p>Here you can enter how many sales units are included in one purchase unit. If, for example, you buy a box of 12 pencils, which you sell individually, you enter 12 here. The value must be greater than 0. Maconomy alerts you if you enter a value different from 1 and the sales and purchase units are the same. The value must be 1 for items with serial number control. Maconomy</p>

Field	Description
	uses the item to inventory the items in the correct quantities. The field must be completed. If the value is changed, it has no effect on existing item purchase orders.
<b>Minimum Production Unit</b>	Here you can enter the item's minimum production unit. It must be greater than zero.
<b>Gross Weight</b>	Here you enter the item's gross weight per pricing unit. The weight unit is optional, but it must be the same for all items, since Maconomy uses the value here to total the weights of the order lines to find the total weight of an order. The total weight of an order is printed on the packing slip in the Sales Orders module. The packing slip shows the gross weight.
<b>Net Weight (kg.)</b>	Here you can enter the item's net weight per unit. The information is used by Intrastat. The value must be in kilos, since Intrastat assumes reports are made in this unit. The value here is not used in the Sales Orders and Item Purchase modules.
<b>Volume</b>	Here you enter the item volume per pricing unit. You can freely choose the unit of volume (defined in Popup Fields in the Set-Up module) but it must be the same for all items, as Maconomy uses the value to total the volumes of order lines in an order.

**Note Island**

Field	Description
<b>Note No.</b>	In this field, you can specify the number of a note relating to the current item for further specification. Notes are created and edited in the window Notes in the Set-Up module.
<b>Description</b>	This field shows a description of the note specified in the field "Note No." above.

**Sales Order Island**

Field	Description
<b>Tax Code</b>	<p>In this field, you can specify a tax code (that is, a tax percentage) for the current item. This tax is added to item orders for tax-paying customers. You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters window. When multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2" and, if enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p> <p>If your company applies national tax rates, Maconomy will transfer a tax code from the Tax Tables window in the G/L module. If the combination of item and state/ country has not been created in a tax table, the tax code in this field will be used.</p>

Field	Description
	<p>In the System Information window in the Set-Up module, you can specify whether national tax rates should be applied.</p> <p>Maconomy suggests the tax code from the Item Group Information Card of the item, but you can select a different tax code here. You can maintain tax codes in the Tax Codes window in the G/L module.</p> <p>If you leave the field blank, the item sale will be posted to an account for non-taxed sales.</p> <p>If you have Maconomy Bill of Materials and the item is part of a BOM, Maconomy will use the tax code from the BOM Information Card, not the tax code for the individual BOM part.</p>
<b>Item Tax Code</b>	<p>In this field, you can specify a company tax code created in the window Popup Fields. Maconomy uses this field to determine the tax code to be used in the calculation of tax for the current item as the reporting code is part of the criteria for the selection of a tax code in the window Tax Tables in the G/L module. The tax table selected for the responsible company in the window Company Information is used in the selection criteria. However, the tax code is only selected from a tax table if the field "Use Tax Tables" has been selected in the window System Information, and only if the responsible company has a tax table assigned to it. If no tax table is assigned to the responsible company, or if you use differentiated tax, and you do not use tax tables, Maconomy uses the tax code specified for the item. If you use neither tax tables nor differentiated tax, Maconomy uses the standard tax code specified in the window System Information in the Set-Up module.</p> <p>If you use tax tables, and the system parameter "Get on account tax code from tax table" is marked, the tax code to be transferred to on account invoices is found in a tax table. But instead of using the item tax code specified on an item, Maconomy uses the on account tax code in the field "On Account Tax Code" in the window System Information in the Set-Up module (along with various other information) to point out the relevant tax table line. If the system parameter "Get on account tax code from tax table" is not marked, the standard tax code specified in the window System Information is always used as the tax code on invoices on account. For further information about the information used to point out the correct tax code, see the description of the window Tax Tables in the G/L module.</p> <p>When posting entries, the reporting code is used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if extended tax reporting has been selected in the window System Information.</p>
<b>Markup % of Cost</b>	<p>Here you specify a gross margin percentage, if the item is not assigned to a price list. The sales price is then calculated from the cost in the relevant warehouse and a GM %. Maconomy selects whichever GM % from this field and the "GM % Sales Price" field is greater than 0, otherwise it uses 0.</p> <p>Maconomy automatically suggests the value in the item's Item Group Information Card, but you can change it. If an order line does not have a sales price, Maconomy suggests a sales price based on the following algorithm:</p>

Field	Description
	Sales price = Cost / (100 - GM %) x 100.
<b>New Item No.</b>	<p>Here you can enter the number of an existing item in Maconomy. It will be used if a given item has been discontinued and is being replaced by another item. Maconomy will issue an alert and show the item number here, if you try to create item lines with the discontinued item in the windows Quotes, Sales Orders and Invoices.</p> <p>You can also substitute a discontinued item with the item here to apply in all quote lines and all sales order lines that have not been processed in the Sales Orders module. This takes place in the Item Substitution window.</p>
<b>Activity No.</b>	<p>In this field, you can specify an activity number if you want an activity number to be derived from the item on quote, order, invoice, and credit memo lines in the Sales Orders module. If you specify an activity for the current item, the activity number will be transferred to the field "Activity No." when the item is specified on a line in a quote, order, and so on, assigned to a job. When the item is specified on a line belonging to a quote, order, and so on, which is not assigned to a job, the activity number is not transferred.</p> <p>You can only specify an activity for which the field "Item No." in the window Activities in the Job Cost module is blank.</p>
<b>Graded Quantity Discount</b>	<p>If you mark this field, Maconomy will calculate quantity discounts as a graded discount. By graded quantity discount is meant a discount which does not affect all items on an order line but only the quantity of items within the quantity range of each quantity discount. If you for instance grant a discount of 10% on 2-4 items and a 20% discount on 5-10 items, it means that an order for 8 items will be granted no discount on the first item, a 10% discount on the next 3 items, and 20% on the last four items.</p> <p>You cannot enter a pricing combination if graded quantity discount is to be calculated.</p>

### Print Control Island

Field	Description
<b>Statistics 1-4</b>	<p>In these fields you can specify a code for statistics purposes.</p> <p>When you make prints in the statistics windows, you can use the value here to select the item in a selection criteria specification.</p>
<b>Print on Price List</b>	<p>If you mark this field, the item will be shown on the printed price list in the Price Lists window. If the field is not marked, the printed price list will not show the item, regardless of whether the item is in the price list.</p>
<b>Bar Code Used</b>	<p>You can mark this field if your company uses a bar code for the item. It is purely for reference.</p>
<b>Bar Code</b>	<p>Here you can enter the item's bar code. It is for reference and can be used to print bar codes.</p>

**Statistics to Tax Authorities Island**

Field	Description
<b>Service</b>	This field is used for an item that is an immaterial, non-taxed service, which is not reported to the EU Sales List System or Intrastat. EU trade with these items is not included in Maconomy's EU statistics reports. Be aware that transport of goods, for example, is not a non-taxed service.
<b>Salary Preparation</b>	This field is used for processing services sold by your company. These items are reported to the EU Sales List System with a separate code.
<b>CN Code</b>	Here you enter the 8 or 10-digit item code from the EU Commission's Combined Nomenclature, called the CN or tariff code. The code is used by Intrastat to identify the item.  If you enter another item with the same CN code, Maconomy will suggest the value from the "Supplementary Unit," "Item Desc." and "Net Weight" fields from the other item.
<b>Supplementary Unit</b>	Here you enter the conversion factor between the item's sales unit (in the "Unit, Sale" field) and the supplementary unit given in the nomenclature. The value must express how many sales units make one supplementary unit. If, for example you sell the item in packages of 30, and the nomenclature has 1000 as supplementary unit, the conversion factor will be $1000/30 = 33.33$ .  If the nomenclature does not have a supplementary unit for the item, the conversion factor is 0.
<b>Item Desc.</b>	Here you enter the item's name, as given in the combined nomenclature. The text will be printed in reports to Intrastat.

## Warehouses Sub-Tab

This section includes the fields and descriptions for the Warehouses Sub-Tab.

Field	Description
<b>Warehouse</b>	Here you select to which warehouse the item is assigned. The pop-up field shows only existing warehouses, that is, warehouses created in the Warehouse Information Card. It is only possible to make registrations for an item on a given warehouse, for example, sales and item purchase orders and inventory changes, if the item has been assigned to the warehouse in question on a line in this window.
<b>Deliv. Time</b>	Here you specify the item's delivery time in days. This information is used in the Sales Orders module to inform a customer of an expected delivery date, if the item is temporarily out of stock. Maconomy then calculates a delivery date based on the delivery time and, if inventory profile is used for the item in the current warehouse, any purchases and productions making the item available within the delivery time.

Field	Description
<b>Inventory Profile</b>	<p>If you mark this field, Maconomy will use the inventory profile for sales, purchases and production of the item from this ware house. The field can only be completed for items with inventory control.</p> <p>An inventory profile is a listing of sales, purchase and production order volume, and thus predicts the expected future shipments and receipts of the item. If you mark this field, the inventory profile can be viewed in the “Inventory Profiles” window. Maconomy uses the profile and the item’s delivery time to calculate delivery dates and quantities. When items are reserved for sales and production, Maconomy calculates the earliest possible delivery date from the current stock, delivery time and the expected shipments and receipts. When you create purchase and production selections, Maconomy uses the same data to calculate the item quantity that precisely covers the preferred maximum stock, as well as the scheduled shipments.</p> <p>Using the actions in the Warehouse Information Card window, you can change the Inventory Profile status of all of items in a given warehouse simultaneously.</p>
<b>Purchase Control</b>	<p>Here you specify whether to apply Maconomy’s item purchase selection facility. Maconomy can automatically create item purchase selections based on the item’s reorder level and maximum inventory. The field can only be completed for items with inventory control.</p>
<b>Buyer</b>	<p>In this field, you can specify the name of the person typically responsible for buying the current item. You can enter any text. The information in this field is used when running item purchase selections, where you can set up criteria where the buyer information on each item determines whether the item in question is to be included in the selection.</p> <p>You can also specify a buyer on each line in the card part, thus indicating an item specific buyer. When you create an item purchase selection for a given warehouse, Maconomy checks the buyer on the line pertaining to the warehouse in question to see if it matches the selection criteria specified of the purchase selection. If no buyer has been specified on the line pertaining to the warehouse in question, the buyer in the card part is checked instead.</p> <p>Similarly, you can specify a buyer for the item group to which the current item is assigned, and the buyer of the item group will thus be checked against the selection criteria of a given item purchase selection if a buyer has been specified neither on the relevant line in the table part of the item information card nor in the card part of the item information card. For further information on this process, see the description of the field “Buyer” in the window Item Purchase Orders in the Item Purchase module.</p>
<b>Reorder Level</b>	<p>Here you specify the item’s reorder level, which is used to make automatic item purchase selections. The field can only be completed for items with inventory control. Maconomy suggests you purchase more of the item when the current inventory, less sales orders and back orders, added to item purchase orders, gives a sum that is equal to or less than the reorder level. The value is specified in units.</p> <p>You can also enter a negative figure here. If, for example, you do not wish to keep an item in stock, but only create an item purchase selection when the item</p>

Field	Description
	is ordered by a customer, you can enter the value of the negative minimum sales unit and the value "0" in the field "Max. Stock." When the item is entered in a sales order in the Sales Orders module, Maconomy will create an item purchase selection for as many units of the item as the customer has ordered.
<b>Max. Stock</b>	Here you specify the inventory's recommended maximum stock of the item. This value is used for calculating the quantity to order when making automatic item purchase selections. Maconomy suggests a restocking to this maximum level when the current stock, less sales orders and back orders, added to item purchase orders, gives a quantity that is less than or equal to the reorder level. Maconomy verifies that the maximum value is greater than the reorder level. The field can only be completed for items with inventory control.
<b>Seasonal Model No.</b>	In this field, you can enter a seasonal model if the item has purchase control and if you want the purchase requirement for the current item to the current warehouse to be dependent on the purchase date. When item purchase selections are created, Maconomy checks if there is a relevant need for purchase of the current item. During this verification process the item's reorder level and maximum stock will be regulated according to the percentages specified in the seasonal model. Maconomy uses the line in the seasonal model which is active at the time where the item can be delivered; that is the creation date of the item purchase selection plus the item's delivery time. Seasonal models are created in the window Seasonal Models in the Item Purchase module. The field can only be completed for items with inventory control.
<b>Rec. Purchase</b>	Here, the recommended purchase quantity of the item is shown. If the field has been filled in, the window Item Purchase Selection in the Item Purchases module will suggest the purchase of a whole number times the specified quantity. The field can only be completed for items with inventory control.
<b>Average Cost</b>	This is the average cost per item pricing unit in the current warehouse. For items with inventory control, Maconomy automatically updates this field by calculating a new average every time you receive units of the item at the current warehouse in the Item Purchase and Inventory modules. For items without inventory control, this field always corresponds to the field "Last Cost."
<b>Last Cost</b>	This is the last cost per item pricing unit in the current warehouse. For items with inventory control, Maconomy automatically updates the value, regardless of whether you receive items at the current warehouse in the Inventory Change window (Inventory module) or in the Item Receipt window (Item Purchase module). You cannot change the value manually.
<b>Standard Cost</b>	Here you can specify the standard cost per item pricing unit in the current warehouse. The field uses the base currency of the company to which the current warehouse is assigned. Until transactions (that is, inventory changes, receipts or shipments) have been made for the item in the warehouse in question, this standard cost is used when calculating prices on, for example, sales orders and invoices, regardless of the costing method used for the item. This allows you to enter a price to be used for

Field	Description
	<p>the first registrations until Maconomy can automatically calculate the average and last costs. Once transactions have been made for the item in the warehouse, Maconomy uses the relevant costs according to the costing method of the item when registrations are made.</p> <p>If the item is in stock, and if you use a standard costing method, you can only change the standard cost by adjusting costs in the window Inventory Change.</p>
<b>Inventory Value</b>	<p>This shows the item's current inventory value in the current warehouse. The amount is shown in the base currency of the company to which the current warehouse is assigned. If the costing method is "Standard," "Average" or "Last," Maconomy calculates the value as the current stock of the item at the current warehouse, multiplied by the item's current cost and divided by the pricing unit. If the item's costing method is FIFO, the value is calculated as the sum of the value of the item batches related to the warehouse. It is not possible to change the value in this field.</p>
<b>Vendor</b>	<p>Here you enter the number of the vendor who is the primary supplier of the item to the warehouse. Maconomy checks that the field "Blocked" has not been marked for the current vendor. If the vendor has not been created as a supplier of the current item to the current warehouse in the window Suppliers in the Item Purchase module, he will automatically be created as supplier.</p> <p>The vendor in this field will be used when creating item purchase selections for the current item to the current warehouse. If you want to register several suppliers for one item, this can be done in the window Suppliers. However, a vendor does not have to be registered as a supplier to be used when purchasing the item on item purchase orders.</p>
<b>Vendor Item No.</b>	<p>Here you enter the vendor's number for the item. This number is printed on item purchase orders in the Item Purchase module, instead of your own item number. This makes it easier for the vendor to identify the item. If you specify a vendor in the field "Vendor No." who has been created as a supplier of the current item for the current warehouse, Maconomy automatically transfers any vendor description entered in the window Suppliers.</p>
<b>Vendor Item Descr.</b>	<p>Here you enter the vendor's item text. This text is printed on item purchase orders in the Item Purchase module, in place of your own item text. If you specify a vendor in the field "Vendor No." who has been created as a supplier of the current item for the current warehouse, Maconomy automatically transfers any vendor description entered in the window Suppliers.</p>
<b>Stock on Hand</b>	<p>This field shows the current inventory in item units. You cannot change the value.</p>
<b>Quote</b>	<p>This field shows how many item units are under quote. Items under quote are not reserved in the warehouse. The value cannot be changed.</p>
<b>Sales Orders</b>	<p>This field shows the current volume of sales orders. The value cannot be changed. The value is calculated as the quantity of units ordered on order lines concerning the current combination of item and warehouse less the quantity delivered on the same lines.</p>

Field	Description
	<p>If you have Maconomy Bill of Materials, and if this item is a raw material, the order volume here will include the quantity of units reserved in the BOM Production window.</p> <p>If you use the back order register in the Sales Orders module, both order lines in the back order register and sales order lines are counted when Maconomy records order and back order quantities.</p>
<b>Available</b>	<p>This field shows how many item units are available in the warehouse.</p> <p>If your company uses the “By Packing” back order method, the available inventory is calculated as the current stock, less sales orders and back orders.</p> <p>If your company uses the “By Reservation” back order method, the available inventory is calculated as the current inventory, less sales orders. The available inventory cannot be negative. The value cannot be changed.</p>
<b>Back Orders</b>	<p>This field shows the current volume of back orders. The value cannot be changed. Your company can select one of two back order methods: “By Packing” and “By Reservation.” The two methods are described in detail in the chapter on Sales Orders, for the “Back Orders” field in the Sales Orders window.</p> <p>If you have Maconomy Bill of Materials, and if this item is a raw material, the back order volume here will include the quantity of units on back order in the BOM Production window.</p> <p>If you use the back order register in the Sales Orders module, you should note that both order lines in the back order register and sales order lines are counted when Maconomy records order and back order quantities.</p>
<b>Purchase Orders</b>	<p>This field shows how many item units are currently on order from the vendor. The value cannot be changed.</p>
<b>Production</b>	<p>This field shows how many units of the item are used in a production in the BOM production window. An item is used in production if it is a BOM part with inventory control that is in a production transaction for which raw materials are reserved.</p>
<b>Production Control</b>	<p>If the item is a BOM part and if you have Maconomy Bill of Materials, you can mark this field to show that the item has production control in this warehouse. If you mark the field, Maconomy will create a production selection for the item in the Production Selection window. This selection will be based on available inventory, reorder level and maximum inventory.</p>
<b>Std. Serial No., Purchase</b>	<p>If you have marked the system parameter “Extended Serial Number Control” and if the current item uses serial number control, you can enter a standard serial number for purchase in this field. The serial number must exist for the current item in the current warehouse. When creating a purchase line for the item, a serial number receipt line with the standard serial number and the ordered number is automatically created in the window Serial No. Receipt. When receipt of items is registered in the window Item Receipt, Maconomy checks if there is exactly one serial number line for the current receipt line and if</p>

Field	Description
	the numbers in the fields "Ordered" and "Received" on this serial number line correspond to the numbers in the corresponding fields on the current receipt line. If this is the case, the serial number line is automatically updated with the number registered as received in the window Item Receipt, and it is therefore not necessary to manually register serial number receipt for items using a standard serial number. If you do not enter a standard serial number, Maconomy does not automatically create serial number receipt lines.
<b>Std. Serial No., Sales</b>	If you have marked the system parameter "Extended Serial Number Control" and if the current item uses with serial number control, you can enter a standard serial number for sales in this field. The serial number must exist for the current item in the current warehouse. When creating an order line in the windows Sales Orders and Credit Orders, a serial number line is automatically created in the window Serial No. Entry with the standard serial number and the quantity specified for packing as well as crediting on the order line. When entering packing information in the window Packing Lists, Maconomy checks if there is exactly one serial number line for the current order line and if the number in the field "Units" on this serial number line corresponds to the number for packing on the current order line. If this is the case, the serial number line is automatically updated with the number registered as packed in the window Packing Lists, and it is therefore not necessary to manually register serial number receipt for items using a standard serial number.
<b>Std. Storage Loc.</b>	<p>In this field, you can specify where the current item is usually stored in the current warehouse after being received and checked.</p> <p>This field is used in the process of finding a target location when picking lists are created from warehouse transactions concerning the current combination of item and warehouse and no target location has been specified on a line. When picking lists are created from warehouse transactions concerning the current combination of item and warehouse and no target location has been specified on a line, this location is used as the target location on the resulting picking list line. If no standard storage location has been specified in this field, Maconomy attempts to find a target location through a procedure which is described in detail in the description of the action "Print Picking List."</p>
<b>Last Storage Loc.</b>	<p>This field shows the location to which the item was last moved in the current warehouse in connection with moving units of the item from one warehouse location to another. The field is automatically updated when closing a picking list for the current warehouse on which the current item is specified. This field thus shows the location to which the item was last moved on a picking list concerning the current warehouse. However, the location can be changed manually to indicate where the item should be moved to next time the current item is to be moved between locations in the warehouse in question.</p> <p>The last storage location is used in the process of finding a source location when picking lists are created from warehouse transactions concerning the current combination of item and warehouse and no target location has been specified on a line. For further information on this process, see the description of the action "Print Picking List."</p>

Field	Description
<b>Std. Picking Loc.</b>	<p>In this field, you can specify where the current item is usually picked in the current warehouse when it is moved to another location for instance to be packed and shipped at a shipping location.</p> <p>This field is used in the process of finding a source location when picking lists are created from warehouse transactions concerning the current combination of item and warehouse and no source location has been specified on a line. When picking lists are created from warehouse transactions concerning the current combination of item and warehouse and no source location has been specified on a line, this location is used as the picking location on the resulting picking list line. If no standard picking location has been specified in this field, Maconomy attempts to find a source location through a procedure which is described in detail in the description of the action "Print Picking List."</p>
<b>Last Picking Loc.</b>	<p>This field shows the location at which the item was last picked in the current warehouse in connection with moving units of the item from one warehouse location to another. The field is automatically updated when closing a picking list for the current warehouse on which the current item is specified. This field thus shows the location from which the item was last picked on a picking list concerning the current warehouse. However, the location can be changed manually to indicate where the item should be picked next time.</p> <p>The last picking location is used in the process of finding a source location when picking lists are created from warehouse transactions concerning the current combination of item and warehouse and no source location has been specified on a line. For further information on this process, see the description of the action "Print Picking List."</p>
<b>Last Receipt</b>	This is the date units of the current item were last received in the current warehouse. The date cannot be changed here.
<b>Last Shipment</b>	This is the date units of the current item were last shipped from the current warehouse. The date cannot be changed here.
<b>Last Inventory Count</b>	This is the date of the latest inventory count of the item in the current warehouse. The date cannot be changed here.
<b>Cost, Oldest Batch</b>	If the costing method for the item is FIFO, the cost of the oldest batch in the current inventory will be shown here.
<b>Company No.</b>	This field displays the number of the company to which the warehouse, in which the current item batches are located, is assigned.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

## Actions

This section shows the Actions available in the Item Information Card workspace.

### Top Tab

Field	Description
<b>Attach Document</b>	This action allows you to attach a document to the item.

## Bill of Materials Information Card Single Dialog Workspace

Use this workspace to create and change BOMs that you can then sell through the Sales Orders module, or use for further production in this module. The Bill of Materials Information Card tab displays the item number, item description, and other general information, such as inventory and price control details. The BOM Elements sub-tab displays how the BOM item parts are attached to the BOM.

A BOM is an item that you create in the Item Information Card with the **BOM** field selected, and to which you attach a number of BOM item parts in this workspace. A BOM item part can be either a single item or another BOM.

The item that the Bill of Materials Information Card tab displays is called the BOM header. You can itemize the BOM (that is, display its BOM item parts in full) in the Sales Orders module. This means that the BOM behaves as a standard item in the Sales Orders module. You can use this kind of BOM for production in this module's production system.

You can also specify whether BOM item parts are to be displayed on external order documents that you print in the Sales Orders module. If a BOM item part is being itemized, its item number is indented, and next to it Maconomy displays a number of dots that show the level that the item has in the BOM. Note, however, that Maconomy's standard printouts can only show up to three dots. Using Maconomy's layout editing tools, you can change the printouts to provide more room.

You can purchase a BOM that has inventory control through the Item Purchase module, just as for standard items. Maconomy handles the BOM as a standard item; you cannot see its composition in the Item Purchase module.

To create a BOM, use the Item Information Card workspace to create the BOM header, select the **Bill of Materials** check box, and create the BOM item parts as standard items. Use the Bill of Materials Information Card workspace to retrieve the BOM header, and use the BOM Elements sub-tab to attach the BOM items to the BOM header.

A BOM can have another BOM among its item parts. You can thus create BOMs in several layers.

The level concept that this manual uses works as follows: The highest level of a BOM (level 0) is the BOM header. The BOM item parts at level 1 are the items and BOM headers that are attached in the sub-tab to the BOM header in the tab. The BOM item parts at level 2 are the items and BOMs that are attached to the BOM header at level 1. The BOM items parts at level 3 are the items and BOMs attached to the BOM at level 2, and so on. You see all of the levels of a BOM in one workspace.

A BOM item part can be another BOM that is being itemized in the Sales Orders module. Such an item part behaves as a standard item in the Sales Orders module.

If a BOM only consists of a BOM header and item parts at one level, you can change its composition in the Order Lines workspace of the Sales Orders module in connection with a sale or crediting. You can enter and remove item parts; however, you cannot enter other BOMs to be itemized.

The structure of a BOM can look like the following figure:

You can, of course, have more than two different items on a level, and an item can appear in several different places in a BOM. The BOM can, in theory, have any number of levels. The examples in this chapter are limited to BOMs in three levels with two different items per level. Order handling is slower when you work with complex BOMs, unless the BOMs are not to be itemized at creation.

Price control, price ratio, and inventory control are central concepts to the handling of BOMs in Maconomy. You can apply price and inventory control at several levels. If you do, Maconomy uses the values of the highest level in each branch of the BOM. The highest level is primarily the top level, then level 1, level 2, and so on.

- Price Control** — Price control means that you have priced the item in a price list in Maconomy or that Maconomy calculates the sales price from cost and GM %, which are given in the item information card. The costs are specific to each warehouse, and the price of a given item can therefore vary from warehouse to warehouse. You can only apply discount agreements to a level that has price control.

It is important to note that price control at a specific level—and thus the BOM's pricing on orders—only takes effect when you enter the BOM in a sales order, credit order, or quote.

When you enter the BOM, Maconomy distributes the price to all of its BOM parts, and the price of the BOM header is the sum of the prices of its item parts. Maconomy fixes the price of the BOM according to the prices at the lowest level of each branch. Therefore, if you want to change the price of the BOM on an order, you must change it at this lowest level using the Order Lines workspace of the Sales Orders module.

- **Inventory Control** — When there is inventory control for a given level in a BOM, Maconomy reserves the items at this level during order processing, and the items are shipped from the warehouse at this level when you print a packing slip. The inventory volumes of BOM parts at lower levels are not affected. Maconomy updates item sales statistics at the highest level that has inventory control. These are updated with the current sales price, using a price list or a price ratio, and the cost at the relevant warehouse in the sub-tab of the item information card.  
If a BOM or a branch of a BOM does not have inventory control, Maconomy updates the item sales statistics at the lowest level.
- **Price Ratio %** — If a BOM is being itemized and is used in the Sales Orders module, you must enter a price ratio for the BOM parts. Maconomy uses the price ratio to distribute the price to the BOM parts when you enter the BOM in a sales order, credit order, or quote. Maconomy distributes the prices and then immediately afterwards calculates the total BOM price from the BOM parts.  
The price that Maconomy calculates for a level that has price control may be different from the price calculated from cost and GM %. This is because the price of a BOM level is always the sum of the levels beneath it, which in this situation Maconomy calculates from the price ratio. Prices are then rounded off, and will be inaccurate.
- **Delivery Dates** — Maconomy calculates delivery dates for BOM items using item information and integration with the workspaces in the Sales Orders module.

The following are a number of examples of price and inventory control at various levels. The examples use items for which a cost is entered for a given warehouse in the sub-tab of the item information cards, and it is assumed that in all cases, the entries pertain to that warehouse. If an item has price control, it produces the following sales prices:

Item Number:	Cost:	Sales Price, Price Control:
01	\$700	\$1000
11	\$200	\$200
12	\$700	\$900
21	\$100	\$150
22	\$500	\$600
31	\$300	\$400
32	\$250	\$300

The price ratio % is stated in the following examples. These are BOMs that are being itemized when used in the Sales Orders module, and for which BOM parts are being shown in order documents.

Note that cost and sales price for a level are not necessarily the sum of the cost or sales price at the lower level. The sales prices are either given in a price list or are found from cost and GM %. Tax is not included in the examples.

When this BOM is sold, you deliver and invoice one unit of item number 01. The BOM has price and inventory control at the highest level, which is why the BOM is priced and stocked as one unit (that is, as a standard item that has inventory control).

Maconomy determines the total sales price of the BOM by retrieving the price of the BOM at the highest level that has price control (here it is the BOM header 01, price \$1,000; price control at lower levels does not come into effect), allocating this price to the BOM parts and summing up the prices again. The \$1,000 is allocated in the following way:

- Item 11 receives a sales price of 20% of \$1,000 = \$200 (which is, incidentally, also its price on the price list).
- Item 12 receives a sales price of 80% of \$1,000 = \$800.
- Item 21 receives a sales price of 20% of \$800 = \$160.
- Item 22 receives a sales price of 80% of \$800 = \$640.
- Item 31 and 32 each receive a sales price of 50% of \$640 = \$320.
- Maconomy determines the total sales price of the BOM by summing up the items at the lower levels:
  - Item 22 consists of 31 and 32, coming to a sales price of \$320 + \$320 = \$640.
  - Item 12 consists of 21 and 22, coming to a sales price of \$160 + \$640 = \$800.
  - Item 01 consists of 11 and 12, and the sales price of the total BOM is therefore \$200 + \$800 = \$1,000.

Maconomy displays these amounts in the Order Lines workspace of the Sales Orders module. Note that Maconomy's functionality is described at length in this particular area. This is because you incur small variances due to the rounding of amounts, both for the price list price and the allocated price, as well as in the calculated price, which is the sum of the prices at the lower levels. Maconomy handles these variances by adding rounding lines to the BOMs, using the formula **Number of items x Item price - Discount = Line price** at all levels. The line price at one level is equal to the sum of the line prices at the level below it.

On the rounding line, Maconomy places a balance that is equal to the amount that causes the variance, and in this way, rounding lines compensate for an erroneous choice of price allocation percentages.

If you itemize the BOM, the rounding line is regarded as equal to the other items during the remainder of the order processing. In the **Round off, Item No.** field in the System Information workspace, you can specify the item number that Maconomy uses for rounding off amounts. If you want the rounding lines to be created automatically, the round-off item must be a BOM item part on the current BOM information card.

The warehouse shipment takes place at the highest level that has inventory control, that is, for item 01. The cost is the current cost of 01, which is \$700. Any inventory volumes for the other items are not affected.

The order confirmation shows a delivery date and a price of \$1,000 next to item number 01.

The packing list shows only item number 01, whereas the packing slip shows the delivery on one unit of item 01 and all of the BOM parts, because the BOM is itemized.

The invoice only shows a price for item 01. The BOM parts are shown with dots to indicate their respective levels.

The item journal shows inventory crediting of \$700. The invoice journal shows sales of \$1,000 and cost of sales of \$700. Maconomy updates sales statistics for item 01, which shows sales of \$1,000 and a gross margin of \$300.

As shown in the preceding illustration, you deliver and invoice one unit of item number 01. The BOM has price and inventory control at the lowest level in each branch, except for one BOM part (item number 31), which does not have inventory control.

Maconomy finds the total sales price by retrieving the price list prices of items 11, 21, 31, and 32 and sums these prices up through the BOM:

- Item 22 consists of 31 and 32, and the sales price is  $\$400 + \$300 = \$700$ .
- Item 12 consists of 21 and 22, and the sales price is  $\$150 + \$700 = \$850$ .
- Item 01 consists of 11 and 12, and the sales price of the total BOM is therefore  $\$200 + \$850 = \$1050$ .

Maconomy displays these amounts in the Order Lines workspace in the Sales Orders module.

The warehouse shipment takes place at the highest level that has inventory control, that is, for items 11, 21, and 32. The cost is the current cost of these items at the warehouse in question.

The order confirmation shows a delivery date and a price each for items 11, 21, 31, and 32. The prices are \$200, \$150, \$400, and \$300 respectively.

The packing list shows items 11, 21, and 32. You confirm packing in the Packing List Lines workspace of the Sales Orders module. The packing slip shows that one unit each of items 11, 21, 31, and 32 are being delivered.

The invoice shows the same prices as the order confirmation, that is, the prices of items 11, 21, 31, and 32, which give a total of \$1050 in the invoice total. Dots are printed next to the BOM parts to indicate their level in the BOM.

The item journal shows that the inventory is credited by the costs of items 11, 21, and 32, that is,  $\$200 + \$100 + \$250 = \$550$ . The invoice journal shows sales of \$1050 and cost of sales of \$850,

in that Maconomy adds the non-inventoried cost of \$300 of item 31 to the inventoried cost of sales of \$550. Maconomy updates statistics for items 11, 21, 31, and 32. These are:

- Item 11: Sales \$200, GM \$0.
- Item 21: Sales \$150, GM \$50.
- Item 31: Sales \$400, GM \$100.
- Item 32: Sales \$300, GM \$50.

As shown in the preceding illustration, you deliver and invoice one unit of item number 01. The BOM has price control at the highest level and inventory control at intermediate levels.

The total sales price is found in the same way as in the first example:

- Item 11 receives a sales price of 20% of \$1,000 = \$200.
- Item 12 receives a sales price of 80% of \$1,000 = \$800.
- Item 21 receives a sales price of 20% of \$800 = \$160.
- Item 22 receives a sales price of 80% of \$800 = \$640.
- Item 31 and 32 each receive a sales price of 50% of \$640 = \$320.
- Maconomy determines the total sales price of the BOM by summing up the prices of the lowest levels:
  - Item 22 consists of 31 and 32, and the sales price will be \$320 + \$320 = \$640.
  - Item 12 consists of 21 and 22, and the sales price will be \$160 + \$640 = \$800.

- Item 01 consists of 11 and 12, and the sales price of the BOM header is therefore  $\$200 + \$800 = \$1,000$ .

Maconomy displays these amounts in the Order Lines workspace of the Sales Orders module.

Warehouse shipment takes place at the highest level that has inventory control, which is items 11, 21, and 22. The cost is the current cost of these items at the warehouse in question.

The order confirmation shows a price of \$1,000 next to item number 01 and a delivery date for items 11, 21, and 22.

The packing list shows items 11, 21, and 22. Packing confirmation happens in the Packing List Lines workspace of the Sales Orders module. The packing slip shows one unit each of items 11, 21, 22, 31, and 32.

The invoice shows one price for item 01 (of \$1,000). Maconomy shows the BOM parts with dots, which indicate their level in the BOM.

The item journal shows that the inventory is credited with costs of items 11, 21, and 22, that is,  $\$200 + \$100 + \$500 = \$800$ . The invoice journal shows sales of \$1,000 and cost of sales of \$800. Maconomy updates statistics for items 11, 21, 31, and 32. These are:

- Item 11: Sales \$200, GM \$0.
- Item 21: Sales \$160, GM \$60.
- Item 22: Sales \$640, GM \$140.

Here you deliver and invoice one unit of item number 01. The BOM has price control and inventory control at different intermediate levels.

Maconomy finds the total sales price of the BOM by retrieving the price of the highest level with price control, (here it is items 11, 21, and 22), allocates these prices to the items at lower levels, and sums them up again. Since only item 22 is itself a BOM with BOM parts at lower levels, Maconomy allocates its price of \$600 as follows:

- Items 31 and 32 each receive a sales price of 50% of \$600 = \$300.

Maconomy then determines the total sales price of the BOM by summing up the lower levels:

- Item 22 consists of items 31 and 32, and the sales price is  $\$300 + \$300 = \$600$ .
- Item 12 consists of items 21 and 22, and the sales price is  $\$150 + \$600 = \$750$ .
- Item 01 consists of items 11 and 12, and the sales price of the total BOM is thus  $\$200 + \$750 = \$950$ .

Maconomy displays these amounts in the Order Lines workspace in the Sales Orders module.

Warehouse shipment happens at the highest level that has inventory control, that is, items 11 and 12. The cost is the current costs of these items in the warehouse in question.

The order confirmation shows a delivery date for items 11 and 12, as well as a price for items 11, 21, and 22. The prices are \$200, \$150, and \$600 respectively.

The packing list shows items 11 and 12. You confirm packing in the Packing List Lines workspace in the Sales Orders module. The packing slip shows one unit each of items 11, 12, 21, 22, 31, and 32.

The invoice shows the same price as the order confirmation, that is, prices for items 11, 21, and 22, and an invoice total of \$950. Maconomy prints the BOM parts with dots indicating their level in the BOM.

The item journal shows that the inventory is credited by the costs of items 11 and 12, that is,  $\$200 + \$700 = \$900$ . The invoice journal shows sales of \$950 and cost of sales of \$900. Maconomy updates the statistics for items 11 and 12. These are:

- Item 11: Sales \$200, GM \$0.
- Item 12: Sales \$750, GM \$50.

## Bill of Materials Information Card Tab

This section includes the fields and descriptions for the Bill of Materials Information Card Tab.

### Item Island

Field	Description
<b>Item No.</b>	This is the number of the BOM. The BOM header is created in the Item Information Card window and marked in the "BOM" field. The item number is unique. You can use the search functions in the Find menu to find a BOM.
<b>Description</b>	This is the BOM text, It is entered and can only be changed in the item information card. The text is shown as a supplement to the item number several places in Maconomy and also on order documents. The item text describes the BOM.

Field	Description
<b>Inventory Control</b>	<p>This shows whether there is inventory control at the highest level of the BOM. The mark cannot be changed here. It is determined for the item group the BOM is attached to in the item information card window.</p> <p>If this field is marked, Maconomy will apply the current cost of the BOM header. If it is not marked, the cost of the BOM is calculated from the costs of the BOM item parts.</p>
<b>Price Control</b>	<p>Here you can select price control for the highest level of the BOM. If this field is marked, Maconomy will either use the price of the BOM from a price list or calculate a price from its cost in the warehouse selected in the field "Warehouse," and the GM% of the item, which is entered in the item information card. Maconomy applies quantity discounts as well as item and customer discount agreements.</p> <p>Maconomy calculates the price of the BOM when it is entered in a sales order by first finding the price at the highest level with price control, then allocating these prices to the lower levels and then adding them up again. Once the BOM is entered in an order line, its price will always be calculated from the prices of its parts at the lowest levels. It means that after being entered in a sales order, a BOM only has price control at the lowest level of each branch. If this field is not marked, the BOM sales price is found by adding up the prices of its parts. When the parts are priced, Maconomy applies any relevant quantity discounts and discount agreements. Maconomy will not apply discount agreements that include the BOM header.</p> <p>You can change this field, but you cannot remove price control from a BOM if it is in a price list or is attached to a discount agreement.</p>
<b>Itemize when Creating</b>	<p>Here you can select whether to itemize the BOM when it is entered (that is, created) in an order line. If this field is marked, all the information about the BOM parts are kept in the Sales Orders module and you can see and change BOM part information in the Order Lines window.</p> <p>If this field is not marked, the BOM will be handled as a standard item during order processing. The Sales Orders module will not contain any information about the BOM parts. If the BOM is not itemized, the BOM header must have both inventory and price control.</p> <p>If you wish to work with BOM production, in which case you sell the finished item in the Sales Orders module as a standard item, and the composition of the finished item is not to be shown in order documents (for example, paint work) you should not mark this field.</p>

### Itemize Island

Field	Description
<b>Quote</b>	<p>Here you designate whether to show individual BOM parts when you print a quote. If this field is marked, the printout will show the BOM header and all the parts.</p> <p>If this field is not marked, the printout will only show the BOM header.</p>

Field	Description
	This field must be marked if the BOM does not have price control. The field cannot be marked if the BOM is not being itemized in the Sales Orders module.
<b>Order Confirmation</b>	<p>Here you designate whether to show individual BOM parts when you print an order confirmation. If this field is marked, the printout will show the BOM header and all the parts.</p> <p>If this field is not marked, the printout will only show the BOM header.</p> <p>This field cannot be marked if the BOM is not being itemized in the Sales Orders module.</p>
<b>Packing Slip</b>	<p>Here you specify whether to show individual BOM parts when you print a packing slip. If this field is marked, the printout will show the BOM header and all the parts.</p> <p>If this field is not marked, the printout will only show the BOM header. This is only possible if there is inventory control for the BOM header.</p> <p>This field cannot be marked if the BOM is not being itemized in the Sales Orders module.</p>
<b>Invoice</b>	<p>Here you specify whether to show individual BOM parts when you print an invoice. If this field is marked, the printout will show the BOM header and all the parts.</p> <p>If this field is not marked, the printout will only show the BOM header. This is only possible if there is price control for the BOM header.</p> <p>This field cannot be marked if the BOM is not being itemized in the Sales Orders module.</p>

**Cost Island**

Field	Description
<b>Control %</b>	<p>This is the sum of the percentages entered in the "Price Ratio %" field in the table. If the BOM is sold in the Sales Orders module, the control percentage must be 100%. This means that Maconomy can allocate a price to the BOM parts. This allocation takes place when the BOM is entered in an order line.</p> <p>If Maconomy attempts to allocate a price and the control percentage is not 100%, Maconomy alerts you of the error and the order processing cannot be completed until the control percentage is corrected.</p>
<b>Warehouse</b>	In this field, you can select the warehouse whose prices you want displayed in the window. If no warehouse is selected, or if not all of the BOM parts are assigned to the selected warehouse, all cost prices in both the card and table parts of the window are shown as 0. When you select a warehouse, Maconomy retrieves the cost prices from the relevant warehouse information line in the window Item Information Card, and the cost prices in the card and table parts are shown in the currency of the selected warehouse.
<b>Cost</b>	This is the sum of the costs of the BOM parts in the selected warehouse. The individual costs are shown in the "Cost" fields in the table part. The cost sum

Field	Description
	<p>includes the quantities of the BOM parts given in the “Quantity” fields in the table. The cost here is not necessarily the same as the BOM’s cost in the table part of the item information card, if the BOM has inventory control. It is then the BOM’s cost in the item information card which is used in order processing.</p> <p>If the BOM is used in production, the cost here will be the same as the cost of one unit of the finished item, provided costs are calculated from raw materials. This is determined in the BOM Production window.</p>
<b>Currency</b>	This field displays the currency in which the cost prices in both the card and table parts are shown. The currency corresponds to the base currency of the company to which the selected warehouse belongs.

### User Island

See the “Getting Started” topic for a description of the fields in the island User.

### BOM Elements Sub-Tab

This section includes the fields and descriptions for the BOM Elements Sub-Tab.

Field	Description
<b>Item No.</b>	<p>Here you specify which items the BOM is composed of. Items are created in the Item Information Card window. An item can appear several times in the same BOM and it can also be a BOM itself. There is no limit to how many levels a BOM can consist of.</p> <p>If you cannot remember the number of an item, you can use the search functions in the Find menu.</p>
<b>Quantity</b>	Here you enter how many units of the item are on this particular line in the BOM.
<b>Description</b>	This is the item text. It is retrieved from the Item Information Card window. It cannot be changed here.
<b>Extra Text</b>	Here you can specify an extra text to further describe the BOM part. This text is printed on order documents. If an item appears more than once in the BOM, and has different functions, you make the distinction here.
<b>Price Ratio %</b>	<p>Here you enter the percentage used to price the item in the Sales Orders module. When a BOM is being priced, Maconomy finds the price of the item on the highest level in the BOM with price control and allocates it to the items on levels beneath it using this percentage. The prices are then added up again to give the price of the BOM header.</p> <p>The price ratio percentage given in the “Price Ratio %” field applies to the total quantity of the item in the BOM. If the number here is 4, for example, the price ratio % for the item is 20, and the BOM is priced at \$1,000 in a price list, the BOM part line will be priced at \$200 in an order line, which gives a unit price of \$50, provided the item’s pricing unit is 1. If it is not, the unit price is calculated to give a line price of \$200.</p>

Field	Description
	The percentages here are totaled in the “Control %” field in the card part of the window. If the BOM is being itemized in the Sales Orders module, the sum must be exactly 100.
<b>Cost</b>	<p>This is the BOM part's cost value in the warehouse selected in the card part. The cost is retrieved from the table part of the item information card. If no warehouse is selected in the card part, or if not all of the BOM parts are assigned to the selected warehouse, all cost prices in both the card and table parts of the window are shown as 0.</p> <p>The cost in this field is multiplied by the number in the “Quantity” field and divided by the pricing unit of the BOM part. This will produce the BOM line's share of the cost in the “Cost” field in the card part of the window.</p>
<b>Bill of Materials</b>	This field shows whether the BOM part itself is a BOM. If this field is marked, it means the item is created as a BOM in the Item Information Card window. If this field is blank, the item is a standard item. You cannot change the value here.
<b>Inventory Control</b>	This field shows whether the BOM part has inventory control. The value is retrieved from the Item Information Card window. You cannot change the value here.
<b>Price Control</b>	This field shows whether the BOM part has price control. You cannot change the value here. All standard items have price control. If the item is a BOM, you can assign price control in the item's own BOM Information Card.

## Copy BOM Single Dialog Workspace

Use this workspace to create a BOM from an existing BOM.

The new BOM has the same parts as the existing one. When you copy a BOM, you specify the item number and item description for the new BOM, and you assign it to an item group.

Maconomy creates the item that forms the new BOM header during the BOM copying, whereas the BOM parts exist already.

When you copy a BOM in this workspace, much of the information from the original BOM header is carried over to the new one. Maconomy transfers information from the Units, Sales Order, Service, Print Control, and Statistics to Tax Authorities islands in the item information card, and additional information from the Inventory, Description, and Cost islands. Maconomy also retrieves price control and BOM itemization information from the BOM information card.

After you make the copy, you can change the information and the component parts of the new BOM in the Item Information Card and BOM Information Card workspaces. You must create inventory and price information on the new BOM.

To help you verify that you are copying the correct BOM, the sub-tab shows the existing item parts.

## Copy BOM Tab

This section includes the fields and descriptions for the Copy BOM Tab.

## Existing BOM Island

Field	Description
<b>Item No.</b>	This field shows the item number of the existing BOM. To retrieve a BOM, you can use the search functions in the Find menu.
<b>Description</b>	This is the item text from the “Description Lang. 1” field in the item information card of the existing BOM. The text cannot be changed here.
<b>Item Group</b>	This is the name of the item group to which the existing BOM belongs. It cannot be changed here.

## New BOM Island

Field	Description
<b>Item No.</b>	This field shows the item number of the existing BOM. To retrieve a BOM, you can use the search functions in the Find menu.
<b>Description, Lang. 1</b>	Here you enter a descriptive item text. Maconomy suggests the text from the “Description Lang. 1” field in the item information card of the existing BOM, but you can change it. The text appears in various of Maconomy's windows and printouts, where it is shown next to the item number. The text can be changed again in the Item Information Card.
<b>Description, Lang. 2</b>	This field functions in the same way as the “Description Lang. 1” field and applies to the item text language 2.
<b>Description, Lang. 3</b>	This field functions in the same way as the “Description Lang. 1” field and applies to the item text language 3.
<b>Internal Desc.</b>	Here you can enter an internal item text. Maconomy suggests the text from the “Internal Desc.” field in the item information card of the existing BOM. The text can be changed again in the Item Information Card.
<b>Item Group</b>	Here you assign the new BOM to an item group. All item group related information is then transferred to the item information card. Maconomy suggests the item group assigned to the existing BOM.
<b>Copy Language Texts</b>	Select this option to copy the item texts in language 4+ defined in the window language Texts to the new BOM. The item text in language 1-3 is defined by the fields Description, Lang. 1-3 so they will not be affected by this field.

## BOM Elements Sub-Tab

This section includes the fields and descriptions for the BOM Elements Sub-Tab.

Field	Description
<b>Item No.</b>	This field shows the item numbers of the component parts of the existing BOM. The information cannot be changed here. You can change the components of the BOM in the BOM Information Card.
<b>Quantity</b>	This shows how many units of the item are included on this BOM line. The information cannot be changed here, but it is copied to the new BOM Information card, where you can enter and delete parts.
<b>Description</b>	This is the item text specified in the Item Information Card window. It cannot be changed here.
<b>Extra Text</b>	This field shows any extra text assigned to the item. The text was assigned in the BOM Information Card window. It is printed on various order documents. The text is transferred to the new BOM Information Card, where it can be changed.
<b>Bill of Materials</b>	This field shows whether the item is a BOM. If this field is marked, it means the item is created as a BOM in the Item Information Card window. If this field is blank, the item is a standard item. You cannot change the value here.

## Serial Number Information Single Dialog Workspace

Use this workspace to enter or read information about a particular unit of an item that has serial number control.

The tab shows which item is assigned to the specific serial number. In the selection criteria fields you can determine which serial numbers to view in the sub-tab. The sub-tab shows the serial numbers of a particular item, and you can add or delete serial numbers. You can also read purchase and sales order information, which Maconomy updates. One line in the sub-tab represents one serial number/article of the item in the tab. A serial number/article can either be a single unit of the item or several units of the item, for example, 100 meters of cable in a cable drum.

You set up serial number control in the Item Information Card workspace. This workspace only shows items that have serial number control. You must enter serial numbers in this workspace before you can use an item that has serial number control in order processing.

You create serial numbers manually by entering them in the sub-tab. When you receive items that have serial number control in the Item Purchase module or by means of a manual inventory change of the type **Receipt**, you can enter their serial numbers. Maconomy then records them automatically in this workspace, and you can use them in order processing.

If an item has serial number control, Maconomy prints its serial number on the packing slips that you print in the Sales Orders module when the item is sold.

You can only delete serial numbers here if their current stock on hand is 0.

## Serial Number Information Tab

This section includes the fields and descriptions for the Serial Number Information Tab.

## Item Island

Field	Description
<b>Item No.</b>	<p>This is the number of the item. You can only see items marked for serial number control in the "Serial No. Control" field in the item information card.</p> <p>Next to the item number is the text entered in the "Description Lang. 1" field in the item information card. Item number and text cannot be changed here.</p>

## Selection Criteria Island

Field	Description
<b>No. of Serial Nos. In Stock</b>	<p>This field shows how many serial numbered articles of the item, of those shown in the table, are currently in stock. A serial number is in stock if there is a value greater than 0 in the field "Stock on Hand" in the table.</p> <p>If you receive a serial number in the Item Purchase module, it will be added to the quantity in the field "Stock on Hand." When you sell a serial numbered article in the Sales Orders module, the quantity sold will similarly be deducted.</p> <p>Maconomy does not automatically verify that the number of serial numbers in stock is the same as the quantity of the item in stock. The item volume can be seen in the Item Information window.</p> <p>If you wish to balance the item volume with serial number volume, compare the "Volume" field in the Item Information window with the quantity here. You select the relevant warehouse in the "Warehouse" field.</p>
<b>Show Only Ser. Nos. in Stock</b>	<p>If you mark this field, the table will only show serial numbers currently in your inventory. A serial number is in stock when there is a value greater than zero in the field "Stock on Hand" in the table.</p>
<b>Warehouse</b>	<p>Here you select the warehouse of the serial numbers you wish to see in the table. A serial number is placed in the warehouse selected in the "Warehouse" field in the serial number line. A serial number can be assigned to a warehouse without being available, that is, that the value in the field "Stock on Hand" is not more than zero.</p> <p>The pop-up field shows existing warehouses created in the Warehouse Information Card window.</p>
<b>Serial No.</b>	<p>Here you can enter a range of serial numbers. The table will only show articles within this range that have serial number control. They are sorted by serial number.</p> <p>If you do not complete this field, it will not influence the selection criteria.</p>
<b>Alternative Serial No.</b>	<p>Here you can enter a range of alternative serial numbers. The table will only show articles with an alternative serial number within this range. You can use an alternative serial number if the wrong serial number was entered for an</p>

Field	Description
	<p>article received in the Item Purchase module. You can then use the correct serial number as alternative serial number.</p> <p>If you do not complete this field, it will not influence the selection criteria.</p>
<b>Date Received</b>	<p>Here you enter a range of dates. The table will only show serial numbers received within this period.</p> <p>If you do not complete this field, it will not influence the selection criteria.</p> <p>You can enter the date a serial number is received when you enter the serial number manually in this window. When a serial number is received in the Item Purchase module, Maconomy automatically inserts the date.</p>
<b>Delivery Date</b>	<p>Here you enter a range of dates. The table will only show serial numbers delivered to a customer within this period.</p> <p>If you do not complete this field, it will not influence the selection criteria.</p> <p>You can enter the date a serial number is delivered when you enter the serial number manually in this window. When a serial number is delivered from Sales Orders module, Maconomy automatically inserts the date.</p>
<b>Production Date</b>	<p>In these fields, you can enter a range of production dates. The table part will only show serial numbers with a production date within the stated range.</p>
<b>Sell-by Date</b>	<p>In these fields, you can enter a range of sell-by dates. The table part will only show serial numbers with a sell-by date within the specified range.</p>
<b>Expiry Date</b>	<p>In these fields, you can enter a range of expiry dates. The table part will only show serial numbers with an expiry date within the specified range.</p>

## Serial Number Information Sub-Tab

This section includes the fields and descriptions for the Serial Number Information Sub-Tab.

Field	Description
<b>Serial No.</b>	<p>Here you can enter the serial number. Serial numbers must be unique, so Maconomy verifies that the serial number is not entered for another item number.</p> <p>You can only enter a serial number when entering an article of an item. Once the article has been created here or in the Item Purchase module, the serial number cannot be changed. Serial numbers are also created when approving a picking or packing list on which a hitherto unknown serial number is specified.</p> <p>The articles are sorted by serial number. The serial number is printed on packing slips in the Sales Orders module when it is being delivered.</p>
<b>Alt. Serial No.</b>	<p>Here you can enter an alternative serial number. You can use the field if the wrong serial number was entered when the article was delivered. If you try to deliver the same number again, Maconomy will alert you that the serial number has been delivered in a given order.</p>

Field	Description
	<p>You should then trace the serial number that was actually delivered but not reported as such. This serial number can now be entered as alternative serial number for the article that was reported then and that you are trying to deliver now, and vice versa. The two serial numbers will now refer to each other.</p> <p>The serial number of the article that was actually delivered will now be reported in the new sales order. When you later look up the two serial numbers will have a cross reference, and thus reflect the correct life cycles of the articles.</p>
<b>Warehouse</b>	<p>This field shows the warehouse in which the serial number is located. If the serial number is recorded via an item purchase order in the Item Purchase module, Maconomy enters the warehouse automatically.</p> <p>You can select a warehouse in this field when you create a serial number manually. If you wish to move a serial number to another warehouse, you must record the movements in the window Inventory Change.</p> <p>If you deliver a serial number from the Sales Orders module, which is recorded in a warehouse different from the one on the sales order, Maconomy issues an alert.</p>
<b>Std. Storage Loc.</b>	<p>In this field, you can specify where the current serial number is usually stored in the current warehouse after being received and checked.</p> <p>This field is used in the process of finding a target location when picking lists are created from warehouse transactions concerning the current combination of item, serial number, and warehouse and no target location has been specified on a line. In such cases, this location is used as the target location on the resulting picking list line. If no standard storage location has been specified in this field, Maconomy attempts to find a target location through a procedure which is described in detail in the description of the action "Print Picking List."</p>
<b>Std. Picking Loc.</b>	<p>In this field, you can specify where the current serial number is usually picked in the current warehouse when it is moved to another location for instance to be packed and shipped at a shipping location.</p> <p>This field is used in the process of finding a source location when picking lists are created from warehouse transactions concerning the current combination of item, serial number, and warehouse and no source location has been specified on a line. In such cases, this location is used as the picking location on the resulting picking list line. If no standard picking location has been specified in this field, Maconomy attempts to find a source location through a procedure which is described in detail in the description of the action "Print Picking List."</p>
<b>Stock on Hand</b>	<p>This field shows how much of the article with the serial number is currently in stock. The quantity cannot be changed manually. When you sell from the Sales Orders module, Maconomy automatically deducts the quantity sold. When a serial number is created in the Item Purchase module, Maconomy automatically adds the quantity.</p> <p>Maconomy does not automatically verify that the actual quantity in stock of the serial number is the same as the physical stock of the serial number in the current warehouse shown in the window Item Information.</p>

Field	Description
	For items that do not use full serial number registration, the stock on hand cannot be negative. If a quantity greater than the stock on hand is specified in a serial number movement, the stock is written down to zero, as this is an indication that you are simply shipping serial numbers that were not registered at receipt. For items that use full serial number registration, entering a serial number movement with a quantity greater than the stock on hand will result in a negative stock on hand, as it is assumed that you are shipping items that have arrived but have not yet been registered in your system.
<b>Sales Orders</b>	This field shows the order volume in number of units of the current serial number. The order volume corresponds to the quantity specified on serial number entry lines that have not yet been delivered. The value cannot be changed in this field.
<b>Item Purchase Order No.</b>	This is the number of the item purchase order in the Item Purchase module that the serial number was purchased in. The information is used to trace the life cycle of the serial number.  If the serial number has been recorded manually, you can enter an optional item purchase order number. If you do not enter a number, Maconomy inserts a zero. You cannot change the number here once the serial number has been created.
<b>Trans. No.</b>	This is the number of the item transaction that was created when the serial number was recorded in the Item Purchase module. The number is used to trace the life cycle of the serial number. You can view and print the item transaction in the Inventory Change window.  If the serial number has been recorded manually in this window, you can enter an optional transaction number. If you do not enter a number, Maconomy inserts a zero.  You cannot change the number here once the serial number has been created.
<b>Trans. Type</b>	This is the transaction type of the item transaction that was created when the serial number was recorded in the Item Purchase module. The transaction type will be derived from the movement voucher that has the same transaction number as the one in the field "Trans. No."
<b>Vendor</b>	This is the number of the vendor who delivered the serial number via an item purchase order you have made in the Item Purchase module. The number is used to trace the life cycle of the serial number.  If the serial number has been recorded manually, you can enter an optional vendor number.  You cannot change the number here once the serial number has been created.
<b>Date Received</b>	This is the date the serial number was received. Maconomy automatically inserts the date you approve the item receipt in the Item Purchase module. The date is used to trace the life cycle of the serial number.  If the serial number has been recorded manually in this window, you can enter an optional date.  You cannot change the date here once the serial number has been created.

Field	Description
<b>Order No.</b>	<p>This is the number of the latest sales order in the Sales Orders module on which the serial number was sold. The information is used to trace the life cycle of the serial number. If the serial number consists of several units, which are delivered on several orders, Maconomy shows the order number for the last delivery.</p> <p>If the serial number has been recorded manually, you can enter an optional sales order number. If you do not enter a number, Maconomy inserts a zero.</p> <p>When the item is sold from the Sales Orders module, Maconomy verifies that there is a sufficient quantity in the "In Stock" field.</p> <p>You cannot change the number here once the serial number has been created.</p>
<b>Packing Slip No.</b>	<p>This is the number of the latest packing slip in the Sales Orders module on which the serial number was delivered. The information is used to trace the life cycle of the serial number. If the serial number consists of several units delivered in several packing slips, Maconomy shows the packing slip number for the last delivery.</p> <p>If the serial number has been recorded manually, you can enter an optional packing slip number. If you do not enter a number, Maconomy inserts a zero.</p> <p>You cannot change the number here once the serial number has been created.</p>
<b>Customer No.</b>	<p>This is the number of the ship-to customer to whom the serial numbered item was delivered in a sales order in the Sales Orders module. The information is used to trace the life cycle of the serial number. If the serial number consists of several units which are delivered to several customers, Maconomy shows the last customer to whom delivery was made.</p> <p>If the serial number has been recorded manually, you can enter an optional customer number.</p> <p>You cannot change the number here once the serial number has been created.</p>
<b>Bill to Customer</b>	<p>This is the number of the latest bill-to customer to whom the serial numbered item was sold on a sales order in the Sales Orders module. The information is used to trace the life cycle of the serial number. If the serial number consists of several units delivered on orders with different bill-to customers, Maconomy shows the last bill-to customer to whom delivery was made.</p> <p>If the serial number has been recorded manually, you can enter an optional customer number.</p> <p>You cannot change the number here once the serial number has been created.</p>
<b>Delivery Date</b>	<p>This is the date on which the serial numbered item was delivered to a customer. Maconomy automatically inserts the date the packing list with the item was approved in the Sales Orders module. The information is used to trace the life cycle of the serial number. If the serial number consists of several units delivered on different dates, Maconomy shows the last delivery date.</p> <p>If the serial number has been recorded manually, you can enter an optional date.</p>

Field	Description
<b>Production Date</b>	In this field, you can enter the production date of the current serial number. If the serial number has been created on the basis of an item receipt or an inventory change, the production date is transferred from the current serial number receipt line or serial number movement line, and if the same serial number has been received on several receipts, the production date for the latest receipt is displayed. However, the date is for information only and can be changed in this field.
<b>Sell-by Date</b>	In this field, you can enter the sell-by date of the current serial number. If the serial number has been created on the basis of an item receipt or an inventory change, the sell-by date is transferred from the current serial number receipt line or serial number movement line, and if the same serial number has been received on several receipts, the sell-by date for the latest receipt is displayed. The date is for information only and can be changed in this field.
<b>Expiry Date</b>	In this field, you can enter the expiry date of the current serial number. If the serial number has been created on the basis of an item receipt or an inventory change, the expiry date is transferred from the current serial number receipt line or serial number movement line, and if the same serial number has been received on several receipts, the expiry date for the latest receipt is displayed. The date is for information only and can be changed in this field.
<b>Serial No. Text 1-5</b>	In this field, you can enter various information related to the current serial number. If the serial number has been created on the basis of an item receipt or an inventory change, the information is transferred from the current serial number receipt line or serial number movement line, and if the same serial number has been received on several receipts, the information related to the latest receipt is displayed. The content of these fields is for information only and can be changed here.
<b>Cost</b>	This field displays the serial number's cost price in the base currency of the warehouse. If the base currency of the warehouse is different from the base currency of the company at item receipt or item movement, the cost price will be converted into the base currency of the warehouse. If the serial number has been created on the basis of an item receipt in the window Item Receipt, the cost price in this field will correspond to the purchase price on the item receipt. If the serial number has been created on the basis of an inventory change in the window Inventory Change, the cost price in this field will correspond to the cost price specified on the inventory change. Furthermore, the cost price is displayed on serial number entry lines in connection with sales of the serial number. In this way, it is possible to make statistics on losses and gains on the various serial numbers. However, the field has no importance in connection with account posting, as Maconomy uses the cost price at the relevant warehouse from the current item's information card for calculation of cost of sales when selling the serial number. Thus, this field is used for information purposes only.
<b>Currency</b>	This field displays the currency used as standard currency in the company specified in the field "Company No." on the warehouse information card of the current serial number's warehouse. See the description of the cost price of FIFO items in the table part of the window Item Information Card.

## Import Serial Numbers Single Dialog Workspace

Use this workspace to import serial number information for an item receipt in the Item Purchase module or for serial number reporting in the Sales Orders module.

The serial number information must be in a tab-separated file and comply with a fixed format, as described in the Import File Island.

You can create your import file using a bar code reader. When, for example, you are making packing and serial number reports in the Sales Orders module, you can collect serial numbers and item numbers using the bar code reader and then import the information into Maconomy in this workspace.

Enter the name of the import file and your purpose for using it. When you click **OK**, Maconomy imports the data from the file. Maconomy informs you of how the import went in a text file that it places in the same folder as the Maconomy program. The name of this report file is **Serial Numbers.<date>**, where **<date>** is the date of the import. You can use a word processing program to read the text file.

If errors occur during the import, Maconomy stops the import process and does not import any data. Maconomy runs through the entire file and reports any errors. Errors occur if the import file contains sales order/item purchase order numbers or item numbers that are not present in Maconomy.

### Import Serial Numbers Tab

This section includes the fields and descriptions for the Import Serial Numbers Tab.

#### Import Island

Field	Description
<b>Type</b>	<p>Here you select which purpose you are importing serial numbers for: "Purchase" or "Sales."</p> <p>If you select "Purchase," the information will be used for receiving serial numbers in the Item Purchase module. The imported numbers will be shown in the Serial Number Receipt window. The import file must not contain serial numbers already used in Maconomy. After importing the serial numbers you can receive them in the Item Receipt window.</p> <p>If you select "Sales," the information will be used for delivering serial numbers in the Sales Orders module. The imported numbers will be shown in the Serial Number Entry window. After importing the serial numbers you can create packing reports and deliver the numbers in the Packing Lists window.</p>

#### Import file Island

Field	Description
<b>Name</b>	<p>Here you enter the name of the file containing the serial number information. If you do not specify a path here or if the specified path is invalid, Maconomy shows a dialog where you can select the relevant file.</p>

Field	Description
	<p>The import file must be a tab-separated ASCII file, structured as shown below. You can create tab-separated files by saving data in text format in a word processing program or a spreadsheet.</p> <p>As shown in the example below, you must enter a tab to separate one field from another. This means that if you do not want to enter a value in a given field, you simply enter an extra tab. The import file must contain a tab for each field skipped on a line. When you import serial number information of the type "Purchase," each line must therefore contain a total of 8 tabs and end with a carriage return.</p> <p><b>Importing Serial Number Information of the Type "Purchase."</b></p> <p>If you import serial number information for the Item Purchase module, (that is, you have selected "Purchase" in the pop-up field "Type"), the import file must contain one or several blocks structured as follows:</p> <p>Header:                   Item Purchase Order No. (Return)</p> <p>Line:                    Item No. (Tab) Serial No. (Tab) Production Date (Tab) Sell-by Date (Tab) Expiry Date (Tab) Serial No. Text 1 (Tab)... Serial No. Text 1 (Return)</p> <p>Footer:                 **** (Return)</p> <p>Each block contains one header, one or several lines, and one footer. An example of this is shown below:</p> <pre> 26106      (Return) 2234      (Tab)      2001A300      (Tab)      09.04.9      (Tab*6      (Return)               1              9              ) 2234      (Tab)      2001A300      (Tab*2      09.07.0      (Tab*5      (Return)               2              )              0              ) 2236      (Tab)      A4201      (Tab*3      09.08.0      (Tab*4      (Return)               )              0              ) ****      (Return) 2611      (Return) 0 5101      (Tab)      32004      (Tab*4      X-43      (Tab*3      (Return)               )              ) 2236      (Tab)      A3202      (Tab*5      Obsol.      (Tab*2      (Return)               )              ) ****      (Return) </pre> <p>This example will look like the figure below when entered manually in a spreadsheet:</p>

Field	Description
26106	
2234	2001A300 1 09.04.9 9
2234	2001A300 2 09.07.0 0
2236	A4201 09.08.0 0
****	
26110	
5101	32004 X-43
2236	A3202 Obsol.
****	
<p>The order number in the header of each block must be an existing, non-closed item purchase order in Maconomy.</p> <p><b>Importing Serial Number Information of the Type “Sales.”</b></p> <p>If you import serial number information for the Sales Orders module, (that is, you selected “Sales” in the pop-up field “Type”), the file must contain one or more blocks, as shown below:</p> <p><b>Header:</b> Sales Order Number (Return)</p> <p><b>Line:</b> Item No. (Tab) Serial Number (Return)</p> <p><b>Footer:</b> **** (Return)</p> <p>Each block has one header, one or more lines, and one footer. Below is an example:</p> <p>25106 (Return)</p> <p>1234 (Tab) 1001A2001 (Return)</p> <p>1234 (Tab) 1001A2002 (Return)</p> <p>1236 (Tab) A3201 (Return)</p> <p>**** (Return)</p> <p>25110 (Return)</p> <p>4101 (Tab) 32004 (Return)</p> <p>1236 (Tab) A3202 (Return)</p> <p>**** (Return)</p>	

Field	Description																		
	This example will look like the figure below when entered manually in a spreadsheet:																		
	<table border="1"> <tr><td>25106</td><td></td></tr> <tr><td>1234</td><td>1001A2001</td></tr> <tr><td>1234</td><td>1001A2002</td></tr> <tr><td>1236</td><td>A3201</td></tr> <tr><td>*****</td><td></td></tr> <tr><td>25110</td><td></td></tr> <tr><td>4101</td><td>32004</td></tr> <tr><td>1236</td><td>A3202</td></tr> <tr><td>*****</td><td></td></tr> </table>	25106		1234	1001A2001	1234	1001A2002	1236	A3201	*****		25110		4101	32004	1236	A3202	*****	
25106																			
1234	1001A2001																		
1234	1001A2002																		
1236	A3201																		
*****																			
25110																			
4101	32004																		
1236	A3202																		
*****																			
	The order number in the header of each block must be that of an existing sales order number. Also, there must be an active packing list for the sales order. The item numbers must exist in Maconomy and have serial number control.																		

## Property Information Card Single Dialog Workspace

Use this workspace to create the properties that you want to assign to your items.

A property can be, for example, specifications about a specific item's frequency or voltage. You create properties in this workspace and assign them to items in the Item Properties workspace. You can then create statistics about items assigned with specific properties.

Maconomy also uses properties in the Destination Properties workspace of the Sales Orders module. You can specify the properties that an item should or should not have, and if this item is to be delivered to a certain destination. Maconomy gives you a warning if you create quotes or orders with item lines that contain items not compliant with the property requirements for the quote or order's assigned destination. See the Destination Properties workspace in the Sales Orders module for more information about how Maconomy controls the relations between item properties and destination properties.

### Property Information Card Tab

This section includes the fields and descriptions for the Property Information Card Tab.

#### Property Island

Field	Description
<b>Name</b>	In this field, you can enter the name of the current property.
<b>Property Type</b>	In this field, you can select a property type for the current property. In this way, you can group your properties in, for example, technical specifications, storage conditions, and so on. You can change the property type at any time. The

Field	Description
	values of the property types are created in pop-up type “Property Types” in the window Popup Fields in the Set-Up module.

**Remarks Island**

Field	Description
<b>Remarks</b>	In these fields, you can enter various information about the current property. The remarks will be suggested when the current property is assigned to an item or a destination.

**User Island**

See the “Getting Started” topic for a description of the fields in the island User.

## Item Properties Single Dialog Workspace

Use this workspace to assign properties to your items. A property can be, for example, specifications about a specific item's frequency or voltage.

