	<p>may require that the invoice is edited in the window Invoice Editing before being printed.</p> <p>If the current job is a main job, and the job's invoice layout rule specifies "Main Job Invoicing" and "Main Job Invoice Selection," selecting this action will include all subjobs of the current main job which are to be blanket invoiced on the main job. If the current job is a subjob to a main job with the above setup, this action cannot be selected. For more information, please see the description of the window Invoice Layout Rules.</p> <p>If split billing is used, that is, multiple bill-to customers are specified for the job in the window Bill to Customer Distribution, an invoice for each bill-to customer is printed when you select this action. Each of these can be edited in the window Invoice Editing. At the subsequent posting of the invoice journal, Maconomy uses the following posting references specified for the department of the individual bill-to customer: "Sales Nontaxable," "Sales Taxable," "Export Sales," "Invoice Discount," "Invoiced on Account," "Customer Exchange Rate Variance," and "Amount Rounding." The remaining posting references are taken from the department of the job. Please note that when distributing the billing price of the invoice lines on customers, a small rounding correction may be made on one of the invoice lines. However, the total billing price will not change. For more information, please see the description of the window Bill to Customer Distribution.</p> <p>A user can only print an invoice in this window if the field "Can Print Invoice" in the window Actions in the Set-Up module is marked for the user in question.</p> <p>When you print the invoice, Maconomy creates an invoice journal in the G/L module, so that the relevant accounts in the general ledger and accounts receivable are updated when the invoice journal is posted. If the system parameter "Automatic posting of invoices" is marked, the invoice journal is posted automatically when it is printed. If that system parameter is not marked, the invoice journal must be posted in the G/L module. If you wish to reprint an invoice, select "Print This" in the File menu in the window Show Job Invoice.</p> <p>The invoice is printed according to the invoice layout rule selected for the current job. See the description of the window Invoice Layout Rules for a description of invoice layout rules.</p> <p>Invoices to be collected electronically are only printed if the customer payment mode selected for the job has a mark in the field "Print Invoice." The customer payment mode is selected for a job in the window Job Information, and the customer payment mode is set up in the window Customer Payment Modes in the Banking module.</p> <p>If the invoice causes the reconciliation of one or several invoices on account or credit memos on account, and the system parameter "Print on account spec. on invoice/credit memo" is marked, a specification of which invoices on account and/or credit memos on account are reconciled is printed on the invoice. The reconciliation can be controlled in the window Job Invoices On Account.</p> <p>When you print an invoice that has a document archive, it is reassigned to the finalized invoice.</p>

Field	Description
<b>Print Credit Memo</b>	<p>This action is available whenever a draft credit memo exists on the job which has been approved for invoicing.</p> <p>When you select this action, you create and print a credit memo on the basis of the credit memo selection in the window.</p> <p>When you print the credit memo, Maconomy creates an invoice journal in the G/L module, so that the relevant accounts in the General Ledger and accounts receivable are updated when the invoice journal is posted. If the system parameter "Automatic posting of invoices" is marked, the invoice journal is posted automatically when it is printed. If this system parameter is not marked, the invoice journal must be posted in the G/L module. If you wish to reprint a credit memo, select "Print This" in the File menu in the window Show Job Credit Memo.</p> <p>It is only possible to select this action if the current credit memo selection has been approved using the action "Approve Credit Memo Selection" or "Approve for Crediting on Account," and if the value in the field "Billing Price, Total" is negative. Moreover, the credit memo selection must have been approved in the window Invoice Editing if the job's job parameter of the type "Invoice Approval" specifies that invoice editing is required.</p> <p>If the current job is a subjob to a main job for which the main job's invoice layout rule specifies "Main Job Invoicing," this action cannot be selected.</p> <p>If split billing is used, that is, multiple bill-to customers are specified for the job in the window Bill to Customer Distribution, a credit memo for each bill-to customer is printed when you select this action. For more information, please see the description of the window Bill to Customer Distribution.</p> <p>A user can only print an invoice in this window if the field "Can Print Invoice" in the window Actions in the Set-Up module is marked for the user in question.</p> <p>The credit memo is printed according to the invoice layout rule selected for the current job. See the description of the window Invoice Layout Rules for a description of invoice layout rules.</p> <p>If the credit memo pertains to a job invoice which has reconciled one or several invoices on account or credit memos on account, the invoices on account or credit memos on account in question are reopened. If the system parameter "Print on account spec. on invoice/credit memo" is marked, a specification of which invoices on account and/or credit memos on account are affected is printed on the credit memo.</p> <p>Please note that the credit memo will not be printed if the customer payment mode selected for the job has a mark in the field "Electronic Collection," but has no mark in the field "Print Invoice" in the window Customer Payment Modes in the Banking module. In this case, the credited amount will be offset in the next electronic collection.</p>
<b>Rederive Tax Code</b>	<p>If the setup for the derivation of a tax code has been changed since the job entries were created, you can select this action to rederive the tax code of the job entries in the table part. All open job entries are updated with the tax reporting code selected for the job.</p> <p>When you select this action, any approval of the invoice selection is removed.</p>

Field	Description
	<p>The action is not available when the invoice selection is closed. When the invoice selection is open, and drafts exist on the job, this action only affects job entries that are available in the present invoice selection. In other words, the action does not include job entries that are for invoicing on a draft.</p>
<b>Invoice to Credit Memo</b>	<p>This action is only available when the invoice selection is open, and no drafts exist on the job. When you have created a draft to credit an invoice, you cannot create multiple drafts until you have completed the crediting by printing the credit memo (or deleted the draft to cancel the crediting).</p> <p>When you select this action, Maconomy creates a credit memo selection based on the job invoice number you have specified in the field "From Invoice No." in the card part of the window. If the job invoice number specified pertains to an invoice on account, this is credited by the amount specified in the field "On Account Reduction." If that field is empty, the total open amount on the invoice on account is credited, that is, the amount not yet reconciled by a job invoice or a previous job credit memo on account.</p> <p>A credit note must be in the same currency as the original invoice on account. This means that Maconomy requires the invoice currency on the bill-to customer of the original invoice on account to match the invoice currency of the original invoice. The bill-to customer must also be specified directly on the job.</p> <p>If the invoice to be credited is on account and has been closed through Job Invoice Allocation, then the job invoice allocation will automatically be reverted, and the corresponding Job Invoice Allocation journal will be created.</p> <p>Note that if the system parameter "Allow Multiple Credit Memos Per Invoice" has not been marked, it is only possible to make one credit memo per invoice. If that system parameter is marked, Maconomy will issue an alert if you attempt to make a second credit memo on the basis of a job invoice of which a part has already been credited.</p> <p>If you mark the field "Restore Job Entries," you can also reverse the job entries on which the invoice was based, returning the status of the job to the way it was before the invoicing was made. The job entries on which the job entry was based are shown in the window Itemize Invoice Selection, where the values for invoicing appear as they did on the job invoice, only in negative figures. In a similar way, previously reconciled job invoices on account and job credit memos on account are reopened if they have been reconciled by the job invoice number specified in the field "From Invoice No." This can be seen in the window Job Invoices On Account.</p> <p>If the field "Restore Job Entries" has not been marked, Maconomy will create job entries with the same amounts and quantities, only in negative figures. These job entries will be unposted with a mark in field "Dir. Inv." In a similar way, any previously reconciled job invoices on account and job credit memos on account will not be reopened.</p> <p>Regardless of whether the field "Restore Job Entries" has been marked, Maconomy resets the quantities and amounts on those entries shown in the table part of the window Itemize Invoice Selection which have no connection to</p>

Field	Description
	<p>the job invoice in question. This way, job crediting can be done by simply selecting the functions “Invoice to Credit Memo” and “Print Credit Memo.”</p> <p>If the invoice number in the field “From Invoice No.” is a blanket invoice which involves a main job, and the main job’s invoice layout rule specifies “Main Job Invoicing” and “Main Job Invoice Selection,” the credit memo will include all job entries in the main job/subjob structure invoiced on the blanket invoice. If “Main Job Invoice Selection” is not selected for the main job, this action must be selected for each job referenced in the blanket invoice you want to convert to a credit memo.</p> <p>Moreover, you should note that if a job entry on an invoice belongs to a job that has been transferred to other dimensions in the window Job Transfer on a transfer date which is after the entry date of the current entry, the invoiced amount will be suggested for crediting on a job entry in the department to which the job has been transferred, that is, the job with the new dimensions. If the job entry on the invoice has been transferred to new dimensions, that is, to a new department, the amount for crediting will be suggested on this job entry. See the introduction of the window Job Transfer for more information about the possibility of transferring jobs.</p>
<b>Undo Invoice to Credit Memo</b>	You can use this action to bring the job out of the state of crediting if the Invoice to Credit Memo has been faulty applied.
<b>Remove Latest Draft</b>	<p>Use this action to remove the current draft invoice and save it as a previous edit. If the draft invoices has a document archive, it remains attached to the previous edit. unless the invoice is a blanket invoice.</p> <p>The previous edit overwrites any existing previous edits. Any document archive for the deleted previous edit is no longer attached to any invoice, but continues to exist in the Documents and Notes workspace.</p>
<b>Remove All Drafts</b>	<p>Use this action to remove the current draft invoice and save it as a previous edit. If the draft invoice has a document archive, it remains attached to the previous edit, unless the invoice is a blanket invoice.</p> <p>The previous edit overwrites any existing previous edits. Any document archive for the deleted previous edit is no longer attached to any invoice, but continues to exist in the Documents and Notes workspace.</p>

## On Account Invoice Selection Single Dialogs Workspace

Use this workspace to specify and approve amounts for pre-invoices and invoicing on account.

This workspace provides a more detailed view and a breakdown of the **Amount for Invoicing on Account** field from the Invoice Selection workspace.

Because this workspace provides a detailed view of on account invoice amounts, you can use it to review and approve on account invoices without going to the Invoice Editing workspace.

## On Account Invoice Selection Tab

This section includes the fields and descriptions for the On Account Invoice Selection tab.

## Job Island

Field	Description
<b>Job</b>	This field shows the name of the job selected for invoicing on account.

## Customer Island

Field	Description
<b>Customer</b>	This field shows the name and number of the customer. The name of the bill-to customer is shown in the line below.
<b>Bill to Customer</b>	This field shows the name and number of the customer to whom the invoice should be sent. The name of the bill-to customer is shown on the line below.

## Invoice Island

Field	Description
<b>Invoice Type</b>	<p>Use this field to specify the type of invoice to approve when you approve the invoice selection. The available options include:</p> <ul style="list-style-type: none"> <li>■ T&amp;M</li> <li>■ On Account</li> <li>■ T&amp;M and On Account</li> <li>■ Pre-Invoice — Select this option to instruct Maconomy to create a pre-invoice instead of an invoice on account or a time and material invoice. If a job is set up for pre-invoicing by default, Maconomy automatically populates the <b>Invoice Type</b> field with <b>Pre-Invoice</b> when you enter a positive amount in the <b>Total</b> field.</li> </ul> <p>If a job is not set up for pre-invoicing, this invoice type cannot be selected.</p>
<b>Combine T&amp;M, On Account by Default</b>	Select this check box to combine T&M with On Account by Default. If this check box is selected, the Invoice Type field switches to T&M and On Account when you set an amount for invoicing on account.
<b>Preferred Invoice Date</b>	In this field, you can enter the preferred invoice date. The date must be within the open posting interval, which is specified in the window System Information in the Set-Up module. If you do not enter a date, Maconomy inserts the current date when the invoice is printed.

Field	Description
	<p>If the job is assigned the job parameter type "Invoice Approval" in which the job parameter attribute "Pref. Inv. Date From Plan" has been given the value "Yes," and if an invoice plan has been created for the job in question, the date in this field will be transferred from the assigned invoicing plan when you select the action "Transfer Invoicing Plan" in the Action menu. If the plan consists of several invoicing plan lines, Maconomy will use the date specified on the line most recently created. The date considered for invoicing plan lines with job phases or milestones is the completion date of the phase/milestone in question.</p> <p>If split billing is used (that is, there are multiple bill-to customers on the job), changing the preferred invoice date in this field will change the date on all invoices approved from this invoice selection. However, if the date is changed on one of the invoices in the window Invoice Editing, this field will be blank unless the date is the same on all invoices approved from this invoice selection. For more information, please see the description of the window Invoice Editing.</p>
<b>Invoice Name</b>	<p>Here you specify the name of the invoice. When you approve the invoice selection, this name will appear in the window Invoice Editing, where you can update it. The invoice name can be added to prints of invoice and credit memos and their corresponding drafts.</p> <p>The invoice name is merged into the customer entry text and the finance entry on the customer.</p>
<b>Show Customer Balances On Invoice</b>	<p>Select this field to indicate that you want to see the customer's prior and new balance on the job invoice printout.</p> <p>The default value is inherited from the customer / company-specific customer; however, you can override it in the Invoice Selection, On Account Invoice Selection, and Blanket Invoice Selection windows.</p>
<b>Show Customer Statement On Invoice</b>	<p>Select this field to indicate that you want to see the customer statement on the job invoice printout.</p> <p>The default value is inherited from the customer / company-specific customer; however, you can override it in the Invoice Selection, On Account Invoice Selection, and Blanket Invoice Selection windows.</p>
<b>Show Customer Aging On Invoice</b>	<p>Select this field to indicate that you want to see the A/R aging on the job invoice printout.</p>

### Totals in Job Currency Island

These fields sum up what is being prepared for invoicing on the current invoice on account selection, what is being prepared for invoicing on other draft invoice on account selections for the job, and what has previously been invoiced on account.

Field	Description
<b>Time</b>	These fields sum up the amounts for invoicing on account on time activities.
<b>Amount</b>	These fields sum up the amounts for invoicing on account on amount activities.
<b>Total</b>	These fields sum up the amounts for invoicing on account on time and amount activities.
<b>Outlay</b>	These fields sum up the amounts for invoicing on account on outlay activities.
<b>Incl. in Fixed Price</b>	These fields sum up the amounts for invoicing on account on activities included in the fixed price.
<b>Fixed Price</b>	<p>This field shows the effective quote price of the job as defined in the window Quote Editing. Depending on the selected basis for fixed price in the field "Basis" on the current job's invoice layout rule, the price in this field can originate from the quote price specified for the job and which can be edited in the window Quote Editing, or from the job's budgeted sales price registered on the most recently approved revision of the job budget of the type specified in the window Invoice Layout Rules.</p> <p>For time and material jobs, this field shows a quote price, if any.</p>

### Payment Island

Field	Description
<b>Pmt. Terms</b>	These are the payment terms that apply to the invoices for this job. Payment terms are chosen in the window Job Information and cannot be changed here.
<b>Blanket Invoice</b>	<p>This field is marked if the invoices (or credit memos) made for the job are to be blanket invoiced (or credited). Maconomy retrieves the value from the window Job Information, and you cannot change this field manually.</p> <p>Blanket invoicing means that all non-invoiced but approved invoice selections are placed in one invoice when you print from one of the windows Job Invoicing or Blanket Invoicing Overview, and provided the jobs involve the same company, department, bill-to customer, company tax code, currency code, invoice currency code, and depending on whether they are taxed or not (check mark in the field Tax). If the layout rule selected for the job specifies main job invoicing, you can also include invoices on account or invoices that are to reconcile invoices on account in the blanket invoice. To blanket credit a customer, the same requirements apply. However, a credit memo selection will not be included in a blanket crediting if it was created from an invoice.</p> <p>To blanket invoice or blanket credit jobs which are not part of a main job/subjob structure with main job invoicing, you must use the windows Job Invoicing or Job Crediting, respectively. For more information, please see the description of the window Invoice Layout Rules.</p>

Field	Description
	Note that if the system parameter "Blanket Invoicing per Main Job" is set to "Yes," the jobs must be placed in a hierarchy to be blanket invoiced.
<b>Tax</b>	This field shows whether the invoices are subject to tax. Maconomy retrieves the value from the window Job Information, and it cannot be changed here.
<b>Currency</b>	This field shows the currency of the job. Maconomy retrieves the value from the window Job Price Information and it cannot be changed here.

### Status Island

Field	Description
<b>Open for Selection</b>	A checkmark in this field shows that the on-account invoice selection is open. You can only change the invoice selection when the invoice selection is open. The invoice selection is closed after you select one of the actions that creates a draft, and it is opened after you print invoices or credit memos. You can also open the invoice selection by using the action "New Invoice Selection," provided the job is set up to allow multiple drafts.
<b>Drafts for Editing</b>	If the job parameter of the type "Invoice Approval" for the current job specifies that invoice editing is required, this field is marked by Maconomy when the invoice selection is approved using the approval functions in the Action menu. If invoice editing is not required according to the job parameter type "Invoice Selection," the functionality of this field is similar to that of the field "Approved for Invoicing" below. A subjob which is invoiced on the main job can be approved from the main job only (see the description of the field "Approved for Invoicing on Main Job" below). However, this will not cause this field to be marked as well, as such invoices must also be edited from the main job.
<b>Blanket Drafts for Editing</b>	This field indicates whether there are blanket draft invoices for editing. Blanket drafts are created when you approve invoice selection in Blanket Invoice Selection or apply the "Create Blanket Drafts" action in Blanket Invoicing Overview.
<b>Submitted Drafts</b>	This field shows the number of submitted invoice drafts.
<b>Approved for Invoicing</b>	This field shows whether or not the job is approved for invoicing using the approval functions in the Action menu in this window or the window Approve Invoice Selection. However, the job parameter of the type "Invoice Approval" for the current job may require that the invoice is edited in the window Invoice Editing before this field is marked. For more information, please see the description of the field "Approved for Editing" above and the job parameter type "Invoice Approval."

Field	Description
<b>Approved for Inv. on Main Job</b>	This field shows whether or not the job is approved for invoicing on its main job. The field will be marked by Maconomy if the current job is a subjob, the field "Invoiced on Main Job" in the island Main Job Invoicing is marked, and the main job is approved in this window or the window Approve Invoice Selection.
<b>Submitted by</b>	This field shows the name of user who submitted this draft.
<b>Submitted Date</b>	This field shows the date when the draft was submitted.
<b>Approved by</b>	This field displays the name of the user who approved the job for invoicing. The name of the approver is automatically saved when the job is approved by the action "Approve for Invoicing on Account." This field will be cleared if the invoice is reopened for editing. For subjobs approved for invoicing on the main job, this field displays the name of the person who approved the main job.
<b>Approval Date</b>	This field displays the date on which the job was approved for invoicing. The approval date is automatically saved when the job is approved by the action "Approve for Invoicing on Account." This field will be cleared if the invoice is reopened for editing. For subjobs approved for invoicing on the main job, this field displays the date the main job was approved.

### Currency Island

Field	Description
<b>Job Currency</b>	<p>This field shows the currency of the job.</p> <p>If the job parameter attribute "Allow Invoice on Account in Multiple Currencies" is set to "No," the invoice currency of all bill-to customers on the job will be equal to the currency of the job indicated in this field. If the currency is changed, all invoice currencies will be changed accordingly.</p> <p>If the job parameter attribute "Allow Invoice on Account in Multiple Currencies" is set to "Yes," changing the currency on the job will have no consequences on invoice currencies of bill-to customers.</p> <p>Note: Prices in the window Job Price Information will remain in the currency of the job, even if the invoice currency differs.</p>
<b>Invoice Currency</b>	<p>This field shows the invoice currency for invoicing on account the bill-to customer on the job.</p> <p>You can set up more than one bill-to customer for a job in the window Bill To Customer Distribution.</p> <p>If the job parameter attribute "Allow Invoice on Account in Multiple Currencies" is set to "No," the invoice currency cannot be changed, but will remain the same as the currency of the job.</p>

Field	Description
<b>Specify Exchange Rate</b>	<p>No check mark in this field indicates that the field Exchange Rate follows the exchange rate table for the bill-to customer specified on the job.</p> <p>If there is a check mark in this field, you can set the exchange rate manually.</p> <p>If the job parameter attribute "Allow Invoice on Account in Multiple Currencies" is set to "No," you cannot manually enter the exchange rate.</p> <p>Note: There may be unblocked bill-to customers in the window Bill To Customer Distribution who may not be set up to use the same invoice currency and exchange rate.</p>
<b>Exchange Rate</b>	<p>This field shows the exchange rate between job currency and invoice currency for the bill-to customer specified on the job.</p> <p>By default, the exchange rate is the current exchange rate specified in the Exchange Rate Tables window, but if the field Specify Exchange Rate is marked, the exchange rate is fixed at the rate you specify.</p> <p>If you change the exchange rate, the field Amount for Invoicing on Account, Currency will be recalculated, and a check mark will be placed automatically in the field Specify Exchange Rate. If the exchange rate deviates from the exchange rate table by more than the allowed deviation set in the system parameter "Margin for job exchange rate variance, %," a warning will be displayed.</p> <p>Note that there may be unblocked bill-to customers in the window Bill To Customer Distribution who may not be set up to use the same invoice currency and exchange rate.</p>

### Company Island

Field	Description
<b>Company</b>	<p>This field shows the name and number of the company responsible for the job. The value in this field cannot be changed. For more information, please see the description of the window Jobs.</p>
<b>Base Currency</b>	<p>This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of company base currency and enterprise currency.</p>

### Settling Company Island

Field	Description
<b>Settling Company</b>	<p>This field shows the name and number of the settling company that applies to the current job.</p> <p>For further information about the influence of a settling company and how such a company is selected, please see the section "Multiple Companies" in the chapter "Introduction to the G/L module." Intercompany entries are described in the window Intercompany Accounts in the G/L module.</p>

**Credit Memo Island**

Field	Description
<b>From Invoice No.</b>	<p>This field is used when you use the <b>Invoice to Credit Note</b> action.</p> <p>Enter a job invoice number. Maconomy verifies whether the number is assigned to an existing job invoice associated with the current job. If the entered invoice number belongs to an invoice on account, the <b>Restore Job Entries</b> check box is automatically selected.</p> <p>An invoice number cannot be entered in this field when corresponding to a pending or cancelled pre-invoice.</p>
<b>Type</b>	Select the invoice type, T&M or On Account.

## On Account Specification Entries Sub-Tab

This section includes the fields and descriptions for the On Account Specification Entries sub-tab.

Field	Description
<b>Standard Text Code</b>	Enter a code from the list of standard invoicing texts specified on the job. When you enter a code in this field, the text on the line is replaced by the standard text corresponding to the code. The field will appear as a drop-down list. The code is not stored, as it is only used for choosing a standard text.
<b>Description</b>	In this field you can enter a text to be displayed on the invoice line when the amount has been transferred for invoicing on account. The description can be edited in the window Invoice Editing.
<b>Quantity</b>	Use this field to enter a quantity for invoicing. When quantity is changed, the billing price is updated accordingly so that Quantity x Billing Price = Amount. The default value is 1.
<b>Billing Price, Invoice Currency</b>	Use this field to enter a Billing Price. When you change this price, the total amount is updated accordingly. It is not possible to update both billing price and total price at the same time. If a bill-to customer is selected on the line, then the invoice currency is the invoice currency of this bill-to customer; otherwise, it is the invoice currency of the job.
<b>Billing Price, Inv. Currency</b>	In this field you can enter the amount to be invoiced. If a bill-to customer is selected on the line, then the invoice currency is the invoice currency of this bill-to customer; otherwise, it is the invoice currency of the job.
<b>Invoice Currency</b>	This field shows the invoice currency. If a bill-to customer is selected on the line, the invoice currency is the invoice currency of this bill-to customer; otherwise, it is the invoice currency of the job.
<b>Tax Code</b>	In this field you can enter or change the tax code for the amount on the line.
<b>Activity No.</b>	This field shows the activity number associated with the job entry. If the job parameter attribute "Activity required for Invoicing On Account" is set

Field	Description
	to "Yes" in the job parameter selection of type "Invoicing On Account," the activity number must be set and changed in this field.
<b>Activity Name</b>	This field shows the name of the current activity.
<b>Incl. in Fixed Price</b>	A check mark in this field indicates that the invoice on account is included in the fixed price of the job.
<b>Activity Type</b>	This field shows the type of the activity. If no activity is selected on the line, the field defaults to the activity type "Amount."
<b>Task</b>	This field shows the name of the task. If tasks are required on the job, and if the job parameter attribute "Activity required for Invoicing On Account" is set to "Yes" in the job parameter selection of type "Invoicing On Account," the task must be set and changed in this field.
<b>Task Description</b>	This field shows the description of the task specified in the field "Task Name" on the current line.
<b>Employee No.</b>	This field shows the number of the employee. If an activity number of activity type "Time" is selected on the line, the employee number must be filled in.
<b>Employee Name</b>	This field shows the name of the employee.
<b>Billing Price, Currency</b>	In this field you can enter the amount to be invoiced in the currency of the job.
<b>Transferred from Invoicing Plan</b>	This field indicates whether the line originates from an invoicing plan line.
<b>Invoice Allocation</b>	This field indicates whether the amount for invoicing on account on the activity number is available for invoice allocation in the window Job Invoice Allocation.
<b>Bill to Customer</b>	In this field you can specify which bill-to customer on the job will be invoiced with the amount on the line. If no bill-to customer is specified, the amount is distributed among all bill-to customers on the job according to the setup in the window Bill To Customer Distribution (split billing).
<b>Bill to Customer Appropriation</b>	In this field you can specify the bill-to customer appropriation if several appropriations exist for the bill-to customer in the window Bill To Customer Distribution.
<b>Job No.</b>	This field shows the number of the job being carried out.
<b>Location</b>	The functionality of this field is similar to that of the field "Activity No." above.

Field	Description
<b>Entity</b>	The functionality of this field is similar to that of the field “Activity No.” above.
<b>Project</b>	The functionality of this field is similar to that of the field “Activity No.” above.
<b>Purpose</b>	The functionality of this field is similar to that of the field “Activity No.” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Activity No.” above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Activity No.” above.
<b>Text 1-5</b>	These editable fields show values from the invoice plan, (or, if the line is not transferred from invoicing plan, these fields remain text fields). When transferring the invoice plan, the values from the text fields on the invoice plan are transferred to these fields and when that on account selection is approved, the values are transferred to the draft and the invoice foundation.

## Actions

This section shows the actions available in the On Account Invoice Selection workspace.

### On Account Invoice Selection Tab

Field	Description
<b>Transfer Invoicing Plan</b>	<p>This action is not available when invoice selection is closed.</p> <p>Use this action to allow Maconomy to transfer due lines in the invoicing plan of the current job to the invoice selection. However, if the <b>Transfer Several Invoicing Plan Lines</b> system parameter is disabled, only the first due line of the invoicing plan is transferred.</p> <p>The amount is shown in the <b>Amount for Invoicing on Account</b> field in the sub-tab. Once the lines have been transferred, use the <b>Approve for Invoicing on Account</b> action to approve the on account invoice selection for further processing in the Invoice Editing tab. For further information, see the description of the Invoicing Plans workspace.</p> <p>Note: Invoicing plan lines must be approved in the Invoicing Plans workspace before they can be transferred for invoicing in this workspace if the <b>Approval of Invoicing Plan Lines</b> job parameter is enabled for the current job.</p> <p>If the current job is a sub-job to a main job, and the main job's invoice layout rule specifies Main Job Invoicing, this action cannot be used.</p> <p>If the invoicing plan contains a mix of lines for invoicing on account and pre-invoicing, running this action transfers only one type of line at a time. Once the transferred lines are invoiced, the action can be run again to transfer the remaining lines of a different type.</p>

Field	Description
<b>Undo Transfer Invoicing Plan</b>	<p>Lines created using the action “Transfer Invoicing Plan” are protected from being deleted. Instead you must use the undo action. When you select this action, Maconomy will undo the transfer from the invoicing plan.</p> <p>This action is not available when the on-account invoice selection is closed.</p>
<b>Approve for Invoicing on Account</b>	<p>When you select this action, you approve the invoice on account. If invoice editing is required, invoice editing of this invoice on account is not closed in the window Invoice Editing.</p> <p>This action is not available when the invoice selection is closed.</p> <p>If the current job is a main job, and the job’s invoice layout rule specifies Main Job Invoicing, invoicing on account can only be carried out on the main job.</p> <p>If the current job is set up for split billing (that is, there are more than one bill-to customer on the job), selecting this action will generate invoice lines for each bill-to customer on the job with an amount greater than zero selected in the field “Selected Amount” in the table part of the window Bill to Customer Distribution. Please note that when distributing the billing price lines on customers, a small rounding correction may be made on one of the entry lines. However, the total billing price will not change. For more information, please see the description of the window Bill to Customer Distribution.</p> <p>If you change anything in this window, the approval is canceled, and the invoice selection must be approved again. Maconomy issues an alert if the approval is canceled. Note that if the job is set up for split billing (that is, there are more than one bill-to customer on the job), multiple invoices may be generated for the current invoice selection, which all may need editing.</p> <p>You can either invoice an approved selection by choosing “Print Invoice” in this window or by choosing “Print Invoice” in the window Invoice Editing. You can also invoice selected invoices for several jobs at a time in the window Job Invoicing. However, the job parameter of the type “Invoice Approval” for the current job may require that the invoice is edited in the window Invoice Editing before being printed.</p>
<b>Approve for Crediting on Account</b>	<p>The functionality of this action is similar to that of the action “Approve for Invoicing on Account,” but pertains to credit memos on account, including crediting invoices on account.</p>
<b>New Invoice Selection</b>	<p>This action is available when the invoice selection is closed, that is, after creating a draft, and provided the job is set up to allow multiple drafts. When you have run this action, the job is open for invoice selection. The quantity and amount for invoicing will be reset to zero on job entries that are approved for invoicing, and remaining job entries will be set for invoicing. The amount for invoicing on account will also be reset to zero.</p>
<b>Print Draft</b>	<p>This action is available whenever a draft invoice or a draft credit memo exists on the job.</p> <p>When you select this action, Maconomy prints a draft copy of the current invoice or credit memo. No postings are made when you select this action.</p>

Field	Description
<b>Print Invoice</b>	<p>This action is available whenever a draft invoice exists on the job which has been approved for invoicing.</p> <p>When you select this action, you create and print an invoice on account based on the invoice selection in the window.</p> <p>It is only possible to select this action if the invoice has been approved using the action "Approve for Invoicing on Account." In addition, the job parameter of the type "Invoice Approval" for the current job may require that the invoice is edited in the window Invoice Editing before being printed.</p> <p>If the current job is a main job, and the job's invoice layout rule specifies "Main Job Invoicing" and "Main Job Invoice Selection," selecting then invoicing on account can only be carried out from the main job. For more information, please see the description of the window Invoice Layout Rules.</p> <p>If split billing is used, that is, multiple bill-to customers are specified for the job in the window Bill to Customer Distribution, an invoice for each bill-to customer is printed when you select this action. Each of these can be edited in the window Invoice Editing. Please note that when distributing the billing price of the invoice lines on customers, a small rounding correction may be made on one of the invoice lines. However, the total billing price will not change. For more information, please see the description of the window Bill to Customer Distribution.</p> <p>A user can only print an invoice in this window if the field "Can Print Invoice" in the window Actions in the Set-Up module is marked for the user in question.</p> <p>The invoice is printed according to the invoice layout rule selected for the current job. See the description of the window Invoice Layout Rules for a description of invoice layout rules.</p> <p>Invoices to be collected electronically are only printed if the customer payment mode selected for the job has a mark in the field "Print Invoice." The customer payment mode is selected for a job in the window Job Information, and the customer payment mode is set up in the window Customer Payment Modes in the Banking module.</p>
<b>Print Credit Memo</b>	<p>This action is available whenever a draft credit memo exists on the job which has been approved for invoicing.</p> <p>For further information about printing credit memos, see the description for the action "Print Invoice" above.</p>
<b>Rederive Tax Code</b>	<p>If the setup for the derivation of a tax code has been changed since the lines were created, you can select this action to rederive the tax code of the lines in the table part. All open lines are updated with the tax reporting code selected for the job.</p> <p>When you select the action, any approval of the invoice selection is removed.</p> <p>This action is not available when the invoice selection is closed. When the invoice selection is open, and drafts exist on the job, this action only affects lines that are available in the present invoice selection. In other words, the action does not include lines that are for invoicing on a draft.</p>

Field	Description
<b>Invoice to Credit Memo</b>	<p>This action is only available when the invoice selection is open, and no drafts exist on the job. When you have created a draft to credit an invoice, you cannot create multiple drafts until you have completed the crediting by printing the credit memo (or deleted the draft to cancel the crediting).</p> <p>When you select this action, Maconomy creates a credit memo selection based on the job invoice number you have specified in the field "From Invoice No." in the card part of the window. The original invoice on account is credited by the amount specified in the field "On Account Reduction." If that field is empty, the total open amount on the invoice on account is credited, that is, the amount not yet reconciled by a job invoice or a previous job credit memo on account.</p> <p>A credit note must be in the same currency as the original invoice on account. This means that Maconomy requires the invoice currency on the bill-to customer of the original invoice on account to match the invoice currency of the original invoice. The bill-to customer must also be specified directly on the job.</p> <p>If the invoice to be credited has been closed through Job Invoice Allocation, the job invoice allocation will automatically be reverted, and the corresponding Job Invoice Allocation journal will be created.</p> <p>Note that if the system parameter "Allow Multiple Credit Memos Per Invoice" has not been marked, it is only possible to make one credit memo per invoice. If this system parameter is marked, Maconomy will issue an alert if you attempt to make a second credit memo on the basis of a job invoice of which a part has already been credited.</p>
<b>Undo Invoice to Credit Memo</b>	<p>You can use this action to bring the job out of the state of crediting if the Invoice to Credit Memo has been faulty applied.</p>
<b>Remove Latest Draft</b>	<p>The functionality of this action is similar to that of the action "Remove Latest Draft" in the window Invoice Selection</p>
<b>Remove All Drafts</b>	<p>The functionality of this action is similar to that of the action "Remove All Drafts" in the window Invoice Selection.</p>
<b>Calculate Invoice Surcharge</b>	<p>Use this action to calculate the surcharge based on the Job Surcharge Rule specified on the job. The surcharge is calculated based on the current invoice selection (T&amp;M, On Account, or both). Directly created job entries (<b>direct invoicing</b>) are included in the calculation of surcharges.</p> <p>The action is enabled if the job has the job parameter "Surcharge at Invoicing" set to Yes and if the job is open for invoice selection.</p>

## Bill to Customer Distribution Single Dialogs Workspace

Use this workspace to specify whether a job has more than one bill-to customer.

This is also known as "split billing." You can also specify different bill-to customers, as well as assign a maximum billing price to each customer.

Sometimes a job is funded by several "customers," all part of the same organization. For instance, an advertising firm might run a campaign that benefits several entities in its organization, with each entity sharing in the funding of the campaign.

For each job, you can specify multiple bill-to customers. Each customer must be set up in Maconomy before being added as a bill-to customer. You can specify the share that each customer contributes to funding the job and the maximum amount the customer will contribute.

As an alternative, you can add one customer to Maconomy several times, with the entities identified in the **Appropriation** field as if they were separate customers. Then you can specify the share that each entity contributes to funding the job and the maximum amount the entity will contribute.

When you invoice the job, Maconomy generates an invoice for each combination of bill-to customer and appropriation, for the correct proportion of the total invoice.

When you select a job with split billing for invoicing, Maconomy suggests invoice amounts based on the setup in this workspace. However, you can change the suggested amounts.

The Bill To Customer Distribution tab of this workspace displays information for a job, such as the total billable price, the amount currently selected for invoicing, and previously invoiced amounts.

The Bill To Customers sub-tab displays a line for each of the job's bill-to customers. You can add more customers if the current job is open. You can change a customer's share of invoiced amounts, priority, and maximum billing price.

However, the total of all invoice amounts for bill-to customers must equal the amount selected for invoicing before you can approve the invoice selection:

- For time and materials invoices, the **Current Invoice Selection** field must be equal to the total for the **Selected for Invoicing on Entries** column in the sub-tab.
- For invoices on account, the **Current Invoice Selection** field must be equal to the total for the **Selected on Account** column in the sub-tab.

### Maximum Billing Price

Along with assigning each bill-to customer a share of the total cost of the job, you can assign a maximum billing price to each customer. When the maximum is reached, Maconomy stops billing the customer.

You can also assign priorities to bill-to customers. The customer(s) with the highest priority are invoiced first. Maconomy does not invoice lower priority customers until the higher priority customers reach their maximum billing prices.

### Example

Consider the following scenario. You win a job with three different bill-to customers, A, B, and C. The total job price is \$30,000 USD. The following invoicing agreement is made:

1. "A" is billed first, up to \$10,000.

2. "B" and "C" are billed the remaining amount. "B" will pay 60% of the remaining amount; "C" will pay 40%.
3. However, "B" will pay a maximum of \$13,000. "C" will assume any amount above the \$13,000.

This agreement translates into the following setup in this workspace:

Customer	Share, %	Max. Billing Price	Priority
A	100	10,000	1
B	60	13,000	2
C	40		2

Customer "A" is invoiced 100% up to the maximum billing price of \$10,000. Customers "B" and "C" share the remaining invoicing 60/40, unless the maximum billing price for "B" is reached. After that point, only "C" is invoiced.

When you credit a job with split billing, the preceding process happens, but in reverse order.

If you overrule the amounts suggested by Maconomy—for example, by forcing invoicing of a lower-priority customer—Maconomy will attempt to compensate for this the next time that you invoice the job.

### Main Jobs and Sub-jobs

For main jobs with main job invoicing, the main job controls how the billing is split between bill-to customers. The amount that is distributed between bill-to customers is the sum of the job entries for the current main job and for all sub-jobs.

### Bill To Customer Distribution Tab

This section includes the fields and descriptions for the Bill To Customer Distribution tab.

### Job Island

Field	Description
<b>Job</b>	This field shows the name and number of the job to which the current job invoicing distribution applies.
<b>Job Group</b>	This field shows the job group to which the current job is assigned. It is entered in the window Jobs and cannot be changed here.
<b>Status</b>	This field shows the status of the current job. The job status will be Quote or Order. It can be changed in the window Jobs.
<b>Responsible</b>	This field shows the name of the user responsible for the current job.
<b>Project Manager</b>	This field shows the name and number of the employee who is project manager for the job. It is derived from the job and cannot be changed here.

**Set-up Island**

Field	Description
<b>Setup Percentage Valid From</b>	In this field you can enter a date. Maconomy will only consider the current setup percentage for invoice entries on the job as of the date specified in this field when calculating the amounts in the fields "Suggested %" and "Suggested Amount" in the table part. For information about the use of this field, please see the description of the field "Selected %."
<b>Maximum Billing Price, Total</b>	This field shows the sum of the maximum billing prices specified for the customers in the table part.
<b>Show Blocked Lines</b>	If you mark this field, all bill-to customers in the table part are displayed, even if they have been blocked. For more information, please see the description of the Blocked field below.

**Company Island**

Field	Description
<b>Company</b>	This field shows the name and number of the company responsible for the current job. The company number is transferred from the window Jobs and cannot be changed here.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the Company No. field above. See the Base Currency field in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

**Settling Company Island**

Field	Description
<b>Settling Company</b>	<p>This field shows the name and number of the settling company of the customer associated with the current job.</p> <p>If the number in this field is different from the company number in the Company No. field in the island Customer, intercompany entries between the two companies will automatically be created in connection with posting job invoices on the current job. When balancing intercompany entries, the company specified in this field is the intercompany company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p>

**Invoice Selection Island**

Field	Description
<b>Invoice Type</b>	Use this field to specify the type of invoice to approve when you approve the invoice selection. The available options include:

Field	Description
	<ul style="list-style-type: none"> <li>▪ T&amp;M</li> <li>▪ On Account</li> <li>▪ T&amp;M and On Account</li> <li>▪ Pre-Invoice — Selecting this option instructs Maconomy to create a pre-invoice instead of an invoice on account or a time and material invoice. If a job is set up for pre-invoicing by default, Maconomy automatically populates the Invoice Type field with Pre-Invoice when you enter a positive amount in the Total field. If a job is not set up for pre-invoicing, this invoice type cannot be selected.</li> </ul>
<b>Currency</b>	This field displays the currency of the current job as specified in the window Job Price Information.
<b>Current Invoice Selection</b>	<p>This field shows the sum of open entries on the job. This corresponds to the value of the Total Billing Price field or Amount for Invoicing on Account field in the Invoice Selection island in the Invoice Selection window, depending on whether the invoice selection is on account or not.</p> <p>When invoicing on account, this field shows the same value in invoice currency as the Amount for Invoicing on Account, Invoice Currency field in the Invoice Selection window.</p> <p>The Transfer to Invoice Selection action updates the amount based on the amount in the Hereof Selected on Customers field.</p>
<b>Hereof Selected on Customers</b>	<p>This field shows the sum of the Selected Amount fields in the table part of this window. You can only approve an invoice selection if the amount selected on customers corresponds to the total billing price.</p> <p>When invoicing on account, the bill-to customers listed in the table part may use different invoice currencies and exchange rates. The sum in this field is calculated based on the exchange rate.</p> <p>For more information, please see the description of the Transfer to Invoice Selection action.</p>
<b>Prev. Invoiced</b>	This field shows the amount previously invoiced on the current job, including invoices on account.

## Bill To Customers Sub-Tab

This section includes the fields and descriptions for the Bill To Customers sub-tab.

Field	Description
<b>Bill to Customer</b>	In this field, you can specify the customer number of the bill-to customers on the job. You can add customers on new lines in the table if the current job is open and invoiceable. You can delete a customer from the table if the customer has not yet been invoiced, but the field cannot be changed. If

Field	Description
	<p>you want to change the bill-to customer you must set the Setup % to zero or delete the line and then create a bill-to customer.</p> <p>You cannot delete a bill-to customer if invoicing plan lines exist for the bill-to customer.</p> <p>A bill-to customer can be entered on several lines, provided that the customer has a different appropriation specification in the field "Appropriation" (see below).</p> <p>Please note that all jobs are shown in this window, including jobs that are not set up for split billing. Jobs with only one customer in the table part are not set up for split billing. Adding a customer changes a job to being a split billing job.</p>
<b>Name</b>	<p>This field shows the name of the customer selected in the field "Bill to Customer" above.</p>
<b>Appropriation</b>	<p>In this field, you can indicate the source of funding for the job. This can be useful if, for example, you carry out a job on behalf of a customer on the basis of funding from a government body or a private foundation. The field is for reference only and is closed when the job is invoiced for the first time.</p> <p>If a bill-to customer has several sources of funding for this job, the customer can be added to several lines in this window, provided a unique appropriation is specified in this field for each instance of the bill-to customer. See the example in the introduction to this window.</p> <p>If you change the appropriation for the bill-to customer specified on the job, then the job is updated accordingly.</p> <p>If invoicing plan lines exist for the bill-to customer and an appropriation has been specified, any changes you make in this field will update the plan lines accordingly.</p> <p>This field can also be used as a simple way of setting up one bill-to customer for invoicing in several currencies. In the window Invoicing Plans you can create invoicing plan lines for different appropriations of the same bill-to customer based on the invoice currency of the specific appropriation.</p>
<b>Blocked</b>	<p>If you mark this field, the customer on the current line is blocked for further invoicing. If the field "Show Blocked Lines" in the card part is not marked, the line disappears from view when you mark this field and press Return. If an amount has been selected for the customer, the amount will be distributed proportionally on the other customers in the table part. To see the line again, mark the field "Show Blocked Lines" in the card part and press Return.</p> <p>A bill-to customer selected on the job cannot be blocked before you have selected another bill-to customer on the job.</p> <p>If you remove the mark from this field, Maconomy will recalculate the invoice distribution according to the specified percentages, priorities, and maximum billing prices.</p>

Field	Description
	<p>If invoicing plan lines exist for the bill-to customer that have not yet been transferred, a warning will tell you that the bill-to customer is blocked for further invoicing.</p>
<b>Invoice Currency</b>	<p>In this field you choose the currency used when you invoice on account the bill-to customer on the job.</p> <p>Any approved invoice selection will be removed if you change the invoice currency.</p> <p>If you change the invoice currency and invoicing plan lines exist for the bill-to customer or for split billing all bill-to customers in the window Invoicing Plans, the amount in invoice currency on the lines will be recalculated. You will get a warning about the recalculation.</p> <p>If the job parameter attribute Allow Invoice on Account in Multiple Currencies is set to No, then invoice currency cannot be changed but will remain the same as the currency of the job.</p>
<b>Setup, %</b>	<p>In this field you can enter the current customer's share in the invoicing of the current job. Please note that the sum of percentages in this field for all customers in the table part with the same priority selected in the field "Priority" must add up to 100.</p> <p>The value you enter is a default value. It is used by Maconomy for calculating the initial value in the field "Suggested Amount." However, you may change this value to anything within the bounds of the invoice selection. The next time that you open this window, Maconomy will again calculate the suggested amount to invoice each customer based on the default setup percentage in this field.</p>
<b>Maximum Billing Price</b>	<p>In this field you can enter a maximum billing price for the current customer. A customer cannot be invoiced for more than this amount, regardless of the percentage selected in the field "Setup, %." Please note that if you have multiple priority levels you should make sure to enter a value in this field for the customer(s) with the highest priority. Otherwise, lower-priority customers will never be invoiced. A zero in this field means that there is no maximum billing price.</p> <p>Note that you can enter a negative amount in this field. If you do this, the amount indicates the maximum amount you want the current customer to be credited when crediting. At the same time, there is no upper limit on the amount which can be invoiced to the customer.</p> <p>You cannot specify a negative maximum billing price for one customer and a positive for another. Furthermore, if the customer has previously been invoiced on the current job, you cannot specify a maximum billing price which is lower than the value in the field "Prev. Invoiced."</p> <p>If a maximum billing price is specified for all customers, you cannot approve an invoice selection for an amount which exceeds the total amount of the maximum billing price specified in this window.</p>

Field	Description									
Priority	<p>In this field you can enter a priority. All or multiple customers can have the same priority. The priority specifies the order in which the customers are to be invoiced, with “1” being the highest priority. Please note the following:</p> <ol style="list-style-type: none"><li>1. The highest-priority customers are invoiced first, up to the amount specified in the field “Maximum Billing Price.”</li><li>2. Whenever there is a customer with a lower priority, make sure to specify a maximum billing price for all higher-priority customers. Otherwise, the lower-priority customers will never be invoiced.</li><li>3. The sum of the percentages in the field “Setup, %” must equal 100 per priority level.</li></ol>									
Invoicing Group	<p>Maconomy can produce an invoice for each invoicing group when using main job invoicing. In this field you can assign an invoicing group to the job.</p>									
Suggested % for Invoicing	<p>This field shows the percentage of the current invoice selection that Maconomy suggests for invoicing on the customer on the current line. The suggestion is based on the values of the fields “Setup, %,” “Maximum Billing Price,” and “Priority.” This field is updated by Maconomy when you update the invoice selection. You can, however, change the selected percentage in the field “Selected %.” If you do that, this field can help you revert to the percentage originally suggested by Maconomy; just type the percentage shown here into the field “Selected %.”</p>									
Suggested, Currency	<p>This field shows the amount suggested for invoicing based on the setup of the bill to customer. The suggested amount is calculated by distribution of the amount selected for invoicing. If the <b>Invoice Type</b> field in Invoice Selection is set to T&amp;M, then the amount covers only T&amp;M selected for invoicing. If the field is set to On Account, the amount covers only the selection for on account invoicing. If the field is T&amp;M and On Account, the amount includes both parts.</p>									
Selected % for Invoicing	<p>In this field, you can specify a percentage of the current invoice selection which you want to invoice to the customer on the current line. When you change this field, the selected amount will be displayed in the field “Selected Amount” (see below). For instance, if you wish to postpone the invoicing of a certain customer, enter “0” in this field, and continue the invoicing process.</p> <p>Maconomy will compensate for the changes the next time that you invoice the job. Assume, for example, that you have set up a job with two bill-to customers. The setup percentages and suggested invoicing percentages are displayed below:</p> <table><tr><th></th><th>Customer A</th><th>Customer B</th></tr><tr><td>Setup %</td><td>40%</td><td>60%</td></tr><tr><td>Suggested %</td><td>40%</td><td>60%</td></tr></table>		Customer A	Customer B	Setup %	40%	60%	Suggested %	40%	60%
	Customer A	Customer B								
Setup %	40%	60%								
Suggested %	40%	60%								

Field	Description																					
	<p>You then register job entries worth 10,000 on the job, and open this window to adjust the job invoice distribution. Now assume that you choose a different value in this field ("Selected %"):</p> <table><tr><th>Date: 03-04-01</th><th>Customer A</th><th>Customer B</th></tr><tr><td>Setup %</td><td>40%</td><td>60%</td></tr><tr><td>Suggested %</td><td>40%</td><td>60%</td></tr><tr><td>Selected %</td><td>50%</td><td>50%</td></tr></table> <p>You then invoice the amount (5,000 to each customer). Then, further new entries for 10,000 are registered on the job. The next time that you open the window, Maconomy will adjust the suggested percentage to compensate for the previous invoicing override:</p> <table><tr><th>Date: 03-04-01</th><th>Customer A</th><th>Customer B</th></tr><tr><td>Setup %</td><td>40%</td><td>60%</td></tr><tr><td>Suggested %</td><td>30%</td><td>70%</td></tr></table> <p>If you leave the suggested values, the original setup percentage will match the amounts actually invoiced (8,000 and 12,000, respectively).</p> <p>However, a date in the field "Setup Percentage Valid From" in the card part may change this. For example: Consider the two invoicing mentioned above, and notice the dates of the invoicing (indicated in the tables above). If the field "Setup Percentage Valid From" is changed to the date "03-04-05" when the second invoice distribution is changed in this window, the value of the field "Suggested %" will not be "30%" and "70%" for the two customers, respectively, but "40%" and "60%," respectively, as in the original setup. By setting a date in the field "Setup Percentage Valid From" in the card part, you can tell Maconomy to disregard any job invoice distributions, which may or may not have been according to standard, when making the new suggestion.</p> <p>If the value in the field "Suggested %" above changes, this field will be reset to the value of the field "Suggested %."</p>	Date: 03-04-01	Customer A	Customer B	Setup %	40%	60%	Suggested %	40%	60%	Selected %	50%	50%	Date: 03-04-01	Customer A	Customer B	Setup %	40%	60%	Suggested %	30%	70%
Date: 03-04-01	Customer A	Customer B																				
Setup %	40%	60%																				
Suggested %	40%	60%																				
Selected %	50%	50%																				
Date: 03-04-01	Customer A	Customer B																				
Setup %	40%	60%																				
Suggested %	30%	70%																				
Selected, Currency	This field defaults to the same amount as in the above <b>Suggested, Invoice Currency</b> field, but can be changed manually to distribute the billing price differently among the bill to customers.																					
Specified Exchange Rate	<p>This field shows the exchange rate between job currency and invoice currency for the bill-to customer specified on the line.</p> <p>By default, the exchange rate is the current exchange rate specified in the table for the job on the preferred invoice date (or current date if no preferred invoice date is set), but if the field Specify Exchange Rate is marked, the exchange rate is fixed at the rate you specify.</p>																					

Field	Description
	<p>If you change the exchange rate, the field “Amount for Invoicing on Account, Currency” will be recalculated and a check mark will be placed automatically in the field “Specify Exchange Rate.” If the exchange rate deviates from the exchange rate table by more than 10%, a warning will be displayed.</p> <p>Note: The base currency for the exchange rate is based on the rate specified in the field “Exch. Rate in Ref. Currency” in the window System Information.</p> <p>Note: There may be unblocked bill-to customers in the window Bill To Customer Distribution who may not be set up to use the same invoice currency and exchange rate.</p>
<b>Specify Exchange Rate</b>	<p>No check mark in this field indicates that the field Currency Exchange Rate follows the exchange rate table for the bill-to customer specified on the job.</p> <p>If there is a check mark in the field, you can set the exchange rate manually.</p> <p>If the job parameter attribute “Allow Invoice on Account in Multiple Currencies” is set to “No,” you cannot manually enter the exchange rate.</p> <p>Note: There may be unblocked bill-to customers in the window Bill To Customer Distribution who may not be set up to use the same invoice currency and exchange rate.</p>
<b>Suggested, Invoice Currency</b>	<p>This field shows the suggested amount in the invoice currency of the bill to customer. Note that invoicing in a currency other than that of the job is only supported for on account invoicing. In the standard layout for the Workspace Client, this field is hidden when the invoice type is not On Account.</p>
<b>Selected, Invoice Currency</b>	<p>This field defaults to the same amount as in the above <b>Suggested, Invoice Currency</b> field, but can be changed manually. In the standard layout for the Workspace Client, this field is hidden when the invoice type is not On Account.</p>
<b>Net on Account</b>	<p>This field shows the net amount which has previously been invoiced on account on the job to the customer on the current line.</p>
<b>Tax on Account</b>	<p>This field shows the tax amount which has been invoiced on account on the job to the customer on the current line.</p>
<b>On Account Reconciliation on Drafts</b>	<p>This field shows the sum of approved drafts which currently reconcile on account amounts.</p>
<b>Available for On Account Reconciliation</b>	<p>This field shows the amount available for on account reconciliation.</p>

Field	Description
<b>For On Account Reconciliation</b>	This field shows the amount approved for on account reconciliation.
<b>Prev. Invoiced</b>	This field shows the amount which the customer on the current line has previously been invoiced on the job.
<b>Prev. Invoiced, %</b>	This field shows the amount which the customer on the current line has previously been invoiced as a percentage of the total amount previously invoiced on the job.
<b>Remarks</b>	In this field you can enter a remark about the current invoice selection. The remark is for reference only. The initial text in this field is derived from the field "Remarks" in the island General Information in the window Customer Information Card.
<b>Attn.</b>	In this field you can specify the customer's attention person. Maconomy will suggest the person specified on the customer's information card. If either the system parameter "Allow Job Specific Billing Addresses" or "Allow Job Specific Bill To Customer Attention Persons" is marked, you can change the name here.
<b>Preferred Inv. Date</b>	In this field you can specify a preferred invoice date. This date will be transferred to the invoice when printed.
<b>Invoice Name</b>	In this field you can specify a name for the invoice. This is useful if you have set up invoicing plans for multiple bill-to customers on a job and then transfer multiple lines. These lines may, for example, have different purchase order numbers (referring to client order numbers).
<b>Invoice Discount %</b>	In this field you can specify any invoice discount percentage granted to the customer on the current line. Maconomy will suggest the value specified on the customer's information card, but you can change it here.
<b>Payment Terms</b>	In this field you can specify the payment terms for the customer on the current line. Maconomy will suggest the payment terms specified on the customer's information card, but you can change them here.
<b>Cust. Payment Mode</b>	In this field you can specify the customer payment mode for the customer on the current line. Maconomy will suggest the customer payment mode specified on the customer's information card, but you can change it here.
<b>Global Location No.</b>	If the customer on the current line has requested that you use a specific global location number on invoices pertaining to the current job, you can specify the location number in question here. The number specified here will be transferred to invoices created for the customer in connection with the current job. Maconomy suggests the global location number specified in the window Company Specific Payment Information for the customer in question, but you can change it here if the location number to be used in connection with the current job is not the same as the standard location number of the customer.

Field	Description
	For further information about the concept of global location numbers, see the introduction to the window Company Locations in the G/L module.
<b>Tax</b>	In this field you can specify if the customer on the current line is subject to tax. Maconomy will suggest the value specified on the customer's information card, but you can change it here.
<b>Tax No., Invoice</b>	In this field you can specify the tax number of the customer on the current line. Maconomy will suggest the tax number specified on the customer's information card, but you can change it here.
<b>Company Tax Code, Invoice</b>	In this field you can specify the company tax code for the customer on the current line. Maconomy will suggest the code specified on the customer's information card, but you can change it here.
<b>Language</b>	In this field you can specify the language of the customer on the current line. Maconomy will suggest the language specified on the customer's information card, but you can change it here.
<b>Department</b>	In this field you can specify the department to which the customer on the current line is assigned. Maconomy will suggest the department specified on the customer's information card, but you can change it here. The department to which a customer is assigned influences the way in which job entries are posted in the General Ledger. For more information, please see the description of the window Activities.
<b>Date of Last Invoice</b>	This field shows the date of the latest invoice sent to the customer on the current line.
<b>Last Invoice No.</b>	This field shows the number of the last invoice sent to the customer on the current line.
<b>No. of Invoices</b>	This field shows the number of invoices which have been created for the customer on the current line.
<b>No. of Copies</b>	This field shows the number of invoices which have been printed for the customer on the current line. If, for example, you reprint an invoice from the window Show Job Invoice, the number in this field will be greater than the number of invoices shown in the field "No. of Invoices" above.
<b>Last Credit Memo Date</b>	This field shows the date of the latest credit memo sent to the customer on the current line.
<b>No. of Creditings</b>	This field shows the number of credit memos which have been created for the customer on the current line.
<b>No. of Credit Memo Printouts</b>	This field shows the number of credit memos which have been printed for the customer on the current line. If, for example, you reprint a credit memo from the window Show Job Credit Memo, the number in this field will be greater than the number of credit memos shown in the field "No. of Creditings" above.

Field	Description
<b>Address (line 2)</b>	This field shows the first line of the current bill-to customer's address. If the system parameter "Allow Job Specific Billing Addresses" and the field "Job Specific Address" in the table part of this window are marked, you can change the address. Otherwise, the address is copied from the Customer Information Card.
<b>Address (line 3)</b>	This field shows the second line of the current bill-to customer's address. The functionality of this field is similar to that of the field "Address" above.
<b>Zip Code</b>	In this field, you can enter the zip code of the postal district entered on the current line.
<b>Postal District</b>	In this field, you can specify the postal district of the address. If you enter a new zip code on the line and leave this field blank, this field is automatically completed, provided that the zip code in question has been entered for the relevant country in the window Postal Districts in the Set-Up module. For further information, see the description of the window Postal Districts.
<b>Address (line 4)</b>	This field shows the third line of the current bill-to customer's address. If the system parameter "Allow Job Specific Billing Addresses" and the field "Job Specific Address" in the table part of this window are marked, you can change the address. Otherwise, the address is copied from the Customer Information Card.
<b>Address (line 5)</b>	This field shows the fourth line of the current bill-to customer's address. The functionality of this field is similar to that of the field "Address" above.
<b>Country</b>	The functionality of this field is similar to that of the field "Address" above.
<b>Phone</b>	The functionality of this field is similar to that of the field "Address" above.
<b>Fax</b>	The functionality of this field is similar to that of the field "Address" above.
<b>Telex</b>	The functionality of this field is similar to that of the field "Address" above.
<b>E-mail</b>	The functionality of this field is similar to that of the field "Address" above.
<b>Job Specific Address</b>	If the system parameter "Allow Job Specific Billing Addresses" is marked, you can mark this field to allow the change of the current bill-to customer's address for this job. The change of address will, for example, be reflected on job invoices and credit memos printed for the current job. See also the description of the window Job Information.

## Actions

This section shows the Actions available in the Bill to Customer Distribution workspace.

### Top Tab

Field	Description
<b>Show Blocked Lines</b>	This action will show all bill to customers including blocked bill to customers in the table.
<b>Hide Blocked Lines</b>	This action will show all bill to customers excluding blocked bill to customers in the table.
<b>Calculate Setup Percentage</b>	<p>When you select this action, Maconomy calculates a setup percentage for all bill-to customers in the table part of the window. The calculation is based on the specified maximum billing price, if any. If no maximum billing price is specified for a customer, that customer will have a setup % of zero. For instance, if there are two customers with a maximum billing price of 4,000 and 6,000, respectively, Maconomy will calculate the setup percentages as 40% and 60%, respectively.</p> <p>This action is primarily used in connection with the initial setup of the job's invoice distribution, and you can change the setup percentages manually later.</p>
<b>Transfer to Invoice Selection</b>	<p>You can select this action if the job is not blocked for invoicing, the current job status is "Order," and if the total amount selected on the customers is different from the current invoice selection.</p> <p>This action handles invoice-on-account amounts in several invoice currencies and exchange rates. The sum expressed in the currency of the job is transferred to the invoice selection.</p> <p>When you select this action, the amount for invoicing on the job is adjusted in the following way: All open entries on the job (including any subjobs that are invoiced on the job) are adjusted so that the total invoice selection will agree with the amount selected on the customers in this window.</p> <p>It should be noted that the field "Close Balance" on the job entries will be left unmarked in the window Invoice Selection. This means that the remaining amount will appear on the next invoice selection for the job.</p>
<b>Approve</b>	This is the same new action as in Invoice Selection.
<b>Approve for Invoicing on Account</b>	The functionality of this action is similar to that of the action "Approve for Invoicing on Account" in the window Invoice Selection.

Field	Description
<b>Approve for Crediting on Account</b>	The functionality of this action is similar to that of the action “Approve for Crediting on Account” in the window Invoice Selection.
<b>Remove All Drafts</b>	The functionality of this action is similar to that of the action “Remove All Drafts” in the window Invoice Selection.

## Itemize Invoice Selection Single Dialogs Workspace

Use this workspace to show the individual job entries recorded on the jobs processed in the Job Cost module.

You can create job entries for direct invoicing or crediting. As long as the job entries are open (that is, not invoiced), you can view and edit them here.

**Note:** The description of this workspace assumes that you are creating invoices, but most of the features also apply to creating credit memos.

The Itemize Invoice Selection tab shows information for each invoice selection line in the Invoice Selection workspace. While the lines in the Invoice Selection workspace are summed, here they are broken down into individual job entries.

Any negative **Total** amount represents a credit memo, and can be processed in this workspace.

If the current job is a fixed-price job and has the **Allow Invoicing on Account Only** job parameter set to **Yes**, you can only create entries that will not be included in the fixed price of the job.

### Write-Ups and Write-Downs

If you use the **Transfer Desired Sales Price** or **Transfer Fixed Price** actions in the Invoice Selection workspace to perform a write-up or write-down, and the current job has the **Transfer Write-Up/Down to Fixed Allocation Combination** job parameter set to **Yes**, the transfer is allocated to a separate allocation combination. In other words, the change in the sales price is not transferred proportionally to the entries selected for invoicing. Instead, the difference is allocated to a single new entry whose dimensions are determined by the **Write-Up/Down** job parameter.

Depending on the current invoice layout, the write-up or write-down may be displayed on a separate line in the invoice selection and possibly on the invoice itself.

If the job's **Allow Write-Up/Down at Transfer Billing Price Only** job parameter is set to **Yes**, you cannot change quantities, billing prices, or markup percentages directly in this workspace.

For more information about parameters that pertain to fixed-price jobs, including write-ups and write-downs, see the descriptions of the Job Parameters and Job Parameter Selection Rules workspaces.

### Employee Control

If you specified employee control for the current job in the Jobs workspace, you can only create entries for employees who appear in the job's budget or who are listed in the job's employee control list.

If the **Use Fixed Budget Type for Employee Control** system parameter is selected, Maconomy uses a budget of the type specified in the **Budget Type No. for Employee Control** system parameter. Otherwise Maconomy uses the planning budget.

### Itemize Invoice Selection Tab

This section includes the fields and descriptions for the Itemize Invoice Selection tab.

#### Invoice Selection Line Island

Field	Description
<b>Job</b>	This field shows the name and number of the job to which the job entries in the table are entered.
<b>Activity No.</b>	If the current job has an invoice layout rule which specifies that invoice selections are to be summarized by Activity at level one or two, this field shows the number of the activity by which the job entries in the table part of the window are summed. The values in this island are the same as the ones displayed on a line in the window Invoice Selection. Note that if direct invoicing has been performed, this field may contain a value, even if the current invoice layout rule does not specify summation on this dimension in the window Invoice Layout Rules. For more information, please see the description of the windows Invoice Selection and Invoice Layout Rules.
<b>Activity Name</b>	This field shows the activity text entered for the activity in the window Activities.
<b>Task</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Task Description</b>	This field shows the task description which was entered when the task was created.
<b>Empl. No.</b>	This is the employee number entered for the time activity in the table part of the window Invoice Selection.
<b>Employee Name</b>	This is the name of the employee entered for the time activity in the table part of the window Invoice Selection.
<b>Employee Category No.</b>	This field shows the number of the employee category for the line in question.
<b>Employee Category</b>	This field shows the name of the employee category for the line in question.
<b>Task Group 1-6</b>	The functionality of these fields is similar to that of the field "Activity No." above. For further information on work breakdown structure and task groups, see the descriptions under "Job Tasks" and under "Job Budgets."

### Invoice Selection Line, Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Activity No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Activity No." above.

### Invoice Selection Island

Field	Description
<b>Open</b>	<p>The "Quantity" column shows how many units have been entered to the activity, but which have not been invoiced. The "Billing Price" column shows the total billing price entered but not yet invoiced.</p> <p>The open quantity is the sum of the values in the "No., Open" fields in the table. The open billing price is the sum of the values in the "Billing Price, Open" fields in the table.</p>
<b>Available</b>	This field shows the available billing price. If you do not allow multiple invoice drafts on the job, or if you do not have any drafts, then this is the same as the work in progress.
<b>To Invoice</b>	<p>The "Quantity" column shows how many units are selected for invoicing. The "Billing Price" column shows the billing price selected to be invoiced.</p> <p>The quantity to be invoiced is the sum of the values in the "Invoice Quantity" fields in the table. The billing price to be invoiced is the sum of the values in the "Billing Price to Inv." fields in the table.</p>
<b>Prev. Invoiced</b>	<p>The "Quantity" column shows how many units have already been invoiced for the job. The "Billing Price" column shows how much has been invoiced for the job activity.</p> <p>The previously invoiced quantity is the sum of the values in the "Quan., Inv." fields in the table, and the billing price is the sum of the values in the "Billing Price, Invoice" fields.</p>
<b>Total</b>	The "Quantity" column shows how many units of the activity have been selected for invoicing and previously invoiced. The "Billing Price" column shows how much has been selected to be invoiced and previously invoiced for the job.

Field	Description
<b>Budget</b>	The “Quantity” column shows the budgeted quantity for the job. The “Billing Price” column shows the budgeted billing price of the job activity. Job budgets are made in the window Job Budgets.
<b>Entered</b>	The “Quantity” column shows how many units of the activity have been entered to the job. The “Billing Price” column shows the billing price sum of the quantity entered.

**Direct Invoicing Island**

Field	Description
<b>Direct Inv.</b>	This field is marked if you have chosen direct invoicing for the entry in the table part of the window Invoice Selection. It cannot be changed here.

**Up/Down Island**

Field	Description
<b>To Date</b>	These fields show the write-up/-down number of hours and billing price of invoicing lines already invoiced. The “Hours” column shows how many units (hours) have already been invoiced for the job. The “Billing Price” column shows how much (amount) has been invoiced for the job activity.
<b>Selection</b>	These fields show the write-up/-down number of hours and billing price resulting from invoicing the current invoice selection that has been transferred for invoicing in the table part.  Write-up and write-down are the differences between the registered number/ amount and the invoiced number/ amount. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Total</b>	These fields show the total write-up/-down number of hours and billing price for the job after invoicing the current invoice selection that has been transferred for invoicing in the table part.  Write-up and write-down are the differences between the registered number/amount and the invoiced number/amount. Write-ups are shown in positive figures, and write-downs in negative figures.

**Selection Criteria Island**

Field	Description
<b>Entries within selection criteria only</b>	If the system parameter “Keep delimitation when changing invoice selection” is selected, any delimitations made in the window Invoice Selection are preserved in this window. This means that if, for example, you select a certain cut-off date in the window Invoice Selection and carry out an invoicing action—that action will only affect the underlying entries identified by the delimitation.  If you mark this field, and the system parameter mentioned above is selected, the table part only shows the entries identified by the delimitation made in the

Field	Description
	window Invoice Selection. If you remove the mark, the table part shows all entries.