You create properties in the Property Information Card workspace and assign them to specific items in this workspace. You can then create statistics about items with specific properties.

Maconomy also uses properties in the Destination Properties workspace of the Sales Orders module, where you can specify the properties that an item should or should not have, and if this item is to be delivered to a certain destination. Maconomy gives you a warning if you create quotes or orders with item lines that contain items not compliant with the property requirements for the quote or order's assigned destination.

In the Item Properties workspace, the tab displays information about an item. Use the sub-tab to assign properties to the displayed item.

**Item Properties Tab**

This section includes the fields and descriptions for the Item Properties Tab.

**Item Island**

Field	Description
<b>Item No.</b>	This field shows the number of the current item.
<b>Description</b>	This field shows a description of the current item.

**User Island**

See the chapter “Getting Started” for a description of the fields in the island User.

## Item Properties Sub-Tab

This section includes the fields and descriptions for the Item Properties Sub-Tab.

Field	Description
<b>Property Name</b>	In this field, you can enter the name of a property created in the window Property Information Card. The property will thus be assigned to the item shown in the card part.
<b>Property Type</b>	This field shows to which property type the current property is assigned.
<b>Remarks 1-5</b>	In these fields, you can enter various information about the current item property line. Maconomy will propose the remarks stated on the information card of the current property, but you can change the remarks here.

## Price Lists Single Dialog Workspace

Use this workspace to maintain your company's price lists. When you enter the name of the price list issue, currency, and application in the tab, you can enter the prices of the items on the current price list in the sub-tab. If you change the name of one price list issue, Maconomy changes all of the issue names of the price list.

You can create price lists in several different currencies. Every price list quotes the price at step one, that is, the price of one unit of the item. If you want to apply quantity discounts, create these in the Quantity Discounts workspace.

Each price list has one or more issues. You assign each issue to a period, and no two issues can have overlapping periods. Thus, you can only assign one issue to each date.

This workspace shows an issue of the price list. Each issue of the price list is identified by a price list name and an issue number, and you can look through the available issues. The **Delete Price List** action enables you to delete the displayed issue of the price list. However, you cannot delete a price list if no other issues of the current price lists exist.

You can use the selection criteria fields in the tab to specify the items to display in the sub-tab. When you open the workspace, the **Show Lines** field is not selected, and the sub-tab is empty. This enables you to open the workspace more quickly.

When you create a price list, you only enter the name of the price list. Later, you enter the item lines in the sub-tab or in the Quantity Discounts workspace. You can create a price list with all of the items in your item assortment in one operation using the Change Price Lists workspace.

If you have Maconomy Bill of Materials, you can create BOM price lists, provided that the BOMs have price control.

You cannot delete a version of a price list if there is only one existing version. Maconomy extends the date period for the version that is placed just before the deleted version so that it also covers the period of the deleted version. If you delete the earliest existing period, Maconomy extends the date period for the price list version that is placed after the deleted period. This avoids periodic gaps.

For auditing purposes, it is recommended that you print and file the price list every time that you change it. To print the list, use **Print This** in the File menu.

## Price Lists Tab

This section includes the fields and descriptions for the Price Lists Tab.

### Price List Island

Field	Description
<b>Name</b>	Here you can enter the name of the price list. The name is the identification of the price list. An unlimited number of characters can be entered here, and you can use both letters and numbers. You can change the name of an existing price list. All issue names of the price list will be changed if the name is changed here. Completion of the field is mandatory.
<b>Issue</b>	This field shows the issue number of the current price list issue.
<b>Period</b>	This field shows the period within which the price list issue is valid.
<b>Currency</b>	Select the currency of the price list here. This currency will be used to specify prices in the table part. You cannot change the currency code of an existing price list. You maintain currencies in the Popup Fields window in the Set- Up module.
<b>Application</b>	Here you specify whether the price list applies to sales or purchases. The pop-up field has two values: "Sales Price List" and "Purchase Price List." Sales price lists are used in the Accounts Receivable and Sales Orders modules. Purchase price lists are used in the Accounts Payable and Item Purchase modules. You cannot change the application of an existing price list.

### Selection Criteria Island

Field	Description
<b>Show Lines</b>	You must mark this field to display the items in the price list in the window. When marked, the table shows all items in the price list meeting the selection criteria specifications in this island. This field is not marked when the window is opened. This means allows the window to be opened quickly, without immediately calling up every item in the price list. Although you can specify in an item's information card, it is not to be printed on a price list, the item will still be shown in this window.
<b>Item No.</b>	Here you can enter a range of item numbers. If the "Show Lines" field is marked, the table will show the items in the price list within this range. The items are sorted by item number.
<b>Item Group</b>	Here you can select an item group. The table will show items in this group, if the "Show Lines" field is marked. The item group refers to the group that was selected in the item information card when the item was entered in the price list.

**Access Level Island**

Field	Description
<b>Name</b>	<p>Here you can enter the name of an access level. Users only have access to seeing information about the current price list and referring to it in other windows if they have been assigned to this or a higher access level in the window User Access Levels in the Set-Up module. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to price lists may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section “Introduction to the Access Control System” in the Set-Up module. The access level applies to all issues of the price list.</p> <p>If you do not specify an access level, all users will have access to see information about the current price list.</p>
<b>Description</b>	This field shows the description of the access level specified in the field above.

**User Island**

See the “Getting Started” topic for a description of the fields in the island User.

**Items Sub-Tab**

This section includes the fields and descriptions for the Items Sub-Tab.

Field	Description
<b>Item No.</b>	<p>Here you enter the number of the item to be included in the price list. The items in the price list are sorted by number. Maconomy verifies that the number exists and that it only appears once in the same price list.</p> <p>You can use the search functions in the Find menu to find an item.</p> <p>If you have Maconomy Bill of Materials, Maconomy verifies that any BOM in the price list has price control.</p>
<b>Description</b>	This field shows the text in the “Description Lang. 1” field from the item’s information card. You cannot change the text here.
<b>Pricing Unit</b>	This field shows the pricing unit of the item. The pricing unit is the number of units included in the item’s unit price. This applies to sales prices, costs, weight and volume. If the price list is a purchase price list, Maconomy retrieves the price from the “Purchase Pricing Unit” field in the Item Information Card window. You cannot change the value here.
<b>Price at Step 1</b>	Here you enter the price of one pricing unit of the item. In the Quantity Discounts window you can enter prices on up to six price steps as well as a recommended sales price.

## Quantity Discounts Single Dialog Workspace

Use this workspace to maintain the quantity discounts that you offer to your customers.

You can page through the items in your stock and select a price list for each item. For every price list, you can enter prices and other information up to five steps. Maconomy retrieves the price lists in the pop-up field in this workspace from the Price Lists workspace.

You can work with several issues of a price list and look through available price list issues. When you look through different items, you can maintain the current price list and issue number. If the item does not exist in the current issue of the price list, Maconomy starts by searching for the item in the price list that is valid on the current date. If the item does not exist in that price list, Maconomy searches one of the existing issues of the current price list.

If the item does not exist among these issues, Maconomy searches for the item in the other price lists, starting with issue number 1 in the first price list.

You can also control the relation between the prices in the **Step 1** field and the **Recommended sales price** field by using a markup percentage.

A quantity discount invokes a new, lower unit price, which determines the line price. Maconomy then applies any other line discount from a customer or item discount agreement.

For auditing purposes, it is recommended that you print out and file the quantity discount every time that you change it. To print out the card, use **Print...** in the File menu.

### Quantity Discounts Tab

This section includes the fields and descriptions for the Quantity Discounts Tab.

#### Item Island

Field	Description
<b>Item No.</b>	This is the number of the item. You can retrieve items using the search functions in the Find menu.
<b>Description</b>	This is the item text from the "Description Lang. 1" field from the Item Information Card. The text cannot be changed here.
<b>Bill of Materials</b>	This field shows whether the item is a BOM or a standard item. If the field is marked, the item is a BOM. BOMs must have price control to be assigned to a price list.
<b>Graded Quantity Discount</b>	If you mark this field, Maconomy will calculate quantity discounts as a graded discount. By graded quantity discount is meant a discount which does not affect all items on an order line but only the quantity of items within the quantity range of each quantity discount. If you for instance grant a discount of 10% on 2-4 items and a 20% discount on 5-10 items, it means that an order for 8 items will be granted no discount on the first item, a 10% discount on the next 3 items, and 20% on the last four items. The field determines how quantity discounts are calculated in the subscription module.

Field	Description
<b>Unit, Sales</b>	This is the item sales unit. It cannot be changed here.
<b>Minimum Sales Unit</b>	This is the item's minimum sales unit. The value cannot be changed here.
<b>Pricing Unit, Sales</b>	This shows how many item units are included in the unit price. This applies to sales price, cost, weight and volume. It cannot be changed here.
<b>Unit, Purchase</b>	This is the unit used when the item is purchased in the Item Purchase Orders window. It cannot be changed here.
<b>Min. Purchase Unit</b>	This is the item's minimum purchase unit. It cannot be changed here.
<b>Pricing Unit, Purchase</b>	This shows how many units of the item are included in the unit price of the item for purchases. It cannot be changed here.
<b>Sales/Purchase Unit</b>	This shows how many sales units are included in one purchase unit. It cannot be changed here.

### Price List Island

Field	Description
<b>Name</b>	Here you select a price list from the existing price lists in the pop-up field. If you select a price list, which already includes the item, the table will show prices and discounts on all five steps. If you select a price list that does not already include the item, Maconomy suggests you include the item.
<b>Currency</b>	This is the currency of the price list. It cannot be changed here.
<b>Period</b>	In this field, the period in which the price list issue is valid is shown.
<b>Issue</b>	In this field, you can enter an issue number. If the number is zero, Maconomy will search for the period containing the current date, and the issue number of that period will be transferred to the field.
<b>Quantity</b>	<p>Here you enter the minimum quantity a customer must buy to receive the discount. You can specify a value for up to six price steps as well as a recommended sales price.</p> <p>Quantity and price on one price step can be zero even though they are greater at the higher price step. If quantity and price are zero, Maconomy uses the price from the highest underlying price step, for which quantity and price are not zero. If you enter a quantity, you must also enter either price or discount. If you leave this field blank, you cannot enter price or discount.</p>

Field	Description
	The price at step 1 is, by nature, the price of one pricing unit of the item. Hence, the quantity at step 1 is always one. Maconomy verifies that the quantity is higher as the steps rise.
<b>Price</b>	<p>Here you can enter a price per pricing unit on up to five steps.</p> <p>The price applies to a customer order for as many items as are specified in the "Quantity" field.</p> <p>Maconomy verifies that the price at one step is not higher than the price at the lower price step.</p> <p>Alternatively, you can specify a percentage in the "Discount %" field. Prices are then automatically calculated from the price at step one.</p> <p>If you enter a value in this field and in the "Discount %" field, Maconomy calculates the discount percentage from the fixed price.</p>
<b>Discount %</b>	<p>Here you can enter a discount percentage per pricing unit on up to five steps. The price applies to a customer order for as many items as are specified in the "Quantity" field.</p> <p>The percentage at step 1 is always zero. Maconomy verifies that the discount per pricing unit increases as price steps rise.</p> <p>Alternatively, you can specify a price in the "Price" field. Maconomy then calculates the corresponding discount percentage.</p>
<b>Step 1</b>	Here you enter the price of one pricing unit of the item. Quantity and Discount % cannot be changed at step 1, as the quantity is always one and the discount always 0. Maconomy suggests the price from the price list, but you can change it here. If you change the price at step 1, Maconomy automatically recalculates the prices at the other steps, using the discounts in the "Discount %" column.
<b>Step 2</b>	Here you enter quantity, price and discount at step 2. Maconomy verifies that the quantity and discount are higher than at step 1, and that the price per pricing unit is lower than at step 1.
<b>Step 3</b>	Here you enter quantity, price and discount at step 3. Maconomy verifies that the quantity and discount are higher than at step 2, and that the price per pricing unit is lower than at step 2.
<b>Step 4</b>	Here you enter quantity, price and discount at step 4. Maconomy verifies that the quantity and discount are higher than at step 3, and that the price per pricing unit is lower than at step 3.
<b>Step 5</b>	Here you enter quantity, price and discount at step 5. Maconomy verifies that the quantity and discount are higher than at step 4, and that the price per pricing unit is lower than at step 4.
<b>Step 6</b>	Here you enter quantity, price and discount at step 6. Maconomy verifies that the quantity and discount are higher than at step 5 and that the price per pricing unit is lower than at step 5.

Field	Description
<b>Recommended sales price</b>	Here you enter the item's recommended sales price. When you edit and create price lists from costs, the recommended sales prices is set at zero.
<b>Recommended Markup %</b>	<p>In this field, you can enter a recommended markup percentage. This percentage determines the relation between the prices in the field "Step 1" and the field "Recommended Sales Price." The amounts in the two fields are calculated as the price in the field "Step 1" plus the markup which is based on the markup percentage and the recommended sales price.</p> <p>If the markup percentage or the recommended sales price is zero, the two price fields will not affect each other. If all three fields are completed, the values of the fields will be adjusted as follows:</p> <ol style="list-style-type: none"> <li>1. The price in Step 1 is adjusted if the markup percentage is altered.</li> <li>2. The price in Step 1 is adjusted if the recommended sales price is altered.</li> <li>3. The recommended sales price is adjusted if the price in Step 1 is altered.</li> </ol>

## Change Price Lists Single Dialog Workspace

Use this workspace to maintain your company's price lists.

Using existing information in Maconomy, this workspace allows you to create and change the prices in a price list all at the same time, whereas the Price Lists workspace only lets you create and change the prices of individual items in a price list.

The **Issue** and **Name** fields determine the price list that is selected.

When you click **OK**, Maconomy records the changes that you made.

For auditing purposes, it is recommended that you print and file a price list every time that you change it. To print the card, use **Print This** in the File menu of the Price Lists workspace.

### Change Price Lists Tab

This section includes the fields and descriptions for the Change Price Lists Tab.

#### Change Island

Field	Description
<b>Type</b>	Here, you select the type of change you wish to make. You can choose between the following five types: "New Price List from Costs," "New Price List from Price List," "Update Price List," "Replace Price List," and "New Issue." The five values correspond to the titles of the five islands in the window, and all changes are made in the island corresponding to the selected type of change. You can only make one type of change at a time.

Field	Description
	<p>If you select "New Price List from Costs," Maconomy creates a price list based on the cost of every item in the selected warehouse. If you are creating a purchase price list, the prices will be costs.</p> <p>If you are making a sales price list, Maconomy adds a gross margin based on one of the two values in the "GM % Sales Price" and "Markup % of Cost" fields from the Item Information Card. Maconomy selects whichever value is higher than zero. BOMs can only be included if they have price control.</p> <p>The recommended sales price from the Quantity Discounts window is set at zero when you create and edit sales prices from costs.</p> <p>If you select "New Price List from Price List," you create a price list based on an existing price list. All the prices in the new price list are changed according to a fixed percentage rate (negative or positive). When you change prices this way, you can keep the original price list.</p> <p>If you select "Update Price List," you apply a percentage change, negative or positive, to all prices in an existing price list. The version number of the price list is increased by one.</p> <p>When you select "Replace Price List," you transfer all the prices from one existing price list to another existing price list. You can use this method to update a price list, without withdrawing it temporarily from the system.</p> <p>If you wish to update a price list this way, you first create a price list from the existing one. When the new price list is updated, you replace the old one with the new one. You then assign it the name of the old price list.</p> <p>The version number of the updated price list is increased by one.</p> <p>If you create a price list based on an existing price list, you avoid having to change price list references from the Sales Orders module.</p> <p>If you select "New Issue," a new issue is created as a copy of the stated price list and issue. The starting date of the new issue must be specified in the island New Issue. If the issue number is zero, the issue of the price list which is valid on the current date will be transferred.</p>

### New Price List from Costs Island

Field	Description
<b>Name</b>	<p>Here you enter the name of the new price list. The new prices are based on individual item costs in the selected warehouse.</p> <p>BOMs can only be included if they have price control.</p>
<b>Currency</b>	<p>Here you select the currency of the new price list. If the new price list uses another currency than the original one, the exchange rate valid on today's date is retrieved. For sales price lists, the exchange rate table for sales is used. For purchase price lists, the exchange rate table for purchase is used.</p> <p>You maintain currency codes in the Popup Fields window in the Set-Up module.</p>
<b>Application</b>	<p>Specify here whether the price list applies to sales or purchases.</p> <p>The pop-up field has two values: "Sales Price List" and "Purchase Price List."</p> <p>Sales price lists are used in the Accounts Receivable and Sales Orders modules.</p>

Field	Description
	Purchase price lists are used in the Accounts Payable and Item Purchase module. You cannot change the application of an existing price list.
<b>Warehouse</b>	In this field, you must select a warehouse if you are creating a price list based on the cost of the individual items. The price list created will include all items in the warehouse in question, that is, items assigned to the warehouse in the table part of the window Item Information Card and will be based on the cost prices applying to these items in the selected warehouse. However, BOMs for which not all BOM parts are assigned to the selected warehouse are not included in the price list.

### Replace Price List Island

Field	Description
<b>From List</b>	<p>Here you specify which existing price list you are transferring to the price list in the "To List" field.</p> <p>If a markup percentage of the price list that replaces the current price list exists, this percentage will be copied and used for the calculation of the recommended sales price, based on the new price stated in the field "Step 1."</p> <p>Price lists are created in the Price Lists window.</p>
<b>Issue</b>	<p>In this field, you can enter the issue number of a price list. The issue number and the name stated in the field above determine the price list which will be copied.</p> <p>The suggested value of this field is 0, causing the current issue to be updated. If another issue is to be updated, you can enter the number of the desired issue.</p>
<b>To Price List</b>	<p>Here you specify to which existing price list the price list in the "From List" is being transferred. The original prices in this price list will be overwritten.</p> <p>Price lists are created in the Price Lists window.</p>
<b>Issue</b>	<p>In this field, you can enter the issue number of a price list. The issue number and the name stated in the field above determine the price list which will be replaced.</p> <p>The suggested value of this field is 0, causing the current issue to be replaced. If another issue is to be replaced, enter the number of the desired issue.</p>

### New Issue Island

Field	Description
<b>Price list</b>	In this field, you can select the name of the price list for which an issue is to be created.
<b>Issue</b>	In this field, you can enter the issue number of the issue on which you wish to base the new issue. If the number is zero, the price list issue which is valid on the current date will be selected.
<b>Start Date</b>	<p>In this field, you can enter the starting date of the new issue of the price list.</p> <p>For example, the range of dates on an existing price list could be: Issue 1 [ - 31/1/97] Issue 2 [1/2/97 - 10/3/97] Issue 3 [11/3/97 - ]</p>

Field	Description
	<p>Note that the latest existing issue does not have an ending date. When creating an issue of the price list, the starting date can be entered in this field, and the new issue 4 will start on the specified date.</p> <p>Example:</p> <p>If the starting date of the new issue, Issue 4, is 25/3/97, the period of Issue 3 is shortened to [11/3/97 - 24/3/97], and the period of Issue 4 will be [25/3/97 - ], since no two periods can overlap.</p> <p>The starting date of a new issue can also be earlier than that of the previous issue. For example, the starting date of issue 4 can be set at 7/3/97 which is within the range of Issue 2. The result is that the ending date of Issue 2 will change to 6/3/97, while the ending date of Issue 4 is 10/3/97.</p> <p>In this way, the order of the issues is Issue 1, Issue 2, Issue 4, Issue 3, and so on.</p>

### Update Price List Island

Field	Description
<b>Price List</b>	<p>Here you specify which existing price list is being changed.</p> <p>If a markup percentage for the price list exists, this percentage will be used for the calculation of the recommended sales price, based on the new price stated in the field "Step 1."</p> <p>Price lists are created in the Price Lists window.</p>
<b>Issue</b>	<p>In this field, you can enter the issue number of a price list. The issue number and the name stated in the field "Price List" determine the price list which will be updated.</p> <p>The suggested value of this field is 0, causing the current issue to be updated. If another issue is to be updated, you can enter the number of the desired issue.</p>
<b>% Change</b>	<p>Here you enter the percentage change. You can enter a negative or positive value. The value cannot be less than "-100," however.</p>

### New Price List from Price List Island

Field	Description
<b>Name</b>	<p>Here, you enter the name of the new price list. which you are creating, based on an existing price list.</p> <p>If a markup percentage for the source price list exists, this percentage will be copied and used in calculating the recommended sales price, based on the new price in the field "Step 1."</p>
<b>Currency</b>	<p>Here you select the currency of the new price list.</p> <p>You define currency codes in the Popup Fields window in the Set-Up module.</p>
<b>From Price List</b>	<p>Here you specify on which existing price list the new price list is based.</p> <p>Price lists are created in the Price Lists window.</p>

Field	Description
<b>Issue</b>	<p>In this field, you can enter the issue number of a price list. The issue number and the field "From Price List" determine the price list on which the new price list will be based.</p> <p>The suggested value of this field is 0, causing the current issue to be copied. If another issue of the price list is to be copied, you can enter the number of the desired issue.</p>
<b>% Change</b>	<p>Here you enter the percentage change. You can enter a negative or positive value. The value cannot be less than "-100."</p> <p>You can, for example, create a purchase price list based on the vendor's recommended retail price list. The percentage change will thus be the discount percentage your company gets from the vendor, and the percentage figure will be negative. You can then use the purchase price list to create item purchase orders in the Item Purchase module.</p>
<b>Application</b>	<p>Here you specify whether the price list applies to sales or purchases. The pop-up field has two values: "Sales Price List" and "Purchase Price List." Sales price lists are used in the Accounts Receivable and Sales Orders modules. Purchase price lists are used in the Accounts Payable and Item Purchase module. You cannot change the application of an existing price list.</p>

## Import Price Lists Single Dialog Workspace

Use this workspace to import price list information for the items you that have created in Maconomy.

This information must be in a tab-separated data file. Maconomy puts the imported price data into an existing price list. You can then use the price lists as normal.

The import price list facility is a useful tool when you receive price lists from your vendors. It is then easy to update your purchase price lists merely by importing new files.

You must specify the price list and issue that you are updating and the percentage change that you want to apply. When you click **OK**, Maconomy displays a dialog where you can select the appropriate import file, and Maconomy then imports the price data from that file. If an item in the import file already exists in the price list, its price is updated at price step 1. If the item is not on the price list, you can choose to add it to the price list. If you select the **Create New** field, the item is added to the price list if it exists in Maconomy. You can import prices with quantity specification at all price steps using the **All Price Steps** field. If the price list has quantity discounts, Maconomy recalculates the other price steps from the imported price and the discount percentages specified in the Quantity Discounts workspace. The Quantity Discounts workspace should not be open when you import prices.

Maconomy tells you how the import is progressing in a window on the screen, and places a text file of the import report in the same folder as the Maconomy program on your computer. The name of the report file is **PriceList.<date>**, where **<date>** is the date of the import. You can use a word processing program to read the text file.

If there are errors during the import, Maconomy does not import the information. Maconomy runs through the entire import file and alerts you about any errors. An example of an error is when the import file contains item numbers that are unknown to Maconomy.

## Import Price Lists Tab

This section includes the fields and descriptions for the Import Price Lists Tab.

### Price List Island

Field	Description
<b>Name</b>	<p>Here you can select which price list the imported prices are to update. The pop-up field shows existing price lists created in the Price Lists window.</p> <p>If an item in the import file already exists in the price list, its price will be updated at step 1. If an item is not already in the price list, it will be inserted in the price list at step 1, provided it exists in Maconomy. If the price list has quantity discounts, Maconomy recalculates the other price steps from the imported price and the discount percentages given in the Quantity Discounts window.</p>
<b>Issue</b>	<p>In this field you can enter the issue number of a price list. The issue number and the name stated in the field "Name" determine the price list which will be imported. The suggested issue number is 1.</p>
<b>Currency</b>	<p>Here you select the currency of the prices in the import file. If they are not in the same currency as the price list you are updating, Maconomy converts them using the current exchange rate table.</p> <p>The pop-up field shows the currency codes you have entered in the Popup Fields window. Exchange Rate tables are created in the Exchange Rate Tables window and you select the current table in the System Information window.</p>
<b>Change %</b>	<p>Here you can enter a percentage if you wish adjust the prices in the import file. The original price data in the file are not changed.</p> <p>If you enter a positive figure, the prices are increased. If you enter a negative figure, the prices are reduced.</p>

### Import Island

Field	Description
<b>All Price Steps</b>	<p>Here you decide whether to import prices at all steps. If you mark the field, every line in the import file must contain the following fields: (tab-separated): Item Number, Price Step 1, Quantity Step 2, Price Step 2, Quantity Step 3, ..., Price Step 6, Quantity Step 6, Recommended Sales Price.</p> <p>If a field in the import file is marked "#KEEP," the value from the existing price list will be applied. However, stating a new value of a given field in the import file will cause the stated price to be changed. If the relation between the price at Step 1 and the recommended sales price is adjusted (caused by a markup percentage), an alteration of one of these fields will result in an adjustment of the other field.</p> <p>If the item exists in the price list, Maconomy writes over all the values and the discounts are re-calculated (that is, the quantity for the different price steps can be changed). If the item is not in the price list, it is created there if the "Create New" field is marked and the item exists in Maconomy.</p> <p>If the field is not marked, Maconomy will only import prices at step 1.</p>

Field	Description
	You can also enter a comment in the import file. This is done by creating a line in which the first field is left blank.
<b>Create New</b>	Here you decide whether to create items that are in the import file but not in the price list. If the field is marked, Maconomy will put the items from the import file in the price list if the items exist in Maconomy. If the mark is removed, Maconomy will not put the new items in the price list.
<b>Write Over Price List</b>	If you mark this field, all lines on the chosen price list will be deleted before you start the import. Then, the new price list is generated, based on the data in the import file. If a markup percentage is stated on the existing price list, it will not be written over but used to recalculate the recommended sales price using the new price at Step 1.
<b>Ignore Non-existing items</b>	If you mark this field, Maconomy will ignore any items in the import file which do not already exist in the system.

## Item Discount Agreements Single Dialog Workspace

Use this workspace to manage item-related discount agreements. You can browse through the items in the system in the tab. In the sub-tab, specify a discount agreement on each line.

You can define these agreements and their associated terms for each item number. For example, you can define a clearance discount to promote sales of an overstocked item.

Maconomy transfers a discount to an order or invoice line in the Sales Orders module or to an item purchase order line in the Item Purchase module. If several item or customer discount agreements overlap, Maconomy selects the one that results in the highest discount amount. In other words, you can apply only one discount agreement, whether item or customer-related, per order or invoice line. However, you can simultaneously give a quantity discount and an invoice discount to a customer.

If an order or invoice line meets the conditions specified in the Discount Table workspace, Maconomy always applies the discount in the Discount Table, regardless of whether the customer would get a greater price reduction from an item or customer discount agreement.

### Item Discount Agreements Tab

This section includes the fields and descriptions for the Item Discount Agreements Tab.

#### Item Island

Field	Description
<b>Item No.</b>	This is the item number. If the item is a BOM and if you are working with sales discount agreements, it is only possible to create item discount agreements for the current item if you have specified that this is a BOM with price control in the field "Price Control" in the BOM Information Card.

Field	Description
<b>Description</b>	This is the item text from the “Description Lang. 1” field from the Item Information Card. The text cannot be changed here.
<b>BOM</b>	This field shows whether the item is a BOM or a standard item. If this field is marked, the item is a BOM. You can only create an item discount agreement for a BOM with price control.
<b>Unit</b>	This field shows the unit in which the quantity of the item is registered. The value in this field cannot be changed here.
<b>Minimum Sales Unit</b>	This is the item’s minimum sales unit. This facility is usable, if the item is packed with more units in the same packaging, and only if this packaging is sold intact. The value in this field cannot be changed here.
<b>Pricing Unit</b>	<p>This field shows how many item units are included in the unit price. This applies to sales prices, costs, weight and volume. The value cannot be changed here.</p> <p>If you enter a fixed amount in the discount agreement, you can determine whether the discount is to be deducted from the total line price or the price per pricing unit.</p>

### Discount Agreements Sub-Tab

This section includes the fields and descriptions for the Discount Agreements Sub-Tab.

Field	Description
<b>Application</b>	In this field, you can specify if the discount agreement is to be used in connection with sales or purchase.
<b>Customer Group</b>	In this field, you can select a customer group so that only customers included in the selected group are granted the discount specified in the current discount agreement. The field can only be filled in if you have selected “Sales” in the field “Application.”
<b>Enterprise</b>	Here, you can select an enterprise. The discount agreement will only apply to customers in this enterprise. The field can only be filled in if you have selected “Sales” in the field “Application.”
<b>Segment</b>	The functionality of this field is similar to that of the field “Enterprise” above. The field can only be filled in if you have selected “Sales” in the field “Application.”
<b>Area</b>	The functionality of this field is similar to the functionality of the field “Enterprise” above. The field can only be filled in if you have selected “Sales” in the field “Application.”
<b>From Customer No.</b>	This field and the field “To Customer No.” make up a range of customer numbers. The discount agreement will only apply to customers within this range. If you leave this field blank, the range will include all customers with numbers up to the value specified in the field “To Customer No.” The field can only be filled in if you have selected “Sales” in the field “Application.”

Field	Description
<b>To Customer No.</b>	This field and the field "From Customer No." make up a range of customer numbers. The discount agreement will only apply to customers within this range. If you leave this field blank, the range will include all customers with numbers from the value specified in the field "To Customer No." and up. The field can only be filled in if you have selected "Sales" in the field "Application."
<b>From Destination No.</b>	This field and the field "To Destination No." make up a range of destination numbers. The discount agreement only applies to orders assigned to a destination within the specified range. If you leave this field blank, the range will include all orders assigned to destinations with numbers up to the value specified in the field "To Destination No.." The fields can only be filled in if you have selected "Sales" in the field "Application."
<b>To Destination No.</b>	This field and the field "From Destination No." make up a range of destination numbers. The discount agreement only applies to orders assigned to a destination within the specified range. If you leave this field blank, the range will include all orders assigned to destinations with numbers from the value specified in the field "To Destination No." and up. The fields can only be filled in if you have selected "Sales" in the field "Application."
<b>Vendor Group</b>	In this field, you can select a vendor group so that only vendors belonging to the selected vendor group are granted the discount specified in the current discount agreement. The field can only be filled in if you have selected "Purchase" in the field "Application."
<b>From Vendor No.</b>	This field and the field "To Vendor No." make up a range of vendor numbers. The discount agreement will only apply to vendors within this range. If you leave this field blank, the range will include all vendors with numbers up to the value specified in the field "To Vendor No.." The field can only be filled in if you have selected "Purchase" in the field "Application."
<b>To Vendor No.</b>	This field and the field "From Vendor No." make up a range of vendor numbers. The discount agreement will only apply to vendors within this range. If you leave this field blank, the range will include all vendors with numbers from the value specified in the field "From Vendor No." and up. The field can only be filled in if you have selected "Purchase" in the field "Application."
<b>First Delivery Date</b>	This field and the field "Last Delivery Date" make up a range of delivery dates. The discount will only be granted if the current item is ordered for delivery within the specified range of dates. This means that the date in the "Pref. Delivery Date" field in the Sales Orders window must be within this range in order for the discount to be granted. If you leave this field blank, the range will include all dates up until the date specified in the field "Last Delivery Date."
<b>Date of Last Shipment</b>	This field and the field "First Delivery Date" make up a range of delivery dates. The discount will only be granted if the current item is ordered for delivery within the specified range of dates. This means that the date in the "Pref. Delivery Date" field in the Sales Orders window must be within this range in order for the discount to be granted. If you leave this field blank, the range will include all dates from the value specified in the field "Last Delivery Date" and up.

Field	Description
<b>Min. Quantity</b>	<p>In this field, you can enter the minimum quantity of units a customer must order to receive the current discount.</p> <p>If you leave the field blank, it will have no influence on the selection criteria.</p>
<b>Min. Amount</b>	<p>Here you enter the minimum currency amount a customer must spend to receive the discount.</p> <p>If you leave the field blank, the amount does not have any influence on the possibility of getting a discount in accordance with the current discount agreement.</p>
<b>Enterprise Currency</b>	<p>This field shows the currency selected as the enterprise currency in the Maconomy system. For further information about the concepts of enterprise currency and base currencies, see the description of the field "Base Currency" in the window Company Information in the G/L module.</p>
<b>Amount</b>	<p>In this field, you can enter the discount of the current discount agreement, if the discount is granted as an amount. You must enter a value here or in the "%" field. If you enter a value in both fields, Maconomy selects the discount resulting in the highest discount amount.</p> <p>If you enter an amount here, you can use the field "By Pricing Unit" to determine whether to deduct the discount from the total line price or by pricing unit.</p> <p>The amount is shown in the enterprise currency.</p>
<b>By Pricing Unit</b>	<p>A mark in this field determines if the discount in the "Amount" field is to be deducted from the total line price unit or by pricing unit. The pricing unit is shown in the field "Pricing Unit" on the Item Information Card.</p> <p>If you do not mark this field, the discount amount will be deducted from the total line price, which is shown in the field "Amount."</p> <p>To illustrate, if this field is marked, the pricing unit for an item is 6, and the customer orders 24 units of the designated item, the discount will be 4 times the amount in the "Amount" field.</p>
<b>Discount %</b>	<p>In this field, you can enter the discount percentage if the discount is granted in percentages. You must enter a value here or in the field "Amount." If you enter a value in both fields, Maconomy selects the discount resulting in the highest discount amount.</p>
<b>Discount Desc.</b>	<p>Here you enter the discount text in the primary language of the system. The primary language is the one appearing on the first table line for the pop-up type "Languages" in the table part of the window Popup Fields. The description appears on quotes, orders, and invoices assigned to the primary language, as the text is transferred to the "Discount Desc." field on the table lines where the current discount is granted.</p> <p>The text you enter is furthermore created as an entry in the window Language Texts in the Set-Up module. It is then possible to assign translations of the discount description in the languages used in Maconomy. This makes it possible, for example, to send an invoice to a German company with the discount descriptions in German. In those cases where no translation of the</p>

Field	Description
	discount description has been made in the language used in a given context for instance on the printout of an order confirmation, Maconomy uses the description in this field instead. For more information about discount descriptions in other languages, please see the description of the window Language Texts in the Set-Up module.
<b>Fixed Price List</b>	<p>In this field, you can select a price list so that the selected customers or vendors will be locked to a certain price list assigned to the current item. If you specify a fixed price list and the current item discount is triggered, the item's unit price on the order, purchase or invoice line will be calculated according to the price list in this field instead of according to the price list specified on the order. Hence, a discount agreement can result in another price list being used than the one originally stated on the order. Furthermore, Maconomy will calculate the discount on the basis of the fields "Amount" and "Discount %."</p> <p>The discount agreement is only used if the price, according to the fixed price list, less the discount, is lower than the price quoted for the order, the invoice or the credit order.</p> <p>The pop-up field shows the price lists created in the window Price Lists for the current item. However, you can select "blank," which means that the item's price always has to be calculated on the basis of the price list specified on the order, the invoice or the item purchase order. However, discount will still be calculated on the basis of the fields "Amount" or "Discount %." Please note that the price list has to have the same application (purchase or sales) as the discount agreement.</p>
<b>Fixed Price Step</b>	<p>In this field, you can enter a price step so that the selected customers or vendors will be locked to a certain price list for the current item in the fixed price list assigned to the discount agreement. This means that the item's unit price is calculated on the basis of this price step on the price list specified in the field "Fixed Price List" for the current item discount agreement, instead of for the price step that the number of units on the line would usually result in. If the value "blank" has been selected in the field "Fixed Price List," you cannot enter a value in this field.</p> <p>You can choose not to fill in this field and if you leave the field blank, the item's unit price is to be taken from the price step that the number of units on the current order-, invoice- or purchase line gives rise to.</p>
<b>Created by</b>	This field shows the name of the user who created the current discount line.
<b>Created on</b>	This field shows the date on which the current discount line was created.
<b>Changed by</b>	This field shows the name of the last user who made changes to the current discount line.
<b>Changed on</b>	This field shows the date on which the current discount line was changed

Field	Description
<b>Version</b>	This field shows a number corresponding to the version of the information on the line. Maconomy automatically increases the version number by one every time the information on the line is changed. It is not possible to retrieve previous versions.
<b>Remarks 1-5</b>	In these fields, you can enter various remarks to the discount on the line.

## Discount Table Single Dialog Workspace

Use this workspace to create a discount table. The tab shows user information, and the sub-tab shows discount table lines. A discount table line shows the conditions that must be met for a customer to get the discount. It also shows the actual discount percentage.

Maconomy uses the discount table to automatically apply discounts to quote, sales order, and credit order lines in the Sales Orders module, and to invoice and credit memo lines in the Accounts Receivable module.

If an order or invoice line meets the conditions set out in a discount line, Maconomy always bases the discount on the discount table, regardless of whether the customer would get a greater price reduction from an item or customer discount agreement.

The discount table is useful if you want to work with a discount percentage for whole item groups and customer groups at the same time. You can also base the discount on order mode.

Maconomy transfers a discount as a line discount to the relevant item line in the Sales Orders or Accounts Receivable module. If an item line meets the conditions of more than one discount table line, Maconomy applies the highest discount rate. In addition to the line discount, you can give a quantity and/or invoice discount.

For auditing purposes, it is recommended that you print and file the discount table every time that you change it. To print the card, use **Print ...** in the File menu.

### Discount Table Tab

This section includes the fields and descriptions for the Discount Table Tab.

#### User Island

See the “Getting Started” topic for a description of the fields in the island User.

### Discount lines Sub-Tab

This section includes the fields and descriptions for the Discount lines Sub-Tab.

Field	Description
<b>Customer Group</b>	Here you can select the customer group the discount table line applies to. If you select “blank,” customer group has no influence on whom the discount is given to.

Field	Description
<b>From Customer No.</b>	<p>In this field, you can specify the first number in a range of customers who should be allowed the discount on the current line. The last number in the range can be specified in the field "To Customer No." below. A customer only matches the current line if he has a customer number equal to or higher than the number specified in this field and equal to or lower than the number specified in the field "To Customer No.."</p> <p>If you leave this field blank, the range will include all customers with numbers up to the value specified in the field "To Customer No.." If you leave the field "To Customer No." blank, the range will include all customers with from the value specified in the field "From Customer No." and up.</p>
<b>To Customer No.</b>	See the field "From Customer No." above for a description of the functionality of this field.
<b>Item Group</b>	Here you can select the item group the discount table line applies to. If you select "blank," item group has no influence on when the discount applies.
<b>Item Type</b>	Here you can select the item type the discount table line applies to. If you select "blank," item type has no influence on when the discount applies.
<b>Item Pop- up 1-5</b>	Here you can select the item pop-up values that an item must be assigned to match the current discount table line. If you select "blank" in a given pop-up field, the field in question is ignored when Maconomy determines whether an item matches the current discount table line.
<b>Order Mode</b>	<p>Here you can select the order mode the discount table line applies to. Order mode is selected in the Quotes, Sales Orders or Credit Orders window.</p> <p>If you select "blank," order mode has no influence on when the discount is given. Only discount table lines with blank order mode will be considered in the Invoices and Credit Memos windows in the Sales Orders module.</p>
<b>Discount %</b>	Here you enter the discount percent the customer is given when buying items that meet the conditions of the discount table line.
<b>Discount Desc.</b>	<p>Here you enter the discount text in the primary language of the system. The primary language is the one appearing on the first table line for the pop-up type "Languages" in the table part of the window Popup Fields. The description appears on quotes, orders, and invoices assigned to the primary language, as the text is transferred the "Discount Desc." field on the table lines where the current discount is granted.</p> <p>The text you enter is furthermore created as an entry in the window Language Texts in the Set-Up module. It is then possible to assign translations of the discount description in the languages used in Maconomy. This makes it possible, for example, to send an invoice to a German company with the discount descriptions in German. In those cases where no translation of the discount description has been made in the language used in a given context for instance on the printout of an order confirmation, Maconomy uses the description in this field instead. For more information about discount</p>

Field	Description
	descriptions in other languages, please see the description of the window Language Texts in the Set-Up module.

## Catalogs Single Dialog Workspace

Use this workspace to set up item catalogs and catalog structures.

This workspace is only available if you have the Portal module Procurement Portal.

You use catalogs for setting up a product structure that procurement portal users can utilize for browsing and finding items to order. The catalogs enable you to set up a hierarchical structure, breaking down your range of items into categories that make it easy for the procurement portal users to find the items to order.

You set up the catalog structure up by creating the relevant item categories, arranging them in a hierarchical structure, and then assigning the individual items to the catalogs on the lowest level.

To set up a hierarchical catalog structure, start by creating all of the catalogs. Next, select the top-level catalog in the tab. In the sub-tab, create a line for each catalog that should be a subcatalog to the one in the tab, specifying the relevant catalog numbers in the **Catalog No.** field.

You can assign items to catalogs at the lowest level, that is, catalogs that do not contain any subcatalogs. To assign an item to a catalog, select the catalog in the tab and create a line in the sub-tab, specifying the item in the **Item No.** field.

For each catalog, mark the **Entry Catalog** field if you want it to appear on the list of catalogs in the My Catalogs Portal component. Thus, you are able to select the front page catalogs that are initially presented to users, from which they start browsing for items. A catalog does not need to be at the top level of the catalog structure to be selected as an entry catalog.

For each Procurement Portal user, you are required to create a personal catalog to which favorite items can be added. Use the specific user name as the catalog number. Subcatalogs should not be assigned to any of the personal catalogs.

### Catalogs Tab

This section includes the fields and descriptions for the Catalogs Tab.

#### Catalog Island

Field	Description
<b>Catalog No.</b>	In this field, you can specify the number of the catalog when creating a catalog. Once the catalog has been created, this field cannot be changed.
<b>Name</b>	In this field, specify a name for the catalog. This is the name which may be shown in the Portal.
<b>Entry Catalog</b>	If you mark this field, the catalog will appear in the My Catalogs component in the Portal Web Shop for all web shop users. This means that if the current catalog should be a "front page" catalog available to any user, this field should be marked. If the current catalog is a personal catalog, you should not mark this field, as the personal catalog should only be available to the user to whom the

Field	Description
	catalog belongs. For further information on the My Catalogs component and personal catalogs, see the section “My Catalogs” in the Portal Modules manual.
<b>Picture File Reference</b>	<p>In this field, you can specify a reference to an image file to be assigned to the catalog. If you specify a file reference, the image will be displayed when the current catalog is selected in the procurement portal, provided that a placeholder for the image is included in the layout of the Catalog Home component.</p> <p>The file reference must be specified as a valid URL, either as a full path specification starting with “http://” or relative to the web server. For instance, if you specify “/Images/Furniture/LSofa1.jpg,” it means that the file is placed in the folder “Furniture” which is a subfolder to “Images,” which again is a subfolder directly below the root level of the web server.</p>

### Information Island

Field	Description
<b>Information 1-5</b>	In these fields, you can specify additional information about the current catalog.

### Customer Island

Field	Description
<b>Customer No.</b>	<p>In this field, you can enter the number of a customer. If you enter a customer number, this island and the individual lines in the table part will show pricing information.</p> <p>This means that if you enter a customer, each line on which an item has been specified will show the price of the item in question according to the price list to which the specified customer is assigned. Furthermore, each item line will show any discounts to which the customer is entitled according to item and customer discount agreements. If you also specify a quantity on a line, an extended line price is calculated, and any relevant quantity discount is applied. The Customer island will display totals for all the lines in the table part on which a quantity has been specified.</p> <p>If you do not specify a customer number, no prices and discounts are displayed, as Maconomy needs a customer number to be able to apply the relevant price list.</p> <p>The functionality of this field and the price fields in this island as well as in the table part is used in the Procurement Portal module where certain components use the fields for displaying the prices and discounts that will apply to the current customer when ordering a given quantity.</p>
<b>Price List</b>	If you have specified a customer in the field “Customer No.” above, this field shows the name of the price list assigned to the customer in question. The information is retrieved from the window Customer Information Card. If no customer has been specified, this field is blank.

Field	Description
<b>Price Step</b>	If you have specified a customer in the field "Customer No." above, this field shows the name of the price step of the customer in question. The information is retrieved from the window Customer Information Card. If no customer has been specified, this field is blank.
<b>Currency</b>	If you have specified a customer in the field "Customer No." above, this field shows the currency of the customer in question. The prices in the window are displayed in this currency. The information is retrieved from the window Customer Information Card. If no customer has been specified, this field is blank.
<b>Goods</b>	If you have specified a customer in the field "Customer No." above, this field shows the sum of the amounts in the field "Extended Price" in the table part of the window. The field thus shows the total price for the items in the table part in the specified quantities. If no customer has been specified, this field is blank.

### Catalog Lines Sub-Tab

This section includes the fields and descriptions for the Catalog Lines Sub-Tab.

Field	Description
<b>Catalog</b>	If you wish to assign a subcatalog to the catalog selected in the card part of the window, specify the number of the catalog to be assigned as a subcatalog in this field. It is possible to specify a catalog even though the table part also contains lines where items have been specified. However, the Catalog component in the Procurement Portal does not display the information correctly if the table part contains a mix of catalogs and items. It is therefore recommended that you only specify catalogs or items in the table part of the same catalog.
<b>Name</b>	If you have specified a catalog in the field "Catalog" above, this field shows the name of the catalog in question.
<b>Item No.</b>	If you wish to assign an item to the catalog selected in the card part of the window, specify the number of the desired item in this field. It is possible to specify an item even though the table part also contains lines where catalogs have been specified. However, the Catalog component in the Procurement Portal does not display the information correctly if the table part contains a mix of catalogs and items. It is therefore recommended that you only specify catalogs or items in the table part of the same catalog.
<b>Description</b>	If you have specified an item in the field "Item No." above, this field shows a description of the item in question.
<b>External Desc.</b>	This is the description of each line item that will appear on the invoice.
<b>Unit</b>	If you have specified an item in the field "Item No." above, this field shows the unit in which the item is measured.

Field	Description
<b>Unit Price</b>	If you have specified an item in the field "Item No." above, and a customer has been specified in the card part of the window, this field shows the unit price of the item according to the price list assigned to the specified customer. If no price list is assigned to the customer, the unit price is zero. The price is calculated as described in for the field "Unit Price" in the window Sales Orders.
<b>Discount %</b>	If you have specified an item in the field "Item No." above, and a customer has been specified in the card part of the window, this field shows any discount percentage to which the customer in question is entitled according to item and customer discount agreements, and quantity discounts achieved as a result of the quantity specified on the line. The discount percentage is calculated as described in for the field "Discount %" in the window Sales Orders. If you have not specified a quantity on the line, the discount is shown as zero.
<b>Quantity</b>	In this field, you can specify a quantity. If you do so, and a customer has been specified in the card part of the window, Maconomy will calculate an extended line price and any discounts to which you may be entitled according to customer and item discount agreements as well as quantity discount rules. The functionality of this field and the price fields in this window is used in the Procurement Portal module where certain components use the fields for displaying the prices and discounts that will apply to the current customer when ordering a given quantity.
<b>Extended Price</b>	This field shows the total price of the current line item.
<b>Picture File Reference</b>	<p>In this field, you can specify a reference to an image file to be shown in the web shop next to the information on the item or catalog specified on the line. If a catalog has been specified on the line, Maconomy suggests the picture file reference from the card part of the catalog in question. If an item has been specified on the line, the picture file reference from the information card of the item is suggested. In both cases, you can change the file reference for the current line.</p> <p>The file reference must be specified as a valid URL, either as a full path specification starting with "http://" or relative to the web server. For instance, if you specify "/Images/Furniture/LSofa1.jpg," it means that the file is placed in the folder "Furniture" which is a subfolder to "Images," which again is a subfolder directly below the root level of the web server.</p>
<b>Information 1-5</b>	In these fields, you can specify additional information about the current catalog line.

## Delete Section

This section includes the fields and descriptions for the Delete workspaces.

### Delete Item Entries Single Dialog Workspace

Use this workspace to delete item entries (Inventory Changes: shipments/receipts) up to a given date and for one or more items.

It is important that you enter the correct date to prevent deleting the wrong entries. This workspace only affects the Inventory module.

It is recommended that you make a backup copy before you delete any entries. Maconomy prints out a list of the deleted entries.

When you delete an entry, all of the entry information disappears, and the entry is removed from the inventory journal.

If you delete all of the entries in an inventory transaction, the inventory transaction itself also disappears. From then on, you cannot retrieve or print the inventory transaction in the Inventory Change workspace.

### Delete Item Entries Tab

This section includes the fields and descriptions for the Delete Item Entries Tab.

#### Selection Criteria Island

Field	Description
<b>Posted Before</b>	Here you enter a date. Maconomy deletes the entries posted before this date. You must enter a date.
<b>Company No.</b>	In this field you enter a range of company numbers. Maconomy will only delete entries to items within this range.
<b>Item No.</b>	Here you specify a range of item numbers. Maconomy will only delete entries to items within this range.
<b>Item Group</b>	Here you select an item group. Maconomy will only delete entries to items in the item group.
<b>Item Type</b>	Here you select an item type. Maconomy will only delete entries to items of this type.
<b>Warehouse</b>	Here you select a warehouse. Maconomy will only delete entries to this warehouse.

## Sales Orders Overview

This chapter describes the Sales Orders module. Here you process quotes, sales orders and credit memos.

### Registration Section

This section includes the fields and descriptions for the Registration section workspaces.

#### Quote Workspace

Use this workspace to create and edit quotes for customers.

Use the Quote tab to enter general and account information about the quote. When you press Return after entering information in the tab, Maconomy verifies the information. You can then enter item lines and text lines in the Quote Lines sub-tab.

To create a quote, enter the customer number. Maconomy verifies that the customer exists and is not blocked. Maconomy also alerts you if the bill-to customer's credit limit has been exceeded. Maconomy retrieves other information from the Customer information card in the Accounts Receivable module, and suggests that information in the quote. Thus, you only need to change the information that is specific to the current quote.

Maconomy also checks the credit limit for every new item line that you enter in the Quote Lines sub-tab and when you convert a quote to a sales order. If the credit limit is exceeded, Maconomy issues a warning, allowing you to undo the conversion. If you have the correct permissions to approve sales orders, Maconomy automatically approves the sales order and updates the bill-to customer's order volume. Note that Maconomy includes both the bill-to customer's balance and order volume in the credit limit evaluation. A sales order or credit order must therefore be approved or invoiced to be included in the credit limit evaluation.

When checking whether the customer's credit limit has been exceeded, Maconomy checks the current customer's credit limit at the enterprise level as well as at the company level. See the description of the fields in the Credit Limit island in the Payment Information and Company Specific Payment information workspaces in the A/R module for more information about how Maconomy handles credit limits.

Maconomy applies price lists and discount agreements from the Accounts Receivable and Inventory modules, but the items in the quote are not reserved in the warehouse. If the customer accepts the quote, you can convert it to a sales order. Maconomy then reserves the items in the warehouse.

You can also copy a quote. The copy can either be another quote or a sales order. You can specify that the prices in the original quote are to be transferred to the copy, but if you do not want to copy the prices, or if you need to specify another customer, currency, price list, or price step, Maconomy recalculates the prices on each quote line. If you specify a customer, Maconomy transfers the basic information about the customer from the customer information card, regardless of whether you specify the same customer as on the original quote.

If you have Maconomy Bill of Materials, you can enter both standard items and bills of materials (BOMs) in the Quote Lines sub-tab. Maconomy only displays the BOM header, not the parts. If the item is a BOM to be shown on the quote, you can see the BOM parts in the Order Lines workspace. The Order Lines workspace automatically shows the item in the last item line that you created.

## Quote Tab

This section includes the fields and descriptions for the Quote tab.

### Quote Island

Field	Description
<b>Quote No.</b>	This number is the sole and absolute identification of the quote. Maconomy automatically allocates the next available quote number. The number cannot be changed manually, but you determine how quote numbers are allocated in the Numbers window.
<b>Order Mode</b>	Here you select the order mode, that is, how the quote is relayed to the customer, for example, "By telephone," "By fax." You maintain order modes in the Popup Fields window in the Set-Up module.
<b>Sales Person</b>	Here you enter the number of the employee who is sales representative on the quote. Maconomy automatically suggests the sales representative who normally sells to this customer, retrieving the number from the customer information card. You can change the number.  If you cannot remember the number, you can use the search functions in the Find menu.  This field also displays the sales person's name. Maconomy retrieves it from the Employees window in the Set-Up module using the specified sales person number.
<b>Received by</b>	Here you enter the name of the employee in your company who received the customer's request for a quote. Maconomy suggests the name of the user who is creating the quote, but you can change it. You must complete the field.
<b>Expires</b>	Here you can enter the date the quote expires.

### Ship to Address Island

Field	Description
<b>Customer</b>	In this field, you enter the number of the customer receiving the quote. Maconomy checks that the customer has been created in Maconomy and, if the system parameter "Aut. company specific customer creation" has not been marked in the Set-Up module, if the current customer has been created as a company specific customer for the company responsible for the contract. If this parameter has not been marked, the customer has to be created as a company specific customer in the window Company Specific Customer Information Card before quotes can be created with the current combination of customer and company. Furthermore, Maconomy checks that the customer has not been blocked in the window Payment Information in the A/R module.  When you press Return, Maconomy retrieves various information from the customer's information card in the A/R module, and suggests the values in the corresponding fields here. You can change most of the suggested values.

Field	Description
	<p>The other lines show the customer's name and address. It is retrieved from the customer information card. You can change the information.</p> <p>The customer number can be changed up until lines have been created in the quote. If you change the customer number, Maconomy will update the quote with various information from the customer information card and derive the dimensions for the card part of the quote again. If charges have been specified on the quote, the ship-to customer can only be changed to a customer using the currency already specified on the quote.</p>
<b>Attn.</b>	This is the customer's attention person the person to whom shipping information is directed. It is retrieved from the Customer information card. The name can be changed here.
<b>Country</b>	This is the customer's country. It is retrieved from the customer information card. You can change it.
<b>Phone</b>	This is the customer's telephone number, retrieved from the customer's information card. It can be changed here.
<b>Fax</b>	This is the customer's fax number, retrieved from the customer's information card. It can be changed here.
<b>Telex</b>	This is the customer's telex number, retrieved from the customer's information card. It can be changed here.
<b>E-mail</b>	This is the customer's e-mail address, retrieved from the customer's information card. It can be changed here.

### Status Island

Field	Description
<b>Created on</b>	This is the date the quote was created. The date cannot be changed.
<b>Printed</b>	This field shows whether the quote has been printed or not. To print a quote, use the action "Print Quote." This is the only way to mark the field.
<b>Last Printed on</b>	This is the date the quote was last printed. The date cannot be changed manually.
<b>Quantity</b>	<p>This field shows how many times the quote has been printed.</p> <p>This quantity does not include copies from your computer's standard print dialog. You cannot change the value of this field.</p>

### Price Island

Field	Description
<b>Currency</b>	Here you select the currency of the quote. Maconomy suggests the currency from the customer's information card, but you can change it. The currency can

Field	Description
	be changed for the current quote up until the first item line is entered on the quote or a charge is specified.
<b>Exchange Rate Date</b>	<p>In this field, you can specify the exchange rate date for the calculation of prices in currency on the quote. The exchange rate date is also used in the calculation of charges. When a quote is created, Maconomy automatically suggests today's date in this field if the system parameter "Fix exchange rate at order creation" has been marked. However, you can change or delete the exchange rate date at any time whether the field has been completed automatically or not.</p> <p>If this field contains a date, all prices on the current quote will be calculated using the exchange rate valid on the specified date. This way, the same exchange rates and thereby the same currency prices are used throughout the order flow, ensuring that, for example, the amount invoiced matches the amount originally quoted to the customer.</p> <p>If you leave this field empty, prices will be calculated using the exchange rate valid at the time of the price calculation.</p> <p>Currency prices are calculated when lines are created, and recalculated when updating lines and when printing information such as packing slips and invoices later in the process. Changing or removing the currency may therefore result in variances between the original quote amount and the amount invoiced or appearing on another printout.</p>
<b>Total Sales</b>	This field shows the sum of the prices of the item lines in the quote. The value cannot be changed here.
<b>Invoice Discount %</b>	<p>Here you can enter an invoice discount percentage. Maconomy suggests the value from the Bill To or Ship To Customer's information card, depending on whether or not you have marked the "Inv. Disc. from Bill to Cust." field in the System Information window. You can change the suggested value.</p> <p>If you select another invoice discount % than the one suggested, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus discounts, is given to users in the window Actions in the Set-Up module.</p> <p>An invoice discount is deducted from the item sum. This is shown on the quote printout.</p>
<b>Invoice Discount</b>	This field shows the calculated discount amount in the currency selected for the current quote.
<b>Tax on Sales</b>	<p>This field shows the calculated tax amount in the currency selected for the current quote. Tax is only calculated if the "Tax" field in this island has been marked.</p> <p>If multiple tax codes are enabled, three additional fields will be added above the "Tax on Sales" field: "Tax 1," "Tax 2" and, if enabled, "Tax 3." In this case, the "Tax on Sales" field calculates the sum of the other individual tax amount fields. For further information on multiple tax codes, please see the description in "Tax Codes."</p>

Field	Description
<b>Total Charges</b>	This field shows the sum of any charges on the quote, including tax. Charges are calculated when you select the action "Calculate Charges."
<b>Tax on Charges</b>	This field shows the tax calculated from any charges on the quote. If multiple tax codes are enabled, three additional fields will be added above the "Tax on Charges" field: "Tax 1, Charges," "Tax 2, Charges" and, if enabled, "Tax 3, Charges." In this case, the "Tax on Charges" field calculates the sum of the other individual tax amount fields. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Total (incl. charges)</b>	This field shows the total price of the quote in the currency of the quote. The field thus shows the sum of the fields "Total Sales," "Tax on Sales," and charges including tax, less the amount in the field "Invoice Discount."
<b>Price List</b>	Here you select a sales price list. Maconomy suggests the value from the customer's information card, but you can change it. The pop-up field only shows existing sales price lists, that is, sales prices lists created in the Price Lists window in the Inventory module. If you select "blank," Maconomy calculates prices from costs and gross margins.  If you select another price list than the one suggested, Maconomy verifies that you have user access to it. Access to changing price information, and thus price lists, is given to users in the window Actions in the Set-Up module.  If you use a price list with a currency that is different from the currency used in connection with the quote, Maconomy will give you a warning. In such cases, the prices stated in the price list will be recalculated to the currency of the quote using the exchange rate table for sales.
<b>Price Step</b>	Here you can select a price step in the price list from which to take the prices in the quote. Step "6" is the highest. Maconomy suggests the value from the customer's information card, but you can select another. This field only applies if you enter a value in the Price List field.  If you select another price step than the one suggested, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus price step, is given to users in the window Actions in the Set-Up module.  Note, that if the "Fixed Price Step" field in the System Information window is marked, and if you enter a value between 1 and 6, Maconomy will always suggest the price on the given price step, regardless of whether the quantity ordered would normally justify a lower price because of a quantity discount.  If the "Fixed Price Step" is not marked, Maconomy applies the highest price step the order quantity justifies.
<b>Keep Price</b>	In this field, you can specify the value which Maconomy should suggest in the corresponding field on each line created in the table part. On the lines, the field determines whether a change in quantity should cause the current unit price or discount percentage to be recalculated. For further information, see the description of the field "Keep Price."

Field	Description
	When you create a quote, Maconomy suggests the value from the corresponding field in the customer information card, but you can change it for the current quote.
<b>Tax</b>	<p>If this field is marked, the quote will be taxed. Maconomy suggests the value from the customer information card in the accounts receivable module, but it is possible to change it.</p> <p>If you change the value, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus the value here, is given in the window Actions in the Set-Up module.</p>
<b>Tax No.</b>	Here you enter the customer's tax number. Maconomy suggests the value from the bill-to customer's information card in the Accounts Receivable module, but it is possible to change it. If a validation rule is assigned to the tax number field in the window Rules of Validation in the Set-Up module, Maconomy will validate the tax number upon entry or change. If you enter a new bill-to customer, Maconomy transfers the new tax number.

### Payment Island

Field	Description
<b>Pmt. Terms</b>	<p>Here you select which payment terms to apply if the quote is accepted. Maconomy automatically retrieves the value you normally use for this customer from the Payment Information window in the Accounts Receivable module, but you can change it.</p> <p>If you change the payment terms, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus payment terms, is given to users in the window Actions in the Set-Up module.</p> <p>Payment Terms are defined in the Popup Fields window in the Set-Up module.</p>
<b>Blanket Invoice</b>	<p>If you mark this field, the quote will be invoiced on a blanket invoice to the customer. Maconomy suggests the value from the customer's information card in the Accounts Receivable module, but you can change it.</p> <p>Blanket invoicing means that all uninvoiced deliveries to a customer with the same bill-to customer, currency, department, warehouse, and responsible company will be gathered in one invoice. This is done in the Print Invoice window.</p>

### Weight and Volume Island

Field	Description
<b>Weight</b>	<p>This is the total weight of the item lines in the quote. The value cannot be changed here.</p> <p>If you have Maconomy Bill of Materials, and the item on the line is a BOM without inventory control, Maconomy uses the weight of the BOM parts on the highest level with inventory control in the total quote weight. Any weight entered for the BOM header on its item information card is not used.</p>

Field	Description
<b>Volume</b>	<p>This is the total volume of the item lines in the quote. The value cannot be changed here.</p> <p>If you have Maconomy Bill of Materials, and the item on the line is a BOM without inventory control, Maconomy uses the weight of the BOM parts on the highest level with inventory control in the total quote weight. Any weight entered for the BOM header on its item information card is not used.</p>

### Order Linking Island

Field	Description
<b>No. of Suborders</b>	<p>This field displays the number of suborders linked to the current quote, if any. Note that it is not possible to delete a quote to which suborders have been linked. If the quote is not accepted, all linked quotes must therefore be deleted first.</p>
<b>Main Order No.</b>	<p>In this field, you can enter the number of a quote or a sales order if you want to link the current quote to a main order. The current quote will then become a suborder to the order or quote specified. If you later remove the value, the link between the current quote and the main order is deleted. If the current quote itself is a main order, this field will display the quote's own number, and this value cannot be changed as a main order cannot be a suborder of another sales order or quote.</p> <p>The linking of orders and quotes enables you to print all information about all orders and quotes assigned to a main order. You can print summary information about main orders and their suborders in the windows Print Main Order and Print Main Order Invoice. The individual suborders are processed as normal, single orders, for example, implying that each suborder must be approved and invoiced separately.</p> <p>Note that it is not possible to delete a quote to which suborders have been linked. If the quote is not accepted, all linked quotes must therefore be deleted first.</p>
<b>Itemize</b>	<p>This field is not used in the current version of Maconomy.</p>

### Account Information Island

Field	Description
<b>Changed</b>	<p>This field shows whether you have changed any of the information suggested by Maconomy in the above fields. Maconomy marks the field if you have changed information in any of the following fields: "Pmt. Terms," "Tax," "Price List," "Price Step," "Invoice Discount %," and all the fields in the Charges island. Maconomy also registers changes in the amount and discount fields in the table part. The value cannot be changed.</p> <p>If you have Maconomy Bill of Materials, Maconomy registers any changes to prices or discounts of BOM parts made in the Order Lines window.</p>

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the quote in question. By assigning a document archive to a quote, you can keep track of the various documents related to the quote. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives. This field also shows the description of the specified document archive.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.

**Dimensions Island**

Field	Description
<b>Location</b>	In this field, you can enter a value for the dimension Location. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Parameters in the set-up module. See the chapter "Introduction to the G/L Module" and the window Dimension Derivations for a further description of dimension derivation.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

**Credit Card Island**

Field	Description
<b>Credit Card No.</b>	If the customer wants to pay by credit card, you can enter the number of the credit card in this field. Maconomy will automatically suggest the credit card number specified on the bill-to customer's information card, but you can change the number here. Note that the number is only for information; customer payments using credit cards cannot be handled by Maconomy's Banking module. If a credit card number is entered, an expiry date must also be specified.

Field	Description
<b>Expiry Date</b>	In this field, you can enter the expiry date of the credit card specified in the field "Credit Card No." above. If an expiry date is entered, a credit card number must also be specified.
<b>Amount Authorized</b>	In this field, you can specify the amount which the credit card issuer has accepted to pay for the order which will later be created for the current quote.
<b>Authorization Code</b>	In this field, you can specify the authorization code which the credit card issuer has given when approving the amount in the field "Amount Authorized" above.
<b>Authorization Date</b>	In this field, you can specify the date when the amount was authorized by the credit card issuer.

### Contact Management Island

Field	Description
<b>Campaign No.</b>	In this field, you can enter the number of a campaign if the current quote is connected to a certain campaign in the Contact Management module. If you enter a campaign number, Maconomy transfers the number to lines that are then created in the table part. The campaign number can be used for, for example, statistical purposes.

### Copying Island

Field	Description
<b>Cust. No.</b>	In this field, you can enter the customer number to be used on the copy of the current quote. If you specify a number, Maconomy will get the latest customer information from the A/R module. If you do not complete the field, the customer number and the customer information on the current quote will be transferred to the new copy. If you specify a customer number, Maconomy automatically recalculates the prices on the copy unless you complete the field "Maintain Prices" in this island.
<b>Order Type</b>	In this field, you can specify whether the copy is to be a quote or a sales order. Although the pop-up shows other options, only "Quote" and "Sales Order" can be selected. Maconomy suggests "Quote." If you choose to create a sales order, the copy created will be a non-approved sales order, and if you choose to create a quote, the quote will be a non-printed quote.
<b>Warehouse</b>	In this field, you can select a warehouse to be used on the copy. Maconomy suggests the warehouse specified on the current quote, but if you enter another customer number in the field "Customer No." in this island, Maconomy gets the warehouse specified on the customer information card of the customer in question.
<b>Company No.</b>	In this field, you can specify the company to be used on the copy. If you specify a company number, the company in question will be responsible for

Field	Description
	the copy. If you do not enter a number, the company responsible for the current quote will be used on the copy.
<b>Currency</b>	In this field, you can select a currency to be used on the copy. If you select a currency, Maconomy automatically recalculates the prices on the copy unless you complete the field "Maintain Prices" in this island. If the user does not have access to changing prices, the value in this field cannot be changed.
<b>Price List</b>	In this field, you can select a price list to be used on the copy. If you select a price list, Maconomy automatically recalculates the prices on the copy unless you complete the field "Maintain Prices" in this island. Maconomy suggests the price list specified on the current quote, but if you specify another customer number in the field "Customer No." in this island, Maconomy gets the price list specified on the customer information card of the customer in question.
<b>Price Step</b>	In this field, you can specify a fixed price step to be used on the copy. If you specify a price step, Maconomy automatically recalculates the prices on the copy unless you complete the field "Maintain Prices" in this island. Maconomy suggests the price step specified on the current quote, but if you specify another customer number in the field "Customer No." in this island, Maconomy gets the price step specified on the customer information card of the customer in question.
<b>Pref. Deliv. Date</b>	In this field, you can enter a preferred delivery date to be used on the copy. Maconomy suggests today's date but you can change the date.
<b>Job No.</b>	In this field, you can specify a job number to be used on the copy. Note that if a job has been closed, it is no longer possible to create a quote for the job unless the job is first reopened in the window Jobs in the Job Cost module. If you complete this field, you must also complete the field "Activity No." in this island.
<b>Activity No.</b>	In this field, you can specify an activity number to be used on the copy.
<b>Task</b>	In this field, you can specify a task to be used on the copy.
<b>Maintain Prices</b>	If you complete this field, the prices on the lines of the current quote will also be used on the copy. If you do not complete the field, or if you have specified a customer, currency, price list or price step, Maconomy calculates the prices on the copy.

**Remarks Island**

Field	Description
<b>Reference</b>	Here you enter the customer contact with whom you spoke about the quote. The name is printed on the quote as well as on other order documents.
<b>Customer</b>	Here you can enter an internal note about the customer. The text is printed on the packing list if the quote results in a sales order. Maconomy suggests the note from the Customer information card, but you can change it.
<b>Warehouse</b>	Here you enter an internal note to warehouse employees. The text is printed on the packing list if the quote results in a sales order. You can, for example, specify how the item should be handled and packed, or request an invoice to be sent along with the delivery.
<b>End User No.</b>	<p>Here you enter the number of the end customer associated with the quote. If you are dealing with an end customer sale, which is determined by order mode, you must complete the field. It is an end customer sale if the "End User Required" field is marked in the Popup Fields window in the Set-Up module for the order mode. It is only possible to enter the number of an end customer in the Accounts Receivable module to which the customer on the quote is registered. You can use the search functions in the Find menu if you cannot remember the number.</p> <p>The field is used if your quote is for a customer who is reselling to an end customer. Information on your end customers is managed in the End Users window.</p>

**Billing Address Island**

Field	Description
<b>Bill to Customer</b>	<p>Here you can enter the number of a bill-to customer. Maconomy retrieves the bill-to customer from the ship-to customer's information card, but you can change it. Maconomy verifies that the customer exists in the Accounts Receivable module.</p> <p>The two customers are not the same, if items are being delivered to one customer and billed to another.</p> <p>The other lines show the bill-to customer's name and address. Maconomy retrieves the information from the customer information card. The address is maintained on the customer information card and cannot be changed here.</p>
<b>Attn.</b>	This is the customer's attention person the person to whom payment information is directed. Maconomy retrieves the name from the customer's information card. It cannot be changed here.
<b>Country</b>	This is the customer's country. It is retrieved from the customer information card. It cannot be changed here.

**Settling Company Island**

Field	Description
<b>Company No.</b>	<p>This field shows the number of the settling company that applies to the current quote.</p> <p>If an invoice is created later in the process and the company in this field is different from the one specified in the island Company, Maconomy will automatically create intercompany balances. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>For further information about the influence of a settling company and how such a company is determined, please see the section Multiple Companies in the chapter "Introduction to the G/L Module." Intercompany balances are described in the window Intercompany Accounts in the G/L module.</p>
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

**Company Island**

Field	Description
<b>Company No.</b>	<p>In this field, you can enter the number of the company responsible for the quote. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the set-up module.</p> <p>If an invoice is created later in the process, and the company in this field is different from the one shown in the field "Company No." in the island Settling Company, Maconomy will automatically create intercompany balances. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>See the section "Multiple Companies" in the chapter "Introduction to the G/L Module" and the window Intercompany Accounts in the G/L module for a further description of the concept of responsible companies and intercompany balance.</p> <p>This field also shows the name of the specified company.</p>

**Delivery Island**

Field	Description
<b>Partial Delivery</b>	<p>You can mark this field to permit partial delivery when the quote is converted to a sales order. Maconomy suggests the value from the System Information window in the Set-Up module, but you can change it.</p> <p>If the field is not marked, you can only print a warehouse transaction, picking list, packing list, packing slip or invoice in the Sales Orders window if all the items sold are being packed. In the Packing Lists window you cannot</p>

Field	Description
	<p>approve a packing list until the warehouse has confirmed that all the items have been packed.</p> <p>Furthermore, the field determines whether individual consignments can be specified for each line. For further information on this, see the field "Consignment No." in the card and table parts.</p>
<b>Back Order Handling</b>	<p>Here you select how to process back orders. There are three possible ways: Save, Delete, and Transfer. A more detailed description is given in the window Sales Orders. Maconomy automatically suggests the value that is entered in the customer's information card, but it can be changed in the quote.</p>
<b>Blanket Order</b>	<p>In this field, you can specify whether conversion of the quote should result in a blanket order, that is, a sales order where the field "Blanket Order" is marked. If this field is marked on the order to which the quote is converted, back orders registered to the delivery customer are transferred to the order when you print a picking list or packing list.</p> <p>The field also determines whether Maconomy is allowed to move order lines to and from the order to which the quote is converted. For detailed information on blanket orders, please see the description of the corresponding field in the window Sales Orders.</p> <p>The field has no significance until the quote is converted to a sales order.</p>
<b>Split Lines Automatically</b>	<p>If this field is marked, converting the current quote will cause Maconomy to attempt to split the resulting order lines with the purpose of obtaining the earliest possible delivery date for as many units of the items as possible, as described in the section on the action "Convert to Order."</p>
<b>Pref. Deliv. Date</b>	<p>Here you can enter the customer's preferred delivery date, if the quote results in a sales order. Maconomy suggests the date on which the quote was created. However, if you enter a blank preferred delivery date, today's date is considered the preferred delivery date.</p> <p>If you enter a historical date here, you run the risk that Maconomy uses an obsolete discount agreement to calculate prices.</p>
<b>Urgent</b>	<p>In this field, you can specify whether this sales order is urgent. An order can, for example, be urgent if the items must be delivered within a shorter time frame than allowed by the items' usual delivery time. If you mark this field and specify a delivery date in the field "Deliv. Date," Maconomy will not automatically change the delivery date according to the availability of the items in the warehouse. When you mark this field, Maconomy forces a reservation of the items on the delivery date specified in the field "Deliv. Date," even if this will cause the reservation of more units than available, and even if the back order principle "By reservation" is used. This field should therefore be used with caution.</p> <p>It is not possible to mark blanket orders and orders with partial delivery as urgent.</p>

Field	Description
<b>Deliv. Date</b>	<p>This field shows the expected delivery date if the quote is accepted. The field shows the latest delivery date for the quote and BOM lines.</p> <p>If the quote header is assigned to a consignment, the delivery date registered on the quote and the assigned lines will be changed to the packing date of the consignment. After this, it is not possible to add lines that cannot be delivered on the packing date of the consignment.</p> <p>If the field "Urgent" is marked, you can manually enter a value in this field. Marking the quote as urgent will prevent Maconomy from changing the delivery date according to the availability of the items in the warehouse. Please note, however, that it is only possible to enter a delivery date for an urgent quote if the field "Partial Delivery" is not marked. If the field "Partial Delivery" is marked, the delivery date of an urgent quote can only be changed on the individual items in the table part of the window. For urgent quotes, the date in this field is automatically transferred to the sales order when the quote is converted to a sales order.</p>
<b>Warehouse</b>	<p>In this field, you can select which warehouse the items are to be delivered from, if the quote is accepted. Maconomy suggests the sales warehouse from which the items are normally delivered to the current customer, but you can select another. The pop-up field only shows existing warehouses, that is, warehouses created in the window Warehouse Information Card in the Inventory module.</p> <p>You can only deliver items from one warehouse on a given quote, unless you have marked the field "Get Inventory From Item" in the window System Information in the Set-Up module. If that field is marked, a warehouse can be specified on each line in the table part. If multiple warehouses have been specified for a quote, a sales order will at the approval of the order to which the quote has been converted be created for each warehouse on the order in addition to the warehouse specified in this field.</p> <p>If an invoice is created later in the process, and you have selected a warehouse assigned to another company than the one specified in the island Company on the current quote, Maconomy will automatically create intercompany balances when the item journal is posted. In the intercompany balance, the company to which the warehouse is assigned will be the intercompany company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p>
<b>Stock Location No.</b>	<p>In this field, you can specify the location in the selected warehouse from which you expect the items to be shipped. This location will apply to those lines in the table part where the stock location field is left blank. If a stock location is specified on a given line, it overrules any location specified in this field. Maconomy suggests the standard shipping location specified for the current warehouse in the window Warehouse Information card, but you can specify another location. When you create a line in the table part, the location in this field is suggested on the new line.</p>

Field	Description
	It is not mandatory to enter location numbers in this window. However, the location information is also transferred when the quote is converted to an order, and it is not possible to create a warehouse transaction for an order until you have either entered a location in the card part or on the individual item lines.
<b>Carrier</b>	Here you select the carrier to deliver the items on the current quote, if the quote is accepted. Maconomy suggests the carrier from the customer's information card, but you can change it. If a destination has been specified on the quote, and the quote is not yet assigned to a consignment, the field can be changed to blank. In this case, Maconomy will disregard the carrier when assigning the quote to a consignment. See "Appendix B: Assign Quote/Order to Consignment" for further information about assigning quotes to a consignment. Carriers are maintained in the window Popup Fields in the Set-Up module.
<b>Delivery Mode</b>	Here you select which delivery mode to apply, if the quote is accepted. Maconomy suggests the delivery mode from the customer's information card, but you can change it. If a destination has been specified on the quote, and the quote is not yet assigned to a consignment, the field can be changed to blank. In this case, Maconomy will disregard the delivery mode when assigning the quote to a consignment. See "Appendix B: Assign Quote/Order to Consignment" for further information about assigning quotes to a consignment. Delivery modes are maintained in the window Popup Fields in the Set-Up module.
<b>Delivery Terms</b>	Here you select which delivery terms to apply, if the quote is accepted. Maconomy suggests the delivery terms from the customer's information card, but you can change it. If a destination has been specified on the quote, and the quote is not yet assigned to a consignment, the field can be changed to blank. In this case, Maconomy will disregard the delivery terms when assigning the quote to a consignment. See "Appendix B: Assign Quote/Order to Consignment" for further information about assigning quotes to a consignment. Delivery terms are maintained in the window Popup Fields in the Set-Up module.
<b>Consignment Type</b>	In this field, you can select the consignment type which is to apply to the current quote. Maconomy will automatically retrieve the consignment type on the customer information card for the current customer, but the consignment type can be changed here. If a destination has been specified on the quote, and the quote is not yet assigned to a consignment, the field can be changed to blank. In this case, Maconomy will disregard the consignment type when assigning the quote to a consignment. See "Appendix B: Assign Quote/Order to Consignment" for further information about assigning quotes to a consignment. Consignment types are maintained in the window Popup Fields in the Set-Up module.
<b>Destination No.</b>	In this field, you can specify the number of the destination to which the current quote is to be delivered if it is accepted. Maconomy will automatically retrieve the destination number on the customer information card for the

Field	Description
	current customer, but the destination number can be changed here. The destination number is used when Maconomy assigns the quote to a consignment. Maconomy will only consider consignments for the destination specified in this field. See “Appendix B: Assign Quote/Order to Consignment” for further information about assigning quotes to a consignment.
<b>Consignment No.</b>	<p>In this field, you can specify a consignment number if you want to assign the current quote to a consignment manually. Assigning a quote to a consignment means that the quote will be part of a joint delivery of different sales orders to the same destination on the same date and with the same combination of carrier, delivery mode, delivery terms, and consignment type.</p> <p>If the quote has partial delivery, it is possible to assign each line to a separate consignment, but if you specify a consignment — In this field, all lines in the table part are automatically also assigned to this consignment whether the quote has partial delivery or not.</p> <p>It is also possible to have Maconomy automatically assign the quote to a consignment by selecting the action “Assign Quote to Consignment.” If you let Maconomy select a consignment, Maconomy will attempt to find a consignment which matches the quote’s terms with regard to destination, delivery date, carrier, delivery mode, delivery terms, and consignment type. Please note, however, that if the quote has partial delivery, the action will be carried out on the individual quote lines instead of the card part.</p> <p>When you complete the field, any values in the fields “Carrier,” “Delivery Mode,” “Delivery Terms,” “Consignment Type,” and “Destination No.” are overwritten with the information pertaining to the selected consignment. Furthermore, all delivery dates on the quote are changed to the packing date of the consignment. See “Appendix B: Assign Quote/Order to Consignment” for further information about assigning quotes to a consignment.</p> <p>If the field is completed and you select the action “Convert Quote to Order,” Maconomy checks if all items on the lines of the quote can be delivered on the packing date of the consignment in question. If they cannot all be delivered on the packing date, the quote cannot be converted.</p>
<b>Latest Arrival</b>	In this field, you can specify a date for the latest arrival permitted for the items to the current customer. If you specify a date In this field, Maconomy will issue a warning if the quote is assigned to a consignment with an arrival date after the date in this field.
<b>Packing Date</b>	If the quote is assigned to a consignment, this field displays the date on which packing for the consignment in question should commence. The value is retrieved from the corresponding field in the window Consignments for the consignment in question. If the quote is assigned to a consignment, the delivery date registered on the quote is changed to the date displayed In this field, and the contents of this field can no longer be changed.
<b>Consignment Date</b>	If the quote is assigned to a consignment, this field displays the expected date of departure for the consignment in question. The value is retrieved from the corresponding field in the window Consignments for the consignment in question.

Field	Description
<b>Arrival Date</b>	If the quote is assigned to a consignment, this field displays the expected date of arrival to the destination for the consignment in question. The value is retrieved from the corresponding field in the window Consignments for the consignment in question.
<b>Charge Table</b>	In this field, you can select a charge table to be used for charge calculation. The field is transferred from the customer information card when the quote is created.
<b>Charge Discount %</b>	In this field, you can enter a charge discount percentage. A discount percentage entered in this field will be applied in addition to the one which can be specified in the charge table. The field is transferred from the customer information card when the quote is created.

### Charges Island

Field	Description
<b>Charge 1</b>	<p>Here you can select a charge. Maconomy suggests the value from the “Charge Code 1” field in the customer’s information card, but you can change it.</p> <p>In the window Charges you can enter the charge codes which should be available in this pop-up field, and you can define the texts, percentages and/or amounts to be attached to each charge. If a charge is specified to be a one-time charge, the charge will be removed from the quote upon invoicing later in the process.</p> <p>The charge amount can be calculated on the basis of the information in the selected charge code, or it can be entered manually. In the latter case, the field “Maintain” is automatically selected. The charges in the quote are not calculated, until you select the action “Calculate Charges.” You have to select this action if you want to see the charges expected on the subsequent invoice.</p> <p>You can select the action several times for the same quote. This may be necessary if lines are added to the quote, or the charge codes are changed. When the action is selected, the charges are calculated for the entire quote, including manually entered amounts. You may however maintain the amount of any charge by selecting the corresponding field “Maintain,” for example, if you have agreed on a fixed charge amount, which is not necessarily the same as the calculated amount.</p> <p>When you print external order papers, such as quotes, order confirmations, and invoices, only charges where the field “Maintain” is not marked are recalculated automatically. However, please note that the charges calculated as a result of a printout are only displayed on the printout, as the amounts are not updated in the quote window.</p> <p>If you change the charge code or the fixed charge amount, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus to change charge codes and charges, is given in the window Actions in the Set-Up module.</p>
<b>Charge 2</b>	This field applies to charge 2, and it functions in the same way as the “Charge 2” field described above.

Field	Description
<b>Charge 3</b>	This field applies to charge 3, and it functions in the same way as the “Charge 3” field described above.
<b>Charge 4</b>	This field applies to charge 4, and it functions in the same way as the “Charge 4” field described above.

### Customer Information Island

Field	Description
<b>Department</b>	<p>Here you select the department which the quote involves. Maconomy suggests the value from the information card of the Ship To or Bill To customer, depending on whether or not you have marked the “Dept. from Bill to Cust.” field in the window System Information. You can change the suggested department.</p> <p>Departments are maintained in the window Posting References in the G/L module.</p>
<b>Language</b>	<p>Here you can select the language of the quote. Maconomy suggests the value from the customer’s information card, but you can change it. Any external order documents, resulting from the quote, will be printed in the language specified here. For further guidance, see the “Description Lang. 1,” “Description Lang. 2,” and “Description Lang. 3” fields in the Description island in the Item Information Card window in the Inventory module.</p> <p>You can use the language code to print the quote in different languages. You can also use Maconomy’s layout editing tools to create different language quote layouts. These are applied in the Print Quote window.</p> <p>You maintain language codes in the Popup Fields window in the Set-Up module.</p>
<b>Customer Group</b>	This is the customer group to which the customer is assigned. The value is retrieved from the customer’s information card. It cannot be changed here.
<b>Cust. Payment Mode</b>	<p>In this field, you can specify how the customer is to pay the invoice created later in the process. If the field is left blank, Maconomy will use the customer payment mode specified for the customer in the window Payment Information.</p> <p>Customer payment modes are created in the window Customer Payment Modes in the Banking module.</p>
<b>Global Location No.</b>	<p>If the customer has requested that you use a specific global location number on invoices pertaining to the current quote, you can specify the location number in question here. Maconomy suggests the global location number specified in the window Company Specific Payment Information for the customer in question, but you can change it here if the location number to be used in connection with the current quote is not the same as the standard location number of the customer.</p> <p>For further information about the concept of global location numbers, see the introduction to the window Company Locations in the G/L module.</p>

Field	Description
<b>Enterprise</b>	This field shows the value from the field "Enterprise" in the window Customer Information Card, but it is possible to change it. Enterprises are created in the window Popup Fields in the Set-Up module. They are used for statistics.
<b>Segment</b>	This field shows the value from the field "Segment" in the window Customer Information Card, but it is possible to change it. Segments are created in the window Popup Fields in the Set-Up module. They are used for statistics.
<b>Area</b>	This field shows the value from the field "Area" in the window Customer Information Card, but it is possible to change it. Areas are created in the window Popup Fields in the Set-Up module. They are used for statistics.
<b>Company Tax Code</b>	<p>In this field, you can specify a company tax code created in the window Popup Fields. The field is used by Maconomy for determining the tax code to be used in the calculation of tax for the current quote, as the reporting code is part of the criteria for the selection of a tax code in the window Tax Tables in the G/L module. At this selection, Maconomy uses the tax table specified for the responsible company assigned to the current quote. The tax table is selected in the window Company Information. However, the tax code is only selected from a tax table if you have specified that tax tables which are specified in the window System Information are to be used, and only if the company responsible for the current quote is assigned to a tax table. If no tax table has been specified for the responsible company or if you use differentiated tax, and you do not use tax tables, Maconomy uses the tax code specified for the individual item in the window Item Information Card in the Inventory module or, in the case of charges, the tax code specified for the individual charge in the window Charges.</p> <p>If you use neither differentiated tax nor tax tables, Maconomy uses the standard tax code specified in the window System Information in the Set-Up module.</p> <p>If you use tax tables, and the system parameter "Get on account tax code from tax table" is marked, the tax code to be transferred to account invoices is found in a tax table. But instead of using the item tax code specified on an activity, item, charge or account, Maconomy uses the on account tax code in the field "On Account Tax Code" in the window System Information in the Set-Up module (along with various other information) to point out the relevant tax table line. If the system parameter "Get on account tax code from tax table" is not marked, the standard tax code specified in the window System Information is always used as the tax code on invoices on account. For further information about the information used to point out the correct tax code, please see the description of the window Tax Tables in the G/L module.</p> <p>When posting invoices, the reporting code is used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if extended tax reporting has been selected in the window System Information.</p> <p>The value of this field is transferred from the customer information card, but can be changed in this field.</p>

**Job Cost Island**

Field	Description
<b>Invoice in Job Cost</b>	<p>You can mark this field to show that a sales order created from this quote is to be invoiced in the Job Cost module. You can only mark the field if the quote is assigned to a job.</p> <p>Please note that this field must be marked if you enter the number of a job which uses the invoicing method "Fixed-price," and for which only invoicing on account is allowed, in the field "Job No." in this island. The invoicing method selected for a job can be seen and changed in the window Job Parameter Selection.</p> <p>Furthermore, if the system parameter "Invoice Orders with Job Numbers in Job Cost" has been marked, this field is automatically marked if you specify a job number in the field "Job No." below. Subsequently removing the job number will cause the field to be unmarked.</p> <p>If a job has been closed, it is no longer possible to create a quote for the job unless the job is first reopened in the window Jobs in the Job Cost module.</p>
<b>Job No.</b>	<p>Here you can enter the number of a job from the Job Cost module to assign the quote to a job. Certain jobs might, for example, involve item sales from Maconomy's Inventory module.</p> <p>If you enter a job number when creating a quote and you leave the field "Customer No." blank in the island "Ship to Address," the quote is automatically assigned to the same customer as the job.</p> <p>If the quote is converted to a sales order, the sales order will be invoiced separately in the Sales Orders module. The sales figures are transferred to the job specified here so that the job can be costed with the inclusion of item sales. Please note that if you specify a job number, it is only possible to convert the quote into a sales order if the job has order status.</p> <p>Maconomy verifies that the job exists, that it has quote status, and that the company responsible for the job is the same as the one responsible for the quote. Maconomy also verifies that the job is neither blocked nor closed. If the Ship to Customer on the quote and job are not the same, Maconomy gives you a warning. If there are lines in the quote before it is assigned to a job, you must first enter an activity number on the individual quote lines.</p> <p>If you enter a job number here, and the system parameter "Invoice Orders with Job Numbers in Job Cost" has been marked, the field "Invoice in Job Cost" above is automatically marked, and subsequently removing the job number will cause the field to be unmarked.</p> <p>Please note that if you specify a job that uses the invoicing method "Fixed-price" and for which only invoicing on account is allowed, the field "Invoice in Job Cost" must be marked. The pricing method selected for a job can be seen and edited in the window Job Parameter Selection.</p>
<b>Activity No.</b>	In this field, you can enter the number of an amount activity from the Job Cost module if the quote is assigned to a job. This activity number will be suggested on lines created in the table part.
<b>Task</b>	In this field you can enter the name of a task if the quote is assigned to a job.

### Statistics to Tax Authorities Island

Field	Description
<b>EU Sale</b>	This field must be marked if the invoice is for an EU sale. If the "Sales List System Report" field in the System Information window is marked, Maconomy will mark this field if the bill-to customer is from another EU country and is not subject to paying tax, that is, the "Tax" field is not marked. If the field "Sales List System Report" is marked, the invoice will be included in your quarterly report to the EU Sales List System.
<b>Intrastat Reg.</b>	Here you can specify whether to include the invoice in your monthly report to Intrastat. If the "Intrastat Export Report" field in the System Information window is marked, Maconomy suggests a mark here if the bill-to customer is from another EU country and is not subject to paying tax, that is, the "Tax" field is not marked.
<b>EU Trade Type</b>	Here you can enter either "Normal" or "Triangulation" to indicate the EU trade type. Triangulation means you act as agent for a vendor in another EU country and a customer in third EU country. Invoice amounts from triangulation are not included in the EU sales on your tax specification, but are reported separately to the Sales List System.  The value is copied from the information card of the bill-to customer, but can be changed here.
<b>Nature</b>	Here you select which transaction to report to Intrastat. They are created in the Popup field window in the Set-Up module.
<b>Customs Document</b>	In this field, you can enter the number of any customs document which pertains to the current quote. Maconomy will automatically complete this field when you print a customs document which makes up the current quote in the window Print Customs Document, but you can change the number to assign the quote to another existing customs document.

### Extra Fields Island

Field	Description
<b>Popup 1-5</b>	In these fields, you can specify further information regarding the quote and the current customer. You might, for example, specify a "hold" code or information about substitution items. Maconomy suggests the value of the corresponding fields in the customer's information card, but you can change the values for the current quote. The pop-up options are created in the window Popup Fields in the Set-Up module.

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

## Quote Lines Sub-Tab

This section includes the fields and descriptions for the Quote Lines sub-tab.

Field	Description
<b>Item No.</b>	<p>Here you enter the item number related to the quote.</p> <p>Maconomy verifies that the item exists, that is, that it has been created in the window Item Information Card in the inventory module. Maconomy also verifies that the item belongs to the warehouse specified in the card part.</p> <p>To create a text line on the quote, it is necessary to leave this field blank. You must enter the text in the field "Description" and leave all other fields blank.</p>
<b>Quantity</b>	<p>Here you enter the item quantity.</p> <p>If the line is a text line, leave the field blank.</p> <p>If the item is a BOM, you can change the quantity after the line has been created if the BOM is not itemized on the printed quote. You specify in the BOM Information Card whether BOM parts are to be itemized on quotes.</p> <p>Please note that if the quantity is changed on a line containing an item with price control, Maconomy makes a recalculation of the prices, unless the field "Keep Price" is marked for the line.</p>
<b>Unit</b>	<p>Here you choose the item unit of the quote. Maconomy suggests the value from the item's information card in the Inventory module, but you can change it.</p>
<b>Description</b>	<p>This is the item text, retrieved from the "Description Lang. 1" field in the Item Information Card. The text can be changed.</p>
<b>Unit Price</b>	<p>In this field, you can enter the item's unit price in the quote. If the quote is assigned to a price list, and the item is included in the price list, Maconomy suggests the price from the price list.</p> <p>If the quantity justifies a quantity discount, or if a fixed price step has been specified on the quote, the unit price suggested in this field will be the price on the price step in question as specified in the window Quantity Discounts in the Inventory module. However, the suggested price can be changed here if you and the customer have agreed on a special price.</p> <p>If the item is not included in the price list, or if you have not selected a price list for the quote, Maconomy suggests the current cost of the item in the warehouse in question and adds the gross margin percentage, both of which are retrieved from the item's information card. This functionality only applies if the field "Sales Price Costing" has not been marked on the item's information card. If sales price costing is used for the item, the price is still retrieved from the price list, but in this case, the cost is determined by the sales price, using the gross margin percentage. The cost is not shown, but it is used when posting the cost of sales. If the item is not in the price list, Maconomy suggests the price 0.</p> <p>Please note that the unit price of BOMs can be reduced if the following scenario occurs: If the item is a BOM with inventory control that does not use price control, this means that the price in this field should be calculated from</p>

Field	Description
	<p>the unit prices of the BOM parts. If the unit price of one of these BOM parts is calculated from cost and the BOM part is not assigned to the warehouse on the current line (by means of a warehouse assignment line in the table part of the window Item Information Card), the unit price of that BOM part is set to zero, which affects the price in this field.</p> <p>Maconomy uses the preferred delivery date of the quote to determine which price list should be used in the calculation of prices.</p> <p>See also the description of the BOM Information Card for a more detailed description of BOM pricing.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Discount %</b>	<p>This shows a discount % if the customer is entitled to a discount from the Discount Tables window in the Inventory module or from a customer or item discount agreement. You can change the suggested discount %, but you cannot change both the percent and the discount amount in the "Discount" field, since these two are related. The discount % is calculated from the discount amount.</p> <p>If you change the value — In this field, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus to change the discount %, is given to users in the window Actions in the Set-Up module.</p> <p>If the item is a BOM which is not to be itemized on the quote, the discount % is calculated as described above for standard items, and you can change it here.</p> <p>If the item is a BOM which is to be itemized in full, the discount % is the total discount on all the BOM parts in proportion to the total price of the BOM. The calculation is based on the item on the highest level with price control. A BOM part contributes to the total discount if it has price control and if it is not an item in a BOM with price control. This functionality applies to any number of levels in the BOM. If you change the discount % here, the new value is copied to all the BOM lines, after which the discount amount is recalculated as described for the "Discount" field.</p> <p>You can see the BOM part lines in the Order Lines window, where you can change the discount % on items on the lowest BOM level.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Discount</b>	<p>This shows a discount if the customer is entitled to a discount from the Discount Tables window in the Inventory module or from a customer or item discount agreement. You can change the suggested discount, but you cannot change both the discount amount and the percent in the "Discount %" field, since these two are related. The discount % is calculated from the discount amount.</p> <p>If you change the value — In this field, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus to change the discount, is given to users in the window Actions in the Set-Up module.</p>

Field	Description
	<p>If you have Maconomy Bill of Materials and if the item is a BOM which is not being shown in full on the quote, the discount is calculated in the same way as for standard items and you can change it afterwards.</p>
<b>Extended Price</b>	<p>If the item is a BOM which is to be shown in full, you cannot change the discount here. The discount is the total discount on all the BOM parts in the BOM. The calculation is based on the item on the highest level with price control. A BOM part contributes to the total discount if it has price control and if it is not an item in a BOM with price control. This functionality applies to any number of levels in the BOM. If you change the discount, the discount % is recalculated from the calculated unit price and is copied to all the BOM lines. The discount amount is then recalculated for every BOM part and is summed up in this field.</p> <p>You can see the BOM part lines in the Order Lines window, where you can change the discount on items on the lowest BOM level.</p> <p>If the line is a text line, leave the field blank.</p> <p>This is the extended price of the line. It is calculated by multiplying the item quantity by the unit price, dividing this total by the pricing unit, and deducting any discount. This extended price is transferred to the "Price" field in the Total Quote island in the card part of the window. It cannot be changed here.</p> <p>Maconomy alerts you if the extended price causes the bill-to customer's credit limit to be exceeded. When checking if the customer's credit limit has been exceeded, Maconomy checks the current customer's credit limit at enterprise level as well as at company level. See the description of the fields in the island Credit Limit in the windows Payment Information and Company Specific Payment information in the A/R module for further information about how credit limits are handled in Maconomy.</p>
<b>Deliv. Date</b>	<p>Here you can enter a delivery date for the individual items.</p> <p>If the quote is converted to a sales order and the item is not fully available on the given date, Maconomy gives a warning and automatically calculates the expected delivery date from the item's delivery time in the Item Information Card. When the quote is converted to an order, Maconomy checks if the items can be delivered on this date. If they cannot, Maconomy recalculates the delivery date on the resulting order line. Please note that this can result in the line being split up on the order if the field "Split Lines Automatically" is marked and some of the units of the item can be delivered sooner than the rest due to changed availability.</p> <p>If a quote is converted to an order without partial delivery, this field cannot be changed, once the order is approved or assigned to a consignment, as the value of this field always follows the corresponding field in the card part of the window. The items on the order are reserved in one lot. Maconomy automatically updates all order lines and the delivery date in the card part of the window if you add an order line which cannot be delivered on the existing delivery date of the order.</p> <p>The delivery date can be changed as you please as long as the line is not assigned to a consignment. If the delivery date is changed to an earlier date,</p>

Field	Description
	<p>Maconomy checks if the item can be delivered on this date. If this is not the case, the date will automatically be changed to the date on which the item can be delivered. If you want to update the delivery date so that it reflects the latest developments in availability (for instance changes in the expected availability date of purchased items), you can delete the date in the field and press Enter. Maconomy will then calculate the earliest possible delivery date based on delivery time, the current purchase, production and order volumes, and quantity in stock. If there are other lines on the quote with the same item number, these lines are also treated as if those items were reserved on an order, while similar lines on other quotes are ignored. However, whether you enter an earlier date or a blank value, the original date will be kept (that is, the date registered before the change was made) if the date found during the search is later than the original date.</p> <p>This field cannot be changed, once the line is assigned to a consignment, as the value of this field will then always reflect the packing date of the consignment in question.</p> <p>You can also select the action "Update Delivery Dates" to recalculate the delivery date on all the lines on the quote. In this case, however, Maconomy does not keep the original delivery date in case the search results in a later date.</p> <p>If the field "Consignment No." is completed in the card part of the window, and you select the action "Convert Quote to Order," Maconomy checks whether all lines in the table part can be delivered on or before the packing date of the consignment in question as described above. If they cannot all be delivered on the packing date, the quote cannot be converted.</p> <p>If a consignment is specified on the current line but not in the card part, and the line cannot be delivered on or before the packing date of the consignment in question, converting the quote will cause Maconomy to assign the resulting order line to the earliest possible consignment on which the items on the line can be delivered. If such a consignment cannot be found, the quote cannot be converted.</p> <p>If the field "Urgent" is marked in the card part of the window, you can manually enter a value in this field. Marking the quote as urgent will prevent Maconomy from changing the delivery dates according to the availability of the items in the warehouse. Please note, however, that it is only possible to enter a delivery date in this field if the field "Partial Delivery" is marked. If the field "Partial Delivery" is not marked, the delivery date of an urgent quote can only be changed in the field "Deliv. Date" in the card part of the window. The date in this field is automatically transferred to the sales order when the quote is converted to a sales order.</p>
<b>Confirmed Delivery Date</b>	<p>In this field, you can enter the last date which has been communicated to the customer as the delivery date. In other words, this is the date which the customer has been informed as the day on which he can expect to receive the items on the line. By comparing the date in this field with the one in the field "Deliv. Date" on the line (or "Arrival Date" if the line has been assigned to a consignment), you can determine whether the customer needs to be</p>

Field	Description
	informed of any delivery date changes. You can enter a date manually, but when you print out the quote, Maconomy overwrites the value as follows: If the line has not been assigned to a consignment, the field is assigned the line's delivery date. If the line has been assigned to a consignment, the field is assigned the arrival date of the consignment in question.
<b>Remarks</b>	Here you can enter a remark about the delivery of the item.
<b>Consignment No.</b>	<p>In this field, you can specify a consignment number if you want to manually assign the current line to a consignment. The field is only relevant for quotes with partial delivery, as the value otherwise has no influence on the quote handling. Therefore, the following description is based on the assumption that the quote has partial delivery.</p> <p>Assigning a quote line to a consignment means that the line will be part of a joint delivery of different item lines to the same destination on the same date and with the same combination of carrier, delivery mode, delivery terms, and consignment type.</p> <p>It is possible to assign each line to a separate consignment. However, if you specify a consignment in the card part, all lines in the table part are automatically also assigned to this consignment whether the quote has partial delivery or not.</p> <p>It is also possible to have Maconomy automatically assign each line on the quote to a consignment by selecting the action "Assign Quote to Consignment." When you select this action, Maconomy will attempt to find a consignment which matches the quote's terms with regard to destination, carrier, delivery mode, delivery terms, and consignment type. If a destination has been specified on the quote, and the system parameter "Automatically assign order lines to consignment" has been marked, Maconomy automatically runs this action every time a quote line is created, or an existing line is changed in a manner which results in a changed delivery date.</p> <p>When the field is completed, the delivery date on the line is changed to the packing date of the consignment. See "Appendix B: Assign Quote/Order to Consignment" for further information about assigning quote lines to a consignment.</p> <p>If the field "Consignment No." is completed in the card part of the window, and you select the action "Convert Quote to Order," Maconomy checks whether all lines in the table part can be delivered on or before the packing date of the consignment in question. If they cannot all be delivered on the packing date, the quote cannot be converted. However, if a consignment is specified on the current line but not in the card part, and the line cannot be delivered on or before the packing date of the consignment in question, converting the quote will cause Maconomy to assign the resulting order line to the earliest possible consignment on which the items on the line can be delivered. If such a consignment cannot be found, the quote cannot be converted.</p>

Field	Description
<b>Packing Date</b>	If the line is assigned to a consignment, this field displays the date on which packing for the consignment in question should commence. The value is retrieved from the corresponding field in the window Consignments for the consignment in question. When the line is assigned to a consignment, the delivery date of the line is changed to the date in this field, and the contents of the field can no longer be changed.
<b>Consignment Date</b>	If the line is assigned to a consignment, this field displays the expected date of departure for the consignment in question. The value is retrieved from the corresponding field in the window Consignments for the consignment in question.
<b>Arrival Date</b>	If the line is assigned to a consignment, this field displays the expected date of arrival at the destination. The value is retrieved from the corresponding field in the window Consignments for the consignment in question.
<b>Warehouse</b>	<p>In this field, you can select the warehouse from which you expect the items to be delivered if the quote is accepted and converted into an order. The value is copied from the corresponding field in the card part of this window. If you have marked the field "Get Inventory From Item" in the window System Information in the Set-Up module, Maconomy suggests the primary warehouse for the current item. This value is copied from the Item Information Card, but can be changed here. If you have marked the field "Get Inventory From Item," but no primary warehouse has been specified for the item, Maconomy will suggest the warehouse displayed in the card part of the quote.</p> <p>As this is only a quote, the related items are not reserved in the warehouse before the quote is converted into an order and this order has been approved. See the description of the corresponding field in the table part of the window Sales Orders for further information on the assigned warehouse after conversion of a quote.</p>
<b>Stock Location No.</b>	<p>In this field, you can specify the location in the selected warehouse from which you expect to ship the items on the current line. When you create a line, Maconomy checks if a standard picking location has been specified in the table part of the item's information card on a line pertaining to the warehouse specified on the current quote line. If a standard picking location has been specified and if this location is also marked as a shipping location in the window Warehouse Information Card, the item's standard picking location is suggested in this field, but the value can be changed manually. If no standard picking location has been specified for the item or if the item has a standard picking location for the warehouse but it is not a shipping location, Maconomy suggests a blank value in this field. When this field is blank, the stock location number specified in the card part of the window will apply to the line.</p> <p>It is not mandatory to enter location numbers in this window. However, the location information is transferred when the quote is converted to an order, and it is not possible to create a warehouse transaction for an order until you have either entered a location in the card part or on the individual item lines.</p>

Field	Description
<b>Discount Desc.</b>	<p>This is the discount description printed on all external order documents. If the description of the discount (be it item discount, customer discount or a discount from a discount table) granted on the line has been translated into the language specified in the card part of the quote, the translation in question is shown here. If no such translation exists, Maconomy suggests the discount description specified for the discount in question in the window Item Discount Agreements, Customer Discount Agreement or Discount Tables, depending on the type of discount granted. However, you can change the text here. Translations are created in the window Language Texts in the Set-Up module.</p> <p>If you have entered a discount manually, you can enter a text here to describe the discount. The text is printed on all external order documents.</p> <p>If the line is a text line, leave this field blank.</p>
<b>Pricing Unit</b>	<p>This is the quantity of units included in the item's unit price. The value is retrieved from the Item Information Card and cannot be changed here.</p>
<b>Note No.</b>	<p>In this field, you can specify the number of a note to be assigned to the current line for further specification. Notes are created and edited in the window Notes in the Set-Up module.</p>
<b>Note Description</b>	<p>This field shows a description of the note specified in the field "Note No." above.</p>
<b>Item Note No.</b>	<p>If the item specified on the line is a template item, that is, an item for which a template note has been specified in the window Item Information Card, a copy of the template note from the item information card is created, and the copy is assigned to the current quote line by means of this field.</p> <p>A template item is an item where the generic item information is not specific enough, as certain details may change from order to order. An example of a template item is a business card where the basic information about the card such as the paper type and background color is static, but each time a batch of cards is ordered, the title, name and address to be printed on the card are different. It is therefore important that a number of additional fields are made available so that a user ordering a business card is allowed to enter this information. Once the quote line has been created and this field has automatically been completed, you can enter the additional information required for the template item by opening the window Notes in the Set-Up module, selecting the note — In this field, and specifying the relevant data in the table part.</p> <p>For further information on the use and set-up of template items, see the description of the field "Template Note No." in the window Item Information Card.</p> <p>The information entered in the note is also printed on external order documents.</p>

Field	Description
<b>Item Note Description</b>	This field shows a description of the note specified in the field "Item Note No." above.
<b>External Desc.</b>	<p>This is the item description printed on all external order documents. If a translation exists for the current item in the language specified in the card part of the quote, the translation in question is shown here. If no such translation exists, the item text from the field "Item Description, Language 1" is suggested instead. You can change the text here. Translations are created in the window Language Texts in the Set-Up module.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Internal Desc.</b>	<p>This is the internal item text from the Item Information Card. You can change this text. It is printed on the packing list and is suitable for messages to warehouse employees. You can, for example, specify how the item should be handled and packed. The text is not printed on external order documents.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Extra Text 1-10</b>	In these fields, you can enter supplementary text for a further description of the current item. In the first three fields, Maconomy suggests the value from the corresponding fields in the item information card. You can change the suggested texts and enter additional information in the remaining seven fields.
<b>Popup 1-5</b>	In these fields, you can enter further information about the current item. Maconomy suggests the value from the corresponding fields in the item information card, but you can change the value for the current quote line. The pop-up options are created in the window Popup Fields in the Set-Up module.
<b>Orig. Quantity</b>	In this field, you can specify how many units of the current item were originally quoted. When creating a line, Maconomy will copy the value in the field "Quantity" to this field, but you can change the value later. When the quote is converted to an order, the value in this field on the sales order will be changed to the value in the field "Quantity," but can still be changed on the sales order.
<b>Price List</b>	<p>This is the price list from which the item line is priced. Maconomy suggests the price list from the card part of the window, unless the customer is tied to another price list by a discount agreement which is then suggested instead. The value cannot be changed here.</p> <p>If you have Maconomy Bill of Materials, and the item is a BOM without price control, the field will be blank. The extended price will be calculated from the sum of the BOM parts, which are priced according to the price list in the card part.</p>
<b>Price Step</b>	This is the price step in the price list according to which the item is priced. Maconomy suggests the value justified by the amount of items ordered. But if the customer is tied to a fixed price step, this price step is applied instead. You cannot change the value in this field.

Field	Description
	If you have Maconomy Bill of Materials, and the item is a BOM without price control, the value will be "0." The extended price is calculated from the sum of the prices of the BOM parts.
<b>Keep Price</b>	In this field, you can specify whether the unit price and discount percentage on the current line should be recalculated when changing the quantity. If you mark the field, a change in quantity will not cause the current unit price or discount percentage to be recalculated, even if the new quantity results in, for example, a different price step. However, you can change the unit price and discount percentage manually. Maconomy suggests the value from the corresponding field in the card part, but you can change it for the individual order lines.
<b>Price at Step 1</b>	This is the price of one pricing unit, if the quote is assigned to a price list and if the item is included in the price list. If not, the value here will correspond to the unit price. The value cannot be changed here.
<b>Quantity Disc.</b>	This is the discount amount. It is defined as the difference between the price at price step 1 and the actual unit price, multiplied by the item quantity and divided by the pricing unit. It is usually the total discount on the item line. The value cannot be changed here.
<b>Bill of Materials</b>	This field shows whether the item is a standard item or a BOM. If the field is marked, the item is a BOM. The individual parts of the BOM can be changed in the Order Lines window if the BOM is being shown in full.
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the field "Location" in the card part of the window.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivations for further information about dimension derivation.</p> <p>If the current line is a text line, that is, no item number has been specified on the line, you cannot enter a value in this field.</p>
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

Field	Description
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Length</b>	<p>Here you can enter the length of the item. If you also enter a width below, Maconomy will calculate "Quantity" by multiplying length by width. If you complete the "Quantity" field, the length and width are reset.</p> <p>You can use this facility for entering column measurements for newspaper and magazine advertisements, for example.</p>
<b>Width</b>	<p>Here you can enter the width of the item. If you also enter a length above, Maconomy will calculate "Quantity" by multiplying length by width. If you complete the "Quantity" field, the length and width are reset.</p> <p>You can use this facility for entering column measurements for newspaper and magazine advertisements, for example.</p>
<b>Activity No.</b>	<p>In this field, you can enter an amount activity if the current line relates to an activity and the quote is assigned to a job. When you create a line on a quote on which a job number has been specified, Maconomy attempts to derive an activity number using the following procedure:</p> <ol style="list-style-type: none"> <li>1. If the user manually enters an activity number, this number is used.</li> <li>2. If no value is entered manually, Maconomy checks the information card of the item specified on the line to see if an activity number has been specified there (see the window "Activity No." in the card part of the window Item Information Card). If so, the activity number in question is transferred to this field.</li> <li>3. If no activity number was found in step 2, the activity number specified in the corresponding field in the card part of the quote is used.</li> <li>4. If no activity was found in step 3, the activity number to be derived from the standard task of the task list assigned to the job on the quote is used.</li> </ol> <p>If no job has been specified on the quote, any manually entered value is changed to a blank value, as you cannot specify an activity to a line which does not pertain to a job.</p>
<b>Task</b>	In this field, you can enter the name of a task if the quote is linked to a job. If the corresponding field in the card part of the window contains a value, it will automatically be suggested in this field.
<b>Campaign No.</b>	In this field, you can enter the number of a campaign if the current quote line is connected to a certain campaign in the Contact Management module. If you enter a campaign number in the card part, Maconomy transfers the number to this field when creating lines. The campaign number can be used for, for example, statistical purposes.

## Sales Orders Workspace

Use this workspace to enter and change sales orders for customers.

In the Sales Orders tab, you enter general and account information. After you press Return, Maconomy verifies the information. You can then enter order lines and text lines in the Order Lines sub-tab.

To create a sales order, enter the number of a customer. Maconomy verifies that the customer exists and that order entry for the customer is not blocked. Maconomy alerts you if the bill-to customer's credit limit has been exceeded. You can then hold the order until the customer's balance is reduced.

Maconomy also checks whether the customer's credit limit is exceeded when you enter an item line and when you approve the order. If the credit limit is exceeded, Maconomy issues a warning and automatically blocks the order upon approval if you select the **Credit Block** field in the System Information workspace in the Set-Up module. Note that Maconomy includes both the customer's credit limit and order volume in the credit limit evaluation. A sales order or credit order must thus be approved or invoiced before it is included in the evaluation.

When checking whether the customer's credit limit has been exceeded, Maconomy checks the current customer's credit limit at the enterprise level as well as at the company level. See the description of the fields in the Credit Limit island in the Payment Information and Company Specific Payment Information workspaces in the A/R module for more information about how Maconomy handles credit limits.

Maconomy then retrieves more information from the Customer Information Card workspace in the Accounts Receivable module and suggests this information on the sales order. Thus, you only need to change the information that is specific to the current order.

As you enter order lines, Maconomy applies price lists and discount agreements from the Accounts Receivable and Inventory modules.

You can also copy a sales order. The copy can either be another sales order or a quote. You can specify that the prices on the original order are also to be used on the copy, but if you do not want to copy the prices, Maconomy recalculates the prices on each order line. Maconomy transfers the basic information about the customer from the customer information card, regardless of whether you specify the same customer as on the original order.

If you have Maconomy Bill of Materials, you can enter both standard items and bills of materials (BOM) in the Order Lines sub-tab. Maconomy only displays the BOM header, not the parts. If the BOM is shown in full on the sales order, you can see the item parts in the Order Lines workspace, which automatically shows the item in the last item line that you created.

If you select the **Subscrip. Order No.** field in this workspace, Maconomy creates the sales order automatically from the Subscription module.

You can only see sales orders that you created in the Subscription module if you select the **Show Subscription Sales and Credit Orders** field in the System Information workspace. You cannot edit orders that originate from the Subscription module in this workspace; you must edit them in the Subscription module. Delivery to a customer is not permitted if you select the **Blocked For Delivery** field on the customer information card.

You can only delete a sales order if no items have been delivered, that is, no packing slip has been created for the order. When you delete a sales order, you cancel the reservation of items in the warehouse. Maconomy updates the **Orders** and **Available** fields in the Item Information Card and Item Information workspaces in the Inventory module. If you are using Maconomy Bill of

Materials, and if the item on the deleted line is a BOM that is itemized on creation, Maconomy deletes the elements of the BOM from the sales order and cancels their reservation.

Note that if you delete an order for which an inventory change transaction exists in the Inventory module, Maconomy sets the quantities on this transaction to zero and closes the transaction.

## Sales Orders Tab

This section includes the fields and descriptions for the Sales Orders tab.

### Sales Orders Island

Field	Description
<b>Order No.</b>	This number is the sole and absolute identification of the sales order. Maconomy automatically allocates the next available order number. The number cannot be changed manually, but you determine how sales order numbers are allocated in the window System Numbers.
<b>Order Mode</b>	Here you select the order mode, that is, how the quote is relayed to the customer, for example, "By Phone," "By fax." You maintain order modes in the Popup Fields window in the Set-Up module.
<b>Sales Person</b>	Here you enter the number of the employee who is sales representative on the sales order. Maconomy automatically suggests the sales representative who normally sells to this customer, retrieving the number from the customer information card. You can change the number.  If you cannot remember the number, you can use the search functions in the Find menu.  This field also displays the sales person's name. Maconomy retrieves it from the Employees window in the Set-Up module using the specified sales person number.
<b>Received by</b>	Here you enter the name of the employee in your company who received the customer's request for a sales order. Maconomy suggests the name of the user who is creating the quote, but you can change it. You must complete the field.

### Ship to Address Island

Field	Description
<b>Customer</b>	In this field, you enter the number of the customer who ordered the items. Maconomy checks that the customer has been created in Maconomy and, if the system parameter "Aut. company specific customer creation" has not been marked in the Set-Up module, if the current customer has been created as a company specific customer for the company responsible for the contract. If this parameter has not been marked, the customer has to be created as a company specific customer in the window Company Specific Customer Information Card before orders can be created with the current combination of customer and company. Furthermore, Maconomy checks that the customer has not been blocked in the window Payment Information in the A/R module.

Field	Description
	<p>When you press Return, Maconomy retrieves various information from the Customer information card in the Accounts Receivable module and suggests the values in corresponding fields here. You can change most of the suggested values.</p> <p>The other lines show the customer's name and address. It is retrieved from the Customer information card. You can change the information on the current sales order.</p> <p>The customer number can be changed until lines have been created on the sales order. If you change the customer number, Maconomy will update the sales order with various information from the customer information card and will derive the dimensions in the card part of the sales order again. If charges have been specified on the order, the ship-to customer can only be changed to a customer using the currency already specified on the order.</p>
<b>Attn.</b>	This is the customer's attention person the person to whom shipping information is directed. It is retrieved from the Customer information card. The name can be changed here.
<b>Country</b>	This is the customer's country. It is retrieved from the customer's information card. It can be changed here.
<b>Phone</b>	This is the customer's telephone number, retrieved from the customer's information card. It can be changed here.
<b>Fax</b>	This is the customer's fax number, retrieved from the customer's information card. It can be changed here.
<b>Telex</b>	This is the customer's telex number, retrieved from the customer's information card. It can be changed here.
<b>E-mail</b>	This is the customer's e-mail address, retrieved from the customer's information card. It can be changed here.

### Price Island

Field	Description
<b>Currency</b>	Here you select the currency of the sales order. Maconomy suggests the currency from the customer's information card, but you can change it. The currency can be changed for the current order up until the first item line is entered on the order, or a charge is specified.
<b>Exchange Rate Date</b>	<p>In this field, you can specify the exchange rate date for the calculation of prices in currency on the order. The exchange rate date is also used in the calculation of charges. When an order is created, Maconomy automatically suggests today's date in this field if the system parameter "Fix exchange rate at order creation" has been marked. However, you can change or delete the exchange rate date at any time whether the field has been completed automatically or not.</p> <p>If this field contains a date, all prices on the current order will be calculated using the exchange rate valid on the specified date. This way, the same exchange rates and thereby the same currency prices are used throughout the</p>

Field	Description
	<p>order process, ensuring that, for example, the amount invoiced matches the amount originally appearing on the order confirmation.</p> <p>If you leave this field empty, prices will be calculated using the exchange rate valid at the time of the price calculation.</p> <p>Currency prices are calculated when lines are created and recalculated when updating lines and when printing information such as packing slips and invoices. Changing or removing the currency may therefore result in variances between the original quote amount and the amount invoiced or appearing on another printout.</p>
<b>Sales</b>	This field shows the sum of the prices on the item lines on the current sales order. The price cannot be changed here.
<b>Invoice Discount %</b>	<p>Here you can enter an invoice discount percentage. Maconomy suggests the value from the Bill To or Ship To Customer's information card, depending on whether or not you have marked the "Inv. Disc. from Bill to Cust." field in the System Information window. You can change the suggested value.</p> <p>If you select another invoice discount % than the one suggested, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus discounts, is given to users in the window Actions in the Set-Up module.</p> <p>An invoice discount is deducted from the item sum. This is shown on the various printed order documents.</p>
<b>Invoice Discount</b>	This is the calculated invoice discount amount deducted from the invoice. The discount is retrieved from the invoice in the window Invoices or the sales order in the window Sales Orders.
<b>Tax on Sales</b>	<p>This field shows the calculated tax amount in the currency selected for the current order. Tax is only calculated if the field "Tax" in this island has been marked.</p> <p>If multiple tax codes are enabled, three additional fields will be added above the "Tax on Sales" field: "Tax 1," "Tax 2" and, if enabled, "Tax 3." In this case, the "Tax on Sales" field calculates the sum of the other individual tax amount fields. For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Total Charges</b>	This field shows the sum of any charges on the order, including tax. Charges are calculated when you select the action "Calculate Charges."
<b>Tax on Charges</b>	<p>This field shows the tax calculated from any charges on the order.</p> <p>If multiple tax codes are enabled, three additional fields will be added above the "Tax on Charges" field: "Tax 1, Charges," "Tax 2, Charges" and, if enabled, "Tax 3, Charges." In this case, the "Tax on Charges" field calculates the sum of the other individual tax amount fields. For further information on multiple tax codes, please see the description in "Tax Codes."</p>

Field	Description
<b>Total (incl. charges)</b>	This field shows the total price of the order in the currency of the quote. The field thus shows the sum of the fields "Total Sales," "Tax on Sales," and charges including tax, less the amount in the field "Invoice Discount."
<b>Items on Account</b>	<p>This field shows how much of the order total is invoiced on account. In the Invoicing on Account window, you can invoice part or all of the order before the first delivery.</p> <p>When you finally invoice the order, this amount is deducted. The amount must not be less than "0.00." The amount cannot be changed here.</p>
<b>Tax on Account</b>	This field shows how much tax has been invoiced on account. When you invoice the sales order, this amount is deducted. The amount must not be less than "0.00." The amount cannot be changed here.
<b>Price List</b>	<p>Here you select a sales price list with which to price the items on the sales order. Maconomy suggests the value from the customer's information card, but you can change it. The pop-up field only shows existing sales price lists, that is, sales prices lists created in the Price Lists window in the Inventory module. If you select "blank," Maconomy calculates prices from costs and gross margins.</p> <p>If you select another price list than the one suggested, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus price lists, is given to users in the window Actions in the Set-Up module.</p> <p>If you select a price list in a different currency from the sales order, Maconomy alerts you. The prices from the price list you select here will be converted to the currency of the sales order, using the current exchange rate table.</p> <p>If you use a price list with a currency that is different from the currency used in connection with the sales order, Maconomy will give you a warning. In such cases the prices stated in the price list will be recalculated to the currency of the quote by the exchange rate table for sale.</p>
<b>Price Step</b>	<p>Here you can select a price step in the price list at which to price the items on the sales order. Step "6" is the highest. Maconomy suggests the value from the customer's information card, but you can select another. This field only applies if you enter a value in the Price List field.</p> <p>If you change the suggested price step, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus price step, is given to users in the window Actions in the Set-Up module.</p> <p>Note, that if the "Fixed Price Step" field in the System Information window is marked, and if you enter a value between 1 and 6, Maconomy will always suggest the price on the given price step, regardless of whether the quantity ordered would normally justify a lower price because of a quantity discount.</p> <p>If the "Fixed Price Step" field is not marked, Maconomy applies the highest price step the order quantity justifies.</p>
<b>Keep Price</b>	In this field you can specify whether unit prices and discount percentages on sales order lines pertaining to the current customer should be recalculated when changing the quantity. The value in this field is transferred to the card part of

Field	Description
	sales orders pertaining to the current customer, but can be changed for each order.
<b>Tax</b>	<p>If this field is marked, the sales order is taxed. Maconomy suggests the value from the customer's information card in the Accounts Receivable module, but you can change it.</p> <p>If you change the value, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus the value here, is given to users in the window Actions in the Set-Up module.</p>
<b>Tax No.</b>	<p>Here you enter the customer's tax number. Maconomy suggests the value from the customer's information card in the Accounts Receivable module, but you can change it. If a validation rule is assigned to the tax number field in the window Rules of Validation in the Set-Up module, Maconomy will validate the tax number upon entry or change. If you change the bill-to customer, Maconomy retrieves the new tax number.</p>

### Charges Island

Field	Description
<b>Charge 1</b>	<p>In the window Charges you can enter the charge codes which should be available in this pop-up field, and you can define the texts, percentages and/or amounts to be attached to each charge. If a charge is specified to be a one-time charge, the charge will be removed from the order once invoicing has been made, later in the process.</p> <p>The charge amount can be calculated on the basis of the information in the selected charge code, or it can be entered manually. In the latter case, the field "Maintain" is automatically selected. The charges on the order are not calculated until you select the action "Calculate Charges." You have to select this action if you want to see the charges expected on the subsequent invoice.</p> <p>You can select the action several times for the same order. This may be necessary if lines are added to the order, or the charge codes are changed. When the action is selected, the charges are calculated for the entire order, including manually entered amounts. You may however maintain the amount of any charge by selecting the corresponding field "Maintain," for example, if you have agreed on a fixed charge amount, which is not necessarily the same as the calculated amount.</p> <p>When you print external order papers, such as quotes, order confirmations, and invoices, only charges where the field "Maintain" is not marked are recalculated automatically. However, please note that the charges calculated as a result of a printout are only displayed on the printout, as the amounts are not updated in the sales order window.</p> <p>If you change the charge code or the fixed charge amount, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus to change charge codes and charges, is given in the window Actions in the Set-Up module.</p>
<b>Charge 2</b>	The functionality of this field applies to "Charge 2" and is similar to the functionality of "Charge 1."

Field	Description
<b>Charge 3</b>	The functionality of this field applies to “Charge 3” and is similar to the functionality of “Charge 1.”
<b>Charge 4</b>	The functionality of this field applies to “Charge 4” and is similar to the functionality of “Charge 1.”

### Order Linking Island

Field	Description
<b>No. of Suborders</b>	<p>This field displays the number of suborders linked to the current sales order, if any.</p> <p>Note that it is not possible to delete an order to which suborders have been linked. If you want to delete the sales order, all linked orders must therefore be deleted first.</p>
<b>Main Order No.</b>	<p>In this field, you can enter the number of a sales order if you want to link the current sales order to a main order. The current order will then become a suborder to the order specified. If you later remove the value, the link between the current order and the main order is deleted. If the current order itself is a main order, this field will display the order’s own number, and this value cannot be changed as a main order cannot be a suborder of another sales order.</p> <p>The linking of orders enables you to print all information about all orders assigned to a main order. You can print summary information about main orders and their suborders in the windows Print Main Order and Print Main Order Invoice. The individual suborders are processed as normal, single orders, for example, implying that each suborder must be approved and invoiced separately.</p> <p>Please note that it is not possible to delete an order to which suborders are attached. If you want to delete the sales order, all linked orders must therefore be deleted first.</p>
<b>Itemize</b>	This field is not used in the current version of Maconomy.

### Item Purchase Order Island

Field	Description
<b>Item Purchase Order No.</b>	This is the number of an item purchase order, if the sales order is attached to an item purchase order which is common to all item lines. A common item purchase order is created from a sales order in the Sales Order to Item Purchase Orders window. Maconomy assigns the item purchase order to the sales order by registering the item purchase order number here and in the “Item Purchase Order No.” field on the item lines. You cannot change the number.
<b>Vendor</b>	If the sales order is attached to an item purchase order that is common to all sales order lines, this field shows which vendor the order was made to. You cannot change the number.

Field	Description
	<p>Even if you have not yet made an item purchase order from the sales order, only entered a vendor in the Sales Order to Item Purchase Orders window, the vendor number will be shown here.</p> <p>If the sales order is attached to a common item purchase order, the first lines of the vendor's name and address will be shown in this field. You cannot change those lines here.</p> <p>Even if you have not yet made an item purchase order from the sales order, only entered a vendor in the Sales Order to Item Purchase Orders window, the vendor name and address will be shown here.</p>
<b>Last Item Receipt</b>	If one or more of the sales order lines is attached to an item purchase order, this field shows the date of the reception of the last item for any one of the given item purchase orders. The value cannot be changed here.

### Account Information Island

Field	Description
<b>Changed</b>	<p>This field shows whether you have changed any of the information suggested by Maconomy in the above fields. Maconomy marks the field if you have changed information in any of the following fields: "Pmt. Terms," "Tax," "Price List," "Price Step," "Invoice Discount %," and all the fields in the Charges island. Maconomy also registers changes in the amount and discount fields in the table part. The value cannot be changed.</p> <p>If you have Maconomy Bill of Materials, Maconomy registers any changes to prices or discounts of BOM parts made in the Order Lines window.</p>

### Document Archive Island

Field	Description
<b>Document Archive</b>	<p>In this field, you can assign a document archive to the sales order. By assigning a document archive to a sales order, you can keep track of the various documents related to the sales order. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.</p> <p>This field also shows the description of the specified document archive.</p>
<b>Document Count</b>	This field displays the number of documents in the Document Archive.

### Job Cost Island

Field	Description
<b>Invoice in Job Cost</b>	You can mark this field to indicate that the order is to be invoiced in the Job Cost module. You can only mark the field if the order is assigned to a job and no items have been delivered.

Field	Description
	<p>If a job has been closed, it is neither possible to assign an order to the job nor to create an order for the job unless the job is first reopened in the window Jobs in the Job Cost module.</p> <p>If you mark this field, it will not be possible to invoice the order from the Sales Orders module. When you select one of the actions "Print Packing Slip" or "Release to Invoice," the subsequent posting will create a job item journal with job entries which can then be invoiced in the Job Cost module. Maconomy creates a job entry for each order line. When you make external printouts, you can choose whether to print the job entries/registrations on a line each or sum them up by activity.</p> <p>If the system parameter "Invoice Orders with Job Numbers in Job Cost" has been marked, this field is automatically marked if you specify a job number in the field "Job No." below. Subsequently removing the job number will cause the field to be unmarked. The field is always marked automatically when you create orders from the Job Budgets window.</p> <p>Please note that this field must be marked if you enter the number of a job which uses the invoicing method "Fixed-price," and for which only invoicing on account is allowed in the field "Job No." in this island. The invoicing method selected for a job can be seen and changed in the window Job Parameter Selection in the Job Cost module.</p>
<b>Job No.</b>	<p>In this field, you can enter the number of a job from the Job Cost module if you wish to assign the order to a job. Certain jobs might involve item sales from Maconomy's Inventory module, in which case you can create the sales order in this window and then assign the job here.</p> <p>If you enter a job number when creating an order, and you leave the field "Customer No." blank in the island Ship to Address, the order is automatically assigned to the same customer as the job.</p> <p>If you do not mark the field "Invoice in Job Cost" in this island, the sales order is invoiced separately in the Sales Orders module, but the sales figures are transferred to the job.</p> <p>If you enter a job number, and the system parameter "Invoice Orders with Job Numbers in Job Cost" has been marked, the field "Invoice in Job Cost" above is automatically marked, and subsequently removing the job number will cause the field to be unmarked. Maconomy verifies that the job is neither blocked nor closed. If the Ship to Customer on the sales order and job are not the same, Maconomy alerts you. If there are lines on the order before it is assigned to a job, you must first enter an activity number on the order lines.</p> <p>Please note that if you enter the number of a job which uses the invoicing method "Fixed-price" and for which, only invoicing on account is allowed, — In this field, you must mark the field "Invoice in Job Cost," as costs of fixed-price jobs should always be invoiced on account.</p>
<b>Activity No.</b>	<p>In this field, you can enter the number of an amount activity from the Job Cost module if the order is assigned to a job. This activity number will be suggested on lines created in the table part.</p>

Field	Description
<b>Task</b>	In this field you can enter the name of a task if the sales order is linked to a job.

### Statistics to Tax Authorities Island

Field	Description
<b>EU Sale</b>	This field must be marked if the sales order is for an EU sale. If the "Sales List System Report" field in the System Information window is marked, Maconomy will mark this field if the bill-to customer is from another EU country and is not subject to paying tax, that is, the "Tax" field is not marked. If this field is marked, the sales order will be included in your quarterly report to the EU Sales List System.
<b>Intrastat Reg.</b>	Here you can specify whether to include the sales order in your monthly report to Intrastat. If the "Intrastat Export Report" field in the System Information window is marked, Maconomy suggests a mark here if the bill-to customer is from another EU country and is not subject to paying tax, that is, the "Tax" field is not marked.
<b>EU Trade Type</b>	Here you can enter either "Normal" or "Triangulation" to indicate the EU trade type. Triangulation is used when you act as a sales agent for a vendor in another EU country and an end customer (bill-to customer) in a third EU country. Sales order amounts from triangulation are not included in the EU sales on your tax specification, but are reported separately to the Sales List System. The value is copied from the bill-to customer's information card, but can be changed here.
<b>Nature</b>	Here you select which transaction to report to Intrastat. They are created in the Popup field window in the Set-Up module.
<b>Customs Document</b>	In this field, you can enter the number of any customs document which pertains to the current sales order. Maconomy will automatically complete this field when you print a customs document which makes up the current order in the window Print Customs Document, but you can change the number to assign the order to another existing customs document.

### Credit Card Island

Field	Description
<b>Credit Card No.</b>	If the customer wants to pay by credit card, you can enter the number of the credit card in this field. Maconomy will automatically suggest the credit card number specified on the bill-to customer's information card, but you can change the number here. Note that the number is only for information; customer payments using credit cards cannot be handled by Maconomy's Banking module. If a credit card number is entered, an expiry date must also be specified.

Field	Description
<b>Expiry Date</b>	In this field, you can enter the expiry date of the credit card specified in the field "Credit Card No." above. If an expiry date is entered, a credit card number must also be specified.
<b>Amount Authorized</b>	In this field, you can specify the amount which the credit card issuer has accepted to pay for the order which will later be created for the current quote.
<b>Authorization Code</b>	In this field, you can specify the authorization code which the credit card issuer has given when approving the amount in the field "Amount Authorized" above.
<b>Authorization Date</b>	In this field, you can specify the date when the amount was authorized by the credit card issuer.

### Subscription Order Island

Field	Description
<b>Subscription Order No.</b>	If the order was created automatically from the subscription module, this field will contain a subscription order number. If the order originates from the Subscription module, the order cannot be edited in this window, but should be done in the Subscription module.

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

### Remarks Island

Field	Description
<b>Reference</b>	Here you enter the customer contact with whom you spoke about the sales order. The name is printed on order documents.
<b>Customer</b>	Here you can enter an internal note about the customer. The text is printed on the packing list. Maconomy suggests the note from the customer's information card, but you can change it.
<b>Warehouse</b>	Here you enter an internal note to warehouse employees. The text is printed on the packing list. You can, for example, specify how the item should be handled and packed, or request an invoice to be sent along with the delivery.
<b>End User No.</b>	Here you enter the number of the end customer the sales order is for. If you are dealing with an end customer sale, which is determined by order mode, you must complete the field. It is an end customer sale if the "End User Required" field is marked in the Popup Fields window in the Set-Up module for the order mode. It is only possible to enter the number of an end customer in the Accounts Receivable module to which the customer on the sales order is registered. You can use the search functions in the Find menu if you cannot remember the number.

Field	Description
	The field is used if your sales order is for a customer who deals with an end customer. Information on your end customers is managed in the End Users window.

### Billing Address Island

Field	Description
<b>Bill to Customer</b>	<p>Here you can enter the number of a bill-to customer. Maconomy retrieves the bill-to customer from the ship-to customer's information card, but you can change it. Maconomy verifies that the customer exists in the Accounts Receivable module.</p> <p>The two customers are not the same, if items are being delivered to one customer and billed to another.</p> <p>The other lines show the customer's name and address. Maconomy retrieves the information from the customer's information card. It cannot be changed here.</p>
<b>Attn.</b>	This is the customer's attention person the person to whom payment information is directed. Maconomy retrieves the name from the customer's information card. It cannot be changed here.
<b>Country</b>	This is the customer's country. It is retrieved from the customer information card. It cannot be changed here.