## Job Entries Sub-Tab

This section includes the fields and descriptions for the Job Entries sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number of the current job entry. If the current job in the card part is a main job, and the job's invoice layout rule is marked in the fields "Main Job Invoicing" and "Main Job Invoice Selection," the lines in the table part may derive from subjobs of the main job. It is possible to enter job entries for direct invoicing on the associated subjobs in this window.
<b>Date</b>	This field shows the date on which the job entry was entered. It cannot be changed on existing lines. However, you can enter a date when manually creating a line.
<b>Description</b>	This is the entry text. It cannot be changed. However, you can enter a description when manually creating a line.
<b>Empl. No.</b>	This is the number of the employee registered on the job entry. This field must be completed if the field "Direct Inv." has been marked, and the activity on the line is a time activity. Maconomy will automatically suggest the employee specified in the system parameter "Employee No. for direct invoicing." You cannot change the field on existing lines.
<b>Employee Name</b>	This is the name of the employee entered for the time activity in the table part of the Invoice Selection window.
<b>Invoice Quantity</b>	If the job parameter attribute "Allow Write-Up/Down at Transfer of Billing Price Only" of the type "Write-Up/Down" is not marked for the current job, you can change how many units of the activity you wish to invoice in this field. The job entry is invoiced when you approve and print the invoice selection in the window Invoice Selection. Maconomy suggests the quantity you entered when the job entry was entered.  You can change the value here if you wish to temporarily invoice the customer part of the quantity entered, or if you wish to invoice the customer for more or less than the entered quantity. In the latter case, the job entry must be closed, which is done by marking the "Close" field.
<b>Billing Price, Unit</b>	In this field, you enter the activity's billing price per unit. Maconomy suggests the billing price per unit entered for the entry.  If the job parameter attribute "Allow Write-Up/Down at Transfer of Billing Price Only" of the type "Write-Up/Down" is not marked for the current job, you can change the value here if you wish to invoice another price to the customer.

Field	Description
<b>Billing Price to Inv.</b>	<p>This field shows how much you are invoicing the customer when the invoice selection is approved in the window Invoice Selection and subsequently invoiced in the window Invoice Selection, Invoice Editing or Job Invoicing.</p> <p>The billing price here is calculated as the “Billing Price, Unit” multiplied by the “Invoice Quantity.”</p>
<b>Invoice</b>	<p>This field shows whether the current job entry has been selected for invoicing. If you remove the mark in this field, the value in the field “Invoice Quantity” is reset to zero.</p>
<b>Close</b>	<p>In this field, you can specify whether the entry is to be closed when the invoice selection is approved and invoiced. If you mark this field, the entry will be closed, which means that you cannot invoice it again. If the quantity or price to invoice is greater than what was originally entered, Maconomy will calculate the up- or down-written amount when invoicing takes place. The result can be seen in the card part of this window after invoicing has taken place. It can also be seen in the table part of the Invoice Selection and Job Card windows, as well as on various printouts, for example, the job profitability printout.</p> <p>If you unmark this field on manually created lines, the job entry will not be closed at invoicing. You can use this functionality if you wish to invoice the customer for a specific amount before the work has actually been registered. When the invoice is printed, an open job entry with a negative open cost and a negative open billing price is automatically created, as you must still register the activities covered by the invoice. When you register the activities in a job journal or a time sheet, the negative cost and billing price will be written down according to the cost and billing prices of the activities or employees in question.</p> <p>When you manually create a line and unmark this field, the cost from the employee or activity is transferred to the field “Cost Price Pc” as you are not invoicing without registering activities, but invoicing an amount before registering the activities.</p> <p>If you leave this field marked, no cost is transferred from the employee or activity. You can use this functionality to invoice without registering activities.</p>
<b>Action</b>	<p>This pop-up field serves two purposes: It tells you at a glance what the effect of the selections on the current line is, and it is a shortcut to performing various common operations on the current line. A corresponding field exists for the current invoice selection line in the window Invoice Selection (the sum of the job entries in the table part of this window). If you change the value of this field, the value of the corresponding field in the window Invoice Selection is reset to the blank value.</p> <p>This field can have four values:</p>

Field	Description
	<ul style="list-style-type: none"> <li>■ Invoice — If you select this value, the fields “Close” and “Invoice” are marked on the current line. This means that the open entry is closed when you approve and print the invoice in the window Invoice Selection; the line is invoiced in full. For more information, please see the description of the fields “Close” and “Invoice.”</li> <li>■ Write Off — If you select this value, the fields “Close” and “Invoice” are marked on the current line, and the fields “Invoice Quantity” and “Billing Price to Inv.” are reset to zero. This means that the current, open job entry is closed when you approve and print the invoice in the window Invoice Selection, but nothing is invoiced; the line is written off completely, and the job is written down by the current line’s amount. Note that this action cannot be selected if the job parameter attribute “Allow Write-Up/Down at Transfer of Billing Price Only” of the type “Write-Up/Down” is marked for the current job.</li> <li>■ Carry Forward — If you select this value, any marks in the fields “Close” and “Invoice” are removed on the current line, and the fields “Invoice Quantity” and “Billing Price to Inv.” are reset to zero. This means that nothing is invoiced on the current line when you approve and print the invoice in the window Invoice Selection, but the balance is not closed — that is, the balance is carried forward, and the job entry will reappear at the next invoicing.</li> <li>■ Blank — This is the default value. Please note that if you have selected a non-blank value in this field, it will be reset to blank if the current invoice selection line is changed in the window Invoice Selection, or if you manually change the value of the field “Close.”</li> </ul> <p>Note again that this field is merely a shortcut to actions which can also be performed by changing the affected fields manually.</p> <p>For more information, please see the description of the field “Action” in the window Invoice Selection.</p>
<b>Proposed Quantity</b>	This field displays the invoiceable quantity proposed by the project manager in the Approve Expense Sheet Lines window. If the job entry only covers a job surcharge amount, the value in the field will be 1. This value is identical to the initial value in the “Invoice Quantity” field.
<b>Proposed Billing Price, Unit</b>	This field displays the unit billing price proposed by the project manager in the Approve Time Sheet Lines or Approve Expense Sheet Lines window. The amount includes applicable job surcharges, if any.
<b>Proposed Billing Price, Total</b>	This field displays the total billing price proposed by the project manager in the Approve Time Sheet Lines or Approve Expense Sheet Lines window. The amount includes applicable job surcharges, if any.
<b>Use Invoice Proposal</b>	This check box shows whether the quantity and billing price in the “Proposed Quantity,” “Proposed Billing Price, Unit,” and “Proposed Billing Price, Total” fields will be used for invoicing. If the project manager or

Field	Description
	<p>employee has approved the values in these three fields, this check box will be marked, which means the values in the three fields will be used for invoicing. If the check box is not marked, this indicates that the values from the fields "Invoice Quantity," "Billing Price, Unit," and "Billing Price to Inv." will be used for invoicing.</p>
<b>Reallocate</b>	<p>If you mark this field, the current job entry is marked for reallocation. When a job entry is marked for reallocation, it cannot be invoiced in the window Invoice Selection. The quantity and amount for invoicing are reset to zero, and any mark in the fields "Invoice" and "Close" is removed.</p> <p>To be able to invoice the job entry, you must first either perform the reallocation in the window Job Reallocation by Job or unmark the field in this window or the window Invoice Selection.</p> <p>Note that entries for direct invoicing cannot be marked for reallocation. Note also that selecting an action in the field "Action" automatically unmarks this field.</p>
<b>Incl. in Fixed Price</b>	<p>A check mark in this field indicates that the entry is included in the fixed price of a fixed-price job. When you create a line, Maconomy automatically marks this field if the current entry is not to be included in the fixed price of the relevant job. The check mark in this field cannot be removed manually.</p>
<b>Dir. Inv.</b>	<p>This field is marked if you are doing direct invoicing or crediting on the job entry level. This field is marked on lines created manually in this window or the window Invoice Selection. The field can also become marked as a result of using the action "Invoice to Credit Memo" in the window Invoice Selection without marking the field "Restore Job Entries." You cannot change the value here.</p> <p>If the job has been set up to use invoice allocation, you cannot create job entries for direct invoicing on dimensions that have been defined for use with a fixed-price job.</p>
<b>Cost, Unit</b>	<p>This is the cost originally recorded for the entry. You cannot change it here. The cost is used to calculate the markup percentage in the fields "Markup, Unit" and "Markup %."</p> <p>If the job is capitalized, the cost multiplied by the quantity in the "Invoice Quantity" field will be posted to the cost of sales account when the invoice selection is invoiced. This account is specified by means of a dimension combination in the window Posting References in the G/L module, or in the table part of the window Activities if you have selected "Post by Activity" in the window System Information.</p> <p>If you unmark the field "Close" on manually created lines, Maconomy automatically transfers the cost of the current employee or activity to this field. You can change the cost of the employee in the window Employees in the Set-Up module. The cost of an activity can be changed in the window Activities.</p>
<b>Markup, Unit</b>	<p>In this field, you can enter the amount by which you want to mark up the current invoice line per unit. Maconomy calculates and shows a markup</p>

Field	Description
	amount based on the values in the fields "Billing Price, Unit" and "Cost, Unit." If you change the suggested markup, Maconomy will recalculate the line's billing price to invoice.
<b>Markup</b>	In this field, you can enter or change the markup amount for the current line. The field "Close Entries" must be marked. Maconomy suggests the difference between the cost and the billing price of the current table line. When you change this field and press Return, the fields "Billing Price for Allocation" and "Markup %" on the current line are updated, and the fields relating to the desired sales price in the card part are updated as well to reflect the new billing price to allocate.
<b>Markup %</b>	In this field, you can enter the percentage by which you want to mark up the current invoice line. Maconomy calculates and suggests a markup percentage based on the values in the fields "Billing Price, Unit" and "Cost, Unit." The markup percentage is the gross margin as percentage of cost. If you change the suggested markup percentage, Maconomy will recalculate the line's billing price to invoice.
<b>Quantity, Open</b>	This field shows how many units of the activity you have entered to the job entry and which have not already been invoiced.
<b>Billing Price, Open</b>	This shows how much of the billing price you have not already invoiced to the customer. Maconomy calculates the amount as the value in the "No., Open" field multiplied by the original billing price per piece.
<b>Quantity, Inv.</b>	This shows the quantity which has previously been invoiced to the customer.
<b>Billing Price, Inv.</b>	This is the amount you have previously invoiced to the customer.
<b>Quantity, Total</b>	This is the total quantity which, after the invoice selection is approved and invoiced, will be invoiced to the customer. It is the sum of the quantities in the "Invoice Quantity" and "No. Invoiced" fields.
<b>Billing Price, Total</b>	This is the total billing price which, after the invoice selection is approved and invoiced, will be invoiced to the customer. It is the sum of the amounts in the "Billing Price to Inv." and "Billing Price, Invoiced" fields.
<b>Quantity, Reg.</b>	This is the quantity given when the job entry was entered. When the job entry is closed, Maconomy calculates any up- or down-written difference between the quantity in this field and the quantity invoiced to the customer.
<b>Billing Price, Reg.</b>	This is the total billing price entered for the job entry. When the job entry is closed, Maconomy calculates any up- or down-written difference between the billing price in this field and the billing price invoiced to the customer.

Field	Description
<b>Quantity, Up/Down, To Date</b>	This field shows the write-up/-down quantity already invoiced for the activity. Write-up and write-down are the differences between the registered quantity and the invoiced quantity. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Billing Price, Up/Down, To Date</b>	This field shows the write-up/-down billing price already invoiced for the activity. Write-up and write-down are the differences between the registered billing price and the invoiced billing price. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Quantity, Up/Down, Selection</b>	This field shows the potential write-up/-down quantity resulting from invoicing the current invoice selection. Write-up and write-down are the differences between the registered quantity and the invoiced quantity. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Sales Price, Up/Down, Selection</b>	This field shows the potential write-up/-down sales price resulting from invoicing the current invoice selection. Write-up and write-down are the differences between the registered billing price and the invoiced billing price. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Quantity, Up/Down, Total</b>	This field shows the total write-up/-down quantity for the job after invoicing the current invoice selection. Write-up and write-down are the differences between the registered quantity and the invoiced quantity. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Sales Price, Up/Down, Total</b>	This field shows the total write-up/-down sales price for the job after invoicing the current invoice selection. Write-up and write-down are the differences between the registered billing price and the invoiced billing price. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Tax Code</b>	<p>This field shows the tax code of the current activity. You can change the tax code, either directly in the field or by selecting the action "Rederive Tax Code" if the tax code has been changed for the job.</p> <p>You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters window. When multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2," and, if enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Item Tax Code</b>	In this field, the item tax code of the current activity is shown. The value can be altered here.
<b>Quantity</b>	In this field, you can specify a quantity used in the current activity.
<b>Quantity 2</b>	The functionality of this field is similar to that of the field "Quantity" above.

Field	Description
<b>Remarks</b>	In this field, you can enter a remark to describe the current job entry. This could, for example, be a note about the reason for writing down an entry. If a remark is entered for the current invoice selection line in the window Invoice Selection, it will overwrite any remarks entered in this window. If a remark is changed on any line in this window, the "Remarks" field in the window Invoice Selection is blanked for that invoice selection line.
<b>Employee Category</b>	This field shows the Employee Category of the line in question.
<b>Act. No.</b>	This field shows and lets you enter the activity assigned to the current line.
<b>Activity Name</b>	This field shows the name defined for the current activity.
<b>Task</b>	This field shows the task assigned to the current line. If a task list exists for the job, a task must be specified on the line. If dimension values have been specified on the task in question, Maconomy suggests these dimension values on the line unless another value has been entered manually. If the window Task Lists specifies that derived dimension values should overwrite existing dimension values, any manually entered dimensions will be overwritten. If no task list has been assigned to the job, you cannot enter a task.
<b>Task Description</b>	This field shows the text defined for the current task, if a task has been entered in the field "Task."
<b>Task Group 1-6</b>	The functionality of these fields is similar to the functionality of the field "Location" above. For further information on work breakdown structures and task groups, see the descriptions under "Job Tasks" and under "Job Budgets."
<b>Location</b>	This field shows the location assigned to the current job entry. You can only change the value in this field if the job entry has been marked for direct invoicing and is yet to be invoiced.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

Field	Description
<b>Vendor Invoice Document</b>	This field shows a document attached to a vendor invoice, such as a scanned invoice or an e-mail.
<b>Purch. Order No.</b>	If the job entry was based on a purchase order, the number of the purchase order in question is shown in this field.
<b>Purchase Order Line No.</b>	If the job entry was based on a purchase order, this field shows the number of the line on the purchase order on which the entry was based.
<b>Accrual Entry</b>	This field shows whether the current job entry is an accrual entry, that is, if the entry was created as a result of an accrual being raised from a purchase order line in the window Job Accruals.
<b>Overtime Spec.</b>	This pop-up field shows any specification of overtime on the current job entry. You can change the value in this field. For more information, see the description of the window Job Price Information.
<b>Daily Description</b>	In this field you can enter or edit any daily description associated with the current job entry. The text in this field may be printed on the invoice, depending on the invoice layout of the current job. For more information, see the description of the window Job Tasks.
<b>Accrual Type</b>	This field shows any accrual type selected for the current job entry.
<b>Period From, Accrual</b>	If the current job entry has been accrued, this field and the field "Period To, Accrual" below show the starting and ending periods through which the entry was accrued.
<b>Period To, Accrual</b>	See the description of the field "Period From, Accrual" above.
<b>Period From, Subscription</b>	If the current job entry originates from a subscription order, this field and the field "Period To, Subscription" below show the starting and ending periods of the subscription.
<b>Period To, Subscription</b>	See the description of the field "Period From, Subscription" above.

## Actions

This section shows the Actions available in the Itemize Invoice Selection workspace.

### Bottom Tab

Field	Description
<b>Rederive Tax Code</b>	<p>If the setup for the derivation of a tax code has been changed since the job entries were created, you can select this action to rederive the tax code of the job entries in the table part. All open job entries are updated with the tax reporting code selected for the job.</p> <p>When you select this action, any approval of the invoice selection is removed. This action is not available when the invoice selection is closed.</p>
<b>View Vendor Invoice Document</b>	<p>Use this action to view any document attached to a vendor invoice, for example a scanned invoice or an e-mail.</p> <p>This action is enabled when at least one job entry in the table part originates from a vendor invoice with an invoice number specified. If the action is used on other types of job entry, an error message will be displayed.</p>

## Invoice Preparation Single Dialogs Workspace

Use this workspace to prepare a job invoice.

Because you can use this workspace to both select invoice entries to bill and edit invoices, this workspace can replace the Invoice Selection, Invoice Editing, and On Account Invoice Selection workspaces for some jobs.

This workspace has limited functionality so that it is easy to use. You cannot use this workspace to:

- Write off entries or write up/down entries.
- Direct invoice or over invoice.
- Use certain functionality that is controlled by the Invoice Layout Rules workspace, including:
  - Show Line Amounts (amounts are shown on the lines).
  - Show Markup Separately (markup is not shown separately).
  - Create Invoice from Quote.
  - Period Indication.
  - Show Items Separately.
  - Combine Invoice Printout Lines (lines are combined).

You can use this workspace to perform split billing.

### Select Invoice Lines to Bill

When you open the workspace, the Invoice Lines sub-tab, which lists the entries to be billed, is normally empty. Use the **Prepare Invoice** action to populate the sub-tab with entries, based on one of the following options:

- **Budget** — All of the dimensions that are used to select invoice entries are derived from the job's budget lines. The Budget option creates an invoice on account. Therefore, the job should be set up to use activities for invoicing on account.
- **Entries with Close All**— You select all open job entries.
- **Entries with Delimit** — You enter the dimensions used to select invoice entries. For example, you can choose to include all open entries before a specific date.

### Format Invoice Lines

In the Invoice Layout Rules workspace, you can specify how invoice entries should be grouped, ordered, and subtotaled, and what text lines should be shown in this workspace.

### Approving and Editing

Use the **Approve** action to approve the invoice entries and generate a draft invoice. If the **Invoice Editing Required** job parameter is set to **Yes**, you must edit the draft invoice.

If you change the quantity or billing price of entries, you need to choose what should happen to the difference between the open quantity and the quantity that you have chosen to invoice. You can carry the difference forward. You cannot perform write-offs or write up/down in this workspace.

### Invoice Preparation Tab

This section includes the fields and descriptions for the Invoice Preparation tab.

Field	Description
<b>Job</b>	This field shows the job name and number.
<b>Customer</b>	This field shows the customer name.
<b>Project Manager</b>	This field shows the name and number of the project manager.

### Invoiced on Account Island

Field	Description
<b>Net Invoiced on Account</b>	This field shows the net invoiced on account.
<b>Tax Invoiced on Account</b>	This field shows the tax invoiced on account.

Field	Description
<b>Approved reconciliation</b>	This field shows the amount approved for on account reconciliation.
<b>Available for Reduction</b>	This field shows the amount on account that is available for reduction.
<b>On Account Reduction</b>	Use this field to enter the on-account reduction amount.

#### Totals Island

Field	Description
<b>All amounts in</b>	This field shows the currency used in the invoice.

#### Billing Price Island

Field	Description
<b>Available</b>	This field shows the available billing price. If you do not allow multiple invoice drafts on the job, or if you do not have any drafts, then this is the same as the work in progress.
<b>Carry Forward</b>	This field shows the billing price that will be carried forward if you approve the selection.
<b>For Invoicing</b>	This field shows the amount for invoicing.
<b>Budget</b>	This field shows the budget amount.

#### Status Island

Field	Description
<b>Blocked, Time Registration</b>	Select this box to block the job for time registrations.
<b>Blocked, Amount Registration</b>	Select this box to block the job for amount registrations.
<b>Drafts for Editing</b>	This field indicates if there are invoice drafts for editing.
<b>Approved for Invoicing</b>	This field indicates if the amount has been approved for invoicing.

## Invoice Lines Sub-Tab

This section includes the fields and descriptions for the Invoice Lines sub-tab.

Field	Description
<b>External Description</b>	This column shows a description of each line item in the invoice. This is the text that will appear on the invoice.
<b>Quantity</b>	This column shows the unit quantity for each line item on the invoice.
<b>Price</b>	This column shows the price per unit of each line item in the invoice.
<b>Total Price</b>	This column shows the total price of line item. This is derived using the formula: Quantity * Price = Total Price.
<b>Budget</b>	This column shows the budgeted billing price allotted to each line item on the invoice.
<b>Available</b>	This column shows the available billing price for invoicing on each line item on the invoice.
<b>Carry Forward</b>	This column shows the carry forward amount for each line item in the invoice.
<b>Only Total Price</b>	This field shows only the total price.
<b>Type</b>	This column shows the line type. The line either of the type Time, Amount, Time and Amount, Sum/Text, or Info. This is set by the Prepare Invoice action and reflects the activity type for the underlying entries for invoicing, in case the invoice is based on job entries. Lines of the type Info are created if there is a budget or purchase for which there are no actuals.
<b>Description</b>	This column shows a description of each line item in the invoice, such as task description or employee name, depending on the chosen invoice layout rule.
<b>Origin</b>	This field shows the origin of the line, such as task name or employee number, depending on the chosen invoice layout rule.
<b>Tax Code</b>	This column shows the tax code that applies to each line item in the invoice.
<b>Unit</b>	This field displays the unit specified for the quantity on the line. This field is not displayed by default, but the view can be customized to display it.

## Actions

This section shows the Actions available in the Invoice Preparation workspace.

### Top Tab

Field	Description
<b>Prepare Invoice</b>	<p>This action prepares the invoice with the chosen basis. If the invoice preparation is based on the budget or a percentage of the budget, then this action will create lines based on the budget, with or without grouping of the lines as specified in the invoice layout rule, and this will be set for invoicing on account. You can also base invoice preparation on job entries. You can either close all entries or use selection criteria, such as a cut-off date, for delimitation. You can subsequently edit the text and amount to invoice. Note that Invoice Preparation does not allow you to write up or down entries.</p> <p>If Basis for Invoice is set to "Budget", clicking this action copies the unit from the budget lines to the invoice lines in this workspace.</p>
<b>Clear</b>	This action clears the invoice preparation.
<b>Approve</b>	This action approves the invoice selection, producing a draft invoice. Because of the features that are available to you in invoice preparation, it is often not necessary to do any additional editing of the draft.
<b>Remove Latest Draft</b>	This action removes the latest draft invoice. You can use this action if a draft invoice or credit memo that is still related to the invoice selection exists on the job.
<b>Remove All Drafts</b>	If you select this action, the approval status of the current invoice or credit memo selection is removed. If you make a change in an approved selection, Maconomy shows a message warning you that the current selection has been approved, and asking you if you want to continue. By selecting this action first, you are not prompted with that message.
<b>Print Draft</b>	<p>This action is available whenever a draft invoice or a draft credit memo exists on the job.</p> <p>When you select this action, Maconomy prints a draft copy of the current invoice or credit memo. No postings are made when you select this action.</p>
<b>Print Invoice</b>	<p>This action is available whenever a draft invoice exists on the job that has been approved for invoicing.</p> <p>When you select this action, you create and print an invoice or invoice on account on the basis of the invoice selection in the window.</p>
<b>Print Credit Memo</b>	<p>This action is available whenever a draft credit memo exists on the job that has been approved for invoicing.</p> <p>When you select this action, you create and print a credit memo on the basis of the credit memo selection in the window.</p>

## Blanket Invoice Selection Single Dialogs Workspace

Use this workspace to prepare a blanket invoice for a bill-to customer, as well as view and update pre-invoicing activities.

Use blanket invoicing to generate a single invoice for multiple jobs that you are performing for a single customer.

In general, this workspace has the same functionality as the Invoice Selection workspace, but it applies to blanket invoicing instead of invoicing for a single job.

For each bill-to customer, the Job sub-tab lists current jobs, one line per job. You can choose to include or exclude jobs from the blanket invoice. You can also perform actions that affect all of the selected jobs, including entering delimiters that control the entries that are billed, approving invoices, and printing draft and final invoices.

### Blanket Invoice Collection Tab

This section includes the fields and descriptions for the Blanket Invoice Collection tab.

#### Blanket Invoicing Criteria Island

Field	Description
<b>Bill to Customer</b>	This field shows the name and number of the customer to which the jobs belong and the first line of the customer's name. The fields in this island are shared by the jobs in the table part; all of the jobs have the same bill-to customer, company, department, and so on.
<b>Company</b>	This field shows the name and number of the company that is responsible for the jobs, with the associated company name.
<b>Department</b>	This field shows the department of the jobs that are displayed in the table part.
<b>Currency</b>	This field shows the currency of the jobs in the table part.
<b>Invoice Currency</b>	This field shows the invoice currency (for invoicing on account) on the jobs.
<b>Tax</b>	This checkbox is selected if the invoices are subject to tax. Maconomy retrieves this value from the Job Information window. You cannot change it here.
<b>Company Tax Code</b>	This field shows the company tax code of the jobs. Maconomy uses this field to determine the tax code to use in calculating tax for the individual allocation lines, as the reporting code is part of the criteria for the selection of a G/L tax code in the G/L Tax Tables window, if such a table was specified for the company that is responsible for the jobs.
<b>Main Job No.</b>	This field shows the number of the main job in case the Blanket Invoicing per Main Job system parameter is selected. If that is the case, the table part shows the main job and all of the subjobs that are set up for blanket invoicing.

Field	Description
<b>Job Collection</b>	This field shows the number of the job collection of the jobs, provided that they belong to a job collection where the Blanket invoice Separately field is selected. This field is also displayed in the Blanket Invoice Overview window.

**Draft Overview Island**

Field	Description
<b>Number of Drafts for Editing</b>	This field shows the number of draft invoices for editing.
<b>Number of Drafts for Invoicing</b>	This field shows the number of draft invoices for invoicing.

**Work in Progress Island**

Field	Description
<b>WIP Available</b>	This field shows the WIP available for invoicing for time activities and amount activities, as well as the total WIP.
<b>WIP for Invoicing</b>	Enter the amount of WIP to invoice. When you change the amount of WIP to invoice, Maconomy selects entries for invoicing, with the oldest entries first, to reach the specified amount.
<b>Carry Forward</b>	Enter the amount of WIP to carry forward.
<b>Billing Price</b>	You can change the billing price of the WIP to invoice in this field. When you change the billing price, Maconomy adjusts the hourly rate proportionately to the registered rate, to obtain the specified total billing price. Maconomy applies a change in billing price only to time-related activities.
<b>Write-Up/Down</b>	Enter the amount of WIP to write down. When you change the amount for Write-Up/Down, Maconomy adjusts the hourly rate proportionately to the registered rate, to obtain the specified total billing price. Maconomy applies a change in Write-Up/Down only to time-related activities.
<b>Realization Rate</b>	This field shows the realization rate. This is based on the Billing Price and the WIP for Invoicing fields for time. You can change the Realization Rate, which adjusts the Billing Price and Write-Up/Down accordingly. When you change the Realization Rate, Maconomy adjusts the hourly rate proportionately to the registered rate, to obtain the specified total billing price.

Field	Description
	Maconomy applies a change in Realization Rate only to time-related activities.
<b>Exclude Entries for Carry Forward</b>	<p>Select this check box to exclude selected entries in the table part that are marked for carry forward from the billing adjustment when changing the WIP for Invoicing.</p> <p>You can only select this check box simultaneously with a change in the WIP for Invoicing field.</p>

**Invoiced this Customer Island**

Field	Description
<b>For all Jobs in Currency</b>	This field shows the currency of all of the jobs that are included in the totals on this panel.
<b>Invoiced Billing Price</b>	These fields display the invoiced billing price for this year and the prior year.
<b>Invoiced Billing Price, Time</b>	These fields display the write-up/down amount for the time activity entries that have been invoiced for this year and the prior year. These fields are similar to the Invoiced Billing Price fields, except that they only sum up time activities invoiced.
<b>Realization Rate</b>	This field displays a weighted average of the approved budgeted realization for the selected jobs.
<b>Invoiced on Account</b>	This field shows the amount (fixed price) invoiced on account.
<b>On Account Movement</b>	This field shows the total amount invoiced on account, minus on account reconciliation in the given period during the current year and prior year. This field is focused on the customer, rather than the currently opened job.

**Customer Balance Island**

Field	Description
<b>Balance</b>	This field displays the currency and the balance in that currency for the company specific customer.

**Invoice Island**

Field	Description
<b>Preferred Invoice Date</b>	Enter a preferred invoice date. If you leave this field blank, the invoice date is the current date when the draft invoice is printed as an invoice.

Field	Description
<b>Show Write Down Separately</b>	<p>If the invoice layout rule is set up to show amounts on lines, the draft invoice that Maconomy creates when you approve an invoice selection on a job shows the amount that is being invoiced, including any write-up/down that you might have selected.</p> <p>You can show write-down on a single, separate line, and then instead show the billing price, excluding write down, on the specification. Select this field to do this.</p> <p>You can set up the text in this line (such as Courtesy discount) in the Language Texts window on the entry with key1 @JobWriteDownLine.</p>
<b>Show Customer Balances On Invoice</b>	Select this check box to show a customer's prior balance and the new balance on the invoice. The default value is inherited from the customer or company-specific customer, but you can overwrite it in this window and the Invoice Selection and On Account Invoice Selection windows.
<b>Show Customer Statement On Invoice</b>	Select this check box to show the customer statement on the job invoice printout. The default value is inherited from the customer or company-specific customer, but you can overwrite it in this window and the Invoice Selection and On Account Invoice Selection windows.
<b>Show Customer Aging On Invoice</b>	Select this check box to show the A/R aging on the job invoice printout. The default value is inherited from the customer or company-specific customer, but you can overwrite it in this window and the Invoice Selection and On Account Invoice Selection windows.
<b>Include Detailed Specification</b>	Select this check box to include a detailed specification in the invoice. You can only select this box if the job is set up to create a detailed invoice specification.

#### Selection of Jobs Island

Field	Description
<b>Only Show Included Jobs</b>	If this check box is selected, the table part shows only the jobs where the "Include" field is selected.
<b>Job</b>	If you change this field, only this single job is included in the table part.
<b>Account Manager</b>	If you change this field, only jobs that have this account manager are included in the table part.
<b>Project Manager</b>	If you change this field, only jobs that have this project manager are included in the table part.
<b>Only Open Activities</b>	When this check box is marked only jobs with open entries are shown in the table.

### Overview Island

Field	Description
<b>Budgeted Billing Price</b>	This field shows the total budgeted billing price for the included jobs in the table part, from the budget type selected as the current budget in the Job Budgets window.
<b>Write Up/Down to Date</b>	This field shows the total write up/down for all invoices on the jobs that are included in the table part.
<b>Realization Rate to Date</b>	This field shows the realization rate to date. This is the revenue recognized as a percentage of the invoiced work in progress (WIP). This is based on the Billing Price and the WIP for Invoicing fields for time.
<b>Invoiced to Date</b>	These fields show the total billing price of the time-and-material invoices that have previously been made for the jobs that are included in the table part.
<b>Net on Account</b>	This field shows the amount net on account for the jobs that are included in the table part. This is the amount that has been invoiced on account, excluding subsequent on-account reconciliation.
<b>Total Invoiced to Date</b>	This field shows the sum of the invoiced billing price (time-and-material invoices) and the amount net on account.
<b>For Invoicing on Account</b>	This field shows the sum of amounts selected for on account invoicing in the table part on lines marked to be included in the current blanket invoicing.
<b>On Account Reduction</b>	This field shows the amount which will be reconciled at the next regular invoicing of the job. The amount is the total of the "Reconciliation Amount" fields in the table part for the invoices and credit memos on account that will be reconciled. The amount in this field is also shown in the "On Account Reduction" field in the Invoice Selection window. If the amount is changed in the Invoice Selection window, any changes in this window are canceled, and the oldest invoices on account (for positive amounts) and credit memos on account (for negative amounts) are reconciled first.

### Print Specification Island

Field	Description
<b>Invoice Layout</b>	When this field is updated it will update the corresponding field on all lines in the table. Table line may have different values in that case the value in the card field is blank. If the job selection criteria are changed and lines are added to the table these lines will not be updated instead the card field will be blanked if the new jobs use different invoice layout'.
<b>Detailed Invoice Specification</b>	This field is similar to Invoice Layout but updates the field Detailed Invoice Specification in the table.

## Job Sub-Tab

This section includes the fields and descriptions for the Job sub-tab.

Field	Description
<b>Job No.</b>	This field shows the number of the job. The table part shows jobs that are set up for blanket invoicing and that match the card part with respect to the field in the Blanket Invoicing Criteria island.
<b>Job Name</b>	This field shows the name of the job as entered in the Jobs window.
<b>Include</b>	<p>Deselect this field to exclude a job from the invoice selection.</p> <p>Jobs that are marked as included are affected by the actions in this window, and the totals in the card part cover only those jobs that are marked as included.</p> <p>If you apply the Close All or Delimit action, these actions affect only the included jobs; the actions deselect the jobs that have no entries that are selected for invoicing.</p> <p>The Invoice To Credit Memo action sets an invoice for crediting on all of the jobs that contributed to the invoice being credited. This action then deselects the jobs that did not contribute to the invoice.</p>
<b>WIP Available</b>	This field shows the WIP available for invoicing for time activities and amount activities.
<b>WIP Available, Time</b>	This field shows the WIP available for time activities.
<b>WIP Available, Amount</b>	This field shows the WIP available for amount activities.
<b>WIP for Invoicing</b>	<p>Enter the amount of WIP to invoice.</p> <p>When you change the amount of WIP to invoice, Maconomy selects entries for invoicing, with the oldest entries first, to reach the specified amount.</p>
<b>WIP for Invoicing, Time</b>	Enter the amount of WIP, Time to invoice. Entries of activity type time will be selected to match this amount.
<b>WIP for Invoicing, Amount</b>	Enter the amount of WIP, Time to invoice. Entries of activity type amount will be selected to match this amount.
<b>Carry Forward</b>	Enter the amount of WIP to carry forward.

Field	Description
<b>Carry Forward, Time</b>	Enter the amount of WIP to carry forward for time activities.
<b>Carry Forward, Amount</b>	Enter the amount of WIP to carry forward for amount activities.
<b>Billing Price</b>	<p>You can change the billing price of the WIP to invoice in this field.</p> <p>When you change the billing price, Maconomy adjusts the hourly rate proportionately to the registered rate, to obtain the specified total billing price.</p> <p>Maconomy applies a change in billing price only to time-related activities.</p>
<b>Billing Price, Time</b>	This field shows the billing price for time activities. You can change this value.
<b>Billing Price, Amount</b>	This field shows the billing price for amount activities.
<b>Write-Up/Down</b>	<p>Enter the amount of WIP to write up/down.</p> <p>When you change the amount for Write-Up/Down, Maconomy adjusts the hourly rate proportionately to the registered rate, to obtain the specified total billing price.</p> <p>Maconomy applies a change in Write-Up/Down only to time-related activities.</p>
<b>Write Up/Down, Time</b>	Enter the amount of WIP to write up/down for time activities.
<b>Write Up/Down, Amount</b>	This field shows the write up/down of amount activities. The amount cannot be changed here.
<b>Realization Rate</b>	<p>This field shows the realization rate. This is based on the Billing Price and the WIP for Invoicing fields for time. You can change the Realization Rate, which adjusts the Billing Price and Write-Up/Down accordingly.</p> <p>When you change the Realization Rate, Maconomy adjusts the hourly rate proportionately to the registered rate, to obtain the specified total billing price.</p> <p>Maconomy applies a change in Realization Rate only to time-related activities.</p>
<b>Budgeted Realization Rate</b>	This field displays a weighted average of the approved budgeted realization for the selected jobs.

Field	Description
<b>Exclude Entries for Carry Forward</b>	<p>Select this check box to exclude selected entries in the table part that are marked for carry forward from the billing adjustment when changing the WIP for Invoicing.</p> <p>You can only select this check box simultaneously with a change in the WIP for Invoicing field.</p>
<b>Status</b>	<p>This field shows the status of the job with respect to invoice selection. For example, the field shows "Approved for Invoicing" if there is a draft invoice on the job that is approved for invoicing. If the job is not approved for invoicing, but draft invoices exist, this field shows "Approved for Editing."</p> <p>If there are no draft invoices on the job, but it has an amount for invoicing on account, this field shows the texts "Invoicing on Account" or "Plan Transferred" if the amount comes from the invoicing plan.</p>
<b>Write Up/Down to Date</b>	<p>This field shows the write-up/down until today's date. Write-up and write-down are the difference between the registered billing price and the invoiced billing price. Write-ups are shown as positive figures, and write-downs as negative figures.</p>
<b>Realization Rate to Date</b>	<p>This field shows the realization rate to date. This is the revenue recognized as a percentage of the invoiced work in progress (WIP). This is based on the Billing Price and the WIP for Invoicing fields for time.</p>
<b>Invoiced to Date</b>	<p>This field shows the amount invoiced to date for the jobs included in the draft invoice.</p>
<b>Net on Account</b>	<p>This field shows how much of the job price was invoiced on account and deducted from the final job invoice. If you are looking at an invoice on account, this field will show "0.00."</p>
<b>Total Invoiced to Date</b>	<p>This field shows the sum of the invoiced billing price (time-and-material invoices) and the amount net on account, up to this date.</p>
<b>Budgeted Billing Price</b>	<p>This field shows the total budgeted billing price for the included jobs in the table part, from the budget type selected as the current budget in the Job Budgets window, for the job on this table line.</p>
<b>Remaining to Invoice</b>	<p>This field shows the difference between the budgeted billing price and the total invoiced to date for the job on this table line.</p>
<b>Invoice on Account</b>	<p>In this field an amount may be set by the user for invoicing on account the job on the table line.</p>
<b>Latest Invoice</b>	<p>The field shows the date of last invoice printed.</p>
<b>End Invoice</b>	<p>If you mark this field, the field "End Invoiced" will be marked when an invoice is created from the selection. If you have also marked the field "Close at End Invoicing" on the job, the job will be closed upon invoicing,</p>

Field	Description
	provided that the job has no open entries, no open purchase orders, no open invoices on account, and no unapproved time sheets.
<b>Customer</b>	This is the name of the customer on the job on this table line.
<b>Invoice Type</b>	Same as new field in card part of Invoice Selection.
<b>Combine T&amp;M On Account by Default</b>	Select this check box to combine T&M with On Account by Default. If this check box is selected, the Invoice Type field switches to T&M and On Account when you set an amount for invoicing on account.
<b>Level 1-5</b>	These fields show the customer hierarchy. The current customer will be in the hierarchy if customer hierarchies are set up.
<b>Budget Text 1-5</b>	These fields show the value of extra text fields in the latest job budget revision.

## Actions

This section shows the Actions available in the Blanket Invoice Selection workspace.

### Top Tab

Field	Description
<b>Include All Jobs</b>	Use this action to select the Include field on all of the jobs in the table part.
<b>Exclude All Jobs</b>	Use this action to deselect the Include field on all of the jobs in the table part.
<b>Close All</b>	This action is similar to the action "Balance" in that it changes the amount for allocation to obtain a zero balance. The difference is that this action also marks all job entries to be closed so that the balance results in a write-up or a write-down, depending on whether the balance is positive or negative. This action selects all entries for allocation and closing, and it selects all open invoices for reconciliation. To obtain a zero balance, this action distributes the amount for allocation proportionately to all open job entries. If there is no open billing price, this action creates a revenue adjustment entry with an amount for allocation that equals the amount net on account.
<b>Delimit</b>	This action is used for creating an invoice selection for all open entries selected in the island Delimitation for all jobs specified in the island Selection Criteria. Invoice selections for fixed-price jobs are not included if the job parameter attribute "Allow Invoicing On Account Only" in the job parameter type "Fixed Price Job Set-Up" is assigned the value "Yes," and if outlays are included in the fixed price and if the job is assigned a job allocation combination rule which does not define fixed-price entries. However, outlays are included in the

Field	Description
	<p>delimitation if outlays are not to be included in the fixed price, that is, if the job parameter attribute "Include Outlays in Fixed Price" in the job parameter type "Pricing Method" is assigned the value "No" for the job in question. Moreover, if a fixed-price job uses a job allocation combination rule defining non-fixed-price entries to be invoiced separately, such non-fixed-price entries are also included when selecting this action.</p> <p>If there are jobs with a closed invoice selection that meet the selection criteria, a warning will be displayed when you run this action. If you choose to proceed, all drafts on these jobs will be deleted before the delimitation takes place.</p> <p>If the field "Extend Selection" in the island Delimitation is marked, all entries selected by the criteria in the island Delimitation will be added to the entries already selected. In this way an invoice selection can be constructed in stages; you can, for instance, select registered entries for various ranges of employees.</p> <p>If the field "Extend Selection" is not marked when this action is selected, all existing invoice selections will be deleted, and one is created containing the criteria specified in the island Delimitation. See also the field "Extend Selection" in this window.</p>
<b>Transfer Invoicing Plans</b>	<p>When this action is selected, Maconomy identifies any due lines in the invoicing plans of the jobs matching the selection criteria, and transfers them to the invoice selections. However, if the system parameter "Transfer Several Invoicing Plan Lines" is unmarked, only the first due line of the invoicing plan is transferred.</p> <p>This action excludes jobs with a closed invoice selection.</p> <p>The amounts are shown in the field "Amount for Invoicing on Account, Invoice Currency" in the table part. Next, the invoice selection lines can be approved, allowing you to process the on-account invoices further in the window Invoice Editing. For further information, please see the description of the window Invoicing Plans and the action "Approve" below.</p> <p>Note that invoicing plan lines must be approved in the window Invoicing Plans before they can be transferred for invoicing in this window if the job parameter attribute "Approval of Invoicing Plan Lines" has been set to "Yes" for the current job.</p> <p>If any invoice selection in the table part is for a subjob to a main job where the main job's invoice layout rule specifies "Main Job Invoicing," no invoicing plan is transferred to the job.</p>
<b>Approve</b>	<p>When you select this action, you approve the invoice selections for the jobs that match the selection criteria in the card part of the window if the field "Approve" is marked. The approval date and name of the approver is automatically saved. Please note that the jobs that match the selection criteria are included, even if they are not shown in the table part (the field "Show Lines" is not marked). An invoice selection must be approved before you can edit it in the window Invoice Editing and invoice it. If you change anything in the window Invoice Editing, the approval is canceled, and the invoice selection must be approved again. Maconomy issues an alert if the approval is canceled.</p> <p>The action excludes jobs with a closed invoice selection.</p>

Field	Description
	<p>Maconomy issues a warning if there are open purchase orders on the job. If the field "Show Markup Separately" in the window Job information is marked, the use of this action will lead to the creation of an invoice on which the costs of all amount activities will be shown in the table part with an extra line at the bottom of the invoice showing the markup.</p> <p>You cannot approve invoice selections for fixed-price jobs set up to be invoiced on account only if outlays are included in the fixed price, if the job is assigned a job allocation combination rule which does not define fixed-price entries, and if the amount for invoicing on account is zero. However, outlays for fixed-price jobs are included in the delimitation, if outlays are not to be included in the fixed price, that is, if the job parameter attribute "Include Outlays in Fixed Price" in the job parameter type "Pricing Method" is assigned the value "No" for the job in question. Moreover, if a fixed-price job uses a job allocation combination rule defining non-fixed-price entries to be invoiced separately, such non-fixed-price entries are also approved for invoicing when selecting this action.</p> <p>Moreover, you should note that you cannot approve an invoice selection which is assigned to a job that has been approved for transfer. See the description of the window Job Transfer for information about job transfers.</p> <p>If any invoice selection in the table part is for a main job where the main job's invoice layout rule specifies "Main Job Invoicing," selecting this action will approve the invoice selection of all subjobs of the current main job which are to be blanket invoiced.</p> <p>You can invoice an approved selection either by choosing "Print Invoice" in this window or by choosing "Print Invoice" in the window Invoice Editing. You can also invoice selected invoices for several jobs at a time in the window Job Invoicing. If the job parameter attribute "Invoice Editing Required" in the job parameter type "Invoice Approval" is assigned the value "Yes" on the job in question, you must approve the invoice in the windows Invoice Selection or Invoice Editing. If several approved invoice selections are to be invoiced at the same time, this must be done in the window Job Invoicing.</p> <p>For jobs set up with a job parameter where the line "Allow Combined T&amp;M with On Account Invoicing" is set to <b>Yes</b>, this action combines jobs onto the same draft, even if they have different Invoice Types (field in the table part).</p>
<b>New Invoice Selection</b>	<p>This action is available when the invoice selection is closed, that is, after creating a draft, and provided the job is set up to allow multiple drafts. When you have run this action, the job is open for invoice selection. The quantity and amount for invoicing will be reset to zero on job entries that are approved for invoicing, and remaining job entries will be set for invoicing. The amount for invoicing on account will also be reset to zero.</p>
<b>Invoice to Credit Memo</b>	<p>If, for example, you print a blanket invoice and then regret it, you can use this action to credit the entire blanket invoice. When you select this action, Maconomy creates a credit memo selection based on the job invoice number in the field "Based on Invoice No." in the card part of the window. A credit memo selection is created for each job that is part of the blanket invoice. This action also approves each credit memo selection for the job part of the blanket invoice.</p>

Field	Description
	A warning will tell you if one of the jobs on the blanket invoice no longer meets the blanket invoice criteria set up in the card part. Note that a main job invoice cannot be credited.
<b>Calculate Invoice Surcharge</b>	This action calculates surcharge based on the Job Surcharge Rule specified on the jobs separately. The action applies only for the jobs set up to use "Surcharge at Invoicing" (a job parameter) and only for those jobs that are open for invoice selection.
<b>Remove Approval</b>	Use this action to remove approval of a draft invoice. When removed, the draft is saved as a previous edit. The document archive for the previous edit is no longer attached to any invoice, but continues to exist in the Documents and Notes workspace.
<b>Print Invoice</b>	Use this action to print the invoice. When you print an invoice that has a document archive, it is reassigned to the finalized invoice.

## Selection in Blanket Invoice Selection Single Dialogs Workspace

Use this workspace to perform blanket invoicing selections simultaneously with another user on the same customer.

This workspace is an internal sub-workspace used in blanket invoicing.

### Job Selection in Blanket Invoice Selection Tab

This section includes the fields and descriptions for the Job Selection in Blanket Invoice Selection tab.

#### User Island

Field	Description
<b>Username</b>	This field shows the current users username. This is an internal field used for making sure only current users specific selection criteria show and have effect.

#### Selection of Jobs Island

Field	Description
<b>Show Lines</b>	When you mark this field, the lines that match the values specified in the selection criteria below are shown in an attached table. Please note that the actions selected in the Action menu will be carried out on all jobs that match the selection criteria, regardless of whether the lines are shown in the table part.
<b>Job</b>	Use this field to filter only a particular single job for blanket invoice selection right now.

Field	Description
<b>Account Manager</b>	Use this field to filter only jobs having this particular account manager for blanket invoice selection right now.
<b>Project Manager</b>	Use this field to filter only jobs having this particular project manager for blanket invoice selection right now.
<b>Employee 1-10</b>	Use these fields to filter only jobs having particular employees 1-10 for blanket invoice selection right now.
<b>Company</b>	Use this field to filter only jobs belonging to this particular company for blanket invoice selection right now.
<b>Location</b>	Use this field to filter only jobs belonging to this particular location for blanket invoice selection right now.
<b>Entity</b>	Use this field to filter only jobs belonging to this particular entity for blanket invoice selection right now.
<b>Project</b>	Use this field to filter only jobs belonging to this particular project for blanket invoice selection right now.
<b>Purpose</b>	Use this field to filter only jobs belonging to this particular purpose for blanket invoice selection right now.
<b>Spec. 1-3</b>	Use this field to filter only jobs belonging to the particular specification 1-3 for blanket invoice selection right now.
<b>Local Spec. 1-3</b>	Use this field to filter only jobs belonging to the particular local specification 1-3 for blanket invoice selection right now.
<b>Only Open Activities</b>	When this check box is marked only jobs with open entries included in the blanket invoice.

## Actions

This section shows the Actions available in the Job Selection in Blanket Invoice Selection workspace.

### Top Tab

Field	Description
<b>Change Selection of Jobs</b>	Use this action to execute the selection criteria thus filtering jobs for blanket invoice selection currently.

## Blanket Invoicing Overview Single Dialogs Workspace

Use this workspace to view an overview of the jobs with bill-to customer and appropriation that can be blanket invoiced together.

Use blanket invoicing to generate a single invoice for multiple jobs. All non-invoiced but approved invoice selections appear on one invoice, generated from either this workspace or the Job Invoicing workspace.

The jobs must be set up to be blanket invoiced and must involve the same company, department, bill-to customer, company tax code, currency, and invoice currency. They must all be taxed or all not taxed, not a mixture of both. Additional rules are:

- The jobs must not be blocked for invoicing.
- Invoices and credit notes cannot be blanket invoiced together.
- Jobs with multiple bill-to customers and, as a result, multiple drafts, cannot be blanket invoiced.

Jobs that are set up with main job invoicing are not shown in this workspace and cannot be blanket invoiced.

The Blanket Invoicing Overview tab of this workspace displays blanket invoicing criteria. The criteria are maintained by Maconomy to match all of the combinations of company, department, bill-to customer, and so on, that exist for jobs that are set up with blanket invoicing.

The Bill To Customers sub-tab displays the bill-to customers that meet these criteria and are set up with blanket invoicing.

### Blanket Invoicing Overview Tab

This section includes the fields and descriptions for the Blanket Invoicing Overview tab.

#### Blanket Invoicing Criteria Island

Field	Description
<b>Company</b>	This field shows the name and number of the company. The company number is transferred from the window Jobs and cannot be changed here.
<b>Bill to Customer</b>	This field shows the number and name of the bill-to customer. You cannot change it here, only in the window Jobs.
<b>Department</b>	This field shows the department associated with the blanket invoice collection.
<b>Currency</b>	This field shows the currency of the blanket invoice collection.
<b>Invoice Currency</b>	This field shows the currency of the blanket invoice collection.
<b>Tax</b>	This field shows whether the invoices created for the current job are subject to tax. Maconomy retrieves the value from the window Job Information and it cannot be changed here.

Field	Description
<b>Company Tax Code</b>	This field shows the company tax code of the blanket invoicing criteria.
<b>Main Job No.</b>	This field displays the main job number.
<b>Job Collection</b>	This field shows the number of the job collection. This field is also displayed in the Jobs and Invoice Selection windows for jobs included in a job collection.
<b>Number of Jobs for Invoicing</b>	This field shows the number of jobs in the collection ready for invoicing.
<b>Billing Price, Invoice Currency</b>	This field shows the sum of the amounts entered in the field "Billing Price, Invoice Currency" in the table part of the window.

#### Selection Criteria Island

Field	Description
<b>Show Only Ready for Blanket Inv.</b>	If you place a check mark in this field, you choose to display in the table part only the invoices that are check marked as being ready for blanket invoicing. See also the field "Ready for Blanket Invoicing" in the table part for further information.
<b>Debit/ Credit</b>	Use this field to choose to display only lines with either debit or credit. The value you enter also affects the actions "Print Draft Invoices" and "Print Invoices."
<b>Invoice Type</b>	This existing field gives you the choice between 'Invoice' for T&M invoices and 'Invoice On Account' for invoices on account. The first option for T&M invoices this will be changed to 'T&M and the second option will be changed to 'On Account'. Note that the field can be left blank to include both types of draft invoices including the new combined drafts.

#### Print Draft Control Island

Field	Description
<b>Include Non Approved Drafts</b>	If you place a check mark in this field, you choose to print draft invoices that have not been approved yet.

## Bill To Customers Sub-Tab

This section includes the fields and descriptions for the Bill To Customers sub-tab.

Field	Description
<b>Job Number</b>	This field shows the job number of a job in the collection. The job belongs to the company and department specified in the card part of the window and is specified in the same currency.
<b>Job Name</b>	This field shows the job name of a job in the collection. The job belongs to the company and department specified in the card part of the window and is specified in the same currency.
<b>Ship to Customer No.</b>	This field shows the customer number of the ship-to customers on the job.
<b>Ship to Customer Name</b>	This field shows the customer name of the ship-to customers on the job.
<b>Appropriation</b>	<p>This field shows the source of funding for the job. For example, it shows if you carry out a job on behalf of a customer funded by a government body or a private foundation. This field is for reference only and is closed when the job is invoiced for the first time.</p> <p>If a bill-to customer has several sources of funding for this job, the customer can be added to several lines in this window, provided a unique appropriation is specified in this field for each instance of the bill-to customer. See the example in the introduction to this window.</p> <p>If you change the appropriation for the bill-to customer specified on the job, then the job is updated accordingly.</p> <p>If invoicing plan lines exist for the bill-to customer and an appropriation has been specified, any changes you make in this field will update the plan lines accordingly.</p>
<b>Ready for Blanket Invoicing</b>	<p>This field indicates whether the current row can be included in a blanket invoice. This field will only contain a check mark if the line is approved for invoicing, and if an amount for on account reduction is not included in the draft. If multiple drafts exist because of split billing, there will be no check mark in this field.</p> <p>Note that certain conditions must be fulfilled before a draft can be included in a blanket invoice. If these conditions are not met, a situation may arise where a draft will not be included in a blanket invoice even if there is a check mark in this field. For example, a draft credit note will never be included in a debit blanket invoice.</p> <p>The "Status" field may also explain why a specific line is/is not ready for blanket invoicing.</p>
<b>Include</b>	In this field you can specify which jobs to include/exclude from blanket invoicing and blanket draft invoicing.

Field	Description
<b>Use on Invoice Header</b>	Marking this field on a job will make that job's number and preferred invoice date (if any) appear on the header of the blanket invoice. If the field is marked on more than one job for a single blanket invoice, then the last marked job will be used.
<b>Debit/ Credit</b>	This field shows whether the current approved invoice selection is a debit or a credit draft invoice.
<b>Number of Drafts Ready</b>	This field shows a count if multiple drafts are currently approved and waiting printing.
<b>Billing Price, Invoice Currency</b>	This field shows the amount for invoicing in the currency of the invoice. The field "Billing Price, Invoice Currency" in the card part of the window sums up the amount for invoicing from jobs where the field "Include" has been check marked
<b>Open Billing Price, Job</b>	This field shows the total billing price of open job entries on the job on the line in the table.
<b>Invoice Type</b>	This is the existing field 'Type' that will be renamed to 'Invoice Type'. The field showed 'Invoice' for T&M invoices and 'Invoice On Account' for invoices on account. This will be changed to show 'T&M' for T&M invoices, 'On Account' for on account invoices and for the new combined invoices the field will show 'T&M and On Account'.
<b>Project Manager No.</b>	This field shows the number of the project manager responsible for the job and invoices.
<b>Project Manager</b>	This field shows the name of the project manager selected in the "Project Manager No." field.
<b>Status</b>	This read-only field shows the various status indications that a line can have: <ul style="list-style-type: none"> <li>▪ The job is not approved for invoicing.</li> <li>▪ The job is approved for invoicing with multiple bill-to customers.</li> <li>▪ The job is approved for invoicing, but with an account reduction.</li> <li>▪ The job is approved for invoicing, but an invoice is being credited with an account reduction.</li> <li>▪ The job is approved for invoicing, but for another bill-to customer.</li> </ul>
<b>Blanket Draft Numbers</b>	This field shows the draft number of the blanket draft invoice that a job belongs to, if the job is approved for invoice selection. If the job is set up to allow multiple drafts (simultaneously), there might be more than one draft number. In that chase, this field shows them as a comma-separated list of the draft numbers of the blanket drafts that this job contributes to.

Field	Description
	You can include a job on more than one blanket draft if it has approved invoice selections of different kinds, such as debit vs. credit.

## Actions

This section shows the Actions available in the Blanket Invoicing Overview workspace.

### Top Tab

Field	Description
<b>Invoice to Credit Memo</b>	If, for example, you print a blanket invoice and then regret it, you can use this action to credit the entire blanket invoice. When you select this action, Maconomy creates a credit memo selection based on the job invoice number in the field "Based on Invoice No." in the card part of the window. A credit memo selection is created for each job that is part of the blanket invoice. This action also approves each credit memo selection for the job part of the blanket invoice. A warning will tell you if one of the jobs on the blanket invoice no longer meets the blanket invoice criteria set up in the card part. Note that a main job invoice cannot be credited.
<b>Create Blanket Drafts</b>	Use this action to create blanket drafts for all jobs whose Include fields are marked in the table part. This action might create more than one draft, due to restrictions on which kinds of invoice selections you can blanket invoice together. It will combine T&M drafts with On Account drafts onto the same blanket draft for jobs set up to allow combined invoicing.
<b>Print Drafts</b>	Use this action to print drafts for all jobs whose Include fields are marked in the table part. You can print jobs that do not have existing drafts.
<b>Print Invoices</b>	Use this action to print invoices for all jobs whose Include fields are marked in the table part. You can print jobs that do not have existing blanket drafts. When you print an invoice that contains jobs that were set up with detailed invoice specifications, all of the detailed invoice specifications appear at the end.

## Approve Invoice Selection Single Dialogs Workspace

Use this workspace for batch approval of invoice selections and credit memo selections.

In the Approve Invoice Selection tab, use the Selection Criteria island to limit the number of jobs that are displayed in the Jobs sub-tab. Use the Jobs sub-tab to review all of the jobs in Maconomy that are not closed.

**Note:** The description of this workspace assumes that you are creating invoices, but most of the features also apply to creating credit memos.

This workspace is useful for businesses that do not want to approve every single invoice selection individually, either because they do not need to check all invoices or because there are

too many invoices to make this check possible. This workspace gives you a quick and easy way to scan invoice selections and approve them.

Use the selection criteria in the Approve Invoice Selection tab to select the jobs that you want to approve. For every user, Maconomy saves the selection criteria from session to session. This means that each time that you open this workspace, Maconomy displays the selection criteria that you used last. Maconomy also copies the selection criteria to the Print Invoice Selection workspace when you use the **Print** action in this workspace.

Use the **Approve** field in the Jobs sub-tab to mark each job or invoice selection as ready for approval. Maconomy keeps count of the number of marked jobs.

Use the **Approve** action to approve all marked jobs at the same time. You can choose to approve only invoices, only credit memos, or both. You can enter a preferred invoice date. If you leave this field empty, the invoice date will be the current date when you print the invoices. You can also choose to print draft invoices and/or draft credit memos for all approved invoice selections.

Next you can edit invoice selections in the Invoice Editing workspace, or batch print them from the Job Invoicing or Job Crediting workspace.

## Approve Invoice Selection Tab

This section includes the fields and descriptions for the Approve Invoice Selection tab.

### Selection Criteria Island

Field	Description
<b>Show Lines</b>	When you mark this field, the lines matching the values specified in the selection criteria below are shown in the table part of this window. Please note that actions selected in the Action menu will be carried out on all jobs matching the selection criteria, regardless of whether the lines are shown in the table part.
<b>Jobs w. Open Sales Price Only</b>	When you mark this field, the selection criteria will only include jobs with entries with an open billing price, that is, job entries which have not yet been invoiced.
<b>Jobs w. Allow Invoice Proposals Only</b>	When you mark this field, the selection criteria will only include jobs that allow invoice proposals, that is, jobs on which the "Allow Invoice Proposals" field has been marked in the Jobs window.
<b>Jobs w. Amount for Inv. on Account Only</b>	When you mark this field, the selection criteria will only include jobs that contain entries with amounts for Invoicing On Account.
<b>Jobs w. Invoicing Plan Lines for Inv. On Account Only</b>	When you mark this field, the selection criteria will only include jobs with an amount transferred from the invoicing plan.
<b>Job No.</b>	In these fields, you can specify a range of job numbers. Only jobs within the specified range of job numbers are selected. If you do not enter a range, the job numbers will not be considered in the selection.

Field	Description
	If the range of jobs includes jobs which are main jobs with an invoice layout rule that specifies "Main Job Invoicing," the associated subjobs will be selected for invoicing as well, even though they are not part of the selection criteria. If, on the other hand, the range of jobs includes subjobs whose main jobs use "Main Job Invoicing," the subjobs are not selected for invoicing unless the main jobs are also included in the range of jobs. For more information, please see the description of the window Invoice Layout Rules.
<b>Job Collection No.</b>	This field shows the number of the job collection. This field will also be displayed in the Jobs and Invoice Selection windows for jobs that belong to a job collection.
<b>Job Group</b>	In these fields, you can specify a job group. Only jobs within this job group will be selected. If you do not enter a job group, the job group to which the jobs are assigned will not be considered.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. Only jobs with a responsible company within the specified range are selected. If you do not enter a range, the responsible company assigned to the jobs will not be considered in the selection.
<b>Customer No.</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Bill to Customer</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Department</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Language</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Responsible</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Sales Rep.</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Project Manager</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Popup 1-5</b>	The functionality of these fields is similar to that of the field "Job Group." The values in these pop-up fields are specified in the window Jobs.
<b>Employee No. 1-10</b>	The functionality of this field is similar to that of the field "Job Group."

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Entity</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Project</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Purpose</b>	The functionality of these fields is similar to the functionality of the "Job Group" field above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Job Group" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Job Group" above.

### Delimitation Island

Field	Description
<b>Cut-off Date</b>	The action "Transfer Invoicing Plan" transfers all invoicing plan lines with a date on or before the specified date. The date field defaults to the current date.
<b>G/L Entry Date</b>	In this field you can delimit the invoice selection by the entry date on job entries. Only entries with an entry date up to this date will be invoiced.
<b>Extend Selection</b>	<p>If you mark this field and then select the action "Delimit," Maconomy will extend the invoice selection to also include entries within the types and ranges specified in the other fields of this island. You can specify, for example, "10-20" as a range of employee numbers, and then select "Delimit." Then you can specify "40-50" as a new range of employee numbers, make sure that this field is marked, and then reselect the action "Delimit." In this way, you have extended your selection to cover job entries for the employees "10-20" and "40-45."</p> <p>If you do not check this field and then select "Delimit" in the Action menu, Maconomy will only display (in the table part) invoice selections with the sum of job entries matching types and ranges specified in the other fields in this island.</p> <p>All criteria selected in this island have to match job entries for the entries to be selected for invoicing. Maconomy searches for job entries that match the selected criteria for the jobs specified in the island Selection Criteria.</p>

**Approval Island**

Field	Description
<b>Show Totals</b>	When you mark this field, the figures applying to those lines which have been marked for approval are summarized and displayed in the island Approval. If you do not mark this field, the island Approval will not show any summarized figures.
<b>Include Invoices</b>	If this field is marked, all invoice selections from the table part are included when you select "Approve" in the Action menu. If this field is not marked, the invoice selections are not included.
<b>Include Credit Memos</b>	If this field is marked, all credit memo selections from the table part are included when you select "Approve" in the Action menu. If this field is not marked, the credit memo selections are not included.
<b>Number of Jobs</b>	In this field, you can see the total number of invoice selections in the table part that have been marked in the field "Approve." The field is updated automatically by Maconomy.
<b>Amount for Invoicing</b>	This field shows the total amount for invoice selections in the table part where the field "Approval" is marked. The amount is shown in the enterprise currency. The field is updated automatically by Maconomy.
<b>Amount for Crediting</b>	This field shows the total amount for credit memo selections in the table part where the field "Approval" is marked. The amount is shown in the enterprise currency. The field is updated automatically by Maconomy.
<b>Preferred Inv. Date</b>	In this field, you can specify a date within the open posting period to be suggested as invoice date and credit date, respectively, when you print invoices and credit memos approved in this window. The field displays today's date by default. When you select "Approve" in the Action menu, the date is copied from this field to the corresponding field in the table part of each job selected for approval. Hereafter, the date can be changed by job.

**Jobs Sub-Tab**

This section includes the fields and descriptions for the Jobs sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job associated with the current invoice selection.
<b>Job Name</b>	This field shows the name of the job associated with the current invoice selection.
<b>Fixed Price Job</b>	This field shows whether the job on the line is a fixed-price job or a time and material job. If the field is marked, the job on the line is a fixed-price job.
<b>Approve</b>	In this field, you can specify that the current invoice selection should be approved when you choose the action "Approve." You cannot approve invoice selections that pertain to fixed-price jobs if the job parameter

Field	Description
	<p>attribute “Allow Invoicing On Account Only” in the job parameter type “Pricing Method” is assigned the value “Yes” on the job in question. However, outlays or, more generally, non-fixed-price entries on the job will be approved, if outlays should not be included in the fixed price of a fixed-price job or if the job in question is assigned to a job allocation combination rule defining non-fixed-price entries.</p>
<b>Task Group Status</b>	<p>This field indicates whether the job entries associated with the present job are assigned to the correct task groups. If the value in this field is “Not Up to Date,” this indicates that the task group structure is not up to date. To update the task group information, select the action “Transfer Task Groups” in the Action menu. The value will then change to “Up to Date.”</p> <p>This functionality is relevant if you use a work breakdown structure in your budget, and the invoice layout rule of the job specifies that invoice selections or invoices should be grouped by task groups.</p> <p>In Maconomy, a task is associated with each job entry, containing information about the task groups assigned to the task against which the job entry is posted. The information is expressed as a task group level, ranging from task group 1 to 6, where level 1 is the top level in the hierarchy.</p> <p>If you change the job budget structure after posting job entries, Maconomy does not automatically update the entries with the new budget structure information, as the number of entries to update could be enormous. Updating all entries after each structural change could therefore be very time-consuming. Thus, if you change the work breakdown structure in the Job Budgets window, the budget must be resubmitted for these structural changes to be reflected in the Invoice Selection window. By resubmitting the budget or selecting this action, the task group status in this field will automatically be updated. Additionally, the task group status is automatically updated when the following actions are performed: Close All, Delimit, Apply Invoice Proposals, Transfer Fixed Price, Transfer Desired Sales Price, Transfer Budget, and Print Invoice.</p> <p>For further information on work breakdown structures and task groups, see the descriptions under “Job Tasks” and under “Job Budgets.”</p>
<b>Includes Subjobs</b>	<p>This field shows whether the current invoice selection is for a main job which uses “Main Job Invoicing.” For more information, please see the field “Includes Subjobs” in the window Invoice Selection.</p>
<b>Approved on Main Job</b>	<p>This field shows whether the current invoice selection is for a subjob which is invoiced from its main job. For more information, please see the field “Invoiced on Main Job” in the window Invoice Selection.</p>
<b>Preferred Inv. Date</b>	<p>The preferred invoice date is the date normally written on the invoice when it is printed. When you select the action “Approve,” the preferred invoice date specified in the field “Preferred Inv. Date” in the card part of the window is copied to this field on the individual invoice selection line. The field can then be changed. The date entered should be within the</p>

Field	Description
	open posting period. If you do not enter a date in this field, today's date is used as invoice date.
<b>Invoice Name</b>	<p>Here you specify the name of the invoice. When you approve the invoice selection, this name will appear in the window Invoice Editing, where you can update it. The invoice name can be added to prints of invoice and credit memos and their corresponding drafts.</p> <p>The invoice name is merged into the customer entry text and the finance entry on the customer.</p>
<b>Invoice Type</b>	Same as the new field in the Invoice Selection tab.
<b>Customer No.</b>	This field shows number of the customer associated with the job.
<b>Customer Name</b>	This field shows the name of the customer associated with the job.
<b>Company No.</b>	This field shows the number of the responsible company associated with the job. See also the window Jobs for further information about responsible companies.
<b>Company Name</b>	This field shows the name of the selected company number.
<b>Allow Invoice Proposals</b>	This check box shows whether the field "Allow PM Invoice Proposals" or the field "Allow Employee Invoice Proposals" has been marked in the window Jobs. If the field has been marked, one or both of these fields have been marked. For further information about this functionality, please see the description of the fields "Allow PM Invoice Proposals" and "Allow Employee Invoice Proposals" in the window Jobs.
<b>Bill to Customer Cust. No.</b>	This field shows the number of the bill-to customer associated with the job.
<b>Amount, Currency</b>	This field shows the total sum of the job's entries in the currency of the job. The amount will be approved for invoicing when you select the "Approve" action.
<b>Currency</b>	This field shows the currency of the job.
<b>Amount, Base</b>	This field shows the total sum of the job's entries in the base currency of the responsible company. The amount will be approved for invoicing when you select the action "Approve." For more information about currency conversion in the Job Cost module, please see "Appendix A: Price Calculation in the Job Cost Module."
<b>Base Currency</b>	This field shows the currency used as base currency by the company responsible for the job.