### Settling Company Island

Field	Description
<b>Company No.</b>	<p>This field shows the number of the settling company that applies to the current sales order.</p> <p>If an invoice is created later in the process and the company in this field is different from the one specified in the island Company, Maconomy will automatically create intercompany balances. In this case, the company in this field will be the intercompany company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>For further information about the influence of a settling company and how such a company is determined, please see the section Multiple Companies in the chapter "Introduction to the G/L Module." Intercompany balances are described in the window Intercompany Accounts in the G/L module.</p> <p>This field also shows the name of the specified settling company. The name is retrieved from the first line in the Address island in the Company Information window in the G/L module for the specified company.</p>

**Company Island**

Field	Description
<b>Company</b>	<p>In this field, you can enter the number of the company responsible for the order. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>If the company in this field is different from the one shown in the island Settling Company, Maconomy will automatically create intercompany balances at the posting of the invoice created from the order. In the intercompany balance, the company in this field will be the responsible company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>See the section "Multiple Companies" in the chapter "Introduction to the G/L Module" and the window Intercompany Accounts in the G/L module for a further description of the concept of responsible companies and intercompany balances.</p> <p>This field also shows the name of the specified company.</p>

**Delivery Island**

Field	Description
<b>Your Item Purchase No.</b>	Here you can enter the customer's item purchase order number, if the sales order was created from an item purchase order.
<b>Order Date</b>	Here you can enter the order date.
<b>Partial Delivery</b>	<p>You can mark this field to permit partial delivery if not all items are available. Maconomy suggests the value from the System Information window in the Set-Up module, but you can change it. If the field is not marked, you can only select those actions that result in delivery of items if all the items sold are set to be packed, and Maconomy issues a warning if you print a warehouse transaction or picking list when not all items are set for packing. In the window Packing Lists, you cannot approve a packing list before the warehouse has confirmed that all the items have been packed.</p> <p>Furthermore, the field determines whether individual consignments can be specified for each line. For further information on this, see the field "Consignment No." in the card and table parts, as well as the action "Approve Order."</p>
<b>Back Order Handling</b>	<p>Here you select how to process back orders. There are three ways:</p> <ul style="list-style-type: none"> <li>■ <b>Save</b> — The individual item lines show what has been delivered up to now. The quantity is updated every time a delivery is made (that is, a packing slip is printed). When all items have been delivered, the item</li> </ul>

Field	Description
	<p>line will be flagged as having been fully delivered. The back order information is thus kept on the individual item line on the sales order. This option cannot be selected on orders where a destination has been specified.</p> <ul style="list-style-type: none"> <li>■ <b>Delete</b> — When the order is delivered, Maconomy reduces the quantity ordered on all order lines to match the quantity delivered. The order is then marked as fully delivered. The items that were not delivered are not tracked and must be re-ordered by the customer.</li> <li>■ <b>Transfer</b> — When items are delivered, the order is processed in a similar way as when back orders are deleted, with the difference that the back order information is transferred to a back order register. Transferred back orders can be inspected in the window Back Order Register.</li> </ul> <p>In the Customer Information Card window, you can select which method is to be used for your customers as standard. The value entered there is then suggested automatically when you create a sales order.</p>
<b>Blanket Order</b>	<p>If this field is marked, and you select “Print Picking List” or “Print Picking and Packing List” in the Action menu, Maconomy will copy the back orders registered to the delivery customer. Back orders can also be copied using the action “Get Back Order,” regardless of whether or not this field has been marked. However, the action only includes back order lines that have the same currency as the actual sales order. Maconomy then creates item lines for the copied back orders.</p> <p>The field also determines whether Maconomy is allowed to move order lines to and from the order. When you approve the order, Maconomy will run a process to ensure that only one combination of warehouse and consignment is represented in the table part. If more than one combination of warehouse and consignment can be found on the lines in the table part, approving the order will therefore cause Maconomy to split up the order by moving lines to other orders (existing or automatically created), and in this context, the value in this field determines how the lines are moved. This process is described in detail for the action “Approve Order.”</p> <p>Once the order has been approved, a mark in this field means that order lines may be transferred to the current order from other blanket orders being approved. Furthermore, when using the action “Assign to Sales Orders” in the window Back Order Register, only approved orders where this field is marked are taken into consideration when Maconomy attempts to assign each back order line to a suitable order. For further information, see the description of the action “Assign to Sales Order” in the window Back Orders.</p>
<b>Closed for New Lines</b>	<p>If you mark this field, only blocked lines can be added to the current order. If both this field and the field “Blanket Order” are marked on the current order, approving other orders where the field “Blanket Order” is marked will not cause any lines to be moved to the current order.</p>

Field	Description
	<p>Maconomy automatically marks the field if all lines are moved away from the current order when the order is approved, thus preventing lines from other orders to be moved to the current order.</p> <p>The field can only be marked on approved orders where all lines have been blocked.</p>
<b>Split Lines Automatically</b>	<p>If this field is marked, creating a line will cause Maconomy to attempt to split the line into a number of lines with the purpose of obtaining the earliest possible delivery date for as many units of the items as possible. This corresponds to running the action "Split Line" on the line. Therefore, please see the description of the action "Split Line" for information on the procedure of order line split-up.</p>
<b>Urgent</b>	<p>In this field, you can specify whether this sales order is urgent. An order can, for example, be urgent if the items must be delivered within a shorter time frame than allowed by the items' usual delivery time. If you mark this field and specify a delivery date in the field "Deliv. Date," Maconomy will not automatically change the delivery date according to the availability of the items in the warehouse. When you mark this field, Maconomy forces a reservation of the items on the delivery date specified in the field "Deliv. Date," even if this will cause the reservation of more units than available, and even if the back order principle "By reservation" is used. This field should therefore be used with caution.</p> <p>It is not possible to mark blanket orders and orders with partial delivery as urgent.</p>
<b>Pref. Deliv. Date</b>	<p>Here you can enter the customer's preferred delivery date. Maconomy suggests the date on which the order was created. However, if you enter a blank value, today's date is considered the preferred delivery date.</p> <p>Note that if you enter a historical date here, you run the risk that Maconomy uses an obsolete discount agreement to calculate prices.</p>
<b>Deliv. Date</b>	<p>For orders with partial delivery, this field shows the date upon which the last items can be delivered, that is, the latest delivery date on order and BOM lines that are not blocked. Items without inventory control are included in the calculation. The field cannot be changed on orders with partial delivery.</p> <p>If the order does not have partial delivery, the functionality of the field depends on whether the order has been approved or is assigned to a consignment. While the order is neither approved nor assigned to a consignment (in the field "Consignment No." in the card part), the field displays the latest delivery date for non-blocked order and BOM lines, and cannot be changed here.</p> <p>When the order is approved or assigned to a consignment, the delivery dates on all the non-blocked lines of the order are changed to the date specified in this field. The delivery date can be changed in this field if the order is not assigned to a consignment (in the card part). If the delivery date is changed to a later date, the delivery date will be changed accordingly on all the non-blocked lines of the order. If the delivery date is changed to an earlier date,</p>

Field	Description
	<p>Maconomy checks if all items on non-blocked lines can be delivered on this date. If this is not the case, the delivery date will automatically be changed to the earliest date on which all items on non-blocked lines can be delivered for the current order. However, the original date will be kept (that is, the date specified before the field was changed) if the date found during the search is later than the original date. If you subsequently add a line which can only be delivered after this date, all delivery dates of the order are changed to the delivery date of the new line.</p> <p>If the order is assigned to a consignment (in the card part), the delivery dates on the order and the assigned, non-blocked order lines are changed to the packing date of the consignment. After this, you cannot add lines that cannot be delivered on the packing date of the consignment, and the contents of the field can no longer be changed.</p> <p>If the field "Urgent" is marked, you can manually enter a value in this field. Marking the order as urgent will prevent Maconomy from changing the delivery date according to the availability of the items in the warehouse. Please note, however, that it is only possible to enter a delivery date for an urgent order if the field "Partial Delivery" is not marked. If the field "Partial Delivery" is marked, the delivery date of an urgent order can only be changed on the individual item lines in the table part of the window.</p>
<b>Warehouse</b>	<p>Here you select the warehouse from which the items are to be delivered. Maconomy suggests the sales warehouse from the customer's information card, but this can be changed. The pop-up field shows the warehouses created in the Warehouse Information Card window in the Inventory module.</p> <p>On a sales order, you can only specify delivery items from one warehouse unless the field "Get Inventory From Item" has been marked in the window System Information. If so, a warehouse can be specified on each line in the table part. When the sales order is approved, and multiple warehouses have been specified for the order, a sales order will be created for each warehouse on the order in addition to the warehouse specified in this field.</p> <p>If you select a warehouse assigned to another company than the one specified in the island Company on the current sales order, Maconomy will automatically create intercompany balances at the posting of any invoices created from the order. In the intercompany balance, the company to which the warehouse is assigned will be the intercompany company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p>
<b>Stock Location No.</b>	<p>In this field, you can specify the location in the current warehouse from which the items are to be shipped. This location will apply to those lines in the table part where the warehouse location field is left blank. If a warehouse location is specified on a given line, it overrules any location specified in this field.</p> <p>When you create an order or change the warehouse in the card part of the order, Maconomy suggests the standard shipping location specified for the selected warehouse, but you can specify another location.</p>

Field	Description
	It is not possible to create a warehouse transaction or select any of the actions that result in the creation of a warehouse transaction until you have either entered a location in the card part or on the individual item lines.
<b>Carrier</b>	<p>Here you select the carrier who is to deliver the items.</p> <p>Maconomy suggests the carrier from the customer's information card, but you can change it. If a destination has been specified on the order, and the order is not yet assigned to a consignment, the field can be changed to blank. In this case, Maconomy will disregard the carrier when assigning a consignment to the sales order. See "Appendix B: Assign Quote/Order to Consignment" for further information about assigning sales orders to a consignment. Carriers are maintained in the window Popup Fields in the Set-Up module.</p>
<b>Delivery Mode</b>	<p>Here you select the delivery mode applying to the current sales order. Maconomy suggests the delivery mode from the customer's information card, but you can change it. If a destination has been specified on the order, and the order is not yet assigned to a consignment, the field can be changed to blank. In this case, Maconomy will disregard the delivery mode when assigning the order to a consignment. See "Appendix B: Assign Quote/Order to Consignment" for further information about assigning orders to a consignment. Delivery modes are maintained in the window Popup Fields in the Set-Up module.</p>
<b>Delivery Terms</b>	<p>Here you select the delivery terms applying to the current sales order. Maconomy suggests the delivery terms from the customer's information card, but you can change it. If a destination has been specified on the order, and the order is not yet assigned to a consignment, the field can be changed to blank. In this case, Maconomy will disregard the delivery terms when assigning the order to a consignment. See "Appendix B: Assign Quote/Order to Consignment" for further information about assigning orders to a consignment. Delivery terms are maintained in the window Popup Fields in the Set-Up module.</p>
<b>Consignment Type</b>	<p>In this field, you can select the consignment type applying to the current sales order. Maconomy will automatically retrieve the consignment type on the customer information card for the current customer, but the consignment type can be changed here. If a destination has been specified on the order, and the order is not yet assigned to a consignment, the field can be changed to blank. In this case, Maconomy will disregard the consignment type when assigning the order to a consignment. See "Appendix B: Assign Quote/Order to Consignment" for further information about assigning orders to a consignment. Consignment types are maintained in the window Popup Fields in the Set-Up module.</p>
<b>Destination No.</b>	<p>In this field, you can specify the number of the destination to which the current sales order is to be delivered. Maconomy will automatically retrieve the destination number on the customer information card of the current customer, but the destination number can be changed here. The order and the individual order lines can only be assigned to a consignment going to the</p>

Field	Description
	destination specified in this field. See “Appendix B: Assign Quote/Order to Consignment” for further information about assigning orders to a consignment automatically.
<b>Consignment No.</b>	<p>In this field, you can specify a consignment number if you want to manually assign the current sales order to a consignment. Assigning an order to a consignment means that the order will be part of a joint delivery of different sales orders to the same destination on the same date and with the same combination of carrier, delivery mode, delivery terms, and consignment type. If the order has partial delivery, it is possible to assign each line to a separate consignment, but if you specify a consignment — In this field, all lines in the table part except blocked lines are automatically also assigned to this consignment whether the order has partial delivery or not.</p> <p>It is also possible to have Maconomy automatically assign the order to a consignment by selecting the action “Assign Order to Consignment.” When you select this action, Maconomy will attempt to find a consignment which matches the order’s terms with regard to destination, delivery date, carrier, delivery mode, delivery terms, and consignment type, and which has sufficient weight and volume capacity for the order. Please note, however, that if the order has partial delivery, the action will be carried out on the individual order lines instead of the card part.</p> <p>When the field is completed, any values in the fields “Carrier,” “Delivery Mode,” “Delivery Terms,” “Consignment Type,” and “Destination No.” are overwritten with the information pertaining to the selected consignment. Furthermore, all delivery dates on the order are changed to the packing date of the consignment. See “Appendix B: Assign Quote/Order to Consignment” for further information about assigning orders to a consignment.</p> <p>If the order does not have partial delivery, and a destination has been specified, the field must be completed before the order can be approved. On orders with partial delivery, approving the order causes Maconomy to carry out certain actions to ensure that all lines in the table part are assigned to the same consignment. This can involve moving lines to other orders so that only lines pertaining to one consignment are left on the order, or simply rejecting the approval so that adjustments can be made manually. When the order is approved, Maconomy also copies the consignment left in the table part to this field, thus ensuring that all lines added to the table part are assigned to the same consignment. For further information on the approval of orders and on moving lines to other orders, please see the action “Approve Order” and the field “Blanket Order.”</p>
<b>Latest Arrival</b>	In this field, you can specify a date for the latest arrival permitted for the items to the current customer. If you specify a date In this field, Maconomy will issue a warning if the order is assigned to a consignment with an arrival date after the date in this field.
<b>Packing Date</b>	If the sales order is assigned to a consignment (in the card part), this field displays the date on which packing for the consignment in question should commence. The value is retrieved from the corresponding field in the window

Field	Description
	Consignments for the consignment in question. When the order is assigned to a consignment, the delivery date of the order is changed to the date in this field, and the contents of the field can no longer be changed.
<b>Consignment Date</b>	If the sales order is assigned to a consignment (in the card part), this field displays the expected date of departure for the consignment in question. The value is retrieved from the corresponding field in the window Consignments for the consignment in question.
<b>Arrival Date</b>	If the sales order is assigned to a consignment (in the card part), this field displays the expected date of arrival at the destination. The value is retrieved from the corresponding field in the window Consignments for the consignment in question.
<b>Charge Table</b>	In this field, you can select a charge table to be used for charge calculation if any charges with a mark in the field "From Charge Table" in the window Charges apply to the current order. The field is transferred from the customer information card when the order is created.
<b>Charge Discount %</b>	In this field, you can enter a charge discount percentage. A discount percentage entered in this field will be applied in addition to the one which can be specified in the charge table. The field is transferred from the customer information card when the order is created.
<b>Bill of Lading No.</b>	In this field, you can enter a bill of lading number which will be included on packing slips related to the current order.

### Weight and Volume Island

Field	Description
<b>Weight</b>	<p>This is the total weight of the item lines on the sales order. The value cannot be changed here.</p> <p>If you have Maconomy Bill of Materials, and the item on the line is a BOM without inventory control, Maconomy uses the weight of the BOM parts on the highest level with inventory control in the total sales order weight. Any weight entered for the BOM header on its item information card is not used.</p>
<b>Volume</b>	<p>This is the total volume of the item lines on the sales order. The value cannot be changed here.</p> <p>If you have Maconomy Bill of Materials, and the item on the line is a BOM without inventory control, Maconomy uses the weight of the BOM parts on the highest level with inventory control in the total sales order weight. Any weight entered for the BOM header on its item information card is not used.</p>

## Invoicing Island

Field	Description
<b>Blanket Invoice</b>	<p>You can mark this field if you want to invoice the order in a blanket invoice. Maconomy suggests the value from the Customer Information Card, but you can change it.</p> <p>Blanket invoicing means that all uninvoiced deliveries to customers with the same bill-to customer, the same currency, the same department, the same warehouse, and the same responsible company are invoiced in one invoice. This takes place in the window Invoicing.</p> <p>Sales orders assigned to jobs in the Job Cost module should not be blanket invoiced as the blanket invoice will be assigned to the job specified on the first sales order.</p>
<b>Batch Invoice</b>	<p>You can mark this field if you want to invoice the sales order in a batch in the window Print Invoice. Maconomy always suggests that the sales order is invoiced this way, but you can remove the mark.</p> <p>If the order is assigned to a consignment, Maconomy checks if the field "Batch Invoice" is marked for the consignment in question. If it is not, the mark from this field is removed when the order is assigned to the consignment. The field can, however, be changed later.</p> <p>In the window Invoicing Listing, you can see which orders are being batch invoiced, and you can remove the mark there.</p>
<b>Preferred Inv. Date</b>	<p>Here you can enter a preferred invoice date. If you leave it blank, Maconomy suggests today's date.</p> <p>The date is always determined in this way, regardless of whether the sales order is invoiced directly in this window or whether it is invoiced in a batch in the Print Invoice window.</p> <p>You can change the date in the Invoicing Listing window.</p> <p>If the field "Deliv. Date from Pref. Inv. Date" in the island Sales Order and the field "Allow Back Dating" in the island Item in the window System Information are marked, you can enter a date in this field. The date will be used on the packing slip at delivery.</p>

## Customer Information Island

Field	Description
<b>Department</b>	<p>Here you select the department which is relevant to the sales order. Maconomy suggests the value from the information card of either the Ship To or Bill To customer, depending on whether or not you have marked the field "Dept. from Bill to Cust." in the window System Information. You can change the suggested department.</p> <p>You maintain departments in the window Posting References in the G/L module.</p>

Field	Description
<b>Customer Group</b>	This is the customer group to which the customer is assigned. The value is transferred from the information card of the customer. It cannot be changed here.
<b>Language</b>	<p>Here you can select the language of the sales order. Maconomy suggests the value from the information card of the customer, but it is possible to change it. External order documents will be printed out in the language specified here. For further information, see the fields "Description Lang. 1," "Description Lang. 2," and "Description Lang. 3" in the island Description in the window Item Information Card.</p> <p>The language code is used to print external order documents in different languages. You can use Maconomy's layout editing tools to create different language layouts. You can select different language codes in the Print Order Confirmation, Print Packing Slip (in the File menu in the Show Packing Slip window), and in the Print Invoice windows. You can also select different language layouts in these windows.</p> <p>Language codes are maintained in the window Popup Fields in the Set-Up module.</p>
<b>Pmt. Terms</b>	<p>Here you select the payment terms. Maconomy suggests the value from the customer's Payment Information window, but you can select another.</p> <p>If you change the value, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus the value here, is given to users in the window Actions in the Set-Up module.</p> <p>You maintain payment terms in the Popup Fields window in the Set-Up module.</p>
<b>Cust. Payment Mode</b>	<p>In this field, you can specify how the customer is to pay the invoice printed on the basis of the sales order. Maconomy suggests the customer payment mode specified on the bill-to customer's information card, but this can be changed.</p> <p>Customer payment modes are created in the window Customer Payment Modes in the Banking module.</p>
<b>Global Location No.</b>	<p>If the customer on the current order has requested that you use a specific global location number on the invoice pertaining to the current order, you can specify the location number in question here. The number specified here will be transferred to invoices created for the customer in connection with the current order. Maconomy suggests the global location number specified in the window Company Specific Payment Information for the customer in question, but you can change it here if the location number to be used in connection with the current order is not the same as the standard location number of the customer.</p> <p>For further information about the concept of global location numbers, see the introduction to the window Company Locations in the G/L module.</p>
<b>Enterprise</b>	Here you can attach the sales order to an enterprise, or group of companies. Maconomy automatically suggests the value from the customer information card, but you can choose another. The field is used for statistics.
<b>Segment</b>	Here you can attach the sales order to an industry segment.

Field	Description
	Maconomy automatically suggests the value from the customer information card, but you can choose another. The field is used for statistics.
<b>Area</b>	In this field, you can assign an area to the order. Maconomy automatically suggests the value from the field "Area" in the window Customer Information Card, but it is possible to change it.
<b>Company Tax Code</b>	<p>In this field, you can specify a company tax code created in the window Popup Fields. The field is used by Maconomy for determining the tax code to be used in the calculation of tax for the current sales order, as the reporting code is part of the criteria for the selection of a tax code in the window Tax Tables in the G/L module. At this selection, Maconomy uses the tax table specified for the company responsible for the order. This tax table is selected in the window Company Information. However, the tax code is only selected from a tax table, if you have specified that tax tables which are specified in the window System Information are to be used, and only if the company responsible for the order is assigned to a tax table. If no tax table has been specified for the responsible company or if you use differentiated tax, and you do not use tax tables, Maconomy uses the tax code specified for the individual item in the window Item Information Card in the Inventory module or, in the case of charges, the tax code specified for the individual charge in the window Charges. If you use neither differentiated tax nor tax tables, Maconomy uses the standard tax code specified in the window System Information in the Set-Up module.</p> <p>If you use tax tables, and the system parameter "Get on account tax code from tax table" is marked, the tax code to be transferred to on account invoices is found in a tax table. But instead of using the item tax code specified on an activity, item, charge or account, Maconomy uses the on account tax code in the field "On Account Tax Code" in the window System Information in the Set-Up module (along with various other information) to point out the relevant tax table line. If the system parameter "Get on account tax code from tax table" is not marked, the standard tax code specified in the window System Information is always used as the tax code on invoices on account. For further information about the information used to point out the correct tax code, please see the description of the window Tax Tables in the G/L module.</p> <p>When posting invoices, the reporting code is used for determining which tax report entries to create. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if extended tax reporting has been selected in the window System Information.</p>

### Dimensions Island

Field	Description
<b>Location</b>	In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can

Field	Description
	<p>derive a value for which overwriting has been selected. If no value can be derived, the standard value is transferred from the window System Parameters in the Set-Up module.</p> <p>See the section on dimension derivation in the chapter “Introduction to the G/L module” as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field “Location” above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field “Location” above.
<b>Purpose</b>	The functionality of this field is similar to that of the field “Location” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.

### Extra Fields Island

Field	Description
<b>Popup 1-5</b>	In these fields, you can specify further information regarding the sales order and the current customer. You might, for example, specify a “hold” code or information about substitution items. Maconomy suggests the value of the corresponding fields in the customer’s information card, but you can change the values for the current sales order. The pop-up options are created in the window Popup Fields in the Set-Up module.

### Contact Management Island

Field	Description
<b>Campaign No.</b>	In this field, you can enter the number of a campaign if the current sales order is connected to a certain campaign in the Contact Management module. If you enter a campaign number, Maconomy transfers the number to lines that are then created in the table part. The campaign number can be used for, for example, statistical purposes.

### Copying Island

Field	Description
<b>Cust. No.</b>	In this field, you can enter the customer number to be used on the copy of the current order. If you specify a number, Maconomy will get the latest customer information from the A/R module. If you do not complete the field, the

Field	Description
	customer number and the customer information on the current order is transferred to the new copy. If you specify a customer number, Maconomy automatically recalculates the prices on the copy unless you complete the field "Maintain Prices" in this island.
<b>Order Type</b>	In this field, you can specify whether the copy is to be a quote or a sales order. Although the pop-up shows other options, only "Quote" and "Sales Order" can be selected. Maconomy suggests the value "Sales Order." If you choose to create a sales order, the copy created will be a non-approved sales order and if you choose to create a quote, the quote will be a nonprinted quote.
<b>Warehouse</b>	In this field, you can select a warehouse to be used on the copy. Maconomy suggests the warehouse specified on the current order, but if you enter another customer number in the field "Customer No." in this island, Maconomy gets the warehouse specified on the customer information card of the customer in question.
<b>Company No.</b>	In this field, you can select a company which will be responsible for the copy. If you do not enter a value, the company responsible for the current order is used on the copy.
<b>Currency</b>	In this field, you can select a currency to be used on the copy. If you select a currency, Maconomy automatically recalculates the prices on the copy unless you complete the field "Maintain Prices" in this island. If the user does not have access to changing prices, the value in this field cannot be changed.
<b>Price List</b>	In this field, you can select a price list to be used on the copy. If you select a price list, Maconomy automatically recalculates the prices on the copy unless you complete the field "Maintain Prices" in this island. Maconomy suggests the price list specified on the current order, but if you specify another customer number in the field "Customer No." in this island, Maconomy gets the price list specified on the customer information card of the customer in question.
<b>Price Step</b>	In this field, you can specify a fixed price step to be used on the copy. If you specify a price step, Maconomy automatically recalculates the prices on the copy unless you complete the field "Maintain Prices" in this island. Maconomy suggests the price step specified on the current order, but if you specify another customer number in the field "Customer No." in this island, Maconomy gets the price step specified on the customer information card of the customer in question.
<b>Pref. Deliv. Date</b>	In this field, you can enter a preferred delivery date to be used on the copy. Maconomy suggests today's date but you can change the date.
<b>Job No.</b>	In this field, you can specify a job number to be used on the copy.

Field	Description
	<p>Note that if a job has been closed, it is no longer possible to create an order for the job unless the job is first reopened in the window Jobs in the Job Cost module.</p> <p>If you complete this field, you must also complete the field "Activity No." in this island.</p>
<b>Activity No.</b>	In this field, you can specify an activity number to be used on the copy.
<b>Task</b>	In this field, you can specify a task to be used on the copy.
<b>Maintain Prices</b>	If you complete this field, the prices on the lines of the current order will also be used on the copy. If you do not complete the field, or if you have specified a customer, currency, price list or price step, Maconomy calculates the prices on the copy.

### Order Lines Sub-Tab

This section includes the fields and descriptions for the Order Lines sub-tab.

Field	Description
<b>Item No.</b>	<p>Here you enter the number of the item ordered. Items are created in the window Item Information Card in the Inventory module. Maconomy verifies that the item belongs in the warehouse specified in the card part.</p> <p>To create a text line, leave this field blank. You enter the text in the "Description" field, and leave all other fields blank.</p>
<b>Quantity</b>	<p>Here you enter the quantity of items ordered. The items are reserved in the warehouse. If your company uses the "By Reservation" back order principle, Maconomy creates back orders for any items not available at this time. Maconomy also updates the "Orders" and "Available" fields in the table part of the Item Information Card and Item Information windows in the Inventory module.</p> <p>If you enter values in the "Length" and "Width" fields, Maconomy calculates a quantity here by multiplying the length with the width. The facility is useful for entering column measurements for newspaper or magazine advertisements, for example. If you change the quantity found by Maconomy, the "Length" and "Width" fields will be reset.</p> <p>If the line is a text line, leave the field blank.</p> <p>If the item is a BOM with inventory control, it is reserved in the same way as standard items. If the item is a BOM without inventory control, and if it is itemized on the sales order, it will be reserved at BOM part level, at the highest level with inventory control. In the Order Lines window you can handle the BOM parts for BOMs which are being shown in full on the sales order.</p>

Field	Description
	Furthermore, if you change the quantity on a line containing an item with price control, Maconomy makes a recalculation of the prices.
<b>Unit</b>	Here you select the unit the item is sold in. Maconomy suggests the unit entered in the item's information card, but you can change it.
<b>Description</b>	This is the item text, retrieved from the "Description Lang. 1" field in the Item Information Card. The text can be changed. If the line is a text line, you enter the text here.
<b>Unit Price</b>	<p>In this field, you can enter the item's unit price on the sales order.</p> <p>If the order is assigned to a price list, and the item is included in the price list, Maconomy suggests the price from the price list.</p> <p>If the quantity justifies a quantity discount, or if a fixed price step has been specified on the order, the unit price suggested in this field will be the price on the price step in question as specified in the window Quantity Discounts in the Inventory module. However, the suggested price can be changed here if you and the customer have agreed on a special price.</p> <p>If the item is not included in the price list, or if you have not selected a price list for the order, Maconomy suggests the current cost of the item in the warehouse in question and adds the gross margin percentage, both of which are retrieved from the item's information card. This functionality only applies if the field "Sales Price Costing" has not been marked on the item's information card. If sales price costing is used for the item, the price is still transferred from the price list, but in this case, the cost is determined by the sales price, using the gross margin percentage. The cost is not shown, but it is used when posting the cost of sales. If the item is not in the price list, Maconomy suggests the price 0.</p> <p>Please note that the unit price of BOMs can be reduced if the following scenario occurs: If the item is a BOM with inventory control that does not use price control, this means that the price in this field should be calculated from the unit prices of the BOM parts. If the unit price of one of these BOM parts is calculated from cost and the BOM part is not assigned to the warehouse on the current line (by means of a warehouse assignment line in the table part of the window Item Information Card), the unit price of that BOM part is set to zero, which affects the price in this field.</p> <p>Maconomy uses the preferred delivery date in the card part of the order to determine which price list should be used in the calculation of prices.</p> <p>See also the description of the BOM Information Card for a more detailed description of BOM pricing.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Discount %</b>	This shows a discount % if the customer is entitled to a discount from the Discount Tables window in the Inventory module or from a customer or item discount agreement. You can change the suggested discount %, but you cannot change both the percent and the discount amount in the "Discount" field, since these two are related. The discount % is calculated from the discount amount.

Field	Description
	<p>If you change the value — In this field, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus to change the discount %, is given to users in the window Actions in the Set-Up module.</p> <p>If the item is a BOM which is not being shown on the sales order, the discount % is calculated as described above for standard items, and you can change it here.</p> <p>If the item is a BOM which is to be shown in full, the discount % is the total discount on all the BOM parts in proportion to the total price of the BOM. The calculation is based on the item on the highest level with price control. A BOM part contributes to the total discount if it has price control and if it is not an item in a BOM with price control. This functionality applies to any number of levels in the BOM. If you change the discount % here, the new value is copied to all the BOM lines, after which the discount amount is recalculated as described for the “Discount” field.</p> <p>You can see the BOM part lines in the Order Lines window, where you can change the discount % on items on the lowest BOM level.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Discount</b>	<p>This shows a discount if the customer is entitled to a discount from the Discount Tables window in the Inventory module or from a customer or item discount agreement. You can change the suggested discount, but you cannot change both the discount amount and the percent in the “Discount %” field, since these two are related. The discount % is calculated from the discount amount.</p> <p>If you change the value Maconomy verifies that you have user access to doing so. Access to changing price information, and thus to change the discount, is given to users in the window Actions in the Set-Up module.</p> <p>If you have Maconomy Bill of Materials and if the item is a BOM which is not being shown in full on the quote, the discount is calculated in the same way as for standard items and you can change it afterwards.</p> <p>If the item is a BOM which is to be shown in full, you cannot change the discount here. The discount is the total discount on all the BOM parts in the BOM. The calculation is based on the item on the highest level with price control. A BOM part contributes to the total discount if it has price control and if it is not an item in a BOM with price control. This functionality applies to any number of levels in the BOM. If you change the discount, the discount % is recalculated from the calculated unit price and is copied to all the BOM lines. The discount amount is then recalculated for every BOM part and is summed up in this field.</p> <p>You can see the BOM part lines in the Order Lines window, where you can change the discount on items on the lowest BOM level.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Extended Price</b>	<p>This is the extended price for the line. It is calculated by multiplying the item quantity by the unit price, dividing this sum by the pricing unit and deducting</p>

Field	Description
	<p>any discount. This extended price is transferred to the "Price" field in the Order Sum island in the card part of the window. It cannot be changed here.</p> <p>Maconomy alerts you if the extended price causes the bill-to customer's credit limit to be exceeded. When checking if the bill-to customer's credit limit has been exceeded, Maconomy checks the current customer's credit limit at enterprise level as well as at company level. See the description of the fields in the island Credit Limit in the windows Payment Information and Company Specific Payment information in the A/R module for further information about how credit limits are handled in Maconomy.</p>
<b>Deliv. Date</b>	<p>Here you can enter a preferred delivery date, applicable to the item line. Maconomy suggests the preferred delivery date specified in the card part of the window, but you can change it.</p> <p>If the line is a text line, you cannot enter a date here.</p> <p>If the item is not fully available on the given date, Maconomy calculates the expected delivery date from the item's delivery time in the Item Information Card. If the item also has an inventory profile, the delivery date is calculated to the first possible delivery using the current purchase volume.</p> <p>The delivery date can be changed as you please. If the delivery date is changed to an earlier date, Maconomy checks if the item can be delivered on this date. If this is not the case, the date will automatically be changed to the date on which the item can be delivered. If you want to update the delivery date so that it reflects the latest developments in availability (for instance changes in the expected availability date of purchased items), you can delete the date in the field and press Enter. Maconomy will then calculate the earliest possible delivery date based on delivery time, the current purchase, production and order volumes, and quantity in stock. However, whether you enter an earlier date or a blank value, the original date will be kept (that is, the date registered before the change was made) if the date found during the search is later than the original date.</p> <p>You can also select the action "Update Delivery Dates" to recalculate the delivery date on all the lines on the order, or use the window Update Item Reservations to update delivery dates on a range of order lines. In this case, however, Maconomy does not keep the original delivery date in case the search results in a later date. Please note that when delivery dates are updated using the action "Update Delivery Dates," each line is treated as if it were a line being created, while all other item reservations stay the same and thereby have first priority. However, when delivery dates are changed in batch in the window Update Item Reservations, all the affected lines are re-reserved, and lines concerning the same item are prioritized based on their current delivery dates, resulting in a fairer re-reservation, as lines with earlier delivery dates are more likely to benefit from items received earlier than expected.</p> <p>On orders without partial delivery, this field cannot be changed, once the order is approved or assigned to a consignment, as the value of this field will then always reflect the corresponding field in the card part of the window. The date can, however, always be changed on a blocked line. It is possible to add</p>

Field	Description
	<p>a line that cannot be delivered on the delivery date for an approved order which does not have partial delivery and is not assigned to a consignment. If this is the case, Maconomy changes all delivery dates on the order to the date on which the new line can be delivered.</p> <p>If the field "Urgent" is marked in the card part of the window, you can manually enter a delivery date in this field. Marking the order as urgent will prevent Maconomy from changing the delivery date according to the availability of the items in the warehouse. As a consequence, deleting the delivery date and pressing Enter as described above has no effect on urgent orders, as the value is returned to the one specified before it was deleted. Please note, however, that it is only possible to enter a delivery date in this field on an urgent order if the field "Partial Delivery" has been marked. If the field "Partial Delivery" has not been marked, the delivery date of an urgent order can only be changed in the card part of the window.</p>
<b>Deliv. Week</b>	This is the number of the week the delivery date in the "Deliv. Date" is in. You cannot change it here.
<b>Remarks</b>	Here you can enter a remark about the delivery of the item. The note is transferred to any item purchase orders created from the sales order.
<b>Consignment No.</b>	<p>In this field, you can specify a consignment number if you want to manually assign the current line to a consignment. The field is only relevant for orders with partial delivery, as the value otherwise has no influence on the order handling. Therefore, the following description is based on the assumption that the order has partial delivery.</p> <p>Assigning an order line to a consignment means that the line will be part of a joint delivery of different order lines to the same destination on the same date and with the same combination of carrier, delivery mode, delivery terms, and consignment type.</p> <p>It is possible to assign each line to a separate consignment. However, if you specify a consignment in the card part, all lines in the table part are automatically also assigned to this consignment whether the order has partial delivery or not.</p> <p>It is also possible to have Maconomy automatically assign each order line on the order to a consignment by selecting the action "Assign Order to Consignment." When you select this action, Maconomy will attempt to find a consignment which matches the order's terms with regard to destination, carrier, delivery mode, delivery terms, and consignment type. If a destination has been specified on the order, and the system parameter "Automatically assign order lines to consignment" has been marked, Maconomy automatically runs this action every time an order line is created, or an existing line is changed in a manner which results in a changed delivery date.</p> <p>When the field is completed, the delivery date on the line is changed to the packing date of the consignment. See "Appendix B: Assign Quote/Order to Consignment" for further information about assigning order lines to a consignment.</p>

Field	Description
	When the order is approved, Maconomy carries out certain actions to ensure that all lines in the table part are assigned to the same consignment. This can involve moving lines to other orders so that only lines pertaining to one consignment are left on the order, or simply rejecting the approval. When the order is approved, Maconomy also copies the consignment left in the table part to the consignment field in the card part, thus ensuring that all lines added to the table part are assigned to the same consignment. For further information on the approval of orders and on moving lines to other orders, please see the action "Approve Order" and the field "Blanket Order."
<b>Packing Date</b>	If the line is assigned to a consignment, this field displays the date on which packing for the consignment in question should commence. The value is retrieved from the corresponding field in the window Consignments for the consignment in question. When the line is assigned to a consignment, the delivery date of the line is changed to the date in this field, and the contents of the field can no longer be changed.
<b>Consignment Date</b>	If the line is assigned to a consignment, this field displays the expected date of departure for the consignment in question. The value is retrieved from the corresponding field in the window Consignments for the consignment in question.
<b>Arrival Date</b>	If the line is assigned to a consignment, this field displays the expected date of arrival at the destination. The value is retrieved from the corresponding field in the window Consignments for the consignment in question.
<b>Warehouse</b>	<p>You can specify a warehouse in this field. A warehouse can be specified until the order is approved, and only if the field "Get Inventory From Item" in the window System Information in the Set-Up module has been marked. If the item on the line has serial number control, it also applies that changing the warehouse only is possible if no serial numbers have been entered for the line in the window Serial Number Reporting.</p> <p>The warehouse stated as primary warehouse in the field "Primary Warehouse" on the item information card is shown by default. If nothing is stated in that field, the warehouse will be transferred from the card part of the order. Once a warehouse has been specified, the item will be reserved in the warehouse in question.</p> <p>When the order is approved, Maconomy carries out certain actions to ensure that all lines in the table part are assigned to the same warehouse. This is done by moving lines to other orders so that only lines pertaining to one warehouse are left on the order. For further information on the approval of orders and on moving lines to other orders, please see the action "Approve Order" and the field "Blanket Order."</p>
<b>Stock Location No.</b>	In this field, you can specify the location in the selected warehouse from which the items on the current line are to be shipped. When you create a line, Maconomy checks if a standard picking location has been specified in the table part of the item's information card on a line pertaining to the warehouse specified on the current order line. If a standard picking location has been specified and if this location is also marked as a shipping location in the

Field	Description
	<p>window Warehouse Information Card, the item's standard picking location is suggested In this field, but the value can be changed manually. If no standard picking location has been specified for the item or if the item has a standard picking location for the warehouse but it is not a shipping location, Maconomy suggests a blank value in this field.</p> <p>If the item is a BOM without inventory control, Maconomy uses the same method to derive a location for the automatically created lines representing items on the highest level with inventory control in the window Order Lines.</p> <p>If the field is blank, the location number specified in the card part of the window will apply to the line. For further information on the effects of the location number on a sales order, please see the descriptions of the actions in this window.</p> <p>You cannot select any of the actions that result in the creation of a warehouse transaction until you have either entered a location in the card part or on the individual item lines.</p>
<b>For Packing</b>	<p>Here you enter how many item units to pack. The number for packing is an indication of the number of units to be dispatched in the next shipment of items on the order. Therefore, this quantity is suggested on the warehouse transaction created when you select the action "Create Warehouse Transaction" or one of the other actions resulting in the automatic creation of a warehouse transaction, to tell the warehouse personnel that a certain number of items should be moved to the packing area. If a packing list is created for the order without first creating a warehouse transaction (neither by selecting the action "Create Warehouse Transaction" nor by selecting "Create Picking List"), this quantity is used on the packing list. This allows you to split the order into different deliveries. Maconomy verifies that the quantity is divisible by the item's minimum sales unit.</p> <p>If your company uses the "By Packing" back order method, Maconomy suggests that all the items be packed. Maconomy verifies that the value in this field does not exceed the difference between items ordered and items already delivered.</p> <p>If your company uses the "By Reservation" back order method, Maconomy suggests the quantity of items currently available in the warehouse as the quantity for packing. Maconomy verifies that the value in this field does not exceed the difference between items ordered and items already delivered. Maconomy puts unavailable items on back order.</p> <p>However, if the system parameter "Reset quantity to pack to 0" has been marked, the quantity in this field will be zero, even if the current line belongs to an urgent order.</p> <p>If the field "Urgent" has been marked in the card part of the window, the number in this field is automatically set to the quantity specified in the field "Quantity" on the current line, regardless of the availability of the items in the warehouse. However, the quantity for packing can be changed manually.</p> <p>If you have Maconomy Bill of Materials, and the item is a BOM without inventory control, the value here will always be "0" and cannot be changed.</p>

Field	Description
	<p>Packing selection is made for the individual BOM parts in the Packing List Lines window.</p> <p>If you have assigned an item purchase order line with direct delivery, that is, if the "Item Purchase Order No." field has a value and the "Drop Ship" field is marked, the value in this field will always be zero. Order lines which are delivered directly from vendor to customer will therefore not be included in packing lists or packing slips.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Discount Desc.</b>	<p>This is the discount description printed on all external order documents. If the description of the discount (be it item discount, customer discount or a discount from a discount table) granted on the line has been translated into the language specified in the card part of the order, the translation in question is shown here. If no such translation exists, Maconomy suggests the discount description specified for the discount in question in the window Item Discount Agreements, Customer Discount Agreement or Discount Tables, depending on the type of discount granted. However, you can change the text here.</p> <p>Translations are created in the window Language Texts in the Set-Up module.</p> <p>If you have entered a discount manually, you can enter a text here to describe the discount. The text is printed on all external order documents.</p> <p>If the line is a text line, leave this field blank.</p>
<b>Pricing Unit</b>	<p>This is quantity of units included in the item's unit price. The value is retrieved from the Item Information Card and cannot be changed here.</p>
<b>Note No.</b>	<p>In this field, you can specify the number of a note to be assigned to the current line for further specification. Notes are created and edited in the window Notes in the Set-Up module.</p>
<b>Note Description</b>	<p>This field shows a description of the note specified in the field "Note No." above.</p>
<b>Item Note No.</b>	<p>If the item specified on the line is a template item, that is, an item for which a template note has been specified in the window Item Information Card, a copy of the template note from the item information card is created, and the copy is assigned to the current order line by means of this field.</p> <p>A template item is an item where the generic item information is not specific enough, as certain details may change from order to order. An example of a template item is a business card where the basic information about the card such as the paper type and background color is static, but each time a batch of cards is ordered, the title, name and address to be printed on the card are different. It is therefore important that a number of additional fields are made available so that a user ordering a business card is allowed to enter this information. Once the order line has been created and this field has automatically been completed, you can enter the additional information required for the template item by opening the window Notes in the Set-Up</p>

Field	Description
	<p>module, selecting the note — In this field, and specifying the relevant data in the table part.</p> <p>For further information on the use and set-up of template items, see the description of the field “Template Note No.” in the window Item Information Card.</p> <p>The information entered in the note is also printed on external order documents.</p>
<b>Item Note Description</b>	This field shows a description of the note specified in the field “Item Note No.” above.
<b>External Desc.</b>	<p>This is the item description printed on all external order documents. If a translation exists for the current item in the language specified in the card part of the order, the translation in question is shown here. If no such translation exists, the item text from the field “Item Description, Language 1” is suggested instead. You can change the text here. Translations are created in the window Language Texts in the Set-Up module.</p> <p>If the line is a text line, you cannot enter a text here.</p>
<b>Internal Desc.</b>	<p>This is the internal item text from the Item Information Card. You can change this text. The text is printed on the packing list and is suitable for messages to warehouse employees. You can, for example, specify how the item should be handled and packed. The text is not printed on external order documents.</p> <p>If the line is a text line, you cannot enter a text here.</p>
<b>Extra Text 1-10</b>	In these fields, you can enter supplementary text for a further description of the current item. In the first three fields, Maconomy suggests the value from the corresponding fields in the item information card. You can change the suggested texts and enter additional information in the remaining seven fields.
<b>Popup 1-5</b>	In these fields, you can enter further information about the current item. Maconomy suggests the value from the corresponding fields in the item information card, but you can change the value for the current sales order line. The pop-up options are created in the window Popup Fields in the Set-Up module.
<b>Orig. Quantity</b>	In this field, you can specify how many units of the current item were originally ordered. When creating a line or when converting a quote to an order, Maconomy will copy the value in the field “Quantity” to this field, but you can change the value later.
<b>Delivered</b>	<p>This field shows how many item units have been delivered. The value cannot be changed.</p> <p>If you have Maconomy Bill of Materials, and the item is a BOM without inventory control, you can split it up and deliver it in parts. The quantity shown here is the quantity of whole BOMs. The exact quantity of delivered BOM parts is shown in the table part of the Order Lines window.</p>

Field	Description
<b>Invoiced</b>	<p>This field shows how many item units have been invoiced. The value cannot be changed.</p> <p>If you have Maconomy Bill of Materials, and the item is a BOM without inventory control, you can invoice part of it. The number here will show how many complete BOMs you have invoiced.</p> <p>The exact number of invoiced BOM parts is shown in the table part of the Order Lines window.</p>
<b>Transferred to Job Cost</b>	<p>This field shows how many units of the item have already been transferred to the Job Cost module from the item line. It cannot be changed here.</p> <p>An item is transferred to the Job Cost module by printing a packing slip or releasing for invoicing, provided the order is marked in the "Invoice in Job Cost" field. Item deliveries transferred to the Job Cost module cannot be invoiced in the Sales Orders module.</p>
<b>Back Orders</b>	<p>This field shows how many item units are on back order. The value cannot be changed here. To deliver a back order item, enter the quantity in the "For Packing" field.</p> <p>If you have Maconomy Bill of Materials, and the item is a BOM without inventory control, the value will always be "0." You must enter a quantity for each BOM part in the "For Packing" field in the Order Lines window.</p> <p>If the customer does not wish to receive the back order items, they can be deleted and the sales order can be closed. Back order items are deleted by deleting the line with the back order or by changing the quantity ordered in the "Quantity" field to equal the value in the "Delivered" field.</p> <p>You can operate with one of the following two back order principles:</p> <ol style="list-style-type: none"> <li>1. By Reservation — If your company keeps items in stock, you can choose to put an item on back order immediately the order line is created (that is, when the item is reserved in the warehouse) if the order is for more of the item than you currently have in stock. Maconomy ensures that only the available quantity is selected in the next picking list and packing list.</li> <li>2. By Packing — If your company orders items from your vendor when your customer places an order, you can select all the ordered items to be picked and packed, even though Maconomy tells you that some of the items are unavailable. The items might be back in stock when a picking list or packing list is printed on the delivery date. If they are not, this is reported back from the warehouse, at which time the item is in back order. This takes place in the Packing Lists window. You select a back order method in the System Information window in the Set-Up module.</li> </ol>
<b>For Purchase</b>	<p>If the item line is attached to an item purchase order, this field shows how many units you are buying. The quantity is in sales units, but the item quantity will always correspond to a whole number of the item's minimum purchase unit. You can enter the value manually in the Sales Order to Item</p>

Field	Description
	Purchase Orders window, or calculate it automatically from the back order quantity or the not yet delivered quantity.
<b>Currently Received</b>	If the item line is attached to an item purchase order, this field shows how many units you have received so far for the item purchase order line. The quantity is in sales units.
<b>Price List</b>	<p>This is the price list according to which the item line is priced. Maconomy suggests the price list from the card part of the window, unless the customer is tied to another price list by a discount agreement, which then is suggested instead. The value cannot be changed here.</p> <p>If you have Maconomy Bill of Materials, and the item is a BOM without price control, the field will be blank. The extended price will be calculated from the sum of the BOM parts, which are priced according to the price list in the card part.</p>
<b>Price Step</b>	<p>This is the price step in the price list according to which the item is priced. Maconomy suggests the value justified by the amount of items ordered. But if the customer is tied to a fixed price step, this price step is applied instead. You cannot change the value of this field.</p> <p>If you have Maconomy Bill of Materials, and the item is a BOM without price control, the value will be "0." The extended price is calculated from the sum of the prices of the BOM parts.</p>
<b>Keep Price</b>	In this field, you can specify whether the unit price and discount percentage on the current line should be recalculated when changing the quantity. If you mark the field, a change in quantity will not cause the current unit price or discount percentage to be recalculated, even if the new quantity results in, for example, a different price step. However, you can change the unit price and discount percentage manually. Maconomy suggests the value from the corresponding field in the card part, but you can change it for the individual order lines.
<b>Price at Step 1</b>	This is the price of one pricing unit, if the sales order is assigned to a price list and if the item price is included in the price list. If not, the value here will correspond to the unit price. The value cannot be changed here.
<b>Quantity Disc.</b>	This is the discount amount. It is defined as the difference between the price at price step 1 and the actual unit price, multiplied by the item quantity and divided by the pricing unit. It is usually the total discount on the item line. The value cannot be changed here.
<b>Bill of Materials</b>	This field shows whether the item is a standard item or a BOM. If the field is marked, the item is a BOM. The individual parts of the BOM can be changed in the Order Lines window if the BOM is being shown in full. The BOM information card shows whether the BOM parts are to be shown on the sales order.
<b>Location</b>	In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L

Field	Description
	<p>module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the field "Location" in the card part of the window.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Last Deliv. Date</b>	This is the date of the last delivery of items on the item line. Maconomy suggests today's date when you deliver items, that is, print a packing slip. You can change the date.
<b>Latest Promised Deliv. Date</b>	Here you can enter the latest date you promised to deliver by.
<b>Confirmed Delivery Date</b>	In this field, you can enter the last date which has been communicated to the customer as the delivery date. In other words, this is the date which the customer has been informed as the day on which he can expect to receive the items on the line. By comparing the date in this field with the one in the field "Deliv. Date" on the line (or "Arrival Date" if a consignment has been specified on the line), you can determine whether the customer needs to be informed of any delivery date changes. You can enter a date manually, but when you print an order confirmation, Maconomy overwrites the value as follows: If the line has not been assigned to a consignment, the field is assigned the line's delivery date. If the line has been assigned to a consignment, the field is assigned the arrival date of the consignment in question.
<b>Length</b>	<p>Here you can enter the length of the item. If you also enter a width below, Maconomy will calculate "Quantity" by multiplying length by width. If you complete the "Quantity" field, the length and width are reset.</p> <p>You can use this facility for entering column measurements for newspaper and magazine advertisements, for example.</p>

Field	Description
	When the sales order is invoiced, the length and width are transferred to the invoice line, except in the case of part-deliveries.
<b>Width</b>	<p>Here you can enter the width of the item. If you also enter a length above, Maconomy will calculate "Quantity" by multiplying length by width. If you complete the "Quantity" field, the length and width are reset.</p> <p>You can use this facility for entering column measurements for newspaper and magazine advertisements, for example.</p> <p>When the sales order is invoiced, the length and width are transferred to the invoice line, except in the case of part-deliveries.</p>
<b>Item Purchase Order No.</b>	If the item line is attached to an item purchase order, this field shows the number of the item purchase order. It cannot be changed here.
<b>Drop Ship</b>	If you have created or are going to create an item purchase order from the sales order line for direct delivery (drop-shipment), this field will be marked. The mark cannot be removed or set manually.
<b>Order Date</b>	Here you can see the date the order line was created.
<b>Activity No.</b>	<p>In this field, you can enter an amount activity if the current line relates to an activity and the sales order is assigned to a job. When you create a line on an order on which a job number has been specified, Maconomy attempts to derive an activity number using the following procedure:</p> <ol style="list-style-type: none"> <li>1. If the user manually enters an activity number, this number is used.</li> <li>2. If no value is entered manually, Maconomy checks the information card of the item specified on the line to see if an activity number has been specified there (see the window "Activity No." in the card part of the window Item Information Card). If so, the activity number in question is transferred to this field.</li> <li>3. If no activity number was found in step 2, the activity number specified in the corresponding field in the card part of the order is used.</li> <li>4. If no activity was found in step 3, the activity number to be derived from the standard task of the task list assigned to the job on the order is used.</li> </ol> <p>If no job has been specified on the order, any manually entered value is changed to a blank value, as you cannot specify an activity to a line which does not pertain to a job.</p>
<b>Task</b>	In this field, you can enter the name of a task if the order is linked to a job. If the corresponding field in the card part of the window contains a value, it will automatically be suggested in this field.
<b>Orig. Order No.</b>	This field shows the number of the sales order on which the item line was originally created.

Field	Description
<b>Customer's Item Purchase No.</b>	This field shows the customer's item purchase order number, if the original sales order was created on the basis of an item purchase order from the customer. The number is transferred from the card part, but it can be changed on the order lines.
<b>Vendor</b>	In this field you can enter a vendor number. The vendor is used when creating purchase orders in the window Sales Order to Item Purchase Orders. The default value is the vendor number from the item information card, if a vendor has been specified for the item.
<b>Vendor Name</b>	This field shows the name of the vendor in the field "Vendor" above.
<b>Campaign No.</b>	In this field, you can enter the number of a campaign if the current sales order line is connected to a certain campaign in the Contact Management module. If you enter a campaign number in the card part, Maconomy transfers the number to this field when creating lines. The campaign number can be used for, for example, statistical purposes.
<b>Blocked</b>	<p>This field is used for specifying whether the current line is blocked. A mark in this field indicates that the line cannot be delivered in a satisfactory way for instance because the items are not available by the delivery date. When one or several lines are blocked, none of the items on the order can be picked, packed or delivered. This means that you cannot select any of the actions that involve picking, packing or creating packing slips as long as the order contains blocked lines.</p> <p>Lines can be blocked and unblocked manually, but you can have Maconomy unblock lines which have become valid for unblocking, for example, because the items have become available on the delivery date or because some lines can be moved to orders where they match the delivery information. This is done by selecting the action "Activate Lines." Maconomy can also block and unblock lines automatically in the procedures of certain other actions in the Action menu. For further information on Maconomy's procedures for blocking and unblocking lines, please see the descriptions of the actions "Update Delivery Dates," "Split Line," "Assign to Consignment," "Approve Order," and "Activate Lines."</p>

## Order Lines Workspace

Use this workspace to handle individual order lines.

You create those lines in the Quote, Sales Orders, or Credit Orders workspaces, or Maconomy retrieves them from a sales order to the backorder register. The Order Lines tab displays general and account information about individual order lines. This workspace is particularly relevant for order lines that consist of a BOM that is being itemized on order documents. The BOM Lines sub-tab then displays the individual BOM parts. This workspace is thus a supplement to the sub-tabs in the Quote, Sales Orders, Credit Orders, and Back Order Register workspaces if you use BOMs in Maconomy.

The BOM Lines sub-tab displays all of the items in the BOM, if you are itemizing the BOM. You cannot change any information in the Order Lines tab, except through a number of actions, but you can change various BOM part information in the BOM Lines sub-tab. You can delete and enter item lines that do not have nested BOMs, and you can change price, discount, quantity, quantity for packing, texts, and dimension information. However, you can only change price, discount, and quantity for items on the lowest level of the BOM, which means that Maconomy recalculates the price as the sum of the prices of the items on all levels.

You can also view order lines that consist of texts or standard items, but because the workspace is particularly relevant for BOMs, the field descriptions are mostly concerned with BOMs. If you retrieve a text line or standard item, only the Order Lines tab is active. It displays the same information as on the order lines in the Quote, Sales Orders, Credit Orders, or Back Order Register workspaces, in addition to other information from the item information card.

## Order Lines Tab

This section includes the fields and descriptions for the Order Lines tab.

### Order Line Island

Field	Description
<b>Order No.</b>	This field shows the order number of the quote, sales order or credit order, in which the order line appears. If the line is a back order register line, the order number will be the same as the sales order it came from. The order number, order type, and line number combine to make the sole and absolute identification of the order line. To retrieve an order line, you can use the search functions in the Find menu. The order number cannot be changed.
<b>Line No.</b>	This field shows the line number in the quote, sales order or credit order, in which the order line appears. If the line is a back order register line, the line number will be the same as on the sales order it came from. The order number, order type, and line number combine to make the sole and absolute identification of the order line. Maconomy allocates an order line numbers according to where the order line is placed on the order. The value cannot be changed here. To retrieve an order line, you can use the search functions in the Find menu.
<b>Order Type</b>	This field shows whether the order is a quote, sales order, credit order or back order. The value cannot be changed here.
<b>Blocked</b>	This field shows whether the current line has been blocked. Only sales order lines and back order lines can be blocked.  Lines can be blocked and unblocked manually in the window Sales Orders and Back Order Register, but you can have Maconomy unblock sales order lines which have become valid for unblocking, for example, because the items have become available on the delivery date. This is done by selecting the action "Activate Line." For further information on Maconomy's procedure for unblocking lines, please see the description of the action "Activate Line."

**Item Island**

Field	Description
<b>Item No.</b>	This is the item number on the order line.
<b>Description</b>	This is the item text. The text is retrieved from the "Description" field in the Quote, Sales Orders, Credit Orders or Back Order Register window. The text cannot be changed here.
<b>External Desc.</b>	This is the external item description. The text is retrieved from the "External Desc." field in the Quote, Sales Orders, Credit Orders or Back Order Register window. The text cannot be changed here.
<b>Internal Desc.</b>	This is the internal item description. The text is retrieved from the "Internal Desc." field in the Quote, Sales Orders, Credit Orders or Back Order Register window. The text cannot be changed here.
<b>Extra Text 1-10</b>	These fields display the supplementary text entered for the item on the current order line. The text cannot be changed here.
<b>Item Group</b>	This is the item group. The information is retrieved from the Item Information Card in the Inventory module. The value cannot be changed.
<b>Item Type</b>	This is the item group. The information is retrieved from the Item Information Card in the Inventory module. The value cannot be changed.
<b>Unit</b>	This is the unit item in which the item is sold. The value is retrieved from the "Internal Desc." field in the Quote, Sales Orders, Credit Orders or Back Order Register window. It cannot be changed here.

**Dimensions Island**

Field	Description
<b>Location</b>	This field shows the location assigned to the item line. It is used when the invoice journal (from the sales or credit order) is posted. It only applies to standard items and BOMs with inventory control.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

**Quotes/Sales Orders Island**

Field	Description
<b>Ordered</b>	This field shows how many units of the item are ordered in the quote or sales order. If the line is a back order line, the quantity will be the remaining quantity from the sales order after delivery. The value is retrieved from the "Quantity" field in the table part of the Quote, Sales Orders or Back Order Register window. It cannot be changed here.
<b>For Packing</b>	This field shows how many item units are selected to be packed. The value is retrieved from the "For Packing" field in the table part of the Sales Orders window. It cannot be changed here. If the order is a quote or a back order register line, the value is "0."
<b>Back Orders</b>	If the line is from a sales order, this field shows how many item units are on back order. The value is retrieved from the "Back Orders" field in the table part of the Sales Orders window.  If the line is a back order register line, the quantity will always be zero, when you use the "By Packing" back order principle. If you use the "By Reservation" back order principle, the field will show how much of the item is not available.  If the order is a quote, the value is "0." The back order quantity cannot be changed here.
<b>Delivered</b>	This field shows how many item units have been delivered. The value is retrieved from the "Delivered" field in the table part of the Sales Orders window. It cannot be changed here. If the order line is from a quote or back order register, the value is "0."
<b>Invoiced</b>	This field shows how many item units are invoiced. The value is retrieved from the "Invoiced" field in the table part of the Sales Orders window. It cannot be changed here. If the order line is from a quote or back order register, the value is "0."

**Number of Back Orders Island**

Field	Description
<b>Orig. Order No.</b>	If the order line is a sales order line, which is transferred from a back order register line, this field shows the number of the sales order in which the line was originally created. It cannot be changed. The field has no significance for lines from quotes and credit orders.
<b>Orig. Line No.</b>	If the line is a sales order line transferred from the back order register, or if it is a back order register line, this field shows the line number on the sales order it was originally created in. It cannot be changed. The field has no significance for quotes and credit orders.
<b>Orig. Ordered</b>	If the line is a sales order line transferred from the back order register, or if it is a back order register line, this field shows how many items were originally ordered. It cannot be changed. The field has no significance for quotes and credit orders.

Field	Description
<b>Deliv. to Date</b>	<p>If the line is a sales order line transferred from the back order register, or if it is a back order register line, this field shows how many items have been delivered since the line was originally created. A sales order line transferred from the back order register is transferred back to the back order register, if it still is not possible to deliver the desired quantity. An order line can be transferred back and forth from the sales order and repeatedly.</p> <p>The value cannot be changed. The field has no significance for lines in quotes and credit orders.</p>

### Consignment Island

Field	Description
<b>Consignment No.</b>	<p>This field shows the consignment to which the current order line is assigned. The field is only relevant for orders with partial delivery, as the value otherwise has no influence on the order handling. Therefore, the following description is based on the assumption that the order has partial delivery.</p> <p>If an order line is assigned to a consignment, it means that the line will be part of a joint delivery of different order lines to the same destination on the same date and with the same combination of carrier, delivery mode, delivery terms, and consignment type.</p> <p>It is possible to assign each line on a sales order to a separate consignment. However, if a consignment has been specified for the order in the card part of the window Sales Orders, all lines belonging to the order are automatically also assigned to this consignment whether the order has partial delivery or not.</p> <p>It is also possible to have Maconomy automatically assign the current order line to a consignment by selecting the action "Assign to Consignment," provided that the line is not a back order line. When you select this action, Maconomy will attempt to find a consignment which matches the order's terms with regard to destination, carrier, delivery mode, delivery terms, and consignment type.</p> <p>When the field is completed, the delivery date is changed to the packing date of the consignment. See "Appendix B: Assign Quote/Order to Consignment" for further information about assigning order lines to a consignment.</p>
<b>Packing Date</b>	<p>If the current order line is assigned to a consignment, this field displays the date on which packing for the consignment in question should commence. The value is retrieved from the corresponding field in the window Consignments for the consignment in question. When the line is assigned to a consignment, the delivery date of the line is changed to the date in this field, and the contents of the field can no longer be changed.</p>

**Price List Island**

Field	Description
<b>Price List</b>	This field shows the price list according to which the order line is priced. The price list is retrieved from the "Price List" field in the table part of the Quote, Sales Orders, Credit Orders or Back Order Register window. The value cannot be changed here.
<b>Price Step</b>	This is the price step in the price list according to which the order line is priced. The price step is retrieved from the "Price Step" field in the table part of the Quote, Sales Orders, Credit Orders or Back Order Register window. The value cannot be changed here.
<b>Keep Price</b>	This field shows whether the unit price and discount percentage on the current line are to be recalculated when changing the quantity. The value is retrieved from the corresponding field in the table part of the current order or quote.
<b>Price at Step 1</b>	This is the price of one pricing unit, if the order line is assigned to a price list and if the item is included in the price list. The value cannot be changed here.

**Note Island**

Field	Description
<b>Note</b>	If a note has been assigned to the current line, this field shows the number of the note in question. The note text can be viewed and edited in the window Notes in the Set-Up module.

**Extra Fields Island**

Field	Description
<b>Popup 1-5</b>	These fields show the values entered in the corresponding fields on the current order line.

**Credit Orders Island**

Field	Description
<b>Credited</b>	This field shows how many item units are credited in the credit order. The value is retrieved from the "Credited" field in the table part of the Credit Orders window. It cannot be changed here.
<b>Returned</b>	This field shows how many item units have been returned. The value is retrieved from the "Return" field in the table part of the Credit Orders window. It cannot be changed here.

**Number of item purchase orders Island**

Field	Description
<b>Item Purchase Order No.</b>	If the order line is attached to an item purchase order line, this field shows the number of the item purchase order. Item purchase orders are attached to sales orders in the Sales Order to Item Purchase Orders window in the Item Purchase module. The number cannot be changed here.
<b>For Purchase</b>	If the order line is or will be attached to an item purchase order line, this field shows how many units of the item you are buying. The value cannot be changed here, but if the item purchase order has not been created yet, you can enter a quantity in the Sales Order to Item Purchase Orders window.
<b>Received</b>	If the order line is attached to an item purchase order line, this field shows how many units you have received until now. The quantity is in sales units.

**Warehouse Island**

Field	Description
<b>Inventory Control</b>	This field is marked if the item has inventory control. The value is retrieved from the Item Information Card in the Inventory module. It cannot be changed.
<b>Warehouse</b>	This is the warehouse to which the quote, sales order or credit order is assigned. The value is retrieved from the "Warehouse" field in the order window. Order lines in the back order register are assigned to the same warehouse as the sales order they came from. You cannot change the value here.
<b>Stock Location No.</b>	This is the warehouse location specified on the current order line.
<b>Delivery Date</b>	<p>This is the date by which the item on the current order can be delivered. The date is retrieved from the field "Deliv. Date" in the table part of the window Sales Orders. The delivery date cannot be changed here.</p> <p>As long as the order from which the order line originates is neither approved nor assigned to a consignment, this field displays the last possible delivery date for order and BOM lines on the order.</p> <p>When the order is approved, the delivery date on all lines of the order is changed to the date specified in this field. When the order has been approved, the delivery date for the current order can be changed in the window Sales Orders, if the order is not assigned to a consignment. If the delivery date is changed to a later date, the delivery date registered on all lines of the order will be changed accordingly, but if the delivery date on the current order line is changed to an earlier date, all reservations on the order will be renewed, and Maconomy will calculate a new delivery date for the order. If you then add a line for an item/BOM that can only be delivered after this date, all delivery dates on the order will be changed according to the delivery date registered on the new line.</p>

Field	Description
	<p>If the order is assigned to a consignment, the delivery date of the order and the assigned order lines will be changed to the packing date of the consignment. After this, you cannot add lines that cannot be delivered on the packing date of the consignment.</p> <p>If the order line concerns a BOM that is itemized upon creation of the order, you should consider special rules concerning calculation of delivery dates. This functionality is described in detail for the field "Deliv. date" in the table part of this window as well as described in Appendix C: Calculation of delivery dates for BOMs in the Sales Orders module.</p>
<b>Confirmed Delivery Date</b>	<p>This field shows the last date which has been communicated to the customer as the delivery date. In other words, this is the date which the customer has been informed as the day on which he can expect to receive the items on the line. By comparing the date in this field with the one in the field "Deliv. Date" on the line (or "Arrival Date" if a consignment has been specified on the line), you can determine whether the customer needs to be informed of any delivery date changes.</p>

### Price Island

Field	Description
<b>Price Control</b>	<p>This field shows whether the item has price control. If the field is marked, Maconomy calculates the price from a price list or cost information, including discounts. All standard items have price control. Price control is optional for BOMs. Price control is assigned in the "Price Control" field in the BOM Information Card window in the Inventory module. You cannot change the value here. If the field is not marked, the price is calculated as the sum of the prices of the BOM parts. These are specified in the table part.</p>
<b>Unit Price</b>	<p>This is unit price effective on the order line.</p> <p>If the item is a standard item or BOM for which individual items are not itemized, the price is calculated as described in the field "Unit Price" in the window Sales Orders:</p> <p>If the item is an itemized BOM with price control, the unit price is first calculated in the same ways as for standard items. The price is then distributed to the BOM parts in the percentages given in the BOM information card in the Inventory module, after which the price for the highest level is recalculated as the sum of the prices of the BOM parts.</p> <p>If the item is an un-itemized BOM without price control, the unit price is the sum of the BOM parts. The highest level with price control determines the BOM price. The individual BOM part prices are calculated by multiplying the unit price by the quantity of the item in the BOM, which is given in the BOM information card, multiplied by the BOM header pricing unit and divided by the BOM part's pricing unit.</p> <p>See also the description of the window BOM Information Card for a more detailed description of how BOMs are priced.</p>

Field	Description
<b>Pricing Unit</b>	This is the quantity of item units included in the unit price, unit weight and unit volume of the item. The value is retrieved from the Item Information Card and cannot be changed here.
<b>Extended Price</b>	This is the extended price of the order line. The price is calculated by multiplying the quantity ordered by the unit price and dividing this sum by the pricing unit. Any line discount is then deducted. The extended price is shown in the "Item Sales" field in the Price island in the card part of this window. The value cannot be changed here.
<b>Currency</b>	This is the currency of the order line.

**Discount Island**

Field	Description
<b>Quantity Disc.</b>	This is the quantity discount on the order line. If the item is a BOM without price control, the quantity discount is calculated as the sum of the discounts on the individual BOM parts. If the item is a standard item or BOM with price control, Maconomy applies any quantity discount quoted by the item's price list. Quantity discounts are calculated as the difference between the price at price step 1 and the unit price, multiplied by the quantity ordered, and divided by the pricing unit. The value is shown in the "Quantity Discount" field in the table part of the Quote, Sales Orders Credit Orders or Back Order Register window. The value cannot be changed here.
<b>Discount %</b>	This field shows the discount percentage on the order line, if applicable. The customer can be entitled to a discount from a discount table line in the Discount Table window in the Inventory module or from a customer or item discount agreement. The discount can also have been entered manually. It is retrieved from the "Discount %" field in the Quote, Sales Orders, Credit Orders or Back Order Register window the order is created in. You cannot change it here.
<b>Discount</b>	This field shows the discount amount on the order line, if applicable. The customer can be entitled to a discount from a discount table line in the Discount Table window in the Inventory module or from a customer or item discount agreement. The discount can also have been entered manually. It is retrieved from the "Discount" field in the Quote, Sales Orders, Credit Orders or Back Order Register window the order is created in. You cannot change it here.
<b>Discount Desc.</b>	This is the discount text from the "Discount Desc." field in the table part of the Quote, Sales Orders, Credit Orders or Back Order Register window the order was created in. The discount text is printed on all external order papers next to the line discount it refers to.

**General Island**

Field	Description
<b>Weight</b>	This is the item's weight per pricing unit. The weight is given in the standard item's or BOM's information card in the Inventory module. If the item is a standard item or a BOM with inventory control, the value here will be included in the total order weight. If the item is a BOM without inventory control, the order weight is found from the weight of the BOM parts on the highest level with inventory control. The weight here will then not be used. It cannot be changed here.
<b>Volume</b>	This is the item volume per pricing unit. The volume is given in the standard item's or BOM's information card in the Inventory module. If the item is a standard item or a BOM with inventory control, the value here will be included in the total order volume. If the item is a BOM without inventory control, the order volume is found from the volume of the BOM parts on the highest level with inventory control. The volume here will then not be used. It cannot be changed here.
<b>Tax Code</b>	<p>This field shows the tax code from the Item Information Card in the Inventory module. Tax codes are maintained in the Popup Fields window in the Set-Up module. The tax code has no significance to back order register lines.</p> <p>If multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2" and, if three tax levels are enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p> <p>Please note that if the "Tax" field in the Quote, Sales Orders or Credit Orders window is marked, Maconomy uses one of the two following principles to charge tax:</p> <ol style="list-style-type: none"> <li>1. If there is a mark in the "Differentiated Tax" field in the "Tax" island in the System Information window, Maconomy calculates a tax amount from the tax code in this field. <p>Please note that the tax on a BOM is calculated from the highest level with inventory control. Tax on a BOM without inventory control is calculated from the BOM part lines with inventory control and which are not part of a BOM with inventory control, using the tax code in the BOM part's information card. Tax on a BOM with inventory control is found from the BOM header, using the tax code in the BOM header's item information card.</p> </li> <li>2. If the "Differentiated Tax" field is blank, Maconomy uses the standard tax code from the System Information window. <p>Please note that the tax on a BOM is calculated from the highest level with inventory control. Tax on a BOM without inventory control is calculated from the BOM part lines with inventory control, using the standard tax code from the System Information window. Tax on a BOM with inventory control is calculated from the BOM header using the standard tax code.</p> </li> </ol>
<b>Sales Price Costing</b>	This field shows whether you are applying the Sales Price Costing to the item on the order line. If the field is marked, and if the item is a standard item or a BOM with inventory control, Maconomy calculates the cost as a fixed percentage of the extended price. The percentage rate is specified in the "GM % Sales Price" field in

Field	Description
	<p>the Item Information Card window. If the field is not marked, Maconomy uses the item's cost in the warehouse in question. Cost and cost principle are specified in the Item Information Card.</p> <p>If the item is a BOM without inventory control, Maconomy calculates the cost as the sum of the costs of the BOM parts. If so, the information in this field is not used.</p>

### Item Note Island

Field	Description
<b>Note</b>	If an item note has been assigned to the current line, this field shows the number of the note in question. The note text can be viewed and edited in the window Notes in the Set-Up module. For more information, please see the description of the field "Note."

### BOM Lines Sub-Tab

This section includes the fields and descriptions for the BOM Lines sub-tab.

Field	Description
<b>Level</b>	<p>This shows which level of the BOM the BOM part is on. Level 1 consists of items or BOM headers which are assigned directly to the BOM on an order line in the BOM Information Card in the Inventory module. Items on level 2 are part of a BOM which itself is part of a BOM, and so on.</p> <p>When you create a BOM part, its level will always be "1." In the Sales Orders module, you cannot enter BOM parts levels lower than one and you cannot enter items to BOMs composed of more than one level.</p>
<b>Item No.</b>	This is the item number of the BOM part. If you enter a BOM part, enter its item number here. If you cannot remember the number of an item, you can use the search functions in the Find menu. You can only enter standard items or BOMs not itemized on the order or order document.
<b>Quantity</b>	<p>The quantity here shows how many BOM parts are in one unit of the BOM on the level higher than the BOM part.</p> <p>When you enter a BOM part line, which must be on level one, the quantity here denotes how many of the items are in one unit of the order line BOM.</p>
<b>Total</b>	This is the total quantity of the BOM parts on the quote, sales order, credit order or back order line. It is found by multiplying the "Quantity" by the "No. BOMs" field and cannot be changed here.
<b>Unit</b>	Here you select the unit of the BOM part. Maconomy suggests the unit from the item information card in the Inventory module.
<b>Description</b>	Here you can enter an item text. Maconomy suggests the text from the "Description Lang. 1" field from the item's information card.
<b>Extra Text</b>	Here you can assign an extra text to the BOM part. The text is printed on various order documents. If the item appears more than once in a BOM, and

Field	Description
	has different functions, you can make the distinction here. Maconomy suggests the text from the BOM part line in the BOM Information Card window in the Inventory module.
<b>Unit Price</b>	<p>This is the unit price on the quote, sales order, credit order or back order line. If the line is from the back order register, the unit price is transferred from the sales order. For quotes, sales orders and credit orders, this price is calculated as described below.</p> <p>If the item is part of a BOM with price control, the price is found by one of the following two methods:</p> <ol style="list-style-type: none"> <li>1. The BOM part has price control: <p>If the item is a standard item or BOM, which is not itemized on the order or order documents, the price is calculated by the following method:</p> <p>If there is a price list in the card part of the window, and if there is a price for the item in the price list, Maconomy will automatically suggest the unit price here.</p> <p>To set the price, Maconomy uses the delivery date on the order line to determine the price list edition which is valid at the time of delivery.</p> <p>If the quantity ordered justifies to a quantity discount, Maconomy includes the discount in the suggested price. If the price list does not have a price for the item, or if you have not selected a price list for the quote, sales order or credit order, Maconomy suggests the cost at the warehouse in question plus a GM %, both of which are retrieved from the item's information card in the Inventory module.</p> <p>If the item is a BOM with price control, which is being shown on the order or order documents, the price is calculated thus:</p> <p>First the unit price is calculated in the same way as for standard items. The price is then distributed to the BOM parts in proportion to the price percentages entered on the BOM information card in the Inventory module. Finally, the price at the highest level is recalculated as the sum of the prices of the BOM parts.</p> </li> <li>2. The BOM part does not have price control (it is in this case always a BOM): <p>The price of a BOM without price control and which is being shown on the order or order documents is calculated as the sum of the prices of the BOM parts, the price at the highest level being determining. The prices of the individual BOM parts are included in the sum with an amount which is calculated by multiplying the unit price by the quantity of the item in the BOM, according to the BOM information card in the Inventory module, multiplied by the BOM header's pricing unit and divided by the BOM part's pricing unit.</p> <p>If the BOM part is part of a BOM with price control, the price is calculated as described above and distributed in accordance with the</p> </li> </ol>

Field	Description
	<p>allocation percentages from the BOM information card in the Inventory module. The price of the item on the highest level with price control is taken from a price list or calculated from cost and GM% as described above.</p> <p>Please note that the unit price of BOMs can be reduced if the following scenario occurs: If the item is a BOM with inventory control that does not use price control, this means that the price in this field should be calculated from the unit prices of the BOM parts. If the unit price of one of these BOM parts is calculated from cost and the BOM part is not assigned to the warehouse on the current line (by means of a warehouse assignment line in the table part of the window Item Information Card), the unit price of that BOM part is set to zero, which affects the price in this field.</p> <p>It is only possible to change unit prices of BOM part lines which are at the lowest level.</p> <p>Maconomy alerts you if you have entered a new BOM part, which is not part of a BOM with price control, if you have entered a price list which does not have a price for the item and if cost is zero.</p>
<b>Discount %</b>	<p>Here you can enter a discount % if the BOM part is at the lowest level of the BOM. Maconomy suggests a discount % if the item has price control and if the customer is entitled to a discount from a discount table line in the Discount Table window or from a customer or item discount agreement. If the item is at the lowest level of the BOM, you can change the suggested discount %, but you cannot change both the percent and the discount amount in the "Discount" field, since these two are related.</p> <p>If you change the value — In this field, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus to change the discount %, is given to users in the window Actions in the Set-Up module.</p> <p>If the item is a BOM which is not being shown on the sales order, the discount % is calculated as described above for standard items, and you can change it here.</p> <p>If the item is a BOM which is to be shown in full, the discount % is the total discount on all the BOM parts in proportion to the total price of the BOM. The calculation is based on the item on the highest level with price control. A BOM part contributes to the total discount if it has price control and if it is not an item in a BOM with price control. This functionality applies to any number of levels in the BOM. If you change the discount % here, the new value is copied to all the BOM lines, after which the discount amount is recalculated as described for the "Discount" field.</p>
<b>Discount</b>	<p>Here you can enter a discount amount if the BOM part is at the lowest level of the BOM. Maconomy suggests a discount if the item has price control and if the customer is entitled to a discount from a discount table line in the Discount Table window or from a customer or item discount agreement. If the item is at the lowest level of the BOM, you can change the suggested discount, but you</p>

Field	Description
	<p>cannot change both the discount amount and the percent in the “Discount %” field, since these two are related.</p> <p>If you change the value — In this field, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus to change the discount, is given to users in the window Actions in the Set-Up module.</p> <p>If you have Maconomy Bill of Materials and if the item is a BOM which is not being shown in full, the discount is calculated in the same way as for standard items and you can change it afterwards.</p> <p>If the item is a BOM which is to be shown in full, you cannot change the discount here. The discount is the total discount on all the BOM parts in the BOM. The calculation is based on the item on the highest level with price control. A BOM part contributes to the total discount if it has price control and if it is not an item in a BOM with price control. This functionality applies to any number of levels in the BOM. If you change the discount, the discount % is recalculated from the calculated unit price and is copied to all the BOM lines. The discount amount is then recalculated for every BOM part and is summed up in this field.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Extended price</b>	<p>This is the extended price. It is found by multiplying the total quantity by the unit price and dividing this figure by the pricing unit. Any line discount is then deducted. The extended price cannot be changed here.</p>
<b>Deliv. Date</b>	<p>This is the item’s delivery date.</p> <p>In this field, you can enter another preferred delivery date for the BOM item, if the upper level of the BOM has inventory control. If the BOM has inventory control, and if the BOM is itemized upon creation on the sales order, the BOM lines will be assigned the same delivery date as that of the order line in this window. If the BOM does not have inventory control, and the BOM is itemized upon creation on the quote/sales order, the suggested or preferred date in this field will be the basis for Maconomy’s calculation of an expected delivery date for each BOM line. These individual dates are only displayed in this field. On the order line in the window Sales Orders/Quote, the delivery date corresponds to the date on which the BOM can be delivered, that is, the delivery date of the BOM part that can be delivered last.</p> <p>For each BOM part the delivery date corresponds to the delivery date of the underlying BOM parts, and changes to the delivery dates of the BOM parts will therefore also be displayed in the field “Deliv. Date” on the BOM line. If none of the parts have inventory control, Maconomy will use the preferred delivery date of the order.</p> <p>The delivery date of a BOM can be changed if the item is provided with inventory control. If the delivery date is changed to an earlier date, Maconomy checks if the item can be delivered on this date. If this is not the case, the date will automatically be changed to the date on which the item can be delivered. For items on the highest level with inventory control, you can update the delivery date so that it reflects the latest developments in availability (for instance changes in the expected date of receipt of purchased</p>

Field	Description
	<p>items). This is done by deleting the date in the field and pressing Enter. Maconomy will then calculate the earliest possible delivery date based on delivery time, the current purchase, production and order volumes, and quantity in stock. However, whether you enter an earlier date or a blank value, the original date will be kept (that is, the date registered before the change was made) if the date found during the search is later than the original date.</p> <p>See “Appendix C: Calculation of delivery dates for BOMs” for further information on how delivery dates for BOMs on order lines are calculated.</p> <p>If the order line is assigned to a quote, the date in this field will be equal to the date in the field “Pref. Deliv. Date” in the card part of the window Quote.</p>
<b>Confirmed Delivery Date</b>	<p>In this field, you can enter the last date which has been communicated to the customer as the delivery date. In other words, this is the date which the customer has been informed as the day on which he can expect to receive the items on the line. By comparing the date in this field with the one in the field “Deliv. Date” on the line (or “Arrival Date” if a consignment has been specified on the line), you can determine whether the customer needs to be informed of any delivery date changes. You can enter a date manually, but when you print an order confirmation, Maconomy overwrites the value as follows: If the order line in the card part has not been assigned to a consignment, the field is assigned the line’s delivery date. If the order line has been assigned to a consignment, the field is assigned the arrival date of the consignment in question.</p>
<b>Deliv. Week</b>	<p>This field displays the number of the week in which the delivery date in the field “Deliv. Date” is placed. The value in this field cannot be changed here.</p>
<b>Stock Location No.</b>	<p>In this field, you can specify the location in the selected warehouse from which the items on the current line are to be shipped. If you leave this field blank, the location number specified in the card part of the window will apply to the line. For further information on the effects of the location number on an order line, please see the descriptions of the actions in the window Sales Orders.</p> <p>If the item in the card part is a BOM without inventory control, Maconomy attempts to derive a location for the items on the highest level with inventory control for the lines created automatically. To do this, Maconomy checks if a standard picking location has been specified in the table part of the item’s information card on a line pertaining to the warehouse specified in the card part. If a standard picking location has been specified and if this location is also marked as a shipping location in the window Warehouse Information Card, the item’s standard picking location is suggested — In this field, but the value can be changed manually. If no standard picking location has been specified for the item or if the item has a standard picking location for the warehouse but it is not a shipping location, Maconomy suggests a blank value in this field. This procedure is also used when manually creating lines.</p> <p>You cannot select any of the actions that result in the creation of a warehouse transaction or packing list until you have either entered a location in the card part or on the individual item lines. For itemized BOMs without inventory</p>

Field	Description
	control, a warehouse transaction or packing list cannot be created until you have specified a location for the BOM part items on the highest level with inventory control.
<b>For Packing</b>	<p>Here you enter how many of the items to pack from the warehouse, if the line is in a sales order and if the BOM part is not in a BOM with inventory control. This field is especially useful if the customer is having part of the order delivered now and the rest later.</p> <p>The field has no function if the BOM has inventory control.</p> <p>If your company applies the “By Packing” back order principle, Maconomy suggests that all the items are selected here. Maconomy verifies that the value does not exceed the difference between items ordered and items already delivered.</p> <p>If your company applies the “By Reservation” back order principle, Maconomy selects as many items as are available in the warehouse. Maconomy verifies that the value here does not exceed the difference between items ordered and items already delivered. Any unavailable items are put on back order.</p> <p>The field has no function if the order line is from a quote, credit order or back order register.</p>
<b>Discount Desc.</b>	<p>This is the discount description printed on all external order documents. If the description of the discount (be it item discount, customer discount or a discount from a discount table) granted on the line has been translated into the language specified in the card part of the quote or order to which the order line belongs, the translation in question is suggested here. If no such translation exists, Maconomy suggests the discount description specified for the discount in question in the window Item Discount Agreements, Customer Discount Agreement or Discount Tables, depending on the type of discount granted. However, you can change the text here. Translations are created in the window Language Texts in the Set-Up module.</p> <p>If you have entered a discount manually, you can enter a text to describe it.</p> <p>If the line is a back order register line, the text is transferred from the sales order.</p>
<b>Pricing Unit</b>	This field shows how many item units are included in the unit price. The value is retrieved from the Item Information Card in the Inventory module. It cannot be changed here.
<b>External Desc.</b>	This is the item description printed on all external order documents. If a translation exists for the current item in the language specified in the card part of the quote, order or credit order from which the line originates (or from which it was transferred if it is a back order register line), the translation in question is shown here. If no such translation exists, the item text from the field “Item Description, Language 1” is suggested instead. You can change the text here. Translations are created in the window Language Texts in the Set-Up module.
<b>Internal Desc.</b>	This is the internal item text from the Item Information Card. You can change this text. It is printed on the packing list and is suitable for messages to

Field	Description
	warehouse employees. You can, for example, specify how the item should be handled and packed. The text is not printed on external order documents.
<b>Extra Text 1-10</b>	In these fields, you can enter supplementary text for a further description of the current item. In the first three fields, Maconomy suggests the value from the corresponding fields in the item information card. You can change the suggested texts and enter additional information in the remaining seven fields.
<b>Popup 1-5</b>	In these fields, you can enter further information about the current item. Maconomy suggests the value from the corresponding fields in the item information card, but you can change the value for the current order line. The pop-up options are created in the window Popup Fields in the Set-Up module.
<b>Delivered</b>	<p>This shows how many units of the BOM part have already been delivered. If the BOM part is a BOM, which is being shown on the order or order documents, the field will show how many complete BOMs have been delivered. You cannot change the value.</p> <p>The field has no function, if the order line is from a quote, credit order or back order register.</p>
<b>Invoiced</b>	<p>This shows how many units of the BOM part have already been invoiced. If the BOM part is a BOM, which is being shown in full on the order or order documents, the field will show how many complete BOMs have been invoiced. You cannot change the value.</p> <p>The field has no function, if the order line is from a quote, credit order or back order register.</p>
<b>Back Orders</b>	<p>This shows how many items are in back order. It only applies if the item is not part of a BOM with inventory control. If the item is part of a BOM with inventory control, back orders are always zero. You cannot change it here. A back order is delivered by entering the remaining quantity in the "For Packing" field, after which you can print a packing list, packing slip or invoice in the Sales Orders window, or you can select "Release to Invoice."</p> <p>If the line is a back order register line, the quantity will always be zero when you use the "By Packing" back order principle. If you use the "By Reservation" back order principle, the field will show how much of the item is not available.</p> <p>The field has no function, if the order line is from a quote or credit order.</p>
<b>Return</b>	Here you can enter how many items are being returned in the crediting. It only applies to credit orders and if the BOM part is not part of a BOM with inventory control. It is always zero for items which are part of BOM with inventory control.
<b>Originally Ordered</b>	If the order line is a sales order line, which is transferred from the back order register, or if it is a back order register line, this field will show how much was ordered in the original sales order. The value cannot be changed. The field has no significance for quote and credit order lines.
<b>Deliv. to Date</b>	If the order line is a sales order line, which is transferred from the back order register, or if it is a back order register line, this field will show how many items have been delivered since the line was originally created.

Field	Description
	The value cannot be changed. The field has no significance for quote and credit order lines.
<b>Bill of Materials</b>	This shows whether the BOM part is a BOM itself. If the field is marked, the item was created in the Item Information Card window and marked in the "BOM" field. Its BOM parts are shown on the lines beneath it in this table. Prices, discounts, inventory figures, and so on, are for a nested BOM calculated from the BOM parts using the same principle as the BOM on the order line. You cannot change the value here.
<b>Inventory Control</b>	<p>This field shows whether inventory control is applied to the BOM part. If the field is marked, Maconomy applies the inventory control at the BOM part level.</p> <p>If inventory control is applied to BOM which the item is part of or to a BOM at a higher level, the field will not be marked, regardless of whether the "Inventory Control" field is marked in the item information card. Inventory control is then applied to at the highest level with inventory control. You cannot change the value in the field.</p>
<b>Price Control</b>	<p>This field shows whether price control is applied to the BOM part. If the field is marked, Maconomy applies the price control at the BOM part level.</p> <p>If there is price control at a higher level, that is, if the BOM part is part of a BOM with price control, the field will not be marked, regardless of whether the BOM part is a standard item or a BOM with price control. Price control is then applied at the highest level with price control. You cannot change the value of this field.</p>
<b>Price List</b>	<p>This is the price list applied in the item line. Maconomy automatically inserts the value from the quote, sales order or credit order. You cannot change the value.</p> <p>If the item line is not assigned to price control, the field is blank.</p>
<b>Price Step</b>	<p>This field shows the price step in the price list applied in the item line. If the item is assigned price control, Maconomy automatically suggests the price step justified by the quantity in the "Total" field. If the quote, sales order or credit order is tied to a fixed price step (and the item is priced on this step) Maconomy automatically inserts this step. If the line is a back order register line, the value will be transferred from the sales order. You cannot change the price step.</p> <p>If the item line is not assigned to price control, the value is zero.</p>
<b>Price at Step 1</b>	<p>This is the price of one unit of the item if the quote, sales order or credit order is assigned to a price list, which includes this item, and if the item line is assigned price control. If the line is a back order register line, the value will be transferred from the sales order. The price cannot be changed here.</p> <p>If the item line is not assigned to price control, the value is zero.</p>
<b>Quantity Disc.</b>	This field shows the quantity discount on the item line, if applicable. The item line must be marked in the "Price Control" field. Quantity Discount is defined as the difference between the price at price step 1 and the actual unit price,

Field	Description
	multiplied by the item quantity in the "Total" field. The value cannot be changed here.
<b>Quote</b>	If this field is marked, the BOM part is shown on the printed quote. The value is retrieved from the BOM information card for the BOM it is part of. The field is not marked if the item is part of a nested BOM which is not being printed on the quote. If the field is not marked, only the BOM header is shown on the quote. You cannot change the value.
<b>Order Confirmation</b>	If this field is marked, the BOM part is shown on the printed order confirmation. The value is retrieved from the BOM information card for the BOM it is part of. The field is not marked if the item is part of a nested BOM which is not being printed on the order confirmation. If the field is not marked, only the BOM header is shown on the order confirmation. You cannot change the value.
<b>Packing Slip</b>	If this field is marked, the BOM part is shown on the printed packing slip. The value is retrieved from the BOM information card for the BOM it is part of. The field is not marked if the item is part of a nested BOM which is not being printed on the packing slip. If the field is not marked, only the BOM header is shown on the packing slip. You cannot change the value.
<b>Invoice</b>	If this field is marked, the BOM part is shown on the printed invoice. The value is retrieved from the BOM information card for the BOM it is part of. The field is not marked if the item is part of a nested BOM which is not being printed on the invoice. If the field is not marked, only the BOM header is shown on the invoice. You cannot change the value.
<b>No. BOMs</b>	<p>This field shows how many BOMs on the order line the BOM part is part of. If the BOM part is on level 1, this value here will be the same as in the "Ordered" field in the Quotes/Sales Orders island or the "Credited" field in the Credit Orders island in the card part of the island. If the BOM part is on level 2, the value here will take into account how many times the BOM on level 1 is included in the BOM on the order line, and so on.</p> <p>The value here is used to calculate the value in the "Total" field and cannot be changed.</p>
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If the current line was created automatically from a sales order line, the value in this field is retrieved from the sales order line in question.</p> <p>If the line was created manually, and you do not enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the field "Location" in the card part of the window.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>

Field	Description
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

## Order Information Workspace

Use this workspace to enter more detailed information about a quote, sales order, or credit order.

You can enter information in up to 20 text fields and 5 date fields.

### Order Information Tab

This section includes the fields and descriptions for the Order Information tab.

#### Sales Orders Island

Field	Description
<b>Order No.</b>	This is the number of the quote or order.

#### Ship to Customer Island

Field	Description
<b>Customer</b>	This is the number of the customer the quote or order is for. You cannot change it. The lines following the customer number are the first two lines of the customer's name and address.

#### Information Island

Here you can enter any information you wish about the quote or order. You can use Maconomy's layout editing tools to create a layout for quotes, order confirmations, draft invoices, invoices, packing slips, draft credit memos, credit memos, returns lists and labels, so that the text entered in these fields can be included in your external, sales order related printouts.

## Extra Fields Island

Field	Description
<b>Date 1-5</b>	In these fields, you can enter a number of dates related to the current order. You can use Maconomy's layout editing tools to change the layout of quotes, order confirmations, draft invoices, invoices, packing slips, draft credit memos, credit memos, returns lists and labels, so that the content entered in these fields can be included in your external, sales order related printouts.

## Credit Orders Workspace

Use this workspace to create and change credit orders.

In the Credit Orders tab, you enter general and account information. When you press Return, Maconomy verifies the information and opens order lines and text lines in the Credit Order Lines sub-tab.

To create a credit order, first enter the number of the customer. Maconomy verifies that the customer exists. Maconomy then retrieves various information from the Customer Information Card in the Accounts Receivable module and suggests that information in the credit order. You can change most of it.

If you want to credit a customer for all or part of the items from one specific invoice, you can save time by using the Invoice to Credit Order workspace.

In the Invoice to Credit Order workspace, Maconomy automatically creates a credit order based on an invoice. Later, you can retrieve the credit order in this workspace. You can then deselect items or make other adjustments before approving the credit order.

As you enter order lines in a credit order, Maconomy applies price lists and discount agreements from the Accounts Receivable and Inventory modules.

You can also copy a credit order onto a credit order. You can specify that the prices in the original order are also to be used on the copy, but if you do not want to copy the prices, Maconomy recalculates the prices on each order line. Maconomy transfers the basic information about the customer from the customer information card, regardless of whether you specify the same customer as on the original order.

If you have Maconomy Bill of Materials, you can enter both standard items and bills of materials (BOM) in the Credit Order Lines sub-tab. Maconomy only displays the BOM header, not the parts. If the BOM is shown in full on the credit order, you can see the item parts in the Order Lines workspace, which automatically shows the item in the last item line you that you created.

## Credit Orders Tab

This section includes the fields and descriptions for the Credit Orders tab.

## Credit Order Island

Field	Description
<b>Order No.</b>	This number is the sole and absolute identification of the credit order. Maconomy automatically allocates the next available order number. The number cannot be changed manually, but you determine how sales and credit order

Field	Description
	numbers (which share the same number series) are allocated in the Numbers window.
<b>Order Mode</b>	Here you select the order mode, that is, how the quote is relayed to the customer, for example, "By telephone," "By Fax." You maintain order modes in the Popup Fields window in the Set-Up module.
<b>Sales Person</b>	<p>Here you enter the number of the employee who is sales representative on the credit order. Maconomy automatically suggests the sales representative who normally sells to this customer, retrieving the number from the customer information card. You can change the number.</p> <p>If you cannot remember the number, you can use the search functions in the Find menu.</p> <p>This field also displays the sales person's name. Maconomy retrieves it from the Employees window in the Set-Up module using the specified sales person number.</p>
<b>Received by</b>	Here you enter the name of the employee who spoke with the customer about the credit order. Maconomy suggests the name of the user, but you can change it. You must enter a name.

### Ship to Address Island

Field	Description
<b>Customer</b>	<p>In this field, you enter the number of the customer who returns the items in connection with the crediting. Maconomy checks that the customer has been created in Maconomy and, if the system parameter "Aut. company specific customer creation" has not been marked in the Set-Up module, if the current customer has been created as a company specific customer for the company responsible for the contract. If this parameter has not been marked, the customer has to be created as a company specific customer in the window Company Specific Customer Information Card before orders can be created with the current combination of customer and company. Furthermore, Maconomy checks that the customer has not been blocked in the window Payment Information in the A/R module.</p> <p>When you press Return, Maconomy retrieves various information from the customer's information card in the Accounts Receivable module and suggests the values in corresponding fields here. You can change most of it.</p> <p>The other lines in this field show the customer's name and address. These are retrieved from the customer's information card. You can change the information on the current credit order.</p> <p>The customer number can be changed up until lines have been created in the credit order. If you change the customer number, Maconomy will update the credit order with various information from the customer information card and will derive the dimensions for the card part of the credit order again. If charges have been specified on the credit order, the ship-to customer can only be changed to a customer using the currency already specified on the credit order.</p>

Field	Description
<b>Attn.</b>	This is the customer's attention person the person to whom shipping information is directed. It is retrieved from the customer's information card. The name can be changed here.
<b>Country</b>	This is the customer's country. It is retrieved from the customer's information card. It can be changed here.
<b>Phone</b>	This is the customer's telephone number, retrieved from the customer's information card. It can be changed here.
<b>Fax</b>	This is the customer's fax number, retrieved from the customer's information card. It can be changed here.
<b>Telex</b>	This is the customer's telex number, retrieved from the customer's information card. It can be changed here.
<b>E-mail</b>	This is the customer's e-mail address, retrieved from the customer's information card. It can be changed here.

**Status Island**

Field	Description
<b>Approved</b>	If this field is marked, the credit order is approved. To approve a credit order, select the action "Approve Credit Order." The credit order must be approved before you can print a returns list or a credit memo. You can only mark this field by selecting the action "Approve Credit Order."
<b>Date Credited</b>	This is the date the credit order is credited. The date cannot be changed here.

**Credit Order Total Island**

Field	Description
<b>Price</b>	This is the price total of the item lines on the credit order. The value cannot be changed here.
<b>Weight</b>	This is the total weight of the item lines on the credit order. The value cannot be changed here. If you have Maconomy Bill of Materials, and the item on the line is a BOM without inventory control, Maconomy uses the weight of the BOM parts on the highest level with inventory control in the total credit order weight. Any weight entered for the BOM header on its item information card is not used.
<b>Volume</b>	This is the total volume of the item lines on the credit order. The value cannot be changed here. If you have Maconomy Bill of Materials, and the item on the line is a BOM without inventory control, Maconomy uses the weight of the BOM parts on the highest level with inventory control in the total credit order weight. Any weight entered for the BOM header on its item information card is not used.

**Price Island**

Field	Description
<b>Currency</b>	<p>Here you select the currency of the credit order. Maconomy suggests the value from the Customer Information Card, but you can change it. The currency can be changed for the current credit order up until the first item line is entered, or a charge is specified.</p> <p>You maintain currencies in the Popup Fields window in the Set-Up module.</p>
<b>Exchange Rate Date</b>	<p>In this field, you can specify the exchange rate date for the calculation of prices in currency on the credit order. The exchange rate date is also used in the calculation of charges. When a credit order is created, Maconomy automatically suggests today's date in this field if the system parameter "Fix exchange rate at order creation" has been marked. However, you can change or delete the exchange rate date at any time whether the field has been completed automatically or not.</p> <p>If this field contains a date, all prices on the current credit order will be calculated using the exchange rate valid on the specified date. This way, the same exchange rates and thereby the same currency prices are used throughout the order process, ensuring that, for example, the amount credited matches the amount on the original invoice.</p> <p>If you leave this field empty, prices will be calculated using the exchange rate valid at the time of the price calculation.</p> <p>Currency prices are calculated when lines are created, and recalculated when updating lines and when printing information such as credit memos. Changing or removing the currency may therefore result in variances between the credited amount and the amount invoiced or appearing on another printout.</p>
<b>Price List</b>	<p>Here you select a sales price list. Maconomy suggests the value from the Customer Information Card, but you can change it. The pop-up field only shows existing sales price lists, that is, sales prices lists created in the Price Lists window in the Inventory module. If you select "blank," Maconomy calculates prices from costs and gross margins.</p> <p>If you select another price list than the one suggested, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus price lists, is given to users in the window Actions in the Set-Up module.</p> <p>If you select a price list in a different currency from the credit order, Maconomy alerts you of the inconsistency. The prices from the price list you select here will be converted to the currency of the order, using the exchange rate table currently valid in the system.</p> <p>If you use a price list with a currency that is different from the currency used in connection with the credit order, Maconomy will give you a warning. In such cases, the prices stated in the price list will be recalculated to the currency of the quote using the exchange rate table for sale.</p>
<b>Price Step</b>	<p>Here you can select a price step in the price list at which to price the items in the credit order. Step "6" is the highest. Maconomy suggests the value from the customer's information card, but you can select another. This field only applies if you enter a value in the Price List field.</p>

Field	Description
	<p>If you select another price step than the one suggested, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus price step, is given to users in the window Actions in the Set-Up module.</p> <p>Note, that if the “Fixed Price Step” field in the System Information window is marked, and if you enter a value between 1 and 6, Maconomy will always suggest the price on the given price step, regardless of whether the quantity would normally justify a lower price because of a quantity discount.</p> <p>If the “Fixed Price Step” field is not marked, Maconomy applies the highest price step the order quantity justifies.</p> <p>If you select another invoice discount % than the one suggested, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus discounts, is given to users in the window Actions in the Set-Up module.</p> <p>Any invoice discount is deducted from the item sum. This is shown on the credit memo.</p>
<b>Keep Price</b>	<p>In this field, you can specify the value which Maconomy should suggest in the corresponding field on each line created in the table part. On the lines, the field determines whether a change in quantity should cause the current unit price or discount percentage to be recalculated. For further information, see the description of the field “Keep Price.”</p> <p>When you create a credit order, Maconomy suggests the value from the corresponding field in the customer information card, but you can change it for the current credit order.</p>
<b>Invoice Discount %</b>	<p>Here you can enter an invoice discount percentage. Maconomy suggests the value from the Bill To or Ship To Customer’s information card, depending on whether or not you have marked the “Inv. Disc. from Bill to Cust.” field in the System Information window. You can change the suggested value.</p>

## Charges Island

Field	Description
<b>Charge 1</b>	<p>Here you can select a charge. Maconomy suggests the value from the “Charge Code 1” field in the Customer Information Card, but you can change it here.</p> <p>In the window Charges you can enter the charge codes which should be available in this pop-up field, and you can define the texts, percentages and/or amounts to be attached to each charge. If a charge is specified to be a one-time charge, the charge will be removed from the order when crediting is made later in the process.</p> <p>The charge amount can be calculated on the basis of the information in the selected charge code, or it can be entered manually. In the latter case, the field “Maintain” is automatically selected. The charges in the quote are not calculated, until you select the action “Calculate Charges.” You have to select this action if you want to see the charges expected on the subsequent invoice.</p> <p>You can select the action several times for the same quote. This may be necessary if lines are added to the quote, or the charge codes are changed. When the action is</p>

Field	Description
	<p>selected, the charges are calculated for the entire quote, including manually entered amounts. You may however maintain the amount of any charge by selecting the corresponding field "Maintain," for example, if you have agreed on a fixed charge amount, which is not necessarily the same as the calculated amount.</p> <p>When you print external order papers, such as quotes, order confirmations, and invoices, only charges where the field "Maintain" is not marked are recalculated automatically. However, please note that the charges calculated as a result of a printout are only displayed on the printout, as the amounts are not updated on the quote.</p> <p>If you change the charge code or the fixed charge amount, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus to change charge codes and charges, is given in the window Actions in the Set-Up module.</p>
<b>Charge 2</b>	This field applies to charge 2, and it functions in the same way as the "Charge 1" field described above.
<b>Charge 3</b>	This field applies to charge 3, and it functions in the same way as the "Charge 1" field described above.
<b>Charge 4</b>	This field applies to charge 4, and it functions in the same way as the "Charge 1" field described above.

### Account Information Island

Field	Description
<b>Changed</b>	<p>This field shows whether you have changed any of the information suggested by Maconomy in the above fields. Maconomy marks the field if you have changed information in any of the following fields: "Tax," "Price List," "Price Step," "Invoice Discount %," and all the fields in the Charges island. Maconomy also registers changes in the amount and discount fields in the table part. The value cannot be changed.</p> <p>If you have Maconomy Bill of Materials, Maconomy registers any changes to prices or discounts of BOM parts made in the window Order Lines.</p>

### Document Archive Island

Field	Description
<b>Document Archive</b>	<p>In this field, you can assign a document archive to the credit order in question. By assigning a document archive to a credit order you can keep track of the various documents related to the credit order. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.</p> <p>This field also shows the description of the specified document archive.</p>

Field	Description
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

### Job Cost Island

Field	Description
<b>Credit in Job Cost</b>	<p>You can mark this field to show that the order is to be credited in the Job Cost module. You can only mark the field if the order is assigned to a job. However, if a job has been closed, it is neither possible to assign a credit order nor create a credit order for the job unless the job is first reopened in the Job Cost module.</p> <p>If you mark the field, it will not be possible to select "Print Credit Memo." Instead you can use the action "Transfer to Job Cost." When you post the credit memo, Maconomy creates the relevant job entries in the Job Cost module, which can then be invoiced and credited. Maconomy creates an entry for every order line. When you make external printouts, you can choose whether to print the job entries/registrations on a line each or sum them up by activity.</p> <p>If the system parameter "Invoice Orders with Job Numbers in Job Cost" has been marked, this field is automatically marked if you specify a job number in the field "Job No." below. Subsequently removing the job number will cause the field to be unmarked.</p> <p>Please note that this field must be marked, if you enter the number of a job using the invoicing method "Fixed-price" in the below field "Job No.," as crediting concerning fixed-price jobs should always be credited on account. The invoicing method selected for a given job is displayed in the window Job Parameter Selection.</p>
<b>Job No.</b>	<p>Here you can enter the number of a job from the Job Cost module to assign the credit order to a job. Certain jobs might, for example, involve item returns to Maconomy's Inventory module, in which case you can register the return in this window and assign the credit order to the relevant job here.</p> <p>If you enter a job number when creating a credit order, and you leave the field "Customer No." blank in the island Ship to Address, the credit order is automatically assigned to the same customer as the job.</p> <p>If you do not mark the "Credit in Job Cost" field, the credit order is credited separately in the Sales Orders module, but the sales figures are transferred to the job.</p> <p>If you enter a job number here, and the system parameter "Invoice Orders with Job Numbers in Job Cost" has been marked, the field "Invoice in Job Cost" above is automatically marked, and subsequently removing the job number will cause the field to be unmarked.</p> <p>Maconomy verifies that the job is neither blocked nor closed. If the ship-to customer number is the same for the job and the credit order, Maconomy alerts you. If there are lines on the order before it is assigned to a job, you must also enter a value on the order lines.</p>

Field	Description
	Please note that if you enter a job using the invoicing method "Fixed-price," you must mark the field "Credit in Job Cost" as creditings concerning fixed-price jobs should always be credited on account.
<b>Activity No.</b>	In this field, you can enter the number of an activity from the Job Cost module if the order is assigned to a job. This activity number will be suggested on lines created in the table part.  Maconomy verifies that the activity exists and that it is an amount activity. If you enter a value in the "Job No." field, you must enter a value here.
<b>Task</b>	In this field, you can enter the name of a task, if the credit order is linked to a job. This task will be suggested on lines created in the table part.

### Statistics to Tax Authorities Island

Field	Description
<b>EU Sale</b>	This field must be marked if the credit order is for an EU sale. If the "Sales List System Report" field in the System Information window is marked, Maconomy will mark this field if the bill-to customer is from another EU country and is not subject to paying tax, that is, the "Tax" field is not marked. If this field is marked, the credit order will be included in your quarterly report to the EU Sales List System.
<b>Intrastat Reg.</b>	Here you can specify whether to include the credit order in your monthly report to Intrastat. If the "Intrastat Export Report" field in the System Information window is marked, Maconomy suggests a mark here if the bill-to customer is from another EU country and is not subject to paying tax, that is, the "Tax" field is not marked.
<b>EU Trade Type</b>	Here you can enter either "Normal" or "Triangulation" to indicate the EU trade type. Triangulation means you act as agent for a vendor in another EU country and a customer in third EU country. Credit order amounts from triangulation are not included in the EU sales on your tax specification, but are reported separately to the Sales List System. The value is copied from the bill-to customer's information card, but can be changed here.
<b>Nature</b>	Here you select which transaction to report to Intrastat. They are created in the Popup field window in the Set-Up module.
<b>Customs Document</b>	In this field, you can enter the number of any customs document which pertains to the current credit order. If the credit order was created on the basis of an invoice in the window Invoice to Credit Order, and the sales order which underlies the invoice in question is assigned to a customs document, the number of the customs document is displayed in this field. You can, however, change the number to assign the credit order to another existing customs document.

**Order Linking Island**

Field	Description
<b>Main Order No.</b>	This field displays a main order number if the current credit order is linked to a main order. If the credit order was created on the basis of an invoice in the window Invoice to Credit Order, and the sales order which underlies the invoice in question is linked to a main order, then that main order number will be displayed in this field. If the credit order was created in any other way, the value in this field is always 0.

**Extra Fields Island**

Field	Description
<b>Popup 1-5</b>	In these fields, you can specify further information regarding the credit order and the current customer. You might, for example, specify a “hold” code or information about substitution items. Maconomy suggests the value of the corresponding fields in the customer’s information card, but you can change the values for the current credit order. The pop-up options are created in the window Popup Fields in the Set-Up module.

**User Island**

See the chapter “Getting Started” for a description of the fields in the island User.

**Remarks Island**

Field	Description
<b>Re. Invoice No.</b>	This is the invoice number, if the credit order is created from an invoice in the Invoice to Credit Order window. The number cannot be changed here.  Maconomy copies the invoice transferring all item lines to the credit order. You can adjust the item information in this window, before approving the credit order.  If you have Maconomy Bill of Materials, and one of the items is a BOM, the BOM parts are handled in the window Order Lines.
<b>Reference</b>	Here you enter the customer contact with whom you spoke about the credit order. The name is printed on the returns list and the credit order.
<b>Customer</b>	Here you can enter an internal note about the customer. The note does not appear on any printouts. Maconomy suggests the note from the Customer Information Card, but you can change it.
<b>Warehouse</b>	Here you can enter an internal note to warehouse employees.
<b>End User No.</b>	Here you enter the number of the end customer the credit order is for. If you are dealing with an end customer sale, which is determined by order mode, you must complete the field. It is an end customer sale if the “End User Required” field is marked in the Popup Fields window in the Set-Up module for the order mode. It is only possible to enter the number of an end customer in the Accounts Receivable module to which the customer on the credit order is

Field	Description
	<p>registered. You can use the search functions in the Find menu if you cannot remember the number.</p> <p>The field is used if your credit order is for a customer who deals with end customer. Information on your end customers is managed in the End Users window.</p>

### Billing Address Island

Field	Description
<b>Bill to Customer</b>	<p>Here you can enter the number of a bill-to customer. Maconomy suggests the bill-to customer from the ship-to customer's Customer Information Card, but you can change it. Maconomy verifies that the customer exists in the Accounts Receivable module.</p> <p>The two customers are not the same, if items are being returned by one customer and credited to another.</p> <p>The other lines in this field show the customer's name and address. Maconomy retrieves the information from the Customer Information Card, and it cannot be changed here.</p>
<b>Attn.</b>	<p>This is the customer's attention person the person to whom payment information is directed. Maconomy retrieves the name from the Customer Information Card, and it cannot be changed here.</p>
<b>Country</b>	<p>This is the customer's country. It is retrieved from the customer information card. It cannot be changed here.</p>

### Settling Company Island

Field	Description
<b>Settling Company</b>	<p>This field shows the number of the settling company that applies to the current credit memo.</p> <p>If the number in this field is different from the one specified in the island Company, Maconomy will automatically create intercompany balances at the posting of the credit order. In the intercompany balance, the company in this field will be the intercompany company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>For further information about the influence of a settling company and how such a company is determined, please see the section Multiple Companies in the chapter "Introduction to the G/L Module." Intercompany balances are described in the window Intercompany Accounts in the G/L module.</p> <p>This field also shows the name of the specified settling company.</p>

**Company Island**

Field	Description
<b>Company</b>	<p>In this field, you can enter the number of the company responsible for the credit order. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>If the company in this field is different from the one shown in the island Settling Company, Maconomy will automatically create intercompany balances at the posting of the credit order. In the intercompany balance, the company in this field will be the responsible company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>See the sections on dimension derivation and multiple companies in the chapter "Introduction to the G/L Module," and the window Intercompany Accounts in the G/L module for a further description of the concepts of dimension derivation, responsible companies and intercompany balance.</p> <p>This field also shows the name of the specified company.</p>

**Delivery Island**

Field	Description
<b>Warehouse</b>	<p>Here you select the warehouse to which the items are being returned. Maconomy suggests the sales warehouse from the Customer Information Card, but you can change it. The pop-up field only shows existing warehouses, that is, warehouses created in the Warehouse Information Card window in the Inventory module.</p> <p>Note, you can only select one warehouse here.</p>
<b>Stock Location No.</b>	<p>In this field, you can specify the location in the current warehouse at which the returned items are to be received. This location will apply to those lines in the table part where the stock location field is left blank. If a stock location is specified on a given line, it overrules any location specified in this field. When you create an order or change the warehouse in the card part of the order, Maconomy suggests the standard receiving location specified for the selected warehouse, but you can specify another location.</p> <p>It is not possible to create a warehouse transaction for the order until you have either entered a location in the card part or on the individual item lines.</p>
<b>Carrier</b>	<p>Here you select how the items are to be returned. Maconomy suggests the carrier from the Customer Information Card, but you can change it.</p> <p>You maintain carriers in the Popup Fields window in the Set-Up module.</p>
<b>Delivery Mode</b>	<p>Here you select a delivery mode. Maconomy suggests the delivery mode from the Customer Information Card, but you can change it.</p>

Field	Description
	You maintain delivery modes in the Popup Fields window in the Set-Up module.
<b>Delivery Terms</b>	<p>Here you select the delivery terms. Maconomy suggests the delivery terms from the Customer Information Card, but you can change it.</p> <p>You maintain delivery terms in the Popup Fields window in the Set-Up module.</p>
<b>Consignment Type</b>	<p>In this field, you can select the consignment type applying to the current credit order. Maconomy will automatically retrieve the consignment type on the customer information card for the current customer, but the consignment type can be changed here. The field can be used for statistics, but has no significance for consignments and destination control, as a credit order cannot be assigned to a consignment.</p> <p>Consignment types are maintained in the window Popup Fields in the Set-Up module.</p>
<b>Destination No.</b>	In this field, you can specify the number of a destination to which the current credit order is related. The field can be used for statistics, but has no significance for consignments and destination control, as a credit order cannot be assigned to a consignment.
<b>Charge Table</b>	In this field, you can select a charge table to be used for charge calculation. The field is transferred from the customer information card when the credit order is created.
<b>Charge Table %</b>	In this field, you can enter a charge discount percentage. A discount percentage entered in this field will be applied in addition to the one which can be specified in the charge table. The field is transferred from the customer information card when the credit order is created.

### Crediting Island

Field	Description
<b>Batch Credit</b>	<p>You can mark this field if you wish to credit the order in a batch in the Print Credit Memo window. Maconomy marks the field automatically, but you can remove the mark.</p> <p>In the Crediting Listing window you can change the mark for individual credit orders.</p>
<b>Pref. Credit Memo Date</b>	<p>Here you can enter a preferred credit memo date. If you leave the field blank, Maconomy suggests today's date. If you enter a date, it will be used for the credit memo. Maconomy verifies that the date is within the open posting interval, entered in the System Information window in the Set-Up module.</p> <p>You can change the date in the Crediting Listing window.</p> <p>The date is always determined this way, regardless of whether the credit order is credited directly in this window or whether it is credited in a batch in the Print Credit Memo</p>

### Customer Information Island

Field	Description
<b>Department</b>	<p>Here you select the department that relates to the current sales order. Maconomy suggests the value from the Ship To or Bill To customer's information card, depending on whether or not you have marked the "Dept. from Bill to Cust." field in the System Information window. You can change the suggested department.</p> <p>You maintain departments in the window Posting References in the G/L module.</p>
<b>Customer Group</b>	<p>This is the customer group to which the customer is assigned. The value is retrieved from the customer information card. It cannot be changed here.</p>
<b>Language</b>	<p>Here you select the language code of the credit order. Maconomy suggests the value from the customer's information card, but you can change it. The language code allows you to print credit memos in different languages. See also the descriptions of the "Description Lang. 1," "Description Lang. 2," and "Description Lang. 3" fields in the Description island in the Item Information Card window in the Inventory module.</p> <p>You can use the language code to print credit memos in different languages. Maconomy's layout editing tools can be used to create different language layouts. You can select different language codes in the Print Credit Memo window.</p> <p>You define language codes in the Popup Fields window in the Set-Up module.</p>
<b>Tax</b>	<p>If this field is marked, the sales order is taxed. Maconomy suggests the value from the customer's information card in the Accounts Receivable module, but you can change it.</p> <p>If you change the value, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus the value here, is given to users in the window Actions in the Set-Up module.</p>
<b>Tax No.</b>	<p>Here you enter the customer's tax number. Maconomy suggests the value from the bill-to customer's information card in the Accounts Receivable module, but you can change it. If a validation rule is assigned to the tax number field in the window Rules of Validation in the Set-Up module, Maconomy will validate the tax number upon entry or change. If you enter a new bill-to customer, Maconomy retrieves the new tax number.</p>
<b>Cust. Payment Mode</b>	<p>In this field, you can specify a payment mode for the credit order. When you create collection orders in the Banking module, Maconomy will set off credit memos against invoices on which the same bill-to customer and customer payment mode have been specified.</p> <p>Maconomy suggests the customer payment mode specified on the bill-to customer's information card, but this can be changed.</p> <p>Customer payment modes are created in the window Customer Payment Modes in the Banking module.</p>

Field	Description
<b>Global Location No.</b>	<p>If the customer on the current credit order has requested that you use a specific global location number on the credit memo, you can specify the location number in question here. The number specified here will be transferred to the credit memo created from the current order. Maconomy suggests the global location number specified in the window Company Specific Payment Information for the customer in question, but you can change it here if the location number to be used in connection with the current credit order is not the same as the standard location number of the customer.</p> <p>For further information about the concept of global location numbers, see the introduction to the window Company Locations in the G/L module.</p>
<b>Enterprise</b>	<p>Here you can attach the credit order to an enterprise or group of companies. Maconomy automatically suggests the value from the customer information card, but you can choose another. The field is used for statistics.</p>
<b>Segment</b>	<p>In this field, you can assign the credit order to an industry segment. Maconomy automatically suggests the value from the customer information card, but you can choose another. The field is used for statistics.</p>
<b>Area</b>	<p>In this field, you can assign an area to the order. Maconomy automatically suggests the value from the customer information card, but it is possible to change that value.</p>
<b>Company Tax Code</b>	<p>In this field, you can specify a company tax code created in the window PopUp Fields. The field is used by Maconomy for determining the tax code to be used in the calculation of tax for the current credit order, as the reporting code is part of the criteria for the selection of a tax code in the window Tax Tables in the G/L module. At this selection, Maconomy uses the tax table specified for the responsible company of the credit order. This tax table is selected in the window Company Information. However, the tax code is only selected from a tax table, if you have specified that tax tables which are specified in the window System Information are to be used, and only if the company responsible for the credit order is assigned to a tax table. If no tax table has been specified for the responsible company or if you use differentiated tax, and you do not use tax tables, Maconomy uses the tax code specified for the individual item in the window Item Information Card in the Inventory module or, in the case of charges, the tax code specified for the individual charge in the window Charges. If you use neither differentiated tax nor tax tables, Maconomy uses the standard tax code specified in the window System Information in the Set-Up module.</p> <p>When posting credit memos, the reporting code is used for determining which tax report entries to create when crediting. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if extended tax reporting has been selected in the window System Information.</p> <p>The value in this field is transferred from the customer information card, but can be changed here.</p>

**Dimensions Island**

Field	Description
<b>Location</b>	In this field, you can enter a value for the dimension Location. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Parameters in the Set-Up module. See the chapter "Introduction to the G/L Module" and the window Dimension Derivations for a further description of dimension derivation.  The dimension information is used on the customer entries created when the invoice journal is posted.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

**Subscription Order Island**

Field	Description
<b>Subscrip. Order No.</b>	If the order was created automatically from the Subscription module, this field will contain a subscription order number. If the order originates from the Subscription module, the order cannot be edited in this window, but should be done in the Subscription module.

**Contact Management Island**

Field	Description
<b>Campaign No.</b>	In this field, you can enter the number of a campaign if the current credit order is connected to a certain campaign in the Contact Management module. If you enter a campaign number, Maconomy transfers the number to lines that are then created in the table part. The campaign number can be used for, for example, statistical purposes.

**Copying Island**

Field	Description
<b>Customer No.</b>	In this field, you can enter the customer number to be used on the copy of the current order. If you specify a number, Maconomy will get the latest customer information from the A/R module. If you do not complete the field, the customer number and the customer information on the current order is transferred to the new copy. If you specify a customer number, Maconomy automatically recalculates the prices on the copy unless you complete the field "Maintain Prices" in this island.
<b>Warehouse</b>	In this field, you can select a warehouse to be used on the copy. Maconomy suggests the warehouse specified on the current order, but if you enter another customer number in the field "Customer No." in this island, Maconomy gets the warehouse specified on the customer information card of the customer in question.
<b>Company No.</b>	In this field, you can select a company to be responsible for the copy. If you do not enter a value, the company responsible for the current order is used on the copy.
<b>Currency</b>	In this field, you can select a currency to be used on the copy. If you select a currency, Maconomy automatically recalculates the prices on the copy unless you complete the field "Maintain Prices" in this island.  If the user does not have access to changing prices, the value in this field cannot be changed.
<b>Price List</b>	In this field, you can select a price list to be used on the copy. If you select a price list, Maconomy automatically recalculates the prices on the copy unless you complete the field "Maintain Prices" in this island.  Maconomy suggests the price list specified on the current order, but if you specify another customer number in the field "Customer No." in this island, Maconomy gets the price list specified on the customer information card of the customer in question.
<b>Price Step</b>	In this field, you can specify a fixed price step to be used on the copy. If you specify a price step, Maconomy automatically recalculates the prices on the copy unless you complete the field "Maintain Prices" in this island.  Maconomy suggests the price step specified on the current order, but if you specify another customer number in the field "Customer No." in this island, Maconomy gets the price step specified on the customer information card of the customer in question.
<b>Job No.</b>	In this field, you can specify a job number to be used on the copy.  Note that if a job has been closed, it is no longer possible to create an order for the job unless the job is first reopened in the window Jobs in the Job Cost module.  If you complete this field, you must also complete the field "Activity No." in this island.

Field	Description
<b>Activity No.</b>	In this field, you can specify an activity number to be used on the copy.
<b>Task</b>	In this field, you can specify a task to be used on the copy.
<b>Maintain Prices</b>	If you complete this field, the prices on the lines of the current order will also be used on the copy. If you do not complete the field, or if you have specified a customer, currency, price list or price step, Maconomy calculates the prices on the copy.

### Credit Order Lines Sub-Tab

This section includes the fields and descriptions for the Credit Order Lines sub-tab.

Field	Description
<b>Item No.</b>	<p>Here you enter the item to be credited. Maconomy verifies that the item exists in the Item Information Card window in the Accounts Receivable module. Maconomy verifies that the item belongs in the warehouse specified in the card part.</p> <p>To create a text line, you leave this field blank. You enter the text in the "Description" field, and leave all other fields blank.</p>
<b>Description</b>	<p>This is the item text, retrieved from the "Description Lang. 1" field in the Item Information Card. The text can be changed.</p> <p>If the line is a text line, you enter the text here.</p>
<b>Unit</b>	Here you enter the unit the item is being returned in. Maconomy suggests the unit registered in the warehouse, retrieving it from the item information card, but you can change it.
<b>Credited</b>	<p>Here you enter how many item units to credit.</p> <p>If the line is a text line, leave the field blank.</p> <p>If you have Maconomy Bill of Materials, and the item is a BOM which is not being shown on the credit memo, you cannot change the number here after the line has been created.</p>
<b>Return</b>	<p>Here you enter how many item units are being returned from the customer. This quantity is not necessarily the same as quantity credited, as some (or all) of the items may have been lost or damaged during transport.</p> <p>Maconomy automatically suggests the value from the "Credited" field, unless the system parameter "Set Quantity Returned to Zero" has been marked, in which case Maconomy suggests 0.</p> <p>If you enter values in the "Length" and "Width" fields, Maconomy calculates a quantity here by multiplying the length with the width. The facility is useful for entering column measurements for newspaper or magazine advertisements, for example. If you change the quantity found by Maconomy, the "Length" and "Width" fields will be reset.</p>

Field	Description
	<p>If the line is a text line, leave the field blank.</p> <p>If you have Maconomy Bill of Materials and the item is a BOM without inventory control, enter the quantity you expect the customer to return for the BOM part line at the highest level with inventory control in the "Returned" field in the window Order Lines.</p>
<b>Unit Price</b>	<p>In this field, you can enter the item's unit price on the credit order line. If the credit order is assigned to a price list, and the item is included in the price list, Maconomy suggests the price from the price list.</p> <p>If the quantity justifies a quantity discount, or if a fixed price step has been specified on the credit order, the unit price suggested in this field will be the price on the price step in question as specified in the window Quantity Discounts in the Inventory module. However, the suggested price can be changed here if you and the customer have agreed on a special price.</p> <p>If the item is not included in the price list, or if you have not selected a price list for the order, Maconomy suggests the current cost of the item at the warehouse in question and adds the gross margin percentage, both of which are retrieved from the item's information card. This functionality only applies if the field "Sales Price Costing" has not been marked on the item's information card. If sales price costing is used for the item, the price is still retrieved from the price list, but in this case, the cost is determined by the sales price, using the gross margin percentage. The cost is not shown, but it is used when posting the cost of sales. If the item is not in the price list, Maconomy suggests the price 0.</p> <p>Please note that the unit price of BOMs can be reduced if the following scenario occurs: If the item is a BOM with inventory control that does not use price control, this means that the price in this field should be calculated from the unit prices of the BOM parts. If the unit price of one of these BOM parts is calculated from cost and the BOM part is not assigned to the warehouse on the current line (by means of a warehouse assignment line in the table part of the window Item Information Card), the unit price of that BOM part is set to zero, which affects the price in this field.</p> <p>To set the price, Maconomy uses the delivery date on the credit order line to determine which price list is valid at the time of delivery.</p> <p>A balancing, if any, will be placed on a rounding line, if this exists. See the description of the field "Rounding Off, Item No." in the window System information in the chapter Set Up for further information on rounding lines.</p> <p>If the item is an itemized BOM with price control, the unit price is first calculated in the same way as for standard items. The price is then distributed to the BOM parts in the percentages given in the BOM information card in the Inventory module, after which the price for the highest level is recalculated as the sum of the prices of the BOM parts.</p> <p>If the item is an un-itemized BOM without price control, the unit price is the sum of the BOM parts. The highest level with price control determines the BOM price. The individual BOM part prices are calculated by multiplying the unit price by the quantity of the item in the BOM, which is given in the BOM</p>

Field	Description
	<p>information card, multiplied by the BOM header pricing unit and divided by the BOM part's pricing unit.</p> <p>This allocation and summation is repeated if you change the price here.</p> <p>The BOM part lines can be viewed in the window Order Lines in which you can change the price of the BOM part lines at the lowest level of the BOM.</p> <p>See also the description of the BOM Information Card for a more detailed description of BOM pricing.</p> <p>All descriptions regarding BOMs assume that you have Maconomy Bill of Materials.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Discount %</b>	<p>This shows a discount % if the customer is entitled to a discount from the Discount Tables window in the Inventory module or from a customer or item discount agreement. You can change the suggested discount %, but you cannot change both the percent and the discount amount in the "Discount" field, since these two are related. The discount % is calculated from the discount amount.</p> <p>If you change the value — In this field, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus to change the discount %, is given to users in the window Actions in the Set-Up module.</p> <p>If the item is a BOM which is not being shown on the credit order, the discount % is calculated as described above for standard items, and you can change it here.</p> <p>If the item is a BOM which is to be shown in full, the discount % is the total discount on all the BOM parts in proportion to the total price of the BOM. The calculation is based on the item on the highest level with price control. A BOM part contributes to the total discount if it has price control and if it is not an item in a BOM with price control. This functionality applies to any number of levels in the BOM. If you change the discount % here, the new value is copied to all the BOM lines, after which the discount amount is recalculated as described for the "Discount" field.</p> <p>You can see the BOM part lines in the window Order Lines, where you can change the discount % on items on the lowest BOM level.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Discount</b>	<p>This shows a discount if the customer is entitled to a discount from the Discount Tables window in the Inventory module or from a customer or item discount agreement. You can change the suggested discount, but you cannot change both the discount amount and the percent in the "Discount %" field, since these two are related. The discount % is calculated from the discount amount.</p> <p>If you change the value — In this field, Maconomy verifies that you have user access to doing so. Access to changing price information, and thus to change the discount, is given to users in the window Actions in the Set-Up module.</p>

Field	Description
	<p>If you have Maconomy Bill of Materials and if the item is a BOM which is not being shown in full on the credit order, the discount is calculated in the same way as for standard items and you can change it afterwards.</p> <p>If the item is a BOM which is to be shown in full, you cannot change the discount here. The discount is the total discount on all the BOM parts in the BOM. The calculation is based on the item on the highest level with price control. A BOM part contributes to the total discount if it has price control and if it is not an item in a BOM with price control. This functionality applies to any number of levels in the BOM. If you change the discount, the discount % is recalculated from the calculated unit price and is copied to all the BOM lines. The discount amount is then recalculated for every BOM part and is summed up in this field.</p> <p>You can see the BOM part lines in the window Order Lines, where you can change the discount on items on the lowest BOM level.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Extended price</b>	<p>This is the extended price for the line. It is calculated by multiplying the item quantity by the unit price, dividing this sum by the pricing unit and deducting any discount. This extended price is transferred to the "Price" field in the Credit Order Sum island in the card part of the window. It cannot be changed here.</p>
<b>Discount Desc.</b>	<p>This is the discount description printed on all external order documents. If the description of the discount (be it item discount, customer discount or a discount from a discount table) granted on the line has been translated into the language specified in the card part of the credit order, the translation in question is shown here. If no such translation exists, Maconomy suggests the discount description specified for the discount in question in the window Item Discount Agreements, Customer Discount Agreement or Discount Tables, depending on the type of discount granted. However, you can change the text here. Translations are created in the window Language Texts in the Set-Up module.</p> <p>If the line is a text line, leave this field blank.</p>
<b>Stock Location No.</b>	<p>In this field, you can specify the location in the selected warehouse at which the items on the current line are to be received. When you create a line, Maconomy checks if a standard storage location has been specified in the table part of the item's information card on a line pertaining to the warehouse specified on the current order line. If a standard storage location has been specified and if this location is also marked as a receipt location in the window Warehouse Information Card, the item's standard storage location is suggested in this field, but the value can be changed manually. If no standard storage location has been specified for the item or if the item has a standard storage location for the warehouse but it is not a receipt location, Maconomy suggests a blank value in this field.</p> <p>If the item is a BOM without inventory control, Maconomy uses the same method to derive a location for the automatically created lines representing items on the highest level with inventory control in the window Order Lines.</p>

Field	Description
	When this field is blank, the stock location number specified in the card part of the window will apply to the line.
<b>Pricing Unit</b>	This is quantity of units included in the item's unit price. The value is retrieved from the Item Information Card and cannot be changed here.
<b>Note No.</b>	In this field, you can specify the number of a note to be assigned to the current line for further specification. Notes are created and edited in the window Notes in the Set-Up module.
<b>Note Description</b>	This field shows a description of the note specified in the field "Note No." above.
<b>External Desc.</b>	This is the item description printed on all external order documents. If a translation exists for the current item in the language specified in the card part of the credit order, the translation in question is shown here. If no such translation exists, the item text from the field "Item Description, Language 1" is suggested instead. You can change the text here. Translations are created in the window Language Texts in the Set-Up module. If the line is a text line, you cannot enter a text here.
<b>Internal Desc.</b>	This is the internal item text from the Item Information Card. You can change this text. The text is printed on the returns list and is suitable for messages to warehouse employees. You can, for example, enter the date you expect the items to be returned. The text is not printed on external order documents. If the line is a text line, you cannot enter a text here.
<b>Extra Text 1-10</b>	In these fields, you can enter supplementary text for a further description of the current item. In the first three fields, Maconomy suggests the value from the corresponding fields in the item information card. You can change the suggested texts and enter additional information in the remaining seven fields.
<b>Popup 1-5</b>	In these fields, you can enter further information about the current item. Maconomy suggests the value from the corresponding fields in the item information card, but you can change the value for the current credit order line. The pop-up options are created in the window Popup Fields in the Set-Up module.
<b>Orig. Quantity</b>	In this field, you can specify how many units of the current item were originally registered for crediting. When creating a line, Maconomy will copy the value in the field "Credited" to this field, but you can change the value later.
<b>Price List</b>	This is the price list according to which the item line is priced. Maconomy suggests the price list from the card part of the window, unless the customer is tied to another price list by a discount agreement which is then suggested instead. The value cannot be changed manually. If you have Maconomy Bill of Materials, and the item is a BOM without price control, the field will be blank. The extended price is then calculated from the sum of the BOM parts, which are priced according to the price list in the card part.

Field	Description
<b>Price Step</b>	<p>This is the price step in the price list according to which the item is priced. Maconomy suggests the value justified by the amount of items credited. But if the customer is tied to a fixed price step, this price step is applied instead. You cannot change the value of this field manually.</p> <p>If you have Maconomy Bill of Materials, and the item is a BOM without price control, the value will be "0." The extended price is calculated from the sum of the prices of the BOM parts.</p>
<b>Keep Price</b>	<p>In this field, you can specify whether the unit price and discount percentage on the current line should be recalculated when changing the quantity. If you mark the field, a change in quantity will not cause the current unit price or discount percentage to be recalculated, even if the new quantity results in, for example, a different price step. However, you can change the unit price and discount percentage manually. Maconomy suggests the value from the corresponding field in the card part, but you can change it for the individual order lines.</p>
<b>Price at Step 1</b>	<p>This is the price of one pricing unit, if the credit order is assigned to a price list and if the item price is included in the price list. If not, the value here will correspond to the unit price. The value cannot be changed here.</p>
<b>Quantity Disc.</b>	<p>This is the discount amount. It is defined as the difference between the price at price step 1 and the actual unit price, multiplied by the item quantity. The value cannot be changed here. If you have Maconomy Bill of Materials, and the item is a BOM without price control, the value will be "0."</p>
<b>Bill of Materials</b>	<p>This field shows whether the item is a standard item or a BOM. If the field is marked, the item is a BOM. The individual parts of the BOM can be changed in the window Order Lines if the BOM is being shown in full. The BOM information card shows whether the BOM parts are to be shown on the credit order.</p>
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the field "Location" in the card part of the window.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Entity</b>	<p>The functionality of this field is similar to that of the field "Location" above.</p>
<b>Project</b>	<p>The functionality of this field is similar to that of the field "Location" above.</p>
<b>Purpose</b>	<p>The functionality of this field is similar to that of the field "Location" above.</p>

Field	Description
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Length</b>	<p>Here you can enter the length of the item. If you also enter a width below, Maconomy will calculate "Quantity" by multiplying length by width. If you complete the "Quantity" field, the length and width are reset.</p> <p>You can use this facility for entering column measurements for newspaper and magazine advertisements, for example.</p> <p>When the credit order is credited, the length and width are transferred to the credit memo line, except in the case of part deliveries.</p>
<b>Width</b>	<p>Here you can enter the width of the item. If you also enter a length above, Maconomy will calculate "Quantity" by multiplying length by width. If you complete the "Quantity" field, the length and width are reset.</p> <p>You can use this facility for entering column measurements for newspaper and magazine advertisements, for example.</p> <p>When the credit order is credited, the length and width are transferred to the credit memo line, except in the case of part deliveries.</p>
<b>Activity No.</b>	In this field, you can enter an amount activity if the current line relates to an activity. If the corresponding field in the card part of the window contains a value, it will automatically be suggested in this field. However, the activity number suggested from the card part will be overwritten if an activity number is derived from the item specified on the line. An activity number is derived from the item if the item is assigned to an activity in the window Item Information Card and a job has been specified in the card part of the order.
<b>Task</b>	In this field, you can enter the name of a task, if the credit order is linked to a job. If the corresponding field in the card part of the window contains a value, the value entered in this field will be suggested in this field when you create a line.
<b>Order Date</b>	Here you can see which date the order was created.
<b>Vendor</b>	This field shows the vendor number from the item information card if a vendor has been stated for the item.
<b>Vendor Name</b>	This field shows the name of the selected vendor.
<b>Campaign No.</b>	In this field, you can enter the number of a campaign if the current credit order line is connected to a certain campaign in the Contact Management module. If you enter a campaign number in the card part, Maconomy transfers the number to this field when creating lines. The campaign number can be used for, for example, statistical purposes.

## Invoice to Credit Order Workspace

Use this workspace to create a credit order from an invoice.

This saves time if you are crediting a customer for all or part of a specific invoice.

Maconomy automatically creates the credit order based on the invoice. Afterwards, you can retrieve the credit order in the Credit Orders workspace, where you can deselect items or make other adjustments.

Maconomy does not automatically credit a credit order that you create in this workspace. You must approve the credit order in the Credit Orders workspace. You can only create one credit order from an invoice to prevent double-crediting.

You cannot create a credit order from an invoice on account. If you copy an invoice from which items have previously been invoiced on account, Maconomy alerts you that the on-account items are not included in the credit order.

You cannot create a credit order from an invoice that has one or more bills of materials. You must create the credit order in the Credit Orders workspace.

In addition, you cannot create a credit order from an invoice that has one or more BOMs itemized on the sales order on which the invoice is based. You must create the credit order manually in the Credit Orders workspace.

When you create a credit order based on an invoice from this workspace, and the invoice originates from a periodically invoiced subscription order, the credit order is also accrued.

### Invoice to Credit Order Tab

This section includes the fields and descriptions for the Invoice to Credit Order tab.

#### Invoice Island

Field	Description
<b>Invoice No.</b>	This is the number of the invoice. If you cannot remember the number of an invoice, you can use the search functions in the File menu. The number cannot be changed.
<b>Order No.</b>	This is the number of the sales order for which the invoice was created. The number cannot be changed.
<b>Invoice Date</b>	This is the invoice date. The date cannot be changed.
<b>Due Date</b>	This is the date the invoice is due for payment. The due date is calculated from the invoice date and the customer's payment terms. The date cannot be changed.
<b>Amount</b>	This is the total invoice amount. You can use it to check you have the right invoice. The field also shows the currency of the invoice. Neither value can be changed.

**Credit Order Island**

Field	Description
<b>New Order No.</b>	This is the number of the new credit order. It is allocated when you select the action "Generate Credit Order." The number is the next available number from the Numbers window and cannot be changed.
<b>New Warehouse</b>	In this field, you can specify a warehouse if you would like the new credit order to be registered for another warehouse than the one originally specified on the current invoice. If you specify a warehouse in this field, the warehouse will be transferred to the credit order created when you select the action "Generate Credit Order." If you do not specify a warehouse, the warehouse on the new credit order will be copied from the current invoice.

**Company Island**

Field	Description
<b>Company</b>	<p>This field shows the number of the company responsible for the current invoice. The value is transferred from the island Company on the sales order on which the current invoice is based.</p> <p>The company in this field will automatically be responsible for the credit order created when the action "Create Credit Order" is selected.</p> <p>This field also shows the name of the specified company.</p>

**Customer Island**

Field	Description
<b>Bill to Customer</b>	<p>This is the number of the customer who received the invoice. You can use it to check you have the right invoice. The number cannot be changed.</p> <p>The other lines in this field show the name and address of the customer who received the invoice. You can use it to check you have the right invoice. The text cannot be changed here.</p>
<b>Attn.</b>	This is the bill-to customer's attention person the person to whom payment information is directed. The name cannot be changed here.
<b>Country</b>	This is the bill-to customer's country code. It cannot be changed here.

**Footers Workspace**

Use this workspace to define the footers to be printed on a number of external order papers based on quotes, sales orders, and credit orders.

You can enter any text in a footer line, and you can use this feature for an additional description of the item lines in a sales order, for example, or for notifying your customers about opening hours or summer holiday closing.

In the Footers tab you select the quote, sales order, or credit order for which you want to define footer lines. In the Text Lines sub-tab, you enter the footer text, and you can select which external documents you want to print the footers on. For instance, if you want to print a certain footer on quotes and order confirmations, and another on invoices and packing slips, you can create a footer line for each of those document types. Footers are printed immediately below the item lines on the selected document types.

The Text Lines sub-tab also contains any footers created based on footer templates. When you create a sales order or a quote, Maconomy checks whether the quote or sales order matches the selection criteria in one or more footer templates. If this is the case, the footer lines from the templates in question are transferred to this workspace, where you can review and edit them. If footer templates are not used, or if a quote or a sales order does not match any selection criteria of existing footer templates, the Text Lines sub-tab is empty for the quote or order in question.

## Footers Tab

This section includes the fields and descriptions for the Footers tab.

### Sales Orders Island

Field	Description
<b>Order No.</b>	This field shows the number of the quote, sales order or credit order in the window. The value cannot be changed manually. If you cannot remember the number, you can use the search functions in the Find menu.
<b>Order Type</b>	This field shows whether the order is a quote, sales order or credit order. The value cannot be changed.
<b>Created on</b>	This is the date the quote, sales order or credit order was created. The date cannot be changed.
<b>Reference</b>	This is the note entered in the "Reference" field in the quote, sales order or credit order. The text cannot be changed here.

### Company Island

Field	Description
<b>Company</b>	This field shows the number of the company responsible for the current order. The value is transferred from the island Company on the order in question. This field also shows the name of the specified company.

### Ship to Address Island

Field	Description
<b>Customer</b>	This is the number of the customer receiving the quote, sales order or credit order. The number cannot be changed here. The other lines in this field show the customer's name and address. The information is retrieved from the quote, sales order or credit order. It cannot be changed here.

Field	Description
<b>Attn.</b>	This is the customer's attention person the person to whom shipping information is directed. The information is retrieved from the quote, sales order or credit order. It cannot be changed here.

### Text Lines Sub-Tab

This section includes the fields and descriptions for the Text Lines sub-tab.

Field	Description
<b>Description</b>	Here you enter the footer text. Footer texts can still be changed after the current quote/sales order has been printed. The new text will then be used in subsequent prints, including reprints. For invoices, credit memos, and packing slips, the footer in a reprint will however always be the same as on the original printout.
<b>Template No.</b>	If the current line was created on the basis of a footer template, this field displays the number of the template used. If the line was created manually, this field is blank.
<b>Quote</b>	If you mark this field, the current footer line is printed on any quote printed in connection with the order process. The field is only relevant if the card part of the window is displaying a quote.
<b>Order Confirmation</b>	If you mark this field, the current footer line is printed on any order confirmation printed in connection with the order process. On orders which are specified as main orders, the footer will be included when the order is printed from the window Print Main Order. The footer is, however, not included on the suborders assigned to the main order. The field is only relevant if the card part of the window is displaying a quote or a sales order.
<b>Packing List</b>	If you mark this field, the current footer line is printed on any packing list printed in connection with the order process. The field is only relevant if the card part of the window is displaying a quote or a sales order.
<b>Packing Slip</b>	If you mark this field, the current footer line is printed on the packing slip created on the basis of the displayed quote/sales order. The field is only relevant if the card part of the window is displaying a quote or a sales order.
<b>Returns List</b>	If you mark this field, the current footer line is printed on any returns list created on the basis of the displayed credit order. The field is only relevant if the card part of the window is displaying a credit order.
<b>Invoice</b>	If you mark this field, the current footer line is printed on any invoice printed in connection with the order process. On orders which are specified as main orders, the footer will be included when the order is printed from the window Print Main Order Invoice. The footer is, however, not included on the suborders assigned to the main order. The field is only relevant if the card part of the window is displaying a quote or a sales order.

Field	Description
<b>Credit Memo</b>	If you mark this field, the current footer line is printed on any credit memo printed in connection with the order process. The field is only relevant if the card part of the window is displaying a credit order.
<b>Label</b>	If you mark this field, the current footer line is printed on any label created based on the order or quote displayed.
<b>Bill of Lading</b>	If you mark this field, the current footer line is printed on any bill of lading created based on the order displayed.
<b>Consignment</b>	If you mark this field, the current footer line is included when you print information about a consignment, of which the current order is a part, from the window Consignments.
<b>Consignment Slip</b>	If you mark this field, the current footer line is printed on any consignment slip created based on the order displayed.

## Order Status Workspace

Use this workspace to view a status report for individual sales orders.

Maconomy updates the print status on the order documents that a sales order generates: order confirmation, packing list, packing slip, and invoice. In this workspace, Maconomy shows whether the sales order has been fully delivered and invoiced.

You create sales orders in the Sales Orders workspace. In certain situations—for example, when reducing the quantity of items ordered and deleting order lines—a sales order can change status from "partly" to "fully" delivered and/or invoiced. This change is not reflected in the **Delivered** and **Invoiced** fields. In these cases, use the **Update Order Status** action to correct the status fields.