Field	Description
<b>Amount, Enterprise</b>	This field shows the total sum of the job's entries in the enterprise currency of the system.
<b>Invoice Currency</b>	This is the invoice currency of the job. It is determined in the window Jobs and cannot be changed here.
<b>Amount for Invoicing on Account, Invoice Currency</b>	This field shows the amount set for invoicing on account in the window Invoice Selection. The amount is specified in invoice currency.
<b>Invoicing Plan Lines for Invoicing on Account</b>	This field shows if the job has an amount transferred from the invoicing plan.
<b>Amount, Incl. Subjobs, Currency</b>	This field shows the total sum of the job's entries including any entries registered on assigned subjobs. The amount is displayed in the currency of the job.
<b>Amount, Incl. Subjobs, Base</b>	This field shows the total sum of the job's entries including any entries registered on assigned subjobs. The amount is displayed in the base currency of the company being responsible for the job.
<b>Amount, Incl. Subjobs, Enterprise</b>	This field shows the total sum of the job's entries including any entries registered on assigned subjobs. The amount is displayed in the enterprise currency of the system.
<b>Open Sales Price, Currency</b>	This field shows the open sales price equivalent to the sum of job entries not yet invoiced on the current job.
<b>Open Sales Price, Base</b>	This field shows the open sales price in base currency equivalent to the sum of job entries not yet invoiced on the current job.
<b>Open Sales Price Incl. Subjobs, Currency</b>	This field shows the open sales price of the job including the open sales price of any subjobs assigned to the job in question. The amount is displayed in the job's currency.
<b>Open Sales Price Incl. Subjobs, Base</b>	This field shows the open sales price of the job including the open sales price of any subjobs assigned to the job in question. The amount is displayed in the base currency of the company being responsible for the job.
<b>Prev. Invoiced Incl. Subjobs, Currency</b>	This field shows the billing price total, including subjobs, that were previously invoiced to the customer, in the job's currency.

Field	Description
<b>Prev. Invoiced Incl. Subjobs, Base</b>	This field shows the billing price total, including subjobs, that was previously invoiced to the customer, in the job's base currency.
<b>Prev. Invoiced, Currency</b>	The field shows the sum of previously invoiced entries on the current job in the currency of the job.
<b>Prev. Invoiced, Base</b>	The field shows the sum of previously invoiced entries on the current job in base currency.
<b>Budget, Currency</b>	This field shows the total sum of budgeted activities on the current job in the window Job Budgets in the currency of the job.
<b>Budget, Base</b>	This field shows the total sum of budgeted activities on the current job in the window Job Budgets in base currency.
<b>Settling Company No.</b>	<p>This field show the number of the settling company associated with the current job.</p> <p>If the number in this field is different from the company number in the field "Company No.," intercompany entries between the two companies will automatically be created in connection with posting job invoices on the current job. When balancing intercompany entries, the company specified in this field is the intercompany company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>The section "Multiple Companies" in the chapter "Introduction to the G/L Module" contains a more detailed description of settling companies and how the settling company is defined. The concept "intercompany entries" is further described in the window Intercompany Accounts in the G/L module.</p>
<b>Settling Company Name</b>	This field shows the name of the selected settling company number. The value in this field cannot be changed.
<b>Department</b>	This field shows the name of the department associated with the current job.
<b>Description</b>	This field shows the internal description of the current job. The value in this field is transferred from the first line in the field "Internal" in the window Jobs and cannot be changed here.

## Actions

This section shows the Actions available in the Approve Invoice Selection workspace.

### Top Tab

Field	Description
<b>Transfer Invoicing Plans</b>	<p>When this action is selected, Maconomy identifies any due lines in the invoicing plans of the jobs matching the selection criteria, and transfers them to the invoice selections. However, if the system parameter "Transfer Several Invoicing Plan Lines" is unmarked, only the first due line of the invoicing plan is transferred.</p> <p>This action excludes jobs with a closed invoice selection.</p> <p>The amounts are shown in the field "Amount for Invoicing on Account, Invoice Currency" in the table part. Next, the invoice selection lines can be approved, allowing you to process the on-account invoices further in the window Invoice Editing. For further information, please see the description of the window Invoicing Plans and the action "Approve" below.</p> <p>Note that invoicing plan lines must be approved in the window Invoicing Plans before they can be transferred for invoicing in this window if the job parameter attribute "Approval of Invoicing Plan Lines" has been set to "Yes" for the current job.</p> <p>If any invoice selection in the table part is for a subjob to a main job where the main job's invoice layout rule specifies "Main Job Invoicing," no invoicing plan is transferred to the job.</p>
<b>Undo Transfer Invoicing Plans</b>	<p>Running this action will undo the "Transfer Invoicing Plans" action.</p>
<b>Transfer Task Groups</b>	<p>When you select this action, the task group information of the selected job will be updated to reflect the current work breakdown structure of the job budget. After the action has been selected, the value in the "Task Group Status" field will change from "Not Up to Date" to "Up to Date." This functionality is relevant if the invoice layout rule of the selected jobs specifies that invoice selections or invoices should be grouped by task groups, and if the work breakdown structure has been updated in the Job Budgets window.</p> <p>For further information on work breakdown structure and task groups, see the descriptions under "Job Tasks" and under "Job Budgets."</p>
<b>Delimit</b>	<p>This action is used for creating an invoice selection for all open entries selected in the island Delimitation for all jobs specified in the island Selection Criteria. Invoice selections for fixed-price jobs are not included if the job parameter attribute "Allow Invoicing On Account Only" in the job parameter type "Fixed Price Job Set-Up" is assigned the value "Yes," and if outlays are included in the fixed price and if the job is assigned a job allocation combination rule which does not define fixed-price entries. However, outlays are included in the</p>

Field	Description
	<p>delimitation if outlays are not to be included in the fixed price, that is, if the job parameter attribute "Include Outlays in Fixed Price" in the job parameter type "Pricing Method" is assigned the value "No" for the job in question. Moreover, if a fixed-price job uses a job allocation combination rule defining non-fixed-price entries to be invoiced separately, such non-fixed-price entries are also included when selecting this action.</p> <p>If there are jobs with a closed invoice selection that meet the selection criteria, a warning will be displayed when you run this action. If you choose to proceed, all drafts on these jobs will be deleted before the delimitation takes place.</p> <p>If the field "Extend Selection" in the island Delimitation is marked, all entries selected by the criteria in the island Delimitation will be added to the entries already selected. In this way an invoice selection can be constructed in stages; you can, for instance, select registered entries for various ranges of employees.</p> <p>If the field "Extend Selection" is not marked when this action is selected, all existing invoice selections will be deleted, and one is created containing the criteria specified in the island Delimitation. See also the field "Extend Selection" in this window.</p>
<b>Remove Drafts</b>	Select this action to delete any unwanted draft invoices.
<b>Apply Invoice Proposals</b>	<p>This action is used for applying all values proposed by the project manager and/or the employee on the selected job entries. The employee and, subsequently, the project manager can propose different hours, quantities, and billing prices for invoicing, pending approval by the invoicing department.</p> <p>If there are jobs with a closed invoice selection that meet the selection criteria, a warning will be displayed when you run this action. If you choose to proceed, all drafts on these jobs will be deleted before the delimitation takes place.</p> <p>If a job entry has been partially invoiced before the invoice proposal values are applied, the previously invoiced quantity will be subtracted from the proposed quantity before the proposed quantity is applied. Please note that the amount to invoice cannot be less than zero. Similarly, no amount greater than zero can be credited if the job entry includes a negative quantity.</p>
<b>Calculate Invoice Surcharge</b>	This action calculates surcharge based on the Job Surcharge Rule specified on the jobs separately. The action applies only for the jobs set up to use "Surcharge at Invoicing" (a job parameter) and only for those jobs that are open for invoice selection.
<b>Approve</b>	<p>When you select this action, you approve the invoice selections for the jobs that match the selection criteria in the card part of the window if the field "Approve" is marked. The approval date and name of the approver is automatically saved.</p> <p>Please note that the jobs that match the selection criteria are included, even if they are not shown in the table part (the field "Show Lines" is not marked). An invoice selection must be approved before you can edit it in the window Invoice Editing and invoice it. If you change anything in the window Invoice Editing, the</p>

Field	Description
	<p>approval is canceled, and the invoice selection must be approved again. Maconomy issues an alert if the approval is canceled.</p> <p>The action excludes jobs with a closed invoice selection.</p> <p>Maconomy issues a warning if there are open purchase orders on the job. If the field "Show Markup Separately" in the window Job information is marked, the use of this action will lead to the creation of an invoice on which the costs of all amount activities will be shown in the table part with an extra line at the bottom of the invoice showing the markup.</p> <p>You cannot approve invoice selections for fixed-price jobs set up to be invoiced on account only if outlays are included in the fixed price, if the job is assigned a job allocation combination rule which does not define fixed-price entries, and if the amount for invoicing on account is zero. However, outlays for fixed-price jobs are included in the delimitation, if outlays are not to be included in the fixed price, that is, if the job parameter attribute "Include Outlays in Fixed Price" in the job parameter type "Pricing Method" is assigned the value "No" for the job in question. Moreover, if a fixed-price job uses a job allocation combination rule defining non-fixed-price entries to be invoiced separately, such non-fixed-price entries are also approved for invoicing when selecting this action.</p> <p>Moreover, you should note that you cannot approve an invoice selection which is assigned to a job that has been approved for transfer. See the description of the window Job Transfer for information about job transfers.</p> <p>If any invoice selection in the table part is for a main job where the main job's invoice layout rule specifies "Main Job Invoicing," selecting this action will approve the invoice selection of all subjobs of the current main job which are to be blanket invoiced.</p> <p>You can invoice an approved selection either by choosing "Print Invoice" in this window or by choosing "Print Invoice" in the window Invoice Editing. You can also invoice selected invoices for several jobs at a time in the window Job Invoicing. If the job parameter attribute "Invoice Editing Required" in the job parameter type "Invoice Approval" is assigned the value "Yes" on the job in question, you must approve the invoice in the windows Invoice Selection or Invoice Editing. If several approved invoice selections are to be invoiced at the same time, this must be done in the window Job Invoicing.</p> <p>This action approves the jobs for invoicing either T&amp;M, on account, or both combined, depending on the <b>Invoice Type</b> field described above.</p>
<b>Print Drafts</b>	This (existing) action combines T&M drafts with On Account drafts onto the same printed blanket draft for jobs set up to allow combined invoicing.

## Job Invoice Crediting Single Dialogs Workspace

Use this workspace to perform routine crediting tasks.

This workspace is a simpler alternative to performing crediting tasks in the Invoice Selection workspace, where you can create a credit memo with the same level of detail as a job invoice—for example, you can credit individual job entries, give partial credit, and or perform crediting for a certain date range.

This workspace displays information about a single invoice.

Use this workspace to:

- Credit a job invoice in full.
- Give the customer a discount by crediting a percentage of the invoice amount.
- Generate a credit and reuse the job entries to create an invoice in the same operation. This process involves multiple steps: create a credit memo selection, approve it, print a credit memo, create an invoice selection, modify it, approve it, and print the new invoice.

You cannot perform blanket invoicing in this workspace.

**Note:** This workspace requires add-on 104.

## Job Invoice Crediting Tab

This section includes the fields and descriptions for the Job Invoice Crediting tab.

### Billing Address Island

Field	Description
<b>Bill to Customer</b>	This is the number of the customer who was invoiced. The other lines contain the customer's name and address. It is retrieved from the window Jobs.
<b>Attn.</b>	This is the customer's attention person to whom payment information is directed. It is retrieved from the window Jobs.
<b>Country</b>	This is the customer's country code. It is retrieved from the window Jobs.

### Price Island

Field	Description
<b>Currency</b>	This is the currency the job was invoiced in. It is specified in the window Job Information.
<b>Billing Price Total</b>	This is the sum of the billing prices shown in the table part of the job invoice.
<b>Tax</b>	This is the tax Maconomy calculated for the invoice. It is added to the invoice automatically.  If multiple tax codes are enabled, three additional fields will be added above the "Tax" field: "Tax 1," "Tax 2," and, if enabled, "Tax 3." For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Balance Due</b>	This is the amount (in the job's currency) which is due from the bill-to customer. It is the total billing price, less any invoices on account and including tax.

Field	Description
<b>Invoice Discount %</b>	This is the percentage used to calculate the invoice discount. It is retrieved from the Job Information card.
<b>Invoice Discount</b>	This is the invoice discount deducted from the invoice. It is retrieved from the Job Information card, where it was entered as a percentage.
<b>Net on Account</b>	This field shows how much of the job price was invoiced on account and deducted from the final job invoice. If you are looking at an invoice on account, this field will show "0.00."
<b>Tax on Account</b>	<p>This field shows how much tax has been added to any invoices on account for the job. It is deducted from the final job invoice. If you are looking at an invoice on account, this field will show "0.00."</p> <p>If multiple tax codes are enabled, three additional fields will be added above the "Tax on Account" field: "Tax on Account 1," "Tax on Account 2," and, if enabled, "Tax on Account 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p>

### Crediting Island

In this island, you can define how you want to carry out the crediting of the current invoice. Information about the invoice and previously credited amounts is shown in table form.

Field	Description
<b>Restore Job Entries</b>	<p>This field is used when you select the action "Create Credit Memo Selection." If you mark this field and select the action "Create Credit Memo Selection," the current job invoice will be reversed, returning the status of the job to what it was before invoicing.</p> <p>If the invoice to be credited has reconciled job invoices on account and/or credit memos on account, these are reopened when crediting.</p> <p>If the field is not marked, job entries are created when the amount is credited.</p> <p>The field is automatically marked if the current invoice is an invoice on account, and the mark cannot be removed. In this case, crediting the invoice causes the specified invoice on account to be reopened. The reopened invoice can be seen in the window Job Invoices On Account.</p>
<b>Detailed Credit Memo</b>	If you mark this field, all the invoice specification lines will be transferred to the credit memo when it is printed. If you do not mark this field, the credit memo only shows a line with the total credited amount.
<b>Pref. Credit Memo Date</b>	In this field, you can enter the preferred credit memo date. The date must be within the open posting interval, which is specified in the window System Information in the Set-Up module. If you do not enter a date, Maconomy inserts the current date when the credit memo is printed.
<b>Invoice</b>	This field, and the remaining fields in this island, is part of a table showing information about the current invoice and the new credit memo. Each field is a row

Field	Description
	with information about billing price (in both invoice and job currency), percentage of billing price, cost, gross margin, gross margin percentage, and markup percentage. The cost and gross margin are displayed in the base currency of the company
<b>Credited</b>	These fields show information about any amounts previously credited to the current invoice. The amounts are displayed as Billing Price amount (invoice and job currency), Cost amount, and percentage of the billing price of the original invoice.
<b>Credit Memo</b>	<p>In these fields, you can enter an amount or a percentage which you want to credit. By default, the full amount of the original invoice is displayed, but you can change it. The amount you enter cannot exceed the total amount of the original invoice. When you select the action "Create Credit Memo Selection," the amount in the "Billing Price" column of this field is used as the credit memo amount.</p> <p>The invoice currency/job currency exchange rate in the Billing Price fields is based on the original invoice.</p> <p>Whenever you change the credit memo amount, the fields in the "Balance" row of fields below are updated to show the remaining, uncredited amount.</p>
<b>Balance</b>	<p>In these fields, you can enter an amount or a percentage which you do not want to credit. The difference between the amount you enter and the amount available for crediting (that is, original invoice amount less previously credited amounts) is shown in the "Credit Memo" row of fields above when you press Return. This is a shortcut to crediting an invoice down to a certain amount.</p> <p>In the remaining fields of this row, the new GM, GM %, and Markup % of the invoice is calculated. Furthermore, you can adjust the crediting by changing these values manually, but only if the field "Restore Job Entries" is not marked.</p>

### Invoicing Island

In this island, you can define how you want to create an invoice on the basis of the job entries restored by crediting a job invoice in this window. Information about the invoice and previously credited amounts is shown in table form.

Field	Description
<b>Preferred Inv. Date</b>	<p>In this field, you can enter the preferred invoice date. The date must be within the open posting interval, which is specified in the window System Information in the Set-Up module. If you do not enter a date, Maconomy inserts the current date when the invoice is printed.</p> <p>For more information, please see the description of the field "Preferred Invoice Date" in the window Invoice Selection.</p>
<b>Invoice</b>	This field, and the remaining fields in this island, is part of a table showing information about the current invoice and the new invoice. Each field is a row with information about billing price (in both invoice and job currency), percentage of billing price, cost, gross margin, gross margin percentage, and markup percentage. The cost and gross margin are displayed in the base currency of the company.

Field	Description
<b>Credited</b>	These fields show information about any amounts previously credited to the current invoice. The amounts are displayed as Billing Price amount, Cost amount, and percentage of the billing price of the original invoice.
<b>New Invoice</b>	<p>In these fields, you can enter an amount or a percentage which you want to invoice. By default, the full, credited amount of the original invoice is displayed, but you can change it. The amount you enter cannot exceed the total amount of the original invoice. When you select the action "Create New Invoice," the amount in the "Billing Price" column of this field is used as the new invoice amount. Note that you can only create an invoice when the original invoice has been fully credited (that is, the billing price of the invoice has been credited completely).</p> <p>Whenever you change the credit memo amount, the fields in the "Reduction" row of fields below is updated to show the remaining uninvoiced amount (that is, the amount which will be suggested as invoice reduction when you have approved the current invoice selection).</p> <p>In the remaining fields of this row, the new GM, GM %, and Markup % of the invoice is calculated. Furthermore, you can adjust the invoice amount by changing these values manually.</p>
<b>Reduction</b>	In these fields, you can enter an amount or a percentage by which you want to reduce the amount of outstanding open entries. The difference between the amount you enter and the amount available for invoicing (that is, original invoice amount less previously invoiced amounts) is shown in the "New Invoice" row of fields above when you press Return.

### Job Invoice Selection Island

Field	Description
<b>Invoice Selection</b>	Click the icon or link to access the Job workspace.
<b>Job</b>	This is the name and number of the job to which the invoice pertains.
<b>Billing Price Total</b>	<p>This field shows the total open entries on the job to which the current job invoice pertains. Note that this amount may be different from the amount shown in the island Invoicing if additional job entries have been registered for the job since the invoice in this window was created, and those job entries have not been closed.</p> <p>If an amount for invoicing on account is currently approved on the job, this amount is shown.</p>
<b>Billing Price Total, Invoice Currency</b>	This field shows the total open entries on the job in invoice currency to which the current job invoice pertains. Note that this amount may be different from the amount shown in the island Invoicing if additional job entries have been registered for the job since the invoice in this window was created, and those job entries have not been closed.

Field	Description
	If an amount for invoicing on account is currently approved on the job, this amount is shown.
<b>Type</b>	This field shows if the current invoice selection for the job is debit (an invoice) or credit (a credit memo).
<b>Open for Selection</b>	If this field is marked, the current invoice crediting is open for selection.
<b>Approved for Editing</b>	If this field is marked, the current invoice selection of the job has been approved for editing in this window or in the window Invoice Selection.
<b>Invoice Approved</b>	If this field is marked, the current invoice selection of the job has been approved in this window or in the window Invoice Selection.

### Invoice Island

Field	Description
<b>Invoice No.</b>	This is the number of the job invoice. If you cannot remember the number of a job, you can use the search functions in the Find menu. The invoice number series is defined in the window System Numbers in the Set-Up module.
<b>Job</b>	This is the name of the job to which the invoice pertains.
<b>Invoice Name</b>	This is the name of the invoice.
<b>Invoice Date</b>	This is the date the invoice was issued.
<b>Payment Terms</b>	These are the terms that apply to the payment of the current invoice.
<b>Due Date</b>	This is the date the invoice becomes due. It is calculated automatically from the invoice date and terms of payment.
<b>Department</b>	This is the department associated with the job.
<b>Company</b>	This field shows the name and number of the company responsible for the current job. The company number is transferred from the window Jobs and cannot be changed here.
<b>Settling Company</b>	This field shows the name and number of the settling company that applies to the current job.  For further information about the influence of a settling company and how such a company is selected, please see the section "Multiple Companies"

Field	Description
	in the chapter "Introduction to the G/L Module." Intercompany entries are described in the window Intercompany Accounts in the G/L module.
<b>Reference</b>	This is the reference entered in the "Ref." field in the window Jobs.
<b>Tax No.</b>	This is the invoice's tax number. It is retrieved from the window Job Information.
<b>Draft Created</b>	This field shows the name of the user who created the draft invoice (that is, who approved the invoice selection) and the date when the draft invoice was created.
<b>Invoice Approved</b>	This field shows the name of the user who approved the job for invoicing and the date on which the job was approved for invoicing.
<b>Invoice Printed</b>	This field shows the name of the user who printed out the last invoice, currently shown in the window and the date on which the invoice was printed. The name is not altered during reprint.

#### Detailed Specification Island

Field	Description
<b>Show</b>	Select this field to show the lines from the detailed section below the summary section.
<b>Contains Detailed Specification</b>	This field indicates whether the invoice contains lines in the Detailed specification section.

#### Invoice on Account Island

Field	Description
<b>Amount Reconciled</b>	This field shows the amount hitherto reconciled on the current invoice on account. If the amount is zero, the invoice on account has not been reconciled.
<b>Tax Reconciled</b>	<p>This field shows the tax amount hitherto reconciled on the current invoice on account. If the amount is zero, the invoice on account has not been reconciled.</p> <p>If multiple tax codes are enabled, three additional fields will be added above the "Tax reconciled" field: "Tax 1 reconciled," "Tax 2 reconciled," and, if enabled, "Tax 3 reconciled." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Reconciliation Amount</b>	This field shows the amount yet to be reconciled on the current invoice on account.

Field	Description
<b>Reconciliation Tax</b>	This field shows the tax amount yet to be reconciled on the current invoice on account.

**Ship to Address Island**

Field	Description
<b>Customer</b>	This is the number of the customer for whom the job was performed. The other lines in this field show the ship-to customer's name and address. This information is retrieved from the window Jobs.
<b>Attn.</b>	This is the ship-to customer's attention person to whom shipping information is directed. This information is retrieved from the window Jobs.
<b>Country</b>	This is the customer's country code. It is retrieved from the Jobs window.

## Specification Sub-Tab

This section includes the fields and descriptions for the Specification sub-tab.

Field	Description
<b>Description</b>	This is the text describing the invoice line, retrieved from the window Invoice Editing. All invoice lines — both text lines and job entry lines appear in the same order as on the printed invoice.
<b>Quantity</b>	This is the number of units sold on the invoice line.
<b>Unit Price</b>	This is the unit price. For time activities it is the billing price per hour. For amount activities it is the total line billing price.
<b>Billing Price Total</b>	This is the total line billing price in the job's currency.
<b>Base Salary Markup %</b>	If the system parameter "Use markup % for time activities" is selected, then markup percentages in price lists are also applied to time registrations. In this field, you can specify a markup percentage relative to the base salary rate.
<b>Job No.</b>	This is the number of the job in which the current invoice line appears.
<b>Job Name</b>	This is the name of the job in which the current invoice line appears.

## Actions

This section shows the Actions available in the Job Invoice Crediting workspace.

### Top Tab

Field	Description
<b>Create Credit Memo Selection</b>	<p>When you select this action, you create a credit memo for the current invoice, adjusted to the billing price specified in the "Credit Memo" row of fields in the island Crediting. You can only select this action if the current invoice covers one job only, or is a main job with subjobs.</p> <p>The credit memo depends on the value of the field "Restore Job Entries" in the same island. If the field "Restore Job Entries" is marked, the amount set for crediting will credit the job entries which were originally invoiced. In other words, the crediting will "cancel out" the original invoice basis.</p> <p>If the field "Restore Job Entries" is not marked, the credited amount will be marked as a direct crediting, that is, a crediting without underlying job entries. In this case, the original job entries are still part of the statistics of the job. Furthermore, the cost of the credit memo will be zero if you do not restore job entries.</p> <p>Please note that if the field "Do Not Adjust Amount Activities" in the window System Information in the Set-Up module is marked, it may have an effect on the credit memo selection. If you have chosen to credit less than 100% of the original invoice, the amount entries on the job will not be credited. However, if the field is not marked, amount activities will be credited by the same percentage as time activities. Crediting an invoice fully always credits both time and amount activities.</p>
<b>Approve Credit Memo Selection</b>	<p>When you select this action, the current credit memo selection is approved, and a credit memo can subsequently be printed. For more information, please see the description of the action "Approve Credit Memo Selection" in the window Invoice Selection.</p>
<b>Print Credit Memo</b>	<p>When you select this action, you print the current credit memo. You can only select this action if the credit memo has been approved in this window. For more information, please see the description of the action "Print Credit Memo" in the window Invoice Selection.</p>
<b>Create New Invoice Selection</b>	<p>When you select this action, you create an invoice similar to the original invoice shown in this window, with an adjustment of the billing price to the amount shown in the "Billing Price" column of the "New Invoice" row of fields in the island Invoicing.</p> <p>You can only select this action if the original invoice has been credited in full, and the original job entries have been restored (by marking the field "Restore Job Entries" when crediting).</p> <p>This action is useful if you want to revoke a previously printed invoice completely and create an invoice based on the same job entries. Doing this, for example, lets you change the gross margin and/or the markup percentage of the invoice.</p>

Field	Description
	<p>Please note that if the field “Do Not Adjust Amount Activities” in the window System Information in the Set-Up module is marked, it may have an effect on the new invoice selection. Amount activities will then always be invoiced 100%, even if you have chosen to invoice less than 100% of the original invoice. However, if the field is not marked, amount activities will be invoiced by the same percentage as time activities.</p> <p>Note that if the job parameter attribute “Allow Write-Up/Down at Transfer Billing Price Only” of the type “Write-Up/Down” is assigned the value “Yes” on the job in question, you cannot create an invoice selection with an amount which is less than that of the original credit memo, as this would write down the job.</p>
<b>Approve New Invoice Selection</b>	When you select this action, the current invoice selection is approved, and an invoice can subsequently be printed. Note that if the current job has open entries which do not belong to the current invoice selection, they are carried forward so that they are not included in the approval of the new invoice selection. For more information, please see the description of the action “Approve Invoice Selection” in the window Invoice Selection.
<b>Print Draft</b>	When you select this action, Maconomy prints a draft copy of the current credit memo or invoice. For more information, please see the description of the action “Print Draft” in the window Invoice Selection.
<b>Print New Invoice</b>	When you select this action, you print the new invoice defined in the island Invoicing. You can only select this action if the invoice has been approved in this window. For more information, please see the description of the action “Print Invoice” in the window Invoice Selection.
<b>Print Original</b>	When you select this action, a copy of the original invoice displayed in this window is printed. If the invoice layout makes use of the “Reprinted” text functionality, a language-dependent text will be printed on the invoice to signify that the printed invoice is a reprint of the original. For more information, please see the description of the field “Printed” in the window Show Job Invoice.

## Job Invoice Crediting, Full

Full Job Invoice Crediting supports full crediting of invoices and supports crediting of blanket invoices.

This window is similar to Job Invoice Crediting in that it shows invoices and allows you to credit invoices. However, this window only supports full crediting of invoices. This window does not have the limitation of the Job Invoice Crediting workspace, which does not support crediting of blanket invoices or crediting of invoices that combine T&M and on account invoicing.

In the Workspace Client, this window is shown in the 'Job Invoices' workspace in the 'Crediting' section.

## Job Invoice Crediting Tab

This section includes the fields and descriptions for the Job Invoice Crediting tab.

### Invoice Island

Field	Description
<b>Invoice No.</b>	This field shows the invoice number.
<b>Invoice Date</b>	This field shows the invoice date.
<b>Payment terms</b>	This field shows the payment terms of the invoice.
<b>Due Date</b>	This field shows the due date of the invoices.
<b>Invoice Name</b>	This field shows the invoice Name on the invoice.
<b>Job</b>	This field shows the name and number of the job on the invoices.
<b>Company</b>	This field shows the name and number of the company of the invoices.
<b>Settling Company Invoices</b>	This field shows the name and number of the settling company the invoices.

### Amount Island

Field	Description
<b>Invoice Currency</b>	This field shows the currency of the invoice. The following amounts are shown in invoice currency.
<b>Total Billing Price</b>	The total billing price of the invoice. This is the amount invoiced before tax, and before any discount and on account reduction in case it is a T&M invoice.
<b>Tax</b>	The tax on the invoice.
<b>Net on Account</b>	Net on account reduction.
<b>Tax on Account</b>	Tax on account reduction.
<b>Balance Due</b>	The total balance due for the invoice.

Field	Description
<b>Std. Currency</b>	Standard currency of the customer.
<b>Total in Standard</b>	Balance due in standard currency of the customer.

#### Previously Credited Island

Field	Description
<b>Credited Billing Price</b>	If the invoice has been credited, fully or partially, this field shows the billing price credited (before tax, discount, on account reduction).
<b>Credited, Total</b>	If the invoice has been credited, this field shows the total amount credited (including tax, discount, on account reduction).

#### Status Island

Field	Description
<b>Status</b>	This field shows the status of the crediting process, going from Open For Invoice Selection (credited not started) to Approved for Editing (crediting started, draft not yet approved) to Approved for Crediting (credit memo ready to be printed) to Fully Credited. If the crediting has not been started, or completed, the status may show Invoicing in Progress which means that the invoice selection has been approved and is not related to the given invoice.
<b>Billing Price for Crediting</b>	Once crediting has been started, this field shows the billing price for crediting.
<b>Approved for Credit</b>	Once the credit memo is ready print, this field shows the name of user and date of approval.

#### Billing Address Island

This island shows the billing address on the invoice.

#### Ship to Address

This island shows the ship to address on the invoice.

## Actions

This section shows the Actions available in the Job Invoice Crediting (Full) workspace.

### Top Tab

Field	Description
<b>Print Original</b>	This action prints the original invoice.
<b>Create Credit Memo Selection</b>	This action sets the invoice for crediting.
<b>Approve Credit Memo Selection</b>	This action approves the credit memo selection for editing. Editing may be required (depending on the setup).
<b>Print Draft</b>	This action prints the draft credit memo.
<b>Print Credit Memo</b>	This action prints the credit memo. Note that editing and/or approval may be required.

## Invoice Draft Status Single Dialogs Workspace

Use this workspace to review and approve invoice drafts if you are a project manager.

This workspace provides a quick overview of all of the outstanding invoice drafts that are assigned to you. Invoice drafts are preliminary drafts that help the invoicing department create correct invoice selections for subsequent invoice issuance. When you have approved one or more invoice drafts in this workspace, the invoice department can issue invoices based on those approved invoice drafts.

Use the Selection Criteria island to choose invoice drafts that you want to review.

The Draft Invoices sub-tab displays a line for each invoice draft that matches the selection criteria.

The Totals island displays aggregate amounts for the invoice drafts you select, as well as their approval/print status.

When you are satisfied with an invoice line, use the relevant **Approve Draft** and **Print Draft** options. The Totals island displays the total invoice amount of the drafts that are marked for approval.

Use the **Approve Drafts** or **Print Drafts** action to approve or print all marked drafts.

You cannot edit invoice drafts in this workspace. If you want to edit an invoice draft before final approval, use the Invoice Editing workspace. When you edit an invoice draft in the Invoice Editing workspace, the invoice draft must remain open for editing for it to be redisplayed and approved in the Invoice Draft Status workspace.

## Invoice Drafts Status Tab

This section includes the fields and descriptions for the Invoice Drafts Status tab.

### Selection Criteria Island

Field	Description
<b>Show Approved</b>	If this check box is selected, approved invoice drafts will be shown in the sub-tab along with invoice drafts pending approval. If this check box is not selected, only invoice drafts pending approval will be shown in the sub-tab.
<b>Project Manager</b>	This field shows the name of the project manager whose pending draft approvals should be displayed in the sub-tab.
<b>Job No.</b>	These fields allow the user to specify a range of job numbers. The pending draft approvals associated with the selected job numbers will be displayed in the sub-tab.
<b>Job Collection No.</b>	This field shows the number of the job collection for jobs included in a job collection. The field is also displayed in the Jobs and Blanket Invoice Overview windows.
<b>Company No.</b>	These fields allow the user to specify a range of company numbers. The pending draft approvals associated with the selected company numbers will be displayed in the sub-tab.
<b>Settling Company No.</b>	These fields allow the user to specify a range of settling company numbers. The pending draft approvals associated with the selected settling company numbers will be displayed in the sub-tab.
<b>Customer No.</b>	These fields allow the user to specify a range of customer numbers. The pending draft approvals associated with the selected customer numbers will be displayed in the sub-tab.
<b>Customer Group</b>	This field allows the user to select a customer group. The pending draft approvals associated with the selected customer group will be displayed in the sub-tab.
<b>Payment Customer</b>	These fields allow the user to specify a range of payment customer numbers. The pending draft approvals associated with the selected payment customer will be displayed in the sub-tab.
<b>Department No.</b>	This field allows the user to select a department number. The pending draft approvals associated with the selected department number will be displayed in the sub-tab.
<b>Sales Rep.</b>	This field allows the user to select a sales representative. The pending draft approvals associated with the selected sales representative will be displayed in the sub-tab.
<b>Employee 1-10 No.</b>	These fields allow the user to enter the numbers of one or more employees. The pending draft approvals associated with the selected employees will be displayed in the sub-tab.

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	These fields allow the user to specify a range of location codes. The pending draft approvals associated with the selected location codes will be displayed in the sub-tab.
<b>Entity</b>	The functionality of these fields is similar to the functionality of the “Location” field above.
<b>Project</b>	The functionality of these fields is similar to the functionality of the “Location” field above.
<b>Purpose</b>	The functionality of these fields is similar to the functionality of the “Location” field above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the “Location” field above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the “Location” field above.

### Totals Island

Field	Description
<b>Current</b>	This table row shows the total amount of all invoice drafts displayed in the sub-tab, expressed in enterprise currency.
<b>Prior</b>	This table row shows the total amount that has already been invoiced on all selected invoice drafts, expressed in enterprise currency.
<b>Total</b>	This table row shows the sum of the “Current” and “Prior” fields, thus expressing the total invoiceable amount on the selected invoice drafts. The amount is shown in enterprise currency.
<b>Enterprise Currency</b>	This field shows the enterprise currency, for example, USD.
<b>Invoice Drafts to Approve</b>	This field shows the number of invoice drafts that have been marked for approval in the tab.
<b>Invoice Drafts to Print</b>	This field shows the number of invoice drafts that have been marked for printing in the tab.

## Draft Invoices Sub-Tab

This section includes the fields and descriptions for the Draft Invoices sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number associated with the invoice draft.
<b>Job Name</b>	This field shows the job name associated with the invoice draft.
<b>Bill to Customer No.</b>	This field shows the customer number associated with the customer to which the invoice will be sent.
<b>Bill to Customer</b>	This field shows the name of the customer to which the invoice will be sent.
<b>Type</b>	This field shows whether this invoice draft involves a credit or a debit transaction.
<b>Invoice Currency</b>	This field shows the currency of the invoice.
<b>Amount for Invoicing</b>	This field shows the billing price for invoicing. The invoice currency is also shown and If it is an invoice on account then the invoice currency may differ from the jobs currency.
<b>Up/Down</b>	This field shows the amount by which the invoiceable amount has been written up or down, expressed in the currency of the job.
<b>Submitted</b>	A check mark in this field shows if the invoice allocation on the job has been submitted.
<b>Submit Draft</b>	Use this action to submit the draft.
<b>Approved</b>	This field shows whether the invoice draft has already been approved. Approved drafts are only shown if the "Show Approved" field in the Selection Criteria island has been marked.
<b>Approve Draft</b>	This field allows the project manager to mark an invoice draft for approval. When marked for approval, the invoice draft will be included in the totals displayed in the Totals island. To approve drafts marked for approval, select the "Approve Drafts" action from the Action menu.
<b>Created on</b>	This field shows the date on which the invoice draft was created.
<b>Project Manager</b>	This field shows the name of the project manager associated with the job to which the invoice draft belongs.
<b>Print Draft</b>	This field allows the project manager to mark an invoice draft for printing. When marked for printing, the invoice draft will be included in the totals displayed in the Totals island. To approve drafts marked for printing, select the "Print Drafts" action from the Action menu.

Field	Description
<b>Invoice Date</b>	This field shows the invoice date that will appear on the invoice after approval.
<b>Total Incl. Tax</b>	This field shows the total invoiceable amount including tax, expressed in the currency of the invoice.
<b>Tax, Invoice Currency</b>	This field shows the applicable tax level on the invoice amount, expressed in the currency of the invoice. If multiple tax levels have been enabled, two or three continuously numbered fields will replace this field, stating the applicable tax levels on the job. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Invoice Discount %</b>	This field shows the applicable invoice discount percentage on the job. If no discount applies, the value will be zero.
<b>Invoice Discount, Invoice Currency</b>	This field shows the applicable invoice discount amount on the job, expressed in the currency of the invoice.
<b>Invoice Discount, Currency</b>	This field shows the applicable invoice discount amount on the job, expressed in the currency of the job.
<b>Invoiced Prior, Currency</b>	This field shows the amount already invoiced on the job, expressed in the currency of the job.
<b>Up/Down Prior, Currency</b>	This field shows the amount by which the invoiceable amount has previously been written up or down on this job, expressed in the currency of the job.
<b>Net on Account, Currency</b>	This field shows the amount to invoice on account, expressed in the currency of the job.
<b>Invoice Name</b>	This is the name of the invoice.
<b>Invoice Type</b>	This field shows the invoice type as T&M for T&M invoices, On Account for on account invoices, and T&M and On Account for invoices that include both.
<b>Total Incl. Tax, Currency</b>	This field shows the total invoiceable amount including tax, expressed in the currency of the job.
<b>Currency</b>	This field shows the currency of the job.
<b>Draft No.</b>	This is the number of the draft invoice.

Field	Description
<b>Invoice Amount, Base</b>	This field shows the amount to be invoiced, expressed in the base currency of the company to which the job belongs.
<b>Up/Down, Base</b>	This field shows the amount by which the invoiceable amount has been written up or down, expressed in the base currency of the company to which the job belongs.
<b>Invoice Discount, Base</b>	This field shows the applicable discount amount on the job, expressed in the base currency of the company to which the job belongs.
<b>Invoiced Prior, Base</b>	This field shows the amount already invoiced on the job, expressed in the base currency of the company to which the job belongs.
<b>Up/Down Prior, Base</b>	This field shows the amount by which the job has previously been written up or down, expressed in the base currency of the company to which the job belongs.
<b>Tax, Base</b>	This field shows the applicable tax level on the invoice amount, expressed in the base currency. If multiple tax levels have been enabled, two or three continuously numbered fields will replace this field, stating the applicable tax levels on the job. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Net on Account, Base</b>	This field shows the amount to invoice on account, expressed in the base currency of the company to which the job belongs.
<b>Total Incl. Tax, Base</b>	This field shows the total invoiceable amount including tax, expressed in the base currency of the company to which the job belongs.
<b>Base Currency</b>	This field shows the base currency of the company to which the job belongs.
<b>Project Manager No.</b>	This field shows the number of the project manager associated with the job to which the invoice draft belongs.
<b>Created by</b>	This field shows who created the invoice draft.
<b>Department</b>	This field shows the department to which the job associated with the invoice draft belongs.
<b>Sales Rep. No.</b>	This field shows the number of the sales representative associated with the job to which the invoice draft belongs.
<b>Sales Rep.</b>	This field shows the name of the sales representative associated with the job to which the invoice draft belongs.
<b>Customer Group</b>	This field shows the customer group associated with the job to which the invoice draft belongs.
<b>Customer No.</b>	This field shows the customer number associated with the job to which the invoice draft belongs.

Field	Description
<b>Customer</b>	This field shows the name of the customer associated with the job to which the invoice draft belongs.
<b>Company No.</b>	This field shows the company number associated with the job to which the invoice draft belongs.
<b>Company</b>	This field shows the name of the company associated with the job to which the invoice draft belongs.
<b>Settling Company No.</b>	This field shows the settling company number associated with the job to which the invoice draft belongs.
<b>Settling Company</b>	This field shows the name of the settling company associated with the job to which the invoice draft belongs.
<b>Location</b>	This field shows the name of the location associated with the job to which the invoice draft belongs.
<b>Entity</b>	This field shows the name of the entity associated with the job to which the invoice draft belongs.
<b>Project</b>	This field shows the name of the project associated with the job to which the invoice draft belongs.
<b>Purpose</b>	This field shows the purpose associated with the invoice draft.
<b>Spec. 1-3</b>	These fields show specifications for the invoice draft.
<b>Local Spec. 1-3</b>	These fields show local specifications for the invoice draft.
<b>Employee 1-10</b>	These fields show the names of employees who are associated with the job to which the invoice draft belongs.

## Actions

This section shows the Actions available in the Invoice Draft Status workspace.

### Top Tab

Field	Description
<b>Mark All For Draft Printing</b>	By selecting this action, the project manager can mark all invoice drafts that match the selected search criteria for subsequent printing. When this action has been selected, the "Print Draft" field will be marked for all selected invoice drafts.
<b>Unmark All For Draft Printing</b>	By selecting this action, the project manager can unmark all invoice drafts that match the selected search criteria for printing. When this action has been selected, the "Print Draft" field will be unmarked for all selected invoice drafts.

Field	Description
<b>Print Drafts</b>	This action allows the project manager to print all invoice drafts that have been marked for printing.
<b>Mark All For Submission</b>	Use this action to select invoices that are to be submitted.
<b>Unmark All For Submission</b>	Use this action to remove selection from all invoices that are selected to be submitted
<b>Submit Drafts</b>	Use this action to submit selected drafts.
<b>Mark All For Approval</b>	By selecting this action, the project manager can mark all invoice drafts that match the selected search criteria for subsequent approval. When this action has been selected, the "Approve Draft" field will be marked for all selected invoice drafts.
<b>Unmark All For Approval</b>	By selecting this action, the project manager can unmark all invoice drafts that match the selected search criteria for approval. When this action has been selected, the "Approve Draft" field will be unmarked for all selected invoice drafts.
<b>Approve Drafts</b>	This action allows the project manager to approve all invoice drafts that have been marked for approval. Upon approval, the invoicing department will be able to prepare correct invoice selections from the invoice drafts.

## Invoice Editing Single Dialogs Workspace

Use this workspace to edit an approved invoice selection before the invoice can be printed and mailed to the customer.

**Note:** The description of this workspace assumes that you are creating invoices, but most of the features also apply to creating credit memos.

Use the Invoice Selection workspace to create and approve invoice selections. Then use the Invoice Editing workspace to edit the text, quantities, and prices of selections.

When you insert text, Maconomy automatically adjusts the text wrapping and prints the amount in alignment with the bottom line. You can set a standard line width in the System Parameters workspace, but still change the line width in this workspace

You can create an invoice from the edited invoice selection only if the invoice total is the same as it was when the invoice selection was approved.

After you edit the invoice selection, you can use the **Print Invoice** action to create and print the actual invoice. You can use the **Print Credit Memo** action to create and print credit memos. Alternatively, you can create and print several invoices at the same time in the Job Invoicing workspace. You can retrieve and reprint an old invoice or credit memo in the Show Job Invoice or Show Job Credit Memo workspace.

When you create and print an invoice, Maconomy creates an invoice journal. If you have selected the **Automatic posting of invoices** system parameter, the invoice journal is posted automatically. If you do not select that system parameter, you must post the journal in the Posting workspace in the G/L module.

### Invoice Editing Tab

This section includes the fields and descriptions for the Invoice Editing tab.

#### Job Island

Field	Description
<b>Job</b>	This field shows the job name and number that appears in the header of the draft.
<b>Job Group</b>	This is the job group to which the job is assigned. It is entered in the window Jobs and cannot be changed here.
<b>Status</b>	This is the job status. It will always be "Order" by the time you can view it here. It cannot be changed.
<b>Responsible</b>	This is the name of the employee who is responsible for the job. It is entered in the window Jobs and cannot be changed here.

#### Draft Island

Field	Description
<b>Draft No.</b>	This is the number of the draft.
<b>Created by</b>	This is the name of the user who created the draft.
<b>Date</b>	This is the date on which the draft is created.
<b>Blanket Invoice</b>	This check box is selected if the draft invoice is a blanket draft. Blanket drafts typically cover multiple jobs and are produced by approving the invoice selection in the Blanket Invoice Selection window, or by choosing the Create Blanket Draft action in the Blanket Invoicing Overview window.

#### Section Island

Field	Description
<b>Show</b>	Use this field to show either the lines from the summary draft or the lines from the detailed specification, respectively. This field must contain a value.  The default is to show the summary draft.  Note: Two actions, Show Summary and Show Detailed Specification, can also be used to change the default.

Field	Description
	If the job is not set up to create a detailed specification, you see an error if you try to change to the detailed specification.
<b>Contains Detailed Specification</b>	This check box indicates if the draft contains lines in the Detailed specification section.

#### Ship to Customer Island

Field	Description
<b>Ship to Customer</b>	This is the number of the customer for whom the job is being done. It cannot be changed. Below it is the first line of the customer's name, which is retrieved from the window Customer Information Card. The name cannot be changed either.

#### Up/Down Island

Field	Description
<b>Hours</b>	This field shows the write-up/-down number of hours for the entries being invoiced. Write-up and write-down are the differences between the registered number of hours and the invoiced number of hours. Write-ups are shown as positive figures, and write-downs as negative figures.
<b>Billing Price, Time</b>	This field shows the write-up/-down amount for the time activity entries being invoiced. Write-up and write-down are the differences between the registered number of hours and the invoiced number of hours. Write-ups are shown as positive figures, and write-downs as negative figures.
<b>Billing Price</b>	This field shows the write-up/-down amount for all the entries being invoiced. Write-up and write-down are the differences between the registered number of hours and the invoiced number of hours. Write-ups are shown as positive figures, and write-downs as negative figures.

#### Approval Island

Field	Description
<b>Remarks</b>	In this field, you can enter a remark to describe the current job invoice allocation line. This could, for example, be a note about the reason for writing down an entry. The remark entered in this field is copied to all underlying job entries and can be seen in the window Itemize Job Invoice Allocation. If any remarks have already been entered in that window for the individual job entries, they are overwritten by the remark in this field. If a remark is changed in the window Itemize Job Invoice Allocation so that there are different remarks for each job entry, the "Remarks" field in this window is blanked for that allocation line.

**Status Island**

Field	Description
<b>Submitted</b>	A check mark in this field shows if the invoice allocation on the job has been submitted.
<b>Submitted by</b>	If the invoice allocation on the job has been submitted, this field shows the name of the employee who submitted it.
<b>Submitted Date</b>	If the invoice allocation on the job has been submitted, this field shows the date when it was submitted.
<b>Approved</b>	<p>This field shows whether the invoice selection is approved. It is approved in this window using the action "Approve Invoice." You cannot change this field. An invoice selection that has been approved in the window Invoice Selection has a mark in this field when this window is opened, unless the job parameter attribute "Invoice Editing Required" of the job parameter type "Invoice Approval" associated with the current job is assigned the value "Yes."</p> <p>If you change any information in this window, the approval is canceled, and the mark is removed. Maconomy will warn you if this happens.</p>
<b>Approved by</b>	This field shows the name of the user who approved the job for invoicing. The field will be cleared if the invoice is reopened for editing.
<b>Approval Date</b>	This field displays the date on which the job was approved for invoicing. The field will be cleared if the invoice is reopened for editing.
<b>Includes Subjobs</b>	This field shows whether the current invoice selection is for a main job which uses "Main Job Invoicing." For more information, please see the field "Includes Subjobs" in the window Invoice Selection.

**Settling Company Island**

Field	Description
<b>Settling Company</b>	<p>This field shows the name and number of the settling company that applies to the current job.</p> <p>If the number in this field is different from the one specified in the island Company, Maconomy will automatically create intercompany entries at the posting of job invoices. In the intercompany entries, the company in this field will be the intercompany company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>For further information about the influence of a settling company and how such a company is selected, please see the section "Multiple Companies" in the chapter "Introduction to the G/L Module." Intercompany entries are described in the window Intercompany Accounts in the G/L module.</p>

### Restore Editing Island

Restore from Invoice No. In this field, you can specify the number of the invoice whose invoice editing should be copied to the table part, thus replacing any current lines, when selecting the action "Restore Editing from Invoice." As the amounts in the table part will also be copied, you must manually edit the amounts to match the current invoicing in the table part. For further information, see the description of the action "Restore Editing from Invoice."

### Document Archive Island

Field	Description
<b>Document Archive</b>	This field shows the archive number of the attached document.
<b>Document Count</b>	This field shows the number of documents in the Document Archive.

### Balance Island

Field	Description
<b>Billing Price</b>	<p>This field shows any difference between the billing price in the approved invoice selection, shown in the "Billing Price Total" field in the Invoice island, and the sum of the "Billing Price Total" fields in the table of those lines that do not come from the detailed specification.</p> <p>Note that if there are no amounts in the table, the figure here is 0.00.</p> <p>It is only possible to invoice the selection if the amount here is 0.00.</p>
<b>Tax</b>	<p>This field shows any difference between the amount in the tax field in the invoice island and the sum of the tax amounts on the invoice lines that do not come from the detailed specification. Note that if there are no amounts in the table part, the figure in this field is 0.00.</p> <p>If multiple tax codes are enabled, the Tax field is replaced by the following fields: Tax 1, Tax 2, and if three tax levels are enabled, Tax 3.</p>

### Invoice/Credit Memo Island

Field	Description
<b>Type</b>	This field shows the type of document this window displays. If the content of this field is "Debit," the window currently shows an invoice. If the content of the field is "Credit," the window shows a credit memo.
<b>Invoice Currency</b>	This is the currency of the job. It is determined in the window Jobs and cannot be changed here.
<b>Billing Price Total</b>	This is the billing price total for the invoice, expressed in the job's currency. It cannot be changed here.

Field	Description
<b>Invoice Discount %</b>	This is the invoice discount percentage given. It is determined in the window Invoice Selection and cannot be changed here. Invoice discount is not deducted from invoices on account.
<b>Invoice Discount</b>	This is the invoice discount amount given. The amount is calculated from the percent given in the "Invoice Discount %" field, which is entered in the window Invoice Selection. It cannot be changed here. Invoice discount is not deducted from invoices on account.
<b>Tax</b>	This is the tax amount added to the invoice. It cannot be changed here. If multiple tax codes are enabled, the "Tax" field will be replaced by the following fields: "Tax 1," "Tax 2," and, if three tax levels are enabled, "Tax 3." For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Net on Account</b>	If an amount has been paid on account previously, the amount will be shown in this field. The amount will be deducted on the current invoice.
<b>Tax on Account</b>	If tax has been paid on account previously, the tax will be shown in this field. The amount will be deducted on the current invoice.
<b>Balance Due</b>	This field shows the total amount outstanding for a customer when the amounts on account have been deducted on the current invoice selection. The amount is shown in the currency of the job. You cannot alter the amount in this field.
<b>Invoice Name</b>	In this field, you can enter the name of the invoice.
<b>Invoice Date</b>	In this field, you can enter the date of the invoice. Maconomy verifies that the date is within the open posting interval given in the window System Information in the Set-Up module.  If split billing is used (that is, the invoiced job has multiple bill-to customers), changing the invoice date in this field will clear the field "Preferred Inv. Date" in the window Invoice Selection for the current job. However, if the date on all invoices created from the split billing job is changed to the same date in this window, then that date will be shown in the window Invoice Selection also.  For invoices on account with surcharge, the surcharge is calculated as of the preferred invoice date. However, it is not recalculated if you change the invoice date. Instead, a <b>warning</b> message displays.
<b>Payment Terms</b>	This field shows the payment terms that apply to the job. The information has been retrieved from the Job Information window and can be changed in this field.
<b>Due Date</b>	This field shows the date when the invoice falls due. The field cannot be edited.
<b>Invoice Type</b>	This field shows the type of the draft invoice, for example, if it includes T&M, On Account invoicing, or both.

Field	Description
<b>Invoice on Account</b>	This field is marked if the invoice selection is for an invoice (or credit memo) on account. If it is, you can only enter text lines in the table. If it is not, it is a standard job invoice. You cannot change the value in this field.

**Company Island**

Field	Description
<b>Company</b>	This field shows the name and number of the company responsible for the current job. You cannot change the value here.

**Text Island**

Field	Description
<b>Text Wrapping Width %</b>	<p>In this field you can specify how wide the text of a line in the field "Description" can be before wrapping takes place. The line width of the invoice text is specified as a percentage of Maconomy's standard width. This field has the default value specified by the system parameter "Default Invoice Line Width %" in the Set-Up module. By entering a different percentage in this field, you can change the width of the text so that it fits the invoice layout used for the current invoice. If, for example, you enter "120" in this field, Maconomy will make the invoice lines 20% wider than the standard; if you enter "80" in this field, Maconomy will make the invoice lines narrower. If you enter "0" in this field, the automatic word wrapping on invoice lines is disabled. For more information, please see the description of the "Description" field in the table part of the window.</p> <p>Please note that if you change the value in this field, it only affects the width of new text; the width of existing lines is not affected. To change the width of existing lines, you must select the "Wrap Lines" action. When you select this action, Maconomy wraps all text according to the value of this field.</p>
<b>Standard Invoice Text List</b>	This defaults to the standard invoice text list selected on the job, but can be changed here, as needed.

**Copy Editing Island**

Field	Description
<b>Copy from Job No.</b>	In this field, along with the other fields in this island, you can specify a combination of job number, bill-to customer, and appropriation. Together, these three values must point out an approved invoice editing currently in the system. When you select the action "Copy Editing," the lines from the specified invoice editing are copied to the table part. As the amounts in the table part will also be copied, you must manually edit the amounts to match the current invoicing in the table part.

Field	Description
<b>Copy from Bill to Customer</b>	In this field, you can specify the number of a customer. For further information about the functionality of the field, see the description of the field "Copy from Job No." above.
<b>Copy from Appropriation</b>	In this field, you can specify the number of an appropriation. For further information about the functionality of the field, see the description of the field "Copy from Job No." above.

### Billing Address Island

Field	Description
<b>Customer</b>	This is the number of the customer who is being invoiced for the job. It cannot be changed. Below it is the first line of the customer's name, which is retrieved from the window Customer Information Card. The name cannot be changed either.
<b>Appropriation</b>	This field shows the appropriation of the bill-to customer who is being invoiced for the job.
<b>Attn.</b>	This is the customer's attention person; the person to whom shipping and payment information is directed.
<b>Country</b>	Maconomy completes this field automatically if you enter a customer number in the field above.
<b>Phone</b>	This is the customer's phone number.
<b>Fax</b>	This is the customer's fax number.
<b>Telex</b>	This is the customer's telex number.
<b>E-mail</b>	In this field, you may enter the customer's electronic mail address. This information is used for reference.

### Invoice Lines Sub-Tab

This section includes the fields and descriptions for the Invoice Lines sub-tab.

Field	Description
<b>Standard Text Code</b>	Enter a code from the list of standard invoicing texts specified on the job. When you enter a code in this field, the text on the line is replaced by the standard text corresponding to the code. The field will appear as a drop-down list. The code is not stored, as it is only used for choosing a standard text.
<b>Description</b>	In this field, you can enter text on the invoice selection line. You can create invoice lines with or without amounts. If the invoice selection is created with the action "Approve Invoice Selection" in the window Invoice Selection,

Field	Description
	<p>Maconomy suggests a text based on the set-up of the Invoice Island in the window Invoice Layout Rules. If it is created with the action "Approve for Invoicing On Account," Maconomy does not suggest any invoice lines.</p> <p>When you enter text in this field, Maconomy automatically wraps the text each time you press "Return." Maconomy wraps the text according to the value of the field "Width %," moving the text exceeding the specified text width down to the required number of lines. A line with an amount is wrapped and split so that the amount automatically floats to the bottom line of the text.</p> <p>Text above a line with an amount is wrapped as one text block. However, you can divide the text into sections by inserting a blank line between the respective text sections, so that Maconomy will wrap the sections individually. Note, however, that the text section just above an amount line will be wrapped together with this line. This means that if you delete the line, the text section just above will also be deleted. Note that you cannot use the Return key to create sections, as this key is used for executing new changes in Maconomy.</p> <p>If you later need to insert new text or change text on an invoice line, Maconomy will rewrap both this line and the rest of the text block to which it belongs and adjust the entire block to the specified line width, but any other text blocks will not be affected. This means that you can have a number of text blocks with different widths. To wrap and adjust all the text of an invoice, select the action "Wrap Lines."</p> <p>Note that sum lines are never wrapped. In addition, Maconomy sees text lines above such lines as one text block, ending with the text line immediately above the sum line. This means that if you have entered text lines both above and below a sum line which is deleted, these texts are merged when the text is rewrapped, as there is no longer any sum line defining the end of a text block.</p> <p>If the invoice layout rule for the current job specifies that printouts are only to show a total, Maconomy does not suggest any lines in this table.</p> <p>If the invoice layout rule for the current job specifies that printouts are to show totals, and that time and amount activities are to be shown per registration, the entry text will be shown in the table for every entry. If time and amount activities are to be shown by activity or by summary activity, Maconomy suggests the name of the activity.</p> <p>If the invoice is to be created from the job quote, Maconomy suggests the texts from the quote lines.</p> <p>If you have specified for a job invoiced by time and material that the invoice layout is to include a period indication, Maconomy automatically inserts a text line as a header in the invoice when such a job is approved for invoicing. You can see and edit the period indication line as a normal text line in this window. In the window Language Texts in the Set-Up module a language-dependent text can be configured to precede the period indication. Please note that you must maintain changes to the invoicing period manually on this line if you use the action "Restore Editing."</p> <p>If you are editing a blanket invoice of a main job, and the invoice layout rule of the main job specifies "Main Job Invoicing," the main job and its associated</p>

Field	Description
	<p>subjobs are invoiced together. If the field “Combine Invoice Lines” is marked on the invoice layout rule, Maconomy will summarize the entries of all the jobs in the main job/subjob hierarchy according to the invoice layout specification. If the field “Combine Invoice Lines” is not marked, Maconomy will add a section for each subjob on the invoice. For more information, please see the description of the window Invoice Layout Rules.</p>
<b>Quantity</b>	<p>Enter the quantity you wish to invoice. The quantity is used to calculate the total line billing price. The value in the <b>Billing Price</b> field is multiplied by this quantity to provide a value in the <b>Billing Price Total</b> field on the line.</p> <p>If the invoice line is created with the <b>Approve Invoice Selection</b> action in the Invoice Selection workspace, Maconomy suggests a quantity based on the set-up in the Invoice Layout Rules workspace, but only if printouts are to show amounts on lines and not just a total. If you created the invoice from a job quote, the quantity here will be the same as the quantity on the quote line.</p> <p>If you have specified in the Job Information workspace that activities are printed by entry, Maconomy suggests the quantity in the <b>Quantity</b> field in the Itemize Invoice Selection workspace. If you are showing time and amount activities by activity or by summary activity, the quantity is the sum of the quantities for the job entries in the Itemize Invoice Selection workspace.</p> <p>A billing price is not shown on an invoice line for job entries that are not ready for invoicing in this sub-tab.</p> <p>If the invoice layout is set up to use quantities on on account invoices, the quantity can be transferred from on account selection.</p>
<b>Sales Unit</b>	<p>An existing field. Reused by the functionality, but there are no changes to the behavior of the field.</p>
<b>Quantity, Hours</b>	<p>In this field, you can enter a number of hours that are included in the quantity for information purposes.</p>
<b>Billing Price</b>	<p>Enter the billing price per piece in the job currency. The total line billing price in the <b>Billing Price Total</b> field is found by multiplying the price here by the value in the <b>Quantity</b> field.</p> <p>If the invoice line is created with the <b>Approve Invoice Selection</b> action in the Invoice Selection workspace, Maconomy suggests a quantity based on the set-up in the Invoice Layout Rules workspace, but only if printouts are to show amounts on lines and not just a total. If you created the invoice from a job quote, the quantity here will be the same as the quantity on the quote line.</p> <p>If you have specified in the Job Information workspace that activities are printed by entry, Maconomy suggests the quantity in the <b>Billing Price, Unit</b> field in the Itemize Invoice Selection workspace. If you are showing time and amount activities by activity or by summary activity, the quantity is the average of the prices per piece of the job entries. Job entries without prices are not included in the average price per piece.</p>

Field	Description
	<p><b>Note:</b> The average price per piece may be rounded off, so the quantity multiplied by the price per piece will not be the same as the line's total billing price in the <b>Billing Price Total</b> field.</p> <p>If the invoice layout is set up to use quantities on on account invoices, the billing price can be transferred from on account selection.</p>
<b>Billing Price Total</b>	<p>This shows the total billing price of the invoice line in the job's currency. You can only change the amount here if the field "Total Price Only" has been marked.</p> <p>Maconomy calculates the price by multiplying the quantity in the "Quantity" field by the price per piece in the "Billing Price" field.</p> <p>Note that the amount here can be different from the amount found by multiplying the quantity in "Quantity" by the average price per piece in the "Billing Price" field, if the latter is rounded off.</p>
<b>Tax Code</b>	<p>In this field, you select the tax code for the invoice line. Maconomy calculates tax from the line's total billing price, less invoice discount. Maconomy shows the difference between the sum of the tax amounts and the amount in the tax field in the Balance island in the card part of this window.</p> <p>If you have selected not to use differentiated taxes (in the System Information window in the Set-Up module), Maconomy will use the standard tax code. If you are applying differentiated tax, Maconomy uses the tax code you selected on the line.</p> <p>Note that if you have specified in the Invoice Layout Rules window that activities are to be printed by summary activity, Maconomy will suggest the tax code of the summary activity, entered in the Activities window. You should therefore give the same tax code to activities for the same summary activity.</p> <p>You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters "Show Three Tax Levels" and/or "Show Two Tax Levels" must be marked in the System Parameters window. When multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2," and, if enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Total Price Only</b>	<p>If you mark this field, the fields "Quantity" and "Billing Price" are not included in the invoice journal and on the invoice itself. Only the total billing price will be shown. The fields "Quantity" and "Billing Price" are reset to zero and cannot be changed on the line if you mark this field. The field is marked by default if the window is showing an invoice or credit memo on account.</p>
<b>Subtotal</b>	<p>If you mark this field, a subtotal is printed on the draft invoice and on the invoice itself. Subtotal lines are also shown in the window Show Job Invoice. The subtotal is the sum of the invoice lines above the subtotal line which are not themselves a subtotal or already summed on a subtotal line with the same sum level or higher. Once a line has been marked as a subtotal line, the field "Sum Level" must also be completed with a value greater than 0. The only other field on the current subtotal line open for editing is "Description." The</p>

Field	Description
	subtotal is not shown until the editing has been closed using the action "Close Editing."
<b>Sum Level</b>	In this field, you specify a sum level on all subtotal lines. The subtotal on the line includes subtotals above with a lower sum level.
<b>Indentation Level</b>	This field allows you to specify an indentation level for each invoice line. The indentation level increases incrementally from a value of 0. For instance, if you select a value of 0 for the first invoice line and 1 for the second line in this field, the first line will not be indented, while the second line will be indented to the first indentation level. You can make deeper indentations by entering higher values in this field.
<b>Header</b>	Selecting this field will force the line to be formatted as a sum-level header on the print layout.
<b>Level 1-4</b>	These fields show the values by which information on the current line is grouped at level 1-4. If, for instance, the invoice layout rule selected for the job specifies that the invoice should be grouped by task at level 1, the "Level 1" field shows the task name of the entries summarized on the current line.
<b>Base Salary Markup %</b>	If the system parameter "Use markup % for time activities" is selected, markup percentages in price lists are also applied to time registrations. This field shows a markup percentage relative to the base salary rate.
<b>Text 1-2</b>	Enter information related to the quote in these fields. If you have enabled transferring of dimensions from budget lines, these fields automatically display the values of the specified dimensions. These fields are editable even after the quote is submitted or approved.
<b>Text 3-5</b>	Use these fields to include text in the invoice print layout. For on account invoices, the values are transferred from the text fields in on account selection.

## Actions

This section shows the Actions available in the Invoice Editing workspace.

### Top Tab

Field	Description
<b>Attach Document</b>	Use this action to attach a document to the current invoice. For example, this could be a scanned receipt which serves as documentation for the invoice.
<b>Delete Document</b>	Use this action to delete the current document from the invoice's document archive. If a document archive is assigned to the invoice edit being removed, it remains assigned to the now saved previous edit.
<b>Restore Editing</b>	Use this action to restore a previous edit of the invoice.

Field	Description
	If the previous edit has a document archive, it is assigned to the current edit.
<b>Restore Editing, Summary</b>	Use this action to restore a previous edit of the invoice. If the previous edit has a document archive, it is assigned to the current edit.
<b>Restore Editing from Invoice</b>	Use this action to copy an invoice edit from a printed invoice. If the copied edit has a document archive, it is not reassigned or copied to the current invoice edit.
<b>Print Invoice</b>	Use this action to print the invoice. When you print an invoice that has a document archive, it is reassigned to the finalized invoice.

## Job Crediting Single Dialogs Workspace

Use this workspace to create and print job credit memos and job credit memos on account in batches.

If you need to credit many jobs, it may be convenient to credit them in one operation. In this workspace, you can generate credits for all jobs that meet certain selection criteria.

Before you can credit a job in this workspace, the job must have approved credit memo selections that have not already been credited. Approve selections in the Invoice Selection or Approve Invoice Selection workspaces.

Use the Job Crediting tab in this workspace to select the jobs to credit. The Draft Credit Memos sub-tab lists the draft credit memos (one line per credit memo) that are approved for crediting.

When you create and print credits, Maconomy creates an invoice journal. If you selected the **Automatic posting of invoices** system parameter, the invoice journal is posted automatically. If you did not select that system parameter, you must post the journal in the Posting workspace in the G/L module.

### Job Crediting Tab

This section includes the fields and descriptions for the Job Crediting tab.

#### Selection Criteria Island

Field	Description
<b>Show Lines</b>	When you mark this field, the lines matching the values specified in the selection criteria below are shown in the table part of this window. Please note that actions selected in the Action menu will be carried out on all jobs matching the selection criteria, regardless of whether the lines are shown in the table part.

Field	Description
<b>Job No.</b>	<p>In these fields, you can specify a range of job numbers. Only jobs within the specified range of job numbers are selected. If you do not enter a range, the job numbers will not be considered in the selection.</p> <p>If the range of jobs includes jobs which are main jobs with an invoice layout rule that specifies "Main Job Invoicing," then the associated subjobs will be invoiced as well, even though they are not part of the selection criteria. If, on the other hand, the range of jobs includes subjobs whose main jobs use main job invoicing, the subjobs are not invoiced unless the main jobs are also included in the range of jobs. For more information, please see the description of the window Invoice Layout Rules.</p>
<b>Job Collection No.</b>	In this field, you can select to include only jobs that belong to a specific job collection.
<b>Job Group</b>	In these fields, you can specify a job group. Only jobs within this job group will be selected. If you do not enter a job group, the job group to which the jobs are assigned will not be considered.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. Only jobs with a responsible company within the specified range are selected. If you do not enter a range, the responsible company assigned to the jobs will not be considered in the selection.
<b>Customer No.</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Bill to Customer</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Department</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Language</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Responsible</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Sales Rep.</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Project Manager</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Popup 1-5</b>	<p>The functionality of these fields is similar to that of the field "Job Group."</p> <p>The values in these pop-up fields are specified in the window Jobs.</p>
<b>Employee No. 1-10</b>	The functionality of this field is similar to that of the field "Job Group."