### Order Status Tab

This section includes the fields and descriptions for the Order Status tab.

### Sales Orders Island

Field	Description
<b>Order No.</b>	This is the number of the sales order. If you cannot remember the number of a sales order, you can use the search functions in the Find menu. The number cannot be changed.
<b>Customer</b>	This is the number of the customer on the sales order. The number cannot be changed here.
<b>Created on</b>	This is the date the sales order was created. The date cannot be changed manually.
<b>Approved</b>	If this field is marked, the sales order is approved. A sales order must be approved by selecting the action "Approve Sales Order" in the window Sales Orders before

Field	Description
	you can print any order documents regarding the sales order. It is, however, possible to print order confirmations for orders which are not yet approved.

### Order Confirmation Island

Field	Description
<b>Printed</b>	<p>If this field is marked, an order confirmation has been printed for the sales order. To print an order confirmation, you can either select the action "Print Order Confirmation" in the Sales Orders window or use the Print Order Confirmation window, where they are printed in batches. To mark this field, you must print the order confirmation using one of these two actions.</p> <p>To reprint an order confirmation, you must remove the mark here. You can then reprint it using one of the above two actions.</p>
<b>Date Printed</b>	This is the date the order confirmation was last printed. The date cannot be changed manually.
<b>Quantity</b>	This field shows how many times the order confirmation has been printed. It does not include copies from in your computer's standard print dialog. The value cannot be changed manually.

### Delivery Island

Field	Description
<b>Delivered</b>	<p>This field shows how many items have been delivered. The field shows "No," "Partly" or "Yes" depending on whether none, some or all of the items on the sales order have been delivered.</p> <p>In Maconomy, items are regarded as delivered when a packing slip is printed. The packing slip is created when a packing list is approved by selecting the actions "Approve Packing List" or "Print Packing Slip" in the window Packing Lists. If the system parameter "Approve Packing List in Two Steps" is marked, no packing slip is created when you approve a packing list. Furthermore, items are delivered when you print a packing slip directly from the window Sales Orders using the action "Print Packing Slip," and when selecting the action "Release to Invoice." Finally, packing slips can be created in the window Print Packing Slip. The content of the field can only be changed by delivering items in one of the ways specified.</p>
<b>Date of Last Shipment</b>	This is the date of the latest delivery of the sales order. The date cannot be changed manually.
<b>No. of Packing Slips</b>	This field shows how many packing slips have been printed, that is, how many deliveries have been made. The value cannot be changed manually.

Field	Description
<b>No. of Copies</b>	This field shows how many times the packing slip has been printed. Reprinted copies are included, but not copies from your computer's standard print dialog. The value cannot be changed manually.

### Packing List Island

Field	Description
<b>Printed</b>	<p>If this field is marked, a packing list has been printed for the sales order. To print a packing list, you can either use the action "Print Packing List" in the Sales Orders window or use the Print Packing List window, where they are printed in batches. To mark this field, you must print the packing list using one of these two actions.</p> <p>Note, you can only create one packing list per sales order at a time.</p> <p>To reprint an order confirmation, you must remove the mark here. You can then reprint it using one of the two above actions.</p> <p>The mark is automatically removed by Maconomy when an existing packing list is confirmed in the Packing Lists window. Maconomy deletes the packing list.</p>
<b>Ready for Delivery</b>	<p>This field is only significant if the system parameter "Approve Packing List in Two Steps" is marked. The field shows if the current sales order is ready for delivery, that is, the packing list for the current order is approved, but no packing slip has been created. The field determines whether the current order will be included in a printout of packing slips in the window Print Packing Slip, as such a printout will only include orders on which this field is marked. You can remove the mark manually, until a packing slip has been created for the order. This will, for example, be necessary if the packing report contained errors which need to be corrected, or if more order lines for the same packing slip are added after the packing list was approved.</p>
<b>Date Printed</b>	This is the date the latest packing list was printed. The date cannot be changed manually.
<b>Quantity</b>	This field shows how many times you have printed a packing list for the sales order. It does not include copies selected in your computer's standard print dialog. The value cannot be changed manually.

### Invoicing Island

Field	Description
<b>Invoiced</b>	<p>This shows whether any part of the sales order has been invoiced. The field shows "No," "Partly" or "Yes" depending on whether none, some or all of the items on the sales order have been invoiced.</p> <p>There are several ways to generate an invoice in Maconomy: You can select the action "Print Invoice" in the Sales Orders, Packing or Invoicing On Account windows. Or you can invoice in batches in the Invoicing window. The value in the field is changed by one of the above methods.</p>

Field	Description
<b>Date of Last Invoice</b>	This is the date an invoice was last created for the sales order. The date cannot be changed manually.
<b>No. Invoices</b>	This field shows how many invoices have been made for the sales order. The value cannot be changed manually.
<b>No. of Copies</b>	This field shows how many times invoices have been printed. Reprinted copies are included, but not copies from your computer's standard print dialog. The value cannot be changed manually.

## Unblocking Workspace

Use this workspace to create a list of blocked sales orders and to unblock individual sales orders.

If a sales order is blocked because a customer's credit limit was exceeded when the order was approved, you must unblock it in this workspace, regardless of whether the customer's debit balance has since been reduced.

In the Unblocking tab you can define a target group to find the sales orders that you want to review. The Sales Orders sub-tab displays the sales orders in the target group. You can block and unblock orders individually.

When you open this workspace, the Sales Orders sub-tab displays all of the blocked sales orders for delivery on today's date. You can thus use the target group fields in the Unblocking tab to display other sales orders in the Sales Orders sub-tab.

If you select the **Credit Block** field in the System Information workspace, Maconomy automatically blocks a sales order after approval if the bill-to customer's credit limit is exceeded. The credit limit is exceeded when the customer's balance plus order volume exceed the credit limit. An approved sales order that is not blocked becomes blocked if you enter a line that causes the credit limit to be exceeded. When checking whether the customer's credit limit has been exceeded, Maconomy checks the current customer's credit limit at the enterprise level as well as at the company level. See the description of the fields in the Credit Limit island in the Payment Information and Company Specific Payment Information workspaces in the A/R module for more information about how Maconomy handles credit limits.

If the sales order is blocked, the only order document that you can print is the order confirmation.

### Unblocking Tab

This section includes the fields and descriptions for the Unblocking tab.

#### Selection Criteria Island

Field	Description
<b>No. Blocked Orders</b>	<p>This field shows how many blocked sales orders meet the target group specification. You cannot change the value.</p> <p>When you open the window, the number will be limited to sales orders with a preferred delivery date on today's date. You can enter a wider interval of dates to see more blocked orders in the table.</p>

Field	Description
<b>Customer No.</b>	Here you can enter a range of ship-to customer numbers. The table will only show sales orders to be delivered to customers within this range.
<b>Bill to Customer</b>	Here you can enter a range of bill-to customer numbers. The table will only show sales orders to be paid by customers within this range.
<b>Pref. Deliv. Date</b>	Here you can enter an interval of dates. The table will only show sales orders whose preferred delivery date is within this interval.
<b>Order No.</b>	Here you can enter a range of order numbers. The table will only show sales orders numbered within this range.
<b>Company No.</b>	In this field, you can enter a range of company numbers. Only sales orders for which companies within the specified range are responsible are shown in the table part.
<b>Show Blocked Orders Only</b>	You can mark this field if you only wish to see blocked orders in the table. If the field is blank, the table will show both unblocked and blocked orders.

### Sales Orders Sub-Tab

This section includes the fields and descriptions for the Sales Orders sub-tab.

Field	Description
<b>Bill to Customer</b>	This is the number of the bill-to customer who is being invoiced for the items on the sales order.
<b>Pref. Delivery Date</b>	This is the preferred delivery date of the items in the order.
<b>Order No.</b>	This is the number of the sales order.
<b>Order Total, Base</b>	This is the order total, that is, the sum of the extended prices on the sales order, in base currency.
<b>Order Total, Currency</b>	This is the order total, that is, the sum of the extended prices on the sales order, in the currency of the order.
<b>Currency</b>	This field shows the currency of the order.
<b>Blocked</b>	If you mark this field, the sales order is blocked. Maconomy automatically marks the field if the bill-to customer's credit limit is exceeded. If the sales order is blocked you cannot print any order documents except order confirmation. A customer's credit limit is exceeded if his balance plus his order volume exceeds his credit limit. An approved non-blocked sales order will be blocked if you enter a line resulting in an excess of the credit limit.

Field	Description
	When checking if the customer's credit limit has been exceeded, Maconomy checks the current customer's credit limit at enterprise level as well as at company level. See the description of the fields in the island Credit Limit in the windows Payment Information and Company Specific Payment information in the A/R module for further information about how credit limits are handled in Maconomy.
<b>Customer No.</b>	This is the number of the customer who is having the items on the sales order delivered.
<b>Name</b>	This is the first line of the ship-to customer's name.
<b>Warehouse</b>	This is the name of the warehouse the items are being shipped from.
<b>Company No.</b>	This field shows the number of the company responsible for the sales order.

## Consignments Workspace

Use this workspace to maintain information about the consignments to be shipped.

In the Consignments tab you can enter the destination, consignment mode, date, and several other pieces of information about the consignment. Maconomy maintains the Sales Orders sub-tab and displays information about amounts, quantities, and delivery status of the orders and any quotes that are assigned to the current consignment.

You assign orders and quotes to a consignment in the Quote and Sales Orders workspaces, where you can specify a consignment number manually or have Maconomy assign the quote or order to a consignment. You can also assign quote and order lines to consignments individually, but the Sales Orders sub-tab only displays quotes and orders where the header is assigned to the current consignment.

Maconomy can create consignments automatically on the dates when they are required. You do this by specifying a starting date and an interval on one or several lines in the sub-tab of the Destination Card workspace. When assigning quotes and orders automatically to a consignment, Maconomy checks whether it can create a consignment with a packing date before the packing dates of existing consignments. See "Appendix B: Assign Quote/Order to Consignment" for more information about assigning orders to a consignment. The functionality of starting dates and intervals is explained in the Destination Information Card workspace.

## Consignments Tab

This section includes the fields and descriptions for the Consignments tab.

### Consignment Island

Field	Description
<b>Consignment No.</b>	In this field, you can specify a number for the consignment. If you do not specify a number, Maconomy will retrieve the consignment number from the window Number Series in the Set-Up module.
<b>Delivery Mode</b>	In this field, you specify a delivery mode. The combination of the values in this field and the fields "Delivery Terms," "Carrier," and "Consignment Type" make up a consignment mode. The consignment mode must exist in the information card of the destination specified for the current consignment. When creating a consignment, Maconomy completes a number of the fields in this window based on the information from the window Destination Card for the selected consignment mode. You can, however, change the values later. Delivery modes are created in the window Popup Fields in the Set-Up module.
<b>Delivery Terms</b>	In this field, you specify a code for delivery terms. Otherwise, the functionality of this field is similar to that of the field "Delivery Mode" above.
<b>Carrier</b>	In this field, you specify a carrier. Otherwise, the functionality of this field is similar to that of the field "Delivery Mode" above.
<b>Consignment Type</b>	In this field, you specify a consignment type. Otherwise, the functionality of this field is similar to that of the field "Delivery Mode" above.
<b>Destination No.</b>	In this field, you specify the number of the destination to which the current consignment will be shipped. Below the destination number, the name of the selected destination is displayed. Destinations are created in the window Destination Card.

### Dates Island

Field	Description
<b>Packing Date</b>	In this field, you can specify the date on which the packing of items for the current consignment should commence. When creating a consignment, Maconomy suggests the consignment date less the number of packing days specified for the consignment mode selected in the table part of the information card for the destination specified on the current consignment. The packing date is furthermore used for determining whether the current consignment can be used when Maconomy assigns a quote, an order or quote/order lines to a consignment. If you change the packing date after assigning quotes, orders or lines to the consignment, the delivery date on the assigned quotes, orders and lines will be updated accordingly, and the items affected will be reserved again according to the new date. See "Appendix B:

Field	Description
	Assign Quote/Order to Consignment” for further information about assigning orders to a consignment.
<b>Consignment Date</b>	In this field, you enter the date of shipping the consignment. The consignment date is used for determining whether the current consignment can be used when Maconomy assigns a quote, an order or quote/order lines to a consignment. See “Appendix B: Assign Quote/Order to Consignment” for further information about assigning orders to a consignment.
<b>Arrival Date</b>	If the line is assigned to a consignment, this field displays the expected date of arrival at the destination. The value is retrieved from the corresponding field in the window Consignments for the consignment in question.

### Charges Island

Field	Description
<b>Charge 1-4</b>	<p>In these fields, you can enter the charge codes to be transferred to quotes and orders assigned to the current consignment. Any existing charge codes on the individual quotes and orders will be overwritten when assigned to the consignment. Later changes in the charge codes on the consignment will, however, not be reflected on quotes and orders already assigned to the consignment.</p> <p>When creating a consignment, Maconomy suggests the charge codes from the line with the current consignment mode in the table part of the information card of the destination in question.</p>

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

### Remarks Island

these fields, you can enter a number of remarks regarding the current consignment. When creating a consignment, Maconomy suggests the remarks from the consignment mode selected in the table part of the information card of the destination specified on the current consignment.

### Weight/Volume Island

Field	Description
<b>Weight Capacity</b>	<p>In this field, you can specify the total weight permitted for the current consignment. The weight capacity is used when evaluating which consignment Maconomy should choose when automatically assigning an order or a quote to a consignment. Maconomy will only assign an order to a consignment which has the necessary weight capacity available. You can, however, manually assign an order to a consignment, even if the weight capacity of the consignment is exceeded when doing so. When creating a consignment, Maconomy suggests the weight capacity specified on the selected consignment mode.</p> <p>See “Appendix B: Assign Quote/Order to Consignment” for further information about assigning orders to a consignment.</p>

Field	Description
<b>Volume Capacity</b>	The functionality of this field is similar to that of the field "Weight Capacity" above.
<b>Increase in Weight, %</b>	In this field, you can specify a percentage increase in weight. The weight increase is used if the current consignment type requires that the items are shipped in special packaging, for example, wooden crates. The weight increase is used when evaluating which consignment Maconomy should choose when automatically assigning an order or a quote to a consignment. If charges are calculated by weight, the weight increase percentage is used when the expected charges are calculated using the action "Calculate Charges" in the windows Quote and Sales Orders, and when printing quotes and order confirmations. When creating a consignment, Maconomy suggests the weight increase specified on the Destination Card of the selected consignment mode.
<b>Increase in Volume, %</b>	The functionality of this field is similar to that of the field "Increase in Weight, %" above.

#### Order Total Island

Field	Description
<b>No. Orders</b>	This field displays the total number of sales orders assigned to the current consignment. The number does not include quotes assigned to the current consignment.
<b>Gross Weight</b>	This field displays the total gross weight of the current consignment, calculated as the sum of the values in the field "Weight" on the lines in the table part of the window.
<b>Gross Volume</b>	This field displays the total gross volume of the current consignment, calculated as the sum of the values in the field "Volume" on the lines in the table part of the window.
<b>Total No. of Packages</b>	This field displays the total number of packages of the current consignment, calculated as the sum of the values in the field "Package" on the lines in the table part of the window.
<b>Order Total</b>	This field displays the order total of the current consignment, calculated as the sum of the values in the field "Order Total" on the lines in the table part of the window. The total is displayed in the enterprise currency.

#### Consignment Information Island

Field	Description
<b>Consignment Status</b>	<p>This field shows whether the current consignment is open or closed. It is only possible to assign orders to an open consignment.</p> <p>A consignment is open until packing slips have been printed for all of the orders assigned to the consignment in question. However, a closed</p>

Field	Description
	consignment can be reopened manually — In this field, thus making it possible to assign additional orders.
<b>Batch Invoice</b>	This field shows if orders assigned to the current consignment should be batch invoiced. If the field is not selected, any mark in the corresponding field on orders assigned to the current consignment will be removed. If the field is selected in this window, the value in the field "Batch Invoice" will remain unchanged on the individual orders, whether or not it is selected. You can, for example, use this functionality if you usually batch invoice orders, but you want to manually evaluate the charges on orders assigned to a certain consignment mode for a given destination before invoicing.
<b>Delivered</b>	This field displays if the items on the assigned order have been delivered. The field shows "No," "Partly" or "Yes," depending on whether none, some or all of the items on the sales order have been delivered.  If none of the orders assigned to the current consignment is delivered, the field displays "No." If one or more, but not all, of the orders are delivered, the field displays "Partly," and if all the assigned orders are delivered, the field displays "Yes." The order status for each assigned order is shown in the field "Delivered" in the table part of this window. See the field "Delivered" in the window Order Status for further information concerning the delivery of an order in Maconomy.
<b>Blocked</b>	If you mark this field, quotes, orders, and lines will no longer be assigned to the current consignment when you select the action "Assign Quote to Consignment" in the window Quote or the action "Assign Order to Consignment" in the window Sales Orders.
<b>Incl. Quotes</b>	If you mark this field, the table part will display both quotes and sales orders assigned to the current consignment. If the field is not marked, the table part will only display sales orders. Please note that if the number of lines in the table part is changed because you mark or unmark this field, the figures in the island Order Total will be recalculated from the lines currently displayed in the table part.
<b>Show only Ready f. Deliv.</b>	If you mark this field, the table part will only display orders with the value "Yes" in the field "Ready for Delivery" or in the field "Delivered." Please note that if the number of lines in the table part is changed because you mark or unmark this field, the figures in the island Order Total will be recalculated from the lines currently displayed in the table part. Please also note that the field "Number of Orders" always displays the total number of orders assigned to the current consignment regardless of whether these orders are shown in the table part.
<b>Do not Itemize Suborders</b>	If you mark this field, the table part will not display quotes and orders linked to a main order. Please note that if the number of lines in the table part is changed because you mark or unmark this field, the figures in the island Order Total will be recalculated from the lines currently displayed in the table part.

## Sales Orders Sub-Tab

This section includes the fields and descriptions for the Sales Orders sub-tab.

Field	Description
<b>Order No.</b>	This field shows the number of the current quote or the current order.
<b>Customer No.</b>	This field shows the number of the current ship-to customer.
<b>Name</b>	This field shows the name of the current ship-to customer.
<b>Reference</b>	This field shows any reference entered in the field "Reference" on the current quote or order.
<b>Order Total</b>	This field shows the quote or order total for the current quote or order. If the line is displaying a quote, this field shows the value of the field "Total Quote" in the window Quote. The value is converted into enterprise currency. If the line is displaying a sales order, this field shows the value of the field "Order Total" in the window Sales Orders converted into enterprise currency.
<b>Package</b>	This field shows the total number of packages on the current quote or the current sales order.
<b>Weight</b>	<p>This field shows the total weight of the items on the current quote or sales order. If the line is displaying a quote or a sales order which is not yet delivered, the field displays the value from the corresponding field in the card part of the quote or sales order in question, including the increase percentage which may be specified in this window in the field "Increase in Weight, %." If a packing list has been approved for the order, but no packing slip has been created, the field will, however, display the weight entered via the packing reporting.</p> <p>If the order on the current line is delivered, Maconomy shows the weight as specified on the packing slip. This weight depends on whether the packing slip was created in the window Packing Lists, Sales Orders or Print Packing Slip, as Maconomy will calculate the weight in the following way when a packing slip is created:</p> <p>If the packing slip was created in the window Sales Orders, Maconomy uses the weight from the island "Order Total" in the window Sales Orders with the addition of the percentage specified in this window in the field "Increase in Weight, %."</p> <p>If the packing slip was created in the window Packing Lists, the confirmed weight is used.</p> <p>If the packing slip was created in the window Print Packing Slip, the weight reported when selecting the action "Approve Packing List" in the window Packing Lists is used. However, if no approved packing list existed for the order when the packing slip was created, the weight specified on the packing slip will correspond to the total weight from the island Order Total in the</p>

Field	Description
	window Sales Orders with the addition of the percentage specified in this window in the field "Increase in Weight, %."
<b>Volume</b>	The functionality of this field is similar to that of the field "Weight" above.
<b>Order Approved</b>	If the current line is displaying an order, this field shows if the order in question is approved. Packing list printed If the current line is displaying an order, this field shows if a packing list has been printed for the order in question.
<b>Ready for Delivery</b>	If the current line is displaying an order, this field shows if the order in question is ready for delivery, that is, the packing list for the current order is approved, but no packing slip has yet been created. This field is only significant if the system parameter "Approve packing list in two steps" has been marked.
<b>Delivered</b>	If the current line is displaying an order, this field shows whether the order in question has been delivered, that is, a packing slip has been created for the order.

## Print Quote Workspace

Use this workspace to print quotes in batches.

If you create many quotes on the same day, it is convenient to print them all in one operation. You can do that in this workspace, by defining a target group.

In the Quote workspace, you can print a quote immediately after you create or change it using the **Print Quote** action. This enables you to send it to the customer at once.

### Print Quote Tab

This section includes the fields and descriptions for the Print Quote tab.

#### Selection Criteria Island

Field	Description
<b>Quote No.</b>	In these fields, you can enter a range of quote numbers. Maconomy will only print quotes within this range which have not been printed already, unless you have chosen to include printed quotes.
<b>Customer No.</b>	In these fields, you can enter a range of ship-to customer numbers. Maconomy will only print quotes for ship-to customers within this range.
<b>Bill to Customer</b>	In these fields, you can enter a range of bill-to customer numbers. Maconomy will only print quotes for bill-to customers within this range.
<b>Pref. Deliv. Date</b>	In this field, you can enter a range of dates. Maconomy will only print quotes with a preferred delivery date within this range.

Field	Description
<b>Expiry Date</b>	In this field, you can enter a range of expiry dates. Maconomy will only print quotes expiring within this range of dates.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. Maconomy will only print quotes for responsible companies within the specified range.
<b>Consignment No.</b>	In these fields, you can specify a range of consignment numbers. Maconomy will only print quotes assigned to a consignment within the specified range.
<b>Destination No.</b>	In these fields, you can specify a range of destination numbers. Maconomy will only print quotes with a destination within the specified range.
<b>Consignment Date</b>	In these fields, you can specify a range of consignment dates. Maconomy will only print quotes assigned to a consignment with a consignment date within the specified range.
<b>Delivery Mode</b>	In this field, you can select a delivery mode. Maconomy will only print quotes with the selected delivery mode.
<b>Delivery Terms</b>	In this field, you can select a code for delivery terms. Maconomy will only print quotes with the selected delivery terms.
<b>Carrier</b>	In this field, you can select a carrier. Maconomy will only print quotes with the selected carrier.
<b>Consignment Type</b>	In this field, you can select a consignment type. Maconomy will only print quotes with the selected consignment type.
<b>Order Mode</b>	In this field, you can enter an order mode. Maconomy will only print quotes with the selected order mode.
<b>Department</b>	In this field, you can select a department. Maconomy will only print quotes from the selected department.
<b>Language</b>	In this field, you can select a language code. Maconomy will only print quotes with the selected language code.  You can use the language code to print quotes in different languages. Using Maconomy's layout editing tools, you can create different language layouts. The combination of language code and layout allows you to print quotes in different languages.
<b>Main Order No.</b>	In these fields, you can specify a range of order numbers. Maconomy will only print quotes linked to a main order whose order or quote number is within the specified range.

### Print Control Island

Field	Description
<b>Incl. Printed</b>	If you mark this field, you will reprint quotes which meet the selection criteria and which have been printed before.

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

## Actions

This section shows the Actions available in the Print Quote workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print the selected quote.

## Print Order Confirmation Workspace

Use this workspace to print order confirmations in batches.

Order confirmations are sent to customers to confirm that you received an order from them. If you need to print many order confirmations on the same day or in one period, it is convenient to print them all in one operation. You do that in this workspace, by entering a range of order numbers. The printout only includes orders for which a confirmation has not been printed, unless you are reprinting order confirmations.

In the Sales Orders workspace, you can print an order confirmation immediately after you create or change a sales order using the **Print Order Confirmation** action. This enables you to send it to the customer at once.

### Print Order Confirmation Tab

This section includes the fields and descriptions for the Print Order Confirmation tab.

#### Selection Criteria Island

Field	Description
<b>Order No.</b>	In these fields, you can enter a range of order confirmation numbers. Maconomy will only create and print order confirmations within this range which have not been printed already, unless you have chosen to include printed order confirmations.
<b>Customer No.</b>	In these fields, you can enter a range of ship-to customer numbers. Maconomy will only create and print order confirmations for ship-to customers within this range.
<b>Bill to Customer</b>	In these fields, you can enter a range of bill-to customer numbers. Maconomy will only create and print order confirmations to bill-to customers within this range.

Field	Description
<b>Pref. Deliv. Date</b>	In this field, you can enter a range of dates. Maconomy will only create and print order confirmations for sales orders with a preferred delivery date within this range.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. Maconomy will only create and print order confirmations for responsible companies within the specified range.
<b>Consignment No.</b>	In these fields, you can specify a range of consignment numbers. Maconomy will only create and print order confirmations for sales orders assigned to a consignment within the specified range.
<b>Destination No.</b>	In these fields, you can specify a range of destination numbers. Maconomy will only create and print order confirmations for sales orders with a destination within the specified range.
<b>Consignment Date</b>	In these fields, you can specify a range of consignment dates. Maconomy will only create and print order confirmations for sales orders assigned to consignments with a consignment date within the specified range.
<b>Delivery Mode</b>	In this field, you can select a delivery mode. Maconomy will only create and print order confirmations for sales orders with the selected delivery mode.
<b>Delivery Terms</b>	In this field, you can select a code for delivery terms. Maconomy will only create and print order confirmations for sales orders with the selected delivery terms.
<b>Carrier</b>	In this field, you can select a carrier. Maconomy will only create and print order confirmations for sales orders with the selected carrier.
<b>Consignment Type</b>	In this field, you can select a consignment type. Maconomy will only create and print order confirmations for sales orders with the selected consignment type.
<b>Order Mode</b>	In this field, you can enter an order mode. Maconomy will only create and print order confirmations for sales orders with the selected order mode.
<b>Department</b>	In this field, you can select a department. Maconomy will only create and print order confirmations for sales orders from the selected department.
<b>Language</b>	<p>In this field, you can select a language code. Maconomy will only create and print order confirmations for sales orders with the selected language code.</p> <p>You can use the language code to print order confirmations in different languages. Using Maconomy's layout editing tools, you can create different language layouts. The combination of language code and layout allows you to print order confirmations in different languages.</p>
<b>Main Order No.</b>	In these fields, you can specify a range of order numbers. Maconomy will only create and print order confirmations for sales orders linked to a main order whose order number is within the specified range.

**Print Control Island**

Field	Description
<b>Incl. Printed</b>	If you select this field, you will reprint order confirmations which meet the selection criteria and which have been printed before.
<b>Include Non-Approved</b>	If you select this field, the printout will include order confirmations for sales orders which are not yet approved. If the field is not selected, only approved orders which match the selection criteria are included.
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

## Actions

This section shows the Actions available in the Print Order Confirmation workspace.

**Top Tab**

Field	Description
<b>Print</b>	Use this action to print the selected order confirmation.

## Print Main Order Workspace

Use this workspace to print all of the information about main orders and the suborders that are linked to them.

You can use the printout as a kind of joint order confirmation for linked orders. The printout only includes orders that have linked suborders.

In the selection criteria you can specify the main orders whose information you want to print. Note that if a main order matches the selection criteria, all of the suborders that are linked to the main order in question are printed, regardless of whether the suborders match the criteria.

## Print Main Order Tab

This section includes the fields and descriptions for the Print Main Order tab.

**Selection Criteria Island**

Field	Description
<b>Order No.</b>	In these fields, you can specify a range of sales order numbers. Maconomy will only print information about main orders within the specified range.
<b>Main Order No.</b>	In these fields, you can specify a range of sales order numbers. Maconomy will only print information about main orders within the specified range.

Field	Description
<b>Order Type</b>	In this field, you can select an order type. Maconomy will only print main orders with the selected order type. You can only choose between "Quote" and "Sales Order."
<b>Ship to Customer</b>	In these fields, you can enter a range of ship-to customer numbers. Maconomy will only print main orders for ship-to customers within this range.
<b>Bill to Customer</b>	In these fields, you can enter a range of bill-to customer numbers. Maconomy will only print main orders for bill-to customers within this range.
<b>Destination No.</b>	In these fields, you can specify a range of destination numbers. Maconomy will only print main orders for a destination within the specified range.
<b>Delivery Mode</b>	In this field, you can select a delivery mode. Maconomy will only print main orders with the selected delivery mode.
<b>Delivery Terms</b>	In this field, you can select a code for delivery terms. Maconomy will only print main orders with the selected delivery terms.
<b>Carrier</b>	In this field, you can select a carrier. Maconomy will only print main orders with the selected carrier.
<b>Order Mode</b>	In this field, you can enter an order mode. Maconomy will only print information on main orders with the selected order mode.
<b>Consignment Type</b>	In this field, you can select a consignment type. Maconomy will only print main orders with the selected consignment type.
<b>Consignment Date</b>	In these fields, you can specify a range of consignment dates. Maconomy will only print main orders assigned to a consignment with a consignment date within the specified range.
<b>Consignment No.</b>	In these fields, you can specify a range of consignment numbers. Maconomy will only print main orders assigned to a consignment within the specified range.

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option. This layout shows the items and charges associated with the main order and the suborders linked to it. For every item and every charge, the printout shows a line totaling the item or charge in question. The printed amounts are shown in the currency of the main order.

## Actions

This section shows the Actions available in the Print Main Order workspace.

### Top Tab

Field	Description
Print	Use this action to print all information about main orders and the suborders linked to them.

## Delivery Section

This section includes the fields and descriptions for the Delivery section workspaces.

### Packing Lists Workspace

Use this workspace to confirm packing lists that you print in the Sales Orders or Print Packing List workspaces.

The Packing Lists tab displays general and account information about the packing list. Maconomy retrieves some of the information from the sales order to which the packing list is assigned. In the Packing List Lines sub-tab, you can enter how many items were packed.

You print packing lists individually in the Sales Orders workspace or in batches in the Print Packing Lists workspace. You can only open the Packing Lists workspace if Maconomy has unconfirmed packing lists. A packing list is an internal message to the warehouse that a certain number of items are ready to be packed and delivered to a customer. Warehouse personnel use this workspace to confirm that the items have been packed.

The warehouse reports back how many of the items in the packing list have actually been packed. You can then print delivery documents such as a packing slip, an invoice, labels, and a bill of lading.

The item lines in the printed packing list are sorted by location, and the same applies here. This makes it easier for warehouse employees to compare the printed list to the information in this workspace.

When the packing list has been confirmed, it is automatically deleted. You can then print a new packing list for any undelivered items that remain from the sales order. You can only produce one packing list per order at any one time.

If you have Maconomy Bill of Materials, and the item in an order line is a BOM that does not have inventory control, Maconomy confirms the BOM parts that have inventory control individually. This happens in the Packing List Lines workspace. Maconomy shows any BOMs that do not have inventory control with zero items for packing. When you activate the line on which the BOM is specified in this workspace, its BOM parts that have inventory control appear in the Packing List Lines workspace.

## Packing Lists Tab

This section includes the fields and descriptions for the Packing Lists tab.

### Packing List Island

Field	Description
<b>Order No.</b>	This is the number of the sales order to which the packing list is assigned. The sales order number is shown on the printed packing list. The value in this field cannot be changed.
<b>Packing List No.</b>	This is the packing list number in the series of packing lists assigned to the current sales order. You can only produce one packing list per sales order at any one time. The number cannot be changed manually.  It is important for the warehouse employee to check that this number corresponds to the printed packing list he is working with.
<b>Date Printed</b>	This is the date on which the packing list was printed. The date cannot be changed.
<b>Pref. Deliv. Date</b>	This is the customer's preferred delivery date for the items in the packing list. The date is retrieved from the sales order. It cannot be changed here.

### Remarks Island

Field	Description
<b>Warehouse</b>	This field shows the warehouse from which the items are to be packed. Maconomy retrieves the value from the sales order. You cannot change it here.  Below the warehouse name, Maconomy shows any internal note entered in the "Warehouse" field in the Notes island in the window Sales Orders.

### Customer Island

Field	Description
<b>Customer</b>	This field shows the number of the customer to whom the items in the packing list will be delivered. The customer number cannot be changed here.  The other lines in this field show the customer's name and address. The information is retrieved from the card part of the sales order. It can be changed here. Note, however, that if you change the name and address here, the field is also changed on the sales order.
<b>Attn.</b>	This is the customer's attention person the person to whom shipping information is directed. The information is retrieved from the sales order. It can be changed here, causing the corresponding field to be updated on the sales order.
<b>Country</b>	This is the customer's country code, which is retrieved from the sales order. You can change it, causing the corresponding field to be updated on the sales order.

**Company Island**

Field	Description
<b>Company</b>	<p>This field shows the number of the company responsible for the order to which the packing list is assigned. The value is transferred from the field "Company No." in the island Company on the order.</p> <p>This field also shows the name of the specified company.</p>

**Extra Fields Island**

Field	Description
<b>Popup 1-5</b>	<p>In these fields, you can specify further information regarding the packing list and the current customer. You might, for example, specify a "hold" code or information about substitution items. Maconomy suggests the value of the corresponding fields in the customer's information card, but you can change the values for the current packing list, causing the corresponding fields to be updated on the sales order. The pop-up options are created in the window Popup Fields in the Set-Up module.</p>

**Delivery Island**

Field	Description
<b>Partial Delivery</b>	<p>This field shows whether it is possible to make a partial delivery. Unless there is a mark here, it is only possible to approve a packing list if all the items are reported packed. The value is retrieved from the sales order to which the packing list is assigned, and you cannot change it here.</p>
<b>Handled by</b>	<p>Here you enter the name of the warehouse employee who packed the items in the packing list. Maconomy automatically suggests the name of the user, but you can change it. The field must be completed.</p>
<b>Carrier</b>	<p>Here you select a carrier for the delivery. Maconomy automatically suggests the value from the sales order, but you can change it. Note, however, that if you change the carrier here, the field is also changed on the sales order.</p> <p>You maintain carriers in the window Popup Fields in the Set-Up module.</p>
<b>Delivery Mode</b>	<p>Here you select a delivery mode. Maconomy automatically suggests the value from the sales order, but you can change it. Note, however, that if you change the delivery mode here, the field is also changed on the sales order.</p> <p>You maintain delivery modes in the Popup Fields window in the Set-Up module.</p>
<b>Delivery Terms</b>	<p>Here you select the terms of delivery. Maconomy automatically suggests the value from the sales order, but you can change it. Note, however, that if you change the delivery terms here, the field is also changed on the sales order.</p> <p>You maintain delivery terms in the window Popup Fields in the Set-Up module.</p>
<b>Charge Table</b>	<p>This field shows the charge table used for charge calculation. The field is transferred from the sales order to which the packing list is assigned, but you can change it here. Note, however, that if you change the charge table here, the field is also changed on the sales order.</p>

Field	Description
<b>Charge Discount %</b>	This field shows the charge discount percentage applied in addition to the one which can be specified in the charge table. The field is transferred from the sales order to which the packing list is assigned but you can change it here. Note, however, that if you change the charge discount percentage here, the field is also changed on the sales order.
<b>Bill of Lading No.</b>	This field shows a bill of lading number which will be included on packing slips related to the current sales order. The field is transferred from the sales order to which the packing list is assigned but you can change it here. Note, however, that if you change the bill of lading number here, the field is also changed on the sales order.

### Packing List Total Island

Field	Description
<b>Price</b>	This field shows the total price of the item lines in the packing list. If the corresponding sales order is changed, for example, by adding order lines or changing unit prices, quantities or discounts, the value in this field is automatically updated. Furthermore, the value is recalculated as the sum of the prices of the packed items when the packing list is approved or when a packing slip is printed in the Action menu. You cannot change the price manually.
<b>Weight</b>	<p>This field shows the total weight of the item lines in the packing list. The value is calculated from the weight of each individual item. If a line is assigned to a consignment, its weight will include the weight increase specified for the consignment in question. The weights are retrieved from the Item Information Cards in the Inventory module while weight increases are specified in the card part of the window Consignments.</p> <p>If a control weighing shows another weight, you can enter the actual weight here. The weight is printed on the bill of lading.</p> <p>Note that the weight is found from the item quantity in the packing list. If not all the items are actually packed, the weight will not be recalculated.</p> <p>If you have Maconomy Bill of Materials, and the packing list has BOMs with inventory control at part level, the value will include the sum of the weights of the BOM parts.</p>
<b>Volume</b>	<p>This field shows the total volume of the item lines in the packing list. The value is calculated from the volume of each individual item. If a line is assigned to a consignment, its volume will include the volume increase specified for the consignment in question. The volumes are retrieved from the Item Information Cards in the Inventory module while volume increases are specified in the card part of the window Consignments. You can change the value suggested. The value is printed on the bill of lading.</p> <p>Note that the volume is found from the item quantity in the packing list. If not all the items are actually packed, the volume will not be recalculated.</p> <p>If you have Maconomy Bill of Materials, and the packing list has BOMs with inventory control at part level, the value will include the sum of the volumes of the BOM parts.</p>

Field	Description
<b>Area</b>	In this field, you enter how many area units are taken up by the delivery. The value is printed on the bill of lading.
<b>Package</b>	In this field, you enter how many packages the delivery includes. The value is printed on the bill of lading.

### Charges Island

Field	Description
<b>Charges</b>	<p>Here you can select a delivery charge. Maconomy suggests the value from the corresponding field on the sales order, but you can change it, causing the corresponding field to be updated on the sales order.</p> <p>You maintain charges in the window Charges. For every charge, you can define a text as well as a percentage rate or an amount.</p> <p>You can enter a fixed charge amount in the "Fixed Amount" field, which will always be used in invoicing, regardless of the size of the amount of the charge code. If you do so, the charge code is only used to retrieve a charge text.</p>

### Packing List Lines Sub-Tab

This section includes the fields and descriptions for the Packing List Lines sub-tab.

Field	Description
<b>Line No.</b>	This field shows the number of the line on the order to which the current packing line corresponds. The line number is printed on the packing list.
<b>Stock Location</b>	This field shows the location at which the item should be packed and from which it should be shipped. The item lines in the printed packing list are sorted by location, and the same applies here. This makes it easier for warehouse employees to compare the packing list to the information in this window. The value is retrieved from the sales order line on which the packing line is based, but you can specify another location here if the items are shipped from another location.
<b>Item No.</b>	<p>This is the number of the item to be delivered. The number is retrieved from the corresponding line on the sales order. It cannot be changed here.</p> <p>If you have Maconomy Bill of Materials, and the item is a BOM without inventory control, you must confirm the BOM parts (with inventory control) in the window Packing List Lines. If you activate this line, the BOM parts will be shown in the window Packing List Lines.</p>
<b>Description</b>	This is the item text. The text is retrieved from the corresponding item line on the sales order. You can change the text.
<b>Deliv. Date</b>	This is the item line's delivery date. The date is retrieved from the corresponding item line on the sales order. You cannot change the date.

Field	Description
<b>For Packing</b>	<p>This field shows how many item units are selected to be packed and delivered on the preferred delivery date. The value cannot be changed manually.</p> <p>If you have Maconomy Bill of Materials, and the item is a BOM without inventory control, the quantity for packing will always be zero. BOM parts with inventory control are handled in the Packing List Lines window.</p>
<b>Packed</b>	<p>Here you enter the quantity of items actually packed from the warehouse. Maconomy automatically suggests a value, based on the information on the sales order or any warehouse transaction information assigned to the order. For further information on how the suggested value is found, see the description of the action "Print Packing List." You can change the suggested value if the physical inventory is short of items. Maconomy verifies that the amount you enter is divisible by the item's minimum sales unit.</p> <p>If you enter a quantity lower than the quantity in the "For Packing" field, Maconomy automatically creates back orders for the remaining items when the packing list is approved. At the same time, Maconomy updates the field "Back Orders" in the windows Item Information Card and Item Information in the Inventory module. Please note that if the order does not have partial delivery and the value in this field is lower than the quantity in the field "For Packing," the packing list cannot be approved.</p> <p>If you have Maconomy Bill of Materials, and the item is a BOM without inventory control, the BOM cannot be handled in this window. BOM parts with inventory control are handled in the window Packing List Lines. If you activate this line, the BOM parts appear in the window Packing List Lines.</p>
<b>Internal Desc.</b>	<p>This is the internal item description from the Item Information Card. It is suitable for messages to the warehouse, for example, to specify how an item should be handled and packed. The text can be changed.</p> <p>The warehouse can use the field to return messages to the sales department. The text appears in the Sales Orders window when the sales order is retrieved there again. The text is not printed on external order documents.</p>
<b>Extra Text 1-10</b>	<p>In these fields, you can enter supplementary text for a further description of the current item. In the first three fields, Maconomy suggests the value from the corresponding fields in the item information card. You can change the suggested texts and enter additional information in the remaining seven fields.</p>
<b>Popup 1-5</b>	<p>In these fields, you can enter further information about the current item. Maconomy suggests the value from the corresponding fields in the item information card, but you can change the value for the current packing list line. The pop-up options are created in the window Popup Fields in the Set-Up module.</p>
<b>Bill of Materials</b>	<p>If this field is marked, the item is a BOM. If the BOM header is not assigned inventory control, its BOM parts must be confirmed in the Packing List Lines window. If you activate this line, the BOM parts are shown in the window Packing List Lines.</p>

## Packing List Lines Workspace

Use this workspace to confirm packing list lines for BOM parts that have inventory control and are part of a BOM that does not have inventory control at a higher level.

The Packing List Lines tab displays general and account information about the BOM header. In the BOM Lines sub-tab, in each item line, you can enter how many items have been packed. This workspace is part of Maconomy Bill of Materials.

The packing list lines relate to a packing list, which you can print individually in the Sales Orders workspace after you create a sales order or in batches in the Print Packing List workspace. A packing list is an internal message to the warehouse that various items are ready to be packed and delivered to a customer.

This workspace is a supplement to the Packing Lists workspace. Warehouse employees confirm that BOM parts have been packed. This workspace shows the BOM parts from the active BOM part line in the Packing Lists workspace.

At confirmation of the packing list lines, the warehouse reports back how many of the ordered items have actually been packed. You can then print delivery documents such as a packing slip, invoice, labels, and bills of lading from the Print Confirmation workspace.

### Packing List Lines Tab

This section includes the fields and descriptions for the Packing List Lines tab.

#### Order Line Island

Field	Description
<b>Order No.</b>	This is the number of the sales order to which the packing list applies. The sales order number is shown on the printed packing list. The number cannot be changed here.
<b>Line No.</b>	This is the packing list line number from the sales order. The line number is shown on the printed packing list. You can use the search functions in the Find menu to retrieve other lines. The order number and line number combine to form the sole and absolute identification of the packing list line. The number cannot be changed here.

#### Item Island

Field	Description
<b>Item No.</b>	This is the item number in the packing list line.
<b>Unit</b>	This is the item sales unit in the packing list line. The value is retrieved from the "Unit" field in the Sales Orders window. The unit cannot be changed here.
<b>Description</b>	This is the item text. The text is retrieved from the "Unit" field in the Sales Orders window. The text cannot be changed here.
<b>Internal Desc.</b>	This is the internal text. The text is retrieved from the "Unit" field in the Sales Orders window. The text cannot be changed here.

Field	Description
<b>Extra Text 1-10</b>	These are the extra text fields of the packing list line. The information is retrieved from the corresponding lines in the table part of the current sales order. The Extra Fields cannot be changed here.

**Extra Fields Island**

Field	Description
<b>Popup 1-5</b>	These fields show the values of the corresponding fields in the table part of the current sales order. The values cannot be changed here.

## BOM Lines Sub-Tab

This section includes the fields and descriptions for the BOM Lines sub-tab.

Field	Description
<b>Line No.</b>	This is the item's line number in the BOM. This number is printed with the order line number (shown in the card part above) on the packing list. The number is used to identify the BOM part.
<b>Stock Location No.</b>	This field shows the location at which the BOM part should be packed and from which it should be shipped. The item lines and BOM parts in the printed packing list are sorted by location, and the same applies here. This makes it easier for warehouse employees to compare the packing list to the information in this window. The value is retrieved from the sales order line on which the packing line is based, but you can specify another location here if the items are shipped from another location.  If the field is blank, the location number specified in the card part of the window will apply to the line.
<b>Item No.</b>	This is the number of the BOM part to be delivered. The value is retrieved from the corresponding item line on the sales order. The number cannot be changed here.
<b>Description</b>	This is the item text. The text is retrieved from the corresponding item line on the sales order. You can change the text here.
<b>Deliv. Date</b>	This is the item line's delivery date. The date is retrieved from the corresponding item line on the sales order. You cannot change the date here.
<b>For Packing</b>	This field shows how many item units are selected to be packed and delivered on the preferred delivery date. The value cannot be changed manually.
<b>Packed</b>	Here you enter the quantity of items actually packed.  Maconomy automatically suggests the value from the "For Packing" field. You can change the suggested value, if the physical inventory is short of items. Maconomy verifies that the amount you enter is divisible by the item's minimum sales unit.

Field	Description
	If you enter a quantity lower than the quantity in the “For Packing” field, Maconomy automatically creates back orders on the remaining items. At the same time, Maconomy updates the “Back Orders” field in the Item Information Card and Item Information windows in the Inventory module.
<b>Internal Desc.</b>	This is the internal item text from the Item Information Card. It is suitable for messages to warehouse employees. You can, for example, specify how the item should be handled and packed. You can change the text.
<b>Extra Text 1-10</b>	In these fields, you can enter supplementary text for a further description of the current BOM part. In the first three fields, Maconomy suggests the value from the corresponding fields in the BOM item information card. In You can change the suggested texts and enter additional information in the remaining seven fields.
<b>Popup 1-5</b>	In these fields, you can enter further information about the current BOM item. Maconomy suggests the value from the corresponding fields in the BOM item information card, but you can change the value for the current packing list line. The pop-up options are created in the window Popup Fields in the Set-Up module.

## Serial Number Entry Workspace

Use this workspace to enter serial numbers for items that have serial number control that are delivered or returned in connection with a sale or crediting in the Sales Orders or Credit Orders workspaces.

Serial number entry for sales orders in this workspace is mandatory for items that have the serial number control type **Full Ser. No. Reg.** or **Serial No. Reg. at Shipping** set up in the Item Information Card workspace. For credit orders, serial number entry is mandatory for items that have the serial number control type **Full Ser. No. Reg.** or **Serial No. Reg. at Receipt**.

The Serial Number Entry tab contains general information about the item line. In the Serial Numbers sub-tab you enter serial numbers and quantities for each serial number of the item on the item line. You can also specify where the items should be moved to for packing or where they are received, depending on whether you are working with a sales order or a credit order.

An item line that has one of these serial number control types cannot be delivered, invoiced, or credited before you enter a serial number for every single unit of the item in this workspace. If you are selling a serial number that has not yet been created—for example, because the item does not use the serial number control method **Ser. No. Reg. at Receipt**—you must enter the serial number in question in the **New Serial No.** field instead of in the **Serial No.** field.

You typically enter serial numbers that are related to sales orders in this workspace when the warehouse personnel reports back on packing lists, but it might already be done at the time of order receipt, if you are selling an item with a particular serial number. You can specify some of the serial number units at the time of order entry and let the rest be entered when the items are picked or packed. Serial numbers related to items in credit orders are entered when the items are received and before the credit memo is printed. However, to ensure consistency between the information in this workspace and on warehouse transactions/picking lists, the existence of a warehouse transaction or picking list prevents you from entering serial number information for

that order in this workspace until a packing list has been created, causing this workspace to be updated with any serial number information reported during the warehouse transaction/picking procedure.

Maconomy automatically creates serial number lines that display the relevant quantity for items that use standard serial numbers. This is only the case, however, if you select the **Extended Serial Number Control** system parameter. When creating an order line in the Sales Orders and Credit Orders workspaces, Maconomy checks whether a standard serial number for sales from the current warehouse has been entered in the item's information card. If this is the case, Maconomy creates a serial number line in this workspace with the standard serial number and the quantity to be packed or to be credited entered on the order line. This automatic line creation also occurs for quote lines when the quote is converted to a sales order. If one serial number entry line exists for the current order line, and the quantity in the **Quantity** field on the current serial number entry line corresponds to the quantity to be packed or credited on the order line, Maconomy automatically updates the quantity on the serial number entry line, if the quantity to be packed or credited is changed on the sales order or credit order. However, if a packing list has been created, Maconomy updates the serial number entry line with the quantity packed. Consequently, it is not necessary to enter serial number entries manually for items that use a standard serial number. If multiple serial number lines exist for the order line, or the quantities on the order line/packing list line and the serial number entry line do not correspond, Maconomy does not update the quantity, which you must therefore enter manually in this workspace.

When you create a packing list for the current order, some cases may cause the automatic creation of lines in this workspace. This procedure is described in the section "Print Packing List."

If the serial numbers are reported when the warehouse personnel reports back on the packing list, the warehouse staff uses this workspace as a supplement to the Packing Lists workspace, when they have packed items that have serial number control. The serial number is then recorded every time an item that has serial number control is packed.

After you approve the packing list, you can use the Packing Lists workspace to print documents related to the delivery of the packed items, such as a packing slip, invoice, labels, and/or bill of lading. The packing slip shows the number of every serial number delivered of an item that has serial number control.

## Serial Number Entry Tab

This section includes the fields and descriptions for the Serial Number Entry tab.

### Order Line Island

Field	Description
<b>Order No.</b>	This is the number of the sales order or credit order from which the item line originates. The combination of order number and line number identifies the item line. You cannot change an order number here.
<b>Line No.</b>	This is the item line's line number on the sales order or credit order. The combination of order number and line number identifies the item line. You cannot change a line number here. Note, that you can also see item lines with items which do not have serial number control. However, you cannot assign the serial numbers in the table to an item line with an item which does not have serial number control.

Field	Description
<b>Order Type</b>	This is the order type. It is either a sales order or credit order.

**Item Island**

Field	Description
<b>Item No.</b>	This is the item line's item number.
<b>Description</b>	This is the item text.
<b>External Desc.</b>	This is the external item text.
<b>Internal Desc.</b>	This is the internal text.
<b>Item Group</b>	This is the item group to which the item belongs.
<b>Item Type</b>	This is the item type.
<b>Unit</b>	This is the unit in which the item is being sold.

**Number, Sales Order Island**

Field	Description
<b>Ordered</b>	If the item line is from a sales order, this field shows how many units of the item were ordered.
<b>For Packing</b>	If the item line is from a sales order, this field shows how many units of the item are to be packed in the next delivery.
<b>Packed</b>	If the item line is from a sales order, this field shows how many units have been packed.

**Warehouse Island**

Field	Description
<b>Inventory Control</b>	This field is marked if the item on the line has inventory control.
<b>Warehouse</b>	This is the warehouse entered on the order and which the item is delivered from or returned to.
<b>Stock Location</b>	This shows the location to which the items on the line should be moved to be packed, or, in the case of credit orders, the location at which the

Field	Description
	returned items are received. The value is automatically suggested on new lines in the table part.
<b>Delivery Date</b>	This is the delivery date for the item line.

**Dimensions Island**

Field	Description
<b>Location</b>	This is the location retrieved from the "Location" field on the item line in the Sales Orders or Credit Orders window. You cannot change it here.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

**Number, Credit Order Island**

Field	Description
<b>Credit Order</b>	If the item line is from a credit order, this field shows how many units of the item are being credited.
<b>Returned</b>	If the item line is from a credit order, this field shows how many units of the item are being returned.

**Price Island**

Field	Description
<b>Price Control</b>	This field is marked if the item has price control.
<b>Unit Price</b>	This is the unit price of the item line.
<b>Pricing Unit</b>	This is the item's pricing unit, that is, the number of units contained in one unit price of the item. This applies to sales prices, costs, weight and volume.

Field	Description
<b>Extended Price</b>	This is the extended price, which is found by multiplying the number of units on the line by the unit price and then dividing by the pricing unit. A line discount is then deducted, if applicable.

**Price List Island**

Field	Description
<b>Price List</b>	This is the name of the price list the item is priced by, if applicable. If the price is not from a price list, or if the item is a BOM without price control, the field is blank.
<b>Price Step</b>	This is the price list step the item is priced by.
<b>Price at Step 1</b>	This is the price of one pricing unit in the price list used on the sales or credit order.

**Discount Island**

Field	Description
<b>Quantity Disc.</b>	This discount is the difference between the price on step 1 of the price list and the actual unit price, multiplied by the number of units of the item and divided by the pricing unit.
<b>Discount %</b>	This is the discount % on the item line.
<b>Discount</b>	This is the discount amount on the item line.
<b>Discount Desc.</b>	This is the discount text entered on the order.

**General Island**

Field	Description
<b>Weight</b>	This is the item's weight per pricing unit.
<b>Volume</b>	This is the item's volume per pricing unit.
<b>Tax Code</b>	This is the tax code used for calculating sales tax on the item. If multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2" and, if three tax levels are enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."

Field	Description
<b>Sales Price Costing</b>	This field is marked if the item on the item line has sales price costing.

### Serial Numbers Sub-Tab

This section includes the fields and descriptions for the Serial Numbers sub-tab.

Field	Description
<b>Serial No.</b>	<p>In this field, you can enter the serial number of the units of the item, if the item has serial number control. You must give a serial number, which is assigned to this item number in the Serial Number Information window in the Inventory module. Maconomy alerts you if you enter a serial number which does not exist or is assigned to another item.</p> <p>If the serial number in question has not yet been registered in the system, for example, if the current line pertains to a sales order and the item in question uses serial number registration at shipping only, you must enter the serial number in the field "New Serial No." instead.</p> <p>If the item is a BOM without inventory control, you can enter the serial number of an article of one of the BOM parts with serial number control. If the BOM has several levels, you must enter the serial number for the BOM part on the highest level with inventory control.</p> <p>The serial number is printed on the packing slip.</p>
<b>New Serial No.</b>	<p>In this field, you can enter a new serial number if the serial number in question has not yet been registered in the system. This can, for example, be the case if the current line pertains to a sales order and the item in question uses serial number registration at shipping only, as this means that serial numbers are not known until they are shipped. When you enter a new serial number in this field, Maconomy automatically creates a line with the specified serial number in the window Serial Number Information.</p> <p>Maconomy alerts you if the serial number already exists in the system, and you must then enter the number in the field "Serial No." instead.</p> <p>If the item is a BOM without inventory control, you can enter the serial number of an article of one of the BOM parts with serial number control. If the BOM has several levels, you must enter the serial number for the BOM part on the highest level with inventory control.</p> <p>The serial number is printed on the packing slip.</p>
<b>Item No.</b>	<p>In this field, you can specify the item number whose serial number you wish to register on the current line. If the item in the card part has inventory control, you must enter the same number as shown in the field "Item No." in the card part. If the item in the card part is a BOM without inventory control, you can specify the number of an item on the highest level with inventory control in the BOM list.</p>
<b>Quantity</b>	<p>In this field, you can enter the quantity to be delivered of the current serial number. If the system parameter "Extended Serial Number Control" is selected,</p>

Field	Description
	Maconomy will automatically update this field when the following fields are changed: quantity to be packed in the window Sales Orders, quantity to be returned in the window Credit Orders, or the quantity packed in the window Packing Lists, as long as only one serial number entry line exists for the order line in question, and as long as the quantity in the field "Quantity" corresponds to the quantity packed or returned.
<b>Delivered</b>	<p>This field shows the quantity of the current serial number delivered.</p> <p>If the serial number pertains to a sales order, Maconomy will update this field when a packing slip is created for the order. Maconomy updates the Serial Number Information window by deducting the approved quantity from the warehouse and transferring information about customer, order and packing slip.</p> <p>If the serial number was returned on a credit order, Maconomy will update the quantity when the credit memo is printed. Next, Maconomy adds the quantity to the warehouse and resets the customer, sales order and packing slip information.</p>
<b>Stock Location No.</b>	This field shows the location to which the current serial number should be moved for packing and delivery, or, in the case of credit orders, the location at which the returned items are received. If the serial number entry is made for a sales order, Maconomy suggests the location shown in the card part of the window, but you can specify another location for each individual line.
<b>Production Date</b>	This field shows the production date for the current serial number. The production date is retrieved from the window Serial Number Information and cannot be changed here.
<b>Sell-by Date</b>	This field shows the sell-by date of the current serial number. The date is retrieved from the window Serial Number Information and cannot be changed here. Please note that the date is for information only and has no influence on the validity of the serial number.
<b>Expiry Date</b>	This field shows the expiry date of the current serial number. The date is retrieved from the window Serial Number Information and cannot be changed here. Please note that the date is for information only and has no influence on the validity of the serial number.
<b>Serial No. Text 1-5</b>	In these fields, you can enter a number of remarks regarding the current serial number entry line. Maconomy suggests the texts from the window Serial Number Information, but you can change the texts in these fields.
<b>Cost</b>	This field shows the cost of the current serial number. The cost is retrieved from the window Serial Number Information and cannot be changed here. If the serial number was created from an item receipt in the window Item Receipt, the cost in this field corresponds to the purchase price on the item receipt. If the serial number was created from an inventory change in the window Inventory Change, the cost in this field corresponds to the cost entered on the inventory change. The field enables you to keep statistics on losses and gains of individual serial numbers. The field does not, however, have any bookkeeping significance, as Maconomy is using the cost at the warehouse in question as

Field	Description
	specified in the table part of the item's information card for calculating cost of goods sold when the serial number is sold. The field is thus for information only.

## Back Order Register Workspace

Use this workspace to view the order lines that Maconomy transferred from sales orders for which you selected **Transfer** in the **Back Order Handling** field.

The information is displayed by customer. The Back Order Register tab displays selected customer information, and the Order Lines sub-tab displays the transferred order lines.

Maconomy transfers backorders from a sales order to the backorder register when you make a delivery (that is, print a packing slip), and the quantity that was delivered is less than the quantity that was ordered. The quantity delivered is subtracted from the quantity ordered, and Maconomy creates a line in the backorder register that indicates how much remains to be delivered, how much was ordered, the quantity delivered up to now, the original sales order line, and the price calculation.

You can transfer order lines in the backorder register to a sales order by selecting the **Back Order Handling** field in the Sales Orders workspace. Then, when you use the **Print Picking List** action in the Sales Orders workspace, Maconomy transfers lines that are entered to the ship-to customer on the sales order. However, Maconomy only transfer lines that have the same currency and can be delivered on the sales order. Similar functionality applies if you use the **Create Packing List** action in the Sales Orders workspace without first creating a warehouse transaction or picking list. For more information on this process, see the **Print Picking List** and **Print Packing List** actions in the Sales Orders workspace.

You can also transfer backorder lines to sales orders from this workspace using the **Assign to Sales Orders** action, in which case Maconomy tries to find suitable orders for the items on backorder.

You can delete lines one at a time using the Index menu, but you can also delete several lines at a time by selecting them as blocked and using the **Delete Blocked Lines** action in the Action menu.

If the transferred order line is an itemized BOM, you can see the BOM lines in the Order Lines workspace.

### Back Order Register Tab

This section includes the fields and descriptions for the Back Order Register tab.

#### Ship to Customer Island

Field	Description
<b>Customer</b>	This is the number of the customer who is receiving the items in the back order. It cannot be changed here. The remaining lines of this field show the name and address of the ship-to customer. The text is retrieved from the Customer Information Card window and cannot be changed here.

Field	Description
<b>Attn.</b>	This is the attention person with the ship-to customer. The name is retrieved from the Customer Information Card window and cannot be changed here.
<b>Country</b>	This is the country of the ship-to customer. It is retrieved from the Customer Information Card window and cannot be changed here.
<b>Phone</b>	This is the ship-to customer's telephone number. It is retrieved from the Customer Information Card window and cannot be changed here.
<b>Fax</b>	This is the ship-to customer's fax number. It is retrieved from the Customer Information Card window and cannot be changed here.
<b>Telex</b>	This is the ship-to customer's telex number. It is retrieved from the Customer Information Card window and cannot be changed here.
<b>E-mail</b>	This is the ship-to customer's e-mail address. It is retrieved from the Customer Information Card window and cannot be changed here.
<b>Contact Person</b>	This is the contact person with the ship-to customer. It is retrieved from the Customer Information Card window and cannot be changed here.
<b>Language</b>	This is the ship-to customer's language. The name is retrieved from the Customer Information Card window and cannot be changed here.
<b>Currency</b>	This is the currency normally used for the ship-to customer. It is retrieved from the Customer Information Card window and cannot be changed here.
<b>Customer Group</b>	This is the customer group that the ship-to customer belongs to. It is retrieved from the Customer Information Card window and cannot be changed here.
<b>Department</b>	This is the department that the ship-to customer is primarily assigned to. It is retrieved from the Customer Information Card window and cannot be changed here.

#### Bill to Customer Island

Field	Description
<b>Bill to Customer</b>	This is the number of the bill-to customer assigned to the ship-to customer. The number is retrieved from the bill- to customer's information card and cannot be changed here. The remaining lines of this field show the name and address of the bill-to customer. The text is retrieved from the Customer Information Card window and cannot be changed here.
<b>Attn.</b>	This is the attention person with the bill-to customer. The name is retrieved from the Customer Information Card window and cannot be changed here.
<b>Country</b>	This is the country of the bill-to customer. It is retrieved from the Customer Information Card window and cannot be changed here.

**Delivery Island**

Field	Description
<b>Warehouse</b>	This field shows from which warehouse the ship-to customer normally receives items. It is retrieved from the Customer Information Card window and cannot be changed here.
<b>Delivery Terms</b>	This field shows the delivery terms normally applied to this ship-to customer. It is retrieved from the Customer Information Card window and cannot be changed here.
<b>Delivery Mode</b>	This field shows the delivery mode normally used for sales to this ship-to customer. It is retrieved from the Customer Information Card window and cannot be changed here.
<b>Carrier</b>	This field shows which carrier is normally used for sales to this customer. It is retrieved from the Customer Information Card window and cannot be changed here.

**Order Information Island**

Field	Description
<b>Back Order Handling</b>	This field shows which method is normally used for handling back orders to the customer. It is retrieved from the Customer Information Card window and cannot be changed here.
<b>Sales Rep.</b>	This field shows the number of the sales person who is responsible for the customer. It is retrieved from the Customer Information Card window and cannot be changed here.

**Settling Company Island**

Field	Description
<b>Company No.</b>	This field shows the number of the settling company specified on the information card of current customer. If no settling company has been specified for the customer, the field is blank.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

**Order Lines Sub-Tab**

This section includes the fields and descriptions for the Order Lines sub-tab.

Field	Description
<b>Orig. Order No.</b>	This is the number of the sales order the line was transferred from first time.
<b>Orig. Line No.</b>	This is the number of the sales order line the line was transferred from first time.

Field	Description
<b>Item No.</b>	This is the number of the item.
<b>Orig. Ordered</b>	This is the quantity originally ordered before the sales order line was transferred to the back order register.
<b>Deliv. to Date</b>	This is the total quantity delivered since the sales order line was created.
<b>Ordered</b>	This is the quantity which was not delivered last time items were delivered to the customer. When the back order line is transferred to the sales order, the quantity here will be transferred to the sales order line. It can be changed.
<b>Blocked</b>	Mark this field to block the current back order line. When a back order line is blocked, it is ignored when running the actions "Assign to Sales Orders" and "Recalculate Delivery Dates." You can also use the field in combination with the action "Delete Blocked Lines" which will delete all back order lines with a mark in this field.
<b>Unit</b>	This is the unit the item is sold in. It is transferred from the sales order and cannot be changed here.
<b>Description</b>	This is the item text. It is transferred from the sales order and cannot be changed here.
<b>Note No.</b>	In this field, you can specify the number of a note to be assigned to the current line for further specification. The note number is transferred from the sales order, but you can change it here. Notes are created and edited in the window Notes in the Set-Up module.
<b>Note Description</b>	This field shows a description of the note specified in the field "Note No." above.
<b>External Desc.</b>	This is the external item text for the item. It is transferred from the sales order and cannot be changed here.
<b>Internal Desc.</b>	This is the internal item text for the item. It is transferred from the sales order and cannot be changed here.
<b>Extra Text 1-10</b>	These fields show the extra texts entered in the corresponding fields on the order line.
<b>Popup 1-5</b>	These fields show the values entered in the corresponding fields on the current order line.
<b>Orig. Quantity</b>	This field shows how many units of the current item were originally registered.
<b>Unit Price</b>	This is the unit price on the order line. It is transferred from the sales order and cannot be changed here. The unit price is not changed even though the quantity in the "Ordered" field is changed.
<b>Discount %</b>	This is the discount percent on the line, if applicable. It is transferred from the sales order and cannot be changed here.

Field	Description
<b>Discount</b>	This is the discount amount calculated from the above percentage.
<b>Extended Price</b>	This is the extended price, which is found by multiplying the quantity ordered by the unit price and then dividing it with the pricing unit. It also includes a possible line discount.
<b>Currency</b>	This is the currency used on the line. It is transferred from the sales order and cannot be changed here.
<b>Order No.</b>	This is the number of the sales order from which the line was transferred. It can be different from the number in the "Orig. Order No." field, if it has been transferred back to the back order register.
<b>Deliv. Date</b>	<p>This is the delivery date. The delivery date can be changed as you please. If the delivery date is changed to an earlier date, Maconomy checks if the item can be delivered on this date. If this is not the case, the date will automatically be changed to the date on which the item can be delivered. If you want to update the delivery date so that it reflects the latest developments in availability (for instance changes in the expected date of receipt of purchased items), you can delete the date in the field and press Enter. Maconomy will then calculate the earliest possible delivery date based on delivery time, the current purchase, production and order volumes, and quantity in stock. However, whether you enter an earlier date or a blank value, the original date will be kept (that is, the date registered before the change was made) if the date found during the search is later than the original date.</p> <p>You can also select the action "Update Delivery Dates" to recalculate the delivery date on all the lines in the back order register, or use the window Update Back Orders to update delivery dates on a range of back order lines. When delivery dates are changed in batch, the affected lines are re-reserved, and lines concerning the same item are prioritized based on their current delivery dates. In this case, however, Maconomy does not keep the original delivery date in case the search results in a later date.</p>
<b>Remarks</b>	This field shows any remarks about the delivery. It is transferred from the sales order and cannot be changed here.
<b>Discount Desc.</b>	This is the discount text from the order line from which the current line was transferred. The text cannot be changed here.
<b>Pricing Unit</b>	This is the number of units of the item, which are included in the unit price. It is transferred from the sales order and cannot be changed here.
<b>Price List</b>	This is the price list which the item line on the sales order was priced from, before it was transferred to the back order register. It is transferred from the sales order and cannot be changed here.
<b>Price Step</b>	This is the price step the item line on the sales order was priced from, before it was transferred to the back order register. It is transferred from the sales order and cannot be changed here.

Field	Description
<b>Price at Step 1</b>	This is the price of one pricing unit of the item, if the line is assigned to a price list, and if the item is priced in this price list. If you are not using a price list, or if the item is not in the price list, the value here will be the same as the unit price. It cannot be changed here.
<b>Quantity Disc.</b>	This is the discount amount, which is the difference between the price at step 1 and the unit price, multiplied by the number of units and divided by the pricing unit. As a rule, this amount is the total quantity discount on the item line. It cannot be changed here.
<b>Bill of Materials</b>	This shows whether the item is a standard item or a bill of materials. If the field is marked, it is a BOM. You can see the individual items in the BOM in the window Order Lines, if the BOM was specified when the original sales order was created. You determine whether to specify BOMs in the BOM Information Card in the Inventory module.
<b>Settling Company No.</b>	This field shows the number of the settling company which applies to the order from which the back order line originates.
<b>Company No.</b>	This field shows the number of the company responsible for the sales order from which the back order line originates.
<b>Location</b>	In this field, you can enter a location created in the window Locations. The value is transferred from the window Sales Orders, but you can change it here.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Warehouse</b>	This is the warehouse entered on the order and which the item is delivered from or returned to.
<b>Stock Location No.</b>	In this field, you can specify a stock location in the current warehouse from which the items are shipped. This location will apply to those lines in the table part where the stock location field is left blank. If a stock location is specified on a given line, it overrules any location specified in this field. When you create an invoice, Maconomy suggests the standard shipping location specified for the selected warehouse, but you can specify another location.

Field	Description
<b>Last Deliv. Date</b>	This is the date items were last delivered to the customer. It is transferred from the sales order and cannot be changed here.
<b>Latest Promised Deliv. Date</b>	Here you can enter the date you promised to deliver by. The value is transferred from the window Sales Orders, but you can change it here.
<b>Confirmed Delivery Date</b>	In this field, you can enter the last date which has been communicated to the customer as the delivery date. In other words, This is the date the customer has been informed is the delivery date of the items on the line. By comparing the date in this field with the one in the field "Deliv. Date" on the line, you can determine whether the customer needs to be informed of any delivery date changes.
<b>Vendor</b>	In this field you can enter a vendor number. The vendor is used when creating purchase orders in the window Sales Order to Item Purchase Orders. The default value is the vendor number from the item information card, if a vendor has been specified for the item.
<b>Customer's Item Purchase No.</b>	This field shows the customer's item purchase order number, if the original sales order was based on an item purchase order from the customer. It is transferred from the sales order and cannot be changed here.
<b>Campaign No.</b>	In this field, you can enter the number of a campaign if the current sales order is connected to a certain campaign in the Contact Management module. If you enter a campaign number, Maconomy transfers the number to lines that are then created in the table part. The campaign number can be used for, for example, statistical purposes.

## Actions

This section shows the Actions available in the Back Order Register workspace.