**Selection Criteria, Dimensions Island**

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Entity</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Project</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Spec. 1-3</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Local Spec. 1-3</b>	The functionality of this field is similar to that of the field "Job Group."

**Crediting Island**

Field	Description
<b>Number of Drafts</b>	<p>This field shows the number of jobs within the selection criteria for which an approved credit memo selection exists. To be included, the credit memo selection must have a check mark in the field "Credit" in the table part of this window.</p> <p>You can limit the number of jobs in the fields below. If you have a large number of jobs to credit, you might want to split it into smaller and more manageable batches. You cannot change the number in this field manually.</p>
<b>Amount for Crediting</b>	This field shows the total amount for credit memo selections in the table part where the field "Credit" is marked. The amount is shown in the enterprise currency. The field is updated automatically by Maconomy.

**Print Control Island**

Field	Description
<b>Layout</b>	In this field, you can choose which layout to use for the credit memo when you select the action "Print Credit Memos." If no other layouts have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

## Draft Credit Memos Sub-Tab

This section includes the fields and descriptions for the Draft Credit Memos sub-tab.

Field	Description
<b>Job No.</b>	This field shows the numbers of the jobs for which you have made a credit memo selection which has been approved for crediting in the window Invoice Selection using the actions "Approve Credit memo Selection" or "Approve for Crediting on Account," or approved in the window Invoice Editing using the action "Close Editing" with no balance in the island Balance. Maconomy only shows the jobs within the selection criteria specified in the card part of the window.
<b>Bill to Customer No.</b>	This is the number of the customer the job is for.
<b>Bill to Customer</b>	This field shows the name of the customer.
<b>Credit Memo Date</b>	<p>In this field, you can enter the credit memo date you want for the individual credit memos. If a credit memo date has been specified in the field "Invoice Date" in the windows Invoice Selection or Approve Invoice Selection, it will be suggested here.</p> <p>The date you enter must be within the open posting interval, which you define in the window System Information in the Set-Up module. If you do not enter a date here, Maconomy will use today's date.</p>
<b>Credit</b>	<p>This field must be marked if you wish to credit the job when you select "Print Credit Memos" in the Action menu. In the card part, you can limit the number of jobs shown here for crediting, but you can also deselect a job by removing its mark here.</p> <p>If you do not wish to credit a job shown in the table, remove the mark by clicking the field. Maconomy automatically marks all the jobs.</p>
<b>Job Name</b>	This field shows the name of the jobs for which you have made a credit memo selection which has been approved for invoicing in the window Credit Memo Selection using the actions "Approve Credit Memo Selection" or "Approve for Invoicing on Account," or approved in the window Credit Memo Editing using the action "Close Editing" with no balance in the island Balance. Maconomy only shows the jobs within the selection criteria specified in the card part of the window. You cannot change the job numbers here.
<b>Invoice Currency</b>	This field shows the invoice currency.
<b>Billing Price, Invoice Currency</b>	This field shows the amount invoiced on the job selected in the card part, excluding tax. The amount is shown in invoice currency. For credit memos, the amount credited is shown as a positive amount.

Field	Description
<b>Billing Price Up/Down Currency</b>	This field shows the amount written up/down on the invoice in job currency. Hours Up/Down This field shows the write-up/-down number of hours for the entries being invoiced. Write-up and write-down are the differences between the registered number of hours and the invoiced number of hours. Write-ups are shown as positive figures, and write-downs are shown as negative figures.
<b>Currency (Job)</b>	This field shows the currency of the job.
<b>Draft No.</b>	This field shows the numbers of the jobs for which you have made an invoice selection which has been approved for invoicing in the window Invoice Selection using the actions "Approve Invoice Selection" or "Approve for Invoicing on Account," or approved in the window Invoice Editing using the action "Close Editing" with no balance in the island Balance. Maconomy only shows the jobs within the selection criteria specified in the card part of the window. You cannot change the job numbers here.
<b>Blanket Draft</b>	This check box is selected if the invoice draft on the line is a blanket draft.
<b>Credit Memo Name</b>	This is the name of the credit memo. Customer No. This field shows the bill-to customer number.
<b>Customer</b>	This field shows the bill-to customer name.
<b>Company No.</b>	This field shows the number of the company responsible for the current job. The company number is transferred from the window Jobs.
<b>Company</b>	This field shows the name of the company shown in the field "Company No." above.
<b>Settling Company No.</b>	This field shows the number of the settling company that applies to the current job. For further information about the influence of a settling company and how such a company is selected, please see the section "Multiple Companies" in the chapter "Introduction to the G/L Module." Intercompany entries are described in the window Intercompany Accounts in the G/L module.
<b>Settling Company</b>	This field shows the name of the company shown in the field "Settling Company No." above.
<b>Department</b>	This field shows the department associated with the job.

## Actions

This section shows the Actions available in the Job Crediting workspace.

### Top Tab

Field	Description
<b>Print Drafts</b>	This action combines T&M drafts with On Account drafts onto the same blanket draft for jobs with this setup.
<b>Print Credit Memos</b>	Use this action to print credit memos for all jobs whose Include fields are marked in the table part.

## Job Invoices On Account Single Dialogs Workspace

Use this workspace to view information about invoices and credit memos on account that have been printed in Maconomy.

This workspace is closely related to the Invoice Selection workspace, where you can create invoices and credit memos on account. It is also similar to the Display Reconciliation of Job Invoice on Account workspace, where you can trace the exact reconciliation of invoices and credit memos.

In Maconomy, you can create invoices and credit memos, both regular and on account. A regular job invoice can fully or partially reconcile previously printed invoices on account and credit memos on account. In the Invoice Selection workspace, you can specify the amount by which existing invoices on account should be reduced at the next regular invoicing, with the oldest invoices on account being reduced first.

In this workspace, you can specify exactly which invoices or credit memos on account should be reconciled at the next regular job invoicing, and the extent to which they should be reconciled. You can also reconcile both invoices and credit memos with the same invoicing.

The Job Invoices On Account tab displays information about the current job and the amounts that have been invoiced on account up until now. Maconomy also suggests an amount to be reconciled in the next regular invoice.

The Job Invoices On Account sub-tab displays all invoices and credit memos on account that have been invoiced or credited on the job, and the extent to which they have been reconciled. In this sub-tab, you can specify how they should be reconciled at the next invoicing.

### Job Invoices On Account Tab

This section includes the fields and descriptions for the Job Invoices On Account tab.

#### Job Island

Field	Description
<b>Job</b>	This field shows the name and number of the job to which any job invoices or job credit memos on account pertain.

Field	Description
<b>Job Group</b>	This field shows the job group to which the current job is assigned.
<b>Responsible</b>	This field shows the name of the person in the company responsible for the current job.
<b>Department</b>	This field shows the department to which the job is assigned.

#### Invoiced on Account Island

Field	Description
<b>Amount, Net On Account</b>	These fields show the net amount invoiced on account, both for this job, for job collection and the total amount. All amounts are displayed in the job's currency.
<b>Tax, Net On Account</b>	These fields show the net tax invoiced on account, both for this job, for job collection and the total amount. All amounts are displayed in the job's currency.
<b>Approved for reconciliation</b>	These fields show the sum of net on account amounts currently reconciling approved draft invoices of entries for the job, both for this job, for job collection and the total amount. All amounts are displayed in the job's currency.
<b>Net On Account, Fixed</b>	These fields show the net amount invoiced on account included in the fixed price, both for this job, for job collection and the total amount. All amounts are displayed in the job's currency.
<b>Reconciliation, Fixed</b>	<p>In this field, you can specify the amount with which you want to reconcile the fixed price part of the invoice or credit memo on account at the next regular job invoicing. Maconomy suggests the amount that has not yet been reconciled, which is the difference between the amounts in the fields "Amount, Currency" and "Amount Reconciled, Currency." The tax amounts are automatically updated.</p> <p>The field Reconciliation Amount in the table part of the window is automatically updated from changes of the field.</p>
<b>Net On Account, Not Fixed</b>	These fields show the net amount invoiced on account not included in the fixed price, both for this job, for job collection and the total amount. All amounts are displayed in the job's currency.
<b>Reconciliation, Not Fixed</b>	<p>In this field, you can specify the amount with which you want to reconcile the non-fixed-price part of the invoice or credit memo on account at the next regular job invoicing. Maconomy suggests the amount that has not yet been reconciled, which is the difference between the amounts in the fields "Amount, Currency" and "Amount Reconciled, Currency." The tax amounts are automatically updated.</p> <p>The field Reconciliation Amount in the table part of the window is automatically updated from changes of the field.</p>

### Company Island

Field	Description
<b>Company</b>	This field shows the name and number of the company responsible for the current job. For more information, please see the description of the window Jobs.

### Customer island

Field	Description
<b>Ship to Customer</b>	This field shows the number of the customer who has ordered the job. Below it is the first line of the customer's name, which is retrieved from the window Customer Information Card.
<b>Bill to Customer</b>	This field shows the number of the customer who is being invoiced for the job. Below it is the first line of the customer's name, which is retrieved from the window Customer Information Card. Please note that in case of split billing there may be several bill-to customers on the job.

### Payment Island

Field	Description
<b>Payment Terms</b>	This field shows the payment terms that apply to the invoices created for this job. Payment terms are chosen in the window Job Information.
<b>Blanket Invoice</b>	If this field is marked, the invoices made for the current job are to be blanket invoiced, that is, invoice lines for the same customer are joined on one invoice. Maconomy retrieves the value from the window Job Information.
<b>Tax</b>	This field shows whether the invoices created for the current job are subject to tax. Maconomy retrieves the value from the window Job Information.
<b>Currency</b>	This field shows the currency of the invoice. Maconomy retrieves the value from the window Job Price Information.

### Job Collection Island

Field	Description
<b>Job Collection</b>	This field shows the name and number of the job collection for jobs included in a job collection. The field is also displayed in the Jobs and Blanket Invoice Overview windows.
<b>Shares On Account</b>	A check mark in this field indicates that an invoice on account belongs to a job that shares its invoices on account with other jobs and some of those other jobs have an approved invoice selection.

## Settling Company Island

Field	Description
<b>Settling Company</b>	<p>This field shows the name and number of the settling company that applies to the current job.</p> <p>For further information about the influence of a settling company and how such a company is selected, please see the section “Multiple Companies” in the chapter “Introduction to the G/L Module.”</p>

## Job Invoices On Account Sub-Tab

This section includes the fields and descriptions for the Job Invoices On Account sub-tab.

Field	Description
<b>Invoice No.</b>	This field shows the number of the current job invoice on account or job credit memo on account.
<b>Invoice Date</b>	This field shows the date of the current job invoice on account or job credit memo on account.
<b>Invoice Name</b>	This field shows the name of the current job invoice on account or job credit memo on account.
<b>Debit/Credit</b>	This field shows if the current table line concerns a job invoice on account or a job credit memo on account. If the contents of the field is “Debit,” it is an invoice on account; if the contents of the field is “Credit,” it is a credit memo on account
<b>Amount, Currency</b>	This field shows the amount invoiced or credited on account in the job’s currency, excluding tax.
<b>Incl. in Fixed Price</b>	A check mark in this field indicates that the invoice on account is included in the fixed price of the job.
<b>Settled</b>	This field shows if the current invoice or credit memo on account is fully reconciled.
<b>Reconciliation Amount</b>	<p>In this field, you can specify the amount with which you want to reconcile the invoice or credit memo on account at the next regular job invoicing. Maconomy suggests the amount that has not yet been reconciled, which is the difference between the amounts in the fields “Amount, Currency” and “Amount Reconciled, Currency.” The tax amounts are automatically updated.</p> <p>If the current job is a fixed-price job, and the job parameter attributes “Create Invoice Upon Job Closing” and “Allow Invoicing On Account Only” are both assigned the value “Yes” for the job in question, this field cannot be changed as invoices on account for such jobs are always reconciled when the job is closed.</p>
<b>Reconciled Amount, Currency</b>	This field shows any amount which may have been reconciled previously on the current invoice or credit memo on account.

Field	Description
<b>Shared From Job No.</b>	This field shows which job in the job collection shares this invoice on account.
<b>Approved for Reconciliation, Currency</b>	This field shows the sum of net on account amounts currently reconciling approved draft invoices of entries.
<b>Available for Reconciliation, Currency</b>	This field shows the amount currently available for further reconciliation of invoices. This is the amount invoiced on account less the sum of amounts that have been reconciled plus the sum of amounts currently reconciling approved draft invoices.
<b>Currency</b>	This field shows the currency of the job.
<b>Tax, Currency</b>	<p>This field shows the tax amount of the invoice or credit memo on account in the job's currency.</p> <p>If multiple tax codes are enabled, the "Tax, Currency" field will be replaced by the following fields: "Total Tax, Currency," "Tax 1, Currency," "Tax 2, Currency," and, if three tax levels are enabled, "Tax 3, Currency." The "Total Tax, Currency" field calculates the sum of the other individual tax amount fields. For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Reconciliation Tax</b>	This field shows the tax amount to be reconciled on the current invoice or credit memo on account.
<b>Tax Reconciled, Currency</b>	<p>This field shows any tax amount which may have been reconciled previously on the current invoice or credit memo on account.</p> <p>If multiple tax codes are enabled, the "Tax Reconciled, Currency" field will be replaced by the following fields: "Total Tax Reconciled, Currency," "Tax 1 Reconciled, Currency," "Tax 2 Reconciled, Currency," and, if three tax levels are enabled, "Tax 3 Reconciled, Currency." The "Total Tax, Currency" field calculates the sum of the other individual tax amount fields. For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Tax Approved for Reconciliation, Currency</b>	This field shows the sum of net on account tax currently reconciling approved draft invoices of entries.
<b>Invoice Currency</b>	This field shows the currency of the invoice on account. Notice that the invoice currency may be different from the currency specified for the job.
<b>Amount, Invoice Currency</b>	This field shows the amount which was printed on the invoice on account, specified in the currency of the invoice. Notice that the invoice currency may be different from the currency specified for the job.

Field	Description
<b>Quantity</b>	This field shows the quantity that is transferred from on account selection.
<b>Due Date</b>	This field shows the due date of the invoice or credit memo on account.
<b>Printing Date</b>	This field shows when the invoice or credit memo on account was printed.
<b>Printed by</b>	This field shows the name of the user who printed the invoice or credit memo on account.
<b>Bill to Customer</b>	This field shows the name of the bill-to customer assigned to the current invoice or credit memo on account. The relative distribution of job entries on several bill-to customers is called split billing and is defined in the window Bill to Customer Distribution.
<b>Appropriation</b>	This field shows the appropriation of the current bill-to customer. An appropriation is an indication of the customer's source of funding for the job. A customer may, for example, be funding the job via grants from government bodies, and the type of funding for the current invoice or credit memo on account is shown in this field. The appropriation is entered in the window Bill to Customer Distribution.
<b>Being Reopened</b>	This field shows that currently a draft invoice or credit memo has been approved, which will reopen some or all of the amount invoiced on this invoice on account.
<b>Being Reopened from Job No.</b>	This field shows the job number for which a draft invoice or credit memo has currently been approved. This will reopen some or all of the amount invoiced on this invoice on account.
<b>Being Credited</b>	This field shows that currently an approved draft credit note exists so that some or all of the amount invoiced on this invoice on account will be reopened.
<b>Job No.</b>	This field shows the number of the job to which any job invoices or job credit memos on account pertain.
<b>Task</b>	This field shows the name of the task specified on the invoice on account.
<b>Task Description</b>	This field contains a description of the task specified on the invoice on account.
<b>Allocation Group</b>	For jobs set up with detailed job invoice allocation, this field shows the allocation group for the underlying job entries for the line.
<b>Activity No.</b>	This field shows the number of the activity on the invoice on account.
<b>Activity Name</b>	This field shows the name of the activity on the invoice on account.

Field	Description
<b>Invoice Allocation</b>	This field indicates whether the amount for invoicing on account on the activity number is available for invoice allocation in the window Job Invoice Allocation.
<b>Activity Type</b>	This field shows the type of the activity on the invoice on account.
<b>Exchange Rate</b>	This field shows the exchange rate between the currency of the job and the invoice currency on the invoice on account at the time of invoicing.
<b>Employee No.</b>	If the activity number on the invoice on account is of the type Time, then an employee is also specified. This field shows the number of the employee specified on the invoice on account.
<b>Employee Name</b>	This field shows the name of the employee.
<b>Text 1-5</b>	This field shows the text fields that are transferred from on account.

## Actions

This section shows the Actions available in the Job Invoices On Account workspace.

### Top Tab

Field	Description
<b>Reconcile All</b>	When you select this action, any changes in the field "Reconciliation Amount" are canceled, and all invoices on account and credit memo on account are changed to full reconciliation. This means that the field "Reconciliation Amount" is set to equal the amount in the field "Amount, Currency," less the amount in the field "Amount Reconciled, Currency" on every line. The tax amounts are adjusted accordingly. At the same time, the field "On Account Reduction" in the card part is updated to show the sum of the values in the field "Reconciliation Amount," and this amount is transferred to the field "On Account Reduction" in the window Invoice Selection.

## Job Invoice Allocation Single Dialogs Workspace

Use this workspace to match and allocate job entries against invoices on account.

This is similar to the process of creating a zero invoice, but with the difference that no invoice is created.

The Job Invoice Allocation tab displays information about a job and information that is relevant for job invoice allocation. The Job Invoice Selection Lines sub-tab provides detailed information about the job entries that are included in the fixed price.

Job invoice allocation is an internal process, primarily used to ensure that entries and invoices on account are closed properly. The process affects only job entries and invoices on account that are

included in the fixed price, and is only available for jobs that have been set up for invoice allocation.

All of the amounts in the workspace are shown in the currency of the job.

VAT is not considered.

For main jobs that you set up with main job invoicing, this workspace includes entries from sub-jobs.

For a job that has been set up to use job invoice allocation to handle the fixed price (or retainer) part of the job, the actual allocation takes place in one of the following ways:

- You can set up jobs so that the job invoice allocation takes place as part of job closure. With this setup, you can close a fixed-price job when the fixed price equals the amount invoiced. If the revenue recognized differs from the fixed price, Maconomy generates a revenue adjustment for the difference. This revenue adjustment uses the standard task for revenue recognition set up on the job's task list.
- You can manually select the invoices on account and job entries for allocation, then submit and approve the job invoice allocation using the actions that are available in this workspace.
- You can run the allocation process for jobs in batch.

## Job Invoice Allocation Tab

This section includes the fields and descriptions for the Job Invoice Allocation tab.

### Job Island

Field	Description
<b>Job</b>	This field shows the name and number of the job to which any job invoices or job credit memos on account pertain.
<b>Job Group</b>	This field shows the job group to which the current job is assigned.
<b>Status</b>	<p>This is the current job status. When the job is created, it has "Quote" status, unless you have marked the "Created as Order" field in the window System Information. It is then only possible to make quotes from it, not invoices. This is done in the window Quote Editing.</p> <p>If the field "Created as Order" in the window System Information is marked, jobs are created with "Order" status, but only if the current user has been given access to convert jobs to orders in the window Actions in the Set-Up module.</p>
<b>Project Manager</b>	This field shows the name of the project manager of the job.
<b>Responsible</b>	This field shows the name of the person in the company responsible for the current job.

### Status Island

Field	Description
<b>Submitted</b>	A check mark in this field shows if the invoice allocation on the job has been submitted.
<b>Submitted by</b>	If the invoice allocation on the job has been submitted, this field shows the name of the employee who submitted it.
<b>Submitted Date</b>	If the invoice allocation on the job has been submitted, this field shows the date when it was submitted.
<b>Task Group Status</b>	This field shows the status of the task group.

### Fixed Price Island

Field	Description
<b>Invoiced on Account</b>	This field shows the amount (fixed price) invoiced on account.
<b>Fixed price</b>	This field shows the fixed price of the job.
<b>Fixed Price Basis</b>	This field shows the fixed price (basis) of the job (either Budget or Quote).
<b>Fixed Price Budget Type</b>	This field shows the budget type that determines the fixed price.

### Job Revenue Recognition Island

Field	Description
<b>Date</b>	This field shows the date of the last revenue recognition.
<b>Percentage</b>	This field shows the percentage of revenue recognized.
<b>Amount</b>	This field shows the amount of revenue recognized on the job as of the date specified in the field "Date" above.

### Customer Island

Field	Description
<b>Customer</b>	This field shows the number of the customer who has ordered the job. Below it is the first line of the customer's name, which is retrieved from the window Customer Information Card.
<b>Bill to Customer</b>	This field shows the number of the customer who is being invoiced for the job. Below it is the first line of the customer's name, which is retrieved from the window Customer Information Card. Please note that in case of split billing

Field	Description
	there may be several bill-to customers on the job. The table part shows the name of each bill-to customer assigned to the job.

**Company Island**

Field	Description
<b>Company</b>	This field shows the name and number of the company responsible for the current job.
<b>Base Currency</b>	This field shows the base currency of the company to which the job belongs.

**Allocation Island**

Field	Description
<b>Preferred Date</b>	In this field, enter the date you want the invoice allocation to take place.
<b>Close Job</b>	Place a check mark in this field to have Maconomy close the job when you approve the invoice allocation.
<b>Amount for Allocation</b>	<p>This row of fields shows the following amounts:</p> <ul style="list-style-type: none"> <li>On Account — This is the amount for allocation (reconciliation) on the invoices on account on the job. You can change this amount and let Maconomy set the amount for reconciliation on the open invoices on account accordingly.</li> <li>Job Entries — This is the amount for allocation on the selected job entries on the job. The field is closed for editing.</li> <li>Balance — This shows the difference between the two other fields. You can only submit the job invoice allocation if the balance is zero.</li> </ul>
<b>Open Amount</b>	<p>This row of fields shows the following amounts:</p> <ul style="list-style-type: none"> <li>On Account — This is the amount net on account on the job.</li> <li>Job Entries — This is the total open billing price on the job. The amount includes job entries on subjobs that are set up to be invoiced on the main job.</li> <li>Balance — This shows the difference between the two other fields.</li> </ul>
<b>Open Amount, Base</b>	<p>This row of fields shows the following amounts, in base currency.</p> <ul style="list-style-type: none"> <li>On Account — This is the amount net on account on the job.</li> <li>Job Entries — This is the total open billing price on the job. The amount includes job entries on subjobs that are set up to be invoiced on the main job.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Balance — This shows the difference between the other two fields.</li> </ul>
<b>Write Up/Down</b>	<p>This row of fields shows the write up/-down on the job. It only includes job entries that are closed through job invoice allocation. The following amounts are shown in the three columns:</p> <ul style="list-style-type: none"> <li>To Date — This is the current amount (to date).</li> <li>Change — This shows the change after the job invoice allocation has been approved.</li> <li>Total — This is the total amount after the changes.</li> </ul>
<b>Allocated Billing Price</b>	This row of fields show the allocated billing price of the job entries with three different amounts; see the description for the field “Write Up/Down” above.
<b>Allocated Cost, Base</b>	This row of fields show the allocated billing price (at cost price) of the job entries with three different amounts; see the description for the field “Write Up/Down” above.

#### Last Allocation Island

Field	Description
<b>Allocation No.</b>	This field shows the number of the last job invoice allocation.
<b>Allocation Date</b>	This field shows the date of the last job invoice allocation.
<b>Submitted By</b>	This field shows who submitted the last job invoice allocation.
<b>Submitted Date</b>	This field shows when the last job invoice allocation was submitted.
<b>Approved By</b>	This field shows who approved the last job invoice allocation.
<b>Approved Date</b>	This field shows when the last job invoice allocation was approved.
<b>Allocated Amount</b>	This field shows the amount of the last job invoice allocation.

#### Selection Criteria Island

Field	Description
<b>Only Open Activities</b>	Mark this field if you want the table part to show lines with only open entries.

**Revert Island**

Field	Description
<b>Job Invoice Allocation No.</b>	In this field you can enter the number of a previous Job Invoice Allocation for the job. To revert the allocation with this number, run the action "Revert" from the Action menu.

**Move Entries Island**

Field	Description
<b>Date of Movement</b>	This field controls the date of the reallocation used by the actions Move Entries To Invoicing and Move Entries From Invoicing.  If no date is entered, the entries will be moved without changing the entry date. However, the entries may not be within the open posting period and you may therefore have to enter a date of movement (similar to Date of Reallocation).
<b>Move Entries Excluded from the Fixed Price</b>	By default the Move Entries from Invoicing action only moves entries that, according to the setup, should be included in the fixed price. However, you can override this by marking the Move Entries Excluded From Fixed Price field.

**Job Collection Island**

Field	Description
<b>Job Collection</b>	If the job belongs to a job collection, this field shows the description and number of that job collection.

## Job Invoice Selection Lines Sub-Tab

This section includes the fields and descriptions for the Job Invoice Selection Lines sub-tab.

Field	Description
<b>Allocate Quantity</b>	In this field, you can enter the quantity to allocate when the allocation is approved.  If the job parameter attribute "Allow Write-Up/Down at Transfer of Billing Price Only" of the type "Write-Up/Down" is not marked, you can change the number if you wish to allocate fewer or more than the registered quantity (that is, write the job up or down). If you change it, Maconomy will recalculate the field "Billing Price for Allocation."
<b>Billing Price for Allocation</b>	In this field, you can enter the activity billing price for allocation. Maconomy suggests the sum of the billing prices from open entries on the job.
<b>Markup</b>	In this field, you can enter or change the markup amount for the current line. The field "Close Entries" must be marked. Maconomy suggests the difference between the cost and the billing price of the current table line.

Field	Description
	When you change this field and press Return, the fields "Billing Price for Allocation" and "Markup %" on the current line are updated, and the fields relating to the desired sales price in the card part are updated as well to reflect the new billing price to allocate.
<b>Markup %</b>	In this field, you can enter or change the markup percentage for the current line. The field "Close Entries" must be marked. Maconomy suggests the percentage which corresponds to the difference between the cost and the billing price of the current table line. When you change this field and press Return, the fields "Billing Price to Inv." and "Markup" on the current line are updated, and the fields relating to the desired sales price in the card part are updated as well to reflect the new billing price to allocate.
<b>Close Entries</b>	<p>The functionality of this field depends on whether the field "Dir. Inv." is marked and whether the system parameter "Allow over invoicing" has been marked in the Set-Up module. If this parameter has not been marked, the field "Close Entries" cannot be unmarked. Furthermore, if the job parameter attribute "Allow Write-Up/Down at Transfer of Billing Price Only" of the type "Write-Up/Down" is marked for the current job, this field can only be selected if doing so does not give rise to any write-up or write-down of the job.</p> <ul style="list-style-type: none"> <li>■ If the field "Dir. Inv." (Direct Invoicing) is not marked — Mark the field "Close Entries" if you want all underlying job registrations to be closed when you approve the allocation. The field "Close" will be marked accordingly on all the underlying job registrations, which can be seen in the window Itemize Invoice Selection. If you mark this field, all open entries will be allocated and closed. If you do not mark this field, the underlying entries will be closed until the quantity specified in the field "Invoice Quantity" or "Billing Price to Inv.," with the oldest entries being selected for allocation first. If the quantity exceeds the open entries, an entry for direct invoicing is created in the window Itemize Invoice Selection.</li> <li>■ If the field "Dir. Inv." (Direct Invoicing) is marked — If the field "Close Entries" is marked, an entry for allocation is created and then closed. Any job entries with the same allocation combination in the window Itemize Invoice Selection are not closed, but are excluded from the allocation, as the quantity to allocate and the billing price to be allocated are always set to zero. If you do not mark this field, the open billing price for the current allocation combination will be negative next time you create an allocation. For further information, please see the description of the field "Close" in the window Itemize Invoice Selection.</li> </ul>
<b>Without Registrations</b>	This field is used for choosing allocations without underlying job registrations. If you mark this field, you can enter quantity and billing price, irrespective of open job entries, and these will not be affected by the invoicing or crediting. When you mark this field, the field "Close Entries" is

Field	Description															
	<p>automatically marked too, but you can remove that mark manually if the system parameter “Allow over invoicing” has been marked in the Set-Up module.</p> <p>You can also enter a negative quantity and a negative credit memo amount for allocation, that is, crediting without underlying job registrations.</p> <p>When you enter manual activity lines for which there are no job entries, Maconomy will mark this field automatically.</p>															
Action	<p>This pop-up field serves two purposes: It tells you at a glance what the effect of the selections on the current line is, and it is a shortcut to performing various common operations on the line. A corresponding field exists for all underlying job entries in the window Itemize Invoice Selection.</p> <p>The “Action” field reflects the value of the fields “Billing Price to Allocate” and “Close Entries” on the current line. However, if the current job is a time and material job, the value suggested is the one specified in the attribute “Standard invoicing action for job entries on time and material jobs” in the job parameter Registration.</p> <p>This field can have four values. You can change a field on the line manually to see the effect in this field, or you can change this field to change the other fields automatically. The following table shows the available options.</p> <table><tr><th>Billing Price to Allocate</th><th>Close Entries</th><th>Action</th></tr><tr><td>&gt;0</td><td>Yes</td><td>Invoice</td></tr><tr><td>0</td><td>Yes</td><td>Write Off</td></tr><tr><td>0</td><td>No</td><td>Carry Forward</td></tr><tr><td colspan="2">Other Combinations</td><td>Blank</td></tr></table> <p>The following section describes the effect of selecting the different values in this field. Note that if you select a value that does not have any effect (such as “Invoice” when there is nothing to invoice), the value will revert back to reflect what will actually take place when you approve the invoice selection.</p> <ul style="list-style-type: none"><li>■ Invoice — If you select this value on a line where the billing price to invoice is greater than zero, the field “Close Balance” is marked on the current line. This means that all open entries to the current job allocation combination are closed when you approve and print the invoice; the line is invoiced in full. For more information, please see the description of the field “Close Balance.”</li><li>■ Write Off — If you select this value, the field “Close Balance” is marked on the current line, and the fields “Invoice Quantity” and “Billing Price to Inv.” are reset to zero. This means that all open entries to the current job allocation combination are closed when you approve and print the invoice, but nothing is invoiced; the line is</li></ul>	Billing Price to Allocate	Close Entries	Action	>0	Yes	Invoice	0	Yes	Write Off	0	No	Carry Forward	Other Combinations		Blank
Billing Price to Allocate	Close Entries	Action														
>0	Yes	Invoice														
0	Yes	Write Off														
0	No	Carry Forward														
Other Combinations		Blank														

Field	Description
	<p>written off completely, and the job is written down by the current line's amount. Note that this action cannot be selected if the job parameter attribute "Allow Write-Up/Down at Transfer of Billing Price Only" of the type "Write-Up/Down" is marked for the current job.</p> <ul style="list-style-type: none"> <li>■ <b>Carry Forward</b> — If you select this value, any mark in the field "Close Balance" is removed on the current line, and the fields "Invoice Quantity" and "Billing Price to Inv." are reset to zero. This means that nothing is invoiced on the current line when you approve and print the invoice, but the balance is not closed—that is, the balance is carried forward, and the job entry will reappear at the next invoicing.</li> </ul>
<b>Reallocate</b>	If you mark this field, all open, underlying job entries are marked for reallocation. When an allocation line is marked for reallocation, it cannot be allocated. The same applies if any of the underlying job entries is marked in the window Itemize Job Invoice Allocation. The quantity and amount for allocation is reset to zero, and any mark in the fields "Close Entries" and "Without Registrations" is removed.
<b>Remarks</b>	In this field, you can enter a remark to describe the current job invoice allocation line. This could, for example, be a note about the reason for writing down an entry. The remark entered in this field is copied to all underlying job entries and can be seen in the window Itemize Job Invoice Allocation. If any remarks have already been entered in that window for the individual job entries, they are overwritten by the remark in this field. If a remark is changed in the window Itemize Job Invoice Allocation so that there are different remarks for each job entry, the "Remarks" field in this window is blanked for that allocation line.
<b>Task Name</b>	<p>This field shows the name of a task if the current invoice layout rule specifies that the invoice selection should be summed by task.</p> <p>There is only one line per task, which means that all task entries are summed in the table part of this window. For this reason, this field cannot be changed on existing lines, but it is possible to create a line and enter a task name in this field. If you want to create a line for direct invoicing using the same task name, this must be done in the window Itemize Job Invoice Allocation, where the underlying job entries can be seen.</p>
<b>Task Description</b>	This field shows the task description which was entered when the task was created.
<b>Allocation Group</b>	For jobs set up with detailed job invoice allocation, this field shows the allocation group for the underlying job entries for the line.
<b>Activity No.</b>	This field shows the number of an activity if the current invoice layout rule specifies that the allocation should be summed by activity.
<b>Activity Name</b>	This is the activity text which was entered when the activity was created in the window Activities.

Field	Description
<b>Empl. No.</b>	This field must be completed for time activities if you mark the field "Without Registrations." Maconomy automatically suggests the employee specified in the system parameter "Employee No. for direct invoicing." The employee number is transferred to the job entry created when the job is invoiced.
<b>Employee Name</b>	This field displays the name of the employee entered in the field "Empl. No."
<b>Employee Category No.</b>	This field shows the employee category number for the entries summed up on the invoice allocation line.
<b>Employee Category Name</b>	This field shows the name of the employee category specified in the Employee Category No. field above.
<b>Open Quantity</b>	This field shows the number of units that has been entered but not yet allocated or closed. The number, which cannot be changed in this window, is the sum of the "Quantity, Open" values for the entries in the window Itemize Job Invoice Allocation.
<b>Open Billing Price</b>	This field shows the open billing price, that is, the sum of the prices of the number of entered units that have not yet been allocated or closed. This amount, which cannot be changed in this window, is the sum of the "Billing Price, Open" values for the entries in the Itemize Job Invoice Allocation window.
<b>Allocated Quantity</b>	This field shows the quantity of previous job invoice allocations thus the already allocated part of the quantity on the line.
<b>Allocated Amount</b>	This field shows the amount of the last job invoice allocation.
<b>Quantity, Total</b>	This field shows the total quantity that can be allocated when the allocation has been approved. It is the sum of the "Quantity Inv." and "Allocate Quantity" fields.
<b>Billing Price, Total</b>	This field shows the total billing price when the allocation has been approved. It is the sum of the "Billing Price, Allocated" and "Billing Price for Allocation" fields.
<b>Budgeted Quantity</b>	This field shows the total quantity from the budget type selected as the current budget in the Job Budgets window.
<b>Budgeted Billing Price</b>	This field shows the total billing price from the budget type selected as the current budget in the Job Budgets window.
<b>Quantity, Reg.</b>	This field shows the quantity that has been entered.

Field	Description
<b>Billing Price, Reg.</b>	This field shows the total registered billing price, that is, the sum of the billing prices registered to the individual entries.
<b>Quantity, Up/Down, To Date</b>	This field shows the write-up/-down quantity already allocated for the activity until today's date. Write-up and write-down are the differences between the registered quantity and the allocated quantity. Write-ups are shown as positive figures, and write-downs as negative figures.
<b>Billing Price, Up/Down, To Date</b>	This field shows the write-up/-down billing price already allocated for the activity until today's date. Write-up and write-down are the differences between the registered billing price and the allocated billing price. Write-ups are shown as positive figures, and write-downs as negative figures.
<b>Quantity, Up/Down, Selection</b>	This field shows the potential write-up/-down quantity resulting from allocating the current job invoice allocation. Write-up and write-down are the differences between the registered quantity and the allocated quantity. Write-ups are shown as positive figures, and write-downs as negative figures.
<b>Sales Price, Up/Down, Selection</b>	This field shows the potential write-up/-down sales price resulting from allocating the current job invoice allocation. Write-up and write-down are the differences between the registered sales price and the allocated sales price. Write-ups are shown as positive figures, and write-downs as negative figures.
<b>Quantity, Up/Down, Total</b>	This field shows the total write-up/-down quantity for the job after allocating the current job invoice allocation. Write-up and write-down are the difference between the registered quantity and the allocated quantity. Write-ups are shown as positive figures, and write-downs as negative figures.
<b>Sales Price, Up/Down, Total</b>	This field shows the total write-up/-down sales price for the job after allocating the current job invoice allocation. Write-up and write-down are the difference between the registered sales price and the allocated sales price. Write-ups are shown as positive figures, and write-downs as negative figures.
<b>Location</b>	The functionality of this field is similar to that of the field "Task Name" above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Task Name" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Task Name" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Task Name" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Task Name" above.

Field	Description
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Task Name” above.
<b>Task Group 1-6</b>	The functionality of these fields is similar to that of the field “Task Name” above. Task groups are used for reflecting the work breakdown structure of the job budget in the invoice selection.  For further information on work breakdown structure and task groups, see the descriptions under “Job Tasks” and under “Job Budgets.”

## Itemize Job Invoice Allocation Single Dialogs Workspace

Use this workspace to view the details of job invoice allocations at the level of individual job entries.

The Itemize Job Invoice Allocation tab displays the same information as a line in the Job Invoice Allocation workspace. In the sub-tab of the Job Invoice Allocation workspace, the lines are summed up based on the invoice layout rule selected for the current job, whereas the Job Entries sub-tab in this workspace displays the individual job entries that correspond to the line in the Itemize Job Invoice Allocation tab in this workspace.

### Itemize Job Invoice Allocation Tab

This section includes the fields and descriptions for the Itemize Job Invoice Allocation tab.

#### Job Invoice Allocation Line Island

Field	Description
<b>Job</b>	This field shows the name and number of the job to which the job entries in the table are entered.
<b>Activity No.</b>	This field shows the number of an activity if the current invoice layout rule specifies that the allocation should be summed by activity.
<b>Activity Name</b>	This field shows the activity text entered for the activity in the window Activities.
<b>Task</b>	The functionality of this field is similar to that of the field “Activity No.” above.
<b>Task Description</b>	This field shows the task description which was entered when the task was created.
<b>Empl. No.</b>	This field must be completed for time activities if you mark the field “Without Registrations.” Maconomy automatically suggests the employee specified in the system parameter “Employee No. for direct invoicing.” The employee number is transferred to the job entry created when the job is invoiced.
<b>Employee Name</b>	This field displays the name of the employee entered in the field “Empl. No.”

Field	Description
<b>Employee Category No.</b>	This field shows the employee category number for the entries summed up on the invoice allocation line.
<b>Employee Category</b>	This field shows the name of the primary employee category.
<b>Task Group 1-6</b>	The functionality of these fields is similar to that of the field "Activity No." above. For further information on work breakdown structures and task groups, see the descriptions under "Job Tasks" and under "Job Budgets."

#### Job Invoice Allocation Line, Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Activity No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Activity No." above.

#### Job Invoice Allocation Island

Field	Description
<b>Open</b>	<p>The "Quantity" column shows how many units have been entered to the activity, but which have not been invoiced. The "Billing Price" column shows the total billing price entered but not yet invoiced.</p> <p>The open quantity is the sum of the values in the "No., Open" fields in the table. The open billing price is the sum of the values in the "Billing Price, Open" fields in the table.</p>
<b>For Allocation</b>	<p>The "Quantity" column shows how many units are selected for allocation. The "Billing Price" column shows the billing price selected for allocation.</p> <p>The quantity to be allocated is the sum of the values in the "Invoice Quantity" fields in the table. The billing price to be allocated is the sum of the values in the "Billing Price for Allocation" fields in the table.</p>

Field	Description
<b>Prev. Allocated</b>	<p>The “Quantity” column shows how many units have already been allocated for the job. The “Billing Price” column shows how much has been allocated for the job activity.</p> <p>The previously allocated quantity is the sum of the values in the “Quantity Allocated” fields in the table, and the billing price is the sum of the values in the “Billing Price, Allocated” fields.</p>
<b>Total</b>	<p>The “Quantity” column shows how many units of the activity have been selected for allocation and previously allocated. The “Billing Price” column shows how much has been selected for allocation and previously allocated for the job.</p>
<b>Budget</b>	<p>The “Quantity” column shows the budgeted quantity for the job. The “Billing Price” column shows the budgeted billing price of the job activity.</p> <p>Job budgets are made in the window Job Budgets.</p>
<b>Entered</b>	<p>The “Quantity” column shows how many units of the activity have been entered to the job. The “Billing Price” column shows the billing price sum of the quantity entered.</p>

#### Without Registrations Island

Field	Description
<b>Without Registrations</b>	<p>This field is used for choosing allocations without underlying job registrations. If you mark this field, you can enter quantity and billing price, irrespective of open job entries, and these will not be affected by the invoicing or crediting. When you mark this field, the field “Close Entries” is automatically marked too, but you can remove the mark manually if the system parameter “Allow over invoicing” has been marked in the Set-Up module.</p> <p>You can also enter a negative quantity and a negative credit memo amount for allocation, that is, crediting without underlying job registrations.</p> <p>When you enter manual activity lines for which there are no job entries, Maconomy will mark this field automatically.</p>

#### Up/Down Island

Field	Description
<b>To Date</b>	<p>These fields show the write-up/-down quantity and billing price allocated for the activity until today’s date.</p> <p>Write-up and write-down are the differences between the registered quantity and the allocated quantity. Write-ups are shown as positive figures, and write-downs as negative figures.</p>
<b>Selection</b>	<p>These fields show the write-up/-down quantity and billing price resulting from allocating the current job invoice allocation that has been transferred for allocation in the table part.</p>

Field	Description
	Write-up and write-down are the differences between the registered quantity/amount and the allocated quantity/amount. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Total</b>	<p>These fields show the total write-up/-down quantity and billing price for the job after allocating the current job invoice allocation that has been transferred for allocation in the table part.</p> <p>Write-up and write-down are the differences between the registered quantity/amount and the allocated quantity/amount. Write-ups are shown in positive figures, and write-downs in negative figures.</p>

### Selection Criteria Island

Field	Description
<b>Entries within selection criteria only</b>	<p>If the system parameter “Keep delimitation when changing invoice selection” is selected, any delimitations made in the window Job Invoice Allocation are preserved in this window. This means that if, for example, you select a certain cut-off date in the window Job Invoice Allocation and carry out an allocation action, that action will only affect the underlying entries identified by the delimitation.</p> <p>If you mark this field, and the system parameter mentioned above is selected, the table part only shows the entries identified by the delimitation made in the window Job Invoice Allocation. If you remove the mark, the table part shows all entries.</p>

### Job Entries Sub-Tab

This section includes the fields and descriptions for the Job Entries sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number of the current job entry. If the current job in the card part is a main job, and the job's invoice layout rule is marked in the fields “Main Job Invoicing” and “Main Job Invoice Selection,” the lines in the table part may derive from subjobs of the main job. It is not possible to enter job entries that are not included in the fixed price.
<b>Date</b>	This field shows the date on which the job entry was entered. It cannot be changed on existing lines. However, you can enter a date when manually creating a line.
<b>Description</b>	This is the entry text. It cannot be changed. However, you can enter a description when manually creating a line.
<b>Empl. No.</b>	<p>This is the number of the employee registered on the job entry.</p> <p>This field must be completed if the field “Direct Inv.” has been marked, and the activity on the line is a time activity. Maconomy will automatically</p>

Field	Description
	suggest the employee specified in the system parameter “Employee No. for direct invoicing.” You cannot change the field on existing lines.
<b>Allocate Quantity</b>	If the job parameter attribute “Allow Write-Up/Down at Transfer of Billing Price Only” of the type “Write-Up/Down” is not marked for the current job, you can change how many units of the activity you wish to allocate in this field. The job entry is invoiced when you approve and print the allocation in the window Job Invoice Allocation. Maconomy suggests the quantity you entered when the job entry was entered.
<b>Billing Price, Unit</b>	In this field, you enter the activity’s billing price per unit. Maconomy suggests the billing price per unit entered for the entry. If the job parameter attribute “Allow Write-Up/Down at Transfer of Billing Price Only” of the type “Write-Up/Down” is not marked for the current job, you can change the value here if you wish to allocate another price to the customer.
<b>Billing Price for Allocation</b>	This field shows how much you are allocating for invoicing when the invoice allocation is approved in the window Job Invoice Allocation. The billing price here is calculated as the “Billing Price, Unit” multiplied by the “Allocate Quantity.”
<b>Allocate</b>	This field shows whether the current job entry has been selected for invoice allocation. If you remove the mark in this field, the value in the field “Allocate Quantity” is reset to zero.
<b>Close</b>	In this field, you can specify whether the entry is to be closed when the allocation selection is approved and allocated. If you mark this field, the entry will be closed, which means that you cannot allocate it again. If the quantity or price to allocate is greater than what was originally entered, Maconomy will calculate the up- or down-written amount when allocation takes place. The result can be seen in the card part of this window after allocation has taken place. If you unmark this field on manually created lines, the job entry will not be closed on allocation. You can use this functionality if you wish to allocate a specific amount before the work has actually been registered. If you leave this field marked, no cost is transferred from the employee or activity. You can use this functionality to allocate without registering activities.
<b>Action</b>	This pop-up field serves two purposes: It tells you at a glance what the effect of the selections on the current line is, and it is a shortcut to performing various common operations on the current line. A corresponding field exists for the current allocation line in the window Job Invoice Allocation (the sum of the job entries in the table part of this window). If you change the value of this field, the value of the corresponding field in the window Job Invoice Allocation is reset to the blank value. You can choose from the following values in this field:

Field	Description
	<ul style="list-style-type: none"> <li>■ Invoice — If you select this value, the fields “Close” and “Allocate” are marked on the current line. This means that the open entry is closed when you approve the allocation in the window Job Invoice Allocation, and the line is allocated in full.</li> <li>■ Write Off — If you select this value, the fields “Close” and “Allocate” are marked on the current line, and the fields “Allocate Quantity” and “Billing Price for Allocation” are reset to zero. This means that the current, open job entry is closed when you approve the allocation in the window Job Invoice Allocation, but nothing is allocated; the line is written off completely, and the job is written down by the current line’s amount. Note that this action cannot be selected if the job parameter attribute “Allow Write-Up/Down at Transfer of Billing Price Only” of the type “Write-Up/Down” is marked for the current job.</li> <li>■ Carry Forward — If you select this value, any marks in the fields “Close” and “Allocate” are removed on the current line, and the fields “Allocate Quantity” and “Billing Price for Allocation” are reset to zero. This means that nothing is allocated on the current line when you approve the allocation in the window Job Invoice Allocation, but the balance is not closed; that is, the balance is carried forward, and the job entry will reappear at the next allocation.</li> </ul>
<b>Proposed Quantity</b>	This field displays the proposed allocation by the project manager in the Approve Expense Sheet Lines window. If the job entry only covers a job surcharge amount, the value in the field will be 1. This value is identical to the initial value in the Invoice Quantity field.
<b>Proposed Billing Price, Unit</b>	This field displays the unit billing price proposed by the project manager in the Approve Time Sheet Lines or Approve Expense Sheet Lines window. The amount includes applicable job surcharges, if any.
<b>Proposed Billing Price, Total</b>	This field displays the total billing price proposed by the project manager in the Approve Time Sheet Lines or Approve Expense Sheet Lines window. The amount includes applicable job surcharges, if any.
<b>Use Invoice Proposal</b>	This check box shows whether the quantity and billing price in the “Proposed Quantity,” “Proposed Billing Price, Unit,” and “Proposed Billing Price, Total” fields will be used for allocation. If the project manager or employee has approved the values in these three fields, this check box will be marked, which means that the values in the three fields will be used for allocation. If this check box is not marked, this indicates that the values from the fields “Invoice Quantity,” “Billing Price, Unit,” and “Billing Price for Allocation” will be used for the allocation.
<b>Reallocate</b>	If you mark this field, all open, underlying job entries are marked for reallocation. When an allocation line is marked for reallocation, it cannot be allocated. The same applies if any of the underlying job entries is marked in the window Itemize Job Invoice Allocation. The quantity and

Field	Description
	amount for allocation are reset to zero, and any mark in the fields "Close Entries" and "Without Registrations" is removed.
<b>Without Registrations</b>	<p>This field is used for choosing allocations without underlying job registrations. If you mark this field, you can enter quantity and billing price, irrespective of open job entries, and these will not be affected by the invoicing or crediting. When you mark this field, the field "Close Entries" is automatically marked too, but you can remove the mark manually if the system parameter "Allow over invoicing" has been marked in the Set-Up module.</p> <p>You can also enter a negative quantity and a negative credit memo amount for allocation, that is, crediting without underlying job registrations. When you enter manual activity lines for which there are no job entries, Maconomy will mark this field automatically.</p>
<b>Cost, Unit</b>	<p>This is the cost originally recorded for the entry. You cannot change it here. The cost is used to calculate the markup percentage in the fields "Markup, Unit" and "Markup %."</p> <p>If the job is capitalized, the cost multiplied by the quantity in the "Allocate Quantity" field will be posted to the cost of sales account when the invoice selection is invoiced. This account is specified by means of a dimension combination in the window Posting References in the G/L module, or in the table part of the window Activities if you have selected "Post by Activity" in the window System Information.</p> <p>If you unmark the field "Close" on manually created lines, Maconomy automatically transfers the cost of the current employee or activity to this field. You can change the cost of the employee in the window Employees in the Set-Up module. The cost of an activity can be changed in the window Activities.</p>
<b>Markup, Unit</b>	<p>In this field, you can enter the amount by which you want to mark up the current allocation line per unit. Maconomy calculates and shows a markup amount based on the values in the fields "Billing Price, Unit" and "Cost, Unit." If you change the suggested markup, Maconomy will recalculate the line's billing price to invoice.</p>
<b>Markup</b>	<p>In this field, you can enter or change the markup amount for the current line. The field "Close Entries" must be marked. Maconomy suggests the difference between the cost and the billing price of the current table line. When you change this field and press Return, the fields "Billing Price for Allocation" and "Markup %" on the current line are updated, and the fields relating to the desired sales price in the card part are updated as well to reflect the new billing price to allocate.</p>
<b>Markup %</b>	<p>In this field, you can enter the percentage by which you want to mark up the current line. Maconomy calculates and suggests a markup percentage based on the values in the fields "Billing Price, Unit" and "Cost, Unit." The markup percentage is the gross margin as percentage of cost. If you</p>

Field	Description
	change the suggested markup percentage, Maconomy will recalculate the line's billing price to allocate.
<b>Quantity, Open</b>	This field shows how many units of the activity you have entered to the job entry and which have not already been allocated.
<b>Billing Price, Open</b>	This shows how much of the billing price you have not already allocated. Maconomy calculates the amount as the value in the "Quantity, Open" field multiplied by the original billing price per piece.
<b>Quantity, Allocated</b>	This shows the quantity which has previously been allocated for invoicing.
<b>Billing Price, Allocated</b>	This is the amount you have previously allocated for invoicing.
<b>Quantity, Total</b>	This is the total quantity which will be allocated after it has been approved. It is the sum of the quantities in the "Quantity Allocated" and "Billing Price, Allocated" fields.
<b>Billing Price, Total</b>	This is the total billing price which will be allocated after it has been approved. It is the sum of the amounts in the "Billing Price for Allocation" and "Billing Price, Allocated" fields.
<b>Quantity, Reg.</b>	This is the quantity given when the job entry was entered. When the job entry is closed, Maconomy calculates any up- or down-written difference between the quantity in this field and the quantity allocated.
<b>Billing Price, Reg.</b>	This is the total billing price entered for the job entry. When the job entry is closed, Maconomy calculates any up- or down-written difference between the billing price in this field and the billing price allocated.
<b>Quantity, Up/Down, To Date</b>	This field shows the write-up/-down quantity already allocated for the activity. Write-up and write-down are the differences between the registered quantity and the allocated quantity. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Billing Price, Up/Down, To Date</b>	This field shows the write-up/-down billing price already allocated for the activity. Write-up and write-down are the differences between the registered billing price and the allocated billing price. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Quantity, Up/Down, Selection</b>	This field shows the potential write-up/-down quantity resulting from allocating the current line. Write-up and write-down are the differences between the registered quantity and the allocated quantity. Write-ups are shown in positive figures, and write-downs in negative figures.

Field	Description
<b>Sales Price, Up/Down, Selection</b>	This field shows the potential write-up/-down sales price resulting from allocating the current line. Write-up and write-down are the differences between the registered billing price and the allocated billing price. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Quantity, Up/Down, Total</b>	This field shows the total write-up/-down quantity for the job after allocating the current line. Write-up and write-down are the differences between the registered quantity and the allocated quantity. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Sales Price, Up/Down, Total</b>	This field shows the total write-up/-down sales price for the job after allocating the current line. Write-up and write-down are the differences between the registered billing price and the allocated billing price. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Quantity 1</b>	In this field, you can specify a quantity used in the current activity.
<b>Quantity 2</b>	The functionality of this field is similar to that of the field “Quantity” above.
<b>Remarks</b>	In this field, you can enter a remark to describe the current job entry. This could, for example, be a note about the reason for writing down an entry. If a remark is entered for the current allocation line in the window Job Invoice Allocation, it will overwrite any remarks entered in this window. If a remark is changed on any line in this window, the “Remarks” field in the window Job Invoice Allocation is blanked for that allocation line.
<b>Allocation Group</b>	For jobs set up with detailed job invoice allocation, this field shows the allocation group for the underlying job entries for the line.
<b>Act. No.</b>	This field shows and lets you enter the activity assigned to the current line.
<b>Task</b>	This field shows the task assigned to the current line. If a task list exists for the job, a task must be specified on the line. If dimension values have been specified on the task in question, Maconomy suggests these dimension values on the line unless another value has been entered manually. If the window Task Lists specifies that derived dimension values should overwrite existing dimensions values, any manually entered dimensions will be overwritten. If no task list has been assigned to the job, you cannot enter a task.
<b>Location</b>	This field shows the location assigned to the current job entry. You can only change the value in this field if the job entry has been marked for direct invoicing and is yet to be invoiced.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field “Location” above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field “Location” above.

Field	Description
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Task Group 1-6</b>	The functionality of these fields is similar to the functionality of the field "Location" above. For further information on work breakdown structures and task groups, see the descriptions under "Job Tasks" and under "Job Budgets."
<b>Activity Name</b>	This field shows the name defined for the current activity.
<b>Task Description</b>	This field shows the text defined for the current task, if a task has been entered in the field "Task."
<b>Employee Name</b>	This field shows the name of the employee entered in the field "Empl. No." above.
<b>Purch. Order No.</b>	If the job entry was based on a purchase order, the number of the purchase order in question is shown in this field.
<b>Purchase Order Line No.</b>	If the job entry was based on a purchase order, this field shows the number of the line on the purchase order on which the entry was based.
<b>Accrual Entry</b>	This field shows whether the current job entry is an accrual entry, that is, if the entry was created as a result of an accrual being raised from a purchase order line in the window Job Accruals.
<b>Overtime Spec.</b>	This pop-up field shows any specification of overtime on the current job entry. You can change the value in this field. For more information, see the description of the window Job Price Information.
<b>Daily Description</b>	In this field you can enter or edit any daily description associated with the current job entry. The text in this field may be printed on the invoice, depending on the invoice layout of the current job. For more information, see the description of the window Job Tasks.
<b>Accrual Type</b>	This field shows any accrual type selected for the current job entry.
<b>Period From, Accrual</b>	If the current job entry has been accrued, this field and the field "Period To, Accrual" below show the starting and ending periods through which the entry was accrued.
<b>Period To, Accrual</b>	See the description of the field "Period From, Accrual" above.

## Batch Job Invoice Allocation Single Dialogs Workspace

Use this workspace to perform job invoice allocation for multiple jobs in a batch.

In the Batch Job Invoice Allocation tab you can enter selection criteria for the jobs to include. You can also include or exclude individual jobs within the selection criteria. The Jobs sub-tab shares many fields with the tab of the Job Invoice Allocation workspace.

This workspace provides the same actions as the Job Invoice Allocation workspace, except that the actions apply to all of the jobs that match the selection criteria.

The Jobs sub-tab contains one additional field that provides feedback from Maconomy about the outcome of applying a particular action.

### Batch Job Invoice Allocation Tab

This section includes the fields and descriptions for the Batch Job Invoice Allocation tab.

#### Selection Criteria Island

Field	Description
<b>Show Lines</b>	When you mark this field, the lines matching the values specified in the selection criteria below are shown in the table part of this window. Note that actions selected in the Action menu will be carried out on all jobs matching the selection criteria, regardless of whether the lines are shown in the table part or not.
<b>Show Selected Lines Only</b>	When you have specified your criteria for lines to be selected, by marking this field, you can choose to display only the lines marked in the field "Selected" in the table part of the window.
<b>Job No.</b>	In these fields, you can specify a range of job numbers. Only jobs within the specified range of job numbers are selected. If you do not enter a range, the job numbers will not be considered in the selection.
<b>Job Group</b>	In this field, you can select a job group. Only jobs within this job group will be selected. If you do not enter a job group, the job group to which the jobs are assigned will not be considered.
<b>Status</b>	In this field, you can select the current job's status, either "Quote" or "Order."
<b>Estimated Ending Date</b>	In these fields, you can enter the date on which the job is expected to be completed.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. Only jobs with a responsible company within the specified range are selected. If you do not enter a range, the responsible company assigned to the jobs will not be considered in the selection.
<b>Customer No.</b>	The functionality of these fields is similar to that of the field "Company No."

Field	Description
<b>Bill to Customer</b>	The functionality of these fields is similar to that of the field "Company No."
<b>Department</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Language</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Responsible</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Sales Rep.</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Project Manager</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Popup 1-5</b>	The functionality of these fields is similar to that of the field "Job Group." The value in these pop-up fields is specified in the window Jobs.
<b>Employee No. 1-10</b>	The functionality of this field is similar to that of the field "Job Group."

#### Job Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Entity</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Project</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Purpose</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Spec. 1-3</b>	The functionality of this field is similar to that of the field "Job Group."
<b>Local Spec. 1-3</b>	The functionality of this field is similar to that of the field "Job Group."

#### Job Invoice Allocation Island

Field	Description
<b>Show Totals</b>	When you mark this field, the figures applying to the selected lines are summarized.
<b>Allocation Date</b>	In this field you can specify the date for the allocation.

Field	Description
<b>Amounts In</b>	This field shows the currency of the job selected for allocation.
<b>Billing Price for Alloc.</b>	This field shows the activity billing price for allocation. Maconomy suggests the sum of the billing prices from open entries on the job.
<b>Cost Price for Alloc.</b>	This field shows the cost price that can be allocated.
<b>No. of Sel. Jobs</b>	This field shows the number of jobs selected for allocation.
<b>Net On Account</b>	This field shows how much of the total job price has been allocated on account. The amount is shown in the job's currency.
<b>Open Billing Price</b>	This field shows the open billing price, that is, the sum of the prices of the number of entered units that have not yet been allocated or closed. This amount, which cannot be changed in this window, is the sum of the "Billing Price, Open" values for the entries in the Itemize Job Invoice Allocation window.
<b>Open Balance</b>	This field shows the open balance.

## Jobs Sub-Tab

This section includes the fields and descriptions for the Jobs sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number of the entry.
<b>Job Name</b>	This field shows the name of the job.
<b>Customer Name</b>	This field shows the name of the customer.
<b>Selected</b>	In this field you can enter a check mark to include the job entry in the batch job allocation.
<b>Status</b>	This field shows Maconomy's feedback on the action you ran on the selected job entries. For example, the message can tell you why an action did not complete successfully.
<b>Net On Account, Currency</b>	This field shows the amount net on account on the job.
<b>Open Billing Price, Currency</b>	This field shows the total open billing price on the job. The amount includes job entries on subjobs that are set up to be invoiced on the main job.

Field	Description
<b>Open Balance, Currency</b>	This field shows the total open balance for the job in the job's currency.
<b>Allocate</b>	This is the amount for allocation (reconciliation) on the invoices on account on the job. You can change this amount and let Maconomy set the amount for reconciliation on the open invoices on account accordingly.
<b>Balance</b>	This shows the difference between the two other fields. You can only submit the job invoice allocation if the balance is zero.
<b>Up/Down Change, Currency</b>	This field shows the change in write-up/-down after the job invoice allocation has been approved.
<b>Fixed Price, Currency</b>	This field shows the fixed price of the job specified in the currency of the job.
<b>Invoiced On Account</b>	This field shows the amount invoiced on account.
<b>Submitted</b>	A check mark in this field shows if the invoice allocation on the job has been submitted.
<b>Submitted By</b>	If the invoice allocation on the job has been submitted, this field shows the name of the employee who submitted it.
<b>Submitted Date</b>	If the invoice allocation on the job has been submitted, this field shows the date when it was submitted.
<b>Last Allocation Date</b>	This field shows the date of the last job invoice allocation.
<b>Last Submitted By</b>	This field shows who submitted the last job invoice allocation.
<b>Last Submitted Date</b>	This field shows when the last job invoice allocation was submitted.
<b>Last Approved By</b>	This field shows who approved the last job invoice allocation.
<b>Last Approval Date</b>	This field shows when the last job invoice allocation was approved.
<b>Last Allocated Amount</b>	This field shows the amount of the last job invoice allocation.
<b>Last Allocation No.</b>	This field shows the number of the last job invoice allocation.
<b>Revenue Recognition Date</b>	This field shows the date of the last revenue recognition.

Field	Description
<b>Completion %</b>	This field shows the percentage of completed revenue recognized.
<b>Amount, Revenue Recognized</b>	This field shows the amount of revenue recognized on the job as of the date specified in the field "Revenue Recognition Date."
<b>Job Invoice Allocation Completion Date</b>	This field shows the date when the following conditions were first satisfied: The open billing price must be zero, all invoices on account must be reconciled, and the reconciled amount must equal the fixed price all within Job Invoice Allocation.
<b>Up/Down To Date, Currency</b>	This is the write-up/-down of the current amount to date.
<b>Up/Down Total, Currency</b>	This is the total write-up/-down amount after the changes.
<b>Allocated To Date, Currency</b>	This is the allocated billing price of the job entries to date.
<b>Allocated Change, Currency</b>	This field shows the change in allocated billing price of the job entries after the job invoice allocation has been approved.
<b>Allocated Total, Currency</b>	This is the total allocated billing price of the job entries after the changes.
<b>Cost Allocated To Date, Base</b>	This field shows the allocated billing price (at cost price) of the job entries to date.
<b>Cost Allocated Change, Base</b>	This field shows the change in allocated billing price (at cost price) of the job entries.
<b>Cost Allocated Total, Base</b>	This field shows the total allocated billing price (at cost price) of the job entries.
<b>Open Cost, Base</b>	This is the open cost in base currency or company currency.
<b>Status</b>	<p>This is the current job status. When the job is created, it has "Quote" status, unless you have marked the "Created as Order" field in the window System Information. It is then only possible to make quotes from it, not invoices. This is done in the window Quote Editing.</p> <p>If the field "Created as Order" in the window System Information is marked, jobs are created with "Order" status, but only if the current</p>

Field	Description
	user has been given access to convert jobs to orders in the window Actions in the Set-Up module.
<b>Estimated Ending Date</b>	This field shows the date when the job is expected to be finished. The date is for information only.
<b>Customer No.</b>	This field shows the customer number as shown in the Jobs window.
<b>Bill to Customer Cust. No.</b>	This field shows the number of the customer who is being invoiced for the job.
<b>Currency</b>	This field shows the currency of the job entry in the currency of the job.
<b>Base Currency</b>	This field shows the base currency of the current job entry.
<b>Company No.</b>	This field shows the number of the company for whom the job is being done.
<b>Company Name</b>	<p>This field shows the name of the company shown in the field "Company No." above.</p> <p>Settling Company No. This field shows the number of the settling company that applies to the current job.</p> <p>For further information about the influence of a settling company and how such a company is selected, please see the section "Multiple Companies" in the chapter "Introduction to the G/L Module."</p> <p>Intercompany entries are described in the window Intercompany Accounts in the G/L module.</p>
<b>Settling Company Name</b>	This field shows the name of the company shown in the field "Company No." above.
<b>Department</b>	This field shows the name of the department associated with the current job.

## Actions

This section shows the Actions available in the Batch Job Invoice Allocation workspace.

### Top Tab

Field	Description
<b>Select All</b>	This action selects all job entries specified in the selection criteria.
<b>Delimit</b>	The delimit action limits based on the Allocation Group that you select in the card part.

Field	Description
<b>Balance</b>	For jobs set up with detailed job invoice allocation, this action reaches balance for each allocation group.
<b>Close All</b>	This action is similar to the action "Balance" in that it changes the amount for allocation for all jobs within the range of the selection criteria to obtain a zero balance. The difference is that this action also marks all job entries to be closed, so that the balance results in a write-up or a write-down, depending on whether the balance is positive or negative. This action selects all entries for allocation and closing, and it selects all open invoices for reconciliation. To obtain a zero balance, this action distributes the amount for allocation proportionately to all open job entries. If there is no open billing price, this action creates a revenue adjustment entry with an amount for allocation that equals the amount net on account.
<b>Submit</b>	<p>This action submits the job invoice allocation on all jobs within the range of the selection criteria. When submitted, the job changes status and that the Job Invoice Allocation window becomes read-only until it is either approved or the submission has been removed.</p> <p>This action sets the three status fields on the job and puts restrictions on what you can do, just as it does when approving an invoice selection.</p> <p>When an invoice selection has been approved, the field "Approved for Invoicing" in the Invoice Selection window is marked. This is also the case when submitting an invoice allocation.</p>
<b>Approve</b>	<p>This action approves the job invoice allocation. It resembles the printing of an invoice. Running this action updates the job entries within the range of the selection criteria by allocating the specified amount to the entries, creates job invoice lines in a Job Invoice Allocation journal, updates the invoices on account, and creates reconciliation entries.</p> <p>When approved, the job is closed.</p>
<b>Remove Submission</b>	This action removes the submission of already submitted invoice allocations within the range of the selection criteria.

## Job Invoice History Single Dialogs Workspace

Use this workspace to view the list of invoices and credit memos for a job.

For each invoice you can see a payment status that shows whether the invoice (A/R entry) is reconciled, due, or not due. You can print a copy of an invoice.

If the job has been blanket invoiced, this workspace displays the blanket invoice, with fields that show the total of the invoice (including other jobs) and fields that show only the contribution from the job itself.

In the Workspace client, this workspace appears in the Lookup and Invoicing sections of the Jobs workspace. Here you also have access to panes that show additional information about each invoice, including the lines of the invoice, which job entries were included in the invoice, and the on-account reduction.

## Job Invoice History Tab

This section includes the fields and descriptions for the Job Invoice History tab.

### Job Island

Field	Description
<b>Job</b>	This field shows the job name and number.
<b>Status</b>	This field shows the job status.
<b>Project Manager</b>	This field shows the name of the project manager.
<b>Responsible</b>	This field shows the name of the employee who is responsible for the job.

### Totals Island

Field	Description
<b>Currency</b>	This field shows the job currency.
<b>Total Invoiced, Job Currency</b>	This field shows the total amount invoiced on the job, excluding tax, in job currency.
<b>Total Write Up/Down, Job Currency</b>	This field shows the total amount written up/down on invoices, excluding tax, in job currency.
<b>Total Open, Job Currency</b>	This field shows the total amount on open invoices, excluding tax, in job currency. The total amount is included for partially paid invoices.
<b>Total Overdue, Job Currency</b>	This field shows the total overdue amount on open invoices, excluding taxes, in job currency. The total amount is included for partially paid invoices.

### Customer Island

Field	Description
<b>Customer</b>	This field shows the ship-to customer's name and customer number.
<b>Bill to Customer</b>	This field shows the payment customer's customer number.
<b>Name</b>	This field shows the payment customer's name.

**Company Island**

Field	Description
<b>Company</b>	This field shows the responsible company's name and company number.

## Invoices Sub-Tab

This section includes the fields and descriptions for the Invoices sub-tab.

Field	Description
<b>Invoice Date</b>	This field shows the invoice date.
<b>Due date</b>	This field shows the due date.
<b>Invoice No.</b>	This field shows the invoice number.
<b>Type</b>	<p>This field shows the status for invoices, pre-invoices, and credit memos for a job. It shows one of the following statuses for pre-invoices:</p> <ul style="list-style-type: none"> <li>■ Pre-Invoice, Pending Payment – The pre-invoice is printed, but no payment has been reconciled.</li> <li>■ Pre-Invoice, Cancelled – This pre-invoice is no longer needed and is cancelled. <b>Note:</b> Pending payment pre-invoices cannot be credited, like a invoice on account. Instead, they must be cancelled.</li> <li>■ Pre-Invoice, Payment Received – A full or partial payment has been reconciled against this pre-invoice. <b>Note:</b> Once the pre-invoice is in a <b>Payment Received</b> state, it then behaves like an invoice on account.</li> </ul>
<b>Payment Status</b>	<p>This field shows the payment status for invoices, pre-invoices, and credit memos. It shows one of the following statuses:</p> <ul style="list-style-type: none"> <li>■ Due — The invoice or pre-invoice is partially paid, and the current date is past the invoice's or pre-invoice's due date.</li> <li>■ Not Due — A partial payment has been made for this invoice or pre-invoice, and the due date is not yet passed.</li> <li>■ N/A — No payments have been made for the pre-invoice, or the pre-invoice is no longer needed and is cancelled. This status is applicable to pre-invoices only.</li> <li>■ Paid — The amount due for this invoice is fully paid. An invoice that is credited also has a <b>Paid</b> status.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Reconciled — The amount due for the pre-invoice, invoice, or credit memo is fully paid.</li> <li>Not Reconciled — The credit memo is not reconciled. This status is applicable to credit memos only. Partially reconciled memos also have a <b>Not Reconciled</b> status.</li> </ul>
<b>Payment Terms</b>	This field shows the payment terms.
<b>Job Billing Price, Invoice Currency</b>	This field shows the amount invoiced on the job selected in the card part, excluding tax. The amount is shown in invoice currency. For credit memos, the amount credited is shown as a positive amount.
<b>Total Billing Price, Invoice Currency</b>	This field shows the total amount invoiced on all jobs on the invoice, excluding tax. The amount is shown in invoice currency. For credit memos, the amount credited is shown as a positive amount.
<b>Invoice Total, Invoice Currency</b>	This field shows the total amount invoiced in the invoice currency. It includes on account reduction, sales tax and invoice discount.
<b>Invoice Currency</b>	This field shows the invoice currency.
<b>Job Billing Price, Job Currency</b>	This field shows the amount invoiced on the job selected in the card part, excluding tax. The amount is shown in job currency. For credit memos, the amount credited is shown as a positive amount.
<b>Billing Price Up/Down</b>	This field shows the amount written up/down on the invoice in job currency.
<b>Job Currency</b>	This field shows the job currency.
<b>Bill to Customer</b>	This field shows the payment customer's customer number.
<b>Bill to Customer</b>	This field shows the payment customer's name.
<b>From Invoice No.</b>	If this is a credit memo, this field shows the number of the invoice from which the credit memo was created. This field is blank for manually created credit memos.
<b>Billing Price for Invoicing, Invoice Currency</b>	This field shows the billing price of the invoice.

Field	Description
<b>Billing Price, Difference, Invoice Currency</b>	This field shows the difference between the approved billing price and the possibly allowed changes during invoice editing .
<b>Archive Number</b>	This field shows the archive number of the attached document.
<b>Description</b>	This field shows the document archive description.

### Actions

This section shows the Actions available in the Job Invoice History workspace.

#### Bottom Tab

Field	Description
<b>Print Copy</b>	Use this action to print a copy of the invoice that you selected in the table part.

## Lookup Section

This section includes the fields and descriptions for the Lookup section workspaces.

### Show Job Pre-Invoice Events Workspace

Use this window to find and review the history of a pre-invoice for a job. You cannot reprint invoices in this window.

#### Job Pre-Invoice Tab

This section includes the fields and descriptions for the Job Pre-Invoice tab.

#### Job Pre-Invoice Island

Field	Description
<b>Invoice No.</b>	This field shows the pre-invoice's number.
<b>Invoicing Job No.</b>	This field shows the pre-invoice's job number.
<b>Bill to Customer</b>	This field shows values derived from the <b>Bill to Customer</b> field on the Show Job Invoice workspace.
<b>Appropriation</b>	This field shows values derived from the <b>Appropriation</b> field on the Show Job Invoice workspace.

Field	Description
<b>Settling Company</b>	This field shows values derived from the <b>Settling Company</b> field on the Show Job Invoice workspace.
<b>Invoice Date</b>	This field shows the information entered in the <b>Invoice Date</b> field on the Show Job Invoice workspace.
<b>Total, Invoice Currency</b>	This field shows the total amount entered in the invoice currency from the Show Job Invoice workspace.
<b>Total, Standard Currency</b>	This field shows the total amount entered in the <b>Total In Standard</b> field on the Show Job Invoice workspace converted into the bill-to customer's currency.

### Status Island

Field	Description
<b>Pre-Invoice Status</b>	<p>This field shows one of the following statuses of the pre-invoice:</p> <ul style="list-style-type: none"> <li>■ Pending payment — The pre-invoice is awaiting a payment by the customer. It cannot participate in T&amp;M reconciliation and does not affect the job on account totals. No A/R or G/L entries exist for the pre-invoice.</li> <li>■ Selected for reconciliation — The pre-invoice is selected for reconciliation on a journal (for example, a customer payment journal or a general journal).</li> <li>■ Payment received — A full or partial payment has been reconciled against this pre-invoice. The pre-invoice has been posted, resulting in A/R and G/L entries. The pre-invoice can participate in T&amp;M reconciliation and is included in job on account totals.</li> <li>■ Selected for cancellation — The pre-invoice has been selected for cancellation on a T&amp;M draft invoice.</li> <li>■ Cancelled — The pre-invoice is cancelled. No customer payment can be reconciled against such a pre-invoice. The pre-invoice cannot participate in T&amp;M reconciliation.</li> <li>■ Selected for cancellation reversal — The pre-invoice is selected for reversal of cancellation on a T&amp;M draft credit memo.</li> </ul>
<b>Date of Cancellation</b>	This field shows the date when the pre-invoice was cancelled, if the pre-invoice is in a <b>Cancelled</b> state.
<b>Cancelled on Invoice</b>	This field show the invoice number of the T&M invoice where this pre-invoice was cancelled. This field is set only if the pre-invoice is in a <b>Cancelled</b> state.
<b>Cancellation Reported</b>	This field shows whether or not the pre-invoice is cancelled, and the cancellation was reported on a T&M invoice.

Field	Description
<b>Reported on Invoice</b>	This field shows the T&M invoice number where the cancellation of this pre-invoice was reported. This field is set only if the <b>Cancellation Reported</b> field is selected.
<b>Selected for Cancellation Reversal</b>	This field shows the invoice number of the T&M credit memo where the cancellation of this pre-invoice was most recently reversed.
<b>Date of Payment Reconciliation</b>	If the pre-invoice is in a <b>Payment Received</b> state, this field shows the reconciliation date of the payment.

### Job Pre-Invoice Event Sub-Tab

This section includes the fields and descriptions for the Job Pre-Invoice Event sub-tab.

Field	Description
<b>Event No.</b>	This field shows the sequential number for the event.
<b>Event Date</b>	This field show the date on which the event took place.
<b>Transaction Date</b>	<p>This field shows the related transaction's date. The date shown is determined by the event type:</p> <ul style="list-style-type: none"> <li>▪ New Invoice — The field shows the invoice date of the created pre-invoice.</li> <li>▪ Automatic Cancellation — The field shows the invoice date of the T&amp;M invoice that cancelled this pre-invoice.</li> <li>▪ Manual Cancellation — The field shows the same date as the event date.</li> <li>▪ Cancellation Reported — The field shows the invoice date of the T&amp;M invoice where this pre-invoice was reported.</li> <li>▪ Cancellation Reversed — If the cancellation was revoked, the field shows the invoice date of the T&amp;M credit memo for this pre-invoice. If the cancellation was revoked by using the <b>Reverse Pre-Invoice Cancellation</b> action, the field shows the event date.</li> <li>▪ Payment Received — The field shows the reconciliation date of the payment.</li> </ul>
<b>Event Type</b>	<p>This field shows the type of event on this line:</p> <ul style="list-style-type: none"> <li>▪ New Invoice — A pre-invoice is created.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Automatic Cancellation — A pre-invoice is automatically cancelled when a time and material invoice is printed. The <b>Time and Material Invoice Number</b> field specifies the invoice associated with the cancellation.</li> <li>Manual Cancellation — The pre-invoice is manually cancelled by using the <b>Cancel Pre-Invoice</b> action.</li> <li>Cancellation Reported — The cancellation of this pre-invoice is reported on a time and material invoice indicated in the <b>Time and Material Invoice Number</b> field.</li> <li>Cancellation Reversed — The cancellation of this pre-invoice is undone either by using the <b>Reverse Pre-Invoice Cancellation</b> action or by crediting a time and material invoice.  <b>Note:</b> When you credit a T&amp;M invoice with a cancelled pre-invoice, the pre-invoice is cancelled only if the <b>Restore Pre-Invoices</b> check box is selected. If the cancellation was reversed using the action, the <b>Time and Material Invoice Number</b> field is left blank; otherwise, it contains the number of the credit memo involved in the process.</li> <li>Payment Received — A full or partial payment is reconciled against the pre-invoice. The <b>Invoice Journal Number</b> and <b>Invoice Journal Line Number</b> fields indicate the <b>Invoice Journal</b> line where the pre-invoice is posted. The <b>Reconciliation Journal Number</b> and <b>Reconciliation Journal Line Number</b> fields indicate the journal where the pre-invoice is selected for reconciliation. Once a journal is posted, the pre-invoice is no longer selected for reconciliation.</li> </ul>
<b>Username</b>	This field shows the user who performed the last action on a pre-invoice.
<b>Time and Material Invoice</b>	The invoice number of the time and material invoice or credit memo involved in the event, if any.
<b>Invoice Journal No.</b>	If a payment has been received, this field shows the Invoice Journal's journal number where the pre-invoice was posted.
<b>Invoice Journal Line No.</b>	If a payment has been received, this field shows the Invoice Journal's journal line number where the pre-invoice was posted.
<b>Reconciliation Journal No.</b>	If a payment has been received, this field shows the journal number of the journal where the pre-invoice is selected for reconciliation.
<b>Reconciliation Journal Line No.</b>	If a payment is received, this field shows the journal line number of the journal where the pre-invoice is selected for reconciliation.

## Actions

This section shows the Actions available in the Show Job Pre-Invoice Events workspace.

### Top Tab

Field	Description
<b>Cancel Pre-Invoice</b>	Select the pending pre-invoice, then use this action to cancel the pending pre-invoice. Once the pre-invoice is cancelled, no customer payments can be reconciled against the pre-invoice. The pre-invoice does not participate in any on account reconciliations for time and material invoices.
<b>Reverse Pre-Invoice Cancellation</b>	Select the pre-invoice, then use this action to reverse the cancellation of a cancelled pre-invoice. The pre-invoice returns to the <b>Payment Pending</b> state and can be either cancelled again or a payment can be reconciled against it.

## Job Card Workspace

Use this workspace to review entries that you created for a job in the Job Cost module

Use selection criteria to narrow down the entries that are shown. You can also choose to see only open entries, which are entries that have not been invoiced or closed. Entries are sorted by entry date, then by journal number. You cannot make any changes in this workspace.

The Job Card tab displays general and account information about the job. The Job Entries sub-tab displays individual job entries. These are sorted first by entry date, then by journal number.

You can select the entries that you want to view in the sub-tab by specifying selection criteria in the tab. This can give you a good overview of job entries created by a specific employee or in a particular period. The first time that you open this window, you must specify these criteria, but after you have done this once, Maconomy saves the selection criteria for you. This means that each time that you open this workspace, Maconomy displays the last selection criteria that you entered.

You can also choose to see open entries only. Because there can be many entries on a job, Maconomy supplies two system parameters to help delimit the entries in this workspace. If you select the **Open job card without delimitation** system parameter, the Job Entries sub-tab of this workspace displays all of the entries for any period. If you select the **Show Only Open Entries when Opening Job Card** system parameter, the Job Entries sub-tab only displays open entries. You can combine these parameters in the following ways:

<b>Open Job Card without Delimitation</b>	<b>Show Only Open Entries ...</b>	<b>Entries Shown in Job Entries Sub-Tab (Default)</b>
Selected	Not selected	All entered
Selected	Selected	All open entries
Not selected	Not selected	All entries for current month
Not selected	Selected	All open entries for current month

This workspace resembles the Financial Job Card workspace, which shows the open, changed, and closed amounts on items that have been entered, invoiced, or revenue-recognized within a user-defined period, as well as information about work in progress and amounts that have been written up or down on the job, whereas this workspace displays details about work completed on the relevant job.

You can print job cards using the **Print This** action.

## Job Card Tab

This section includes the fields and descriptions for the Job Card tab.

### Job Island

Field	Description
<b>Job</b>	This is the name and number of the job shown in the job card. This value cannot be changed manually, but you can retrieve other jobs using the search functions in the Find menu.
<b>Job Group</b>	This is the job group to which the job is assigned. The job group is selected in the window Jobs and cannot be changed here.
<b>Closed</b>	If this field is marked, the job has been closed. To remove the mark, select the action "Reopen Job" in the window Jobs. To close a job, select the action "Close Job" in the window Jobs. You can always reopen a closed job.

### Ship to Customer Island

Field	Description
<b>Customer</b>	This is the number and first line of the name of the pay-to customer to whom the job pertains. The customer number is retrieved from the Job Information window, and the customer name is retrieved from the Customer Information Card in the A/R module.

### Bill to Customer Island

Field	Description
<b>Customer No.</b>	This is the number and the first line of the name of the bill-customer who is to be billed for the job. This is retrieved from the Customer Information Card in the A/R module.

### Price Island

Field	Description
<b>Currency</b>	This is the job's currency. It is retrieved from the Job Information Card and cannot be changed here.

Field	Description
<b>Net on Account</b>	<p>This field shows how much of the total job price has been invoiced or credited on account. In the window Invoice Selection, you can invoice or credit on account, even before entering the first job entry. You can also invoice all or part of a job on account during its completion and irrespective of the job entries you have made.</p> <p>When you invoice the job after its completion, Maconomy deducts the amount invoiced or credited on account. It cannot be changed here.</p>
<b>Tax on Account</b>	<p>This field shows the amount of sales tax included in any invoices on account or credit memos on account. When the job is invoiced after its completion, the tax amount is deducted from the amount shown in this field. It cannot be changed here.</p>

### Summary Island

Field	Description
<b>Hours</b>	<p>This field shows how many hours have been registered to the job. This value is thus the sum of the numbers in the “Quantity” field for all time activities in the table part of the window.</p>
<b>Cost</b>	<p>This field shows the cost value registered in the base currency of the job. The “Time,” “Amount,” and “Total” fields show the three cost sums from the “Cost, Entered” field on the lines in the table part. The three figures are the cost sums of time activities, amount activities, and a total for all lines.</p>
<b>Billing Price Total Reg.</b>	<p>This field shows the billing price of the job in the job’s currency. The “Time,” “Amount,” and “Total” fields show the three sums of the “Billing Price Open” and “Billing Price Invoiced” fields. The three sums are the invoiced billing price plus the open billing price for time activities, amount activities, and a total for all lines. The values cannot be changed here.</p>
<b>Revenue Recognized</b>	<p>This field shows the amounts revenue recognized on the job’s entries. The amounts are displayed in the base currency of the job.</p>
<b>Billing Price Open</b>	<p>This field shows the open billing price in the job currency. The open billing price is the part which has not already been invoiced to the customer. The “Time,” “Amount,” and “Total” fields show the three sums of open billing prices from the lines in the table part on which the “Closed” field is not marked. If a job entry is partly invoiced, Maconomy only includes the uninvoiced part of the billing price in this field.</p> <p>The three sums are for time activities, amount activities, and a total for all lines. The values cannot be changed here.</p>
<b>Billing Price Invoiced</b>	<p>This field shows the invoiced billing price — that is, the job entries that have been invoiced to the customer in the job’s currency. The “Time,” “Amount,” and “Total” fields show the three sums of invoiced billing prices from the “Billing Price, Inv.” field from the lines in the table part on which the “Closed” field is not marked. The sums also include the invoiced amount of partly invoiced job</p>

Field	Description
	<p>entries. A partly invoiced job entry is not closed, but it has an invoice number in the "Invoice No." field.</p> <p>The three sums are the sum of invoiced billing prices for time activities, amount activities, and a total for all lines. The value cannot be changed here.</p>
<b>Billing Price transferred to</b>	<p>This field shows the sum of billing prices that have been transferred to new dimensions on the job entries displayed in the table part of the window. If a job has been transferred to new dimensions, the table part shows to which new dimensions the job entries have been transferred, and the field "Origin" informs you about the origin of the lines; that is, if the lines have been transferred to new dimensions, the text "Job Transfer" is displayed in the field "Origin." A job can be transferred to new dimensions in the window Job Transfer. The fields "Time," "Amount," and "Total" show the three sums of transferred billing prices, as well as any sums for outlays.</p>
<b>Billing Price transferred from</b>	<p>This field shows the sum of billing prices that has been transferred from the "old" dimensions on the job entries displayed in the table part of the window to new dimensions on the job in question. A job can be transferred to new dimensions in the window Job Transfer. Note that figures are only displayed in this column if you have not marked the field "Show Only Open" in the island Show Entries, as all entries with "old" dimensions are automatically closed when transferred to new dimensions by means of a job transfer. The fields "Time," "Amount," and "Total" show the three sums of transferred billing prices, as well as any sums for outlays</p>
<b>Billing Price Total</b>	<p>This field shows the billing price of the job in the job's currency. The "Time," "Amount," and "Total" fields show the three sums of the "Billing Price Open" and "Billing Price Invoiced" fields. The three sums are the invoiced billing price plus the open billing price for time activities, amount activities, and a total for all lines. The values cannot be changed here.</p>
<b>Time</b>	<p>This field shows the sum of the hours, costs, and billing prices for the time activities in the table part of the window. The values in these five fields cannot be changed here.</p> <p>The value in the "Billing Price Open" field is the sum of uninvoiced billing prices for job entries to time activities.</p> <p>The value in the field "Billing Price Invoiced" is the sum of invoiced billing prices in the "Billing Price, Inv." field for job entries to time activities.</p> <p>The values in the fields "Billing Price Transferred To/From" are the sums of billing prices transferred to and from dimensions on the job as a result of a job transfer, if any, carried out in the window Job Transfer.</p> <p>The value in the "Billing Price Total" field is the sum of the amounts in the two fields above.</p>
<b>Amount</b>	<p>This field shows the sum of the costs and billing prices for the amount activities in the table part of the window. The calculations are similar to those described for the above field "Time."</p> <p>There is no value in the "Hours" field, as it is not relevant to register quantities for amount activities.</p>

Field	Description
<b>Total</b>	This field shows the sum of the costs and billing prices in the table part of the window.
<b>Hereof Outlays</b>	These fields show the registered costs for all amount activities for which the cost type has been set to "Outlays." This means that the fields only show the cost part of the relevant outlays, whereas the below field "Excluding Outlays" also includes the gross margin from the outlay. For more information about outlay activities, please see the description of the window Activities.
<b>Excluding Outlays</b>	These fields show the sum of the registered prices for all activities in the table part of this window, less the cost price for any amount activities for which the cost type has been set to "Outlays."
<b>Total Per</b>	This field shows the unit specified in the island Unit Analysis in the window Job Budgets, as well as the values in the row of "Total" fields, divided by the quantity in the island Unit Analysis. If the job for example is for two advertisements, three houses or ten meters cable, you can use this row to view cost and billing prices per unit.

### Company Island

Field	Description
<b>Company No.</b>	This field shows the number and name of the company responsible for the current job. The company number is transferred from the window Jobs and cannot be changed here.
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### Selection Criteria Island

Field	Description
<b>G/L Entry Date</b>	<p>In this field, you can enter a range of dates to specify which job entries you wish to see in the table part. Maconomy will retrieve job entries posted in the G/L module on a date within the specified range.</p> <p>The hour and price information in the Summary island only includes the job entries shown in the table part.</p> <p>If you leave the fields blank, the entry date will not have any influence on the selection criteria.</p>
<b>Origin</b>	<p>In this field, you can specify the origin of the job entries you wish to see in the table part. Maconomy will retrieve job entries posted using journals of the selected type.</p> <p>The origin of a job entry is the name of the journal type from which they derive, for example, "Job Revenue Recognition." For more information, please see the description of the field "Origin" in the table part of this window.</p>

Field	Description
	If you leave the field blank, the origin will not have any influence on the selection criteria. Please note that not all of the listed journal types are relevant in the Job Cost module. Hence, if you select, for example, "Asset" in this field, no job entries will be shown in the table part.
<b>Entry Type</b>	<p>In this field, you can specify the entry type of the job entries you wish to see in the table part. Maconomy will retrieve job entries of the selected type.</p> <p>When a job entry is posted, Maconomy marks it as a certain type. A job entry can, for example, have the type "Registration" (for a normal time sheet entry) or "Reallocation" (for a reallocated job entry). For more information, please see the description of the field "Entry Type" in the table part of this window.</p> <p>If you leave this field blank, the entry type will not have any influence on the selection criteria.</p>
<b>Show Accrual Entries</b>	In this field, you can specify whether the table part should show accrual entries.
<b>Activity Type</b>	<p>In this field, you can specify the activity type of the job entries you wish to see in the table part. Maconomy will retrieve job entries of the selected activity type.</p> <p>If you leave this field blank, the activity type will not have any influence on the selection criteria.</p>
<b>Cost Type</b>	<p>In this field, you can specify the cost type of the job entries you wish to see in the table part. Maconomy will retrieve job entries of the selected cost type.</p> <p>If you leave this field blank, the cost type will not have any influence on the selection criteria.</p>
<b>Employee No.</b>	<p>In these fields, you can enter a range of employee numbers to specify which job entries you wish to see in the table part. Maconomy will retrieve job entries for the employee or employees you enter here.</p> <p>The hour and price information in the Summary island only includes the job entries shown in the table part.</p> <p>If you leave these fields blank, the employee number will not have any influence on the selection criteria.</p>
<b>Exec. Company No.</b>	The functionality of these fields is similar to that of the field "Employee No." above.
<b>Activity No.</b>	The functionality of these fields is similar to that of the field "Employee No." above.
<b>Task</b>	The functionality of these fields is similar to that of the field "Employee No." above.
<b>Invoice No.</b>	In this field, you can specify the invoice number of the job entries you wish to see in the table part. If you leave the field blank, the invoice number will not have any influence on the selection criteria.

Field	Description
	If a job entry is invoiced twice (for example, partially invoiced the first time), then the invoice number on the job entry will be the number of the latest invoice that included that entry.
<b>Overtime Spec.</b>	The functionality of this field is similar to that of the field “Activity Type” above.
<b>Show</b>	In this field, you can choose whether or not entries included in the fixed-price of a given job should be displayed in the table part of the window and hence included in the calculations displayed in the card part of the window. If you leave the field blank, both kinds of entries (entries included in the fixed price and entries not included in the fixed price) will be included in the table part and hence also in the calculations made in the card part of the window.

### Show Entries Island

Field	Description
<b>Period</b>	<p>In this field, you can enter a range of dates. In the table part, Maconomy will show job entries within the period entered here.</p> <p>The hour and price information in the Summary island only includes the job entries shown in the table part.</p> <p>The system parameters “Open job card without delimitation” and “Show Only Open Entries when Opening Job Card” have an effect on the way this field is marked when you open the window. For more information, please see the introduction to this window.</p>
<b>Show Open Only</b>	<p>In this field, you can mark whether to show only open entries in the table part of the window. If you mark this field, the table part will only show entries for which the field “Closed” is not marked. An open job entry is one which is not fully invoiced to the customer.</p> <p>If the job displayed in the window has been transferred to other dimensions in the window Job Transfer, you should note that only open entries are transferred to new dimensions. This means that if you have marked this field, the column “Billing Price, Transf. From” will not show any figures, as entries which have been transferred from one job entry to another are closed on the “old” entry. If you do not mark this field, the table part and the card part of the window will display figures for both amounts transferred from the dimensions on a job as well as the figures transferred to the new dimensions on the job in question.</p> <p>If you leave this field blank, the field “Closed” has no influence on the selection criteria.</p> <p>The system parameters “Open job card without delimitation” and “Show Only Open Entries when Opening Job Card” have an effect on the way this field is marked when you open the window. For more information, please see the introduction to this window.</p>

**Description Island**

Field	Description
<b>Internal</b>	This is the job description you have entered for internal use in the window Jobs in the "Internal" field. It cannot be changed here.
<b>Ref.</b>	This is the customer reference. It is retrieved from the corresponding field in the window Jobs and cannot be changed here.

**Current Phase Island**

Field	Description
<b>Phase</b>	This field shows the name of the current phase of the job. The field is blank until the first phase is initiated using the action "Initiate First Phase" in the window Job Phases. Once the first phase has been initiated, this field will always show the earliest phase which has not been ended.
<b>Planned Ending Date</b>	This field shows the date on which the current job phase should end according to plan. The value is transferred from the corresponding field in the table part of the window Job Phases.
<b>Due</b>	This field is automatically marked by Maconomy if today's date is later than the date in the field "Planned Ending Date" in this island. This field thus shows if the planned ending date of the job phase has been exceeded. This field cannot be changed manually.
<b>Responsible Employee No.</b>	This field shows the number of the employee responsible for the current phase in the window Job Phases. This employee is responsible for ending the current job phase.
<b>Name</b>	This field shows the name of the employee shown in the field "Responsible Employee No." above.

**Settling Company Island**

Field	Description
<b>Settling Company</b>	<p>This field shows the number and name of the settling company that applies to the current job.</p> <p>If the number in this field is different from the one specified in the island Company, Maconomy will automatically create intercompany entries at the posting of job invoices. In the intercompany entries, the company in this field will be the intercompany company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>For further information about the influence of a settling company and how such a company is selected, please see the section "Multiple Companies" in the chapter "Introduction to the G/L Module." Intercompany entries are described in the window Intercompany Accounts in the G/L module.</p>

**Selection Criteria, Dimensions Island**

Field	Description
<b>Location</b>	The functionality of these fields is similar to that of the field "Employee No." above.
<b>Entity</b>	The functionality of these fields is similar to that of the field "Employee No." above.
<b>Project</b>	The functionality of these fields is similar to that of the field "Employee No." above.
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Employee No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Employee No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Employee No." above.

**Job Entries Sub-Tab**

This section includes the fields and descriptions for the Job Entries sub-tab.

Field	Description
<b>Date</b>	This is the entry date of the job entry. The job entries are sorted primarily by entry date, then by transaction number. The date cannot be changed here.
<b>Act. No.</b>	This is the number of the activity the job entry involves. It cannot be changed here.
<b>Description</b>	This is the entry text given when the job entry was entered. It cannot be changed here.
<b>Quantity</b>	This is the quantity entered for the job entry. The quantity is number of hours for time activities. It cannot be changed here.
<b>Billing Price</b>	This is the total registered job billing price in the job's currency.
<b>Quantity Inv.</b>	This is the total number of units invoiced to the customer in this entry. The "Invoice No." field shows the invoice on which all or part of the entry is invoiced. The quantity cannot be changed here.
<b>Billing Price, Inv.</b>	This is the total invoiced billing price in the job currency. It cannot be changed here.
<b>Revenue Recognized</b>	This field shows the amount revenue recognized on the job entry. The amount is displayed in the base currency of the job.

Field	Description
<b>Incl. in Fixed Price</b>	This field shows whether or not the entry is included in the fixed price of a fixed-price job. If the field is marked, the entry is not included in the fixed price of a job. See the introduction of the window Invoice Selection for a description of how Maconomy determines whether or not entries are to be included in the fixed price of a job.
<b>Closed</b>	<p>This field shows whether or not the job entry is closed. If this field is marked, the entry is closed. A job entry is open until it is completely invoiced or closed.</p> <p>Entries to noninvoiceable activities and noninvoiceable jobs are automatically closed and thereby closed when the entry is made.</p> <p>If, when the entry is closed, you invoice a different quantity or a different billing price than the one registered, the difference is registered in the "Quantity, Up/Down" and "Billing Price, Up/Down" fields on the table line.</p> <p>The field's value cannot be changed here.</p>
<b>Invoice No.</b>	This is the invoice number before the latest invoicing of the job entry. The field also shows the invoice number for job entries that are not invoiced to the customer, but closed in connection with an invoicing.
<b>Quantity, Up/Down</b>	This shows any difference between the quantity you have entered and the quantity you invoice when the job entry is closed. If you have invoiced more than the entered quantity, the value shown is positive. If you have invoiced fewer than the entered quantity, the value is negative.
<b>Billing Price, Up/Down</b>	This shows any difference between the billing price you have entered and the billing price you invoice when the job entry is closed. If the invoiced billing price is greater than the entered billing price, the value will be positive. If the invoiced billing price is below the entered price, the value is negative. The difference between the invoiced billing price and the standard billing price deviation (as seen in the field "Standard Up/Down") is shown in the field "Total Up/Down."
<b>Exec. Company No.</b>	This field shows the number of the company which carried out the activity on the current job entry.
<b>Base Currency, Exec. Company</b>	This field shows the base currency selected for the executing company in the window Company Information.
<b>Cost, Exec. Company</b>	This field shows the cost of one piece of the current activity in the executing company. If the responsible company is the same as the executing company, the cost in this field will be the same as the value in the field "Cost."
<b>Cost</b>	This field shows the job entry cost per piece in the base currency. It cannot be changed here.
<b>Cost, Reg.</b>	This field shows the total registered cost in the base currency. It cannot be changed here.

Field	Description
<b>Empl.</b>	This field shows the number of the employee who completed the activity described in the job entry. Only time activities show a value here. It cannot be changed.
<b>Empl. Cat. No.</b>	This field shows the number of the employee category of the employee in the field "Empl." above.
<b>Empl. Cat.</b>	This field shows the category of the employee in the field "Empl." above.
<b>Trans. No.</b>	This field shows the transaction number of the job entry. Job entries are first sorted by entry date, then by transaction number. The value cannot be changed here.
<b>Trans. Type</b>	This field shows the transaction type of the entry. The field is for reference only and cannot be changed here.
<b>G/L Entry Date</b>	This field shows the date on which the current job entry was posted in the G/L module.
<b>Origin</b>	<p>This field shows the origin of the individual job entry. When a job entry is posted, Maconomy assigns to the job entry information about the journal type from which the job entry was originally derived. This could, for example, be "Time Sheet" or "Job Accrual." Some entries are created without posting journals, for example, entries for direct invoicing. To such entries, the origin "Job" is assigned.</p> <p>The origin of a job entry never changes.</p>
<b>Entry Type</b>	<p>This field shows the entry type of the individual job entry. When a job entry is posted, Maconomy marks it as a certain type. The type will often be "Registration" (for example, time sheet and job journal entries). In the pop-up field "Entry Type" in the island Selection Criteria in the card part of this window, you can see the different entry types used by Maconomy.</p> <p>This is useful if a job entry changes type. If, for instance, a job entry is reallocated, the entry's origin will be preserved, but its type will be changed to "Reallocation" or "Reversal." This way, you can in this window see that a particular entry is, for example, a reallocated time sheet entry.</p>
<b>Reallocated from Job No.</b>	If the current job entry has previously been reallocated, this field shows the number of the job from which the job entry was reallocated.
<b>Reallocated from Task</b>	If the current job entry has previously been reallocated, this field shows the task from which the job entry was reallocated.
<b>Vendor No.</b>	This field shows the number of the vendor who sold you a service in connection with the job entry. It only applies to amount activities and the job entry must be entered in the window Vendor Invoices in the Accounts Payable module.

Field	Description
<b>Vendor Name</b>	This field shows the name of the vendor who sold you a service in connection with the job entry. It only applies to amount activities, and the job entry must be entered in the window Vendor Invoices in the Accounts Payable module.
<b>Vendor Inv. No.</b>	This field shows the number of the vendor invoice you received for the service you bought in connection with the job entry. It only applies to amount activities, and the job entry must be entered in the window Vendor Invoices in the Accounts Payable module.  The vendor invoice number is shown in the "Invoice No." field in the window Vendor Invoices.
<b>Vendor Invoice Document</b>	If this entry originates from a vendor invoice with an attached document then this field shows the document name.
<b>Purch. Order No.</b>	If the current job entry was created from a purchase order, the number of the purchase order in question is shown in this field.
<b>Purchase Order Line No.</b>	If the current job entry was created from a purchase order, this field shows the line on the purchase order in question on which the job entry is based.
<b>Accrual Entry</b>	This field shows if the current entry is an accrual entry, that is, if the entry was created as a result of raising a job accrual from a purchase order line in the window Job Accruals.
<b>Quantity 1</b>	This field shows the quantity used in the current job entry. The value cannot be changed here.
<b>Quantity 2</b>	The functionality of this field is similar to that of the field "Quantity" above.
<b>Company No.</b>	This field shows the company assigned to the job entry. The value cannot be changed here.
<b>Task</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Location</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.

Field	Description
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Remarks</b>	This field shows is the remarks assigned to the job entry.
<b>Activity Name</b>	This field shows the activity text entered for the job entry.
<b>Task Description</b>	This field shows the text defined for the current task, if a task has been entered in the field "Task."
<b>Employee Name</b>	This field shows the name of the employee entered in the field "Empl." above.
<b>Moved</b>	This field shows whether the current entry has been transferred.
<b>Transfer Date</b>	If the current entry has been transferred, this field shows the date of the transfer.
<b>Quantity, Transferred To</b>	If the current entry has been transferred to new dimensions, this field shows the quantity transferred to the job assigned the new dimensions. A job is transferred to new dimensions in the window Job Transfer.
<b>Billing Price, Transferred To</b>	This field shows the total billing price, if any, transferred to the new dimensions on the job.
<b>Quantity, Transferred From</b>	If the current entry has been transferred to new dimensions in the window Job Transfer, this field shows the quantity transferred from the "old" dimensions of the current job entry.
<b>Billing Price, Transferred From</b>	If the current entry has been transferred to new dimensions in the window Job Transfer, this field shows the total billing price transferred from the "old" dimensions of the job entry to the new dimensions of the job entry.
<b>Standard Billing Price</b>	<p>This field shows the standard billing price applied to the entry in question. The difference between the standard billing price, the billing price registered in windows such as Job Budgets and Job Journal, and the invoiced billing price (as found in the window Invoice Selection) can be used for performance analyses. For more information, please see "Appendix A: Price Calculation in the Job Cost Module."</p> <p>Standard Up/Down This field shows the difference between the registered billing price and the standard billing price for the current entry within the selected period.</p>
<b>Total Up/Down</b>	<p>This field shows the difference between the amount invoiced for the current entry within the selected period and the standard billing price for the same period. This corresponds to the sum of the fields "Standard Up/Down" and "Billing Price, Up/Down."</p> <p>Overtime Spec. The functionality of this field is similar to that of the field "Company No." above.</p>

Field	Description
<b>Daily Description</b>	This field shows any daily description associated with the current job entry.
<b>Period From, Subscription</b>	If the current job entry originates from a subscription order, this field and the field "Period To, Subscription" below show the starting and ending periods of the subscription.
<b>Period To, Subscription</b>	See the description of the field "Period From, Subscription" above.

## Actions

This section shows the Actions available in the Job Card workspace.

### Bottom Tab

Field	Description
<b>View Vendor Invoice Document</b>	<p>This action allows you to view any document attached to a vendor invoice, for example, a scanned invoice or an e-mail.</p> <p>The action is enabled when at least one job entry in the table part originates from a vendor invoice with an invoice number specified. If the action is used on other types of job entry, an error message will be displayed.</p>

## Financial Job Card Workspace

Use this workspace to review detailed financial information about job entries that were entered, invoiced, or revenue-recognized for a specific job in a specific period.

Use selection criteria to narrow down the entries that are displayed. This workspace displays the open, changed, and closed amounts for the job entries, as well as information about work in progress and amounts that have been written up or down on the job.

This workspace is similar to the Job Card workspace, but this workspace displays the financial movements made on a job in detail, whereas the Job Card workspace displays details of work completed on the relevant job.

In the Financial Job Card tab in this workspace, you can define selection criteria for the job that the workspace displays. The first time that you open this workspace, you must specify these criteria, but after you have done this once, Maconomy saves the selection criteria for you. This means that each time that you open this workspace, Maconomy displays the last selection criteria that you entered.

In accordance with the selected criteria, the Job Entries sub-tab displays the open, changed, and closed amounts on entries that have been entered, invoiced, or revenue-recognized within the selected period, as well as information about work in progress and amounts that have been written up or down on the job. The entries that the sub-tab displays are summarized, and the resulting totals are displayed in some of the islands in the Financial Job Card tab. A number of these islands are structured in a similar way, all showing opening, closing, and changed amounts for the period specified in the tab.

The "Opening" amounts that these islands display include all of the actions performed on a job before the first date of the date range that you specify in the Financial Job Card tab, whereas "Closing" amounts include all of the actions performed within the selected date range. As the name indicates, the "Change" amounts display the changes made to the relevant amounts within a given period, that is, the difference between the relevant opening and closing amounts.

In addition, the Financial Job Card tab also displays information about differences between standard billing prices, registered billing prices, and invoiced billing prices related to the job in question. At any time, you can choose the currency in which the amounts in this tab should be displayed. This workspace thus provides detailed financial information about the history of the job and the changes made to the job's entries within a given period, thus providing information on both the job entry level and summarized totals at the job level. You can print the information that this workspace displays using the **Print...** action.

### Financial Job Card Tab

This section includes the fields and descriptions for the Financial Job Card tab.

#### Job Island

Field	Description
<b>Job</b>	This is the number and name of the job for which information is shown. This value cannot be changed manually, but you can retrieve other jobs using the search functions in the Find menu.
<b>Job Group</b>	This is the job group to which the job is assigned.
<b>Closed</b>	If this field is marked, the job has been closed. To remove the mark, select the action "Reopen Job" in the window Jobs. To close a job, select the action "Close Job" in the window Jobs.

#### Revenue Recognition Island

This island is structured as a grid showing opening, closing, and changed amounts for a number of figures. Only those job entries and invoices on account which fulfill the criteria specified in the islands Show Entries and Selection Criteria form the basis of the amounts displayed in this island.

Field	Description
<b>Opening</b>	This column shows the opening amounts that are currently registered. The values are divided into the four rows "Revenue Recognized," "Hereof Revenue Adjusted," "Billing Price, Inv.," and "Work In Progress." Opening amounts include all actions carried out on a job before the first date of the date range specified in the island Show Entries in card part of the window.
<b>Change</b>	This column shows the changes made to the amounts in the rows "Revenue Recognized," "Hereof Revenue Adjusted," "Billing Price, Inv.," and "Work In Progress" within the period specified in the island Show Entries in the card part of the window.

Field	Description
<b>Closing</b>	This column shows the closing amounts that are currently registered. The values are divided into the four rows "Revenue Recognized," "Hereof Revenue Adjusted," "Billing Price, Inv.," and "Work In Progress." Closing amounts include all actions carried out on a job within the selected date range specified in the island Show Entries in card part of the window.
<b>Revenue Recognized</b>	This row shows the opening, changed, and closing amounts that have been revenue-recognized on the job before and within the relevant period.
<b>Hereof Revenue Adj.</b>	This row shows the opening, changed, and closing amounts that have been revenue-adjusted on the job before and within the relevant period. If the job is capitalized at billing price, this is calculated as the revenue-recognized amount, less billing price registered, less invoiced up/down. If the job is capitalized at cost price, this is 0.
<b>Cost, Inv.</b>	This row shows the opening, changed, and closing billing prices that have been invoiced on the job before and within the relevant period. The amount is shown in enterprise currency or base currency, depending on the currency type selected in the island Show Entries. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.
<b>Billing Price, Inv.</b>	This row shows the opening, changed, and closing billing prices that have been invoiced on the job before and within the relevant period.
<b>Work In Progress</b>	This row shows the opening, changed, and closing amounts for work in progress that have been registered on the job before and within the relevant period. If the job is capitalized at billing price, this is calculated as the revenue-recognized amount, less invoiced, less transferred from, plus transferred to. If the job is capitalized at cost price, WIP is the open cost price.

### Billing Price Deviation Island

As the structure of this island is similar to that described for the island Revenue Recognition, you should see the introduction to that island for further information about the structure, as well as the opening, closing, and changed amounts displayed.

The fields in this island show any differences between the registered billing price, the standard billing price, and the invoiced billing price. Based on these figures, you can analyze the performance of, for instance, a department, by comparing the standard billing price (the performance target) with the invoiced billing price (the sum actually invoiced to the clients). For more information, please see "Appendix A: Price Calculation in the Job Cost Module."

Field	Description
<b>Standard Billing Price</b>	This row shows the sum of the standard billing prices registered on the job: the opening balance, the change over the selected period, and the closing balance at the end of the selected period.

Field	Description
<b>Standard Up/Down</b>	This row shows the sum of the difference between the registered billing prices and the standard billing prices registered on the job: the opening balance, the change over the selected period, and the closing balance at the end of the selected period. The fields thus show the amounts by which the job exceeds or falls behind the performance target, compared with what was actually registered on the job.
<b>Billing Price, Reg.</b>	This row shows the sum of the billing prices registered on the job: the opening balance, the change over the selected period, and the closing balance at the end of the selected period.
<b>Billing Price, Up/Down</b>	This row shows the sum of the difference between the invoiced (plus open, not yet invoiced) billing prices and the registered billing prices entered on the job: the opening balance, the change over the selected period, and the closing balance at the end of the selected period. The fields thus show if the job has been written up or down when invoiced.
<b>Billing Price, Inv.</b>	This row shows the sum of the billing prices invoiced (plus open, not yet invoiced) on the job: the opening balance, the change over the selected period, and the closing balance at the end of the selected period.
<b>Total Up/Down</b>	This row shows the sum of the differences between the invoiced billing prices and the standard billing prices registered on the job: the opening balance, the change over the selected period, and the closing balance at the end of the selected period. The fields thus show the amounts by which the job exceeds or falls behind the performance target, compared with what was actually invoiced.

### On Account Island

As the structure of this island is similar to that described for the island Revenue Recognition, you should see the introduction of that island for further information about the structure, as well as the opening, closing, and changed amounts displayed.

Field	Description
<b>On Account, Net</b>	This row shows the opening, changed, and closing on account amounts registered on the job before and within the relevant period. The fields thus show how much of the total job price has been invoiced or credited on account within the relevant period.
<b>Tax On Account, Net</b>	This row shows the opening, changed, and closing on account tax amounts registered on the job before and within the relevant period. The fields thus show the amount of sales tax included in any invoices on account or credit memos on account.

**Selection Criteria Island**

Field	Description
<b>Show Lines</b>	When you mark this field, the lines matching the criteria specified in this island are shown in the table part of this window. When the lines are displayed, the amounts on the relevant entries are summed and hence shown in the relevant islands in the card part of the window.
<b>Origin</b>	<p>In this field, you can select the origin of the job entries you wish to see in the table part. Maconomy will retrieve job entries posted using journals of the selected type.</p> <p>The origin of a job entry is the name of the journal type from which they derive, for example, "Job Revenue Recognition."</p> <p>If you leave the field blank, the origin will not have any influence on the selection criteria. Please note that not all of the listed journal types are relevant in the Job Cost module. Hence, if you select, for example, "Asset" in this field, no job entries will be shown in the table part.</p>
<b>Entry Type</b>	<p>In this field, you can select the entry type of the job entries you wish to see in the table part. Maconomy will retrieve job entries of the selected type.</p> <p>When a job entry is posted, Maconomy marks it as a certain type. A job entry can, for example, have the type "Registration" (for a normal time sheet entry) or "Reallocation" (for a reallocated job entry). For more information, please see the description of the field "Entry Type" in the table part of this window.</p>
<b>Show Accrual Entries</b>	In this field, you can specify whether the table part should show accrual entries.
<b>Activity Type</b>	In this field, you can select the activity type of the job entries you wish to see in the table part. Maconomy will only retrieve job entries of the selected activity type.
<b>Cost Type</b>	In this field, you can select the cost type of the job entries you wish to see in the table part. Maconomy will only retrieve job entries of the selected cost type.
<b>Employee No.</b>	In these fields, you can enter a range of employee numbers to specify which job entries you wish to see in the table part. Maconomy will only retrieve job entries for employees with numbers within the specified range.
<b>Exec. Company No.</b>	The functionality of these fields is similar to that of the field "Employee No." above.
<b>Activity No.</b>	The functionality of these fields is similar to that of the field "Employee No." above.
<b>Task</b>	The functionality of these fields is similar to that of the field "Employee No." above.

Field	Description
<b>Overtime Spec.</b>	The functionality of this field is similar to that of the field “Activity Type” above.
<b>Show</b>	In this field, you can choose whether entries included in the fixed price of a given job should be displayed in the table part of the window and hence be included in the calculations displayed in the card part of the window. If you leave the field blank, both kinds of entries (entries included in the fixed price and entries not included in the fixed price) will be included in the table part and hence also in the calculations made in the card part of the window.

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of these fields is similar to that of the field “Employee No.” above.
<b>Entity</b>	The functionality of these fields is similar to that of the field “Employee No.” above.
<b>Project</b>	The functionality of these fields is similar to that of the field “Employee No.” above.
<b>Purpose</b>	The functionality of these fields is similar to that of the field “Employee No.” above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Employee No.” above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Employee No.” above.

#### Show Entries Island

Field	Description
<b>Period</b>	In these fields, you can enter a range of dates. The table part will show the job entries registered, invoiced, or revenue recognized within the specified period. The default values in these fields are the starting and ending date of the previous month.
<b>Currency Type</b>	In this field, you can choose the currency in which figures should be displayed. The options are “Job Currency,” “Base Currency,” and “Enterprise Currency.” All prices in the card and table parts are displayed in the currency type selected here. However, if you select “Job Currency,” cost prices are shown in the base currency. This is because cost prices are only stored in base currency and enterprise currency. The currency type selected in this field can be changed at any time.
<b>Currency</b>	This field shows the currency of the currency type selected in the field “Currency Type.”

Field	Description
<b>Job Currency</b>	This field shows the job's currency. The currency is retrieved from the window Job Information.
<b>Base Currency</b>	This field shows the currency used as base currency in the company to which the job is assigned. The company name is displayed in the island Company.

### Registration/Invoicing Island

As the structure of this island is similar to that described for the island Revenue Recognition, you should see the introduction to that island for further information about the structure, as well as the opening, closing, and changed amounts displayed.

Field	Description
<b>Cost, Reg.</b>	<p>This row shows the opening, changed, and closing cost prices registered on the job before and within the relevant period.</p> <p>The amount is shown in enterprise currency or base currency, depending on the currency type selected in the island Show Entries. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.</p>
<b>Billing Price, Reg.</b>	This row shows the opening, changed, and closing billing prices registered on the job before and within the relevant period.
<b>Cost, Open</b>	<p>This row shows the opening, changed, and closing amounts for open cost registered on the job before and within the relevant period.</p> <p>The amount is shown in enterprise currency or base currency, depending on the currency type selected in the island Show Entries. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.</p>
<b>Billing Price, Open</b>	This row shows the opening, changed, and closing amounts for open billing prices registered on the job before and within the relevant period.
<b>Cost, Inv.</b>	<p>This row shows the opening, changed, and closing cost invoiced on the job before and within the relevant period.</p> <p>The amount is shown in enterprise currency or base currency, depending on the currency type selected in the island Show Entries. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.</p>
<b>Billing Price, Inv.</b>	This row shows the opening, changed, and closing billing prices invoiced on the job before and within the relevant period.
<b>Billing Price, Up/Down</b>	This row shows the opening, changed, and closing amounts for billing prices which have been written up or down on the job before and within the relevant period. The fields thus show any differences between the billing price invoiced on the job and the billing price registered on the job.

### Transfer Island

As the structure of this island is similar to that described for the island Revenue Recognition, you should see the introduction of that island for further information about the structure, as well as the opening, closing, and changed amounts displayed.

Field	Description
<b>Cost, Transferred To</b>	This row shows the sum of the cost transferred to the job: the opening balance, the change over the selected period, and the closing balance at the end of the selected period.  The amount is shown in enterprise currency or base currency, depending on the currency type selected in the island Show Entries. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.
<b>Cost, Transferred From</b>	This row shows the sum of the cost transferred from the job: the opening balance, the change over the selected period, and the closing balance at the end of the selected period.  The amount is shown in enterprise currency or base currency, depending on the currency type selected in the island Show Entries. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.
<b>Billing Price, Transferred To</b>	This row shows the sum of the billing prices transferred to the job: the opening balance, the change over the selected period, and the closing balance at the end of the selected period.
<b>Billing Price, Transferred From</b>	This row shows the sum of the billing prices transferred from the job: the opening balance, the change over the selected period, and the closing balance at the end of the selected period.

### Ship to Customer Island

Field	Description
<b>Customer</b>	This field shows the number and first line of the name of the customer to whom the job pertains.

### Bill to Customer Island

Field	Description
<b>Bill to Customer</b>	This field shows the number and first line of the name of the customer who is to be billed for the job.

**Company Island**

Field	Description
<b>Company</b>	This field shows the number and name of the company responsible for the current job.

**Settling Company Island**

Field	Description
<b>Settling Company</b>	<p>This field shows the number and name of the settling company that applies to the current job.</p> <p>For further information about the influence of a settling company and how such a company is selected, please see the section “Multiple Companies” in the chapter “Introduction to the G/L Module.” Intercompany entries are described in the window Intercompany Accounts in the G/L module.</p>

**Description Island**

Field	Description
<b>Internal</b>	This field shows the job description entered for internal use in the window Jobs in the field “Internal.”
<b>Ref.</b>	This field shows a customer reference. This information is retrieved from the corresponding field in the window Jobs.

**Job Entries Sub-Tab**

This section includes the fields and descriptions for the Job Entries sub-tab.

Note that opening and closing figures for the changed amounts displayed in the table part are not included in the standard layout of this window. However, the opening and closing figures are maintained and can be added to the layout by means of Maconomy’s layout editing tools if so desired.

Field	Description
<b>Entry Details</b>	This field shows a link to the Job Entries workspace. When you click this link, the Job Entries workspace filter which will automatically focus on the job entry and show details.
<b>G/L Entry Date</b>	This field shows the date on which the current job entry was posted in the G/L module.
<b>Entry Date</b>	This field shows the entry date of the job entry. The job entries are sorted primarily by job entry date, then by transaction number.
<b>Act. No.</b>	This field shows the number of the activity registered on the job entry.
<b>Task</b>	This field shows the task registered on the job entry.

Field	Description
<b>Empl.</b>	This field shows the number of the employee registered on the job entry.
<b>Empl. Cat.</b>	This field shows the category of the employee registered on the job entry.
<b>Description</b>	This field shows the entry text specified when the job entry was entered.
<b>Quantity</b>	This field shows the quantity registered on the job entry.
<b>Cost, Reg.</b>	This field shows the cost registered on the job entry. The amount is shown in enterprise currency or base currency, depending on the currency type selected in the island Show Entries. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.
<b>Billing Price, Reg.</b>	This field shows the billing price registered on the job entry.
<b>Revenue Recognized</b>	This field shows the amount revenue-recognized during the period specified in the card part.
<b>Quantity, Inv.</b>	This field shows the quantity invoiced during the period specified in the card part.
<b>Cost, Inv.</b>	This field shows the cost invoiced during the period specified in the card part. The amount is shown in enterprise currency or base currency, depending on the currency type selected in the island Show Entries. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.
<b>Billing Price, Inv.</b>	This field shows the difference between the billing price that would have been invoiced before the beginning of the period specified in the card part if the job was closed at that time, and the billing price that would have been invoiced at the end of the selected period if the job was closed at that particular time.
<b>Quantity, Up/Down</b>	This field shows the difference between the quantity that would have been written up or down before the beginning of the period specified in the card part if the job was closed at that time, and the quantity that would have been written up or down at the end of the selected period, if the job was closed at that particular time.
<b>Billing Price, Up/Down</b>	This field shows the difference between the registered billing price and the invoiced billing price registered on the current entry. If the invoiced billing price is greater than the registered billing price, the value will be

Field	Description
	positive. If the invoiced billing price is below the registered billing price, the value is negative.
<b>Standard Billing Price</b>	This field shows the standard billing price of the current entry.
<b>Standard Up/Down</b>	This field shows the difference between the registered billing price and the standard billing price registered on the current entry. If the registered billing price is greater than the standard billing price, the value will be positive. If the registered billing price is below the standard billing price, the value is negative.
<b>Total Up/Down</b>	This field shows the difference between the standard billing price and the invoiced (plus not yet invoiced) billing price of the current entry. This corresponds to the value of the field "Billing Price, Up/Down" plus the value of the field "Standard Up/Down."
<b>Cost, Transferred To</b>	<p>This field shows the cost transferred to new dimensions on the job during the period specified in the card part.</p> <p>The amount is shown in enterprise currency or base currency, depending on the currency type selected in the island Show Entries. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.</p>
<b>Cost, Transferred From</b>	<p>This field shows the cost transferred from "old" dimensions to new dimensions on the job during the period specified in the card part.</p> <p>The amount is shown in enterprise currency or base currency, depending on the currency type selected in the island Show Entries. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.</p>
<b>Billing Price, Transferred To</b>	This field shows the billing price transferred to new dimensions on the job during the period specified in the card part.
<b>Billing Price, Transferred From</b>	This field shows the billing price transferred from "old" dimensions to new dimensions on the job during the period specified in the card part.
<b>Incl. in Fixed Price</b>	This field shows whether or not the entry is included in the fixed price of a job. If the field is marked, the entry is not included in the fixed price of a job. See the introduction to the window Invoice Selection for a description of how Maconomy determines whether or not entries are to be included in the fixed price of a job.
<b>Exec. Company No.</b>	This field shows the number of the company which carried out the activity on the current job entry.

Field	Description
<b>Base Currency, Exec. Company</b>	This field shows the base currency selected for the executing company in the window Company Information.
<b>Cost, Exec. Company</b>	<p>This field shows the cost of one unit of the current activity in the executing company. If the responsible company is the same as the executing company, the cost in this field will be the same as the value in the field "Cost, Reg."</p> <p>This amount is shown in enterprise currency or base currency, depending on the currency type selected in the island Show Entries. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.</p>
<b>Cost</b>	<p>This field shows the job entry cost per unit in the base currency.</p> <p>This amount is shown in enterprise currency or base currency, depending on the currency type selected in the island Show Entries. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.</p>
<b>Entry No.</b>	This field shows the number of the job entry.
<b>Origin</b>	<p>This field shows the origin of the individual job entry. When a job entry is posted, Maconomy assigns information about the journal type from which the job entry was originally derived, to the job entry. This could, for example, be "Time Sheet" or "Job Accrual." Some entries are created without posting journals, for example, entries for direct invoicing. To such entries, the origin "Job" is assigned.</p> <p>The origin of a job entry never changes.</p>
<b>Entry Type</b>	<p>This field shows the entry type of the individual job entry. When a job entry is posted, Maconomy marks it as a certain type. The type will often be "Registration" (for example, time sheet and job journal entries). In the pop-up field "Entry Type" in the island Selection Criteria in the card part of this window, you can see the different entry types used by Maconomy.</p> <p>This is useful if a job entry changes type. If, for instance, a job entry is reallocated, the entry's origin will be preserved, but its type will be changed to "Reallocation" or "Reversal." This way, you can in this window see that a particular entry is, for example, a reallocated time sheet entry.</p>
<b>Reallocated from Job No.</b>	If the current job entry has previously been reallocated, this field shows the number of the job from which the job entry was reallocated.
<b>Reallocated from Task</b>	If the current job entry has previously been reallocated, this field shows the task from which the job entry was reallocated.

Field	Description
<b>Vendor No.</b>	This field shows the number of the vendor who sold you a service in connection with the job entry.
<b>Vendor Name</b>	This field shows the name of the vendor who sold you a service in connection with the job entry.
<b>Vendor Inv. No.</b>	This field shows the number of the vendor invoice you received for the service you bought in connection with the job entry. The vendor invoice number is shown in the field "Invoice No." in the window Vendor Invoices.
<b>Vendor Invoice Document</b>	This field shows a document attached to a vendor invoice, such as a scanned invoice or an e-mail.
<b>Purch. Order No.</b>	If the current job entry was created from a purchase order, the number of the purchase order in question is shown in this field.
<b>Purchase Order Line No.</b>	If the current job entry was created from a purchase order, this field shows the line on the purchase order in question on which the job entry is based.
<b>Accrual Entry</b>	This field shows if the current entry is an accrual entry, that is, if the entry was created as a result of raising a job accrual from a purchase order line in the window Job Accruals.
<b>Quantity 1</b>	This field shows the quantity used in the current job entry.
<b>Quantity 2</b>	The functionality of this field is similar to that of the field "Quantity" above.
<b>Company No.</b>	This field shows the responsible company assigned to the job entry.
<b>Location</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Company No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Company No." above.

Field	Description
<b>Period From, Subscription</b>	If the current job entry originates from a subscription order, this field and the field "Period To, Subscription" below show the starting and ending periods of the subscription.
<b>Period To, Subscription</b>	See the description of the field "Period From, Subscription" above.
<b>Remarks</b>	This field shows the remarks assigned to the job entry.
<b>Activity Name</b>	This field shows the activity text entered for the job entry.
<b>Task Description</b>	This field shows the text defined for the current task, if a task has been entered in the field "Task."
<b>Employee Name</b>	This field shows the name of the employee entered in the field "Empl." above.
<b>Employee Category</b>	This field shows the category of the employee entered in the field "Empl." above.
<b>Overtime Spec.</b>	This field shows any overtime specification associated with the current job entry.
<b>Daily Description</b>	This field shows any daily description associated with the current job entry.

## Actions

This section shows the Actions available in the Financial Job Card workspace.

### Bottom Tab

Field	Description
<b>View Vendor Invoice Document</b>	<p>Use this action to view any document attached to a vendor invoice, for example a scanned invoice or an e-mail.</p> <p>This action is enabled when at least one job entry in the table part originates from a vendor invoice with an invoice number specified. If this action is used on other types of job entry, an error message will be displayed.</p>

## Pending Job Actions Workspace

Use this workspace to review pending job actions that might prevent you from processing your invoices or closing your jobs.

Examples include timesheets that have not been submitted or approved, open purchase order lines, and journals that have not been posted. This workspace lists your open jobs and their pending job actions.

Pending job actions refer to the activities that are related to a given job that are relevant when, for example, you are about to invoice a job or to close a job.

It may be convenient to check whether there are any open activities that prevent you from, for example, invoicing a job, and this workspace helps you to get a quick overview of pending actions so that you do not need to search in several different workspaces to get this information.

For example, when you attempt to close a job, Maconomy checks that a number of different conditions are satisfied. For example, all time sheets with entries on the given job must have been submitted and approved, and all invoices on account must have been fully reconciled. When Maconomy cannot close a job, you receive an error message that refers to the condition that is not satisfied. In this workspace you get a full overview of all such messages at once.

The Pending Job Actions tab displays information about open jobs (number, name, status, project manager, and so on), while Pending Job Actions sub-tab displays pending job actions. You can set some parameters that filter the pending action lines: you can set a date range, and you can filter out minor warnings that do not prevent job closing. The sub-tab also displays useful information about the job, such as last entry date, quote price, and so on.

## Pending Job Actions Tab

This section includes the fields and descriptions for the Pending Job Actions tab.

### Job Island

Field	Description
<b>Job</b>	This is the number and name of the job for which pending actions are displayed.
<b>Status</b>	This field displays the status of the job, either Quote or Order.
<b>Estimated Ending Date</b>	In this field, you can enter the date on which the job is expected to complete. The date is for information only.
<b>Project Manager No.</b>	In this field, you can enter the number of an employee created in the window Employees in the Set-Up module. Maconomy suggests the number of the user creating the job if this user has an employee number assigned to him. The project manager in this field is the one who can approve time and expense sheet lines if the fields in the island Approval indicate that the project leader can or must approve time and expense sheets. If so, this field must be completed. Furthermore, the project manager of a job can initiate the first job phase and end phases if job phases are used on the job.
<b>Customer</b>	In this field, you enter the number of the customer for whom the job is to be performed. Maconomy verifies that the number is that of an existing customer, and that the customer has not been blocked in the window Payment Information in the A/R module. If the customer's open balance has exceeded the credit limit, Maconomy shows a warning, and you can choose not to create the job. Note that if the current job is a template job, this field is not mandatory.

Field	Description
	This field also shows the customer's name as entered in the Customer Information Card in the A/R module. The name cannot be changed here, but you can change it in the window Job Information.
<b>Main Job No.</b>	If there is a main job related to this job, this field shows the number of the main job.
<b>No. of Subjobs</b>	This field shows the number of underlying jobs assigned to the job.
<b>Currency</b>	This field shows the currency of the job.
<b>Number of Pending Job Actions</b>	This field shows the number of pending job actions that you need to act on before you can close the job.
<b>Updated Date</b>	This field shows the date when the list of pending job actions was updated. Running the action "Close Jobs" will clear the field.

#### Selection Criteria Island

Field	Description
<b>Date</b>	In these fields you can specify a period for which you want to see pending job actions. By default, the fields will be empty and therefore show all entries. Running the action "Refresh List of Pending Job Actions" affects all actions, not only the visible ones.
<b>Category</b>	<p>All pending job actions are grouped into the six categories listed below. You can select or deselect individual categories or use the field "Select All" to select or deselect all categories. Your selection is directly displayed in the table part of this window.</p> <p>Depending on your selections, each category below may show the following warnings and messages:</p> <ul style="list-style-type: none"> <li>■ Select All — Use this field to select or deselect all categories.</li> <li>■ Time and Expense — Time Sheet Not Submitted, Time Sheet Not Approved, Time Not Approved by Manager, Expense Sheet Not Submitted, Expense Sheet Not Approved, Expense Sheet Not Approved by Project Manager, Mileage Sheet Not Submitted, Mileage Sheet Not Approved, Mileage Not Approved by Project Manager</li> <li>■ Purchase — Requisition Line Not Closed, Request For Quote Not Closed, Purchase Order Line Not Closed</li> <li>■ Posting — Time Sheet Journal not posted, Job Accrual Journal not posted, Job Journal not posted, Central Time Sheet Transfer, Vendor Invoice Allocations not posted, Expense Sheet Journal not posted,</li> </ul>

Field	Description
	<p>Mileage Sheet Journal not posted, General Journal not posted, Item Journal not posted, Job Reallocation Journal not posted, Job Revenue Recognition Journal not posted, Vendor Invoices exist</p> <ul style="list-style-type: none"> <li>Invoicing — Open Job Entries, Open Job Entries Not Included in Fixed Price, Open Invoices On Account, Fixed Price Not Invoiced, Invoice Selection Has Been Approved, Draft Invoice For Editing</li> <li>Sales Orders — Order Quote Line Exists, Sales Order Not End Invoiced, Credit Order Not End Invoiced</li> <li>Miscellaneous — Job Entries Being Reallocated, Accrued Balance, Subjob Not Closed, Event Flow Not Closed, Event Not Closed, Distribution from Main Job, Job Entries Marked for Reallocation</li> </ul> <p><b>Note:</b> Selection of the Miscellaneous check box displays "Asset not fully depreciated" in the Description field for a pending job action. You will not be able to close the job until you have removed the association of the asset to the job.</p>
<b>Only Lines Preventing Job Closing</b>	Marking this field limits the number of warnings displayed in the list of pending actions to include only those that prevent a job from closing.

### Job Progress Island

Field	Description
<b>Last Progress Date</b>	This field shows the date for which the progress information for the job was created.
<b>Completion %, Hours</b>	This field shows the completion percentage of the job, expressed as a percentage of total hours.
<b>Completion %, Cost</b>	This field shows the completion percentage of the job, expressed as a percentage of total costs.

### Last Job Revenue Recognition Island

Field	Description
<b>Date</b>	The date displayed in this field is determined by the value in the field "Show Latest Approved Revenue Recognition" in the window Job Revenue Recognition (the island Calculate Revenue). If that field is marked, this field will show the date on which the latest revenue recognition was approved. If that field is not marked, this field will display the date on which revenue was recognized on the job.
<b>Completion %</b>	This field shows the completion percentage of the last job revenue recognition.

Field	Description
<b>Revenue Recognition Amount</b>	<p>This field specifies the size of the amount to be recognized as revenue on the job. This amount can be calculated by Maconomy, and it will then correspond to the percentage of the fixed price shown in the field "Percentage, Recognized As Revenue" in the window Job Revenue Recognition. You can also specify an amount manually, and the percentage in the field "Percentage, Recognized As Revenue" will be updated to correspond to the specified amount. If the job is a fixed-price job, the amount specified cannot exceed the fixed price of the job as shown in the field "Fixed Price Basis." If the job is a time and material job, the values in the fields "Limit Revenue" and "Compl. % Limit" will determine how large an amount you can recognize as revenue on the job. Note that if the job has "Quote" status, the amount must be 0 in this field.</p> <p>When you specify an amount manually, Maconomy will reset the date in the field "Date, New Revenue Recognition" as an indication that you must decide yourself on which date the recognition of the calculated revenue should be based.</p> <p>Note that if you need to make a manual change to a job that uses detailed revenue recognition, such changes cannot be made in this window, but must instead be entered in the window Job Revenue Recognition Details.</p>

### Invoicing Island

Field	Description
<b>Oldest Open Entry</b>	This field shows the oldest entry date of all open job entries on the job.
<b>Last Invoice Date</b>	This field shows the date of the last invoice made for the job. The date cannot be changed here.
<b>Open Billing Price</b>	This field shows amount for open billing prices registered on the job before and within the relevant period.
<b>Net on Account</b>	This field shows the on account amount registered on the job before and within the relevant period. The field shows how much of the total job price has been invoiced or credited on account within the relevant period.
<b>Tax Net on Account</b>	This row shows the on account tax amount registered on the job before and within the relevant period. The fields show the amount of sales tax included in any invoices on account or credit memos on account.
<b>Drafts for Editing</b>	This field is marked if there are draft invoices for editing.
<b>Blanket Drafts for Editing</b>	This checkbox indicates whether there are blanket draft invoices for editing. Blanket drafts are created when you approve invoice selection in Blanket Invoice Selection or apply the "Create Blanket Drafts" action in Blanket Invoicing Overview.

Field	Description
<b>Submitted Drafts</b>	This field shows the number of submitted invoice drafts.
<b>Approved for Invoicing</b>	This field is marked if the job has been approved for invoicing.

#### Price Island

Field	Description
<b>Fixed Price</b>	This field shows the fixed price of the job.
<b>Budgeted Billing Price</b>	This field shows the total budgeted billing price found on the last approved revision of the current budget on the job.
<b>Quote Price</b>	This field shows the approved quote price.

#### Pending Job Actions Sub-Tab

This section includes the fields and descriptions for the Pending Job Actions sub-tab.

Pending job actions are ordered in the table part according to the type (Description), Date (the date when the problem was created), and Related Empl. No. (pointing to a person who may be able to resolve the problem).

Field	Description
<b>Category</b>	This field assigns one of the six categories to each pending job action.
<b>Description</b>	This field shows the type of the pending action. The field may, for example, contain text such as "Subjob not closed."
<b>Details</b>	This field shows the relevant details about the pending action. If, for example, the description is "Subjob not closed," this field would contain the text "Subjob number," followed by the number of the subjob. In other words, this field contains key information about the pending job action.
<b>Related Empl. No.</b>	This field can show the number of an employee who may be able to help solve a problem related to an item listed in this table.
<b>Related Empl. Name</b>	For time sheets that must be submitted, Maconomy suggests the employee on the time sheet, and for time sheets that must be approved, Maconomy suggests the approver. This field shows the name of the employee specified in the field "Related Empl. No."

Field	Description
<b>Date</b>	This field shows the date when the condition preventing the job from closing arose. For example, it would contain the first entry date of an unsubmitted expense sheet.
<b>Prevents Job Closing</b>	This field tells you whether the pending job action prevents the related job from being closed.