### Top Tab

Field	Description
<b>Recalculate Delivery Dates</b>	<p>Using this action, you can update the delivery dates on the back order lines so that they reflect the latest developments in availability (for instance changes in the expected availability date of purchased items).</p> <p>For each line, Maconomy calculates the earliest possible deliver date based on delivery time, inventory profile, the current purchase, production and order volumes, and quantity in stock. Blocked lines are ignored in this process. Please note that for each line, this can result in a later delivery date, as the items on the order are re-reserved as if they were lines being created, while all other item reservations in the system keep their reservation and thereby have first priority.</p> <p>You can also use the window Update Back Order Register to update delivery dates on a range of back order lines. When delivery dates are changed in</p>

Field	Description
	batch, the affected lines are reserved, and lines concerning the same item are prioritized based on their current delivery dates.
<b>Assign Lines to Sales Orders</b>	<p>This action is used for assigning back order lines to suitable sales orders. The action only affects lines that are not blocked. When you select the action, Maconomy will try to assign each of the lines in the current customer's back order register to an order that meets the line's requirements with regards to, for example, delivery information. If there are lines whose information makes them incompatible with existing orders, Maconomy will create orders for these lines. For each line, Maconomy runs the following procedure to find a suitable sales order:</p> <p>Maconomy first recalculates the delivery date of the line using the method described for the action "Update Delivery Dates."</p> <p>Next, Maconomy checks if a destination has been specified for the company specific customer in question.</p> <p>If it has, Maconomy identifies the earliest consignment going to this destination which has a packing date on or after the updated delivery date on the line. The consignment can either be an existing one or one that can be created automatically. Next, Maconomy looks for an approved blanket order (an order with the field "Blanket Order" marked) which has been assigned to this consignment, has not had any items delivered, picked or packed, and is not ready for delivery. If such an order exists, Maconomy transfers the line to the order. If no such order exists, Maconomy creates an order, assigns it to the consignment, and transfers the line to it.</p> <p>If no destination has been specified for the company specific customer, Maconomy looks for an approved blanket order where no destination has been specified, and on which delivery has not yet taken place. If such an order exists, Maconomy transfers the line to the order. If no such order exists, Maconomy creates an order and transfers the line to it.</p> <p>For further information about how Maconomy assigns lines to consignments, see Appendix B: Assign to Consignment.</p>
<b>Delete Blocked Lines</b>	When you select this action, Maconomy removes all lines in the table part where the field "Blocked" has been marked.

## Update Back Order Register Workspace

Use this workspace to update selected backorder registers.

## Update Back Order Register Tab

This section includes the fields and descriptions for the Update Back Order Register tab.

### Selection Criteria Island

Field	Description
<b>Customer No.</b>	In this field, you can specify a range of customer numbers. The update will only include back order lines belonging to customers whose number is within the specified range.
<b>Delivery Date</b>	In this field, you can specify a range of delivery dates. The update will only include back order lines whose delivery date is within the specified range.
<b>Item No.</b>	In this field, you can specify a range of item numbers. The update will only include back order lines for items whose number is within the specified range.

### Update Island

Field	Description
<b>Update Item Reservations</b>	Mark this field if you want to update the delivery dates on the back order lines matching the selection criteria. The delivery dates are updated as described for the action "Update Delivery Dates" in the window Back Order Register, but instead of just updating and re-reserving one line at a time causing each line to lose its current reservation priority, all affected lines are rereserved, and lines concerning the same item are prioritized based on their current delivery dates. This results in a fairer rereservation, as lines with earlier delivery dates are more likely to benefit from items received earlier than expected.
<b>Assign to Sales Orders</b>	Mark this field if you want Maconomy to assign back order lines to suitable sales orders. If you mark the field, Maconomy will try to find a suitable sales order for each back order line matching the selection criteria. To do this, Maconomy uses a process corresponding to the one described for the action "Assign to Sales Orders" in the window Back Order Register. However, instead of running the process on the lines belonging to a given customer, Maconomy runs the process on all lines matching the selection criteria.
<b>Delete Blocked Lines</b>	Mark this field if you want to delete all blocked back order lines matching the selection criteria.

## Actions

This section shows the Actions available in the Update Back Order Register workspace.

### Top Tab

Field	Description
<b>OK</b>	Click OK to execute the selected updates.

## Item Allocation Workspace

Use this workspace to reallocate the number of items to pack on a number of order lines that are assigned to a specific item.

The Item Allocation tab displays the current item that is involved in the reallocation, as well as the selection criteria that determine the lines that the Order Lines sub-tab displays.

The Order Lines sub-tab displays all of the order lines that have the current item number that have not been fully delivered. However, if you select the **Only Include Back Orders** field, the sub-tab only shows order lines to which items on backorder are assigned. Thus, Maconomy does not include order lines from which no deliveries have been made in the list.

### Item Allocation Tab

This section includes the fields and descriptions for the Item Allocation tab.

#### Item Island

Field	Description
<b>Item No.</b>	This field shows the number of the current item, as well as the description of the item. The value of this field cannot be changed here.
<b>Unit</b>	This field shows the unit which is applied to the current item. The value of this field cannot be changed here.
<b>Pricing Unit</b>	This field shows the number of units of the item included in the stated unit price. The value of this field cannot be changed here.
<b>BOM</b>	This field is marked if the current item is part of a BOM. The value of this field cannot be changed here.
<b>Stock on Hand</b>	This field shows the total quantity of the current item in the warehouse selected in the island Selection Criteria. The value of this field cannot be changed here.
<b>Available</b>	This field shows the available quantity of the current item in the warehouse selected in the island Selection Criteria. The value of this field cannot be changed here.

Field	Description
<b>For Packing, Total</b>	This field shows the total quantity of the current item set for packing, calculated as the sum of the quantities stated in the fields "For Packing" in the table part of the window.

#### Selection Criteria Island

Field	Description
<b>Deliv. Date</b>	In these fields, you can specify a range of delivery dates. The standard value of both fields is the current date. This means that by default, the table part will only show order lines that are to be delivered on the current date.
<b>Warehouse</b>	In this field, you can select the warehouse that is related to the reallocation. The field must be completed.
<b>Customer No.</b>	In this field, you can specify a range of customer numbers.
<b>Company No.</b>	In this field, you can enter a range of company numbers. Only lines from sales orders for which companies within the specified range are responsible are shown in the table part.
<b>Only Include Back Orders</b>	<p>Mark this field if you only wish to see back order lines and order lines on which the number of undelivered items is greater than zero. The field is marked by default.</p> <p>If the field is not marked, the table part will show all order lines of the types Sales Order and Back Order that fall within the selection criteria and on which the number of ordered items is greater than the number of delivered items.</p>

#### Order Lines Sub-Tab

This section includes the fields and descriptions for the Order Lines sub-tab.

Field	Description
<b>Order No.</b>	This field shows the number of the order on which the current item is registered.
<b>Line No.</b>	This field shows the number of the current line.
<b>Customer No.</b>	This field shows the number of the customer who placed the current order.
<b>Name</b>	This field shows the name of the customer.
<b>Quantity</b>	This field shows the quantity of items ordered. The value of this field cannot be changed.

Field	Description
<b>For Packing</b>	In this field, you can state the quantity of items set for packing.
<b>Delivered</b>	This field shows the quantity of items delivered.
<b>Unit Price</b>	This field shows the unit price of the item on the current line.
<b>Discount %</b>	If a discount percentage has been entered on the current order line, it is shown here.
<b>Discount</b>	This field shows the discount amount calculated for the item in the field "Item No." in the island Item.
<b>Deliv. Date</b>	This field shows the delivery date of the current order line.
<b>Deliv. Remarks</b>	If a remark regarding the delivery has been entered, it is shown here.
<b>Discount Desc.</b>	This field shows a discount description if a discount has been granted.
<b>External Desc.</b>	This field shows the external description of the item. The description is only used on external printouts.
<b>Internal Desc.</b>	This field shows the internal description of the item.
<b>Price List</b>	This field shows the price list which is used on the current order line.
<b>Price Step</b>	This field shows the price step used on the current order line.
<b>Location</b>	This field shows the value specified for the dimension Location on the current order line.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Last Deliv. Date</b>	This field shows the date of the last delivery.

Field	Description
	Latest Promised Deliv. Date This field shows the date by which delivery must take place.
<b>Currency</b>	This field shows the currency used in the order line.
<b>Customer's Item Purchase No.</b>	This field shows the purchase number of the customer.
<b>Company No.</b>	This field shows the number of the company responsible for the order to which the order line is assigned.

## Actions

This section shows the Actions available in the Item Allocation workspace.

### Top Tab

Field	Description
<b>Reset for Pack</b>	When you select this action, the quantity of items in the field "For Packing" in the table part will be reset on all shown table lines with the item number which is shown in the card part of the window.
<b>Allocate for Pack</b>	<p>When you select this action, the stock in the warehouse of the current item will be allocated in the field "For Packing" on the related order lines. Stock is calculated as the actual stock minus the quantity of items already set for packing on the shown lines.</p> <p>The allocation of items for packing will be made according to the delivery date, the earliest delivery date preceding, until either the whole stock has been allocated or the total quantity of ordered items on all lines has been allocated.</p> <p>The maximum quantity of items set for packing is the difference between the quantity of items ordered in the field "Quantity" and the quantity of items stated in the field "Delivered."</p>

## Bar Code Entries Workspace

Use this workspace to import and process electronic entries of delivered and returned items.

You typically perform the entries using a bar code scanner that reads data as items are delivered and returned.

At regular intervals, Maconomy collects this data in a document that has a fixed format. You can import this data using the **Import Bar Codes** action. The bar code entry is imported regardless of whether the items, orders, or jobs already exist in Maconomy. In the System Information workspace you can specify whether to create a single bar code entry for each bar code that is read, or to create a bar code entry for each delivery or item return in an order or job.

After importing the data, you validate that the imported items, orders, and job numbers were created in Maconomy by using the **Validate Transaction** action. You can also edit the imported data, if an entry was imported incorrectly or omitted.

You approve a bar code entry using the **Approve Transaction** action, which transfers the lines from the entries to the specified orders or job orders. If you select the **New Ord. when Transf. to Sales** field in the System Information workspace, when you approve bar code entries that are linked to a job Maconomy creates an order. When you perform the approval, Maconomy sets the **For packing** field to zero for all related order lines. Then Maconomy prints out the returns lists and packing slips for the returned and delivered items. Finally, Maconomy selects the maximum quantity of the items that are not affected by the transferal for packing.

## Bar Code Entries Tab

This section includes the fields and descriptions for the Bar Code Entries tab.

### Declaration Island

Field	Description
<b>Transaction No.</b>	This field shows the number of the bar code entry. When you create a bar code entry, either by importing bar codes or manually in this window, it is given the next available number from the "Bar Code Entry" system number series. These are edited in the Numbers window in the Set-Up module.
<b>Bar Code Scanner</b>	Here you can enter the identification of the bar code scanner or the person who made the delivery or return.

### Status Island

Field	Description
<b>Validated</b>	This shows whether the bar code entry is validated. When it is validated, Maconomy verifies that the item, job and order number is created in the system.
<b>Approved</b>	This shows whether the bar code entry is approved. When it is approved, Maconomy transfers the bar code lines to sales and credit orders and prints delivery and return notes.

### Company Island

Field	Description
<b>Company No.</b>	<p>In this field, you can enter the number of the company responsible for the bar code entry. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>See the section "Multiple Companies" in the chapter "Introduction to the G/L Module" for a further description of the concept of responsible companies.</p> <p>This field also shows the name of the specified company.</p>

**User Island**

See the chapter “Getting Started” for a description of the fields in the island User.

**Lines Sub-Tab**

This section includes the fields and descriptions for the Lines sub-tab.

Field	Description
<b>Requisitioner</b>	Here you identify the person to whom the item is delivered (or received).
<b>Deliv./Return</b>	Here you designate whether the line is a delivery or a return. When approved, deliveries are transferred to sales orders and returns are transferred to credit orders.
<b>Order No.</b>	Here you can enter the number of the sales order or credit order to which the bar code line is to be transferred. You can either enter the order number here or a job number in the “Job No.” field below. You can only complete one of these fields.
<b>Job No.</b>	Here you can enter the number of the job the bar code line relates to. You can either enter a job number here or an order number in the “Order No.” field above. You cannot complete both fields.  If you enter a number here, you must also enter an activity number in the “Activity No.” field.
<b>Activity No.</b>	Here you must enter the number of an amount activity, if the bar code line relates to a job, whose number is entered in the “Job No.” field.
<b>Task</b>	In this field you can enter the name of a task, if the sales order is linked to a job.
<b>Item No.</b>	Here you must enter the number of the item which is being delivered or returned.
<b>Description</b>	This is the description of the item. It is retrieved from the “Description Lang. 1” field in the Item Information Card window, but it can be changed here.
<b>Serial No.</b>	Here you must enter the serial number of the delivered or returned item, if it has serial number control.
<b>Quantity</b>	Here you must enter the quantity delivered or returned.
<b>Stock Location No.</b>	In this field, you can specify a stock location for the current line. If the line is a delivery, this is the location from which the items on the current line are to be shipped. If the line is a return, this is the location at which the items on the current line are received. The value is transferred to the relevant order line when the entry is approved. If you leave this field blank, Maconomy transfers the blank value to the order line which is created or updated from the bar code entry and attempts to derive a location from the information card of the item on the line as described in the field “Stock

Field	Description
	Location No.” in the table part of the window Sales Orders or Credit Orders, depending on whether the line is a delivery or return.
<b>Customer Name</b>	This field shows the name of the customer the order or job is for.
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the field “Location” in the card part of the window.</p> <p>See the section on dimension derivation in the chapter “Introduction to the G/L module” as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field “Location” above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field “Location” above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field “Location” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field “Location” above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field “Location” above.

## Print Packing List Workspace

Use this workspace to print packing lists in batches.

A packing list is a list of items to be packed and delivered with an indication of the locations at which they can be found. A sales order must be approved before you can print a packing list for it. You must confirm any existing packing list for the same sales order in the Packing Lists workspace before you can print a new one.

If you create many sales orders every day and perform many deliveries, it is convenient to print the packing lists in one operation. You can do this by entering a range of order numbers in this workspace.

In the Sales Orders workspace, you can print a packing list immediately after you create or change a sales order by using the **Print Packing List** action. This enables you to deliver the items at short notice.

You can also print packing lists for sales orders that have item lines to be delivered within a range of delivery dates. This means that you can give notice to warehouse employees, who can then schedule work shifts accordingly.

Maconomy ignores packing lists for blocked sales orders and cannot print them until you revoke the blocking the Unblocking workspace. Similarly, Maconomy ignores orders that have blocked lines and orders for customers who have been blocked or blocked for delivery. In the case of orders that do not have partial delivery, Maconomy skips orders where not all of the items are set for packing.

## Print Packing List Tab

This section includes the fields and descriptions for the Print Packing List tab.

### Selection Criteria Island

Field	Description
<b>Order No.</b>	In this field, you can specify a range of order numbers. Maconomy will only create and print packing lists for sales orders within this range.
<b>Company No.</b>	In this field, you can specify a range of company numbers. Maconomy will only create and print packing lists assigned to sales orders for responsible companies within the specified range.
<b>Packing Date</b>	In this field, you can specify a range of packing dates. Maconomy will only create and print packing lists for sales orders assigned to a consignment with a packing date within this range.
<b>Consignment No.</b>	In these fields, you can specify a range of consignment numbers. Maconomy will only create and print packing lists for sales orders assigned to a consignment within the specified range.
<b>Destination No.</b>	In these fields, you can specify a range of destination numbers. Maconomy will only create and print packing lists for sales orders with a destination number within the specified range.
<b>Consignment Date</b>	In these fields, you can specify a range of consignment dates. Maconomy will only create and print packing lists assigned to sales orders assigned to consignments with a consignment date within the specified range.
<b>Delivery Mode</b>	In this field, you can select a delivery mode. Maconomy will only create and print packing lists for sales orders with the selected delivery mode.
<b>Delivery Terms</b>	In this field, you can select a code for delivery terms. Maconomy will only create and print packing lists for sales orders with the selected delivery terms.
<b>Carrier</b>	In this field, you can select a carrier. Maconomy will only create and print packing lists for sales orders with the selected carrier.
<b>Order Mode</b>	In this field, you can enter an order mode. Maconomy will only create and print packing lists for sales orders with the selected order mode.
<b>Consignment Type</b>	In this field, you can select a consignment type. Maconomy will only create and print packing lists for sales orders with the selected consignment type.

Field	Description
<b>Main Order No.</b>	In these fields, you can specify a range of order numbers. Maconomy will only create and print packing lists for sales orders linked to a main order whose order number is within the specified range.
<b>Warehouse</b>	In this field, you can select a warehouse. Maconomy will only create and print packing lists for sales orders with items to be shipped from this warehouse. The pop-up field shows existing warehouses created in the window Warehouse Information Card.

### Print Control Island

Field	Description
<b>Incl. Printed</b>	In this field, you can specify to reprint packing lists which have already been created and printed, if they match the selection criteria. If you do not mark this field, packing lists will only be printed for sales orders that match the selection criteria and do not have a mark in the field "Printed" in the island Packing List in the window Order Status.
<b>Stock Location</b>	In these fields, you can enter a range of warehouse locations. The printout will only include sales orders on which the stock location in the card part is within the specified range.
<b>Pref. Delivery Date</b>	In these fields, you enter a range of delivery dates. The printout will only include sales orders on which the preferred delivery date in the card part is within the specified range.
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

### Actions

This section shows the Actions available in the Print Packing List workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print packing lists in batches.

## Print Packing Slip Workspace

Use this workspace to print packing slips that meet certain selection criteria.

For example, you can limit the printout to certain customer numbers and/or packing slip numbers. You can also reprint packing slips in batches, for example if a number of packing slips are lost or discarded because of a defective printer. You can also print out packing slips that have been

created but have not yet been printed, or create and print packing slips for a batch of approved orders.

Because the function of a packing slip is to substantiate that items have been shipped, no new shipment is entered when you do a reprint of the packing slip. The new printout is just a copy of the original printout.

In the Sales Orders workspace, you can create and print a packing slip immediately after you create a sales order. In the Warehouse Transaction and Picking Lists workspaces in the Inventory module, you can create and print a packing slip as documentation of your item delivery. You can only print the initial packing slip in one of these three ways.

If you release an order for invoicing in the Sales Orders workspace, Maconomy creates the packing slip but does not print it. The same applies if you do not select the **Approve Packing List in Two Steps** system parameter and you choose to approve a packing list instead of printing a packing slip in the Packing Lists workspace. Finally, you can select the **Create Packing Slips** field in this workspace to create packing slips for all approved, non-blocked orders that have no blocked lines in the selection criteria. However, Maconomy ignores orders for which the bill-to customer or any assigned consignment is blocked or blocked for delivery. Maconomy also ignores orders that you assign to a warehouse that has been set up to disallow negative stock (see the introduction to the Warehouse Information Card workspace) if they contain lines where the quantity to pack would cause the item stock to become negative. If the order's delivery status in the Order Status workspace is **Ready for Delivery**, the packing slip assumes the quantity that has been packed and confirmed on approved packing lists assigned to the order. If not, the packing slip assumes the quantity specified to be packed in the Sales Orders workspace.

When you create packing slips, the printout only shows those lines where the quantity that was ordered is greater than zero. However, if you select the **Include zero amount lines on printouts** system parameter, the printout also includes lines that have an ordered quantity of zero.

Note that the printout always leaves out lines where the quantity for packing is zero, whether or not you select the system parameter. However, Maconomy always includes text lines (lines where no item number has been entered), even though the quantity ordered and for packing on text lines is zero.

## Print Packing Slip Tab

This section includes the fields and descriptions for the Print Packing Slip tab.

### Selection Criteria Island

Field	Description
<b>Order No.</b>	Here you can enter a range of order numbers. The printout will only include packing slips for sales orders within the specified range.
<b>Packing Slip No.</b>	Here you can enter a range of packing slip numbers. The printout will only include packing slips with numbers within the specified range.
<b>Customer No.</b>	Here you can enter a range of customer numbers. The printout will only include packing slips for sales orders with a customer within the specified range.
<b>Delivery Date</b>	Here you can enter a range of delivery dates. The printout will only reprint packing slips with a delivery date within the specified range. If you have

Field	Description
	marked the field "Create Packing Slips," you will only include order lines from approved orders, for which the delivery date is within the specified range.
<b>Company No.</b>	In this field, you can enter a range of company numbers. The printout will only include packing slips assigned to orders for which companies within the specified range are responsible.
<b>Subscrip. Order No.</b>	In this field, you can specify a range of subscription order numbers. The printout will only include packing slips assigned to orders where the subscription order number is within the specified range.
<b>Subscription No.</b>	In this field, you can specify a range of subscription numbers. When creating packing slips, Maconomy will only create packing slips for orders for which the subscription number is within the specified range. The field is only taken into consideration when packing slips are being created, meaning that the field is ignored when printing packing slips that have already been created.
<b>Subscription Group</b>	In this field, you can select a subscription group. When creating packing slips, Maconomy will only create packing slips for orders assigned to the selected subscription group. The field is only taken into consideration when packing slips are being created, meaning that the field is ignored when printing packing slips that have already been created.
<b>Department</b>	Here, you can select a department. The printout will only include packing slips belonging to the selected department.
<b>Warehouse</b>	In this field, you can specify the warehouse that you wish to include on the printout. The field is blank by default. If a warehouse is selected, the printout will only include packing slips from the selected warehouse.
<b>Language</b>	Here you can select a language code. You will then only print packing slips with this code.
<b>Consignment No.</b>	In these fields, you can specify a range of consignment numbers. Maconomy will only create and print packing slips for sales orders assigned to a consignment within the specified range.
<b>Destination No.</b>	In these fields, you can specify a range of destination numbers. Maconomy will only create and print packing slips for sales orders with a destination number within the specified range.
<b>Consignment Date</b>	In these fields, you can specify a range of consignment dates. Maconomy will only create and print packing slips for sales orders assigned to consignments with a consignment date within the specified range.
<b>Delivery Mode</b>	In this field, you can select a delivery mode. Maconomy will only create and print packing slips for sales orders with the selected delivery mode.
<b>Delivery Terms</b>	In this field, you can select a code for delivery terms. Maconomy will only create and print packing slips for sales orders with the selected delivery terms.

Field	Description
<b>Carrier</b>	In this field, you can select a carrier. Maconomy will only create and print packing slips for sales orders with the selected carrier.
<b>Consignment Type</b>	In this field, you can select a consignment type. Maconomy will only create and print packing slips for sales orders with the selected consignment type.
<b>Main Order No.</b>	In these fields, you can specify a range of order numbers. Maconomy will only create and print packing slips for sales orders linked to a main order whose order number is within the specified range.

### Print Control Island

Field	Description
<b>Create Packing Slips</b>	If you mark this field, you will create packing slips for approved sales orders in the selection criteria for which packing slips have not yet been printed. This corresponds to selecting the action "Print Packing Slip" in the Sales Orders window for every one of the sales orders in the selection criteria. For further information on the exact effects of printing packing slips, you should therefore see the description of the action "Print Packing Slip"
<b>Do Not Print</b>	If you mark this field, the packing slips will not be printed. This means you can create a batch of packing slips without printing them.
<b>Incl. Printed</b>	<p>If you mark this field, you will print copies of packing slips which have already been printed and match the selection criteria. If you leave it blank, you will only print packing slips which are not marked in the "Printed" field.</p> <p>The "Printed" field is not marked if a packing slip has been created but not printed. This occurs when you use "Release to Invoice" or "Print Invoice" in the window Sales Orders, or "Approve Packing List" or "Print Invoice" in the window Packing Lists. It is also possible to remove the mark manually after the packing slip is approved. This allows you to reprint a number of packing slips which are not necessarily in any given range.</p>
<b>Layout</b>	<p>In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.</p> <p>If you have Maconomy's layout editing tools, you can add fields, such as price, recommended sales price, gross margin and price mark to the standard layout or any new layout. Recommended sales price is taken from the price list used for the sale, and the customer's gross margin in the case of resale is calculated from the recommended sales price. You can also show whether the price of the item is lower or higher than last time it was sold. It is shown as a plus or minus, and is based on the price shown in the Item Assortment window. In the Customer Information Card, you can specify whether to show prices and price marks on packing slips.</p>

## Actions

This section shows the Actions available in the Print Packing Slip workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print printing packing slips within the selection criteria.

## Print Returns List Workspace

Use this window to print returns lists in batches.

A returns list is an internal message to the warehouse that certain items will be returned from a customer in the near future. The list displays how many units of which items you expect to be returned. You can only print returns lists that are based on an approved credit order.

In the Credit Orders workspace, you can print a returns list immediately after you create or change a credit order using the **Print Returns List** action. This means the warehouse is notified immediately.

If you are handling many credit orders in a specific period, you can select to print the returns lists in one operation. In this workspace, you enter a range of credit orders, and Maconomy automatically prints all of the returns lists in the target group.

### Print Returns List Tab

This section includes the fields and descriptions for the Print Returns List tab.

#### Selection Criteria Island

Field	Description
<b>Credit Order No.</b>	Here you enter a range of credit order numbers. Maconomy prints returns lists for every approved credit order within in the range.
<b>Company No.</b>	In this field, you can enter a range of company numbers. The printout will only include return lists for approved credit orders for which companies within the specified range are responsible.
<b>Warehouse</b>	Here you can select a warehouse. Maconomy only prints returns lists for credit orders assigned to this warehouse.

#### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

## Actions

This section shows the Actions available in the Print Returns List workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print returns lists in batches.

## Print Bill of Lading Workspace

Use this workspace to print bills of lading in batches.

Bills of lading are assigned to deliveries. They display the order number, customer number, name, and address, as well as total weight and volume of the parcels in a delivery.

In the Packing Lists workspace you can print a bill of lading after you confirm a packing list. In this workspace you can enter a range of packing slip numbers, company numbers, and so on, and print several bills of lading in one operation.

### Print Bill of Lading Tab

This section includes the fields and descriptions for the Print Bill of Lading tab.

#### Selection Criteria Island

Field	Description
<b>Packing Slip No.</b>	In these fields, you can enter a range of packing slip numbers. Maconomy will only print bills of lading for deliveries whose packing slip number is within the specified range.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. Maconomy will only print bills of lading for deliveries based on packing slips on which the responsible company is within the specified range.  The responsible company on the packing slip is transferred from the sales order from which the packing slip originates.
<b>Consignment No.</b>	In these fields, you can specify a range of consignment numbers. Maconomy will only print bills of lading for deliveries whose packing slip is assigned to a consignment within the specified range.  The consignment number on the packing slip is transferred from the sales order from which the packing slip originates.
<b>Destination No.</b>	In these fields, you can specify a range of destination numbers. Maconomy will only print bills of lading for deliveries whose packing slip has a destination number within the specified range.  The destination number on the packing slip is transferred from the sales order from which the packing slip originates.

Field	Description
<b>Consignment Date</b>	<p>In these fields, you can specify a range of consignment dates. Maconomy will only print bills of lading for deliveries whose packing slip is assigned to a consignment with a consignment date within the specified range.</p> <p>The consignment date on the packing slip is transferred from the sales order from which the packing slip originates.</p>
<b>Delivery Mode</b>	<p>In this field, you can select a delivery mode. Maconomy will only print bills of lading for deliveries whose packing slip has the selected delivery mode.</p> <p>The delivery mode on the packing slip is transferred from the sales order from which the packing slip originates.</p>
<b>Delivery Terms</b>	<p>In this field, you can select a code for delivery terms. Maconomy will only print bills of lading for deliveries whose packing slip has the selected delivery terms.</p> <p>The delivery terms on the packing slip is transferred from the sales order from which the packing slip originates.</p>
<b>Carrier</b>	<p>In this field, you can select a carrier. Maconomy will only print bills of lading for deliveries whose packing slip has the selected carrier.</p> <p>The carrier on the packing slip is transferred from the sales order from which the packing slip originates.</p>
<b>Consignment Type</b>	<p>In this field, you can select a consignment type. Maconomy will only print bills of lading for deliveries whose packing slip has the selected consignment type.</p> <p>The consignment type on the packing slip is transferred from the sales order from which the packing slip originates.</p>
<b>Main Order No.</b>	<p>In these fields, you can specify a range of order numbers. Maconomy will only print bills of lading for deliveries whose packing slip is linked to a main order whose order number is within the specified range.</p>

### Print Control Island

Field	Description
<b>Layout</b>	<p>In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.</p>

## Actions

This section shows the Actions available in the Print Bill of Lading workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print bills of lading in batches.

## Print Label Workspace

Use this workspace to print labels in batches.

You assign labels to a quote, a sales order, or a credit order, and you usually print them in connection with a delivery. Each label supplies information about a quote or a sales order number, customer number, name, and address, and so on. Labels are attached to parcels for easy identification by the carrier.

In the Packing Lists workspace you can print labels immediately after you approve a packing list. In this workspace, you can print labels for several deliveries in one operation.

### Print Label Tab

This section includes the fields and descriptions for the Print Label tab.

### Selection Criteria Island

Field	Description
<b>Order No.</b>	In these fields, you can specify a range of sales order numbers. Maconomy will only print labels for quotes or orders within the specified range.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. Maconomy will only print labels for quotes or orders whose responsible companies are within the specified range.
<b>Consignment No.</b>	In these fields, you can specify a range of consignment numbers. Maconomy will only print labels for quotes and sales orders assigned to a consignment within the specified range.
<b>Destination No.</b>	In these fields, you can specify a range of destination numbers. Maconomy will only print labels for quotes and sales orders with a destination number within the specified range.
<b>Consignment Date</b>	In these fields, you can specify a range of consignment dates. Maconomy will only print labels for quotes and sales orders assigned to consignments with a consignment date within the specified range.
<b>Delivery Mode</b>	In this field, you can select a delivery mode. Maconomy will only print labels for quotes and sales orders with the selected delivery mode.

Field	Description
<b>Delivery Terms</b>	In this field, you can select a code for delivery terms. Maconomy will only print labels for quotes and sales orders with the selected delivery terms.
<b>Carrier</b>	In this field, you can select a carrier. Maconomy will only print labels for quotes and sales orders with the selected carrier.
<b>Order Mode</b>	In this field, you can enter an order mode. Maconomy will only print labels for quotes and sales orders with the selected order mode.
<b>Consignment Type</b>	In this field, you can select a consignment type. Maconomy will only print labels for quotes and sales orders with the selected consignment type.
<b>Main Order No.</b>	In these fields, you can specify a range of order numbers. Maconomy will only print labels for quotes and sales orders linked to a main order whose order number is within the specified range.

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

### Actions

This section shows the Actions available in the Print Label workspace.

#### Top Tab

Field	Description
<b>Print</b>	Use this action to print labels in batches.

## Print Consignment Slip Workspace

Use this workspace to print consignment slips.

A consignment slip shows information about packing slips for orders that you assigned to a given consignment. You can use the consignment slip as a kind of combined packing slip for the orders that are delivered in a consignment, for example, as a loading list for a carrier.

Each consignment slip contains various information from the tab of the Consignments workspace and a line from each packing slip that you create based on an order that is assigned to the consignment in question.

Printing out consignment slips does not generate packing slips. This means that you must create the packing slip of a sales order as usual in the Packing, Sales Orders, or Print Packing Slip workspaces.

## Print Consignment Slip Tab

This section includes the fields and descriptions for the Print Consignment Slip tab.

### Selection Criteria Island

Field	Description
<b>Consignment No.</b>	In these fields, you can specify a range of consignment numbers. Maconomy will only print consignment slips for consignments within the specified range.
<b>Destination No.</b>	In these fields, you can specify a range of destination numbers. Maconomy will only print consignment slips for consignments going to a destination within the specified range.
<b>Consignment Date</b>	In these fields, you can specify a range of consignment dates. Maconomy will only print consignment slips for consignments with a consignment date within the specified range.
<b>Delivery Mode</b>	In this field, you can select a delivery mode. Maconomy will only print consignment slips with the selected delivery mode.
<b>Delivery Terms</b>	In this field, you can select a code for delivery terms. Maconomy will only print consignment slips with the selected delivery terms.
<b>Carrier</b>	In this field, you can select a carrier. Maconomy will only print consignment slips with the selected carrier.
<b>Consignment Type</b>	In this field, you can select a consignment type. Maconomy will only print consignment slips with the selected consignment type.
<b>Order No.</b>	In these fields, you can specify a range of order numbers. The consignment slip will only be based on packing slips for sales orders within the specified range.
<b>Main Order No.</b>	In these fields, you can specify a range of order numbers. The consignment slip will only be based on sales orders linked to a main order whose order number is within the specified range.
<b>Language</b>	In this field, you can select a language code. The consignment slip will only be based on sales orders with the specified language code.
<b>Include Main Orders</b>	If this field is selected, Maconomy will include packing slips for main orders when printing each consignment slip. If the field is not marked, main orders are omitted from the printout. Packing slips for suborders are printed, however, if they match the other selection criteria.

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option. The printout of each order will display any

Field	Description
	defined footers if it has been specified that the footer should be included when printing consignments.

## Actions

This section shows the Actions available in the Print Consignment Slip workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print consignment slips.

## Print Customs Document Workspace

Use this workspace to print customs documents.

Customs documents are used for documenting the items sent to or from an EU country. In the EU, a number of standard forms exist to simplify the process of shipping consignments between EU countries or to countries outside the EU. In this workspace, you can print customs documents based on the selected sales orders with relevant information about carrier, shipper, total weight, and number of orders in the consignment, for example.

### Print Customs Document Tab

This section includes the fields and descriptions for the Print Customs Document tab.

#### Selection Criteria Island

Field	Description
<b>Customs Document</b>	In these fields, you can specify a range of customs document numbers if you want to reprint a range of customs documents. You can only complete these fields if the field "Create Customs Document" is not selected. If you are reprinting existing customs documents, the other fields and ranges of the selection criteria are ignored.
<b>Order No.</b>	In these fields, you can enter a range of quote and sales order numbers. Maconomy will only print customs documents for quotes or orders within the specified range.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. Maconomy will only print customs documents for quotes or orders whose responsible companies are within the specified range.
<b>Consignment No.</b>	In these fields, you can specify a range of consignment numbers. Maconomy will only print customs documents for quotes and sales orders assigned to a consignment within the specified range.

Field	Description
<b>Destination No.</b>	In these fields, you can specify a range of destination numbers. Maconomy will only print customs documents for quotes and sales orders with a destination number within the specified range.
<b>Consignment Date</b>	In these fields, you can specify a range of consignment dates. Maconomy will only print customs documents for quotes and sales orders assigned to consignments with a consignment date within the specified range.
<b>Delivery Mode</b>	In this field, you can select a delivery mode. Maconomy will only print customs documents for quotes and sales orders with the selected delivery mode.
<b>Delivery Terms</b>	In this field, you can select a code for delivery terms. Maconomy will only print customs documents for quotes and sales orders with the selected delivery terms.
<b>Carrier</b>	In this field, you can select a carrier. Maconomy will only print customs documents for quotes and sales orders with the selected carrier.
<b>Order Mode</b>	In this field, you can enter an order mode. Maconomy will only print customs documents for quotes and sales orders with the selected order mode.
<b>Consignment Type</b>	In this field, you can select a consignment type. Maconomy will only print customs documents for quotes and sales orders with the selected consignment type.
<b>Main Order No.</b>	In these fields, you can specify a range of order numbers. Maconomy will only print customs documents for quotes and sales orders linked to a main order whose order number is within the specified range.
<b>Include Partially Delivered Orders</b>	In this field, you can specify if the printout is also to include partially delivered orders. If you mark this field, the printout will, in addition to the fully delivered orders found within the selection criteria, also include partially delivered orders. An order is partially delivered when some of the items on the order have been delivered, but where some items still remain to be delivered. For each order, the field "Delivered" in the window "Order Status" shows whether or not delivery has started and if so, if the order is fully or partially delivered.

### Texts Island

Field	Description
<b>Text1-10</b>	In these fields, you can enter a number of remarks regarding the customs document to be printed. Using Maconomy's layout editing tools, you can add the text fields to the print layout.

## Print Control Island

Field	Description
<b>Create Customs Document</b>	In this field, you can specify whether you want to create a customs document or to reprint existing customs documents. If you mark the field, a customs document is created with the information from the quotes and sales orders matching the selection criteria. When a customs document is created, Maconomy will automatically select the field "Customs Document" on the sales orders which are identified by the printout. Only sales orders with a blank "Customs Document" field are included in the printout.
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Specification with loading list" is the only option.

## Actions

This section shows the Actions available in the Print Customs Document workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print customs documents.

## Invoicing Section

This section includes the fields and descriptions for the Invoicing section workspaces.

### Invoices Workspace

Use this workspace to create and print out invoices to your customers

The Invoices tab displays general and account information. After you specify customer and invoice information in the tab, you enter items and text lines to the invoice in the Invoice Lines sub-tab.

When you enter the customer number, Maconomy retrieves information from the Customer Information Card. Maconomy then inserts this information into the corresponding fields in the invoice. You can change most of this information.

When you create an invoice, you first enter the number of the customer that the delivery involves. Maconomy checks that the customer exists in the Accounts Receivable module, and that the customer is not blocked for invoicing. Maconomy then checks that the customer's credit limit is not exceeded. If it is, Maconomy alerts you. You can then choose not to create the invoice before the customer has paid overdue bills. Any earlier invoices to the customer must be posted to be included in Maconomy's credit limit evaluation. Similarly, sales and credit orders must be approved or posted before they are included in the credit maximum evaluation. Maconomy also alerts you if the customer's credit limit is exceeded while you add item lines to an invoice. When checking whether the customer's credit limit has been exceeded, Maconomy checks the current

customer's credit limit at the enterprise level as well as at the company level. See the description of the fields in the Credit Limit island in the Payment Information and Company Specific Payment Information workspaces in the A/R module for more information about how Maconomy handles credit limits.

When you create an invoice, Maconomy uses information from other Maconomy workspaces-for example, price lists and quantity discounts-that you maintain in the Inventory module. When pricing items, Maconomy uses the reservation date on the separate order line as a reference to the issue of the price list that is valid at the time of delivery.

## Invoices Tab

This section includes the fields and descriptions for the Invoices tab.

### Billing Address Island

Field	Description
<b>Bill to Customer</b>	<p>Here you enter the number of the bill-to customer. Maconomy retrieves the bill-to customer from the bill-to customer's information card, but you can select another. Maconomy checks that the customer exists. If you cannot remember the bill-to customer number, you can use the search functions in the Find menu.</p> <p>Bill-to Customer and Ship-to Customer are not the same if the shipment of items is sent to one customer and the invoice to another.</p> <p>Maconomy automatically retrieves the bill-to Customer's name, address, country, standard currency, and payment terms from the Customer Information Card.</p> <p>The other lines show the bill-to customer's name and address. The information is retrieved from the Customer Information Card. You can change the information.</p>
<b>Attn.</b>	This is the attention person of the bill-to customer the person to whom payment information is directed. The name is retrieved from the Customer Information Card. You can change the name.
<b>Ctry</b>	This is the country of the bill-to customer. It is retrieved from the customer's information card. It can be changed here.
<b>Phone</b>	This is the telephone number of the bill-to customer, retrieved from the customer's information card. It can be changed here.
<b>Fax</b>	This is the fax number of the bill-to customer, retrieved from the customer's information card. It can be changed here.
<b>Telex</b>	This is the telex number of the bill-to customer, retrieved from the customer's information card. It can be changed here.
<b>E-mail</b>	This is the e-mail address of the bill-to customer, retrieved from the customer's information card. It can be changed here.

## Settling Company Island

Field	Description
<b>Company No.</b>	<p>This field shows the number of the settling company that applies to the current invoice.</p> <p>If the number in this field is different from the one specified in the island Company, Maconomy will automatically create intercompany balances at the posting of the invoice. In the intercompany balance, the company in this field will be the intercompany company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>For further information about the influence of a settling company and how such a company is determined, please see the section Multiple Companies in the chapter "Introduction to the G/L Module." Intercompany balances are described in the window Intercompany Accounts in the G/L module.</p>
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

## Price Island

Field	Description
<b>Currency</b>	Here you select the currency of the invoice. Maconomy automatically retrieves the value from the Customer Information Card. You can change the currency until you enter the first item line in the table part or you specify a charge.
<b>Sales</b>	This is the sum of all the extended prices in the table part, expressed in the invoice currency. The amount includes line and quantity discounts. It does not include invoice discounts, tax or charges.
<b>Invoice Discount %</b>	Here you can enter an invoice discount percentage. Maconomy suggests the value from the Customer Information Card, but you can change it. The invoice discount is automatically deducted from the item sales amount.
<b>Invoice Discount</b>	This is the invoice discount amount, calculated by Maconomy and shown in the invoice currency.
<b>Tax on Sales</b>	<p>This is the calculated tax amount(s) in the currency of the invoice. Maconomy only calculates tax if you mark the "Tax" field in the Price island.</p> <p>If multiple tax codes are enabled, the "Tax on Sales" field will be replaced by the following fields: "Tax 1 on Sales," "Tax 2 on Sales" and, if three tax levels are enabled, "Tax 3 on Sales." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Total (incl. charges)</b>	This is the total invoice amount expressed in the invoice currency. It is the sum of "Sales," "Tax on Sales" and charges including tax deducted from the "Invoice Discount" field.

Field	Description
	<p>If the currency of the invoice is the same as the base currency of the company responsible for the invoice, Maconomy rounds the total invoice amount. However, this is only done if a rounding unit has been specified for the current currency in the field "External Rounding Unit" in the window Currency Rounding in the Set-Up module. If this is the case, invoice amount totals will be rounded to the specified unit. The printout of an invoice will thus show the total invoice amount as well as the amount that constitutes the rounding. When posting the invoice the rounding will be posted as follows: The customer (and thus the A/R Control Account) is debited the invoice total after the rounding, while a rounded amount, if any, is credited or debited the account for amount rounding depending on whether the amount has been rounded up or down. The amount rounding account is specified by means of a dimension combination in the window Posting References in the G/L module. The other entries to which the invoice might give rise are posted as normal.</p>
<b>Std. Currency</b>	<p>This is the bill-to customer's standard currency. It is retrieved from the Customer Information Card.</p>
<b>Total In Standard</b>	<p>This is the total invoice amount in the bill-to customer's standard currency. Maconomy calculates the amount using the current exchange rate table, which is maintained in the window Exchange Rate Tables in the Set-Up module.</p> <p>If this amount added to the customer's balance and order sum exceeds the customer's credit limit, Maconomy issues an alert. Earlier invoices must be posted before they are included in the credit limit evaluation. When checking if the customer's credit limit has been exceeded, Maconomy checks the current customer's credit limit at enterprise level as well as at company level. See the description of the fields in the island Credit Limit in the windows Payment Information and Company Specific Payment information in the A/R module for further information about how credit limits are handled in Maconomy.</p>
<b>Price List</b>	<p>Here you select which price list to use for item lines in the invoice. Maconomy automatically retrieves the price list from the Customer Information Card, but you can select another. You select from existing price lists, that is, sales price lists created in the window Price Lists in the Inventory module. If you select "blank," prices are calculated from item cost price at the current warehouse and gross margin. Cost price and gross margin are specified in the Item Information Card in the Inventory module.</p> <p>If you select a price list in a currency different from the invoice currency, Maconomy converts the prices into the invoice currency using the exchange rate table currently in force.</p>
<b>Price Step</b>	<p>Here you specify whether to take prices from a fixed price step in the price list. The highest level is "6." Maconomy suggests the value from the customer information card, but you can choose another. Any other value than "0" will only have effect if you also choose a price list in the field above.</p> <p>If the field "Fix Price Step" in the window System Information is marked, and if you enter a value here, Maconomy will always suggest the price from the given</p>

Field	Description
	<p>price step, regardless of whether the quantity the customer is buying would normally justify a lower price due to a quantity discount.</p> <p>If the “Fix Price Step” field is not marked, Maconomy will suggest the highest price step justified by the quantity ordered.</p>
<b>Tax</b>	Here you mark whether to add tax to the invoice. Maconomy suggests the value in the Customer Information Card, but you can change it.

### Job Cost Island

Field	Description
<b>Job No.</b>	<p>Here you can enter the number of a job from the Job Cost module, to assign the invoice to a job. Certain jobs can involve item sales from Maconomy’s Inventory module. To register such a sale, you create an invoice in this window and assign it to the appropriate job.</p> <p>The invoice is printed here, and the sales figures are transferred to the Job Cost module. When the job is finished, you can calculate the whole job, including any item sales.</p> <p>Maconomy checks that the job exists, and that you have specified the same ship-to customer number on the invoice and the job. Maconomy also checks that the job is not blocked or ended. If you enter a value in this field, you must also enter the number of an amount activity in the “Activity” field.</p>
<b>Activity No.</b>	In this field, you can enter the number of an amount activity from the Job Cost module if the invoice is assigned to a job. This activity number will be suggested on lines created in the table part.
<b>Task</b>	In this field you can enter the name of a task if the invoice is linked to a job.

### Charges Island

Field	Description
<b>Description</b>	<p>Here you can enter an optional charge text. It is printed on the invoice in front of the actual charge amount. If you wish to add charges to the invoice, you must enter a text here, describing the charge.</p> <p>You can add up to four charges to an invoice. Every one of the four lines in the Charges island, consisting of the “Description,” “Amount,” “Tax Code,” “Tax,” “Rep. Code” and “Group” fields, defines one charge. Note, Maconomy does not retrieve the charge codes from the Customer Information Card.</p>
<b>Amount</b>	Here you enter the charge amount to be added to the invoice. The amount must be in the currency of the invoice.
<b>Tax Code</b>	Here you can specify the tax rate(s) to be applied to the charge. If multiple tax codes are enabled, the “Tax on Sales” field will be replaced by the following fields: “Tax 1 on Sales,” “Tax 2 on Sales” and, if three tax levels are enabled, “Tax 3 on

Field	Description
	Sales.” For further information on multiple tax codes, please see the description in “Tax Codes.”
<b>Tax</b>	This is the tax amount of the charge. Maconomy calculates this figure automatically from the charge entered and the tax code(s) selected. The amount is subsequently added to the invoice if the invoice is subject to tax. The amount in this field cannot be changed.
<b>Rep. Code</b>	<p>In this field, you can enter an item tax code, which is created in the window Popup Fields. Maconomy uses the field to determine which tax code to use for calculating tax for the current charge, as the reporting code is part of the criteria to select a tax code in the window Tax Tables in the G/L module. At this selection, Maconomy uses the tax table specified for the responsible company assigned to the current invoice. This tax table is selected in the window Company Information. However, the tax code is only selected from a tax table, if you have specified that tax tables which are specified in the window System Information are to be used, and only if the company responsible for the current invoice is assigned to a tax table. If no tax table has been specified for the responsible company or if you are using differentiated tax, and you are not using tax tables, Maconomy will use the tax code specified for the individual charge in the window Charges. If neither tax tables nor differentiated tax has been selected, Maconomy uses the standard tax code specified in the window System Information in the Set-Up module.</p> <p>When posting invoices, the reporting code is used for determining which tax report entries are to be created when invoicing the charge. On the basis of the tax report entries, it is possible to create tax reports which show tax and tax basis entries assigned to a given tax report field. This kind of reporting is only possible if extended tax reporting has been selected in the window System Information.</p> <p>The value in this field is transferred from the charge code, but can be changed here.</p>
<b>Group</b>	<p>Here you can enter a code to define the group to which the charge will later be posted. Through a dimension combination in the window Posting References, the group points out the G/L account and other dimension values to which the charge should be posted when you post the invoice. Group 1 charges are posted to the account (and any other dimension values) to which the dimension combination in the posting reference “Order Charge 1” refers for the department the invoice involves. Group 2 charges are posted to the account (and any other dimension values) to which the dimension combination in the posting reference “Order Charge 2” refers, and so on. If you change the group suggested by Maconomy, Maconomy checks that the value is between “1” and “4.” You can assign more than one charge to the same group.</p>

### Dimensions Island

Field	Description
<b>Location</b>	In this field, you can enter a value for the dimension Location. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module.

Field	Description
	If no value can be derived, the standard value is transferred from the window System Parameters in the Set-Up module. See the chapter "Introduction to the G/L Module" and the window Dimension Derivation for a further description of dimension derivation.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

### Ship to Address Island

Field	Description
<b>Ship to Customer</b>	<p>In this field, you enter the number of the customer receiving the items. Maconomy checks that the customer has been created in Maconomy and, if the system parameter "Aut. company specific customer creation" has not been marked in the Set-Up module, whether the current customer has been created as a company-specific customer for the company responsible for the contract. If this parameter has not been marked, the customer must be created as a company-specific customer in the window Company Specific Customer Information Card before orders can be created with the current combination of customer and company. Furthermore, Maconomy checks that the customer has not been blocked in the window Payment Information in the A/R module.</p> <p>If the customer's credit limit is exceeded, Maconomy alerts you. You can then choose not to create the invoice before the customer has paid overdue bills. Please note that previous invoices must be posted before Maconomy includes them in the credit limit evaluation. When checking if the customer's credit limit has been exceeded, Maconomy checks the current customer's credit limit at enterprise level as well as at company level. See the description of the fields in the island Credit Limit in the windows Payment Information and Company Specific Payment information in the A/R module for further information about how credit limits are handled in Maconomy.</p> <p>When you press Return, Maconomy automatically retrieves various information from the Customer Information Card. You can change most of the information.</p> <p>After creating the invoice, you can change the ship-to customer by entering a new customer number in this field. Maconomy then retrieves the information on the new ship-to customer (including bill-to customer) when you press Return. However, the invoice currency will not change if you have entered</p>

Field	Description
	<p>item lines in the table part. Calculated fields, such as “Tax, Sales” and “Due Date,” are calculated again. If charges have been specified on the invoice, the ship-to customer can only be changed to a customer using the currency already specified on the invoice.</p> <p>The other lines show the ship-to customer’s name and address. The information is retrieved from the Customer Information Card. You can change the information.</p>
<b>Attn.</b>	This is the customer’s attention person the person to whom shipping information is directed. The name is retrieved from the customer’s information card, but can be changed here.
<b>Ctry</b>	This is the customer’s country code. It is retrieved from the customer’s information card, but can be changed here.
<b>Phone</b>	This is the customer’s telephone number. It is retrieved from the customer’s information card, but can be changed here.
<b>Fax</b>	This is the customer’s telefax number. It is retrieved from the customer’s information card, but can be changed here.
<b>Telex</b>	This is the customer’s telex number. It is retrieved from the customer’s information card, but can be changed here.
<b>E-mail</b>	This is the customer’s e-mail address. It is retrieved from the customer’s information card, but can be changed here.

### Company Island

Field	Description
<b>Company</b>	<p>In this field, you can enter the number of the company responsible for the invoice. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>If the company in this field is different from the one shown in the island Settling Company, Maconomy will automatically create intercompany balances at the posting of the invoice. In the intercompany balance, the company in this field will be the responsible company. However, if the system parameter “Create intercompany entries for companies with same parent company” is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company. See the section “Multiple Companies” in the chapter “Introduction to the G/L Module” and the window Intercompany Accounts in the G/L module for a further description of the concept of responsible companies and intercompany balances.</p> <p>This field also shows the name of the specified company.</p>

**Invoice Island**

Field	Description
<b>Invoice No.</b>	This is the invoice number the sole and absolute identification of the invoice. Maconomy allocates the next available invoice number, after you enter a customer number.
<b>Invoice Date</b>	This is the date of the invoice. Maconomy automatically suggests today's date. If you change the date, Maconomy checks that it is within the open-posting interval.
<b>Due Date</b>	This is the date the invoice is due for payment. The due date is calculated automatically from the invoice date and payment terms. If you have marked the field "Due Date from Printing Date" in the window System Information, the due date is calculated from the printing date.

**Customer Information Island**

Field	Description
<b>Reference</b>	Here you enter an optional text. You can, for example, enter the name of the customer contact you spoke to about the order. The text is printed on the invoice.
<b>Received by</b>	Here you can enter the name of the employee who created the invoice. Maconomy suggests the name of the user, but you can change it. You must enter a name.
<b>Sales Rep. No.</b>	Here you can enter the number of the employee who is registered as sales representative on the invoice. Maconomy suggests the employee who normally sells to the customer, but you can change it. The number is retrieved from the Customer Information Card. If you cannot remember the number of the sales representative, you can use the search functions in the Find menu.
<b>Sales Rep.</b>	This is the name of the sales representative.
<b>Department</b>	Here you can select the department which the invoice involves. Maconomy suggests the department from the Customer Information Card of the ship-to customer, but you can select another. You maintain departments (with G/L accounts) in the window Posting References in the G/L module.
<b>Warehouse</b>	Here, you select the warehouse from which the invoiced items are delivered. Maconomy suggests the warehouse from the window Customer Information Card, but you can select another. You select from existing warehouses, that is, warehouses created in the Warehouse Information Card in the Inventory module. Note that you can only select one warehouse from which to deliver the invoiced items. If you specify a warehouse assigned to another company than the one responsible for the current invoice, Maconomy will create intercompany

Field	Description
	<p>balances when you post the item journal created as a result of the invoice. In the intercompany balance, the company to which the warehouse is assigned will be the intercompany company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>If you have Maconomy Basic, this field has no function.</p>
<b>Stock Location No.</b>	<p>In this field, you can specify the location in the current warehouse from which the items are shipped. This location will apply to those lines in the table part where the stock location field is left blank. If a stock location is specified on a given line, it overrules any location specified in this field. When you create an invoice, Maconomy suggests the standard shipping location specified for the selected warehouse, but you can specify another location.</p>
<b>Language</b>	<p>Here you can select which language the invoice is printed in. Maconomy suggests the customer's language from the Customer Information Card in the Accounts Receivable module, but you can select another. The language code refers to one of the item descriptions in the Item Information Card "Description Language 1," "Description Language 2" and "Description Language 3." Maconomy uses the code to determine the text in the "Description" field in the table part of the window.</p> <p>You can maintain the language codes in the window Popup Fields in the Set-Up module.</p>
<b>Pmt. Terms</b>	<p>Here you select the payment terms of the invoice. Maconomy automatically suggests the bill-to customer's payment terms from the window Payment Information, but you can change the value. If you do, the invoice due date is calculated again.</p> <p>You maintain payment terms in the window Popup Fields in the Set-Up module.</p>
<b>Cust. Payment Mode</b>	<p>In this field, you can specify how the customer is to pay the invoice. Maconomy suggests the customer payment mode specified on the bill-to customer's information card, but you can change it.</p> <p>Customer payment modes are created in the window Customer Payment Modes in the Banking module.</p>
<b>Global Location No.</b>	<p>If the customer has requested that you use a specific global location number on the invoice, you can specify the location number in question here. Maconomy suggests the global location number specified in the window Company Specific Payment Information for the customer in question, but you can change it here if the location number to be used in connection with the current invoice is not the same as the standard location number of the customer.</p> <p>For further information about the concept of global location numbers, see the introduction to the window Company Locations in the G/L module.</p>

Field	Description
<b>Company Tax Code</b>	<p>In this field, you can enter a company tax code, which is created in the window Popup Fields. Maconomy uses the field to determine which tax code to use for calculating tax for the current invoice, as the reporting code is part of the criteria to select a tax code in the window Tax Tables in the G/L module. At this selection, Maconomy uses the tax table specified for the responsible company assigned to the current invoice. This tax table is selected in the window Company Information. However, the tax code is only selected from a tax table, if you have specified that tax tables which are specified in the window System Information are to be used, and only if the company responsible for the current invoice is assigned to a tax table. If no tax table has been specified for the responsible company or if you are using differentiated tax, and you are not using tax tables, Maconomy will use the tax code specified for the individual item in the window Item Information Card in the Inventory module or, in the case of charges, the tax code specified for the individual charge in the window Charges. If neither tax tables nor differentiated tax has been selected, Maconomy uses the standard tax code specified in the window System Information in the Set-Up module.</p> <p>When posting invoices, the reporting code is used for determining which tax report entries are to be created when invoicing. On the basis of the tax report entries, it is possible to create tax reports which show tax and tax basis entries assigned to a given tax report field. This kind of reporting is only possible if extended tax reporting has been selected in the window System Information.</p> <p>The value in this field is transferred from the customer information card, but can be changed here.</p>
<b>Tax No.</b>	<p>Here you enter the customer's tax number. Maconomy suggests the value for the bill-to customer, but you can change it. If a validation rule is assigned to the tax number field in the window Rules of Validation in the Set-Up module, Maconomy will validate the tax number upon entry or change. If the invoice's bill-to customer is changed, Maconomy retrieves the new tax number.</p>

### Statistics to Tax Authorities Island

Field	Description
<b>EU Sale</b>	<p>This field must be marked if the invoice is for an EU sale. If the "Sales List System Report" field in the window System Information is marked, Maconomy will mark this field if the bill-to customer is from another EU country and is not subject to paying tax, that is, the "Tax" field is not marked. If this field is marked, the invoice will be included in your quarterly report to the EU Sales List System.</p>
<b>Intrastat Reg.</b>	<p>Here you can specify whether to include the invoice in your monthly report to Intrastat. If the "Intrastat Export Report" field in the window system information is marked, Maconomy suggests a mark here if the bill-to customer is from another EU country and is not subject to paying tax, that is, the "Tax" field is not marked.</p>
<b>EU Trade Type</b>	<p>Here you can enter either "Normal" or "Triangulation" to indicate the EU trade type. Triangulation means you act as agent for a vendor in another EU country and a customer in third EU country. Invoice amounts from triangulation are not</p>

Field	Description
	included in the EU sales on your tax specification, but are reported separately to the EU Sales List System. The value is copied from the information card of the bill-to customer, but can be changed here.
<b>Nature</b>	Here you select which transaction to report to Intrastat. They are created in the Popup field window in the Set-Up module.

### Contact Management Island

Field	Description
<b>Campaign No.</b>	In this field, you can enter the number of a campaign if the current invoice is connected to a certain campaign in the Contact Management module. If you enter a campaign number, Maconomy transfers the number to lines that are then created in the table part. The campaign number can be used for, for example, statistical purposes.

### Account Information Island

Field	Description
<b>Changed</b>	This field shows whether any of the information suggested by Maconomy in various fields on the invoice was changed while you created the invoice. Maconomy marks the field automatically if one or more of the following fields in the card part have been changed: "Payment Terms," "Tax," "Price List," "Price Step," "Invoice Discount %." It also marks the field if you enter any charges in the Charges island, or if you change the value in one or more of the amount and discount fields in the table part of the window. The mark cannot be removed.

### Extra Fields Island

Field	Description
<b>Popup 1-5</b>	In these fields, you can specify further information regarding the invoice and the current customer. You might, for example, specify a "hold" code or information about substitution items. Maconomy suggests the value of the corresponding fields in the customer's information card, but you can change the values for the current invoice. The pop-up options are created in the window Popup Fields in the Set-Up module.

### Invoice Lines Sub-Tab

This section includes the fields and descriptions for the Invoice Lines sub-tab.

Field	Description
<b>Item No.</b>	Here you enter the number of the item the customer has ordered. Maconomy verifies that the item has not been discontinued, and that it is assigned to the

Field	Description
	<p>warehouse selected in the card part of the window. If you cannot remember the number of an item, you can use the search functions in the Find menu.</p> <p>If you are creating a text line in the invoice, leave the field blank. You enter the text in the "Description " field and press Return. Item and text lines are printed on the invoice in the order they appear in the table part.</p>
<b>Quantity</b>	<p>Here you enter the quantity of items to invoice to the customer.</p> <p>If the item is under inventory control, and if you have Maconomy Trade, the "Sales Orders" and "Available" fields in the table parts of the windows Item Information Card and Item Information are updated when you enter a quantity here. When the invoice is printed, Maconomy updates the "Sales Orders" and "Stock on Hand" fields in the above two windows.</p> <p>If the item has inventory control, and if you have Maconomy Trade, Maconomy also checks that the quantity entered here is available. If the quantity ordered by the customer is not fully available, Maconomy alerts you. If your company uses the back order principle "By Reservation," you can only enter as much of the item as is available in the warehouse. If you use the "By Packing" principle, you can invoice the complete customer order, knowing that the item's stock will become negative as a consequence. However, if the warehouse in question does not allow negative stock and you specify a quantity greater than what is in stock, Maconomy displays an error message when you attempt to print the invoice.</p> <p>If the line is a text line, leave this field blank.</p>
<b>Unit</b>	<p>Here you select the item's unit. Maconomy suggests the value from the item's information card, but it can be changed.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Description</b>	<p>Here you can enter an item description that will be printed on the invoice. Maconomy automatically suggests the description from the Item Information Card in the Inventory module. If this text exists in several languages, Maconomy selects the language of the Ship To Customer, specified on the Customer Information Card. You can change the description.</p> <p>If the line is a text line, enter the text here.</p>
<b>Unit Price</b>	<p>In this field, you can enter the item's unit price on the invoice. If the invoice is assigned to a price list, and the item is included in the price list, Maconomy suggests the price from the price list.</p> <p>If the quantity justifies a quantity discount, or if a fixed price step has been specified on the invoice, the unit price suggested in this field will be the price on the price step in question as specified in the window Quantity Discounts in the Inventory module. However, the suggested price can be changed here if you and the customer have agreed on a special price.</p> <p>If the item is not included in the price list, or if you have not selected a price list for the invoice, Maconomy suggests the current cost of the item at the warehouse in question and adds the gross margin percent, both of which are retrieved from the item's information card. This functionality only applies if the field "Sales Price Costing" has not been marked on the item's information card.</p>

Field	Description
	<p>If sales price costing is used for the item, the price is still retrieved from the price list, but in this case, the cost is determined by the sales price, using the gross margin percentage. The cost is not shown, but it is used when posting the cost of sales. If the item is not in the price list, Maconomy suggests the price 0.</p> <p>Please note that the unit price of BOMs can be reduced if the following scenario occurs: If the item is a BOM with inventory control that does not use price control, this means that the price in this field should be calculated from the unit prices of the BOM parts. If the unit price of one of these BOM parts is calculated from cost and the BOM part is not assigned to the warehouse on the current line (by means of a warehouse assignment line in the table part of the window Item Information Card), the unit price of that BOM part is set to zero, which affects the price in this field.</p> <p>To set the price, Maconomy uses the delivery date on the invoice line to determine which price list is valid at the time of delivery.</p> <p>See also the description of the window BOM Information Card in the Inventory module for a more detailed description of BOM pricing.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Discount %</b>	<p>Here you can enter a discount percentage for the item. If, instead, you enter an amount in the "Discount" field, Maconomy calculates the discount percentage from the amount and shows it here.</p> <p>If you have Maconomy Trade, Maconomy suggests a discount percentage from a valid discount table, an item discount agreement or a customer discount agreement.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Discount</b>	<p>Here you enter a discount amount. The discount is deducted from the extended price. If you specify a discount percentage in the "Discount %" field, Maconomy calculates the amount from the percentage and shows it here.</p> <p>If you have Maconomy Trade, Maconomy suggests a discount percentage from a valid discount table, an item discount agreement or a customer discount agreement.</p> <p>You can change the values in the "Discount %" and "Discount" fields. If you change one of the values and press Return, Maconomy recalculates the other value, based on the new information. If you change or enter values in both fields, Maconomy uses the discount amount to calculate a discount percentage.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Extended Price</b>	<p>This is the extended price calculated by multiplying the quantity ordered by the unit price and dividing this amount by the pricing unit. The pricing unit is retrieved from the Item Information Card in the Inventory module. Any line discount is then deducted. The extended price is added to the "Sales" field in the Price island in the card part of the window. The amount cannot be changed here.</p>

Field	Description
<b>Pricing Unit</b>	This is quantity of units included in the item's unit price. The value is retrieved from the Item Information Card and cannot be changed here.
<b>Discount Desc.</b>	<p>This is the discount description printed on the invoice. If the description of the discount (be it item discount, customer discount or a discount from a discount table) granted on the line has been translated into the language specified in the card part of the invoice, the translation in question is shown here. If no such translation exists, Maconomy suggests the discount description specified for the discount in question in the window Item Discount Agreements, Customer Discount Agreement or Discount Tables, depending on the type of discount granted. However, you can change the text here. Translations are created in the window Language Texts in the Set-Up module.</p> <p>If you leave this field blank, Maconomy inserts the text "Line Discount" on the discount line.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Reservation Date</b>	This is the date the items are reserved in the warehouse. If the items are to be reserved for another date, you can change the date in this field.
<b>Stock Location No.</b>	In this field, you can specify the location in the selected warehouse from which the items on the current line are shipped. When you create a line, Maconomy checks if a standard picking location has been specified in the table part of the item's information card on a line pertaining to the warehouse specified on the current invoice line. If a standard picking location has been specified and if this location is also marked as a shipping location in the window Warehouse Information Card, the item's standard picking location is suggested In this field, but the value can be changed manually. If no standard picking location has been specified for the item or if the item has a standard picking location for the warehouse but it is not a shipping location, Maconomy suggests a blank value in this field. When this field is blank, the stock location number specified in the card part of the window will apply to the line.
<b>Price List</b>	<p>This is the price list according to which the item line is priced. Maconomy suggests the price list from the card part of the window.</p> <p>If you have Maconomy Trade, the customer can be tied to another price list by a discount agreement. This price list will automatically be transferred to this field instead of the price list originally suggested, and the extended price will be calculated accordingly. The value in this field cannot be changed.</p>
<b>Price Step</b>	This is the price step in the price list, which is used to price the item line. Maconomy suggests the price step justified by the amount of items ordered by the customer. If you specified a fixed price step in the "Price Step" field in the card part (and if there is a price on this level), Maconomy transfers the fixed level to this field. You cannot change it here.
<b>Price at Step 1</b>	This is the price of one pricing unit if the invoice is assigned to a price list which includes the item. You cannot change this price.

Field	Description
<b>Quantity Disc.</b>	This is the discount amount. The discount is the difference between “Price at Level 1” and the actual unit price in the invoice, multiplied by the quantity of items ordered, and divided by the pricing unit.
<b>Internal Descr.</b>	<p>Here you can enter an internal description. Maconomy automatically suggests the internal description from the item’s information card in the Inventory module, but you can change it. The text is not printed on the invoice. It is only for reference.</p> <p>If the line is a text line, you can write a text here, but it will not be printed on the invoice.</p>
<b>Extra Text 1-10</b>	In these fields, you can enter supplementary text for a further description of the current item. Maconomy suggests the value from the corresponding fields in the item information card, but you can change the value for the current invoice line.
<b>Popup 1-5</b>	In these fields, you can enter further information about the current item. Maconomy suggests the value from the corresponding fields in the item information card, but you can change the value for the current invoice line. The pop-up options are created in the window Popup Fields in the Set-Up module.
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the field “Location” in the card part of the window.</p> <p>See the section on dimension derivation in the chapter “Introduction to the G/L module” as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field “Location” above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field “Location” above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field “Location” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field “Location” above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field “Location” above.
<b>Campaign No.</b>	In this field, you can enter the number of a campaign if the current invoice line is connected to a certain campaign in the Contact Management module. If you enter a campaign number in the card part, Maconomy transfers the number to

Field	Description
	this field when creating lines. The campaign number can be used for, for example, statistical purposes.
<b>Activity No.</b>	<p>In this field, you can enter an amount activity if the current line relates to an activity and the invoice is assigned to a job. When you create a line on an invoice on which a job number has been specified, Maconomy attempts to derive an activity number using the following procedure:</p> <ol style="list-style-type: none"> <li>1. If the user manually enters an activity number, this number is used.</li> <li>2. If no value is entered manually, Maconomy checks the information card of the item specified on the line to see if an activity number has been specified there (see the window</li> <li>3. "Activity No." in the card part of the window Item Information Card). If so, the activity number in question is transferred to this field.</li> <li>4. If no activity number was found in step 2, the activity number specified in the corresponding field in the card part of the invoice is used.</li> <li>5. If no activity was found in step 3, the activity number to be derived from the standard task of the task list assigned to the job on the invoice is used.</li> </ol> <p>If no job has been specified on the invoice, any manually entered value is changed to a blank value, as you cannot specify an activity to a line which does not pertain to a job.</p>
<b>Task</b>	In this field, you can enter the name of a task if the invoice is linked to a job. If the corresponding field in the card part of the window contains a value, it will automatically be suggested in this field.

## Credit Memos Workspace

Use this workspace to create and print out credit memos for your customers.

The Credit Memos tab displays general and account information. After you enter customer and credit memo information in the tab, you can assign items and text lines in the Credit Memo Lines sub-tab.

When you create a credit memo, you first enter the number of the customer that the crediting involves. Maconomy checks that the customer exists in the Accounts Receivable module.

When you enter the customer number, Maconomy retrieves information from the Customer Information Card. Maconomy then inserts this information into the corresponding fields in the credit memo. You can change most of this information.

When you create a credit memo, Maconomy uses information from other Maconomy workspaces- such as price lists and quantity discounts-that you maintain in the Inventory module. When pricing items, Maconomy uses the delivery date on the order line as a reference to the issue of the price list that is valid at the time of delivery.

## Credit Memos Tab

This section includes the fields and descriptions for the Credit Memos tab.

**Billing Address Island**

Field	Description
<b>Bill to Customer</b>	<p>Here you enter the number of the bill-to customer. Maconomy retrieves the bill-to customer from the bill-to customer's information card, but you can select another. Maconomy checks that the customer exists. If you cannot remember the bill-to customer number, you can use the search functions in the Find menu.</p> <p>Bill to Customer and Ship to Customer are not the same if items are returned from one customer and the credit memo is sent to another.</p> <p>Maconomy automatically retrieves the bill-to customer's name, address, country, and standard currency from the Customer Information Card.</p> <p>The other lines show the bill-to customer's name and address. The information is retrieved from the Customer Information Card. You can change the information.</p>
<b>Attn.</b>	This is the customer's attention person the person to whom payment information is directed. The name is retrieved from the Customer Information Card. You can change the name.
<b>Country</b>	This is the country code of the bill-to customer. It is retrieved from the customer's information card, but can be changed here.
<b>Phone</b>	This is the telephone number of the bill-to customer. It is retrieved from the customer's information card, but can be changed here.
<b>Fax</b>	This is the telefax number of the bill-to customer. It is retrieved from the customer's information card, but can be changed here.
<b>Telex</b>	This is the telex number of the bill-to customer. It is retrieved from the customer's information card, but can be changed here.
<b>E-mail</b>	This is the e-mail address of the bill-to customer. It is retrieved from the customer's information card, but can be changed here.