## Actions

This section shows the Actions available in the Pending Job Actions workspace.

### Top Tab

Field	Description
<b>Refresh List of Pending Job Actions</b>	<p>Run this action to create an updated list of pending job actions for the job currently selected.</p> <p>When you close the job or refresh the list of pending actions, you may also receive warnings. This happens if, for example, there is an unposted vendor invoice with the job number (the invoice itself, not one of the lines). Such a warning may also be included in the list of pending job actions even though they do not prevent a job from being closed. This also appears from the field "Prevents Job Closing," which will then be unmarked (as opposed to other obstructions); that is, there is no direct obstruction to job closure.</p>
<b>Clear List of Pending Job Actions</b>	<p>Run this action to clear the list of pending job actions for the job currently selected.</p> <p>This can be useful if you decide that the list of already created pending job activities is irrelevant, especially if you report on the generated lists of pending job activities across jobs in an effort to close many jobs at a time.</p>
<b>Close Job</b>	This action will attempt to close the job. If there are pending actions on the job that prevent it from being closed, an error message will be displayed, but the list of pending actions will not be updated.

## Job Overview Workspace

Use this workspace to get a general overview of a job, including budgeted cost and billing price, hours entered, total amount of committed purchase orders, total amount invoiced, pre-invoice totals, customer balance due, and revenue recognized.

This workspace displays:

- Budgeted cost and billing price in current budget, planning, and baseline budgets
- Non-approved billing price from submitted time, expense, and mileage sheets
- Registered and open hours, cost and billing price split by time and amount
- Amount committed on purchase orders

- Next invoice date according to the invoicing plan
- Total amount invoiced on account and amount net on account
- Total amount invoiced and total write up/down
- Billing price set for carry forward
- Customer balance due for the job
- Latest job progress evaluation
- Revenue recognized on the job
- Latest approved revenue recognition by completion percentage or WIP evaluation

The workspace introduces the Factor budgeted, entered, and invoiced on the job. This is calculated as the ratio  $(B_{\text{time}} + (B_{\text{amount}} - C_{\text{amount}})) / C_{\text{time}}$ , where B and C are the total billing price and total cost price in the current job budget, entered on the job, and invoiced on the job respectively, and the sub-scripts refer to the activity type (so  $B_{\text{time}}$  is the total billing price for time related activities). In addition, there is a factor for revenue recognized with the same formula, where B is revenue recognized on the job and C is total entered cost price in case of capitalization at billing price, and otherwise, the total invoiced cost price.

### Job Overview Tab

Use this tab to get a general overview of a job, including budgeted cost and billing price, hours entered, total amount of committed purchase orders, total amount invoiced, pre-invoice totals, customer balance due, and revenue recognized.

### Job Island

Field	Description
<b>Job</b>	This field shows the job number and name.
<b>Currency</b>	This field shows the job currency.
<b>Invoiceable</b>	This field shows whether the job is invoiceable and/or internal job.
<b>Job Group</b>	This field shows the job group.
<b>Project Manager</b>	This field shows the name of the project manager.
<b>Main Job</b>	This field shows the main job number and name if the job is a subjob.
<b>No. of Subjobs</b>	This field shows the number of subjobs if the job is a main job.
<b>Closed</b>	This check box indicates whether the job is closed.

### Dates Island

Field	Description
<b>Start Date</b>	This field shows the date when the job was started, given by the project manager.
<b>Estimated Ending Date</b>	This field shows the expected ending date, given by the project manager.
<b>Actual Completion</b>	This field shows the date when the job was closed.

### Price Island

Field	Description
<b>Invoicing Method</b>	This field shows whether the job is Fixed Price or Time & Material.
<b>Fixed-Price Basis</b>	This field shows whether the basis for fixed price is the budget or the quote.
<b>Fixed Price Budget Type</b>	If the fixed price is based on the budget, this field shows the budget type for the fixed price.
<b>Fixed Price, Currency</b>	This field shows the fixed price of the job in job currency.
<b>Quote Price, Currency</b>	This field shows the quote price in job currency.

### Time Registrations Island

Field	Description
<b>Hours Registered</b>	This field shows the total number of hours registered for the job.
<b>Cost Price Reg., Base</b>	This field shows the registered cost price for time activities in the base currency of the job.
<b>Billing Price Reg., Currency</b>	This field shows the registered billing price for time activities in the job currency.
<b>Latest Time Sheet Registrations</b>	This field shows the date of the latest time sheet with registrations on the job. This includes unsubmitted time sheets.
<b>Last Date Project Manager Time Approvals</b>	This field shows the date of the last time the project manager approved time sheet lines for the job.

**Time Registrations, Invoiced Sub-Island**

Field	Description
<b>Hours, Invoiced</b>	This field shows the total number of hours invoiced for the job.
<b>Hours, Up/Down</b>	This field shows the write up/down in terms of hours.
<b>Billing Price Invoiced, Currency</b>	This field shows the billing price invoiced for time activities in job currency.
<b>Billing Price Up/Down, Currency</b>	This field shows the write up/down for time activities in job currency.
<b>Cost Price Invoiced, Base</b>	This field shows the invoiced cost price for time activities in the base currency of the job.

**Time Registrations, Open Sub-Island**

Field	Description
<b>Hours, Open</b>	This field shows the number of open hours, that is, hours registered but not invoiced.
<b>Billing Price, Currency</b>	This field shows the open billing price for time activities, in job currency.
<b>Cost Price, Base</b>	This field shows the open cost price for time activities in base currency.

**Time Registrations, Non Approved Time Sheets Sub-Island**

Field	Description
<b>Billing Price, Currency</b>	This field shows the total registered billing price on time sheets which has been submitted but not transferred for posting.

**Time Registrations, Non Submitted Time Sheets Sub-Island**

Field	Description
<b>Number of Hours</b>	This field shows number of hours from time sheet lines on the jobs for time sheets that have not been submitted. For time sheets in days, the number of days on the time sheets is converted to hours by multiplying with the number of hours per man day specified on the job.

### Billing Island

Field	Description
<b>Billing Price Up/Down, Total, Currency</b>	This field shows the write up/down in job currency.

### Invoice Selection Status Island

Field	Description
<b>Open for Selection</b>	This check box indicates whether the job is open for invoice selection.
<b>Includes Sub Jobs</b>	This check box is selected if the job is a main job with subjobs set up for invoicing on the main job.
<b>Carry Forward, Currency</b>	This field shows the total amount currently selected for carry forward with respect to invoice selection.
<b>Drafts for Editing</b>	This check box indicates whether draft invoices are currently being edited on the job. A related text field shows the number of drafts being edited.
<b>Blanket Drafts for Editing</b>	This checkbox indicates whether there are blanket draft invoices for editing. Blanket drafts are created when you approve invoice selection in Blanket Invoice Selection or apply the "Create Blanket Drafts" action in Blanket Invoicing Overview.
<b>Submitted Drafts</b>	This field shows the number of submitted invoice drafts.
<b>Approved for Invoicing</b>	This check box indicates whether drafts are currently approved for invoicing on the job.
<b>Submitted by</b>	This field shows the name of user who submitted this draft.
<b>Submitted Date</b>	This field shows the date when the draft was submitted.
<b>Approved by</b>	This field shows the name of the user who approved the job for invoicing.
<b>Approval Date</b>	This field shows the date on which the job was approved for invoicing.

### Revenue Recognition Island

Field	Description
<b>Job Parameter Setup</b>	This field shows the name of the job parameter for revenue recognition setup.

Field	Description
<b>Revenue Recognized, Currency</b>	This field shows the revenue recognized in job currency.

**Factor Island**

Field	Description
<b>Factor, Current Budget</b>	This field shows the factor for the current job budget. This metric is only available for the current budget.
<b>Factor, Reg.</b>	This field shows the factor for the job according to total registered cost and billing price.
<b>Factor, Invoiced</b>	This field shows the factor for the job according to the total invoiced cost and billing price.
<b>Factor, Revenue Recognized</b>	This field shows the factor for the job according to revenue recognized.

**Purchase Orders Island**

Field	Description
<b>Committed, Currency</b>	This field shows the amount committed on purchase orders in job currency.

**Customer Island**

Field	Description
<b>Customer</b>	This field shows the customer number and name on the job.

**Company Island**

Field	Description
<b>Company</b>	This field shows the company number and name on the job.
<b>Base Currency</b>	This field shows the currency of the company on the job.

**Current Budget Island**

Field	Description
<b>Created</b>	This check-box shows if a budget for the current budget type has been created.

Field	Description
<b>Budget Type</b>	This field shows the budget type of the current budget. Budget types are maintained in the pop-up field "Budget Type" in the Popup Fields window in the Set-Up module.
<b>Revision No.</b>	This field shows the revision number of the current job budget.
<b>Cost Price</b>	This field shows the budgeted cost price in base currency.
<b>Billing Price, Currency</b>	This field shows the budgeted billing price in job currency.
<b>Billing Price, Base</b>	This field shows the budgeted billing price in base currency.
<b>Gross Margin, Base</b>	The field shows the gross margin in the current budget.
<b>Gross Margin Percentage</b>	This field shows the gross margin percentage according to the budgeted cost and billing prices.
<b>Markup Percentage</b>	This field shows the markup percentage of the current budget, that is, the gross margin as a percentage of the total cost price.
<b>Submitted</b>	This checkbox indicates whether the budget has been submitted.
<b>Submitted by</b>	This field shows the user name of the person who submitted the project budget.
<b>Date Submitted</b>	This field shows the date on which the project budget was submitted.
<b>Approved</b>	This check box indicates whether the project budget has been approved.
<b>Approved by</b>	This field shows the user name of the person who approved the project budget.
<b>Date Approved</b>	This field shows the date on which the project budget was approved.

#### Amount Registrations Island

Field	Description
<b>Cost Price Reg., Base</b>	This field shows the registered cost price for amount activities in the base currency of the job.
<b>Billing Price Reg., Currency</b>	This field shows the registered billing price for amount activities in the job currency.

Field	Description
<b>Latest Expense Sheet Registrations</b>	This field shows the date of the latest submitted expense sheet that has registrations on the job. This does not include unsubmitted expense sheets.
<b>Latest Mileage Sheet Registrations</b>	This field shows the date of the latest submitted mileage sheet that has registrations on the job. This does not include unsubmitted mileage sheets.
<b>Last Date Project Manager Expense Approvals</b>	This field shows the date of the last time that the project manager approved expense sheet lines for the job.

#### Amount Registrations, Invoiced Sub-Island

Field	Description
<b>Billing Price Invoiced, Currency</b>	This field shows the currency for the invoiced billing price.
<b>Billing Price Up/Down, Currency</b>	This field shows the write up/down for amount activities in the job currency.
<b>Cost Price Invoiced, Base</b>	This field shows the invoiced cost price in the base currency.

#### Amount Registrations, Open Entries Sub-Island

Field	Description
<b>Open Billing Price, Currency</b>	This field shows the open billing price for amount activities in job currency.
<b>Open Cost Price, Base</b>	This field shows the open cost price in base currency.

#### Amount Registrations, Non Approved Expense Sheets Sub-Island

Field	Description
<b>Billing Price, Currency</b>	This field shows the total billing price on expense sheets that has been submitted but not transferred for posting.
<b>Cost Price Excl. Tax, Base</b>	This field shows the total cost excluding tax on expense sheets that have been submitted but not transferred.

### Amount Registrations, Non Approved Mileage Sheets Sub-Island

Field	Description
<b>Billing Price, Currency</b>	This field shows the total billing price for from mileage sheets that have been submitted but not transferred for posting.
<b>Cost Price Excl. Tax, base</b>	This field shows the total cost excluding tax from mileage sheets which have been submitted but not transferred for posting.

### Invoicing Island

Field	Description
<b>Last Invoice</b>	This field shows the date of the last invoice on this job.
<b>Invoiced Total, Currency</b>	This field shows the total invoiced billing price in job currency. The amount does not include on account invoices.

### Invoicing Island, Invoicing on Account Sub-Island

Field	Description
<b>Total Invoiced on Account, Currency</b>	This field shows the total amount invoiced on account in job currency.
<b>Net Invoiced on Account, Currency</b>	This field shows the net amount on account in job currency.
<b>Net Invoiced on Account, Collection, Currency</b>	This field shows the net amount on account including contributions from a job collection.
<b>Next Invoicing Date, Invoicing Plan</b>	This field shows the date of the next invoice according to the invoicing plan.
<b>Next Invoicing Phase, Invoicing Plan</b>	This field shows the date of the next phase to be invoiced as determined by the job phases.

### Invoicing Island, Pre-Invoicing

Field	Description
<b>Pre-Invoiced, Pending Payment, Currency</b>	This field shows the total amount for all pre-invoices on this job that are printed, but payment is not yet reconciled. The sum is displayed in pre-invoice currency.

Field	Description
<b>Pre-Invoiced, Pending Payment, Base</b>	This field shows the total amount for all pre-invoices on this job that are printed, but payment is not yet reconciled. The sum is displayed in pre-invoice base currency.
<b>Pre-Invoiced, Pending Payment, Enterprise</b>	This field shows the total amount for all pre-invoices on the job that are printed, but payment is not yet reconciled. The sum is displayed in pre-invoice enterprise currency.

#### Invoicing Island, Gross Margin Sub-Island

Field	Description
<b>Gross Margin, Invoiced, Base</b>	This field shows the total gross margin for the invoices on the job in base currency.
<b>Gross Margin Percentage, Invoiced</b>	This field shows the gross margin percentage on invoiced job entries. This is calculated as (billing price minus cost price) divided by billing price.
<b>Markup Percentage, Invoiced</b>	This field shows the markup percentage on invoiced job entries. This is calculated as the gross margin divided by the cost price.

#### Customer Balance (Incl. Tax) Island

Field	Description
<b>Customer Balance, Base</b>	This field shows the open amount in accounts receivables for the customer on the job, in base currency.
<b>Customer Balance Due, Base</b>	This field shows the amount due for payment in accounts receivables for the customer, in base currency.

#### Latest Approved Progress Evaluation Island

Field	Description
<b>Unit of Measure</b>	This field shows the unit that job progress shows in hours or cost price.
<b>Show Original Figures</b>	If this check box is selected, the window shows original figures approved in Job Progress, otherwise it shows the updated figures.
<b>Estimate Date</b>	This field shows the date of the last approved evaluation.
<b>Planned</b>	This field shows the hours/cost planned in the Resource Planning module (not People Planner).
<b>Actual</b>	This field shows actual work completed.

Field	Description
<b>ETC</b>	This field shows the estimate to completion. The unit depends on your choice in the Unit of Measure field.
<b>ETC, Days</b>	This field shows the estimated time to completion in days.
<b>Total</b>	This field shows the total work (in hours or cost price), which is the sum of actual and estimate to completion.
<b>Deviation</b>	This field shows the latest deviation between the total in the latest approved evaluation of job progress compared to the previous evaluation.
<b>Accumulated Deviation</b>	This field shows the accumulated deviation, which is the sum of the Deviation fields of all of the previous rows related to the job, including the current one.
<b>Baseline</b>	This field shows budgeted work on the baseline budget.
<b>Baseline Deviation</b>	This field shows the current deviation of the planning budget from the baseline budget.
<b>Completion Percentage</b>	This field shows the completion percentage of the job in the latest approved evaluation of job progress.
<b>Remarks</b>	This field shows any remarks that have been entered about the job's latest approved progress evaluation.
<b>Eval. Status</b>	This field shows the status that was selected in the latest approved evaluation of job progress. Use this field for assigning a high-level job progress status such as "Red," "Yellow," "Green."

## Actions

This section shows the Actions available in the Job Overview workspace.

### Top Tab

Field	Description
<b>Send Job to People Planner</b>	<p>This action will send the job, including budget, to People Planner. System parameters affecting this functionality are:</p> <ul style="list-style-type: none"> <li>Always Allow Send Action — If this is False, and Integration Status Notes are used, you can only push the job from Maconomy to People Planner once. After that, it will only be possible to import it from People Planner.</li> <li>Include Subjobs When Sending Job to People Planner — Allows including subjobs when sending jobs to People Planner.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Default Job Budget Type — If a value is entered, this will be the budget type sent. If a value is not entered, the budget type currently shown in Job Budgets will be sent. There is an exception if the job has been sent to People Planner previously using another budget type. In that case, this budget type will be used again.</li> </ul> <p>Note that with a large batch of budget lines, the performance of this action is impacted. However, it is possible to set up a Scheduled Background Task to recalculate job budgets periodically and therefore reduce the need to manually choose this action.</p> <p>The action is only available if add-ons for People Planner and Custom Actions are installed and the Enable Custom People Planner Actions system parameter is set to True.</p>

## Show Job Invoice Workspace

Use this workspace to find and review a past invoice for a job and, if necessary, reprint it. Additionally, you can cancel pre-invoices here.

Using the List of Invoices tab, you can retrieve a job invoice and see all of the relevant information without having to print it or look for old filed copies. This workspace displays how much tax Maconomy added. Note that this workspace only displays job invoices. You can view the invoices that you create in the Customer and Orders modules in the Show Invoice workspace in the Sales Orders module.

Using the **Print This** action, you can reprint the invoice in this workspace. With **Print...** you can reprint invoices in batches, which might be useful if you need to discard old copies because of a faulty printer or if they are lost. To reprint an old invoice, you must deselect the **Printed** field in the Invoice island. You cannot change the contents of any other fields in this workspace.

When you reprint an invoice, the new printout is always an exact copy of the original, even if you changed information on the job after the first printout. Maconomy saves the job information from the Jobs workspace at the printout of the original invoice and uses this job information on reprints.

### Show Job Invoice Tab

This section includes the fields and descriptions for the Show Job Invoice tab.

#### Billing Address Island

Field	Description
<b>Bill to Customer</b>	<p>This is the number of the customer who was invoiced.</p> <p>The other lines contain the customer's name and address. They are retrieved from the window Jobs.</p>
<b>Attn.</b>	<p>This is the customer's attention person to whom payment information is directed. It is retrieved from the window Jobs.</p>

Field	Description
<b>Country</b>	This is the customer's country code. It is retrieved from the window Jobs.

#### Price Island

Field	Description
<b>Invoice Currency</b>	This is the currency the job was invoiced in. It is specified in the Job Information window. Billing Price Total This is the sum of the billing prices shown in the table part of the job invoice.
<b>Billing Price Total</b>	This is the total line billing price in the job's currency.
<b>Invoice Discount %</b>	This is the percentage used to calculate the invoice discount. It is retrieved from the Job Information card.
<b>Invoice Discount</b>	This is the invoice discount deducted from the invoice. It is retrieved from the Job Information card, where it was entered as a percentage.
<b>Tax</b>	This is the tax Maconomy calculated for the invoice. It is added to the invoice automatically. If multiple tax codes are enabled, the "Tax" field will be replaced by the following fields: "Total Tax," "Tax 1," "Tax 2," and, if enabled, "Tax 3." The "Total Tax" field calculates the sum of the other individual tax amount fields. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Net on Account</b>	This field shows how much of the job price was invoiced on account and deducted from the final job invoice. If you are looking at an invoice on account, this field will show "0.00."
<b>Tax on Account</b>	This field shows how much tax has been added to any invoices on account for the job. It is deducted from the final job invoice. If you are looking at an invoice on account, this field will show "0.00." If multiple tax codes are enabled, the "Tax" field will be replaced by the following fields: "Total Tax on Account," "Tax on Account 1," "Tax on Account 2," and, if enabled, "Tax on Account 3." The "Total Tax on Account" field calculates the sum of the other individual tax amount fields. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Balance Due</b>	This is the amount (in the job's currency) which is due from the bill-to customer. It is the total billing price, less any invoices on account and including tax.
<b>Std. Currency</b>	This is the bill-to customer's currency. It is retrieved from the Customer Information Card in the Accounts Receivable module.

Field	Description
<b>Total In Standard</b>	This is the amount from the "Balance Due" field converted into the bill-to customer's currency.

#### Ship to Address Island

Field	Description
<b>Customer</b>	This is the number of the customer for whom the job was done. The other lines in this field show the ship-to customer's name and address. They are retrieved from the window Jobs.
<b>Attn.</b>	This is the ship-to customer's attention person to whom shipping information is directed. It is retrieved from the window Jobs.
<b>Country</b>	This is the customer's country code. It is retrieved from the window Jobs.

#### Detailed Specification Island

Field	Description
<b>Show</b>	Select this field to show the lines from the detailed section below the summary section.
<b>Contains Detailed Specification</b>	This field indicates whether the invoice contains lines in the Detailed specification section.

#### Invoice Island

Field	Description
<b>Invoice No.</b>	This is the number of the job invoice. If you cannot remember the number of a job, you can use the search functions in the Find menu. The invoice number series is defined in the window System Numbers in the Set-Up module.
<b>Printed</b>	<p>This field is marked by Maconomy if the invoice has been printed. You may want to reprint the invoice in at least two cases:</p> <ol style="list-style-type: none"> <li>1. If the invoice was, for example, damaged in the printer or otherwise lost before sent to the customer.</li> <li>2. If you need a copy for your own use or to send to the customer (if, for example, the customer claims to have misplaced the invoice).</li> </ol> <p>In case number 1, you will want to be able to print an exact copy of the invoice. To do this, remove the mark in this field and select "Print This" in the File menu, or select "Print..." in the File menu and mark the field "Incl. Printed" in the island Print Control before printing the selected invoices. When the invoice is reprinted, this field is marked again automatically.</p>

Field	Description
	<p>In case number 2, you may want to include an indication that the printed invoice is, in fact, a reprint. To do this, simply reprint the invoice without removing the mark in this field or marking the field "Incl. Printed" in the window Print Job Invoice. If the MPL variable "@ReprintOfInvoiceText" has been added to the invoice layout using Maconomy's layout editing tools, a language-dependent text will be printed on the invoice. This text is taken from the window Language Texts in the Set-Up module and is displayed in the invoice language.</p> <p>The new printout is only a copy of the original invoice, and does not affect the accounts.</p>
<b>Job No.</b>	This is the number of the job to which the invoice pertains. If it is a blanket invoice, this field shows the lowest job number of the jobs included in the job invoice. However, if the system parameter "Blanket invoicing per main job" is marked, the field shows the job number of the invoiced main job.
<b>Invoice Name</b>	This field shows the name of the invoice, which is derived from the job.
<b>Invoice Date</b>	This is the date the invoice was issued.
<b>Due Date</b>	This is the date the invoice becomes due. It is calculated automatically from the invoice date and terms of payment.
<b>Department</b>	This is the department associated with the job.
<b>Settling Company</b>	<p>This field shows the name and number of the settling company that applies to the current job.</p> <p>For further information about the influence of a settling company and how such a company is selected, please see "Multiple Companies" in "Introduction to the G/L Module." Intercompany entries are described in the Intercompany Accounts window in the G/L module.</p>
<b>Reference</b>	This is the reference entered in the "Ref." field in the window Jobs.
<b>Tax No.</b>	This is the invoice's tax number. It is retrieved from the window Job Information.
<b>Draft Created</b>	This field shows the name of the user who created the draft invoice (that is, who approved the invoice selection) and the date on which the draft invoice was created.
<b>Invoice Approved</b>	This field shows the name of the user who approved the job for invoicing and the date on which the job was approved for invoicing.
<b>Invoice Printed</b>	This field shows the name of the user who printed out the last invoice, currently shown in the window, and the date on which it was last printed. The name and date are not altered during reprint.

## Invoice Lines Sub-Tab

This section includes the fields and descriptions for the Invoice Lines sub-tab.

Field	Description
<b>Description</b>	This is the text describing the invoice line, retrieved from the window Invoice Editing. All invoice lines — both text lines and job entry lines appear in the same order as on the printed invoice.
<b>Quantity</b>	This is the number of units sold on the invoice line.
<b>Unit Price</b>	This is the unit price. For time activities it is the billing price per hour. For amount activities it is the total line billing price.
<b>Billing Price Total</b>	This is the total line billing price in the job's currency.
<b>Base Salary Markup %</b>	If the system parameter "Use markup % for time activities" is selected, then markup percentages in price lists are also applied to time registrations. This field shows the markup percentage relative to the base salary rate.
<b>Job No.</b>	This is the number of the job the current invoice line appears in.
<b>Job Name</b>	This is the name of the job in which the current invoice line appears.

## Actions

This section shows the Actions available in the Show Job Invoice workspace.

### Top Tab

Field	Description
<b>Cancel Pre-Invoice</b>	Select the pending pre-invoice, then use this action to cancel the pending pre-invoice. Once the pre-invoice is cancelled, no customer payments can be reconciled against the pre-invoice. The pre-invoice does not participate in any on account reconciliations for time and material invoices.
<b>Undo Cancel Pre-Invoice</b>	Select the pre-invoice, then use this action to reverse the cancellation of a cancelled pre-invoice. The pre-invoice returns to the <b>Payment Pending</b> state and can be either cancelled again or a payment can be reconciled against it.

## Show Job Credit Memo Workspace

Use this workspace to find and review a past credit memo for a job and, if necessary, reprint it.

Use this workspace to quickly look up a job credit memo. Using the search functions in the List of Credit Memos tab, you can retrieve a job credit memo and see of the all relevant information

without having to print it or look for old filed copies. This workspace displays how much tax Maconomy added. Note that this workspace only displays job credit memos. You can see the credit memos that you create in the Customer and Orders modules in the Show Credit Memo workspace in the Sales Orders module.

Using the **Print This** action, you can reprint the credit memo in this workspace. With **Print...** you can reprint credit memos in batches, which might be useful if you need to discard old copies because of a faulty printer or if they are lost. To reprint an old invoice, you must deselect the **Printed** field in the Invoice island. You cannot change any other fields in this workspace.

When you reprint a credit memo, the new printout is always an exact copy of the original, even if you changed information about the job after the first printout. Maconomy saves the job information from the Jobs workspace when printing the original credit memo and uses this job information on reprints.

### Show Job Credit Memo Tab

This section includes the fields and descriptions for the Show Job Credit Memo tab.

#### Billing Address Island

Field	Description
<b>Bill to Customer</b>	This is the number of the customer who received the credit memo. The other lines in this field show the customer's name and address. They are retrieved from the window Jobs.
<b>Attn.</b>	This is the customer's attention person to whom payment information is directed. It is retrieved from the window Jobs.
<b>Country</b>	This is the customer's country code. It is retrieved from the window Jobs.

#### Price Island

Field	Description
<b>Invoice Currency</b>	This is the job currency. It is specified in the window Job Information.
<b>Billing Price Total</b>	This is the sum of the billing prices shown in the table part of the job credit memo.
<b>Invoice Discount %</b>	This is the percentage used to calculate the invoice discount. It is retrieved from the Job Information card.
<b>Invoice Discount</b>	This is the invoice discount deducted from the invoice. It is retrieved from the Job Information card, where it was entered as a percentage.

Field	Description
<b>Tax</b>	<p>This is the tax Maconomy calculated for the invoice. It is added to the invoice automatically.</p> <p>If multiple tax codes are enabled, the "Tax" field will be replaced by the following fields: "Tax, Total," "Tax 1," "Tax 2," and, if enabled, "Tax 3." The "Tax, Total" field calculates the sum of the other individual tax amount fields. For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Net on Account</b>	<p>This field shows how much of the job price was credited on account and deducted from the final job invoice. If you are looking at an invoice on account, this field will show "0.00."</p>
<b>Tax on Account</b>	<p>This field shows how much tax has been added to any credit memos on account for the job. It is deducted from the final job credit memo. If you are looking at a credit memo on account, this field will show "0.00."</p> <p>If multiple tax codes are enabled, the "Tax on Account" field will be replaced by the following fields: "Tax, Total," "Tax 1," "Tax 2," and, if enabled, "Tax 3." The "Tax, Total" field calculates the sum of the other individual tax amount fields. For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Total Credited</b>	<p>This is the amount (in the job's currency) which is due from the bill-to customer. It is the total billing price, less any invoices on account and including tax.</p>
<b>Std. Currency</b>	<p>This is the bill-to customer's currency. It is retrieved from the Customer Information Card in the Accounts Receivable module.</p>
<b>Total in Standard</b>	<p>This is the amount from the "Total Credited" field converted into the bill-to customer's currency.</p>

#### Ship to Address Island

Field	Description
<b>Customer</b>	<p>This is the number of the customer for whom the job was done. The other lines will show the ship-to customer's name and address. It is retrieved from the window Jobs.</p>
<b>Attn.</b>	<p>This is the ship-to customer's attention person to whom shipping information is directed. It is retrieved from the window Jobs.</p>
<b>Country</b>	<p>This is the customer's country code. It is retrieved from the window Jobs.</p>

**Detailed Specification Island**

Field	Description
<b>Show</b>	Select this field to show the lines from the detailed section below the summary section.
<b>Contains Detailed Specification</b>	This field indicates whether the invoice contains lines in the Detailed specification section.

**Credit Memo Island**

Field	Description
<b>Credit Memo No.</b>	This is the number of the job credit memo. If you cannot remember the number of a job, you can use the search functions in the Find menu. The invoice number series is defined in the window System Numbers in the Set-Up module.
<b>Printed</b>	This field is marked if the credit memo has been printed. If you want to reprint it, remove the mark and use the "Print..." function in the File menu. When it is reprinted, this field is marked again.  The new printout is only a copy of the original credit memo, and has no effect on accounts.
<b>Re. Invoice No.</b>	This is the number of the job invoice from which the credit memo was created. If it shows "0," the credit memo was created manually.
<b>Job No.</b>	This is the number of the credit memo. If it is a blanket credit memo, this field shows the lowest job number of the jobs included in the job invoice.
<b>Credit Memo Name</b>	This is the name of the credit memo.
<b>Credit Memo Date</b>	This is the date the credit memo was issued.
<b>Department</b>	This is the department associated with the job.
<b>Settling Company</b>	This field shows the number and name of the settling company that applies to the current job.  For further information about the influence of a settling company and how such a company is selected, please see the section "Multiple Companies" in the chapter "Introduction to the G/L Module." Intercompany entries are described in the window Intercompany Accounts in the G/L module.
<b>Reference</b>	This is the reference entered in the "Ref." field in the window Jobs.
<b>Tax No.</b>	This is the credit memo's tax number. It is retrieved from the window Job Information.

Field	Description
<b>Draft Created</b>	This field shows the name of the user who created the draft invoice (that is, who approved the invoice selection) and the date on which the invoice was drafted.
<b>Credit Memo Approved</b>	This field shows the name of the user who approved the job for crediting and the date on which the job was approved for crediting.
<b>Credit Memo Printed</b>	This field shows the name of the user who last printed out the job credit memo currently shown in the window and the last date when the job credit memo was printed. The name and date are not altered during reprinting.

### Credit Memo Lines Sub-Tab

This section includes the fields and descriptions for the Credit Memo Lines sub-tab.

Field	Description
<b>Description</b>	This is the text describing the credit memo line, retrieved from the window Job Crediting. All credit memo lines—both text lines and job entry lines appear in the same order as on the printed credit memo.
<b>Quantity</b>	This is the number of units credited on the credit memo line.
<b>Unit Price</b>	This is the unit price.
<b>Billing Price Total</b>	This is the total line billing price in the job's currency.
<b>Base Salary Markup %</b>	If the system parameter "Use markup % for time activities" is selected, markup percentages in price lists are also applied to time registrations. This field shows a markup percentage relative to the base salary rate.
<b>Job No.</b>	This is the job number that is associated with the credit memo line.
<b>Job Name</b>	This is the name of the job in the "Job No." field.

## Display Reconciliation of Job Invoice on Account Workspace

Use this workspace to review how job invoices and job credit memos on account have been reconciled.

An invoice on account is an invoice issued in advance of any work done. The customer then pays this invoice, and later when a subsequent invoice is produced, the amount paid in advance is deducted from that invoice. This is called a reconciliation of the invoice on account and occurs automatically. This workspace shows which invoices on account are reconciled against which invoices, what amounts are still waiting to be reconciled, and so on.

The functionality of this workspace is almost the same for both job invoices on account and job credit memos on account, so only job invoices on account are mentioned in the following, unless differences apply.

When you print a job invoice on account in the Invoice Selection workspace, Maconomy creates a line in the sub-tab of the Job Invoices On Account workspace that displays information about the invoice on account in question. You can view this line in the Display Reconciliation Of Job Invoice On Account tab in this workspace. When you perform a regular job invoicing, the job invoice can be reconciled (reduced) by an amount previously invoiced on account. The reconciliation amount can be as high as the invoiced amount, unless the invoiced amount is higher than the amount invoiced on account. If several invoices on account exist, you can use the Job Invoices On Account workspace to determine which invoices on account should be reconciled and the extent of the reconciliation. When an invoice on account is fully reconciled, Maconomy closes it. If the same job invoice is later credited, Maconomy reopens the reconciled invoices on account.

This workspace displays an overview of the reconciliation of an invoice on account. The Display Reconciliation Of Job Invoice On Account tab displays information about the current invoice on account. The Reconciliations of Job Invoice on Account sub-tab tracks details about the reconciliation of the invoice on account.

### Display Reconciliation Of Job Invoice On Account Tab

This section includes the fields and descriptions for the Display Reconciliation Of Job Invoice On Account tab.

#### Invoice on Account Island

Field	Description
<b>Invoice No.</b>	This field shows the number of the current job invoice on account.
<b>Debit/Credit</b>	This field shows if the current window concerns a job invoice on account or a job credit memo on account. If the content of the field is "Debit," it is an invoice on account; if the content of the field is "Credit," it is a credit memo on account.
<b>Invoice Name</b>	— This field shows the name of the invoice which is derived from the job.
<b>Invoice Date</b>	This field shows the date of the current job invoice on account.
<b>Due Date</b>	This field shows the due date of the invoice on account.
<b>Approved by</b>	This field shows the name of the user who approved the job for invoicing.
<b>Approval Date</b>	This field displays the date on which the job was approved for invoicing.
<b>Printed By</b>	This field shows the name of the user who printed the invoice on account.

Field	Description
<b>Printing Date</b>	This field shows when the invoice on account was printed.
<b>Incl. in Fixed Price</b>	If this field is marked, the current job entry is not part of the fixed price of the job.

#### Reconciliation Amount Island

Field	Description
<b>Amount, Base</b>	This field shows the amount reconciled on the current invoice on account up till now, in the base currency of the company responsible for the job. If the amount is zero, the invoice on account has not been reconciled.
<b>Amount, Currency</b>	This field shows the amount reconciled on the current invoice on account up till now, in the job's currency. If the amount is zero, the invoice on account has not been reconciled.
<b>Tax, Base</b>	<p>This field shows the tax amount reconciled on the current invoice on account up till now, in the base currency of the company responsible for the job.</p> <p>If multiple tax codes are enabled, the "Tax, Base" field will be replaced by the following fields: "Total Tax, Base," "Tax 1, Base," "Tax 2, Base," and, if enabled, "Tax 3, Base." The "Total Tax, Base" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, see the description in "Tax Codes."</p>
<b>Tax, Currency</b>	<p>This field shows the tax amount reconciled on the current invoice on account up till now, in the job's currency.</p> <p>If multiple tax codes are enabled, the "Tax, Currency" field will be replaced by the following fields: "Total Tax, Currency," "Tax 1, Currency," "Tax 2, Currency," and, if enabled, "Tax 3, Currency." The "Tax Total, Currency" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, see the description in "Tax Codes."</p>
<b>Reconciliation Amount</b>	This field shows the amount to be reconciled on the current invoice on account in the window Job Invoices On Account.
<b>Settled</b>	If this field is marked, the current invoice on account is fully reconciled.

#### Invoice Amount Island

Field	Description
<b>Invoiced, Base</b>	This field shows the amount invoiced on account in the base currency of the company responsible for the job, excluding tax.

Field	Description
<b>Invoiced, Currency</b>	This field shows the amount invoiced on account in the job's currency, excluding tax.
<b>Tax Code</b>	This field shows the tax code used for the job. The tax code is specified in the window Job Information. If multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2," and, if enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Tax, Base</b>	This field shows the tax amount invoiced on account in the base currency of the company responsible for the job. If multiple tax codes are enabled, the "Tax, Base" field will be replaced by the following fields: "Total Tax, Base," "Tax 1, Base," "Tax 2, Base," and, if enabled, "Tax 3, Base." The "Total Tax, Base" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Tax, Currency</b>	This field shows the tax amount invoiced on account in the job's currency. If multiple tax codes are enabled, the "Tax, Currency" field will be replaced by the following fields: "Total Tax, Currency," "Tax 1, Currency," "Tax 2, Currency," and, if enabled, "Tax 3, Currency." The "Tax Total, Currency" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in "Tax Codes."

### Job Island

Field	Description
<b>Job</b>	This field shows the number of the job to which the current job invoice on account pertains. It also shows the name of the job as entered in the Jobs window.

### Reconciliations of Job invoice on Account Sub-Tab

This section includes the fields and descriptions for the Reconciliations of Job invoice on Account sub-tab.

Field	Description
<b>Invoice No.</b>	This field shows the number of the invoice or credit memo which has reconciled the current job invoice on account.
<b>Allocation No.</b>	This field shows the number of a job invoice allocation.
<b>Debit/Credit</b>	This field shows the type of the settling invoice or credit memo. The meaning of this field depends on the contents of the field "Debit/Credit" in the card part of the window, according to the following pattern:

Field	Description
	<ul style="list-style-type: none"> <li>■ If the content of the field “Debit/Credit” in the card part is “Debit,” the card part contains a job invoice on account.</li> <li>■ If the content of the field “Debit/Credit” in the table part is “Credit” — The current reconciliation derives from either a job invoice or a job invoice on account, which has reconciled the current invoice on account. The amount which may still need to be reconciled has decreased.</li> <li>■ If the content of the field “Debit/Credit” in the table part is “Debit” — The current reconciliation derives from a job credit memo, which has credited a job invoice which reconciled the current invoice on account. The amount which may still need to be reconciled has increased.</li> <li>■ If the content of the field “Debit/Credit” in the card part is “Credit,” the card part contains a job credit memo on account.</li> <li>■ If the content of the field “Debit/Credit” in the table part is “Debit” — The current reconciliation derives from either 1) a job credit memo, which reconciled the current credit memo on account, or 2) a job invoice which reconciled the credit memo on Amount Reconciled, Base account and a job invoice for at least the same amount. Please note that in the latter case it is actually the invoice on account that reconciles the credit memo on account. The amount which may still need to be reconciled has decreased.</li> <li>■ If the content of the field “Debit/Credit” in the table part is “Credit” — The current reconciliation derives from a job credit memo, which credited a job invoice of the type described in item 2) above. The amount which may still need to be reconciled has increased.</li> </ul>
<b>Amount Reconciled, Base</b>	This field shows the amount which was reconciled by the invoice or credit memo on the current line, in the base currency of the company responsible for the job.
<b>Tax Reconciled, Base</b>	<p>This field shows the tax amount which was reconciled by the invoice or credit memo on the current line, in the base currency of the company responsible for the job.</p> <p>If multiple tax codes are enabled, the “Tax Reconciled, Base” field will be replaced by the following fields: “Total Tax Reconciled, Base,” “Tax 1 Reconciled, Base,” “Tax 2 Reconciled, Base,” and, if enabled, “Tax 3 Reconciled, Base.” The “Total Tax Reconciled, Base” field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in “Tax Codes.”</p>
<b>Amount Reconciled, Currency</b>	This field shows the amount which was reconciled by the invoice or credit memo on the current line, in the job’s currency.

Field	Description
<b>Tax Reconciled, Currency</b>	This field shows the tax amount which was reconciled by the invoice or credit memo on the current line, in the job's currency.  If multiple tax codes are enabled, the "Tax Reconciled, Currency" field will be replaced by the following fields: "Total Tax Reconciled, Currency," "Tax 1 Reconciled, Currency," "Tax 2 Reconciled, Currency," and, if enabled, "Tax 3 Reconciled, Currency." The "Total Tax Reconciled, Base" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Reconciling Job No.</b>	This field shows the number of the job that reconciles the on account invoice.
<b>Reconciling Job Name</b>	This field shows the name of the reconciling job as entered in the Jobs window.

## Show Job Transfers Workspace

Use this workspace to review all job transfers.

For each job, you see information about each of the approved transfers that were made, including the transfer date, whether the transfer has been posted, the assigned posting date, and the dimensions to which the job has been transferred.

Use the Job Transfer workspace to transfer a job to other dimensions.

In the Show Job Transfers tab, you can see the name of the job and the customer that is assigned to it. The Job Transfers sub-tab displays information about all of the approved transfers that have been made on the job in question. Thus, this workspace provides an overview of any transfers, such as transfer date, whether or not the transfer in question has been posted, the assigned posting date, and the dimensions to which the job has been transferred. You transfer a job to other dimensions in the Job Transfer workspace. See the introduction to that workspace for more information about the possibilities for transferring jobs.

### Show Job Transfers Tab

This section includes the fields and descriptions for the Show Job Transfers tab.

#### Job Island

Field	Description
<b>Job</b>	This field shows the number and name of the job.
<b>Job Group</b>	This field shows the job group to which the job is assigned.
<b>Closed</b>	This field shows whether the job has been closed.

**Customer Island**

Field	Description
<b>Customer</b>	This field shows the number and name of the ship-to customer assigned to the job.
<b>Bill to Customer</b>	This field shows the number and name of the bill-to customer assigned to the job.

**Description Island**

Field	Description
<b>Internal</b>	This field shows any internal description assigned to the job.
<b>Description 2-3</b>	In these fields, you can enter a description of the current job. The fields are for information only.
<b>Ref.</b>	This field shows any reference to a customer representative dealing with the order. The information is transferred from the window Jobs.

**Company Island**

Field	Description
<b>Company</b>	This field shows the number and name of the company responsible for the job.
<b>Base Currency</b>	This field shows the currency used as base currency in the company specified in the field "Company" above.

**Dimension Combination Island**

Field	Description
<b>Dim. Comb. No.</b>	This field shows the number of a dimension combination assigned to the job.

**Derived Company Island**

This table shows the company dimension derived for the job and whether the company number must be overwritten on registrations upon derivation.

**Derived Dimensions Island**

Field	Description
<b>Location</b>	This field shows the value of the dimension "Location" assigned to the job.
<b>Entity</b>	This field shows the value of the dimension "Entity" assigned to the job.

Field	Description
<b>Project</b>	This field shows the value of the dimension "Project" assigned to the job.
<b>Purpose</b>	This field shows the value of the dimension "Purpose" assigned to the job.
<b>Spec. 1-3</b>	These fields show the values of the dimensions "Spec. 1-3" assigned to the job.
<b>Local Spec. 1-3</b>	These fields show the values of the dimensions "Local Spec. 1-3" assigned to the job.

### Job Transfers Sub-Tab

This section includes the fields and descriptions for the Job Transfers sub-tab.

Field	Description
<b>Transfer Date</b>	This field shows the date on which the job displayed in the card part of the window was transferred. The date displayed in this field is thus the date that was specified in the field "Transfer Date" in the window Job Transfer when the transfer of the job was performed.
<b>Posted</b>	This field shows whether the job transfer journal created as a result of the transfer of the job has been posted.
<b>Date Posted</b>	This field shows the posting date of the job transfer journal. If the job transfer journal has not yet been posted, the field "Posted" will not be marked and this field will be blank.
<b>Description</b>	This field shows a description of the transfer. The description displayed in this field is the description entered in the field "Description" in the island Transfer in the window Job Transfer before the transfer of the job was performed.
<b>Location</b>	This field shows the value of the dimension "Location" to which the job was transferred.
<b>Entity</b>	This field shows the value of the dimension "Entity" to which the job was transferred.
<b>Project</b>	This field shows the value of the dimension "Project" to which the job was transferred.
<b>Purpose</b>	This field shows the value of the dimension "Purpose" to which the job was transferred.
<b>Spec. 1-3</b>	These fields show the values of the dimensions "Specification 1-3" to which the job was transferred.
<b>Local Spec. 1-3</b>	These fields show the values of the dimensions "Local Specification 1-3" to which the job was transferred.

## Job Search Workspace

Use this workspace to see an overview of a group of jobs.

You define groups of jobs by choosing selection criteria in the Selection Criterion Specification workspace in the Set-Up module, then you can search for job groups in the Job Search workspace. Additionally in the Selection Criteria Specification workspace, you can define rules for filtering jobs. For example, you can create a rule that finds all jobs with a Project Manager set to a certain employee. Then in the Job Search workspace, you choose that selection criteria, run the Search action, and display a list of matching jobs in the Search Results tab.

In this workspace, Maconomy shows an overview of a certain selection of jobs. In the Selection Criterion Specification workspace in the Set-Up module you can define selection criteria to select different groups of jobs. In the Job Search workspace you can then browse through the different selection criteria specifications of the **Job** type as defined in the Selection Criterion Specification workspace and print out a list of the jobs that meet those criteria.

If the selection criterion specification contains a definition of a selection of events, this workspace also displays these events by job.

You might have defined a selection criterion specification to display all of the jobs for which the current job processing status is **Transferred to Development**. When a job acquires this status—that is, when you close an event in the Job Events workspace in the Contact Management module—the job matches the selection criterion specification and is displayed in this workspace. For more information about creating selection criterion specifications, see the description of the Selection Criterion Specification workspace in the Set-Up module.

When you browse through the selection criterion specifications, the Search Results sub-tab displays the result of the last job search that you performed for the current selection criterion specification. This sub-tab does not necessarily reflect the result of a job search using the current selection criterion specification. To update the search results, you must use the **Search** action in the Action menu.

### Job Search Tab

This section includes the fields and descriptions for the Job Search tab.

#### Selection Criteria Island

Field	Description
<b>Selection Criterion Specification No.</b>	This field shows the number of the current selection criterion specification. The number was entered at the creation of the selection criterion specification in the window Selection Criterion Specification and cannot be changed in this field.
<b>Description</b>	This field shows the description of the current selection criterion specification. The number was entered at the creation of the selection criterion specification in the window Selection Criterion Specification and cannot be changed in this field.
<b>Type</b>	This field shows the type of the current selection criterion specification. The type was selected at the creation of the selection criterion specification in the window Selection Criterion Specification and cannot be

Field	Description
	changed in this field. In this window it is only possible to see selection criterion specifications of the type "Job."
<b>Public</b>	This field shows whether the current selection criterion specification can be seen by all users or only by the user who created it.
<b>Blocked</b>	This field shows whether the current selection criterion specification has been blocked in the window Selection Criterion Specification.

### Result Delimitation Island

Field	Description
<b>No. Lines</b>	If a selection criterion specification is very broad and includes a substantial number of jobs, it may cause a heavy system load. Therefore, a default limit of 200 jobs has been specified, so that the search is interrupted once 200 jobs have been found. You are free to change this value.

### Print Control Island

Field	Description
<b>Layout</b>	When the action "Print Search Result" is selected, Maconomy prints out the overview of the jobs found. In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option. With this layout the jobs are printed with the information that is also shown in the table part.

### Search Results Sub-Tab

This section includes the fields and descriptions for the Search Results sub-tab.

Field	Description
<b>Job No.</b>	The fields in the table part are shown as information only and cannot be changed. The fields show information on the job and on any events assigned to the job as well as the job processing status. If you select the layout "Standard" for your print, all fields in the table part are printed out. This field shows the number of the job which is included in the selection criterion specification in the island Selection Criteria.
<b>Job Name</b>	The functionality of this field is similar to that of the field "Job No." above.
<b>Customer No.</b>	The functionality of this field is similar to that of the field "Job No." above.
<b>Customer Name</b>	The functionality of this field is similar to that of the field "Job No." above.

Field	Description
<b>Event No.</b>	This field shows the number of an event assigned to the job in the window Job Events or Events in the Contact Management module, if any selection criteria concerning events have been specified in the selection criterion specification in question. If this is not the case, the field is blank.
<b>Event Type</b>	The functionality of this field is similar to that of the field "Event No." above.
<b>Description</b>	The functionality of this field is similar to that of the field "Event No." above.
<b>Completed</b>	The functionality of this field is similar to that of the field "Event No." above.
<b>Closed</b>	The functionality of this field is similar to that of the field "Event No." above.
<b>Result</b>	The functionality of this field is similar to that of the field "Event No." above.
<b>New Job Processing Status</b>	The functionality of this field is similar to that of the field "Event No." above.

## Actions

This section shows the Actions available in the Job Search workspace.

### Top Tab

Field	Description
<b>Search</b>	When you select this action, Maconomy will perform a new search on the basis of the specified selection criterion specification. Any search result already shown in the table part is first reset.
<b>Print Search Result</b>	When you select this action, Maconomy will print out the jobs shown in the table part. The jobs are printed with the layout selected in the card part of the window. With the layout "Standard," Maconomy prints out all information on the jobs shown in the table part.
<b>Reset Search Result</b>	When you select this action, the search result currently shown in the table part is reset.

## Job Entry Overview Workspace

Use this workspace to review job entries and their associated invoice lines.

You cannot make any changes in this workspace.

All job entries in the system can be viewed through this workspace. You can choose a specific entry using the filter (List of Job Entries) tab. For each job entry, the workspace shows all invoice

lines (in the Job Invoice Lines tab), though usually a job entry has no more than a few invoice lines.

The information in this workspace is useful if you need to track which job invoice certain job entries belong to.

The Job Entry Overview tab displays one job entry at a time. The Job Invoice Lines sub-tab displays the job invoice line or lines that were created based the job entry in the Job Entry Overview tab.

### Job Entry Overview Tab

This section includes the fields and descriptions for the Job Entry Overview tab.

#### Entry Information Island

Field	Description
<b>Job</b>	This is the number and name of the job to which the current job entry belongs.
<b>Activity No.</b>	The number of the activity registered on the current job entry.
<b>Activity Type</b>	The activity type: Time or Amount.
<b>Activity Name</b>	The description of the activity registered on the current job entry.
<b>Description</b>	The description of the job entry as entered in for example a time sheet.
<b>Task</b>	The task registered on the current job entry.
<b>Employee</b>	The number and name of the employee registered on the current job entry.
<b>Vendor</b>	This is the vendor number and name if the current job entry concerns an amount activity, and the vendor of the service was registered on the job entry.
<b>Vendor Invoice No.</b>	If the current job entry is associated with a vendor invoice, the associated vendor invoice may be registered here.
<b>Item No.</b>	Any item number referenced by the current job entry.
<b>Asset No.</b>	When a job entry is created from asset depreciation, the asset number is on the job entry.
<b>Remarks</b>	Any remarks from the current job entry.

Field	Description
<b>Period From, Subscription</b>	If the current job entry originates from a subscription order, this field and the field "Period To, Subscription" below show the starting and ending periods of the subscription.
<b>Period To, Subscription</b>	See the description of the field "Period From, Subscription" above.
<b>Entry No.</b>	The number of the current job entry.
<b>Date</b>	The date of entry of the current job entry.
<b>Entry Type</b>	The type of the current job entry – for example "Registration" or "Reallocation."
<b>Journal No.</b>	The number of the journal on which the current job entry was posted.
<b>Journal Line No.</b>	The number of the line in the journal on which the current job entry was posted.
<b>Being Reopened</b>	If this field is marked, the current job entry is being reopened, for instance in the window Time Sheets.
<b>Approved for Inv.</b>	If this field is marked, the current job entry has been approved for invoicing.
<b>Accrual Entry</b>	If this field is marked, the current job entry was created as part of an accrual.
<b>Incl. in Fixed Price</b>	If this field is marked, the current job entry is not part of the fixed price of the job.
<b>Action</b>	This field shows the action performed on the current job entry in the window Invoice Selection ("Invoice," "Write Off," or "Carry Forward").
<b>Origin</b>	This field shows where the current job entry was created, for example in a Time Sheet.
<b>External Cost</b>	This field is marked if the job entry must be displayed as an external cost. If the job entry is later reallocated, the cost is treated as external, and therefore kept in the reallocation.
<b>Direct Inv.</b>	If this field is marked, the current job entry was marked for direct invoicing.
<b>Over Invoicing Entry</b>	If this field is marked, the current job entry is an over invoicing entry.
<b>Reallocate</b>	If this field is marked, the current job entry has been marked for reallocation.
<b>Selected</b>	If this field is marked, the current job entry has been selected for reallocation.

Field	Description
<b>Date Reallocated</b>	If the current job entry was reallocated, this field shows the date of reallocation.
<b>Cost Type</b>	This field shows if the current job entry is a Turnover or Outlay activity.
<b>Reallocate</b>	If this field is marked, the current job entry has been marked for reallocation in the window Invoice Selection.
<b>Latest Reallocation Number</b>	This field shows if the number of the latest reallocation of this job entry.
<b>Amount Reallocated</b>	If the current job entry was reallocated, this field shows the amount of the reallocation.
<b>Reallocated from Instance Key</b>	If the current job entry has previously been reallocated, this field shows the instance key of the entry from which the job entry was reallocated.
<b>Reallocated from Job No.</b>	If the current job entry has previously been reallocated, this field shows the number of the job from which the job entry was reallocated.
<b>Reallocated from Task</b>	If the current job entry has previously been reallocated, this field shows the task from which the job entry was reallocated.
<b>Purch. Order No.</b>	If the current job entry is part of a purchase order, this field shows the number of the purchase order.
<b>Purchase Order Line No.</b>	If the current job entry is part of a purchase order, this field shows the line number of the job entry in the purchase order.
<b>G/L Entry Date</b>	This field shows the date on which the current job entry was entered in the General Ledger.
<b>Receivable Tax Code 1</b>	<p>This field shows the receivable G/L tax code of the current job entry. If multiple tax codes are enabled, the "Receivable Tax Code 1" field will be replaced by the following fields: "Receivable Tax Code 1-3"; "Receivable Tax 1-3, Currency"; "Receivable Tax 1-3, Base"; and "Receivable Tax 1-3, Enterprise."</p> <p>For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Invoice</b>	If this field is marked, the current job entry has been selected for invoicing.
<b>Overtime Spec.</b>	This field shows any overtime specification on the current job entry.
<b>Daily Description</b>	This field shows any daily description entered on the current job entry.

Field	Description
<b>Trans. No.</b>	This field shows the transaction number of the current job entry.
<b>Trans. Type</b>	This field shows the transaction type of the current job entry. The field is for reference only and cannot be changed here.
<b>Invoice No.</b>	This field shows the number of the invoice where the current job entry was invoiced.
<b>Invoicing Job No.</b>	This field shows the number of the job invoiced on the invoice of the current job entry.
<b>Date Posted</b>	This field shows the date on which the invoice where the current job entry was invoiced was posted.
<b>Close</b>	If this field is marked, the current job entry will be closed after invoicing.
<b>Closed</b>	If this field is marked, the current job entry is closed.
<b>Tax Code</b>	This field shows the tax code registered on the current job entry. If multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2," and, if three tax levels are enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Item Tax Code</b>	This field shows any tax code associated with any item registered on the current job entry.
<b>Markup %</b>	This field shows the markup percentage of the current job entry.

#### Billing Price Deviation Island

Field	Description
<b>Standard Billing Price, Currency</b>	<p>This field shows the standard billing price per unit in the currency of the job.</p> <p>If the system parameter "Update prices upon dimension change" has been marked, the price in this field is updated when certain key information on the line is changed, for instance, the activity, employee, or dimension values. For further information on this and for a complete list of the fields causing the price to be updated, see the description of the system parameter "Update prices upon dimension change." If the system parameter is not marked, and you wish to ensure that all prices reflect the current set-up of the budget lines, use the action "Recalculate Job Budget."</p> <p>Total Standard Billing Price, Currency This field shows the total standard billing price of the current budget entry in the currency of the job.</p>

Field	Description
	If the system parameter "Update prices upon dimension change" has been marked, the price in this field is updated when certain key information on the line is changed, for instance, the activity, employee, or dimension values. For further information on this and for a complete list of the fields causing the price to be updated, see the description of the system parameter "Update prices upon dimension change." If the system parameter is not marked, and you wish to ensure that all prices reflect the current set-up of the budget lines, use the action "Recalculate Job Budget."
<b>Standard Up/Down, Currency</b>	This field shows the difference between the registered billing price and the standard billing price for the current entry in the currency of the job, within the selected period. This information can be used for performance analyses
<b>Standard Billing Price, Base</b>	This field shows the total budgeted standard billing price in the company's base currency.
<b>Standard Billing Price Total, Base</b>	This field shows the total standard billing price of the current budget entry in the base currency of the company.
<b>Standard Up/Down, Base</b>	This field shows the difference between the registered billing price and the standard billing price for the current entry in the base currency of the company, within the selected period. This information can be used for performance analyses.
<b>Standard Billing Price, Enterprise</b>	This field shows the total budgeted standard billing price in the company's enterprise currency.
<b>Standard Billing Price total, Enterprise</b>	This field shows the total standard billing price of the current budget entry in the enterprise currency of the company.
<b>Standard Up/Down, Enterprise</b>	This field shows the difference between the registered billing price and the standard billing price for the current entry in the enterprise currency of the company, within the selected period. This information can be used for performance analyses.

### Transfer Island

This island shows information about the current entry if the entry has been transferred to or from. For more information about job transfers, please see the overview of the Job Transfer window.

Field	Description
<b>Moved</b>	This field shows whether the entry has been transferred from and subsequently closed.

Field	Description
<b>Transfer Date</b>	If the current entry has been transferred, this field shows the date of the transfer.
<b>Moved G/L entry date</b>	If the current entry's registrations have been transferred to new dimensions and subsequently closed in the Job Transfer window, this field shows the G/L entry date that has been set on the new job entry.
<b>Moved to Entry No.</b>	This field shows the entry number of the new job entry that the current entry was transferred to.
<b>Billing Price, Transferred To</b>	This field shows the total billing price, if any, transferred to the new dimensions on the job.
<b>Billing Price, Transferred From</b>	If the current entry has been transferred to new dimensions in the window Job Transfer, this field shows the total billing price transferred from the "old" dimensions of the job entry to the new dimensions of the job entry.
<b>Cost, Transferred To</b>	This field shows the cost transferred to new dimensions on the job.
<b>Cost, Transferred From</b>	This field shows the cost transferred from "old" dimensions to new dimensions on the job entry.
<b>Billing Price, Transferred To, Base</b>	This field shows the billing price transferred to new dimensions on the job, in base currency.
<b>Billing Price, Transferred From, Base</b>	This field shows the billing price transferred from "old" dimensions to new dimensions on the job entry, in base currency.
<b>Cost, Transferred To, Enterprise</b>	This field shows the cost transferred to new dimensions on the job during the period specified in the card part, in enterprise currency.
<b>Cost, Transferred From, Enterprise</b>	This field shows the cost transferred from "old" dimensions to new dimensions on the job during the period specified in the card part, in enterprise currency.
<b>Billing Price, Transferred To, Enterprise</b>	This field shows the billing price transferred to new dimensions on the job during the period specified in the card part, in enterprise currency.
<b>Billing Price, Transferred From, Enterprise</b>	This field shows the billing price transferred from "old" dimensions to new dimensions on the job during the period specified in the card part, in enterprise currency.

Field	Description
<b>Quantity, Transferred To</b>	If the current entry has been transferred to new dimensions, this field shows the quantity transferred to the job assigned the new dimensions. A job is transferred to new dimensions in the window Job Transfer.
<b>Quantity, Transferred From</b>	If the current entry has been transferred to new dimensions in the window Job Transfer, this field shows the quantity transferred from the "old" dimensions of the current job entry.

### Dimensions Island

Field	Description
<b>Location</b>	This field shows the location entered on the current job entry.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

### Company Island

Field	Description
<b>Company</b>	This field shows the number and name of the company responsible for the job of the current job entry.
<b>Base Currency</b>	This field shows the base currency of the company shown in the field "Company No." above.

### Executing Company Island

Field	Description
<b>Executing Company</b>	This field shows the number and name of the executing company that applies to the current job.
<b>Base Currency</b>	This field shows the base currency of the company shown in the field "Company No." above.

### Price Island

This island shows a large number of details about the current job entry. The island is divided into sections, each of which deals with one of the possible currencies of the price of the current job entry: Job Currency, Base, Enterprise, and Original.

Field	Description
<b>Currency</b>	This field shows the job currency.
<b>Billing Price, Reg.</b>	This field shows the billing price registered on the job entry.
<b>Open Billing Price, Currency</b>	This field shows the total open billing price on the job. The amount includes job entries on subjobs that are set up to be invoiced on the main job.
<b>Billing Price, Inv.</b>	This field shows the billing price invoiced for the current job entry. Billing Price, Up/Down. This shows any difference between the billing price you have entered and the billing price you invoice when the job entry is closed. If the invoiced billing price is greater than the entered billing price, the value will be positive. If the invoiced billing price is below the entered price, the value is negative. The difference between the invoiced billing price and the standard billing price deviation (as seen in the field "Standard Up/Down") is shown in the field "Total Up/Down."
<b>Billing Price Up/Down Upon Cl., Currency</b>	This field shows the amount written up/down on the invoice upon closing, in job currency.
<b>Billing Price</b>	This field shows the billing price of the current entry.
<b>Billing Price for Inv., Currency</b>	This field shows the billing price from this particular job entry currently selected for invoicing.

### Price Island, Base Sub-Island

Field	Description
<b>Cost, Reg.</b>	This field shows the cost registered on the job entry. The amount is shown in enterprise currency or base currency, depending on the currency type selected in the island Show Entries. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.
<b>Open Cost, Base</b>	This is the open cost in base currency or company currency.
<b>Cost, Inv., Base</b>	This field shows the cost invoiced during the period specified in the card part. The amount is shown in enterprise currency or base

Field	Description
	currency, depending on the currency type selected in the Show Entries island. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.
<b>Cost for Inv., Base</b>	This field shows the cost price currently selected for invoicing from this particular job entry.
<b>Cost</b>	This field shows the cost for the job entry.
<b>Receivable Cost Excl. Tax, Base</b>	This field shows the cost price excluding VAT.
<b>Receivable Cost Incl. Tax, Base</b>	This field shows the cost price including VAT. Notice that only if the job entry origin is a vendor invoice or an expense sheet will this amount possibly differ from the amount excluding tax.
<b>Billing Price, Reg., Base</b>	This field shows the total billing price entered for the entry in base currency.
<b>Open Billing Price, Base</b>	This field shows the current open billing price of the job—that is, the sum of non-invoiced registrations on the job in base currency. The first time that you evaluate the job, this amount corresponds to the work in progress. Entries that are not part of the fixed price of the job are excluded.
<b>Billing Price, Inv., Base</b>	This field shows the billing price invoiced for the current job entry, in base currency.
<b>Billing Price, Up/Down, Base</b>	This field shows the write-up/-down amount for all of the entries being invoiced, in the company's currency. Write-up and write-down are the differences between the registered number of hours and the invoiced number of hours. Write-ups are shown as positive figures, and write-downs are shown as negative figures.
<b>Billing Price Up/Down Upon Cl., Base</b>	This field shows the write-up or -down that occurred when the job entry was closed. Notice that this is an internal field to show any difference between write-up or -down upon creation and write-up or -down upon closing on fixed-price jobs.
<b>Billing Price, Base</b>	This field shows the total budgeted billing price in the company's base currency.
<b>Billing Price for Inv., Base</b>	This field shows the billing price from this particular job entry currently selected for invoicing, in base currency.
<b>Intercompany Price, Base</b>	This field shows an intercompany price that will be used as the cost of one unit of the current activity if the executing company and the company responsible for the job in question are not identical.

**Price Island, Enterprise Sub-Island**

Field	Description
<b>Cost, Reg. Enterprise</b>	This field shows the entered cost for the job entry, in enterprise currency.
<b>Open Cost, Enterprise</b>	This is the open cost in enterprise currency.
<b>Cost, Inv., Enterprise</b>	This field shows the cost invoiced during the period specified in the card part, in enterprise currency.
<b>Cost for Inv., Enterprise</b>	This field shows the cost price currently selected for invoicing in enterprise currency.
<b>Cost, Enterprise</b>	This field shows the total of all budgeted cost prices of the jobs displayed in the table part of the window. If the field "Show Totals" in the Selection Criteria island has not been marked, this field will not show any value.
<b>Receivable Cost Excl. Tax, Enterprise</b>	This field shows the cost price excluding VAT, in enterprise currency.
<b>Receivable Cost Incl. Tax, Enterprise</b>	This field shows the cost price including VAT, in enterprise currency.
<b>Billing Price, Reg., Enterprise</b>	This field shows the total billing price entered for the entry, in enterprise currency.
<b>Open Billing Price, Enterprise</b>	This field shows the current open billing price of the job—that is, the sum of non-invoiced registrations on the job in enterprise currency.
<b>Billing Price, Inv., Enterprise</b>	This field shows the opening, changed, and closing billing prices that have been invoiced on the job before and within the relevant period, in enterprise currency.
<b>Billing Price Up/Down, Enterprise</b>	This field shows the amount by which the billing price has been written up or down. Write-up and write-down are the difference between the registered billing price and the invoiced billing price. Only completed entries will be included in the calculation.
<b>Billing Price Up/Down Upon Cl., Enterprise</b>	This field shows the write-up or –down that occurred when the job entry was closed. Notice that this is an internal field to show any difference between write-up or –down upon creation and write-up or –down upon closing on fixed-price jobs.
<b>Billing Price, Enterprise</b>	This field shows the total of all budgeted billing prices of the jobs displayed in the table part of the window. If the field "Show Totals" in the

Field	Description
	Selection Criteria island has not been marked, this field will not show any value.
<b>Billing Price for Inv., Enterprise</b>	This field shows the billing priced invoiced for the job entry, in enterprise currency.
<b>Original Currency</b>	This is the currency in which the invoice was registered (the entry's original currency).
<b>Original Cost</b>	This field shows the cost on the job entry original which may, for example, be a vendor invoice in some other currency.
<b>Accrual, Base</b>	This field shows the amount to be registered for accrual on the line in the system's base currency.
<b>Accrual, Enterprise</b>	This field shows the amount to be registered for accrual on the line in the system's enterprise currency.
<b>Cost, Exec. Company, Base</b>	This field shows the cost of one piece of the current activity in the executing company, in the company's base currency.
<b>Cost, Exec., Company, Enterprise</b>	This field shows the cost of one piece of the current activity in the executing company, in the company's enterprise currency.
<b>Billing Price, Exec. Company, Currency</b>	This field shows the initial billing price as set by the executing company. Notice that intercompany invoicing may lead to the job entry having another final billing price to the end customer.
<b>Billing Price, Exec. Company, Enterprise</b>	This field shows the initial billing price as set by the executing company. Notice that intercompany invoicing may lead to the job entry having another final billing price to the end customer.
<b>Quantity Open</b>	This field shows the number of open units registered in the current job entry. Please note that the open quantity of the job entry will only remain open after reallocation until the entry is invoiced.
<b>Quantity Up/Down.</b>	This field shows the difference between the quantity that would have been written up or down before the beginning of the period specified in the card part if the job was closed at that time, and the quantity that would have been written up or down at the end of the selected period, if the job was closed at that particular time.
<b>Quantity Up/Down at Closing</b>	This field shows the write-up or –down that occurred when the job entry was closed, in the currency of the job. Notice that this is an internal field to show any difference between write-up or –down upon creation and write-up or –down upon closing on fixed-price jobs.
<b>Quantity</b>	In this field you can see the quantity of units that were registered for the activity and assigned to the job entry. If the entry is a time activity, the quantity will be hours.

Field	Description
<b>Invoice Quantity</b>	This field shows the quantity to be invoiced from the job entry.
<b>Quantity Inv.</b>	This field shows the quantity of units invoiced for the current job entry.
<b>Quantity 1</b>	This field shows the quantity entered for the entry.
<b>Quantity 2</b>	This field shows the quantity 2 entered for the entry.
<b>Job Surcharge Entry</b>	<p>This field is marked if the job entry either in the billing price or in the job surcharge amount fields includes additional amounts that relate to a job surcharge rule percentage.</p> <p>See the Job Surcharge Rules window. If a surcharge derives dimensions, a second job entry marked as a surcharge entry is created, in addition to the actual registration.</p>
<b>Job Surcharge Amount</b>	This field shows the job surcharge amount part of the billing price field. This field only shows an amount if the job surcharge rule is not set up to derive another activity for an additional job entry registration.
<b>Job Surcharge Amount, Base</b>	This field shows the job surcharge amount in the base currency.
<b>Job Surcharge Amount, Enterprise</b>	This field shows the job surcharge amount in the enterprise currency.
<b>Base Price, Pc.</b>	This field shows the unit billing price before adjustment that may have been set up in a job price list line.

### Revenue Recognized Island

Field	Description
<b>Orig. Revenue Recognized, Currency</b>	Jobs set up for capitalization at billing price will recognize the total billing price as revenue upon creation of the job entry. The "Orig. Revenue Recognized" field remembers this initial revenue amount. Later, upon invoicing, the job entry billing price may unexpectedly be written up or down, thus changing the revenue recognized amount. The change is detectable by comparing to this original revenue.
<b>Amount Recognized, Currency</b>	This field shows the amount currently recognized as revenue on the job entry.
<b>Orig. Revenue Recognized, Base</b>	This field shows the original revenue recognized in base currency. See the "Orig. Revenue Recognized, Currency" field above.

Field	Description
<b>Amount Recognized, Base</b>	This field shows the amount currently recognized as revenue on the job entry in the base currency.
<b>Orig. Revenue Recognized, Enterprise</b>	This field shows the original revenue recognized in enterprise currency. See the "Orig. Revenue Recognized, Currency" field above.
<b>Revenue Recognized, Enterprise</b>	This field shows the amounts revenue recognized on the job entry in enterprise currency.

### G/L Accrual Island

This island shows information about the current entry if the entry has been accrued in the G/L module. The island shows how the entry was accrued at the time of posting.

Field	Description
<b>Accrual Type</b>	This field shows the type of accrual. The type specifies how the accrual was posted.
<b>Period From, Accrual</b>	This field shows the period from which the job entry was accrued.
<b>Period To, Accrual</b>	This field shows the period to which the job entry was accrued.
<b>Main Entry No.</b>	This field is a reference from the accrual entry to the original entry (the entry that has been accrued).

### Job Invoice Lines Sub-Tab

This section includes the fields and descriptions for the Job Invoice Lines sub-tab.

The table in this window shows job invoice lines that represent the invoice part (or total) of the job entry registration. Several lines may appear if the job entry has been split invoiced or partly invoiced more than once. Notice that these are not the lines that are printed on the invoice, but several job invoice lines are aggregated into invoice printout lines.

Field	Description
<b>Invoice No.</b>	This field shows the invoice number of the invoice on which all or part of the job entry registration was invoiced.
<b>Line No.</b>	This field shows the line number of the job invoice line. This field is used mostly for tracking purposes.
<b>Debit/Credit</b>	This field shows "Debit" for invoices and "Credit" for credit memos.
<b>Activity No.</b>	This field shows the activity number of the job invoice line, which is always the same as the job entry.

Field	Description
<b>Activity Type</b>	This field shows the activity type of the activity.
<b>Task</b>	This field shows the task name of the job entry as registered on the job invoice line.
<b>Description</b>	This field shows the job entry description as copied to the job invoice line.
<b>Employee No.</b>	This field shows the employee number of the job entry as copied to the job invoice line.
<b>Quantity</b>	This field shows the quantity that is included on the invoice after write-up/-down of the job entry quantity is closed.
<b>Quantity, Up/Down</b>	This field shows the quantity write-up or-down that occurred for the quantity registered and invoiced on the invoice for this job invoice line. Thus, if a job entry registers 100, then the job invoice line may close the total registered quantity 100 with a write-up/-down -30 and quantity 70 printed on the invoice.
<b>Cost, Total, Base</b>	This field shows the total cost in the job's base currency.
<b>Billing Price, Curr.</b>	This field shows the unit billing price as included on the invoice after write-up/-down of quantity and total billing price.
<b>Billing Price, Total, Currency</b>	This field shows the billing price that is included on the invoice after write-up/-down of the job entry billing price being closed.
<b>Billing Price, Up/Down, Currency</b>	This field shows the billing price write-up or -down that occurred for the billing price registered and invoiced on the invoice for this job invoice line. Thus, if a job entry registers a billing price of 100, then the job invoice line may close the total registered billing price 100 with a write-up/-down -30 and billing price 70 printed on the invoice.
<b>Billing Price, Base</b>	This field shows the unit billing price as included on the invoice after write-up/-down of quantity and total billing price.
<b>Billing Price, Total, Base</b>	This field shows the billing price that is included on the invoice after write-up/-down of the job entry billing price being closed.
<b>Billing Price, Up/Down, Base</b>	This field shows the amount written up/down on the invoice in base currency.
<b>Closed Billing Price, Base</b>	This field shows the closed standard billing prices in the company's base currency.
<b>Cost, Total, Enterprise</b>	This field shows the total cost in enterprise currency.

Field	Description
<b>Billing Price, Enterprise</b>	This field shows the unit billing price as included on the invoice after write-up/-down of quantity and total billing price.
<b>Billing Price, Total, Enterprise</b>	This field shows the billing price that is included on the invoice after write-up/-down of the job entry billing price being closed.
<b>Billing Price, Up/Down, Enterprise</b>	This field shows the write-up/-down amount for all the entries being invoiced, in enterprise currency. Write-up and write-down are the differences between the registered number of hours and the invoiced number of hours. Write-ups are shown as positive figures, and write-downs as negative figures.
<b>Cost, Total, Exec. Company, Base</b>	This field shows the total cost of the current activity in the executing company, in base currency.
<b>Cost, Total, Exec. Company, Enterprise</b>	This field shows the total cost of the current activity in the executing company, in enterprise currency.
<b>Billing Price, Total, Exec. Company, Currency</b>	This field shows the total billing price of the current activity in the executing company, in base currency.
<b>Billing Price, Total, Exec. Company, Enterprise</b>	This field shows the total billing price of the current activity in the executing company, in enterprise currency.
<b>Exec. Company No.</b>	This field shows the number of the company carrying out the specified activity.
<b>Tax Code 1</b>	This field shows the G/L tax code, if any, used on the entry. If multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2," and, if three tax levels are enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Tax, Base</b>	This field shows the tax amount for the billing price. If multiple tax codes are enabled, the "Tax, Base" field will be replaced by the following fields: "Tax Total, Base," "Tax 1, Base," "Tax 2, Base," and, if enabled, "Tax 3, Base." The "Total Tax, Base" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Tax, Currency</b>	This field shows the tax amount for the billing price. If multiple tax codes are enabled, the "Tax, Currency" field will be replaced by the following fields: "Tax Total, Currency," "Tax 1, Currency," "Tax 2, Currency," and, if enabled, "Tax 3, Currency." The

Field	Description
	"Tax Total, Currency" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Tax, Enterprise</b>	This field shows the tax amount in the enterprise currency.
<b>Item Tax Code</b>	This field shows the item tax code created.
<b>Location</b>	The functionality of this field is similar to that of the field "Task" above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Task" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Task" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Task" above.
<b>Spec. 1-3</b>	The functionality of this field is similar to that of the field "Task" above.
<b>Local Spec. 1-3</b>	The functionality of this field is similar to that of the field "Task" above.
<b>Customer No.</b>	This is the customer number of the job.
<b>Customer Group</b>	This field shows the customer's customer group. See the Popup Fields item Customer Group.
<b>Responsible</b>	This field shows the responsible employee on the job.
<b>Posting Department</b>	This field shows the posting department of the job entry. See Departments in the Posting Reference window.
<b>Number Transferred</b>	This field shows the quantity transferred to the job entry and invoiced on this job invoice line.
<b>Billing Price, Transferred, Currency</b>	This field shows the billing price transferred to the job entry and invoiced on this job invoice line.
<b>Billing Price Transferred, Base</b>	This field shows the billing price transferred to the job entry and invoiced on this job invoice line.
<b>Billing Price Transferred, Enterprise</b>	This field shows the billing price transferred to the job entry and invoiced on this job invoice line.

Field	Description
<b>Deactivated, Base</b>	Depending on the capitalization method, this field shows the amount deactivated upon closing the job entry billing price.
<b>Invoice Date</b>	This is the invoice date.
<b>G/L Entry Date</b>	This field shows the job entry finance entry date.
<b>Invoice Discount</b>	This field shows the discount given upon invoicing according to the customer setup.
<b>Invoice Discount, Base</b>	This field shows the discount given upon invoicing according to the customer setup.
<b>Item No.</b>	This field shows the item number if any item was registered on the job entry.
<b>Company No.</b>	This field shows the number of the company responsible for the job.
<b>Basis Unit Price</b>	This field shows the basis unit price before price list adjustments.
<b>Cost Type</b>	This field shows the cost type selected for the current activity in the Activities window: "Turnover" or "Outlays."
<b>Invoice Discount, Line, Enterprise</b>	This field shows the discount given upon invoicing according to the customer setup.
<b>Entry Type</b>	The type of the current job entry – for example "Registration" or "Reallocation."
<b>Incl. in Fixed Price</b>	If this field is marked, the current job entry is part of the fixed price of the job.
<b>Deactivated, Enterprise</b>	Depending on the capitalization method, this field shows the amount deactivated upon closing the job entry billing price.
<b>Amount Recognized, Currency</b>	This field shows the amount revenue-recognized upon invoicing.
<b>Amount Recognized, Base</b>	This field shows the amount revenue-recognized upon invoicing.
<b>Revenue Recognized, Enterprise</b>	This field shows the amount revenue-recognized upon invoicing.
<b>Origin</b>	This field shows the origin of the job entry.

Field	Description
<b>Bill to Customer</b>	This field shows the number of the customer who received the invoice.
<b>Appropriation</b>	This field shows the bill-to customer appropriation.
<b>Reference, Invoice No.</b>	Upon split billing this field shows the invoice number of the first invoice printed.
<b>Overtime Spec.</b>	This field shows any overtime specification entered for the current job entry.

## Job Entry Analysis Workspace

Use this workspace to analyze job entry origin and posting details, as well as reallocation and more.

This is a building block workspace (a workspace used for building other more complicated workspaces). It shows a list of job entries, and for each job entry, it provides detailed information about the origin of that entry, such as what kind of journals were involved in the creation of the job entry. Additionally, it shows the number of other types of entries, such as finance entries, customer entries, and vendor entries, that were involved in the same transaction.

### Job Entry Tab

This section includes the fields and descriptions for the Job Entry tab.

#### Entry Information Island

Field	Description
<b>Job No.</b>	This field displays the job number.
<b>Activity No.</b>	This field displays the activity number for the job entry.
<b>Activity Type</b>	This field shows the activity type of the activity for the job entry.
<b>Activity Name</b>	This field displays the activity name for the job entry.
<b>Description</b>	This field shows the description of the job entry.
<b>Task</b>	This field shows the task assigned to the entry.
<b>Employee No.</b>	This field displays the employee number for the job entry

Field	Description
<b>Vendor</b>	This field shows the number of the vendor if the job entry has been assigned to one.
<b>Vendor Invoice No.</b>	This field shows the number of the vendor invoice if the job entry is derived from one.
<b>Item No.</b>	This field shows the item number if items have been assigned to the job entry.
<b>Asset No.</b>	This field shows the asset number is on the job entry.
<b>Remarks</b>	This field shows any remarks which have been assigned to the job entry.
<b>Period From, Subscription</b>	If the current job entry originates from a subscription order, this field and the field "Period To, Subscription" below show the starting and ending periods of the subscription.
<b>Period To, Subscription</b>	See the description of the field "Period From, Subscription" above.
<b>Entry No.</b>	This field shows the number of the current job entry.
<b>Date</b>	This field shows the date when the job entry was registered.
<b>Entry Type</b>	<p>This field shows the entry type of the individual job entry. When a job entry is posted, Maconomy marks it as a certain type. The type will often be "Registration" (for example, time sheet and job journal entries).</p> <p>This is useful if a job entry changes type. If, for instance, a job entry is reallocated, the entry's origin will be preserved, but its type will be changed to "Reallocation" or "Reversal." This way, you can in this window see that a particular entry is, for example, a reallocated time sheet entry.</p>
<b>Journal No.</b>	This field shows the number of the journal on which the current job entry was posted.
<b>Journal Line No.</b>	This field shows the number of the line in the journal on which the current job entry was posted.
<b>Being Reopened</b>	If this field is marked, the current job entry is being reopened, for instance, when an invoice is being credited and job entries are being restored.
<b>Approved for Inv.</b>	If this field is marked, the current job entry has been approved for invoicing.
<b>Accrual Entry</b>	If this field is marked, the current job entry was created as part of an accrual.

Field	Description
<b>Incl. in Fixed Price</b>	If this field is marked, the current job entry is part of the fixed price of the job.
<b>Action</b>	This field shows the action performed on the current job entry in the window Invoice Selection ("Invoice," "Write Off," or "Carry Forward").
<b>Origin</b>	This field shows where the current job entry was created, for example in a Time Sheet.
<b>Direct Inv.</b>	This field is marked if you have chosen direct invoicing for the entry in the table part of the window Invoice Selection. It cannot be changed here.
<b>Over Invoicing Entry</b>	If this field is marked, the current job entry is an over invoicing entry.
<b>Reallocate</b>	If this field is marked, the current job entry has been marked for reallocation.
<b>Selected</b>	If this field is marked, the current job entry has been selected for reallocation.
<b>Date Reallocated</b>	If the current job entry was reallocated, this field shows the date of reallocation.
<b>Cost Type</b>	This field shows if the current job entry is a Turnover or Outlay activity.
<b>Reallocate</b>	If this field is marked, the current job entry has been marked for reallocation in the window Invoice Selection.
<b>Latest Reallocation Number</b>	This field shows if the job entry has previously been (partly) reallocated. The number is an internal field used for keeping track of reallocation journals.
<b>Amount Reallocated</b>	If the current job entry was reallocated, this field shows the amount of the reallocation.
<b>Reallocated from Instance Key</b>	If the current job entry has previously been reallocated, this field shows the instance key of the entry from which the job entry was reallocated.
<b>Reallocated from Job No.</b>	If the current job entry has previously been reallocated, this field shows the number of the job from which the job entry was reallocated.
<b>Reallocated from Task</b>	If the current job entry has previously been reallocated, this field shows the task from which the job entry was reallocated.
<b>Purch. Order No.</b>	If the current job entry is part of a purchase order, this field shows the number of the purchase order.
<b>Purchase Order Line No.</b>	If the current job entry is part of a purchase order, this field shows the line number of the job entry in the purchase order.

Field	Description
<b>G/L Entry Date</b>	This field shows the date on which the current job entry was entered in the General Ledger.
<b>Receivable Tax Code 1</b>	<p>This field shows the receivable G/L tax code of the current job entry. If multiple tax codes are enabled, the "Receivable Tax Code 1" field will be replaced by the following fields: "Receivable Tax Code 1-3," "Receivable Tax 1-3, Currency," "Receivable Tax 1-3, Base," and "Receivable Tax 1-3, Enterprise."</p> <p>For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Invoice</b>	If this field is marked, the current job entry has been selected for invoicing.
<b>Overtime Spec.</b>	This field shows any overtime specification on the current job entry.
<b>Daily Description</b>	This field shows any daily description entered on the current job entry.
<b>Trans. No.</b>	This field shows the transaction number of the current job entry.
<b>Trans. Type</b>	This field shows the transaction type of the entry. The field is for reference only and cannot be changed here.
<b>Invoice No.</b>	This field shows the number of the invoice where the current job entry was invoiced.
<b>Invoicing Job No.</b>	This field shows the number of the job invoiced on the invoice of the current job entry.
<b>Date Posted</b>	This field shows the date on which the current job entry was posted.
<b>Close</b>	If this field is marked, the current job entry will be closed after invoicing.
<b>Closed</b>	If this field is marked, the current job entry is closed.
<b>Tax Code</b>	<p>This field shows the tax code registered on the current job entry. If multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2," and, if three tax levels are enabled, "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Item Tax Code</b>	This field shows any tax code associated with any item registered on the current job entry.
<b>Markup %</b>	This field shows the markup percentage of the current job entry.

**Billing Price Deviation Island**

Field	Description
<b>Standard Billing Price, Currency</b>	This field shows the standard billing price per unit in the currency of the job. Total Standard Billing Price, Currency This field shows the total standard billing price of the current budget entry in the currency of the job.
<b>Standard Up/Down, Currency</b>	This field shows the difference between the registered billing price and the standard billing price for the current entry in the currency of the job. This information can be used for performance analyses
<b>Standard Billing Price, Base</b>	This field shows the unit budgeted standard billing price in the company's base currency.
<b>Standard Billing Price Total, Base</b>	This field shows the total standard billing price of the current budget entry in the base currency of the company.
<b>Standard Up/Down, Base</b>	This field shows the difference between the registered billing price and the standard billing price for the current entry in the base currency of the company. This information can be used for performance analyses.
<b>Standard Billing Price, Enterprise</b>	This field shows the unit budgeted standard billing price in the company's enterprise currency.
<b>Standard Billing Price total, Enterprise</b>	This field shows the total standard billing price of the current budget entry in the enterprise currency of the company.
<b>Standard Up/Down, Enterprise</b>	This field shows the difference between the registered billing price and the standard billing price for the current entry in the enterprise currency of the company. This information can be used for performance analyses.

**Transfer Island**

This island shows information about the current entry if the entry has been transferred to or from. For more information about job transfers, please see the overview of the Job Transfer window.

Field	Description
<b>Moved</b>	This field shows whether the entry has been transferred from and subsequently closed.
<b>Transfer Date</b>	If the current entry has been transferred, this field shows the date of the transfer.
<b>Moved G/L entry date</b>	If the current entry's registrations have been transferred to new dimensions and subsequently closed in the Job Transfer window,

Field	Description
	this field shows the G/L entry date that has been set on the new job entry.
<b>Moved to Entry No.</b>	This field shows the entry number of the new job entry that the current entry was transferred to.
<b>Billing Price, Transferred To</b>	This field shows the total billing price, if any, transferred to the new dimensions on the job.
<b>Billing Price, Transferred From</b>	If the current entry has been transferred to new dimensions in the window Job Transfer, this field shows the total billing price transferred from the "old" dimensions of the job entry to the new dimensions of the job entry.
<b>Cost, Transferred To</b>	This field shows the cost transferred to new dimensions on the job.
<b>Cost, Transferred From</b>	This field shows the cost transferred from "old" dimensions to new dimensions on the job entry.
<b>Billing Price, Transferred To, Base</b>	This field shows the billing price transferred to new dimensions on the job, in base currency.
<b>Billing Price, Transferred From, Base</b>	This field shows the billing price transferred from "old" dimensions to new dimensions on the job entry, in base currency.
<b>Cost, Transferred To, Enterprise</b>	This field shows the cost transferred to new dimensions on the job, in enterprise currency.
<b>Cost, Transferred From, Enterprise</b>	This field shows the cost transferred from "old" dimensions to new dimensions on the job, in enterprise currency.
<b>Billing Price, Transferred To, Enterprise</b>	This field shows the billing price transferred to new dimensions in enterprise currency.
<b>Billing Price, Transferred From, Enterprise</b>	This field shows the billing price transferred from "old" dimensions to new dimensions on the job, in enterprise currency.
<b>Quantity, Transferred To</b>	If the current entry has been transferred to new dimensions, this field shows the quantity transferred to the job assigned the new dimensions. A job is transferred to new dimensions in the window Job Transfer.

Field	Description
<b>Quantity, Transferred From</b>	If the current entry has been transferred to new dimensions in the window Job Transfer, this field shows the quantity transferred from the "old" dimensions of the current job entry.

**Company Island**

Field	Description
<b>Company No.</b>	This field shows the number of the company responsible for the job of the current job entry.

**Executing Company Island**

Field	Description
<b>Exec. Company No.</b>	This field shows the number of the executing company that applies to the current job.
<b>Base Currency</b>	This field shows the base currency of the company shown in the field "Exec. Company No." above.

**Price Island, Currency Sub-Island**

This island shows a large number of details about the current job entry. The island is divided into sections, each of which deals with one of the possible currencies of the price of the current job entry: Job Currency, Base, Enterprise, and Original.

Field	Description
<b>Currency</b>	This field shows the job currency.
<b>Billing Price, Reg.</b>	This field shows the billing price registered on the job entry.
<b>Open Billing Price, Currency</b>	This field shows the total open billing price.
<b>Billing Price, Inv.</b>	This field shows the billing price invoiced for the current job entry. Billing Price, Up/Down. This shows any difference between the billing price you have entered and the billing price you invoice when the job entry is closed. If the invoiced billing price is greater than the entered billing price, the value will be positive. If the invoiced billing price is below the entered price, the value is negative. The difference between the invoiced billing price and the standard billing price deviation (as seen in the field "Standard Up/Down") is shown in the field "Total Up/Down."

Field	Description
<b>Billing Price Up/Down Upon Cl., Currency</b>	This field shows the amount written up/down on the invoice upon closing, in job currency.
<b>Billing Price</b>	This field shows the billing price of the current entry.
<b>Billing Price for Inv., Currency</b>	This field shows the billing price from this particular job entry currently selected for invoicing.

**Price Island, Base Sub-Island**

Field	Description
<b>Cost, Reg.</b>	This field shows the cost registered on the job entry.
<b>Open Cost, Base</b>	This is the open cost in base currency or company currency.
<b>Cost, Inv., Base</b>	This field shows the cost invoiced.
<b>Cost for Inv., Base</b>	This field shows the cost price currently selected for invoicing from this particular job entry.
<b>Cost</b>	This field shows the cost for the job entry.
<b>Receivable Cost Excl. Tax, Base</b>	This field shows the cost price excluding VAT.
<b>Receivable Cost Incl. Tax, Base</b>	This field shows the cost price including VAT. Notice that only if the job entry origin is a vendor invoice or an expense sheet will this amount possibly differ from the amount excluding tax.
<b>Billing Price, Reg., Base</b>	This field shows the total billing price entered for the entry in base currency.
<b>Open Billing Price, Base</b>	This field shows the current open billing price.
<b>Billing Price, Inv., Base</b>	This field shows the billing price invoiced for the current job entry, in base currency.
<b>Billing Price, Up/Down, Base</b>	This field shows the write-up/-down amount. Write-up and write-down are the differences between the registered number of hours and the invoiced number of hours. Write-ups are shown as positive figures, and write-downs are shown as negative figures.

Field	Description
<b>Billing Price Up/Down Upon Cl., Base</b>	This field shows the write-up or –down that occurred when the job entry was closed. Notice that this is an internal field to show any difference between write-up or –down upon creation and write-up or –down upon closing on fixed-price jobs.
<b>Billing Price, Base</b>	This field shows the total billing price in the company's base currency.
<b>Billing Price for Inv., Base</b>	This field shows the billing price from this particular job entry currently selected for invoicing, in base currency.
<b>Intercompany Price, Base</b>	This field shows an intercompany price that will be used as the cost of one unit of the current activity if the executing company and the company responsible for the job in question are not identical.

#### Price Island, Enterprise Sub-Island

Field	Description
<b>Cost, Reg. Enterprise</b>	This field shows the entered cost for the job entry, in enterprise currency.
<b>Open Cost, Enterprise</b>	This is the open cost in enterprise currency.
<b>Cost, Inv., Enterprise</b>	This field shows the cost, in enterprise currency.
<b>Cost for Inv., Enterprise</b>	This field shows the cost price currently selected for invoicing from this particular job entry.
<b>Cost, Enterprise</b>	This field shows the cost price in enterprise currency.
<b>Receivable Cost Excl. Tax, Enterprise</b>	This field shows the cost price excluding VAT, in enterprise currency.
<b>Receivable Cost Incl. Tax, Enterprise</b>	This field shows the cost price including VAT, in enterprise currency.
<b>Billing Price, Reg., Enterprise</b>	This field shows the total billing price entered for the entry, in enterprise currency.
<b>Open Billing Price, Enterprise</b>	— This field shows the current open billing price of the job—that is, the sum of non-invoiced registrations on the job in enterprise currency.

Field	Description
<b>Billing Price, Inv., Enterprise</b>	This field shows the billing price invoiced for the current job entry in enterprise currency.
<b>Billing Price Up/Down, Enterprise</b>	This field shows the amount by which the billing price has been written up or down. Write-up and write-down are the difference between the registered billing price and the invoiced billing price.
<b>Billing Price Up/Down Upon Cl., Enterprise</b>	This field shows the write-up or –down that occurred when the job entry was closed. Notice that this is an internal field to show any difference between write-up or –down upon creation and write-up or –down upon closing on fixed-price jobs.
<b>Billing Price, Enterprise</b>	This field shows the total billing price in the enterprise currency.
<b>Billing Price for Inv., Enterprise</b>	This field shows the billing price currently selected for invoicing in enterprise currency.
<b>Original Currency</b>	This is the currency in which the invoice was registered (the entry's original currency).
<b>Original Cost</b>	This field shows the cost on the job entry original which may, for example, be a vendor invoice in some other currency.
<b>Accrual, Base</b>	This field shows the amount to be registered for accrual on the line in the system's base currency.
<b>Accrual, Enterprise</b>	This field shows the amount to be registered for accrual on the line in the system's enterprise currency.
<b>Cost, Exec. Company, Base</b>	This field shows the cost of one piece of the current activity in the executing company, in the company's base currency.
<b>Cost, Exec., Company, Enterprise</b>	This field shows the cost of one piece of the current activity in the executing company, in the company's enterprise currency.
<b>Billing Price, Exec. Company, Currency</b>	This field shows the initial billing price as set by the executing company. Notice that intercompany invoicing may lead to the job entry having another final billing price to the end customer.
<b>Billing Price, Exec. Company, Enterprise</b>	This field shows the initial billing price as set by the executing company. Notice that intercompany invoicing may lead to the job entry having another final billing price to the end customer.
<b>Quantity Open</b>	This field shows the number of open units registered in the current job entry.

Field	Description
<b>Quantity Up/Down.</b>	This field shows the difference between the and the quantity that would have been written up or down at the end of the selected period, if the job was closed at that particular time.
<b>Quantity Up/Down at Closing</b>	This field shows the write-up or –down that occurred when the job entry was closed, in the enterprise currency. Notice that this is an internal field to show any difference between write-up or –down upon creation and write-up or –down upon closing on fixed-price jobs.
<b>Quantity</b>	In this field you can see the quantity of units that were registered for the activity and assigned to the job entry. If the entry is a time activity, the quantity will be hours.
<b>Invoice Quantity</b>	This field shows the quantity to be invoiced from the job entry.
<b>Quantity Inv.</b>	This field shows the quantity of units invoiced for the current job entry.
<b>Quantity 1</b>	This field shows the quantity entered for the entry.
<b>Quantity 2</b>	This field shows the quantity 2 entered for the entry.
<b>Job Surcharge Entry</b>	<p>This field is marked if the job entry either in the billing price or in the job surcharge amount fields includes additional amounts that relate to a job surcharge rule percentage.</p> <p>See the Job Surcharge Rules window. If a surcharge derives dimensions, a second job entry marked as a surcharge entry is created, in addition to the actual registration.</p>
<b>Job Surcharge Amount</b>	This field shows the job surcharge amount part of the billing price field. This field only shows an amount if the job surcharge rule is not set up to derive another activity for an additional job entry registration.
<b>Job Surcharge Amount, Base</b>	This field shows the job surcharge amount in the base currency.
<b>Job Surcharge Amount, Enterprise</b>	This field shows the job surcharge amount in the enterprise currency.
<b>Base Price, Pc.</b>	This field shows the unit billing price before adjustment that may have been set up in a job price list line.

**Revenue Recognized Island**

Field	Description
<b>Orig. Revenue Recognized, Currency</b>	Jobs set up for capitalization at billing price will recognize the total billing price as revenue upon creation of the job entry. The "Orig. Revenue Recognized" field remembers this initial revenue amount. Later, upon invoicing, the job entry billing price may unexpectedly be written up or down, thus changing the revenue recognized amount. The change is detectable by comparing to this original revenue.
<b>Amount Recognized, Currency</b>	This field shows the amount currently recognized as revenue on the job entry.
<b>Orig. Revenue Recognized, Base</b>	This field shows the original revenue recognized in base currency. See the "Orig. Revenue Recognized, Currency" field above.
<b>Amount Recognized, Base</b>	This field shows the amount currently recognized as revenue on the job entry in the base currency.
<b>Orig. Revenue Recognized, Enterprise</b>	This field shows the original revenue recognized in enterprise currency. See the "Orig. Revenue Recognized, Currency" field above.
<b>Revenue Recognized, Enterprise</b>	This field shows the amount revenue-recognized in enterprise currency.

**G/L Accrual Island**

This island shows information about the current entry if the entry has been accrued in the G/L module. The island shows how the entry was accrued at the time of posting.

Field	Description
<b>Accrual Type</b>	This field shows the type of accrual. The type specifies how the accrual was posted.
<b>Period From, Accrual</b>	This field shows the period from which the job entry was accrued.
<b>Period To, Accrual</b>	This field shows the period to which the job entry was accrued.
<b>Accrued at Registration</b>	This field is marked if the job entry was accrued upon registration.
<b>Main Entry Number</b>	This field is a reference from the accrual entry to the original entry (the entry that has been accrued).

## Job Invoice Overview Workspace

Use this workspace to review an invoice and its associated job entries, as well as review pre-invoices.

You cannot make any changes in this workspace.

The information in this workspace is useful if you need to track the job entries of a certain job invoice.

The Job Invoice Overview tab displays one job invoice at a time. The Job Invoice Lines sub-tab displays the job entries that make up the invoice that the Job Invoice Overview tab displays.

### Job Invoice Overview Tab

This section includes the fields and descriptions for the Job Invoice Overview tab.

#### Billing Address Island

This island contains a number of fields showing information about the billing customer of the current job invoice.

Field	Description
<b>Bill to Customer</b>	This field shows the number of the customer billed on the current invoice.
<b>Attn.</b>	This is the name of the bill-to customer's attention personthe person to whom payment information is directed.
<b>Country</b>	This field shows the bill-to customer's country code. It is retrieved from the Customer Information Card in the Accounts Receivable module, when the job is created in the Jobs window.
<b>E-mail</b>	The functionality of this field is similar to that of the field "Country" above.
<b>Phone</b>	The functionality of this field is similar to that of the field "Country" above.
<b>Fax</b>	The functionality of this field is similar to that of the field "Country" above.
<b>Telex</b>	The functionality of this field is similar to that of the field "Country" above.
<b>Department</b>	The functionality of this field is similar to that of the field "Country" above.

#### Company Island

Field	Description
<b>Company</b>	This field shows the number and name of the company responsible for the job of the current job invoice.

## Price Island

This island shows a large number of details about the amounts on the current job invoice. The island is divided into sections, each of which deals with one of the possible currencies of the price of the current job entry: Job Currency, Base, Enterprise, and Standard.

If multiple tax codes are enabled, each tax-related field in this island will be expanded to multiple fields to display information about each tax level, except for the “Tax” check box at the bottom of the island. The tax fields including “Total” calculate the sum of the relevant individual tax fields. For further information on multiple tax codes, please see the description in “Tax Codes.”

Field	Description
<b>Invoice Currency</b>	This field shows the currency specified for the invoice.
<b>Billing Price Total</b>	This field shows the total billing price in the invoice currency.
<b>Tax</b>	This field shows the tax Maconomy calculated for the invoice in invoice currency.
<b>Net on Account</b>	This field shows the amount net on account.
<b>Tax on Account, Currency</b>	This field shows the tax net on account.
<b>Total</b>	This field shows the total billing price, including tax.
<b>Total, Tax excl.</b>	This field shows the part of the total billing price that was not taxed.
<b>Invoice Discount</b>	This is the invoice discount calculated from the percentage that the bill-to customer is set up to receive per default.
<b>Exchange Rate</b>	This field shows the exchange rate used when the invoice was posted.
<b>Job Currency</b>	<p>This field shows the currency of the job.</p> <p>If the job parameter attribute “Allow Invoice on Account in Multiple Currencies” is set to “No,” then the invoice currency of all bill-to customers on the job will be equal to the currency of the job indicated in this field. If the currency is changed, then all invoice currencies will be changed accordingly.</p> <p>If the job parameter attribute “Allow Invoice on Account in Multiple Currencies” is set to “Yes,” then changing the currency on the job will have no consequences on invoice currencies of bill-to customers.</p> <p>Note that prices in the Job Price Information window will remain in the currency of the job, even if the invoice currency differs.</p>
<b>Item Sum, Job Currency</b>	This field shows the total billing price in the job currency.

Field	Description
<b>Tax</b>	This field shows the tax Maconomy calculated for the invoice in the job currency.
<b>Total, Job Currency</b>	This field shows the total billing price, including tax, in the job currency.
<b>Job, Invoiced Time, Job Currency</b>	This field shows the billing price for time activities in the job currency.
<b>Job, Invoiced Amount, Job Currency</b>	This field shows the billing price for amount activities in the job currency.
<b>Base Currency</b>	This field displays the currency used as base currency in the company.
<b>Total Cost</b>	This field shows the total cost for the registrations that have been invoiced.
<b>Sales Price Total, Base</b>	This field shows the total invoice amount in the company's base currency.
<b>Invoice Discount, Base</b>	This field shows the applicable discount amount on the job, expressed in the base currency of the company to which the job belongs.
<b>Total, Base</b>	This field shows the total billing price, including tax, in the base currency.
<b>Tax, Base</b>	If multiple tax codes are enabled, the "Tax, Base" field will be replaced by the following fields: "Tax Total, Base," "Tax 1, Base," "Tax 2, Base," and, if enabled, "Tax 3, Base." The "Total Tax, Base" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Total Tax Exempt, Base</b>	This field shows the total tax exempt in base currency.
<b>Net on Account, Base</b>	This field shows the amount to invoice on account, expressed in the base currency of the company to which the job belongs.
<b>Tax on Account, Base</b>	This field shows the tax net on account in base currency.
<b>Amount Rounding, Base</b>	This is the rounding amount, in base currency. If currency rounding is used (in the Currency Rounding window), then the total interest amount should be rounded up, based on the currency rounding.

Field	Description
<b>Exchange Rate Variance, Base</b>	This field shows any exchange rate variance calculated by Maconomy for payments in foreign currency. The amount is shown in the base currency of the settling company. The amount corresponds to the difference between the base amount reconciled by the payment and the base amount actually paid. A variance will occur if exchange rates have changed. Also, the fact that your bank uses another exchange rate than what is specified in Maconomy will result in differences that are reflected in this field.
<b>Total Cost, Enterprise</b>	This field shows the total cost for the registrations that have been invoiced.
<b>Billing Price Total, Enterprise</b>	This field shows the total billing price of the time sheet line in enterprise currency.
<b>Invoice Discount, Enterprise</b>	This is the invoice discount amount specified in the purchase order, in enterprise currency.
<b>Total, Enterprise</b>	This field shows the total billing price, including tax, in the enterprise currency.
<b>Tax, Enterprise</b>	This field shows the total billing price, including tax, in the enterprise currency.
<b>Net on Account, Enterprise</b>	This field shows the amount net on account in enterprise currency.
<b>Tax on Account, Enterprise</b>	This field shows the tax net on account in enterprise currency.
<b>Amount Rounding, Enterprise</b>	This shows the rounding amount, in enterprise currency if currency rounding is used (in the Currency Rounding window).
<b>Exchange Rate Variance Balancing, Enterprise</b>	This field balances the exchange rate differences between currency and base and base and enterprise.
<b>Exchange Rate Variance, Enterprise</b>	This field shows any exchange rate variance calculated by Maconomy for payments in foreign currency, in the enterprise currency of the settling company. The amount corresponds to the difference between the base amount reconciled by the payment and the base amount actually paid. A variance will occur if exchange rates have changed. Also, the face that your bank uses another exchange rate than what is specified in Maconomy will result in differences that are reflected in this field.

Field	Description
<b>Total Tax Exempt Billing Price, Enterprise</b>	This field shows the part of the total billing price that was not taxed.
<b>Total In Standard</b>	This is the amount from the "Total Billing Price" field converted into the bill-to customer's currency.
<b>Exchange Rate Variance, Standard Currency</b>	This field shows any exchange rate variance calculated by Maconomy for payments in foreign currency. The amount is shown in the standard currency of the settling company. The amount corresponds to the difference between the standard amount reconciled by the payment and the standard amount actually paid. A variance will occur if exchange rates have changed. Also, the fact that your bank uses another exchange rate than what is specified in Maconomy will result in differences that are reflected in this field.
<b>Invoice Discount %</b>	This is the invoice discount that the bill-to customer is set up to receive per default.
<b>Tax</b>	This field shows the tax Maconomy calculated for the invoice.
<b>Exchange Rate Date</b>	This is the exchange rate date. When converting amounts into the currency, Maconomy uses the exchange rates that are valid on this date according to the exchange rate table for sales selected in the System Information window in the Set-Up module for conversion of currency amounts.

#### Document Archive Island

Field	Description
<b>Archive Number</b>	This field shows the archive number of the attached document.
<b>Description</b>	This field shows the document archive description.

#### Ship to Address Island

Field	Description
<b>Customer</b>	This is a Ship-to Customer name, number and address.
<b>Attn.</b>	This field shows the attention person of the ship-to customer specified in the "Ship to Customer" field. The name is taken from the customer information card and cannot be changed here.

Field	Description
<b>Country</b>	This field shows the country of the ship-to customer specified in the “Ship to Customer” field. The country is taken from the customer information card and cannot be changed here.
<b>E-mail</b>	The functionality of this field is similar to that of the field “Country” above.
<b>Phone</b>	The functionality of this field is similar to that of the field “Country” above.
<b>Fax</b>	The functionality of this field is similar to that of the field “Country” above.
<b>Telex</b>	The functionality of this field is similar to that of the field “Country” above.

### Settling Company Island

Field	Description
<b>Settling Company</b>	This field shows the number and name of the settling company that applies to the current job invoice.

### Invoice Island

This island shows a large number of details about the current job invoice, including information about job and payment.

Field	Description
<b>Invoice</b>	This field shows the invoice number for the invoice whose details are shown in this window.
<b>Job</b>	This field shows the job number and name of the invoice.
<b>Invoice Name</b>	This field shows the name of the invoice.
<b>Invoice Date</b>	This is the invoice date. This date is used to calculate the invoice due date.
<b>Type</b>	This existing field shows Invoice for T&M invoices and Invoice On Account for invoices on account. For T&M invoices this will be changed to show T&M Invoice and for the new combined invoices the field will show T&M and On Account Invoice
<b>Due Date</b>	This is the due date of the invoice.
<b>Department</b>	This field shows the department associated with the job.

Field	Description
<b>Reference</b>	This is the reference entered in the "Ref." field in the window Jobs.
<b>Tax No.</b>	This is the invoice's tax number. It is retrieved from the window Job Information.
<b>Customer Group</b>	This field shows the customer group for the customer on this invoice.
<b>End User No.</b>	This is a unique end customer number. The end customer is a customer who buys from one or more of your direct customers.
<b>Activity No.</b>	This is the activity number, if any, on the invoice account. See the job parameter type "Invoicing on Account."
<b>Task Name</b>	This is the task name, if any, on the invoice on account. See the job parameter type "Invoicing on Account."
<b>Enterprise</b>	This is the enterprise dimension value, if any, on the invoice on account. See the job parameter type "Invoicing on Account."
<b>Segment</b>	This is the segment dimension value, if any, on the invoice on account. See the job parameter type "Invoicing on Account."
<b>Area</b>	This is the area dimension value, if any, on the invoice on account. See the job parameter type "Invoicing on Account."
<b>Remarks 1-3</b>	In these fields you can enter any remarks concerning the current activity. The fields are for information only.
<b>Appropriation</b>	This field shows the bill-to customer appropriation.
<b>Sales Rep.</b>	This field shows the name of the sales representative specified in the field "Sales Rep. No."
<b>Sales Rep. No.</b>	This is the number of the sales representative responsible for the customer.
<b>Payment Terms</b>	These are the payment terms that apply to the customer
<b>Blanket Invoice</b>	If this field is marked, the customer is invoiced on a blanket invoice.
<b>Cust. Payment Mode</b>	This field shows a customer payment mode. The customer payment mode is used for finding an offset account for the current payment. You can specify offset accounts by means of a dimension combination in the External Accounts window in the Banking module. A customer payment mode can, for example, be manual payment, check, or a bank account. Customer payment modes are created in the Customer Payment Modes window in the Banking module.
<b>Invoice on Account</b>	This field is marked if the invoice is on account.

Field	Description
<b>Packing Slip No.</b>	This is the packing slip number assigned.
<b>Re. Invoice No.</b>	This is the invoice number if the credit order was created from an invoice.
<b>Origin</b>	This field shows the origin of the invoice. This may be "Order Invoice," "Job Cost Invoice," or "Intercompany Settlement Invoice." Notice, though, that this window only shows "Job Cost Invoices."
<b>Company Tax Code</b>	This field shows the company tax code for the invoice.
<b>Debit/Credit</b>	This shows "Debit" for invoices and "Credit" for credit memos.
<b>Posted</b>	This field shows whether or not the current invoice has been posted. The field is automatically marked by Maconomy when an invoice is posted and cannot be edited manually.
<b>Manually Approved</b>	This field is marked if the invoice origin is an "Intercompany Settlement Invoice" that has been manually approved.
<b>Printed</b>	This field is marked if the job invoice has been printed. Any new printout is only a copy of the original, and has no effect on accounts.
<b>Printed by</b>	This field shows the person who printed out the last invoice, currently shown in the window. The name is not altered during reprint.
<b>Printing Date</b>	This field shows the last date at which the invoice, currently shown in the window, was printed. The date is not altered during reprint.
<b>Version</b>	This field shows the invoice version number

#### Dimensions Island

Field	Description
<b>Location</b>	This field shows the location.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

Field	Description
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

### Customer Island

Field	Description
<b>Popup 1-5</b>	These fields show the values of the fields "Customer Popup" in the island Extra Fields in the window Jobs for the job of the current invoice.

### Job Invoice Lines Sub-Tab

This section includes the fields and descriptions for the Job Invoice Lines sub-tab.

The table part shows a large amount of information about the job entry or job entries that make up the current job invoice. Apart from the fields below, the table part contains fields concerning accruals, transfers, billing price deviations, and revenue recognition.

If multiple tax codes are enabled, the tax-related fields will be replaced by multiple fields that represent the different tax levels. For further information on multiple tax codes, please see the description in "Tax Codes."

Field	Description
<b>Job No.</b>	The number of the job to which the current job entry belongs.
<b>Entry No.</b>	This is the number of the current job entry.
<b>Journal No.</b>	The number of the journal on which the current job entry was posted.
<b>Journal Line No.</b>	The number of the line in the journal on which the current job entry was posted.
<b>Date Posted</b>	This field shows the date on which the invoice where the current job entry was invoiced was posted.
<b>Trans. No.</b>	This field shows the transaction number of the current job entry.
<b>Date</b>	The date of entry of the current job entry.
<b>Activity No.</b>	The number of the activity registered on the current job entry.
<b>Activity Type</b>	The activity type: Time or Amount.
<b>Activity Name</b>	The description of the activity registered on the current job entry.

Field	Description
<b>Task</b>	The task registered on the current job entry.
<b>Description</b>	The description of the job entry as entered in for example a time sheet.
<b>Employee No.</b>	The employee registered on the current job entry.
<b>Employee Name</b>	The name of the employee registered on the current job entry.
<b>Currency</b>	This field shows the currency.
<b>Original Currency</b>	This is the currency in which the invoice was registered (the entry's original currency).
<b>Billing Price, Curr.</b>	This field shows the budgeted cost of the job in the job's currency.
<b>Billing Price, Reg., Currency</b>	This field shows the registered billing price in the job currency.
<b>Open Sales Price, Currency</b>	This field shows the total open sales price on the job. The amount includes job entries on subjobs that are set up to be invoiced on the main job.
<b>Billing Price, Inv., Currency</b>	This field shows the billing price invoiced for the current job entry.
<b>Billing Price, Total, Currency</b>	This field shows the total billing price when the invoice has been approved, in the currency of the job. It is the sum of the "Billing Price, Invoice" and "Billing Price to Inv." fields.
<b>Billing Price for Inv., Currency</b>	This field shows the billing price from this particular job entry currently selected for invoicing.
<b>Billing Price, Up/Down, Currency</b>	This field shows the amount by which the billing price has been written up or down, in the currency of the job. Write-up and write-down are the difference between the registered billing price and the invoiced billing price. Only completed entries will be included in the calculation.
<b>Billing Price Up/Down Upon Cl., Currency</b>	This field shows the write-up or –down that occurred when the job entry was closed, in the currency of the job. Notice that this is an internal field to show any difference between write-up or –down upon creation and write-up or –down upon closing on fixed-price jobs.
<b>Cost, Base</b>	This field contains the cost of the job in base currency.

Field	Description
<b>Cost, Reg., Base</b>	This field shows the cost registered on the job entry. The amount is shown in base currency, depending on the currency type selected in the island Show Entries. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.
<b>Open Cost, Base</b>	This is the open cost in base currency or company currency.
<b>Cost, Inv., Base</b>	This field shows the cost invoiced during the period specified in the card part. The amount is shown in enterprise currency or base currency, depending on the currency type selected in the Show Entries island. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.
<b>Cost, Total, Base</b>	This field displays the total estimated cost in base currency. Maconomy calculates the total cost by multiplying the number in the Quantity field by the cost per piece in the Cost field. If you do not have access to see cost information, as specified in the Actions window in the Set-Up module, this field displays 0.
<b>Cost for Inv., Base</b>	This field shows the cost price currently selected for invoicing from this particular job entry.
<b>Receivable Cost Excl. Tax, Base</b>	This field shows the cost price excluding VAT.
<b>Receivable Cost Incl. Tax, Base</b>	This field shows the cost price including VAT. Notice that only if the job entry origin is a vendor invoice or an expense sheet will this amount possibly differ from the amount excluding tax.
<b>Billing Price, Base</b>	This field shows the total budgeted standard billing price in the company's base currency.
<b>Billing Price, Reg., Base</b>	This field shows the registered billing price on the job entry in base currency.
<b>Open Sales Price, Base</b>	This field shows the open sales price in the currency of the job equivalent to the sum of job entries not yet invoiced on the current job.
<b>Billing Price, Inv., Base</b>	This field shows the billing price invoiced for the current job entry in base currency.
<b>Billing Price, Total, Base</b>	This field shows the total billing price when the invoice has been approved, in base currency. It is the sum of the "Billing Price, Invoice" and "Billing Price to Inv." fields.

Field	Description
<b>Billing Price for Inv., Base</b>	This field shows the billing price from this particular job entry currency selected for invoicing in base currency.
<b>Billing Price, Up/Down, Base</b>	This field shows the amount by which the billing price has been written up or down. Write-up and write-down are the difference between the registered billing price and the invoiced billing price. Only completed entries will be included in the calculation.
<b>Billing Price Up/Down Upon Cl., Base</b>	This field shows the write-up or –down that occurred when the job entry was closed. Notice that this is an internal field to show any difference between write-up or –down upon creation and write-up or –down upon closing on fixed-price jobs.
<b>Cost, Enterprise</b>	This field shows the total of all cost prices of the jobs displayed in the table part of the window. If the field “Show Totals” in the Selection Criteria has not been marked, this field will not show any value.
<b>Cost, Reg. Enterprise</b>	This field shows the entered cost for the job entry, in enterprise currency.
<b>Open Cost, Enterprise</b>	This is the open cost in enterprise currency.
<b>Cost for Inv., Enterprise</b>	This field shows the cost price currently selected for invoicing from this particular job entry.
<b>Cost, Inv. Enterprise</b>	This field shows the cost invoiced during the period specified in the card part, in enterprise currency.
<b>Cost, Exec. Company, Enterprise</b>	This field shows the cost of one unit of the current activity in the executing company. If the responsible company is the same as the executing company, the cost in this field will be the same as the value in the field, “Cost, Reg.”
<b>Receivable Cost Excl. Tax, Enterprise</b>	This field shows the cost price excluding VAT.
<b>Receivable Cost Incl. Tax, Enterprise</b>	This field shows the cost price including VAT.
<b>Billing Price, Enterprise</b>	This field shows the total of all budgeted billing prices of the jobs displayed in the table part of the window. If the field “Show Totals” in the Selection Criteria island has not been marked, this field will not show any value.
<b>Billing Price, Reg., Enterprise</b>	This field shows the registered billing price in enterprise currency.

Field	Description
<b>Open Billing Price, Enterprise</b>	This field shows the current open billing price of the job on the current line, that is, the sum of non-invoiced registrations on the job. The first time that you evaluate the job, this amount corresponds to the work in progress. Entries that are not part of the fixed price of the job are excluded.
<b>Billing Price, Inv., Enterprise</b>	This field shows the opening, changed, and closing billing prices that have been invoiced on the job before and within the relevant period, in enterprise currency.
<b>Billing Price Up/Down, Enterprise</b>	This field shows the amount by which the billing price has been written up or down. Write-up and write-down are the difference between the registered billing price and the invoiced billing price. Only completed entries will be included in the calculation.
<b>Billing Price for Inv., Enterprise</b>	This field shows the billing price invoiced on the job, excluding tax, in enterprise currency. For credit memos, the amount credited is shown as a positive amount.
<b>Billing Price Up/Down Upon Cl., Enterprise</b>	This field shows the write-up or –down that occurred when the job entry was closed, in enterprise currency. Notice that this is an internal field to show any difference between write-up or –down upon creation and write-up or –down upon closing on fixed-price jobs.
<b>Original Cost</b>	This field shows the cost on the job entry original which may, for example, be a vendor invoice in some other currency.
<b>Quantity Open</b>	This field shows the number of open units registered in the current job entry. Please note that the open quantity of the job entry will only remain open after reallocation until the entry is invoiced.
<b>Quantity Inv.</b>	This field shows the quantity of units invoiced for the current job entry.
<b>Invoice Quantity</b>	This field shows the quantity to be invoiced from the job entry.
<b>Quantity, Up/Down</b>	This field shows the quantity of write-ups and write-downs per item hitherto registered for the job entry. Write-up and write-down are the difference between the registered quantity and the invoiced quantity. Only completed entries will be included in the calculation. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Quantity, Reg.</b>	This field shows the quantity that has been entered.
<b>Quantity Up/Down at Closing</b>	This field shows the write-up or –down that occurred when the job entry was closed, in the currency of the job. Notice that this is an internal field to show any difference between write-up or –down upon creation and write-up or –down upon closing on fixed-price jobs.

Field	Description
<b>Billing Price, Exec. Company</b>	This field shows the initial billing price as set by the executing company. Notice that intercompany invoicing may lead to the job entry having another final billing price to the end customer.
<b>Billing Price, Exec. Company, Enterprise</b>	This field shows the initial billing price as set by the executing company. Notice that intercompany invoicing may lead to the job entry having another final billing price to the end customer.
<b>Company No.</b>	This field shows the number of the company that applies to the current job.
<b>Exec. Company No.</b>	This field shows the name of the company carrying out the specified activity.
<b>Cost, Exec. Company</b>	This field shows the cost of one unit of the current activity in the executing company. If the responsible company is the same as the executing company, the cost in this field will be the same as the value in the field "Cost, Reg."
<b>Base Currency, Exec. Company</b>	This field shows the currency used as base currency in the executing company.
<b>Standard Billing Price, Currency</b>	<p>This field shows the standard billing price per unit in the currency of the job.</p> <p>If the system parameter "Update prices upon dimension change" has been marked, the price in this field is updated when certain key information on the line is changed, for instance, the activity, employee, or dimension values. For further information on this and for a complete list of the fields causing the price to be updated, see the description of the system parameter "Update prices upon dimension change." If the system parameter is not marked, and you wish to ensure that all prices reflect the current set-up of the budget lines, use the action "Recalculate Job Budget."</p>
<b>Standard Billing Price, Base</b>	This field shows the standard billing price registered for the current job entry in the base currency of the company that is responsible for the job.
<b>Standard Billing Price, Enterprise</b>	This field displays the standard billing price registered for the current job entry in the enterprise currency of the company that is responsible for the job.
<b>Total Standard Billing Price, Currency</b>	<p>This field shows the total standard billing price of the current budget entry in the currency of the job.</p> <p>If the system parameter "Update prices upon dimension change" has been marked, the price in this field is updated when certain key information on the line is changed, for instance, the activity, employee, or dimension values. For further information on this and for a complete list of the fields causing the price to be updated, see the description of the system parameter "Update prices upon dimension change." If the system parameter is not marked, and you wish to ensure that all prices</p>

Field	Description
	reflect the current set-up of the budget lines, use the action "Recalculate Job Budget."
<b>Standard Billing Price, Base</b>	This field shows the standard billing price of the current budget entry in the base currency of the company.
<b>Standard Billing Price, Enterprise</b>	This field shows the standard billing price of the current budget entry in the enterprise currency of the company.
<b>Total Standard Billing Price, Currency</b>	This field shows the total standard billing price of the current budget entry in the currency of the job. If the system parameter "Update prices upon dimension change" has been marked, the price in this field is updated when certain key information on the line is changed, for instance, the activity, employee, or dimension values. For further information on this and for a complete list of the fields causing the price to be updated, see the description of the system parameter "Update prices upon dimension change." If the system parameter is not marked, and you wish to ensure that all prices reflect the current set-up of the budget lines, use the action "Recalculate Job Budget."
<b>Standard Billing Price Total, Base</b>	This field shows the total standard billing price of the current budget entry in the base currency of the company.
<b>Standard Billing Price Total, Enterprise</b>	This field shows the total standard billing price of the current budget entry in the enterprise currency of the company.
<b>Standard Up/Down, Currency</b>	This field shows the difference between the registered billing price and the standard billing price for the current entry in the currency of the job, within the selected period. This information can be used for performance analyses
<b>Standard Up/Down, Base</b>	This field shows the difference between the registered billing price and the standard billing price for the current entry within the selected period. This information can be used for performance analyses.
<b>Standard Up/Down, Enterprise</b>	This field shows the difference between the registered billing price and the standard billing price for the current entry in the enterprise currency of the company, within the selected period. This information can be used for performance analyses.
<b>Accrual, Enterprise</b>	This field shows the amount to be registered for accrual on the line in the system's enterprise currency.
<b>Entry Type</b>	The type of the current job entry – for example "Registration" or "Reallocation."

Field	Description
<b>Markup %</b>	This field shows the markup percentage of the current job entry.
<b>Close</b>	If this field is marked, the current job entry will be closed after invoicing.
<b>Closed</b>	If this field is marked, the current job entry is closed.
<b>Tax Code</b>	This field shows the tax code registered on the current job entry. If multiple tax codes are enabled, the "Tax Code" field will be replaced by the following fields: "Tax Code 1," "Tax Code 2," and "Tax Code 3." For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Location</b>	This field shows the location entered on the current job invoice.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Vendor</b>	This is the vendor number if the current job entry concerns an amount activity, and the vendor of the service was registered on the job entry.
<b>Vendor Invoice No.</b>	If the current job entry is associated with a vendor invoice, the associated vendor invoice may be registered here.
<b>Approved for Inv.</b>	If this field is marked, the current job entry has been approved for invoicing.
<b>Item No.</b>	Any item number referenced by the current job entry.
<b>Accrual, Base</b>	This field shows the amount to be registered for accrual on the line in the system's base currency.
<b>Amount Reallocated</b>	If the current job entry was reallocated, this field shows the amount of the reallocation.
<b>Date Reallocated</b>	If the current job entry was reallocated, this field shows the date of reallocation.
<b>Item Tax Code</b>	This field shows any tax code associated with any item registered on the current job entry.

Field	Description
<b>Direct Inv.</b>	If this field is marked, the current job entry was marked for direct invoicing.
<b>Being Reopened</b>	If this field is marked, the current job entry is being reopened, for instance in the window Time Sheets.
<b>Remarks</b>	Any remarks from the current job entry.
<b>Quantity</b>	This is the entry quantity.
<b>Quantity 2</b>	This is the entry quantity 2.
<b>Job Surcharge Entry</b>	<p>This field is marked if the job entry includes only quantity and amounts that relate to a job surcharge rule percentage.</p> <p>A job entry registering a normal amount and without this field marked may still include a job surcharge amount in the fields.</p> <p>See the Job Surcharge Rules window. If a surcharge derives dimensions, a second job entry marked as a surcharge entry is created, in addition to the actual registration.</p>
<b>Over Invoicing Entry</b>	If this field is marked, the current job entry is an over invoicing entry.
<b>Base Price, Pc.</b>	This field shows the unit billing price before adjustment that may have been set up in a job price list line.
<b>Job Surcharge Amount</b>	This field shows the job surcharge amount part of the billing price field. This field only shows an amount if the job surcharge rule is not set up to derive another activity for an additional job entry registration.
<b>Job Surcharge Amount, Base</b>	This field shows the job surcharge amount in the base currency.
<b>Reallocate</b>	If this field is marked, the current job entry has been marked for reallocation.
<b>Cost Type</b>	This field shows if the current job entry is a Turnover or Outlay activity.
<b>Purch. Order No.</b>	If the current job entry is part of a purchase order, this field shows the number of the purchase order.
<b>Purchase Order Line No.</b>	If the current job entry is part of a purchase order, this field shows the line number of the job entry in the purchase order.
<b>Accrual Entry</b>	If this field is marked, the current job entry was created as part of an accrual.

Field	Description
<b>G/L Entry Date</b>	This field shows the date on which the current job entry was entered in the General Ledger.
<b>Receivable G/L Tax Code</b>	This field shows the receivable G/L tax code of the current job entry.
<b>Overrun Adjustment</b>	If this field is marked, the current job entry is an automatic overrun adjustment entry.
<b>Invoice</b>	If this field is marked, the current job entry has been selected for invoicing.
<b>Invoicing Job No.</b>	This field shows the number of the job invoiced on the invoice of the current job entry.
<b>Intercompany Price, Base</b>	This field shows an intercompany price that will be used as the cost of one unit of the current activity if the executing company and the company responsible for the job in question are not identical.
<b>Origin</b>	This field shows where the current job entry was created, for example in a Time Sheet.
<b>Incl. in Fixed Price</b>	If this field is marked, the current job entry is not part of the fixed price of the job.
<b>Job Surcharge Amount, Enterprise</b>	This field shows the job surcharge amount in the enterprise currency.
<b>Latest Reallocation Number</b>	This field shows if the number of the latest reallocation of this job entry.
<b>Amount Recognized, Currency</b>	The amount displayed in this field is determined by the value in the field "Show Latest Approved Revenue Recognition" in the Calculate Revenue island. If that field is marked, this field shows the approved amount registered as revenue on the job, in the company's currency. If that field is not marked, this field will display the amount currently recognized as revenue in the job, but which has not yet been approved.
<b>Amount Recognized, Base</b>	The amount displayed in this field is determined by the value in the field "Show Latest Approved Revenue Recognition" in the Calculate Revenue island. If that field is marked, this field shows the approved amount registered as revenue on the job, in the base currency. If that field is not marked, this field will display the amount currently recognized as revenue in the job, but which has not yet been approved.
<b>Revenue Recognized, Enterprise</b>	This field shows the amounts revenue recognized on the job's entries in enterprise currency.

Field	Description
<b>Moved</b>	This field shows whether the current entry has been transferred.
<b>Transfer Date</b>	If the current entry has been transferred, this field shows the date of the transfer.
<b>Moved to Entry No.</b>	This field shows whether the G/L entry date has been moved to the Entry No. field.
<b>Moved G/L entry date</b>	This field shows whether the G/L entry date has been transferred.
<b>Quantity, Transferred To</b>	If the current entry has been transferred to new dimensions, this field shows the quantity transferred to the job assigned the new dimensions. A job is transferred to new dimensions in the window Job Transfer.
<b>Cost, Transferred To, Base</b>	This field shows the cost transferred to new dimensions on the job during the period specified in the card part, in base currency.
<b>Cost, Transferred To, Enterprise</b>	This field shows the cost transferred to new dimensions on the job during the period specified in the card part, in enterprise currency.
<b>Billing Price, Transferred To, Currency</b>	This field shows the billing price transferred to new dimensions on the job during the period specified in the card part, in the currency of the job.
<b>Billing Price, Transferred To, Base</b>	This field shows the billing price transferred to new dimensions on the job during the period specified in the card part, in base currency.
<b>Billing Price, Transferred To, Enterprise</b>	This field shows the billing price transferred to new dimensions on the job during the period specified in the card part, in enterprise currency.
<b>Quantity, Transferred From</b>	If the current entry has been transferred to new dimensions in the Job Transfer window, this field shows the quantity transferred from the "old" dimensions of the current job entry.
<b>Cost, Transferred From, Base</b>	This field shows the cost transferred from "old" dimensions to new dimensions on the job during the period specified in the card part, in base currency.
<b>Cost, Transferred From, Enterprise</b>	This field shows the cost transferred from "old" dimensions to new dimensions on the job during the period specified in the card part, in enterprise currency.
<b>Billing Price, Transferred From, Currency</b>	If the current entry has been transferred to new dimensions in the Job Transfer window, this field shows the total billing price transferred from the "old" dimensions of the job entry to the new dimensions of the job entry, in the job currency.

Field	Description
<b>Billing Price, Transferred From, Base</b>	If the current entry has been transferred to new dimensions in the Job Transfer window, this field shows the total billing price transferred from the “old” dimensions of the job entry to the new dimensions of the job entry, in base currency.
<b>Billing Price, Transferred From, Enterprise</b>	If the current entry has been transferred to new dimensions in the Job Transfer window, this field shows the total billing price transferred from the “old” dimensions of the job entry to the new dimensions of the job entry, in enterprise currency.
<b>Earliest Job Invoice Line</b>	This field shows the date of the earliest invoice that included all or part of this job entry.
<b>Latest Job Invoice Line</b>	This field shows the date of the latest invoice that included all or part of this job entry.
<b>Orig. Revenue Recognized, Currency</b>	Jobs set up for capitalization at billing price will recognize the total billing price as revenue upon creation of the job entry. The “Orig. Revenue Recognized” field remembers this initial revenue amount. Later, upon invoicing, the job entry billing price may unexpectedly be written up or down, thus changing the revenue recognized amount. The change is detectable by comparing to this original revenue.
<b>Orig. Revenue Recognized, Base</b>	This field shows the original revenue recognized in base currency. See the “Orig. Revenue Recognized, Currency” field above.
<b>Orig. Revenue Recognized, Enterprise</b>	This field shows the original revenue recognized in enterprise currency. See the “Orig. Revenue Recognized, Currency” field above.
<b>Action</b>	This field shows the action performed on the current job entry in the window Invoice Selection (“Invoice,” “Write Off,” or “Carry Forward”).
<b>Reallocate</b>	If this field is marked, the current job entry has been marked for reallocation in the window Invoice Selection.
<b>Selected</b>	If this field is marked, the current job entry has been selected for reallocation.
<b>Overtime Spec.</b>	This field shows any overtime specification on the current job entry.
<b>Run No., Export</b>	Upon exporting data in the Export Data window or the stand-alone program Export Finance Data, an “Automatic Payment” number is assigned to the job entry as Run No. This field shows that number.

Field	Description
<b>Revenue Recognition Group Key</b>	This key refers to one of the revenue sum groups defined when detailed revenue recognition is set up in the job parameter type "Revenue Recognition" and two attributes "Detail By."
<b>Accrual Type</b>	This field shows any accrual type selected for the current entry.
<b>Accrual Period From</b>	If the current entry has been accrued, this field shows the first period for which the accrual took place.
<b>Accrual Period To</b>	If the current entry has been accrued, this field shows the last period for which the accrual took place.
<b>Accrued at registration</b>	This field is marked if the job entry was accrued upon creation.
<b>Main Entry Number</b>	This field is a reference from the accrual entry to the original entry (the entry that has been accrued).
<b>Subscription Period From</b>	If this job entry originates from a subscription order of items, this field shows the subscription start date.
<b>Subscription Period To</b>	If this job entry originates from a subscription order of items, this field shows the subscription end date.
<b>Line No.</b>	This field shows the job invoice line number for the invoice that includes part or all of the job entry.
<b>Debit/Credit</b>	This field shows "Debit" for invoices and "Credit" for credit memos.
<b>Print</b>	If you mark this field, the line will be printed when you print the advertising order. The mark is removed automatically when the order has been printed.
<b>Billing Price, Curr</b>	This field shows the budgeted cost of the job in the job's currency.
<b>Billing Price Up/Down, Currency</b>	This field shows the write up/down in job currency.
<b>Billing Price, Base</b>	This field shows the budgeted billing price in base currency.
<b>Cost, Total, Enterprise</b>	This field shows the total allocated cost in the job's enterprise currency.

Field	Description
<b>Billing Price Up/Down, Enterprise</b>	This field shows the amount by which the billing price has been written up or down. Write-up and write-down are the difference between the registered billing price and the invoiced billing price. Only completed entries will be included in the calculation.
<b>Billing Price, Total, Enterprise</b>	This field shows the total invoice amount in enterprise currency.
<b>Billing Price, Total, Exec. Company, Currency</b>	This field shows the total billing price of the current activity in the executing company, in job currency.
<b>Billing Price, Total, Exec. Company, Enterprise</b>	This field shows the total billing price of the current activity in the executing company, in enterprise currency.
<b>Cost, Total, Exec. Company, Base</b>	This field shows the total cost of the current activity in the executing company, in base currency.
<b>Cost, Total, Exec. Company, Enterprise</b>	This field shows the total cost of the current activity in the executing company, in enterprise currency.
<b>Tax, Base</b>	<p>This field shows the tax amount invoiced on account in the base currency of the company responsible for the job.</p> <p>If multiple tax codes are enabled, the "Tax, Base" field will be replaced by the following fields: "Total Tax, Base," "Tax 1, Base," "Tax 2, Base," and, if enabled, "Tax 3, Base." The "Total Tax, Base" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Tax, Currency</b>	<p>This field shows the tax amount invoiced on account in the job's currency.</p> <p>If multiple tax codes are enabled, the "Tax, Currency" field will be replaced by the following fields: "Total Tax, Currency," "Tax 1, Currency," "Tax 2, Currency," and, if enabled, "Tax 3, Currency." The "Tax Total, Currency" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in "Tax Codes."</p>
<b>Customer No.</b>	This is the customer number of the job.
<b>Customer Group</b>	In this field, you can select a customer group. The report will only include jobs for customers in this customer group.

Field	Description
	If you leave this field blank, department will have no influence on the selection criteria. You can only choose from the departments that have been created in the window Popup Fields.
<b>Responsible</b>	In this field, you can enter the identification of an employee responsible for jobs. The report will only include jobs assigned to this person. If you leave this field blank, it will have no influence on the selection criteria.
<b>Posting Department</b>	This field shows the posting department of the job entry. See Departments in the Posting Reference window.
<b>Quantity</b>	This field shows the part of the job entry quantity that has been invoiced on this invoice.
<b>Deactivated, Base</b>	Depending on the capitalization method, this field shows the amount deactivated upon closing the job entry billing price.
<b>Closed Billing Price, Base</b>	This field shows the closed standard billing prices in the company's base currency.
<b>Invoice Date</b>	This is the date when the invoice was issued.
<b>G/L Entry Date</b>	This field shows the date on which the current job entry was posted in the G/L module.
<b>Internal Job</b>	This field shows whether the current job entry belongs to a job for which the field "Internal Job" in the Jobs window has been marked.
<b>Quantity, Up/Down</b>	This field shows any difference between the quantity you have entered and the quantity you invoice when the job entry is closed. If you have invoiced more than the entered quantity, the value shown is positive. If you have invoiced fewer than the entered quantity, the value is negative.
<b>Invoice Discount</b>	This is the invoice discount amount deducted from the invoice. It is retrieved from the Job Information card, where it was entered as a percentage.
<b>Invoice Discount, Base</b>	This field shows the applicable discount amount on the job, expressed in the base currency of the company to which the job belongs.
<b>Task</b>	This field shows the task registered on the job entry.
<b>Tax, Enterprise</b>	This field shows the tax amount in the enterprise currency.
<b>Invoice Discount, Line, Enterprise</b>	This field shows the applicable discount amount on the job, expressed in the enterprise currency of the company to which the job belongs.