**Settling Company Island**

Field	Description
<b>Company No.</b>	<p>This field shows the number of the settling company that applies to the current credit memo.</p> <p>If the number in this field is different from the one specified in the island Company, Maconomy will automatically create intercompany balances at the posting of the credit memo. In the intercompany balance, the company in this field will be the intercompany company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not</p>

Field	Description
	<p>marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>For further information about the influence of a settling company and how such a company is determined, please see the section Multiple Companies in the chapter "Introduction to the G/L Module." Intercompany balances are described in the window Intercompany Accounts in the G/L module.</p>
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

### Price Island

Field	Description
<b>Currency</b>	Here you select the currency of the credit memo. Maconomy automatically retrieves the value from the Customer Information Card. You can change the currency until you enter the first item line in the table part or you specify a charge.
<b>Sales</b>	This is the sum of all the extended prices in the table part, expressed in the credit memo currency. The amount includes line and quantity discounts. It does not include invoice discounts, tax or charges.
<b>Invoice Discount %</b>	Here you can enter an invoice discount percentage. Maconomy suggests the value from the Customer Information Card, but you can change it. The discount is automatically deducted from the item sales amount.
<b>Invoice Discount</b>	This field shows the invoice discount amount, calculated by Maconomy and displayed in the credit memo currency.
<b>Tax on Sales</b>	<p>This is the calculated tax amount(s) in the currency of the credit memo. Maconomy only calculates tax if you mark the "Tax" field in the Price island.</p> <p>If multiple tax codes are enabled, the "Tax on Sales" field will be replaced by the following fields: "Tax 1 on Sales," "Tax 2 on Sales" and, if three tax levels are enabled, "Tax 3 on Sales." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Total (incl. charges)</b>	This is the total credit memo amount expressed in the credit memo currency. It is the sum of "Sales," "Tax on Sales" and charges including tax deducted from the "Invoice Discount" field.
<b>Std. Currency</b>	<p>This is the bill-to customer's standard currency. It is retrieved from the Customer Information Card.</p> <p>If the currency of the credit memo is the same as the base currency of the company responsible for the credit memo, Maconomy rounds the total invoice amount. However, this is only done if a rounding unit has been specified for the current currency in the field "External Rounding Unit" in the window Currency Rounding in the Set-Up module. If this is the case, credit memo totals will be rounded to the specified unit. The printout of a credit memo will thus show the total credit memo amount as well as the amount that constitutes the rounding.</p>

Field	Description
	When posting the credit memo the rounding will be posted as follows: The customer (and thus the A/R Control Account) is debited the credit memo total after the rounding, while a rounded amount, if any, is debited or credited the account for amount rounding depending on whether the amount has been rounded up or down. The other entries to which the credit memo might give rise are posted as normal.
<b>Total In Standard</b>	This is the total credit memo amount in the bill-to customer's standard currency. The calculation of this currency is based on the exchange rate table for sales selected in the window System Information. The exchange rate, which is valid on the invoice date, is used.
<b>Price List</b>	<p>Here you select which price list to use for item lines in the credit memo. Maconomy automatically retrieves the price list from the Customer Information Card, but you can select another. You select from existing price lists, that is, sales price lists created in the window Price Lists in the Inventory module. If you select "blank," prices are calculated from item cost price and gross margin. Cost price and gross margin are specified in the Item Information Card in the Inventory module.</p> <p>If you select a price list in a currency different from the credit memo currency, Maconomy converts the prices into the credit memo currency using the exchange rate table for sales.</p>
<b>Price Step</b>	<p>Here you specify whether to take prices from a fixed price step in the price list. The highest level is "6." Maconomy suggests the value from the customer information card, but you can choose another. Any other value than "0" will only have effect if you also choose a price list in the field above.</p> <p>Note, that if the "Fix Price Step" field in the window System Information is marked, and if you enter a value here, Maconomy will always suggest the price from the given price step, regardless of whether the quantity the customer is buying would normally justify a lower price due to a quantity discount.</p> <p>If the "Fix Price Step" field is not marked, Maconomy will suggest the highest price step justified by the quantity ordered.</p>
<b>Tax</b>	Here you mark whether to add tax to the credit memo. Maconomy suggests the value in the Customer Information Card, but you can change it.

### Account Information Island

Field	Description
<b>Changed</b>	<p>This field shows whether any of the information suggested by Maconomy in various fields on the credit memo was changed while you created the credit memo. Maconomy marks the field automatically if one or more of the following fields in the card part have been changed: "Tax," "Price List," "Price Step," "Invoice Discount %." It also marks the field if you enter any charges in the Charges island, or if you change the value in one or more of the amount and discount fields in the table part of the window. The mark cannot be removed.</p>

**Charges Island**

Field	Description
<b>Description</b>	<p>Here you can enter an optional charge text. It is printed on the credit memo in front of the actual charge amount. If you wish to add charges to the credit memo, you must enter a text here, describing the charge.</p> <p>You can add up to four charges to credit memo. Every one of the four lines in the Charges island, consisting of the "Text," "Amount," "Tax Code" (Tax Code 1-3), "Tax," "Rep. Code" and "Group" fields, defines one charge. Note, Maconomy does not retrieve the charge codes from the Customer Information Card.</p>
<b>Amount</b>	Here you enter the charge amount to be added to the credit memo. The amount must be in the currency of the credit memo.
<b>Tax Code</b>	Here you can specify the tax rate(s) to be applied to the charge. If multiple tax codes are enabled, the "Tax on Sales" field will be replaced by the following fields: "Tax 1 on Sales," "Tax 2 on Sales" and, if three tax levels are enabled, "Tax 3 on Sales." For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Tax</b>	This is the tax amount of the charge. Maconomy calculates this figure automatically from the charge and tax code(s) entered. The amount is then added to the credit memo if the credit memo is subject to tax. The amount in this field cannot be changed.
<b>Rep. Code</b>	<p>In this field, you can enter an item tax code, which is created in the window Pop-up Fields. Maconomy uses the field to determine which tax code to use for calculating tax for the current charge, as the reporting code is part of the criteria to specify a tax code in the window Tax Tables in the G/L module. At this selection, Maconomy uses the tax table specified for the responsible company assigned to the current credit memo. This tax table is selected in the window Company Information. However, the tax code is only selected from a tax table, if you have specified that tax tables which are specified in the window System Information are to be used, and only if the company responsible for the current credit memo is assigned to a tax table. If no tax table has been specified for the responsible company or if you are using differentiated tax, and you are not using tax tables, Maconomy will use the tax code specified for the individual charge in the window Charges. If neither tax tables nor differentiated tax has been selected, Maconomy uses the standard tax code specified in the window System Information in the Set-Up module.</p> <p>When posting credit memos, the reporting code is used for determining which tax report entries are to be created when crediting the charge. On the basis of the tax report entries, it is possible to create tax reports which show tax and tax basis entries assigned to a given tax report field. This kind of reporting is only possible if extended tax reporting has been selected in the window System Information.</p> <p>The value in this field is transferred from the charge code, but can be changed here.</p>
<b>Group</b>	Here you can enter a code to define the group to which the charge will later be posted. Through a dimension combination in the window Posting References, the group points out the G/L account and other dimension values to which the charge

Field	Description
	should be posted when you post the invoice. Group 1 charges are posted to the account (and any other dimension values) to which the dimension combination in the posting reference "Order Charge 1" refers for the department the invoice involves. Group 2 charges are posted to the account (and any other dimension values) to which the dimension combination in the posting reference "Order Charge 2" refers, and so on. If you change the group suggested by Maconomy, Maconomy checks that the value is between "1" and "4." You can assign more than one charge to the same group.

### Dimensions Island

Field	Description
<b>Location</b>	In this field, you can enter a value for the dimension Location. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. If no value can be derived, the standard value is transferred from the window System Parameters in the Set-Up module. See the chapter "Introduction to the G/L Module" and the window Dimension Derivation for a further description of dimension derivation.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

### Extra Fields Island

Field	Description
<b>Popup 1-5</b>	In these fields, you can specify further information regarding the credit memo and the current customer. You might, for example, specify a "hold" code or information about substitution items. Maconomy suggests the value of the corresponding fields in the customer's information card, but you can change the values for the current credit memo. The pop-up options are created in the window Popup Fields in the Set-Up module.

**Ship to Address Island**

Field	Description
<b>Ship to Customer</b>	<p>In this field, you enter the number of the ship-to customer that the crediting involves. Maconomy checks that the customer has been created in Maconomy and, if the system parameter "Aut. company specific customer creation" has not been marked in the Set-Up module, whether the current customer has been created as a company-specific customer for the company responsible for the contract. If this parameter has not been marked, the customer must be created as a company-specific customer in the window Company Specific Customer Information Card before orders can be created with the current combination of customer and company. Furthermore, Maconomy checks that the customer has not been blocked in the window Payment Information in the A/R module.</p> <p>When you press Return, Maconomy automatically retrieves various information from the Customer Information Card. You can change most of the information.</p> <p>After creating the credit memo, you can change the ship-to customer by entering a new customer number in this field. Maconomy then retrieves the information on the new ship-to customer (including bill-to customer) when you press Return. However, the credit memo currency will not change if you have entered item lines in the table part. Calculated fields, such as "Tax, Sales," are calculated again. If charges have been specified on the credit memo, the ship-to customer can only be changed to a customer using the currency already specified on the credit memo.</p> <p>The other lines show the ship-to customer's name and address. The information is retrieved from the Customer Information Card. You can change the information.</p>
<b>Attn.</b>	This is the customer's attention person the person to whom shipping information is directed. The name is retrieved from the Customer Information Card. You can change the name.
<b>Country</b>	This is the customer's country code. It is retrieved from the customer's information card, but can be changed here.
<b>Phone</b>	This is the customer's telephone number. It is retrieved from the customer's information card, but can be changed here.
<b>Fax</b>	This is the customer's telefax number. It is retrieved from the customer's information card, but can be changed here.
<b>Telex</b>	This is the customer's telex number. It is retrieved from the customer's information card, but can be changed here.
<b>E-mail</b>	This is the customer's e-mail address. It is retrieved from the customer's information card, but can be changed here.

**Company Island**

Field	Description
<b>Company</b>	<p>In this field, you can enter the number of the company responsible for the invoice. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>If the company in this field is different from the one shown in the island Settling Company, Maconomy will automatically create intercompany balances at the posting of the credit memo. In the intercompany balance, the company in this field will be the responsible company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company. See the section "Multiple Companies" in the chapter "Introduction to the G/L Module" and the window Intercompany Accounts in the G/L module for a further description of the concept of responsible companies and intercompany balances.</p> <p>This field also shows the name of the specified company.</p>

**Credit Memo Island**

Field	Description
<b>Credit Memo No.</b>	This is the credit memo number the sole and absolute identification of the credit memo. Maconomy allocates the next available credit memo number, after you enter a customer number.
<b>Date</b>	Here you can enter the date of the credit memo. Maconomy automatically suggests today's date. If you change the date, Maconomy checks that it is within the open-posting interval.

**Customer Information Island**

Field	Description
<b>Reference</b>	Here you enter an optional text. You can, for example, enter the name of the customer contact you spoke to about the credit memo. The text is printed on the credit memo.
<b>Received by</b>	Here you can enter the name of the employee who received the customer's request for the credit memo. Maconomy suggests the name of the user, but you can change it. You must enter a name.
<b>Sales Rep. No.</b>	<p>Here you can enter the number of the employee who is registered as sales representative on the credit memo. Maconomy suggests the employee who normally sells to the customer, but you can change it. The number is retrieved from the Customer Information Card.</p> <p>If you cannot remember the number of the sales representative, you can use the search functions in the Find menu.</p>

Field	Description
<b>Sales Rep.</b>	This is the name of the sales representative.
<b>Department</b>	<p>Here you can select the department which the credit memo involves. Maconomy suggests the department from the Customer Information Card of the ship-to customer, but you can select another.</p> <p>You maintain departments (with G/L accounts) in the window Posting References in the G/L module.</p>
<b>Warehouse</b>	<p>Here you can select which warehouse the credited items are returned to. Maconomy suggests the warehouse from the Customer Information Card, but you can select another. You select from existing warehouses, that is, warehouses created in the Warehouse Information Card in the Inventory module.</p> <p>Note, that you can only select one warehouse to which to return the credited items.</p> <p>If you specify a warehouse assigned to another company than the one responsible for the current credit memo, Maconomy will create intercompany balances when you post the item journal created as a result of the credit memo. In the intercompany balance, the company to which the warehouse is assigned will be the intercompany company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>If you have Maconomy Basic, this field has no function.</p>
<b>Stock Location No.</b>	In this field, you can specify the location in the current warehouse at which the returned items are received. This location will apply to those lines in the table part where the stock location field is left blank. If a stock location is specified on a given line, it overrules any location specified in this field. When you create a credit memo, Maconomy suggests the standard receiving location specified for the selected warehouse, but you can specify another location.
<b>Language</b>	<p>Here you can select which language the credit memo is printed in. Maconomy suggests the customer's language from the Customer Information Card in the Accounts Receivable module, but you can select another. The language code refers to one of the item descriptions in the Item Information Card "Description Language 1," "Description Language 2" and "Description Language 3."</p> <p>Maconomy uses the code to determine the text in the "Description" field in the table part of the window.</p> <p>You can maintain the language codes in the window Popup Fields in the Set-Up module.</p>
<b>Company Tax Code</b>	In this field, you can enter a company tax code, which is created in the window Popup Fields. Maconomy uses the field to determine which tax code to use for calculating tax for the current credit memo, as the reporting code is part of the criteria to select a tax code in the window Tax Tables in the G/L module. At this selection, Maconomy uses the tax table specified for the responsible company assigned to the current credit memo. This tax table is selected in the window

Field	Description
	<p>Company Information. However, the tax code is only selected from a tax table, if you have specified that tax tables which are specified in the window System Information are to be used, and only if the company responsible for the current credit memo is assigned to a tax table. If no tax table has been specified for the responsible company or if you are using differentiated tax, and you are not using tax tables, Maconomy will use the tax code specified for the individual item in the window Item Information Card in the Inventory module or, in the case of charges, the tax code specified for the individual charge in the window Charges. If neither tax tables nor differentiated tax has been selected, Maconomy uses the standard tax code specified in the window System Information in the Set-Up module.</p> <p>When posting credit memos, the reporting code is used for determining which tax report entries are to be created when crediting. On the basis of the tax report entries, it is possible to create tax reports which show tax and tax basis entries assigned to a given tax report field. This kind of reporting is only possible if extended tax reporting has been selected in the window System Information.</p> <p>The value in this field is transferred from the customer information card, but can be changed here.</p>
<b>Tax No.</b>	<p>Here you enter the customer's tax number. Maconomy suggests the value for the bill-to customer, but you can change it. If a validation rule is assigned to the tax number field in the window Rules of Validation in the Set-Up module, Maconomy will validate the tax number upon entry or change. If the invoice's bill-to customer is changed, Maconomy retrieves the new tax number.</p>
<b>Cust. Payment Mode</b>	<p>In this field, you can specify the customer payment mode to be used in the settlement of the credit memo. When you create collection selections in the Banking module, Maconomy will reconcile the credit memo against any invoices on which the same bill-to customer and customer payment mode have been specified. Maconomy suggests the customer payment mode specified on the bill-to customer's information card, but you can change it.</p> <p>Customer payment modes are created in the window Customer Payment Modes in the Banking module.</p>
<b>Global Location No.</b>	<p>If the customer has requested that you use a specific global location number on the credit memo, you can specify the location number in question here. Maconomy suggests the global location number specified in the window Company Specific Payment Information for the customer in question, but you can change it here if the location number to be used in connection with the current credit memo is not the same as the standard location number of the customer.</p> <p>For further information about the concept of global location numbers, see the introduction to the window Company Locations in the G/L module.</p>

**Job Cost Island**

Field	Description
<b>Job No.</b>	<p>Here you can enter the number of a job from the Job Cost module, to assign the credit memo to a job. Certain jobs can involve crediting items registered in Maconomy's Inventory module. To register the crediting, you create a credit memo in this window and assign it to the appropriate job.</p> <p>The credit memo is printed here, and the sales figures are transferred to the Job Cost module. When the job is finished, you can calculate the whole job, including any item sales.</p> <p>Maconomy checks that the job exists, and that you have specified the same ship-to customer number on the credit memo and the job. Maconomy also checks that the job is not blocked or ended. If you enter a value in this field, you must also enter the number of an amount activity in the "Activity" field.</p>
<b>Activity</b>	In this field, you can enter the number of an amount activity from the Job Cost module if the credit memo is assigned to a job. This activity number will be suggested on lines created in the table part.
<b>Task</b>	In this field you can enter the name of a task if the credit memo is linked to a job.

**Statistics to Tax Authorities Island**

Field	Description
<b>EU Sale</b>	This field must be marked if the invoice is for an EU sale. If the "Sales List System Report" field in the window System Information is marked, Maconomy will mark this field if the bill-to customer is from another EU country and is not subject to paying tax, that is, the "Tax" field is not marked. If this field is marked, the invoice will be included in your quarterly report to the EU Sales List System.
<b>Intrastat Reg.</b>	Here you can specify whether to include the invoice in your monthly report to Intrastat. If the "Intrastat Export Report" field in the window System Information is marked, Maconomy suggests a mark here if the bill-to customer is from another EU country and is not subject to paying tax, that is, the "Tax" field is not marked.
<b>EU Trade Type</b>	Here you can enter either "Normal" or "Triangulation" to indicate the EU trade type. Triangulation means you act as agent for a vendor in another EU country and a customer in third EU country. Invoice amounts from triangulation are not included in the EU sales on your tax specification, but are reported separately to the Sales List System. The value is copied from the information card of the bill-to customer, but can be changed here.
<b>Nature</b>	Here you select which transaction to report to Intrastat. They are created in the Popup field window in the Set-Up module.

**Contact Management Island**

Field	Description
<b>Campaign No.</b>	In this field, you can enter the number of a campaign if the current credit memo is connected to a certain campaign in the Contact Management module. If you enter a campaign number, Maconomy transfers the number to lines that are then created in the table part. The campaign number can be used for, for example, statistical purposes.

**Credit Memo Lines Sub-Tab**

This section includes the fields and descriptions for the Credit Memo Lines sub-tab.

Field	Description
<b>Item No.</b>	<p>Here you enter the number of the item you are crediting the customer. Maconomy checks that the number exists, that is, that it has been created in the Item Information Card in the Inventory module. Maconomy then checks that the item is assigned to the warehouse selected in the card part of the window. If you cannot remember the number of an item, you can use the search functions in the Find menu.</p> <p>If you are creating a text line in the credit memo, leave the field blank. You enter the text in the "Description" field and press Return. Item and text lines are printed on the credit memo in the order they appear in the table part.</p>
<b>Credited</b>	Here you enter the quantity of items to credit the customer. If the line is a text line, leave this field blank.
<b>Return</b>	<p>Here you enter how many units of the item you are receiving in return. This quantity is not necessarily the same as quantity credited. Some (or all) of the items may have been lost or damaged during transport.</p> <p>Maconomy automatically suggests the value from the "Credited" field, unless the system parameter "Set Quantity Returned to Zero" has been marked, in which case Maconomy suggests 0.</p> <p>If the item is not under inventory control, the credit memo will not cause any inventory movement. But because the cost of sales account is credited the value of returned items (when posted), it is important to enter the correct quantity here.</p> <p>If the line is a text line, leave this field blank.</p>
<b>Unit</b>	<p>Here you select the item's unit. Maconomy suggests the value from the item's information card, but it can be changed.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Description</b>	<p>Here you enter an item text. This text is printed on the credit memo. Maconomy automatically suggests the text from the item's information card in the Inventory module. If this text exists in several languages, Maconomy selects the language of the ship-to customer, which is specified on the Customer Information Card. You can change the item text.</p> <p>If the line is a text line, enter the text here.</p>

Field	Description
<b>Unit Price</b>	<p>In this field, you can enter the item's unit price on the credit memo. If the invoice is assigned to a price list, and the item is included in the price list, Maconomy suggests the price from the price list.</p> <p>If the quantity justifies a quantity discount, or if a fixed price step has been specified on the credit memo, the unit price suggested in this field will be the price on the price step in question as specified in the window Quantity Discounts in the Inventory module. However, the suggested price can be changed here if you and the customer have agreed on a special price.</p> <p>If the item is not included in the price list, or if you have not selected a price list for the credit memo, Maconomy suggests the current cost of the item at the warehouse in question and adds the gross margin percent, both of which are retrieved from the item's information card. This functionality only applies if the field "Sales Price Costing" has not been marked on the item's information card. If sales price costing is used for the item, the price is still retrieved from the price list, but in this case, the cost is determined by the sales price, using the gross margin percentage. The cost is not shown, but it is used when posting the cost of sales. If the item is not in the price list, Maconomy suggests the price 0.</p> <p>Please note that the unit price of BOMs can be reduced if the following scenario occurs: If the item is a BOM with inventory control that does not use price control, this means that the price in this field should be calculated from the unit prices of the BOM parts. If the unit price of one of these BOM parts is calculated from cost and the BOM part is not assigned to the warehouse on the current line (by means of a warehouse assignment line in the table part of the window Item Information Card), the unit price of that BOM part is set to zero, which affects the price in this field.</p> <p>To set the price, Maconomy uses the delivery date on the credit memo line to point out the price list which is valid at the time of delivery.</p> <p>See also the description of the window BOM Information Card in the Inventory module for a more detailed description of BOM pricing.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Discount %</b>	<p>Here you can enter a discount percentage for the item. If, instead, you enter an amount in the "Discount" field, Maconomy calculates the discount percentage from the amount and shows it here.</p> <p>If you have Maconomy Trade, Maconomy suggests a discount percentage from a valid discount table, an item discount agreement or a customer discount agreement.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Discount</b>	<p>Here you enter a discount amount. The discount is deducted from the extended price. If you specify a discount percentage in the "Discount %" field, Maconomy calculates the amount from the percentage and shows it here.</p> <p>If you have Maconomy Trade, Maconomy suggests a discount percentage from a valid discount table, an item discount agreement or a customer discount agreement.</p>

Field	Description
	<p>You can change the values in the “Discount %” and “Discount” fields. If you change one of the values and press Return, Maconomy recalculates the other value, based on the new information. If you change or enter values in both fields, Maconomy uses the discount amount to calculate a discount percentage.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Extended Price</b>	<p>This is the extended price calculated by multiplying the quantity ordered by the unit price and dividing this amount by the pricing unit. The pricing unit is retrieved from the Item Information Card in the Inventory module. Any line discount is then deducted. The extended price is added to the “Sales” field in the Price island in the card part of the window. The amount cannot be changed here.</p>
<b>Pricing Unit</b>	<p>This is quantity of units included in the item’s unit price. The value is retrieved from the Item Information Card and cannot be changed here.</p>
<b>Discount Desc.</b>	<p>This is the discount description printed on the credit memo. If the description of the discount (be it item discount, customer discount or a discount from a discount table) granted on the line has been translated into the language specified in the card part of the credit memo, the translation in question is shown here. If no such translation exists, Maconomy suggests the discount description specified for the discount in question in the window Item Discount Agreements, Customer Discount Agreement or Discount Tables, depending on the type of discount granted. However, you can change the text here. Translations are created in the window Language Texts in the Set-Up module.</p> <p>If you leave this field blank, Maconomy inserts the text “Line Discount” on the discount line.</p> <p>If the line is a text line, leave the field blank.</p>
<b>Stock Location No.</b>	<p>In this field, you can specify the location in the selected warehouse at which the items returned on the current line are received. When you create a line, Maconomy checks if a standard storage location has been specified in the table part of the item’s information card on a line pertaining to the warehouse specified on the current credit memo line. If a standard storage location has been specified and if this location is also marked as a receipt location in the window Warehouse Information Card, the item’s standard storage location is suggested In this field, but the value can be changed manually. If no standard storage location has been specified for the item or if the item has a standard storage location for the warehouse but it is not a receipt location, Maconomy suggests a blank value in this field. When this field is blank, the stock location number specified in the card part of the window will apply to the line.</p>
<b>Price List</b>	<p>This is the price list according to which the item line is priced. Maconomy suggests the price list from the card part of the window.</p> <p>If you have Maconomy Trade, the customer can be tied to another price list by a discount agreement. This price list will automatically be transferred to this field instead of the price list originally suggested, and the extended price will be calculated accordingly. The value in this field cannot be changed.</p>

Field	Description
<b>Price Step</b>	This is the price step in the price list, which is used to price the item line. Maconomy suggests the price step justified by the amount of items ordered by the customer. If you specified a fixed price step in the "Price Step" field in the card part (and if there is a price on this level), Maconomy transfers the fixed level to this field. You cannot change it here.
<b>Price at Step 1</b>	This is the price of one pricing unit if the credit memo is assigned to a price list which includes the item. You cannot change this price.
<b>Quantity Disc.</b>	This is the discount amount. The discount is the difference between "Price at Level 1" and the actual unit price in the credit memo, multiplied by the quantity of items ordered, and divided by the pricing unit.
<b>Internal Desc.</b>	Here you can enter an internal description. Maconomy automatically suggests the internal description from the item's information card in the Inventory module, but you can change it. The text is not printed on the credit memo. It is only for reference.  If the line is a text line, you can write a text here, but it will not be printed on the credit memo.
<b>Extra Text 1-10</b>	In these fields, you can enter supplementary text for a further description of the current item. Maconomy suggests the value from the corresponding fields in the item information card, but you can change the value for the current credit memo line.
<b>Popup 1-5</b>	In these fields, you can enter further information about the current item. Maconomy suggests the value from the corresponding fields in the item information card, but you can change the value for the current credit memo line. The pop-up options are created in the window Popup Fields in the Set-Up module.
<b>Location</b>	In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the field "Location" in the card part of the window.  See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.

Field	Description
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Campaign No.</b>	In this field, you can enter the number of a campaign if the current credit memo line is connected to a certain campaign in the Contact Management module. If you enter a campaign number in the card part, Maconomy transfers the number to this field when creating lines. The campaign number can be used for, for example, statistical purposes.
<b>Activity No.</b>	<p>In this field, you can enter an amount activity if the current line relates to an activity and the credit memo is assigned to a job. When you create a line on a credit memo on which a job number has been specified, Maconomy attempts to derive an activity number using the following procedure:</p> <ol style="list-style-type: none"> <li>1. If the user manually enters an activity number, this number is used.</li> <li>2. If no value is entered manually, Maconomy checks the information card of the item specified on the line to see if an activity number has been specified there (see the window "Activity No." in the card part of the window Item Information Card). If so, the activity number in question is transferred to this field.</li> <li>3. If no activity number was found in step 2, the activity number specified in the corresponding field in the card part of the credit memo is used.</li> <li>4. If no activity was found in step 3, the activity number to be derived from the standard task of the task list assigned to the job on the credit memo is used.</li> </ol> <p>If no job has been specified on the credit memo, any manually entered value is changed to a blank value, as you cannot specify an activity to a line which does not pertain to a job.</p>
<b>Task</b>	In this field, you can enter the name of a task if the credit memo is linked to a job. If the corresponding field in the card part of the window contains a value, it will automatically be suggested in this field.

## Invoicing Listing Workspace

Use this workspace to view a list of sales orders that are ready to be invoiced but have not yet been invoiced.

In the Invoicing Listing tab you specify the target group of orders, customers, and departments. The Sales Orders sub-tab displays the sales orders that are ready to be invoiced. You can determine the invoice date for each delivery.

When you open this workspace, the Sales Orders sub-tab displays all of the noninvoiced sales orders for which there have been deliveries. If you limit the target group in the Invoicing Listing tab, the Sales Orders sub-tab displays only the target group sales orders. Sales orders for which

you have printed a packing slip after you open this workspace are not displayed here; however, Maconomy includes them in the invoicing if you select the **Batch Invoice** field in the Sales Orders workspace.

In the Sales Orders workspace, you can create and print an invoice immediately after you create a sales order, using the **Print Invoice** action. This enables you to give quick service, if the customer collects the items personally and requires an invoice.

If you create many sales orders daily and perform as many deliveries, it is convenient to invoice all of the sales orders in one operation, once a day. Use the Print Invoice workspace to do this. Before you begin a batch invoicing, it is useful to go through the sales orders to make sure that you do not invoice any by mistake. You do that in this workspace, where you can select the sales orders to invoice in the Print Invoice workspace.

If you are invoicing the sales order in the Job Cost module, it does not appear in this workspace.

### Invoice Listing Tab

This section includes the fields and descriptions for the Invoice Listing tab.

#### Selection Criteria Island

Field	Description
<b>No. Orders</b>	This field shows how many sales orders are ready to be invoiced. You can limit the quantity in the target group fields. You might, for example, have a large batch of sales orders to invoice, which you wish to split into smaller portions. You cannot change the value manually.
<b>Order No.</b>	Here you can enter a range of sales order numbers. The table will only show orders within this range.
<b>Bill to Customer</b>	Here you can enter a range of customer numbers. The table will only show sales orders to be paid by customers within this range.
<b>Company No.</b>	In this field, you can enter a range of company numbers. Only sales orders assigned to a company within the specified range are shown in the table part.
<b>Department</b>	Here you can select a department. The table will only show sales orders from this department.

### Sales Orders Sub-Tab

This section includes the fields and descriptions for the Sales Orders sub-tab.

Field	Description
<b>Order No.</b>	This column shows the numbers of the sales orders ready to be invoiced. Maconomy only shows the sales orders specified in the target group fields in the card part. A sales order is ready to be invoiced when items have been delivered. The order numbers cannot be changed here.
<b>Customer No.</b>	This is the number of the customer to whom items were delivered. The number cannot be changed here.

Field	Description
<b>Name</b>	This is the first line of the customer's name. It cannot be changed here.
<b>Bill to Customer Cust. No.</b>	This is the number of the customer who will be invoiced for the sales order. The number cannot be changed here.
<b>Invoice Date</b>	Here you can enter the invoice date. If you leave the field blank, Maconomy inserts today's date. Maconomy verifies that the date is within the open posting interval. The open posting interval is specified in the System Information window in the Set-Up module.
<b>Invoice</b>	You mark this field for the sales order to be invoiced in a batch in the Print Invoice window. As described above, you can use the Selection Criteria to define which group of sales orders you wish to see in the table. You can always deselect individual orders here after defining the target group.  If a sales order is marked for invoicing, and you do not wish it to be invoiced, you must remove the mark here by clicking the field. Maconomy marks the field if the "Batch Invoice" field in the Sales Orders window is marked.
<b>Company No.</b>	This field shows the number of the company responsible for the current order.
<b>Department</b>	This is the department to which the sales order is assigned. You cannot change it here.
<b>Reference</b>	This field shows any note entered in the Reference field in the Sales Orders window. The text cannot be changed here.

## Crediting Listing Workspace

Use this workspace to view a list of credit orders that are ready to be credited—that is, credit orders that have been approved, but have not yet been credited.

In the Crediting Listing tab you specify the target group of credit orders, customers, and departments. The Credit Orders sub-tab displays the credit orders that are ready to be credited.

When you open this workspace, the Credit Orders sub-tab displays all of the uncredited credit orders. If you limit the target group in the Crediting Listing tab, the sub-tab displays only the target group credit orders. Credit orders that you approved after you open this workspace are not displayed here; however, Maconomy includes them in the crediting if you select the **Batch Credit** field in the Credit Orders workspace.

When you credit a credit order, Maconomy automatically creates a warehouse receipt based on the items that your customer is returning.

In the Credit Orders workspace, you can create and print a credit memo immediately after you create a credit order, using the **Print Credit Memo** action. This enables you to give quick service, if the customer returns the items personally and requires a credit memo.

If you create many credit orders daily, it is convenient to credit all of them in one operation, once a day. Use the Print Credit Memo workspace to do this. Before you start a batch crediting, it is

useful to go through the credit orders to make sure that you do not credit any by mistake. You do that in this workspace, where you can select the credit orders to credit in the Print Credit Memo workspace.

### Crediting Listing Tab

This section includes the fields and descriptions for the Crediting Listing tab.

#### Selection Criteria Island

Field	Description
<b>No. Orders</b>	This field show how many credit orders are ready to be credited. You can limit the quantity in the target group fields. You might, for example, have a large batch of credit orders to credit, which you wish to split into smaller portions. You cannot change the value manually.
<b>Order No.</b>	Here you can enter a range of credit order numbers. The table will only show orders within this range.
<b>Bill to Customer</b>	Here you can enter a range of customer numbers. The table will only show credit orders to customers within this range.
<b>Company No.</b>	In this field, you can enter a range of company numbers. Only credit orders assigned to a company within the specified range are shown in the table part.
<b>Department</b>	Here you can select a department. The table will only show credit orders from this department.

### Credit Orders Sub-Tab

This section includes the fields and descriptions for the Credit Orders sub-tab.

Field	Description
<b>Order No.</b>	This column shows the numbers of the credit orders ready to be credited. Maconomy only shows the credit orders specified in the target group fields in the card part. The order numbers cannot be changed here.
<b>Customer No.</b>	This is the number of the customer who returned the items. The number cannot be changed here.
<b>Name</b>	This is the first line of the customer's name. It cannot be changed here.
<b>Bill to Customer Cust. No.</b>	This is the number of the customer who will be credited. The number cannot be changed here.
<b>Credit Memo Date</b>	Here you can enter the credit memo date. If you leave the field blank, Maconomy inserts today's date.
<b>Credit</b>	You mark this field for the credit order to be credited in a batch in the Print Credit Memo window. As described above, you can use the Selection

Field	Description
	<p>Criteria to define which group of credit orders you wish to see in the table. You can always deselect individual orders here after defining the target group.</p> <p>If a credit order is marked for crediting, and you do not wish it to be credited, you must remove the mark here by clicking the field. Maconomy marks the field if the "Batch Credit" field in the Credit Orders window is marked.</p>
<b>Re. Invoice No.</b>	This is the invoice number, if the credit order is created from an invoice in the Invoice to Credit Order window. The number cannot be changed here.
<b>Company No.</b>	This field shows the number of the company responsible for the credit order in question.
<b>Department</b>	This is the department to which the credit order is assigned. You cannot change it here.
<b>Reference</b>	This field shows any note entered in the Reference field in the Credit Orders window. The text cannot be changed here.

## Invoicing on Account Workspace

Use this workspace to invoice a sales order on account; that is, you can apportion a sales order to several invoices.

This division is independent of any deliveries made for the sales order.

You can also invoice part of the order total before making the first delivery. Maconomy deducts the on-account amount the next time that the sales order is invoiced. You must approve the sales order before you can invoice it on account.

When you invoice a sales order on account, Maconomy creates an invoice journal in the G/L module. Maconomy updates all of the relevant G/L and customer accounts when you post the journal. If you have assigned the sales order to a job in the **Job No.** field, Maconomy transfers the sales figures to the job in the Job Cost module.

**Note:** You cannot invoice subscription orders on account in this workspace. You can do that in the Subscription Orders workspace in the Subscription module.

### Invoicing on Account Tab

This section includes the fields and descriptions for the Invoicing on Account tab.

#### Sales Orders Island

Field	Description
<b>Order No.</b>	This is the number of the sales order. If you cannot remember the number of a sales order, you can use the search functions in the Find menu. The number cannot be changed.

Field	Description
<b>Created on</b>	This is the date the sales order was created. The date cannot be changed manually.
<b>Order Total</b>	This is the sum of the item lines on the sales order. The value cannot be changed here.
<b>Currency</b>	This is the currency of the sales order. The currency cannot be changed here.

### Ship to Address Island

Field	Description
<b>Customer</b>	This is the number of the customer receiving the items on the sales order. The number cannot be changed here. The remaining lines of this field show the name and address of the ship-to customer. The text is retrieved from the sales order and cannot be changed here.
<b>Attn.</b>	This is the ship-to customer's attention person the person to whom shipping information is directed. The name is retrieved from the sales order and cannot be changed here.
<b>Country</b>	This is the ship-to customer's country. It is retrieved from the sales order and cannot be changed here.

### Customer Information Island

Field	Description
<b>Pmt. Terms</b>	<p>Here you can enter the payment terms of the sales order. Maconomy suggests the value from the sales order, but you can change it.</p> <p>If the payment terms of the sales order are changed when you invoice on account, the new payment terms will apply to later invoices, unless the payment terms are changed back again, either in the Invoicing on Account or Sales Orders window.</p> <p>If you change the payment terms, Maconomy verifies that you have permission to do so. Permission to change information about prices, and thus payment terms, is given to users individually in the window Actions in the Set-Up module.</p> <p>The payment terms appearing in this pop-up are defined in the Popup Fields window in the Set-Up module.</p>

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you choose the layout of the invoice when it is printed by selecting "Print Invoice." Unless you have added layouts in the window Print Layouts in the Set-Up module, "Standard" is the only option.

**Invoice on Account Island**

Field	Description
<b>%</b>	Here you enter how large a percentage of the order total you wish to invoice on account. Maconomy issues a warning if this figure is higher than 100% of the order total. However, this warning is not issued if the order total is exceeded as a result of invoicing the sales order on account more than once. If you enter both a percentage here and an amount in the "Amount" field, Maconomy calculates a percentage from the amount.
<b>Amount</b>	Here you enter how large an amount of the order total you wish to invoice on account. Maconomy verifies that this figure does not exceed the order total but if you invoice the sales order on account more than once, the figure is not cross checked.
<b>Description</b>	Here you enter a text to describe the invoice. Maconomy suggests "Invoice on Account," but you can change it. You must enter a text.
<b>Invoice Date</b>	Here you enter an invoice date. If you leave the field blank, Maconomy inserts today's date. Maconomy verifies that the date is within the open posting interval. The open posting interval is maintained in the System Information window in the Set-Up module.

**Billing Address Island**

Field	Description
<b>Bill to Customer</b>	This is the number of the customer receiving the invoice. The number cannot be changed here.  The other lines in this field show the name and address of the bill-to customer. The text is retrieved from the sales order and cannot be changed here.
<b>Attn.</b>	This is the bill-to customer's attention person the person to whom payment information is directed. The name is retrieved from the sales order and cannot be changed here.
<b>Country</b>	This is the bill-to customer's country. It is retrieved from the sales order and cannot be changed here.

**Company Island**

Field	Description
<b>Company No.</b>	This field shows the number of the company responsible for the current order. The value is transferred from the island Company on the order in question.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

## Print Invoice Workspace

Use this workspace to invoice a range of sales or subscription order numbers in one operation.

You can also use this workspace for blanket invoicing. Blanket invoicing means that you create one invoice that includes deliveries from different sales or subscription orders. You can also reprint invoices in this workspace. You can limit the printout to include only part of the sales or subscription orders that are ready for invoicing or a range of existing invoices.

You can print sales orders out directly in the Sales Orders workspace after you create and/or edit them, by using the **Print Invoice** action—for example if the customer is collecting the items in person and wants an invoice on the spot.

If you create many sales or subscription orders daily and perform an equal number of deliveries, it can be convenient to invoice all of the sales orders in one operation, once a day. You do this in this workspace, but before you start, it can be useful to go through the list of sales or subscription orders in the Invoicing Listing workspace, where you can deselect individual sales orders.

If you want to create invoices, Maconomy prints out an invoice for all sales or subscription orders that match the selection criteria. You can create a sales order invoice only if:

- You have not selected the **Invoice in Job Cost** field.
- The order is ready to be invoiced, that is, items have been delivered but have not been invoiced.
- You have selected the **Batch Invoice** field in the Sales Orders workspace or the **Invoice** field in the Invoicing Listing workspace.

To invoice a subscription order, you must first approve the subscription order by using the **Approve Order** action in the Subscription Orders workspace in the Subscription module. Maconomy ignores invoices that are based on blocked sales orders; you cannot print them out until you revoke the block in the Unblocking workspace. Similarly, Maconomy ignores invoices for customers who have been blocked or blocked for delivery.

When you invoice in this workspace, Maconomy automatically creates an invoice journal in the G/L module. The sales are posted to the relevant G/L accounts when the invoice journal is posted. If the sales involve a job, entered in the **Job No.** field in the Sales Orders workspace, Maconomy updates the job cards in the Job Cost module when the invoice journal is posted.

If the currency of the invoice is the same as the base currency of the company that is responsible for the invoice, Maconomy rounds the total invoice amount. However, Maconomy only does this if you specified a rounding unit for the current currency in the field **External Rounding Unit** in the Currency Rounding workspace in the Set-Up module. If this is the case, Maconomy rounds invoice amount totals to the specified unit. The printout of an invoice thus shows the total invoice amount as well as the amount that constitutes the rounding. When posting the invoice, Maconomy posts the rounding as follows: The customer (and thus the A/R Control Account) is debited the invoice total after the rounding, while a rounded amount, if any, is credited to or debited from the account for amount rounding, depending on whether the amount has been rounded up or down. The other entries that the invoice might cause are posted normally.

When you invoice a customer, Maconomy updates the customer's item range, which you can see in the Item Assortment workspace in the Inventory module. Maconomy copies the pricing combination group, quantity, price, and invoice date for each order line to the item's line in the customer's item range. If the item does not already exist in the customer's item range, Maconomy

creates it there. For bills of materials, it is the BOM itself, and not the item parts, that are Maconomy creates in the item range.

When you print new invoices, the printout only shows those lines where the quantity ordered is greater than zero. However, if you select the **Include zero amount lines on printouts** system parameter, the printout also includes lines that have an ordered quantity of zero.

You can reprint invoices that have already been printed. If you choose to reprint invoices, Maconomy prints an invoice for every existing invoice in the selection criteria. An existing invoice is only reprinted in this workspace if you deselect the **Printed** field in the Show Invoice workspace for the invoice in question or if you select the **Reprint** field in this workspace. Maconomy does not perform invoicing when reprinting, because the new printout should be considered a copy of the original one.

Note that the printout always leaves out lines where the quantity for packing is zero, whether you selected the system parameter or not. However, text lines (lines where no item number has been specified) are always included, even though the quantity ordered and for packing on text lines is zero.

If a customer payment mode on an order uses electronic collection, Maconomy creates the invoice journal without printing out the invoice unless you select the **Print Invoice** field for the customer payment mode in question in the Customer Payment Modes workspace in the Banking module. The invoice is, however, included on reprints.

## Print Invoice Tab

This section includes the fields and descriptions for the Print Invoice tab.

### Selection Criteria Island

Field	Description
<b>Invoice No.</b>	Here you can enter a range of invoice numbers of existing invoices. Maconomy will only reprint invoices numbered within this range.
<b>Order No.</b>	Here you enter a range of order numbers. Invoices will only be made and printed for sales orders within this range.
<b>Delivery Date</b>	In this field, you can specify a range of delivery dates. Only orders on which the latest date in the field "Last Delivery Date" occurring on the lines in the table part is within the specified range are created and printed out.
<b>Company No.</b>	In this field, you can enter a range of company numbers. The printout will only include invoices based on orders for which companies within the specified range are responsible.
<b>Bill to Customer</b>	Here you can enter a range of bill-to customer numbers. Invoices will only be made and printed for sales orders to be paid by customers within this range.
<b>Customer No.</b>	Here you can enter a range of ship-to customer numbers. Invoices will only be made and printed for sales orders for items to be delivered to customers within this range.

Field	Description
<b>Customer Group</b>	In this field, you can specify which customer group to include in the printout.
<b>Subscrip. Order No.</b>	In this field, you can specify a range of subscription order numbers. Maconomy will only create and print invoices with subscription order numbers within the specified range. The field only applies if the field "Create Subscription Invoices" is marked.
<b>Subscription No.</b>	In this field, you can specify a range of subscription numbers. Maconomy will only create and print invoices with subscription numbers within the specified range. The field only applies if the field "Create Subscription Invoices" is selected.
<b>Subscription Group</b>	In this field, you can select a subscription group. Maconomy will only create and print invoices to customers within the specified subscription group. The field only applies if the field "Create Subscription Invoices" is marked.
<b>Order Mode</b>	In this field, you can choose an order mode Maconomy will only create and print invoices with the specified order mode. This field only applies when creating invoices. It has no effect when reprinting invoices.
<b>Department</b>	Here you can select a department. Maconomy will only create and print invoices for sales orders from this department.
<b>Language</b>	In this field, you can select a language code. Maconomy will only create and print invoices for sales orders with the selected language code. You can use the language code to print invoices in different languages. Using Maconomy's layout editing tools, you can create different language layouts. The combination of language code and layout allows you to print invoices in different languages.
<b>Consignment No.</b>	In these fields, you can specify a range of consignment numbers. Maconomy will only create and print invoices for sales orders assigned to a consignment within the specified range.
<b>Destination No.</b>	In these fields, you can specify a range of destination numbers. Maconomy will only create and print invoices for sales orders with a destination number within the specified range.
<b>Consignment Date</b>	In these fields, you can specify a range of consignment dates. Maconomy will only create and print invoices for sales orders assigned to consignments with a consignment date within the specified range.
<b>Delivery Mode</b>	In this field, you can select a delivery mode. Maconomy will only create and print invoices for sales orders with the selected delivery mode.
<b>Delivery Terms</b>	In this field, you can select a code for delivery terms. Maconomy will only create and print invoices for sales orders with the selected delivery terms.
<b>Carrier</b>	In this field, you can select a carrier. Maconomy will only create and print invoices for sales orders with the selected carrier.

Field	Description
<b>Consignment Type</b>	In this field, you can select a consignment type. Maconomy will only create and print invoices for sales orders with the selected consignment type.
<b>Main Order No.</b>	In these fields, you can specify a range of order numbers. Maconomy will only create and print invoices for sales orders linked to a main order whose order number is within the specified range.
<b>Include Blanket Invoices</b>	If marked, orders that are blanket invoiced are included. The default is marked.

### Print Control Island

Field	Description
<b>Create Sales Order Invoices</b>	<p>Here you choose whether Maconomy is to create invoices for the sales orders in the target group, which are ready to be invoiced.</p> <p>If the field is marked, Maconomy will print an invoice for every sales order that matches the selection criteria and which is not marked in the field "Invoice in Job Cost," is ready to be invoiced, that is, items have been delivered but have not been invoiced, and marked in the field "Batch Invoice" in the window Sales Orders or in the field "Invoice" in the window Invoicing Listing.</p>
<b>Create Subscription Invoices</b>	<p>Mark this field if you wish to create subscription invoices for subscriptions that match the selection criteria and are ready for invoicing. However, only subscriptions belonging to subscription orders where the field "Batch Invoice" has been marked are included in the batch invoicing.</p> <p>If you do not mark this field, the fields "Subscrip. Order No.," "Subscrip. Number," and "Subscription Group" will be ignored.</p>
<b>Incl. Printed</b>	<p>If you mark this field, Maconomy will print invoices which have already been created and which meet the target group specifications.</p> <p>If you do not mark the field, Maconomy will only reprint invoices for which the "Printed" field in the Show Invoice window in the Accounts Receivable module is blank.</p>
<b>Preferred Inv. Date</b>	In this field, you can state a preferred invoice date. If a date is stated, this date will be used as invoice date on the invoices that are created.
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

## Actions

This section shows the Actions available in the Print Invoice workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print invoices.

## Print Credit Memo Workspace

Use this workspace to print a range of credit orders in one operation and to reprint credit memos.

You can limit the printout to only include some of the credit orders that are ready to be credited, or a specific range of existing credit memos to be reprinted.

You can print credit orders directly in the Credit Orders workspace after you create and/or edit them. Use the **Print Credit Memo** action, for example if a customer is returning the items in person and wants a credit memo on the spot.

If you create many sales orders daily, it is convenient to credit them all in one operation, once a day. You do that in this workspace, but before you start, it can be useful to go through the list of orders. You can do this in the Crediting Listing workspace, where you can deselect individual credit orders.

If you want to create credit memos, Maconomy prints a credit memo for every credit order in the target group for which the **Credit in Job Cost** field is not selected or is ready to be credited, that is, it is approved and selected for batch crediting in the Credit Orders workspace or in the Crediting Listing workspace. If the credit memo date of a credit memo is outside the open posting period, the current credit memo is not included on the printout.

When you create an invoice in this workspace, Maconomy automatically creates an item and an invoice journal in the G/L module. The item journal contains G/L entries for the increased inventory value of the returned items, and the invoice journal contains G/L entries for the amounts credited to the customer. Maconomy updates the relevant G/L accounts when you post the two journals. If you select the **Automatic posting of invoices** system parameter, Maconomy posts the invoice journal automatically when you print the invoice. If do not select that system parameter, you must post the invoice journal in the Posting workspace in the G/L module.

If the currency of the credit memo is the same as the base currency of the company that is responsible for the credit memo, Maconomy rounds the total credit memo amount in the **Total, (incl. charges)** field. However, this is only done if you enter a rounding unit for the current currency in the **External Rounding Unit** field in the Currency Rounding workspace in the Set-Up module. If this is the case, Maconomy rounds credit memo totals to the specified unit. The printout of a credit memo thus shows the total credit memo amount as well as the amount that constitutes the rounding. When you post the credit memo Maconomy posts the rounding as follows: The customer (and thus the A/R Control Account) is credited with the credit memo total after the rounding, while a rounded amount, if any, is debited from or credited to the account for amount rounding, depending on whether the amount has been rounded up or down. The other entries that might result from the credit memo are posted normally. You specify the amount rounding account by using a dimension combination in the Posting References workspace in the G/L module.

When you print credit memos, the printout only shows those lines where the quantity credited is greater than zero. However, if you select the **Include zero amount lines on printouts** system parameter, the printout also includes lines that have a credited quantity of zero.

You can reprint credit memos that you have already printed. If you choose to reprint credit memos, Maconomy prints a memo for every existing credit memo that matches the selection criteria. Maconomy only reprints an existing credit memo in this workspace if you deselect the **Printed** field in the Show Credit Memo workspace for the credit memo in question, or if you select the **Reprint** field in this workspace. Maconomy does not create any crediting when it reprints the credit memo, because the new printout is considered a copy of the original one.

Note that the printout always includes text lines (lines where no item number has been specified), even though the quantity credited on text lines is zero.

If the customer payment mode on a credit order uses electronic collection, Maconomy creates the relevant entries in the invoice journal without printing out the credit memo, unless you select the **Print Invoice** field for the customer payment mode in question in the Customer Payment Modes workspace in the Banking module. The credit memo is, however, included on reprints.

Maconomy uses the company name and address of the responsible company on the printout. However, using Maconomy's layout editing tools, you can change this to the name and address of the settling company.

## Print Credit Memo Tab

This section includes the fields and descriptions for the Print Credit Memo tab.

### Selection Criteria Island

Field	Description
<b>Credit Memo No.</b>	Here you can enter a range of credit memo numbers of existing credit memos. Maconomy will only reprint credit memos numbered within this range.
<b>Cred. Order No.</b>	Here you enter a range of order numbers. Credit notes will only be made and printed for credit orders within this range.
<b>Bill to Customer</b>	Here you can enter a range of bill -to customer numbers. Credit notes will only be made and printed for credit orders to bill-to customers within this range.
<b>Company No.</b>	In this field, you can enter a range of company numbers. The printout will only include credit memos based on credit orders for which companies within the specified range are responsible.
<b>Customer No.</b>	Here you can enter a range of ship-to customer numbers. Credit notes will only be made and printed for credit orders to ship-to customers within this range.
<b>Department</b>	Here you can select a department. Credit notes will only be made and printed for credit orders from this department.
<b>Language</b>	Here you can select a language code. Credit notes will only be made and printed for credit orders with this language code.

Field	Description
	You can use the language code to print credit memos in different languages. You can use Maconomy's layout editing tools to create different language layouts. The combination of language code and layout allows you to print credit memos in different languages.

### Print Control Island

Field	Description
<b>Create Credit Memos</b>	<p>Here you choose whether Maconomy is to create credit memos for those credit orders in the target group which are ready to be credited and do not refer to subscription orders.</p> <p>If the field is marked, Maconomy automatically creates an item and an invoice journal in the G/L module. The item journal has G/L entries for the increased inventory value of the returned items, and the invoice journal has G/L entries for the amounts credited to the customer. The relevant G/L accounts are updated when the two journals are posted.</p>
<b>Crate Subs. Credit Orders</b>	In this field, you can specify whether Maconomy should create credit memos for those credit orders that refer to subscription orders that match the selection criteria and marked for crediting. However, credit memos are not printed for those credit orders where the field "Credit in Job Cost" is marked. Furthermore, only subscriptions belonging to subscription orders where the field "Batch Credit" has been marked are included in the batch invoicing.
<b>Incl. Printed</b>	<p>If you mark this field, Maconomy will print credit memos which have already been created and which meet the target group specifications.</p> <p>If you do not mark the field, Maconomy will only reprint credit memos for which the "Printed" field in the Show Credit Memo window is blank.</p>
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

### Actions

This section shows the Actions available in the Print Credit Memo workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print range of credit orders in one operation.

## Print Main Order Invoice Workspace

Use this workspace to print combined invoice information about main orders and the suborders that are linked to them.

The printout only includes invoiced orders to which suborders are linked. The printout sums information from invoices that you already created; printing a main order invoice does not cause any invoicing to occur. You invoice main orders and the individual suborders separately or in the Print Invoice workspace before you include them in printouts from this workspace.

You can use selection criteria to choose the main orders for which you want to print information. Note that if a main order matches the selection criteria, all suborders that are linked to the main order in question are printed, regardless of whether the suborders match the criteria.

### Print Main Order Invoice Tab

This section includes the fields and descriptions for the Print Main Order Invoice tab.

#### Selection Criteria Island

Field	Description
<b>Order No.</b>	In these fields, you can specify a range of sales order numbers. Maconomy will only print main order invoices for main orders within the specified range.
<b>Main Order No.</b>	In these fields, you can specify a range of sales order numbers. Maconomy will only print main order invoices for main orders within the specified range.
<b>Ship to Customer</b>	In these fields, you can enter a range of ship-to customer numbers. Maconomy will only print main order invoices for main orders for ship-to customers within this range.
<b>Bill to Customer</b>	In these fields, you can enter a range of bill-to customer numbers. Maconomy will only print main order invoices for main orders for bill-to customers within this range.
<b>Destination No.</b>	In these fields, you can specify a range of destination numbers. Maconomy will only print main order invoices for main orders going to a destination within the specified range.
<b>Delivery Mode</b>	In this field, you can select a delivery mode. Maconomy will only print main order invoices for main orders with the selected delivery mode.
<b>Delivery Terms</b>	In this field, you can select a code for delivery terms. Maconomy will only print main order invoices for main orders with the selected delivery terms.
<b>Carrier</b>	In this field, you can select a carrier. Maconomy will only print main order invoices for main orders with the selected carrier.
<b>Order Mode</b>	In this field, you can select the order mode with which the potential order would be placed. Based on the value in this field and the other information specified in this island, Maconomy calculates a price and delivery date, any discounts that the potential purchase would trigger, and so on. The

Field	Description
	results of this calculation are shown in the island Results. If an order mode has been specified on the current customer's information card, Maconomy suggests this order mode, but you can select another order mode here.
<b>Consignment Type</b>	In this field, you can select a consignment type. Maconomy will only print main order invoices for main orders with the selected consignment type.
<b>Consignment Date</b>	In these fields, you can specify a range of consignment dates. Maconomy will only print main order invoices for main orders assigned to a consignment with a consignment date within the specified range.
<b>Consignment No.</b>	In these fields, you can specify a range of consignment numbers. Maconomy will only print main order invoices for main orders assigned to a consignment within the specified range.

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option. This layout shows the items and charges invoiced for the main order and its suborders. For each item and charge, a line with totals for the item or charge in question is printed. The printed amounts are displayed in the currency of the main order.

### Actions

This section shows the Actions available in the Print Main Order Invoice workspace.

#### Top Tab

Field	Description
<b>Print</b>	Use this action to print combined invoice information about main orders and the suborders linked to them.

## Lookup Section

This section includes the fields and descriptions for the Lookup section workspaces.

### Sales Calculation Workspace

Use this workspace to calculate prices and delivery dates for potential orders without actually creating the orders.

The functionality of this workspace is useful when, for example, a customer wants to place an order, provided that the goods can be delivered within a certain time frame. In the Quote and Sales Orders workspaces, you can only determine the delivery dates by actually creating a quote

or an order and a number of item lines, but in this workspace, you can have Maconomy provide the necessary price and delivery information without creating a quote or an order.

You can browse through the existing customers. If a given customer wants an estimate of the price of a certain quantity of a given item, or a guarantee that the items can be delivered before a certain date, you can enter the item number while the customer in question is shown in the workspace. After you have also entered the quantity, preferred delivery date, and other details that can influence the price and delivery time, Maconomy calculates the item's price, delivery date, discounts, and so on. Maconomy performs the calculations using the same methods as when normally entering item lines on, for example, sales orders.

If the customer decides to place the order based on the information in the workspace, you must create the order independently as a quote or sales order in the one of the Quote or Sales Orders workspaces.

### Sales Calculation Tab

This section includes the fields and descriptions for the Sales Calculation tab.

#### Customer Information Island

Field	Description
<b>Customer</b>	This field shows the number of the current customer. The other lines show the customer's name and address from the customer information card. The information cannot be changed here.
<b>Blocked for Delivery</b>	This field shows whether the current customer has been blocked for delivery. The information cannot be changed here.
<b>Customer Type</b>	This field shows the customer type of the current customer. The information is retrieved from the customer information card and cannot be changed here.
<b>Customer Group</b>	This field shows the customer group of the current customer. The information is retrieved from the customer information card and cannot be changed here.
<b>Language</b>	This field shows the language of the current customer. The information is retrieved from the customer information card and cannot be changed here.
<b>Enterprise</b>	This field shows the enterprise to which the current customer is assigned. The information is retrieved from the customer information card and cannot be changed here.
<b>Segment</b>	This field shows the segment to which the current customer belongs. The information is retrieved from the customer information card and cannot be changed here.
<b>Area</b>	This field shows the area to which the current customer belongs. The information is retrieved from the customer information card and cannot be changed here.

Field	Description
<b>Currency</b>	This field shows the currency used by the current customer. The information is retrieved from the customer information card and cannot be changed here.
<b>Price List</b>	This field shows the price list used in connection with the current customer. The information is retrieved from the customer information card and cannot be changed here.
<b>Price Step</b>	This field shows the price step to which the current customer belongs. The information is retrieved from the customer information card and cannot be changed here.
<b>Destination No.</b>	This field shows the destination number used in connection with the current customer. The information is retrieved from the customer information card and cannot be changed here.

### Calculation Basis Island

Field	Description
<b>Quantity</b>	In this field, enter the requested quantity of the current item. Based on the value in this field and the other information specified in this island, Maconomy calculates a price and delivery date, and any discounts that the potential purchase would trigger, and so on. The results of this calculation are shown in the island Results.
<b>Pref. Deliv. Date</b>	In this field, you can enter a preferred delivery date. Based on the value in this field and the other information specified in this island, Maconomy calculates a price and delivery date, and any discounts that the potential purchase would trigger, and so on. The results of this calculation are shown in the island Results. The calculation of a delivery date is based on the information registered for the item's main warehouse in the table part of the item information card. Maconomy suggests today's date in this field, but you can enter another date.
<b>Price List</b>	In this field, you can select a price list. Based on the value in this field and the other information specified in this island, Maconomy calculates a price and delivery date, any discounts that the potential purchase would trigger, and so on. The results of this calculation are shown in the island Results. If a price list has been specified on the current customer's information card, Maconomy suggests this price list, but you can select another price list here.
<b>Price Step</b>	In this field, you can enter a price step. Based on the value in this field and the other information specified in this island, Maconomy calculates a price and delivery date, any discounts that the potential purchase would trigger, and so on. The results of this calculation are shown in the island Results. If a price step has been specified on the current customer's information card, Maconomy suggests this price step, but you can select another price step here.
<b>Currency</b>	In this field, you can select the currency in which the calculated prices should be shown. Based on the value in this field and the other information specified in

Field	Description
	this island, Maconomy calculates a price and delivery date, any discounts that the potential purchase would trigger, and so on. The results of this calculation are shown in the island Results. If a currency has been specified on the current customer's information card, Maconomy suggests this currency, but you can select another currency here.
<b>Order Mode</b>	In this field, you can select the order mode with which the potential order would be placed. Based on the value in this field and the other information specified in this island, Maconomy calculates a price and delivery date, any discounts that the potential purchase would trigger, and so on. The results of this calculation are shown in the island Results. If an order mode has been specified on the current customer's information card, Maconomy suggests this order mode, but you can select another order mode here.
<b>Enterprise</b>	In this field, you can select the enterprise on which the calculation should be based. Based on the value in this field and the other information specified in this island, Maconomy calculates a price and delivery date, any discounts that the potential purchase would trigger, and so on. The results of this calculation are shown in the island Results. If an enterprise has been specified on the current customer's information card, Maconomy suggests this enterprise, but you can select another enterprise here.
<b>Segment</b>	In this field, you can select the segment on which the calculation should be based. Based on the value in this field and the other information specified in this island, Maconomy calculates a price and delivery date, any discounts that the potential purchase would trigger, and so on. The results of this calculation are shown in the island Results. If a segment has been specified on the current customer's information card, Maconomy suggests this segment, but you can select another segment here.
<b>Area</b>	In this field, you can select the area on which the calculation should be based. Based on the value in this field and the other information specified in this island, Maconomy calculates a price and delivery date, any discounts that the potential purchase would trigger, and so on. The results of this calculation are shown in the island Results. If an area has been specified on the current customer's information card, Maconomy suggests this area, but you can select another area here.
<b>Warehouse</b>	In this field, you can select the warehouse on which the calculation should be based. Based on the value in this field and the other information specified in this island, Maconomy calculates a price and delivery date, any discounts that the potential purchase would trigger, and so on. The results of this calculation are shown in the island Results. If a warehouse has been specified on the current customer's information card, Maconomy suggests this warehouse, but you can select another warehouse here.
<b>Destination No.</b>	In this field, you can specify the destination to which the items in the potential order should be delivered, and on which the calculation should therefore be based. Based on the value in this field and the other information specified in this island, Maconomy calculates a price and delivery date, any discounts that the potential purchase would trigger, and so on. The results of this calculation are

Field	Description
	shown in the island Results. If a destination has been specified on the current customer's information card, Maconomy suggests this destination, but you can select another destination here.

### Profit Island

Field	Description
<b>Base Currency</b>	This field shows the currency in which the profit amounts are shown.
<b>Cost</b>	This field shows the cost price of the current calculation.
<b>Gross Ratio</b>	This field shows the gross ratio of the current calculation.
<b>Profit Margin</b>	This field shows the profit margin of the current calculation.

### Company Island

Field	Description
<b>Company No.</b>	In this field, you can enter a company number. If the customer shown in the window is not assigned to a settling company, the price calculation will be made as if the company in this field were the settling company of the customer.  If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.
<b>Name</b>	This field shows the name of the company entered in the field "Company No." above.

### Item Information Island

Field	Description
<b>Item No.</b>	In this field, enter the number of the item whose price and delivery date you want to calculate. If you enter an item number in this field, and other information which may influence the price and delivery date in the island Calculation Basis, Maconomy will calculate the price and delivery date and show the result in the island Results. In order for any results to be shown, you must enter an item number in this field and a quantity different from 0 in the field "Quantity" in the island Calculation Basis.
<b>Description 1-3</b>	These fields show the descriptions entered in the three item description fields on the item information card of the current item. The information cannot be changed here.

Field	Description

## Results Island

Field	Description
<b>Unit Price</b>	<p>This field shows the unit price which Maconomy calculated for the item in the field "Item No." in the island Item Information. The price was calculated on the basis of the information specified in the island Calculation Basis.</p> <p>If a price list was selected for the current calculation, and a price exists for the current item in this price list, Maconomy will suggest the unit price from the price list in this field.</p> <p>If the requested quantity justifies a quantity discount, or if a fixed price step has been specified on the quote, the unit price suggested in this field will be the price on the price step in question as specified in the window Quantity Discounts in the Inventory module. However, the suggested price can be changed here, causing Maconomy to recalculate the other price related fields in this island accordingly.</p>

Field	Description
	If the item is not included in the price list, or if you have not selected a price list for in the island Calculation Basis, Maconomy suggests the current cost of the item at the warehouse in question and adds the gross margin percentage, both of which are retrieved from the item's information card.
<b>Discount %</b>	This field shows the discount percentage calculated for the item in the field "Item No." in the island Item Information. The discount percentage was calculated on the basis of the information specified in the island Calculation Basis. However, the suggested discount percentage can be changed here, causing Maconomy to recalculate the other price related fields in this island accordingly. However, if you enter both a discount percentage in this field and a discount amount in the field "Discount," Maconomy will automatically adjust the discount percentage according to the specified unit price and the discount amount.
<b>Discount</b>	This field shows the discount amount calculated for the item in the field "Item No." in the island Item Information. The discount amount was calculated on the basis of the information specified in the island Calculation Basis. However, the suggested discount amount can be changed here, causing Maconomy to recalculate the other price related fields in this island accordingly. However, if you enter both a discount percentage in this field and a discount percentage in the field "Discount %," Maconomy will automatically adjust the discount percentage according to the specified unit price and the discount amount specified in this field.
<b>Quantity Disc.</b>	This field shows the quantity discount calculated for the item in the field "Item No." in the island Item Information. The discount amount was calculated on the basis of the information specified in the island Calculation Basis. The quantity discount is a discount amount representing the difference between the price of the item on the first price step in the price list in question and the unit price in the field "Unit Price" multiplied by the quantity and divided by the price unit.
<b>Total Price</b>	This field shows the total price calculated for the item in the field "Item No." in the island Item Information. The amount was calculated on the basis of the information specified in the islands Item Information and Calculation Basis.
<b>Price List</b>	This field shows the price list calculated for the item in the field "Item No." in the island Item Information. The price list was found on the basis of the information specified in the islands Calculation Basis and Item Information.
<b>Price Step</b>	This field shows the price step reached in the calculation The price step was calculated on the basis of the information specified in the islands Calculation Basis and Item Information.
<b>Price at Step 1</b>	This field shows the price at step 1 calculated for the item in the field "Item No." in the island Item Information. The price list was found on the basis of the information specified in the islands Calculation Basis and Item Information.
<b>Delivery Date</b>	This field shows the delivery date calculated for the item in the field "Item No." in the island Item Information. The date was calculated on the basis of the information specified in the islands Calculation Basis and Item Information.

**Settling Company Island**

Field	Description
<b>Company No.</b>	This field shows the number of the settling company of the current customer.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

## Show Packing Slip Workspace

Use this workspace to view information about packing slips.

A packing slip is a confirmation that items have been delivered to a customer.

You can split a sales order into different deliveries, if partial delivery has been permitted in the Sales Orders workspace. The Sales Orders workspace shows how many items in each item line have been delivered, but not a specification of each delivery, that is, which items were delivered when.

Using the search functions in the Find menu, you can retrieve a packing slip in this workspace and see relevant (partial) delivery information. It is often easier to retrieve the information in Maconomy than to look for a printout in your files.

You can also print packing slips in batches. This saves time if you must reprint old packing slips because of a faulty printer or because they are lost. To reprint packing slips, you must deselect the **Printed** field in the Packing Slip island. You cannot change any information in the workspace; it is purely for reference.

### Show Packing Slip Tab

This section includes the fields and descriptions for the Show Packing Slip tab.

**Ship to Address Island**

Field	Description
<b>Customer</b>	This is the number of the customer who received the delivery. The other lines in this field show the customer's name and address. The information is retrieved from the sales order.
<b>Attn.</b>	This is the customer's attention person the person to whom shipping information is directed. The information is retrieved from the sales order.
<b>Country</b>	This is the customer's country. It is retrieved from the sales order.
<b>Reference</b>	This field shows any note entered in the Reference field on the sales order.

**Company Island**

Field	Description
<b>Company</b>	<p>This field shows the number of the company responsible for the current packing slip. The value is transferred from the island Company on the order to which the packing slip is assigned.</p> <p>This field also shows the name of the specified company.</p>

**Extra Fields Island**

Field	Description
<b>Popup 1-5</b>	These fields show the values of the corresponding fields in the sales order which is the basis for this packing slip.

**Packing Slip Island**

Field	Description
<b>Packing Slip No.</b>	This is the number of the packing slip. If you cannot remember the number of a packing slip, you can use the search functions in the Find menu. You determine the packing slip numbers series in the Numbers window in the Set-Up module.
<b>Printed</b>	<p>This field shows whether the packing slip has been printed. If you wish to reprint it, you must remove the mark. You can then reprint it using the "Print..." function in the File menu.</p> <p>The reprint does not cause any inventory movement. It is merely a copy of the original print.</p>
<b>Order No.</b>	This is the number of the sales order.
<b>Invoice No.</b>	If the delivery is invoiced, this field shows the invoice number.
<b>Job No.</b>	If the order is assigned to a job, this field shows the job number in question.
<b>Version</b>	This is the sales order version effective when the packing slip was created. The value cannot be changed here.
<b>Delivery Date</b>	This is the date the items were delivered.
<b>Weight</b>	This is the total weight of the delivery. Delivery weights are registered by Maconomy automatically.
<b>Volume</b>	This is the total volume of the delivery. Delivery volumes are registered by Maconomy automatically.
<b>Area</b>	This is the total area of the delivery.

Field	Description
<b>Package</b>	This is the number of packages in the delivery. This quantity is specified in the window Packing Lists.
<b>Warehouse</b>	This is the warehouse the items were delivered from. The information is retrieved from the sales order.
<b>Handled by</b>	This is the name of the warehouse employee who packed and delivered the items. The name can be entered in the window Packing Lists.
<b>Bill of Lading No.</b>	If a bill of lading number has been specified on the current sales order, it is shown in this field.