Field	Description
<b>Deactivated, Enterprise</b>	Depending on the capitalization method, this field shows the amount deactivated upon closing the job entry billing price.
<b>Amount Recognized, Currency</b>	The amount displayed in this field is determined by the value in the field "Show Latest Approved Revenue Recognition" in the Calculate Revenue island. If that field is marked, this field shows the approved amount registered as revenue on the job, in the company's currency. If that field is not marked, this field will display the amount currently recognized as revenue in the job, but which has not yet been approved.
<b>Amount Recognized, Base</b>	The amount displayed in this field is determined by the value in the field "Show Latest Approved Revenue Recognition" in the Calculate Revenue island. If that field is marked, this field shows the approved amount registered as revenue on the job, in the base currency. If that field is not marked, this field will display the amount currently recognized as revenue in the job, but which has not yet been approved.
<b>Revenue Recognized, Enterprise</b>	This field shows the amount revenue-recognized during the period specified in the card part, in enterprise currency.
<b>Deactivated Cost, Base</b>	Depending on capitalization method, this field shows the amount deactivated upon closing the job entry cost price.
<b>Deactivated Cost, Enterprise</b>	Depending on capitalization method, this field shows the amount deactivated upon closing the job entry cost price, in the enterprise currency.
<b>Number Transferred</b>	This field shows the quantity transferred to the job entry and invoiced on this job invoice line.
<b>Billing Price Transferred, Currency</b>	This field shows the billing price transferred to the job entry and invoiced on this job invoice line, in the job currency.
<b>Billing Price Transferred, Base</b>	This field shows the billing price transferred to the job entry and invoiced on this job invoice line.
<b>Billing Price Transferred, Enterprise</b>	This field shows the billing price transferred to the job entry and invoiced on this job invoice line.
<b>Bill to Customer</b>	This is the number of the customer who is to be billed for the job.
<b>Appropriation</b>	This field shows the bill-to customer appropriation.

Field	Description
<b>Reference, Invoice No.</b>	Upon split billing this field shows the invoice number of the first invoice printed.
<b>Accrual Type</b>	This field shows the type of accrual. The type specifies how the accrual was posted.
<b>Period From, Accrual</b>	This field shows the period from which the job entry was accrued.
<b>Period To, Accrual</b>	This field shows the period to which the job entry was accrued.

## Actions

This section shows the Actions available in the Job Invoice Overview workspace.

### Top Tab

Field	Description
<b>Print Copy</b>	Use this action to print a copy of the invoice.

## Show Job Invoice Reconciliations Workspace

Use this workspace to review invoices and the invoices/credit notes reconciling the invoice.

For each invoice, this workspace shows invoices on account or credit memos on account are part of the reconciliation.

## Invoices Tab

This section includes the fields and descriptions for the Invoices tab.

### Billing Address Island

Field	Description
<b>Bill to Customer</b>	This field shows the name, number, and address of the customer who was invoiced.
<b>Attn.</b>	This field shows the customer's attention person to whom the invoice was directed.
<b>Country</b>	This field shows the customer's country code.

### Settling Company Island

Field	Description
<b>Settling Company</b>	This field shows the number and name of the settling company that applies to the current job.

### Price Island

Field	Description
<b>Invoice Currency</b>	This field shows the currency of the invoice.
<b>Billing Price Total</b>	This field shows amount invoiced before on account reduction.
<b>Invoice Discount %</b>	This field shows the percentage used to calculate the invoice discount.
<b>Invoice Discount</b>	This field shows the invoice discount deducted from the invoice.
<b>Tax</b>	This field shows the tax Maconomy calculated for the invoice.
<b>Net on Account</b>	This field shows the on account reduction.
<b>Tax on Account, Currency</b>	This field shows the tax on account reduction.
<b>Balance Due</b>	This is the amount (in the invoice currency) which is due from the bill-to customer. It is the total billing price, less any invoices on account and including tax.
<b>Std. Currency</b>	This is the bill-to customer's currency. It is retrieved from the Company Specific Customer Information Card in the Accounts Receivable module.
<b>Total In Standard</b>	This is the amount from the "Total Due" field converted into the bill-to customer's currency.

### Ship to Address Island

Field	Description
<b>Ship to Customer</b>	This is the name, number, and address of the customer for whom the job was done.
<b>Attn.</b>	This is the ship-to customer's attention person - to whom shipping information is directed.
<b>Country</b>	This is the customer's country code.

## Invoice Island

Field	Description
<b>Invoice No.</b>	This is the number of the job invoice.
<b>Debit/Credit</b>	This field shows Debit for invoices and Credit for credit memos.
<b>Invoice on Account</b>	This field is marked if the current job invoice is on account.
<b>Printed</b>	<p>This field is marked by Maconomy if the invoice has been printed. You may want to reprint the invoice in at least two cases:</p> <ul style="list-style-type: none"> <li>▪ If the invoice was, for example, damaged in the printer or otherwise lost before sent to the customer.</li> <li>▪ If you need a copy for your own use or to send to the customer (if, for example, the customer claims to have misplaced the invoice).</li> </ul> <p>In case no. 1, you will want to be able to print an exact copy of the invoice. To do this, remove the mark in this field, and select "Print This" in the File menu, or select "Print..." in the File menu and mark the field "Incl. Printed" in the island Print Control before printing the selected invoices. When the invoice is reprinted, this field is marked again automatically.</p> <p>In case no. 2, you may want to include an indication that the printed invoice is in fact a reprint. To do this, simply reprint the invoices without removing the mark in this field or marking the field "Incl. Printed" in the window Print Job Invoice. If the MPL variable "@ReprintOfInvoiceText" has been added to the invoice layout using Maconomy's layout editing tools, a language-dependent text will be printed on the invoice. This text is taken from the window Language Texts in the Set-Up module and is displayed in the invoice language.</p> <p>The new printout is only a copy of the original invoice, and does not affect the accounts.</p>
<b>Job No.</b>	This is the number of the job to which the invoice pertains. If it is a blanket invoice, this field shows the lowest job number of the jobs included in the job invoice. However, if the system parameter "Blanket invoicing per main job" is marked, the field shows the job number of the invoiced main job.
<b>Invoice Name</b>	This field shows the name of the invoice which is derived from the job.
<b>Invoice Date</b>	This is the date the invoice was issued.
<b>Due Date</b>	This is the date the invoice becomes due. It is calculated automatically from the invoice date and terms of payment.
<b>Department</b>	This is the department associated with the job.

Field	Description
<b>Reference</b>	This is the reference entered in the "Ref." field in the window Jobs.
<b>Tax No.</b>	This is the invoice's tax number. It is retrieved from the window Job Information.
<b>Draft Created</b>	This field shows the name of the user who created the draft invoice, that is, who approved the invoice selection, and the date when the invoice was drafted.
<b>Approved</b>	This field shows the name of the user who approved the invoice draft for printing and the date when the job was approved for invoicing
<b>Printed</b>	This field shows the name of the user who printed out the last invoice, currently shown in the window, and the last date when it was printed. The name and date are not altered during reprint.

### On Account Reconciliations Sub-Tab

This section includes the fields and descriptions for the On Account Reconciliations sub-tab.

Field	Description
<b>Invoice No.</b>	This is the number of the job invoice/credit memo on account.
<b>Debit/Credit</b>	This field shows the direction of the reconciliation.
<b>Amount Reconciled, Currency</b>	This field shows the amount reconciled in the job's currency.
<b>Tax Reconciled, Currency</b>	This field shows the tax amount reconciled in the job's currency. If multiple tax codes are enabled, the "Tax, Currency" field will be replaced by the following fields: "Total Tax, Currency," "Tax 1, Currency," "Tax 2, Currency" and, if enabled, "Tax 3, Currency." The "Tax Total, Currency" field calculates the sum of the other individual tax fields. For further information on multiple tax codes, please see the description in "Tax Codes."
<b>Job No.</b>	This field shows the number of the job to which the current job invoice on account pertains.
<b>Job Name</b>	This field shows the name of the job as entered in the window Jobs.
<b>Reconciling Job No.</b>	This field shows the number of the job which reconciles the on account invoice.
<b>Reconciling Job Name</b>	This field shows the name of the reconciling job as entered in the window Jobs.

## Draft Invoice Selection Summary Workspace

Use this workspace to review approved draft invoices that are not yet printed and posted.

This workspace shows only totals for the draft invoice, such as total WIP available on the job, total WIP for invoicing, total billing price, and write up/down.

### Draft Invoice Selection Summary Tab

This section includes the fields and descriptions for the Draft Invoice Selection Summary tab.

#### Work In Progress Island

Field	Description
<b>WIP Available</b>	This field shows the WIP available for invoicing for time activities and amount activities, as well as the total WIP.
<b>WIP For Invoicing</b>	This field shows the amount of WIP to be invoiced.
<b>Carry Forward</b>	This field shows the amount of WIP that is currently carried forward.
<b>Billing Price</b>	This field shows the billing price for the WIP selected for invoicing.
<b>Write-Up/Down</b>	This field shows the write-up/down.
<b>Realization Rate</b>	This field shows the realization rate. This is based on the Billing Price and the WIP for Invoicing fields for time.

#### Overview Island

Field	Description
<b>For Invoicing on Account</b>	This field shows amounts for invoicing on account.
<b>Budgeted Billing Price</b>	This field shows the total budgeted billing price found on the last approved revision of the current budget on the jobs that are included on the draft invoice.
<b>Registered Billing Price</b>	This field shows the total registered billing price that is, the sum of the billing prices registered to the individual entries.
<b>Write Up/Down to Date</b>	This field shows the write-up/down until today's date. Write-up and write-down are the difference between the registered billing price and the invoiced billing price. Write-ups are shown as positive figures, and write-downs as negative figures.
<b>Realization Rate to Date</b>	This field shows the realization rate to date.

Field	Description
<b>Invoiced to Date</b>	This field shows the amount invoiced to date for the jobs included in the draft invoice.
<b>Net on Account</b>	This field shows the amount net on account for the jobs that are included in the draft invoice.
<b>Total Invoiced to Date</b>	This field shows the sum of the invoiced billing price (time-and-material invoices) and the amount net on account, up to this date.

## Show Invoice Foundation Workspace

Use this workspace to review the write-ups and write-downs made to invoiceable job entries.

For each job, you can see the invoiceable entries and the write-ups and write-downs made to them. You cannot make any changes in this workspace.

These job entries make up the invoice foundation that is related to a job.

This workspace facilitates the process of viewing write-up and write-down values for individual job entries that you have submitted and approved. You cannot change any values in this workspace, because it is exclusively intended for looking up invoiceable job entries that have been written up or down.

The Show Invoice Foundation tab enables you to select a job and view the data that is related to that job. You can also enter selection criteria for the current job to view the appropriate job entry lines in the Job Entries sub-tab. Additionally, the Up/Down island in the Show Invoice Foundation tab enables you to view the total write-ups or write-downs for the lines shown in the sub-tab. The sub-tab displays the job entry lines that match the selection criteria that you provided in the Show Invoice Foundation tab. This gives you a detailed overview of write-ups and write-downs on each individual line.

### Show Invoice Foundation Tab

This section includes the fields and descriptions for the Show Invoice Foundation tab.

#### Selection Criteria Island

Field	Description
<b>Show Only Up/Down Contributions</b>	If you mark this checkbox, the table part will only display job entry lines whose values contribute to a write-up or write-down of the relevant invoice selection.
<b>Show Only Approved For Invoicing</b>	If you mark this check box, the table part will only display job entry lines that have been approved for invoicing.
<b>Show Only Selected For Invoicing</b>	If you mark this check box, the table part will only display job entry lines that have been selected for invoicing.

Field	Description
<b>Fixed Price Entries</b>	<p>This pop-up field allows you to select whether the entries shown in the table part must be included in the fixed price or not. This field is only relevant if the current job is a fixed-price job.</p> <p>If you select "Included in Fixed Price," only job entries included in the fixed price agreed on the job will be displayed in the table part. Selecting "Not Included in Fixed Price" will display all job entries not included in the fixed price, while selecting a blank value will display all entries without any consideration to fixed price.</p>
<b>Activity Type</b>	<p>This pop-up field lets you narrow the selection criteria down by selecting the desired value in the field. For instance, select "Time" if you only want job entries for time activities to be displayed in the table part for the current job.</p>
<b>Employee No.</b>	<p>These fields allow you to specify a range of employee numbers whose associated job entries should be displayed in the table part for the current job.</p>
<b>Activity No.</b>	<p>These fields allow you to specify a range of activity numbers. The job entries to which these activity numbers are assigned will be displayed in the table part for the current job.</p>
<b>Task</b>	<p>These fields allow you to specify a range of tasks. The job entries to which these tasks are assigned will be displayed in the table part for the current job.</p>
<b>Task Group 1-6</b>	<p>These fields allow you to specify a range of Task Group 1-6 values. The job entries to which these values are assigned will be displayed in the table part for the current job. For further information on work breakdown structure and task groups, see the descriptions under "Job Tasks" and under "Job Budgets."</p>

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	<p>These fields allow you to specify a range of locations. The job entries to which these locations are assigned will be displayed in the table part for the current job.</p>
<b>Entity</b>	<p>These fields allow you to specify a range of entities. The job entries to which these entities are assigned will be displayed in the table part for the current job.</p>
<b>Project</b>	<p>These fields allow you to specify a range of projects. The job entries to which these projects are assigned will be displayed in the table part for the current job.</p>
<b>Purpose</b>	<p>These fields allow you to specify a range of purposes. The job entries to which these purposes are assigned will be displayed in the table part for the current job.</p>

Field	Description
<b>Spec. 1-3</b>	These fields allow you to specify a range of Specification 1-3 values. The job entries to which these values are assigned will be displayed in the table part for the current job.
<b>Local Spec. 1-3</b>	These fields allow you to specify a range of Local Specification 1-3 values. The job entries to which these values are assigned will be displayed in the table part for the current job.

**Job Island**

Field	Description
<b>Job</b>	This field shows the job number and name associated with the current invoice selection.
<b>Fixed Price Job</b>	This field shows whether the job on the line is a fixed-price job or a time and material job. If the field is marked, the current job is a fixed-price job.
<b>Job Group</b>	This is the job group to which the job is assigned. It is entered in the "Jobs" window and cannot be changed here.
<b>Company</b>	This field shows the company number and name to which the current job belongs.
<b>Customer</b>	This field shows the number and name of the customer to which the current job belongs.
<b>Bill to Customer</b>	This field shows the number and name of the customer to whom the invoice for the current job should be sent.

**Up/Down Island**

Field	Description
<b>To Date</b>	These fields show the write-up/-down quantity and billing price of invoicing lines already invoiced. The "Quantity" column shows how many units have already been invoiced for the job. The "Billing Price" column shows how much has been invoiced for the job activity.
<b>Selection</b>	These fields show the write-up/down quantity and billing price resulting from invoicing the job entry lines displayed in the table part. Write-up and write-down are the differences between the registered quantity/amount and the invoiced quantity/amount. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Total</b>	These fields show the total write-up/-down quantity and billing price for the job. The fields calculate the sum of the relevant "To Date" and "Selection" fields. Write-up and write-down are the differences between the registered quantity/amount and the invoiced quantity/amount. Write-ups are shown in positive figures, and write-downs in negative figures.

## Job Entries Sub-Tab

This section includes the fields and descriptions for the Job Entries sub-tab.

Field	Description
<b>Job No.</b>	This field shows the number of the job to which the relevant job entry line belongs.
<b>Date</b>	This field shows the entry date for the job entry.
<b>Description</b>	This field shows a description of the job entry.
<b>Invoice Quantity</b>	This field shows the quantity to be invoiced from the job entry.
<b>Billing Price, Unit</b>	This field shows the unit billing price in the job currency.
<b>Billing Price to Inv.</b>	This field shows the billing price to be invoiced, expressed in the job currency.
<b>Approved for Inv.</b>	This checkbox shows whether or not the job entry has been approved for invoicing.
<b>Selected for Invoicing</b>	This check box shows whether or not the job entry has been selected for invoicing.
<b>Quantity, Up/Down, Selection</b>	This field shows the potential write-up/-down quantity on the job entry line. Write-up and write-down are the differences between the registered quantity and the invoiced quantity. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Billing Price, Up/Down, Selection</b>	This field shows the potential write-up/-down billing price on the job entry line. Write-up and write-down are the differences between the registered billing price and the invoiced billing price. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Quantity, Up/Down, To Date</b>	This field shows the write-up/-down quantity already invoiced on the job entry line. Write-up and write-down are the differences between the registered quantity and the invoiced quantity. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Billing Price, Up/Down, To Date</b>	This field shows the write-up/-down billing price already invoiced on the job entry line. Write-up and write-down are the differences between the registered billing price and the invoiced billing price. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Activity No.</b>	This field shows the activity number associated with the job entry.
<b>Activity Name</b>	This field shows the name of the activity associated with the job entry.

Field	Description
<b>Task</b>	This field shows the task associated with the job entry.
<b>Task Description</b>	This field shows a description of the task associated with the job entry.
<b>Location</b>	This field shows the location associated with the job entry.
<b>Entity</b>	This field shows the entity associated with the job entry.
<b>Project</b>	This field shows the project associated with the job entry.
<b>Purpose</b>	This field shows the purpose associated with the job entry.
<b>Spec. 1-3</b>	These fields show the values for Specification 1-3 associated with the job entry.
<b>Local Spec. 1-3</b>	These fields show the values for Local Specification 1-3 associated with the job entry.
<b>Task Group 1-6</b>	These fields show the values for Task Groups 1-6 associated with the job entry. For further information on work breakdown structure and task groups, see the descriptions under “Job Tasks” and under “Job Budgets.”
<b>Employee No.</b>	This field shows the number of the employee associated with the job entry.
<b>Employee Name</b>	This field shows the name of the employee associated with the job entry.

## Show Job Reallocation Workspace

Use this workspace to review all of the reallocations that have been made to a specific job entry, the user who created the reallocation, and the user who approved the reallocation.

You cannot make any changes in this workspace.

This workspace resembles the Job Reallocation workspace, but it displays all of the allocations that have been made (as well as the time when they were created and approved).

## Show Job Reallocation Tab

This section includes the fields and descriptions for the Show Job Reallocation tab.

### Entry Information Island

Field	Description
<b>Job No.</b>	This field shows the number of the job to which the reallocated job entry was assigned.
<b>Job Name</b>	This field shows the name of the job.
<b>Activity No.</b>	This field shows the number of the activity that was specified for the job entry.
<b>Task</b>	This field shows the task that was assigned to the entry.
<b>Description</b>	This field shows the description of the activity specified on the job entry.
<b>Employee No.</b>	This field shows the number of the employee that was assigned to the job entry.
<b>Employee Name</b>	This field shows the name of the employee.
<b>Vendor</b>	This field shows the number of the vendor if the job entry was assigned to a vendor.
<b>Vendor Name</b>	This field shows the name of the vendor.
<b>Vendor Invoice</b>	This field shows the number of the vendor invoice if the job entry was derived from one.
<b>Item No.</b>	This field shows the item number if items were assigned to the job entry to be reallocated.
<b>Description</b>	This field shows the item description if items were assigned to the job entry to be reallocated.
<b>Remarks</b>	This field shows any remarks that were assigned to the job entry when it was reallocated.
<b>Daily Description</b>	This field shows any daily description associated with the job entry.
<b>Reallocated from Job No.</b>	If the current job entry has been reallocated more than once, this field shows the number of the job from which the job entry was reallocated earlier.
<b>Reallocated from Task</b>	If the current job entry has been reallocated more than once, this field shows the task from which the job entry was reallocated earlier.

Field	Description
<b>Subcontractor Vendor No.</b>	The subcontractor vendor number, if any.

#### Reallocation Island

Field	Description
<b>Amount Reallocated</b>	This field shows the amount of units that has been reallocated on the current job entry.
<b>Cost Reallocated</b>	This field shows the cost that has been reallocated on the current job entry.

#### Entry Island

Field	Description
<b>Quantity</b>	This field shows the quantity of units registered on the job.
<b>Cost</b>	This field shows the item cost for the job entry.
<b>Cost, Reg.</b>	This field shows the entered cost for the job entry.
<b>Billing Price, Reg.</b>	This field shows the total billing price entered for the entry.
<b>Currency</b>	This field shows the currency of the job.
<b>Gross Margin %</b>	This field shows the gross margin percentage which has been used in connection with the job entry.
<b>Overtime Spec.</b>	This field shows any specification of overtime on the current job entry.
<b>Trans. No.</b>	This field shows the transaction number of the job entry. Job entries are first sorted by entry date, then by transaction number. The value cannot be changed here.
<b>Trans. Type</b>	This field shows the transaction type of the entry. The field is for reference only and cannot be changed here.
<b>Entry Date</b>	This field shows the date when the job entry was registered.
<b>Invoice No.</b>	This field shows the number on the latest invoice initiated by the job entry.
<b>Closed</b>	This field shows whether the job entry has been completed.

Field	Description
<b>Quantity Inv.</b>	This field shows the quantity of units invoiced for the current job entry.
<b>Billing Price, Inv.</b>	This field shows the billing price invoiced for the current job entry.
<b>Quantity, Up/Down</b>	This field shows the quantity of write-ups and write-downs per item registered for the job entry so far. Write-up and write-down are the differences between the registered quantity and the invoiced quantity. Only completed entries will be included in the calculation. Write-ups are shown in positive figures, and write-downs in negative figures.
<b>Billing Price, Up/Down</b>	This field shows amount by which the billing price has been written up or down. Write-up and write-down are the differences between the registered billing price and the invoiced billing price. Only completed entries will be included in the calculation.
<b>Quantity, Transferred To</b>	If the current entry has been transferred to new dimensions, this field shows the quantity transferred to the job assigned the new dimensions. A job is transferred to new dimensions in the window Job Transfer.
<b>Cost, Transferred, To</b>	<p>This row shows the sum of the cost transferred to the job: the opening balance, the change over the selected period, and the closing balance at the end of the selected period.</p> <p>The amount is shown in enterprise currency or base currency, depending on the currency type selected in the Show Entries island. Please note that if the currency type selected is "Job Currency," the cost is always shown in the base currency, as cost prices are only stored in base and enterprise currency.</p>
<b>Billing Price, Transferred To</b>	This field shows the total billing price, if any, transferred to the new dimensions on the job.
<b>Quantity</b>	This field shows the quantity entered for the entry.
<b>Quantity 2</b>	This field shows the quantity 2 entered for the entry to be reallocated.
<b>Standard Billing Price, Base</b>	This field shows the standard billing price registered for the current job entry.
<b>Standard Up/Down, Base</b>	This field shows the difference between the registered billing price and the standard billing price for the current entry within the selected period. This information can be used for performance analyses.

## Job Reallocation Entries Sub-Tab

This section includes the fields and descriptions for the Job Reallocation Entries sub-tab.

Field	Description
<b>Job No.</b>	In this field you can see the number of the job on which the entry was registered.
<b>Act. No.</b>	In this field you can see the number of the activity for the job entry.
<b>Item No.</b>	In this field you can see an item number if items were assigned to the job entry.
<b>Empl.</b>	In this field you can see the number of the employee that the job entry was assigned to.
<b>Description</b>	In this field you can see the description of the entry.
<b>Created By</b>	This field shows what user created the entry.
<b>Creation Date</b>	This field shows when the entry was created.
<b>Changed By</b>	This field shows what user last changed the entry.
<b>Changed Date</b>	This field shows when the entry was last changed.
<b>Approved By</b>	This field shows what user approved the entry.
<b>Approval Date</b>	This field shows when the entry was approved.
<b>Quantity</b>	In this field you can see the quantity of units that were registered for the activity and assigned to the job entry. If the entry is a time activity, the quantity will be hours.
<b>Total Cost</b>	In this field you can see the total cost price reallocated.
<b>Billing Price Total</b>	This field shows the billing price of the job in the job's currency. The "Time," "Amount," and "Total" fields show the three sums of the "Billing Price Open" and "Billing Price Invoiced" fields. The three sums are the invoiced billing price plus the open billing price for time activities, amount activities, and a total for all lines. The values cannot be changed here.
<b>New Quantity</b>	In this field you can see the number of units on the allocated entry.
<b>New Cost Price</b>	In this field you can see the unit price for the job entry created upon reallocation.

Field	Description
	New cost price Total This field shows the total cost price.

## Job Purchase Processes Workspace

Use this workspace to review the requests for quotes, requisitions, and purchase orders that are associated with a job.

You can also view existing purchase processes and create additional purchase processes.

### Job Purchase Processes Tab

This section includes the fields and descriptions for the Job Purchase Processes tab.

#### Job Island

Field	Description
<b>Job</b>	This is the number and name of the job.
<b>Closed</b>	If this field is marked, the job has been closed.
<b>Project Manager</b>	This is the number and name of the project manager.

#### Company Island

Field	Description
<b>Company No.</b>	This field shows the number of the company that applies to the current job.
<b>Company Name</b>	This field shows the name of the company that is shown in the field "Company No."

### Purchase Process Headers Sub-Tab

This section includes the fields and descriptions for the Purchase Process Headers sub-tab.

Field	Description
<b>Purchase Process No.</b>	This field shows the purchase process number that is related to the purchase order line.
<b>Description</b>	The description of the purchase process that is related to the purchase order line.
<b>Status</b>	The purchase process status may be either empty or "Closed."

Field	Description
<b>Requisition exists</b>	This field is marked if a requisition exists in the purchase process.
<b>Request for Quote exists</b>	This field is marked if a request for quote exists in the purchase process.
<b>Purchase Order exists</b>	This field is marked if a purchase order exists in the purchase process.
<b>Requisitioner Employee No.</b>	In this field you may enter the employee number of the requesting employee.
<b>Requisitioner Employee Name</b>	This field shows the name of the requisitioner employee.
<b>Purchase Employee No.</b>	In this field you may enter the employee number of the employee who is responsible for the purchase order.
<b>Purchaser Employee Name</b>	This field shows the name of the purchase employee.
<b>Company No.</b>	This field shows the number of the company that applies to the current job.
<b>Company Name</b>	This field shows the name of the company that applies to the current job.

## Actions

This section shows the Actions available in the Job Purchase Processes workspace.

### Top Tab

Field	Description
<b>Create New Requisition</b>	When you select this action, a requisition is created and assigned to the purchase process. The new requisition is based on the information in the New Requisition island.
<b>Create New Purchase Order</b>	When you select this action, a purchase order is created and assigned to the purchase process. The new purchase order is based on the information in the New Purchase Order island.

## Show Job Revenue Journals Workspace

Use this workspace to review the revenue recognition for all journals that are posted or are being posted (which is a temporary status while posting is in progress), together with their journal lines.

This workspace shows journals whether they have lines or not. A journal usually has some lines and this workspace shows those lines.

## Job Revenue Journal Tab

This section includes the fields and descriptions for the Job Revenue Journal tab.

## Journal Island

Field	Description
<b>Journal No.</b>	This field shows the journal number of the job revenue journal.
<b>Created by</b>	This field shows the user name of the person who created the job revenue journal. Date This field shows the date on which the job revenue journal was created.

## Company Island

Field	Description
<b>Company</b>	This field shows the number and name of the company responsible for the journal used as a basis for the current template. The company number cannot be changed.
<b>Base Currency</b>	This field shows the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information for a detailed description of the concepts of company base currency and enterprise currency.

## Transaction Numbering Island

Field	Description
<b>Transaction Type</b>	This field shows a default transaction type to be used when creating the lines. The default transaction type that is set up for the Job Revenue Journal in the given company will be shown initially.
<b>Number Series</b>	This field shows a transaction number series created in the popup field "Transaction No. Series" in the window Popup Fields in the Set-Up module. If you select a number series, Maconomy will automatically number your journal lines.

## Entries Sub-Tab

This section includes the fields and descriptions for the Entries sub-tab.

Field	Description
<b>Trans. No.</b>	This field shows the transaction number of the transaction that generated the job revenue journal line.
<b>Transaction Type</b>	This field shows the type of transaction.

Field	Description
<b>Entry Date</b>	This field shows the date on which the job revenue recognition was calculated.
<b>Entry Description</b>	This field shows additional information about the job revenue journal line.
<b>Job Revenue Recognition Type</b>	This field shows the type of job revenue recognition.
<b>Line No.</b>	This field shows which specific journal line generated the job revenue journal line.
<b>Revenue Amount, Currency</b>	This field shows the revenue amount in original currency.
<b>Revenue Adjustment, Currency</b>	This field shows the revenue adjustment in original currency.
<b>Revenue Adjustment, Base</b>	This field shows the revenue adjustment in base currency.
<b>Revenue Adjustment, Enterprise</b>	This field shows the revenue adjustment in enterprise currency.
<b>Currency</b>	This field shows the currency of the registration (original currency).
<b>Job No.</b>	This field shows the job number, if the intercompany entry is related to a job.
<b>Activity No.</b>	This field shows the activity number, if the intercompany entry is related to a job.
<b>Task</b>	This field shows the task, if the intercompany entry is related to a job.
<b>Tax Code</b>	This field shows the tax code used on the intercompany entry.
<b>Company No.</b>	This field shows the company number of the job revenue journal line.
<b>Location</b>	This field shows the location.
<b>Entity</b>	This field shows the entity.
<b>Project</b>	This field shows the project.
<b>Purpose</b>	This field shows the purpose.

Field	Description
<b>Spec. 1 - 3</b>	These fields show specifications 1 through 3.
<b>Local Spec. 1 - 3</b>	These fields show local specifications 1 through 3.

## Show Job Invoice Allocation Reconciliations Workspace

Use this workspace to review the on account invoice reconciliations related to a specific job invoice allocation.

### Job Invoice Allocations Tab

This section includes the fields and descriptions for the Job Invoice Allocations tab.

#### Job Invoice Allocation Island

Field	Description
<b>Job Invoice Allocation No.</b>	This field shows the number of the job invoice allocation.
<b>Reversal of Allocation No.</b>	If the job invoice allocation is a reversal of a previous allocation, then this field shows the number of the reversed job invoice allocation.
<b>Reverted by Allocation No.</b>	If the job invoice allocation has been reversed, then this field shows the number of the reverting job invoice allocation.
<b>Invoice Allocation Date</b>	This field shows the date for the job invoice allocation.
<b>Debit/Credit</b>	This field shows the direction of the job invoice allocation.

#### Status Island

Field	Description
<b>Submitted by</b>	This field shows the name of the user who submitted the job invoice allocation.
<b>Submitted Date</b>	This field shows the date on which the job invoice allocation reconciliation was submitted.
<b>Approved by</b>	This field shows the name of the user who approved the job invoice allocation.
<b>Approval Date</b>	This field shows the date on which the job invoice allocation was approved.

Field	Description
<b>Posted</b>	This field shows whether or not the job invoice allocation has been posted.

#### Job Island

Field	Description
<b>Job No.</b>	This is the job number of the job invoice allocation.
<b>Job Name</b>	This field shows the name of the job as entered in the window Jobs.
<b>Currency</b>	This field shows the currency of the job.
<b>Base Currency</b>	This field shows the currency used as base currency in the Company of the job.
<b>Company No.</b>	This field shows the company number of the job.
<b>Customer No.</b>	This is the customer number of the job.
<b>Customer Name</b>	This field shows the customer name of the job.
<b>Department</b>	This is the department associated with the job.

#### Allocation Island

Field	Description
<b>Billing Price, Currency</b>	This field shows the budgeted cost of the job allocation reconciliation in the job's currency.
<b>Cost Price, Base</b>	This field shows the budgeted cost of the job allocation reconciliation in the job's base currency.
<b>Up/Down, Currency</b>	This field shows the amount by which the invoiceable amount has been written up or down, expressed in the currency of the job.

#### On Account Reconciliations Sub-Tab

This section includes the fields and descriptions for the On Account Reconciliations sub-tab.

Field	Description
<b>Invoice No.</b>	This is the number of the reconciled invoice on account.

Field	Description
<b>Debit/Credit</b>	This field shows the direction of the reconciliation.
<b>Amount Reconciled, Currency</b>	This field shows the amount reconciled on the invoice on account.
<b>Job No.</b>	This field shows the job number of the invoice on account.
<b>Job Name</b>	This field shows the job name of the invoice on account.

## Show Job Invoice Allocation Entries Workspace

Use this workspace to review registrations (job entries) involved in job invoice allocation.

### Job Invoice Allocations Tab

This section includes the fields and descriptions for the Job Invoice Allocations tab.

#### Job Invoice Allocation Island

Field	Description
<b>Job Invoice Allocation No.</b>	This field shows the number of a job invoice allocation.
<b>Reversal of Allocation No.</b>	If the job invoice allocation is a reversal of a previous allocation, then this field shows the number of the reversed job invoice allocation.
<b>Reverted by Allocation No.</b>	If the job invoice allocation has been reversed, then this field shows the number of the reverting job invoice allocation.
<b>Invoice Allocation Date</b>	This field shows the date of the invoice allocation.
<b>Debit/Credit</b>	This field shows the direction of the job invoice allocation.

#### Status Island

Field	Description
<b>Submitted by</b>	This field shows the name of the user who submitted the job invoice allocation.
<b>Submitted Date</b>	This field shows the date on which the job invoice allocation was submitted.

Field	Description
<b>Approved by</b>	This field shows the name of the user who approved the job invoice allocation.
<b>Approval Date</b>	This field shows the date on which the job invoice allocation was approved.
<b>Posted</b>	This field shows whether or not the job invoice allocation has been posted.

**Job Island**

Field	Description
<b>Job No.</b>	This is the job number of the job invoice allocation.
<b>Job Name</b>	This field shows the name of the job as entered in the window Jobs.
<b>Currency</b>	This field shows the currency of the job.
<b>Base Currency</b>	This field shows the currency used as base currency in the Company of the job.
<b>Company No.</b>	This is the customer number of the job.
<b>Customer No.</b>	This is the number of the customer associated with the job allocation entry.
<b>Customer Name</b>	This field shows the customer name of the job.
<b>Department</b>	This is the department associated with the job.

**Allocation Island**

Field	Description
<b>Billing Price, Currency</b>	This field shows the allocated billing price on the job allocation reconciliation in the job's currency.
<b>Cost Price, Base</b>	This field shows the allocated cost on the job allocation reconciliation in the job's base currency.
<b>Up/Down, Currency</b>	This field shows the amount by which the billing price has been written up or down, expressed in the currency of the job.

## Job Entry Allocation Lines Sub-Tab

This section includes the fields and descriptions for the Job Entry Allocation Lines sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number of the allocated job entry.
<b>Job Name</b>	This field shows the job name of the allocated job entry.
<b>Task</b>	This field shows the task of the allocated job entry.
<b>Employee No.</b>	This field shows the number of the allocated job entry.
<b>Quantity</b>	This field shows the allocated quantity.
<b>Quantity, Up/Down</b>	This field shows the write up/down quantity resulting from the allocation of job entries. Write-up and write-down is the difference between the registered quantity and the invoiced quantity. Write-ups are shown as positive figures and write-downs as negative figures.
<b>Billing Price, Curr.</b>	This field shows the unit billing price of the allocation in the job's currency.
<b>Billing Price, Total, Currency</b>	This field shows the allocated billing price in the job's currency.
<b>Billing Price, Up/Down Currency</b>	This field shows the allocated write-up/down billing price in the job's currency. Write-up and write-down is the difference between the registered billing price and the invoiced billing price. Write-ups are shown as positive figures and write-downs as negative figures.
<b>Cost, Total, Base</b>	This field shows the total allocated cost in the job's base currency.
<b>Tax Code 1</b>	This field shows the tax code registered on the allocated job entry.
<b>Accrual Type</b>	This field shows the accrual type of the allocated job entry.
<b>Period From, Accrual</b>	This field shows the period from which the job entry was accrued.
<b>Period To, Accrual</b>	This field shows the period to which the job entry was accrued.
<b>Activity No.</b>	This field shows the number of the activity registered on the job entry.

Field	Description
<b>Activity Type</b>	This field shows the activity type. Time or Amount.
<b>Origin</b>	This field shows from which journal type the job entry originates, for example a Time Sheet.
<b>Entry Type</b>	This field shows the entry type of the job entry, for example "Registration" or "Reallocation."
<b>Description</b>	The description of the allocated job entry as entered in, for example a time sheet.
<b>Basis Unit Price</b>	This field shows the basis unit price.
<b>Item Tax Code</b>	This field shows any tax code associated with any item registered on the job entry.
<b>Item No.</b>	The item number referenced by the job entry.
<b>Exec. Company No.</b>	This field shows the number of the company of the employee on the job entry.
<b>Company No.</b>	This field shows the number of the company responsible the job.
<b>Location</b>	This field shows the location of the job entry.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Transaction Type, Registered</b>	This field shows the registered transaction type of the job entry.

## Reporting Section

This section includes the fields and descriptions for the Reporting section workspaces.

### Print Job Volume Workspace

Use this workspace to generate a report showing the financial status of the jobs that you are managing, sorted by either job or customer.

Use selection criteria to specify the data that you want to see, then use the Print action to generate a PDF file containing the data. Review the PDF on screen or print it.

For each job, the report shows cost and billing prices for open entries, invoiced amounts, and how far the job has progressed. You can print the report sorted by jobs or customers. Note that any invoice discount that a vendor grants on a purchase order is not included in the report, because a purchase order can refer to several different jobs.

#### Print Job Volume Tab

This section includes the fields and descriptions for the Print Job Volume tab.

#### Selection Criteria Island

Field	Description
<b>Job No.</b>	In this field, you can enter a range of job numbers. The list will include the jobs numbered within the range. If you leave these fields blank, job number has no influence on the selection criteria.
<b>Customer No.</b>	In this field, you can enter a range of customer numbers. The list will include jobs for customers numbered within the range. If you leave these fields blank, customer number has no influence on the selection criteria.
<b>Job Group</b>	In this field, you can select a job group. The list will only include jobs belonging to this job group.
<b>Department</b>	In this field, you can select a department. The list will only include jobs assigned to this department.
<b>Cust. Group</b>	In this field, you can select a customer group. The list will only include jobs for customers in this customer group.
<b>Company No.</b>	In this field, you can specify a range of company numbers. The list will only include jobs for which companies within the specified range are responsible.
<b>Location</b>	In this field, you enter a range of locations so that the printout only includes jobs, which fall within the specified range of locations.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.

Field	Description
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

### Currency Island

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which the job volume should be displayed. The job volume will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, the exchange rate date used in the conversion of amounts depends on whether fixed exchange rate information has been specified for the job in question. For jobs without fixed exchange rate information, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table selected in the window System Information in the Set-Up module. For jobs with fixed exchange rate information, Maconomy uses the exchange rate information specified for the job in question in the window Job Price Information. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window. For more information about currency conversion in the Job Cost module, please see "Appendix A: Price Calculation in the Job Cost Module."</p>
<b>Exchange Rate Date</b>	In this field, you can specify an exchange rate date to be used for converting amounts into the reporting currency. The field only applies to jobs without fixed exchange rate information. When converting amounts for such jobs into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."

### Print Control Island

Only include end invoiced If you mark this field, only end-invoiced jobs or customers are included in the printout. Whether the printout is organized by jobs or customers depends on the layout that you select.

Only include jobs with open entries If you mark this field, only jobs with open entries or customers with jobs with open entries are included in the printout. Whether the printout is organized by jobs or customers depends on the layout that you select.

Field	Description
<b>Layout</b>	<p>In this field, you select the layout of the job volume printout, that is, how the jobs are to be sorted. You can choose between “By Customer” and “By Job.”</p> <p>If you select “By Job,” the list will show open sales and costs (that is, prices for work which has been done but not yet invoiced), budgeted billing price, and the invoiced amount. It also shows how far the job has progressed, calculated as the ratio between the billing price of the work which has been done and the budgeted billing price. The information is sorted by job number and job group.</p> <p>If you select “By Customer,” the list shows open cost and billing prices, open on account amount, and budgeted billing prices for every company-specific customer in the selection criteria. Note that the company numbers specified in the fields “Company No.” will refer to the settling companies of the company specific customers included on the list.</p>

## Actions

This section shows the Actions available in the Print Job Volume workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print the list of jobs.

## Print Job Report Workspace

Use this workspace to generate job reports, such as a budget comparison at the activity level.

Enter and select information in the selection criteria fields to define each report. The report includes one page for each job, with general information about the job at the top, and the information that you selected below.

Use selection criteria to specify the data that you want to see, then use the Print action to generate a PDF file containing the data. Review the PDF on screen or print it.

The report includes one page for each job, with a header that shows general information about the job. Below the header the report displays budget and actual amounts for the number of hours used, cost, and billing price at the activity level. Below each total for Budget, Actual, and Invoiced, the report displays the total, less any outlays. The report can also show invoiced amounts by activity and a list of open purchase order lines.

If you did not select the **Can See Cost for Time** field in the Actions workspace in the Set-Up module for the current user, the report does not show costs.

## Print Job Report Tab

This section includes the fields and descriptions for the Print Job Report tab.

## Selection Criteria Island

Field	Description
<b>Job No.</b>	In this field, you can enter a range of job numbers. The report will include the jobs numbered within the range. If you leave these fields blank, job number has no influence on the selection criteria.
<b>Status</b>	In this field, you select the job status. The job report will only include jobs with this status. You can choose between "Quote" and "Order." If you leave this field blank, job status has no influence on the selection criteria.
<b>Job Group</b>	In this field, you can select a job group. The report will only include jobs belonging to this job group. If you leave this field blank, job group will have no influence on the selection criteria. You can only choose from the job groups that have been created in the window Job Groups.
<b>Company No.</b>	In these fields, you can enter a range of company numbers, so that only job reports with a responsible company within the specified range are printed.
<b>Department</b>	In this field, you can select a department. The report will only include jobs assigned to this department. If you leave this field blank, department will have no influence on the selection criteria. You can only choose from the departments that have been created in the window Posting References in the G/L module.
<b>Customer No.</b>	In this field, you can enter a range of customer numbers. The report will include jobs for customers numbered within the range. If you leave these fields blank, customer number has no influence on the selection criteria.
<b>Customer Group</b>	In this field, you can select a customer group. The report will only include jobs for customers in this customer group. If you leave this field blank, department will have no influence on the selection criteria. You can only choose from the departments that have been created in the window Popup Fields.
<b>Responsible</b>	In this field, you can enter the identification of an employee responsible for jobs. The report will only include jobs assigned to this person. If you leave this field blank, it will have no influence on the selection criteria.
<b>Main Job No.</b>	In this field, you can enter the number of a primary job. The job report will only include jobs associated to the primary job.

Field	Description
	If you leave this field blank, it will have no influence on the selection criteria.
<b>Location</b>	In this field, you can enter a range of locations. The job report will only include jobs with the given locations.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Include Closed Jobs</b>	If you mark this field, the job report will include closed jobs.
<b>Incl. Subjobs</b>	In this field you can specify if you want to include subjobs in the displayed figures. If you mark this field, and the range of job numbers includes one or more main jobs, the job report will include sums for all subjobs associated with the main jobs. If the currency of a subjob is different from the currency of the main job, the amounts are converted to the currency of the main job using the current exchange rate table for sales. If this field is not marked, the figures for main jobs are displayed excluding any associated subjobs.

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

### Actions

This section shows the Actions available in the Print Job Report workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print the job report.

## Print Employee Report Workspace

Use this workspace to generate a report that shows employees and the jobs that they have worked on, including the amount of time spent on customer-related activities versus the amount of time spent on internal activities.

Use selection criteria to specify the data that you want to see, then use the Print action to generate a PDF file containing the data. Review the PDF on screen or print it.

The report is sorted by activity number and shows the total number of hours recorded by the employee at cost and billing rates, any write-ups or write-downs, and the gross margin, gross margin percentage, and billing price of the employee's labor.

The report includes both customer-related and internal time. All of the amounts are shown in the base currency of the employee's company. If any of the jobs in the report use fixed exchange rate information, any currency conversions that were made in connection with these jobs are performed according to the fixed exchange rate information in question. You define fixed exchange rate information in the Job Price Information workspace.

### Print Employee Report Tab

This section includes the fields and descriptions for the Print Employee Report tab.

#### Selection Criteria Island

Field	Description
<b>Entry Date</b>	In this field, you can enter a range of dates. The report will only include work entered within this period. Invoiced entries entered before these dates are not included, regardless of whether they were invoiced within the period.
<b>Company No.</b>	In this field, you can enter a range of company numbers. Maconomy only prints reports for employees with a responsible company within the specified range.
<b>Employee No.</b>	In this field, you can enter a range of employee numbers. Maconomy only prints employee reports for employees with numbers within the specified range.
<b>Statistics 1-4</b>	In this field, you can enter a range of statistic codes. Maconomy only prints employee reports for employees with statistic codes within the specified range. The statistic codes are entered in the window Employee Card in the Set-Up module.
<b>Job No.</b>	In this field, you can enter a range of job numbers. Maconomy only prints employee reports for jobs within the specified range.
<b>Show Activities</b>	You can mark this field if you wish the report to specify the activities involved. It will then show customer-related and internal time used.

**Print Control Island**

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.

## Actions

This section shows the Actions available in the Print Employee Report workspace.

**Top Tab**

Field	Description
<b>Print</b>	Use this action to print the employee report.

## Print Job Profitability Workspace

Use this workspace to generate a report that shows the profitability of jobs that have been invoiced in a specified period, sorted by job, customer, employee, or activity.

Use selection criteria on the Print Job Profitability tab to specify the data that you want to see, then use the Print action to generate a PDF file containing the data. Review the PDF on screen or print it.

The selections that you make in the Show Dimensions island determine the jobs, customers, employees, and activities to be shown. The selections that you make in the Include Dimensions island determine the job invoice lines that are included in the report.

## Print Job Profitability Tab

This section includes the fields and descriptions for the Print Job Profitability tab.

**Selection Criteria Island**

Field	Description
<b>Invoice Date</b>	In this field, you can enter a range of dates. The job profitability report will only include invoices made within this period. Note that it does not take into account entry date only invoice date. Maconomy suggests the previous month as date range.
<b>Job Group</b>	In this field, you can select a job group, if you also select the "By Job" layout below. The report will only include jobs belonging to this group. If you leave this field blank, it will have no influence on the selection criteria. You can only choose between job groups created in the window Job Groups.
<b>Job No.</b>	In this field, you can enter a range of job numbers. The report will include the jobs numbered within the range.

Field	Description
	If you leave these fields blank, job number has no influence on the selection criteria.
<b>Show Closed Only</b>	If you mark this field, the report will only include jobs that have been closed. This is only possible if you choose the "By Job" layout. If you leave it blank, the report will include all relevant jobs, and if you mark it, you must enter a range of dates in the "Date Closed" field.
<b>Date Closed</b>	In this field, you can enter a range of dates. The report will only include jobs that have been closed within this period. It is only possible to complete the field if you have chosen the "By Job" layout, and if the "Show Only Closed" field is marked. If you mark the "Show Only Closed" field, you must complete this field.  If you leave this field blank, it has no influence on the selection criteria.
<b>Customer Group</b>	In this field, you can select a customer group. The report will only include jobs for customers in this customer group.  If you leave this field blank, department will have no influence on the selection criteria. The options shown are the customer groups that you have created in the window Popup Fields.
<b>Customer No.</b>	In this field, you can enter a range of customer numbers. The report will only include jobs for customers numbered within the range.  If you leave these fields blank, customer number has no influence on the selection criteria.
<b>Department</b>	In this field, you can select a department. The report will only include jobs assigned to this department.  If you leave this field blank, department will have no influence on the selection criteria. The options shown are the departments that you have created in the window Posting References in the G/L module.
<b>Employee No.</b>	In this field, you can enter a range of employee numbers. The report will only include employees numbered within this range.  If you leave these fields blank, the report will include all employees relevant to the report.
<b>Activity No.</b>	In this field, you can enter a range of activity numbers. The report will only include activities numbered within this range.  If you leave these fields blank, the report will include all activities relevant to the report.
<b>Sales Rep No.</b>	In this field, you can enter a range of sales representative numbers. The report will only include information for sales representatives within this range. This limit can only be applied to the "By Job" and "By Customer" printouts.

**Show Dimensions Island**

Field	Description
<b>Company</b>	In this field, you can enter a range of company numbers, if you wish to limit the printout to only include jobs, customers, employees, and activities assigned to companies within the specified range.
<b>Location</b>	The functionality of this field is similar to the functionality of the field "Company No." above.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Company No." above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Company No." above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Company No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Company No." above.

**Include Dimensions Island**

Field	Description
<b>Company</b>	In this field, you can enter a range of company numbers if you wish to limit the printout to only include invoicing of job entries concerning jobs for which companies within the specified range are responsible.
<b>Executing Company</b>	In this field, you can enter a range of company numbers if you wish to limit the printout to only include invoicing of job entries on which companies within this range have been specified as the executing company.
<b>Location</b>	In this field, you can enter a range of locations if you wish to limit the printout to only include invoicing of job entries, which fall within the specified range of locations.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

**Currency Island**

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which the job profitability report should be displayed. The report will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, the exchange rate date used in the conversion of amounts depends on whether fixed exchange rate information has been specified for the job in question. For jobs without fixed exchange rate information, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table selected in the window System Information in the Set-Up module. For jobs with fixed exchange rate information, Maconomy uses the exchange rate information specified for the job in question in the window Job Price Information. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window. For more information about currency conversion in the Job Cost module, please see "Appendix A: Price Calculation in the Job Cost Module."</p>
<b>Exchange Rate Date</b>	<p>In this field, you can specify an exchange rate date to be used for converting amounts into the reporting currency. The field only applies to jobs without fixed exchange rate information. When converting amounts for such jobs into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."</p>

**Sales Reporting Island**

Field	Description
<b>Include Outlays</b>	<p>If you mark this field, all activities will be summed, including activities of the type "Outlays." If you do not mark the field, the report will not include amounts which derive from activities of the type "Outlays" when calculating invoiced amounts. When calculating the Gross Margin %, any gross margin derived from outlay activities will be included, however. For more information about outlay activities, please see the description of the window Activities.</p>

**Print Control Island**

Field	Description
<b>Show All</b>	<p>If you mark this field the report will include jobs, customers, employees, or activities for which movements in the given period.</p>
<b>Layout</b>	<p>In this field, you select the layout of the printout. You have the following options: "By Job," "By Customer," "By Employee," and "By Activity."</p>

Field	Description
	<p>Selecting "By Job" provides a list of jobs sorted by job group. For each job, the report shows the invoiced amounts, costs of amount activities, gross margin, and gross margin rate. It also shows costs of time activities, total gross margin, gross margin rate, and the amounts written up or down. The report shows totals by job group and a grand total. Primary job figures are the total of underlying job figures.</p> <p>If you select "By Customer," you get a list of company-specific customers sorted by customer group. For every customer, the report shows invoiced amount, costs of invoiced services, gross margin, and gross margin percent. It shows costs of invoiced time activities, total gross margin, and gross margin percent by customer. Last, the report shows up- and down-written amounts, totals by customer group, and one grand total. Note that the company numbers specified in the fields "Company No." will refer to the settling companies of the company-specific customers included on the list.</p> <p>If you select "By Employee," the list is of employees. For every employee, the report shows invoiced and uninvoiced hours used, as well as a total invoiced sum. Note that the number of hours only originates from job invoice lines for time activities. Employee cost is shown, with the resulting gross margin and gross margin percent. Last, the report shows up- and down-written amounts and a grand total for all employees included in the report.</p> <p>If you select "By Activity," the list is of activities. For every activity, the report shows the number of invoiced and uninvoiced hours, total invoiced amount, total cost, gross margin, and gross margin percent. Last in the report are up- and down-written amounts.</p>

## Actions

This section shows the Actions available in the Print Job Profitability workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print the job profitability report.

## Print Job Balance List Workspace

Use this workspace to generate a volume report for your jobs as of a specific date, sorted by job group.

The report includes one line for each job, summarizing all of the entries for the job. The line includes the job number, name, and open cost, open cost, open billing price, and open on account amounts.

The report also shows any amounts recognized as revenue, as well as any overrun adjustments on fixed-price jobs to which you assigned job parameters to specify overrun handling or revenue recognition per completion percentage.

No distinction is made between main jobs and sub-jobs.

Use selection criteria to specify the jobs and entries that you want to see, then use the Print action to generate a PDF file containing the data. Review the PDF on screen or print it.

### Print Job Balance List Tab

This section includes the fields and descriptions for the Print Job Balance List tab.

#### Selection Criteria for Jobs Island

Field	Description
<b>Job No.</b>	In these fields, you can enter a range of job numbers. The job balance list will only include information about jobs within this range.
<b>Ship to Customer</b>	In these fields, you can enter a range of ship-to customer numbers. The job balance list will only include information about jobs whose ship-to customers' numbers fall within this range.
<b>Bill to Customer</b>	In these fields, you can enter a range of bill-to customer numbers. The job balance list will only include information about jobs whose bill-to customers' numbers fall within this range.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. The job balance list will only include information about jobs assigned to responsible companies within this range.
<b>Department</b>	In this field, you can select a department. The job balance list will only include information about jobs assigned to this department.
<b>Job Group</b>	In this field, you can select a job group. The job balance list will only include information about jobs belonging to this group.
<b>Customer Group</b>	In this field, you can select a customer group. The job balance list will only include information about jobs for customers in this customer group.

#### Selection Criteria for Entries Island

Field	Description
<b>Date</b>	In this field, you can enter a date for which to print the job balance list. The list will only include jobs for which there is a volume before or on this date. The printout will only include jobs which were not closed on the selected date.  You must enter a date. If you wish to make a list of today's job volume, you should use the Job Volume report, which is created faster.
<b>Activity No.</b>	In these fields, you can enter a range of activity numbers. The job balance list will only include entries posted on activities within this range.
<b>Task</b>	The functionality of these fields is similar to the functionality of the field "Activity No." above.

**Selection Criteria, Dimensions Island**

Field	Description
<b>Location</b>	The functionality of these fields is similar to the functionality of the field "Activity No." above.
<b>Entity</b>	The functionality of these fields is similar to the functionality of the field "Activity No." above.
<b>Project</b>	The functionality of these fields is similar to the functionality of the field "Activity No." above.
<b>Purpose</b>	The functionality of these fields is similar to the functionality of the field "Activity No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Activity No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Activity No." above.

**Currency Island**

Field	Description
<b>Reporting Currency</b>	<p>In this field, you can specify the currency in which the job balance list should be displayed. The balance list will be converted into and displayed in this currency. If the current user has been assigned to a company in the window Users, Maconomy suggests the company base currency of the company in question.</p> <p>When converting amounts into the selected currency, the exchange rate date used in the conversion of amounts depends on whether fixed exchange rate information has been specified for the job in question. For jobs without fixed exchange rate information, Maconomy uses the exchange rates valid on the date entered in the field "Exchange Rate Date" below, and the exchange rate table used is the exchange rate table selected in the window System Information in the Set-Up module. For jobs with fixed exchange rate information, Maconomy uses the exchange rate information specified for the job in question in the window Job Price Information. Please note that Maconomy performs currency conversion even though the original amount has been registered in the same currency as the one specified in this field, which may give rise to discrepancies between the registered amounts and the amounts shown in this window. For more information about currency conversion in the Job Cost module, please see "Appendix A: Price Calculation in the Job Cost Module."</p>
<b>Exchange Rate Date</b>	<p>In this field, you can specify an exchange rate date to be used for converting amounts into the reporting currency. The field only applies to jobs without fixed exchange rate information. When converting amounts for such jobs into the reporting currency, Maconomy uses the exchange rates valid on this date according to the enterprise exchange rate table selected in the window System Information in the Set-Up module for conversion of currency amounts. See also the field "Reporting Currency."</p>

**Print Control Island**

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, the layouts "Standard," "By Bill-to Customer," and "By Ship-to Customer" are available. The "Standard" layout shows the job balance information of each job in the selection criteria, whereas the two other layouts show the balance information grouped by bill-to and ship-to customer, respectively. For each customer, the balance information is then shown grouped by job.
<b>Show Subtotals For Time Activities</b>	In this field, you can choose whether the printout should include subtotals per job for time activities. If you mark this field, the printout will include a line with the open sales price and the open cost for time activities. The printout also displays a grand total.
<b>Show Subtotals For Amount Activities</b>	In this field, you can choose whether the printout should include subtotals per job for amount activities. If you mark this field, the printout will include a line with the open sales price and the open cost for amount activities. The printout also displays a grand total.
<b>Show Subtotals For Adjustments</b>	In this field, you can choose whether the printout should include subtotals per job for adjustments. If you mark this field, the printout will include a line with the open sales price, adjustment. The printout always displays a grand total. Adjustment amounts are created in connection with overruns or revenue recognition per completion percentage. See the description of the window Job Parameters for further information.

**Actions**

This section shows the Actions available in the Print Job Balance List workspace.

**Top Tab**

Field	Description
<b>Print</b>	Use this action to print the job balance list.

**Print Time Sheet Overview Workspace**

Use this workspace to generate a list of time sheets based on criteria that you choose.

You can include time sheets for specific companies, employees, supervisors, or secretaries. You can group the time sheets by department.

Use selection criteria to specify the data that you want to see, then use the Print action to generate a PDF file containing the data. Review the PDF on screen or print it.

If you select the **Daily Overview** field, you can choose to have the overview display figures for periods and dates, thus providing an overview of both daily time sheets and weekly/monthly time sheets.

You can generate the report for a single department, so that only employees in that department are included. Use the **Show Employees w/o Dept. Under** field to include employees who belong to another department.

### Print Time Sheet Overview Tab

This section includes the fields and descriptions for the Print Time Sheet Overview tab.

#### Selection Criteria Island

Field	Description
<b>Company No.</b>	In these fields you can enter a range of company numbers, if you want to limit the printout so that it only shows time sheets for employees assigned to specific companies. If you do not specify any values in these fields, all time sheets are printed regardless of the employees' assigned company numbers.
<b>Employee No.</b>	In this field, you can specify a range of employee numbers if you wish to limit the printout to include only time sheets from specific employees. If you do not enter a value, all time sheets will be printed out regardless of employee number.
<b>Supervisor</b>	In this field, you can specify an employee number. The printout will only include time sheets for employees whose supervisor is the one specified here. If you do not enter a value in the field, all time sheets will be printed out regardless of supervisor.
<b>Secretary</b>	In this field, you can specify an employee number. The printout will only include time sheets for employees whose secretary is the one specified here. If you do not enter a value in the field, all time sheets will be printed out regardless of secretary.
<b>Mentor</b>	In this field, you can specify an employee number. The printout will only include time sheets for employees whose mentor is the one specified here. If you do not enter a value in the field, all time sheets will be printed out regardless of mentor.
<b>Department</b>	In this field, you can choose to have an overview of time sheets from employees assigned to a specific department.
<b>Period, Date</b>	In these fields, you can enter a period of dates for limiting the number of time sheets to be printed out. If you enter a period of dates in these fields, you cannot change the week numbers in the below fields "Period, Week/Year." Entering dates in these fields means that it is possible to make an overview containing, for example, only the "A-part" of a certain split week time sheet.
<b>Period, Week and Year</b>	In these fields, you enter a period for limiting the number of time sheets to be printed out. The period must be specified as an interval from week/year to week/year.

## Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout, "Standard" is the only option.
<b>Show time sheets which are not</b>	<p>In this field, you can choose whether the report should show information on non-submitted, non-approved, or non-transferred time sheets. The option "Non-Submitted" shows the weeks for which the employee yet has to submit time sheets. Note that if you select this option, time sheets which are not within the employees' employment period will also be included on the printout. If you want the printout to include only time sheets registered within the employment period of the employees, you must mark the field "Only Time Sheets Within Empl. Period."</p> <p>The option "Non-Transferred" shows the weeks for which the employee has submitted time sheets (temporary or final) that still need to be transferred to a job journal by a supervisor. The option "Non-Approved" shows the weeks for which the employee has submitted time sheets which still need to be approved by the supervisor.</p>
<b>Daily Overview</b>	If you mark this field, the overview will also display dates on which daily time sheets have not been submitted, approved, or transferred. If you do not mark this field, the overview only displays the periods (weeks or months) for which time sheets have not been submitted, approved, or transferred. The field is thus supposed to be marked for employees using daily time sheets.
<b>Show Blocked Employees</b>	In this field, you can specify that the printout of the time sheets overview should also show blocked employees. The printout will always show time sheets for employees who are not blocked and who are included in the specified selection criteria.
<b>Only Time Sheets Within Period of Employment</b>	If you mark this field, and you have chosen the option "Nonsubmitted" in the above field "Show time sheets which are," the printout will include only time sheets registered within the employment period of the employees displayed on the printout. If you do not mark the field, the printout will also include any time sheets registered outside the employment period of each employee.
<b>Show All Employees</b>	In this field, you can specify if the overview should be printed for all employees or that the printout should only show employees who have not yet submitted time sheets or need to have their time sheets transferred or approved.
<b>Show Employees Without Dept. Under</b>	To print a time sheet overview for employees who are not assigned to a department, you must select a department in this field. The time sheets of the employees in question will be grouped under the selected department.

## Actions

This section shows the Actions available in the Print Time Sheet Overview workspace.

### Top Tab

Field	Description
Print	Use this action to print the time sheet overview.

## Set-Up Section

This section includes the fields and descriptions for the Set-Up section workspaces.

### Job Parameters Workspace

Use this workspace to define job parameters and the values for their attributes.

A job parameter has a job parameter type, a number of predefined attributes, and a number of values for the attributes.

For instance, you use the Pricing Method job parameter type to define whether a job should be assigned an Invoicing Method of **Fixed Price** or **Time and Material**. Pricing Method is the job parameter type, Invoicing Method is the attribute, and **Fixed Price** and **Time and Material** are values.

Once a job parameter has been defined here, it can be applied to appropriate jobs. You can apply many different parameters to each job. After you create job parameters, use the Job Parameter Selection Rules workspace to define which parameters can be used for which jobs.

You can create job parameters for Registration, Budgeting, Revenue Recognition, Pricing Principle, Events, Job Description, Planning, Invoice Selection, On Account Reconciliation, Invoicing On Account, Job Text Option Lists, Overhead Cost, Invoice Preparation, Employee Revenue Distribution, Charges, Time Transfer, and Write-Up/Down.

### Define a Job Parameter

In the Job Parameters tab in this workspace, you specify the name and type of the job parameter, and assign an access level to the job parameter.

Based on the type of job parameter, Maconomy automatically populates the Job Parameter Attributes sub-tab with appropriate attributes. Each line in the sub-tab displays the name and the default values of an attribute. For example, when you create a job parameter of the Revenue Recognition type, the lines in the sub-tab display the eleven attributes that are predefined for the Revenue Recognition job parameter type.

You cannot change or delete the attributes in these lines manually.

You can, for example, define that the value of the Capitalization Method attribute should be **At Cost** or **At Billing Price**, or that the value of the Handling of Overrun attribute should be **Yes** or **No**.

You define the value of an attribute in the **Value** field in the sub-tab. Refer to the examples shown in the **Value Examples** field.

For most attributes, Maconomy has predefined values from which you can choose. You can create new values only if an attribute's value type is **Option List**.

You can define multiple different job parameters of a given type.

### Example

For example, assume that you set up two different job parameters of the Revenue Recognition type, with different attribute values:

<b>Parameter Name: At Cost, No Revenue Recognition</b>	
<b>Attribute Name</b>	<b>Value</b>
Capitalization Method	At Cost
Revenue Recognition by Completion Percentage	No
Handling of Overrun	No

<b>Parameter Name: At Billing Price with Revenue Recognition</b>	
<b>Attribute Name</b>	<b>Value</b>
Capitalization Method	At Billing Price
Revenue Recognition by Completion Percentage	Yes
Handling of Overrun	No

You can create a job that uses capitalization at cost and at the same time does not handle overruns, because the first parameter (At Cost, No Revenue Recognition) supports that scenario. However, you cannot create a job that uses capitalization at billing price and at the same time handles overrun, because neither of the parameters supports that scenario. You will have to set up a new Revenue Recognition job parameter for such a job.

### Job Parameters Tab

This section includes the fields and descriptions for the Job Parameters tab.

#### Job Parameter Island

Field	Description
<b>Name</b>	In this field, you can specify the name of the job parameter. Once you have pressed Enter, the name cannot be changed.
<b>Description</b>	In this field, you can enter a description of the job parameter.

Field	Description
<b>Type</b>	<p>In this field, you select the type of the job parameters determining the set-up of the jobs created in the system. You can choose among the following job parameter types:</p> <ul style="list-style-type: none"> <li>Registration</li> <li>Budgeting</li> <li>Events</li> <li>On Account Reconciliation</li> <li>Invoicing on Account</li> <li>Invoice Selection</li> <li>Job Description</li> <li>Planning</li> <li>Pricing Principle</li> <li>Revenue Recognition</li> <li>Charges</li> <li>Job Text Option Lists</li> <li>Write-Up/-Down</li> <li>Time Transfer</li> <li>Surcharges</li> </ul> <p>Note that you can create several job parameters of the same type.</p>
<b>Blocked</b>	<p>If you select this check box, the job parameter is blocked and is thus not considered valid for new jobs. However, if an existing job parameter already applies to a job, it will continue to do so, even though the parameter has been blocked. Moreover, if a job parameter is blocked, it is not considered by Maconomy when job parameters are re-derived to jobs.</p> <p>You cannot select this check box if the job parameter in question has been specified as "Default" in one or more of the rules in the Job Parameter Selection Rules window.</p>

### Remarks Island

Field	Description
<b>Remarks</b>	In these five fields, you can assign remarks to the job parameter in question.

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

**Access Level Island**

Field	Description
<b>Access Level</b>	<p>In this field, you can specify an access level for the job parameter in question. A user can only make changes to a given job parameter if he or she has been granted access to doing so. Moreover, in Maconomy windows as, for example, the window Job Parameter Selection, a user can only choose among job parameters to which he or she has been granted access.</p> <p>However, you should note that when a job is created and job parameters are derived to the job in question, Maconomy also derives job parameters to which the user does not have access; that is, any default parameter is applied to the job in question, even though the user creating the job does not have access to the relevant job parameters. The job parameters applied to a job are displayed in the window Job Parameter Selection.</p> <p>This field also shows the description of the specified access level.</p>

**Job Parameter Attributes Sub-Tab**

This section includes the fields and descriptions for the Job Parameter Attributes sub-tab.

Field	Description
<b>Attribute Name</b>	<p>This field shows the name of the job attribute assigned to the job parameter type selected in the card part of the window. If you have created a job parameter, Maconomy automatically generates lines showing the attributes identified by the job parameter type in question. As the attributes assigned to a job parameter type are predefined, it is not possible to create or delete these lines.</p> <p>You can choose among the following job parameter types and assigned attributes:</p> <p><b>Budgeting</b></p> <ul style="list-style-type: none"> <li>Approval of Quote Required — For this attribute, you can specify “Yes” or “No.” If you specify “Yes,” a budget must be submitted and approved before an order confirmation can be printed. If you specify “No,” an order confirmation can be printed immediately after the job has been converted to “Order” status, unless the quote has already been approved. In this case, the latest revision of the quote must be approved before an order confirmation can be printed. Note that if the value of the attribute “Check Budget Against Quote” is “Yes,” this attribute must also have the value “Yes.”</li> <li>Block Purchase Orders when Budget Not Approved — For this attribute, you can specify “All Activities,” “Turnover Activities,” “Outlay Activities” or a blank value. The attribute determines whether purchase orders can be created on the basis of budget lines if the current budget of the job in question has not been approved. The attribute comes into play when the user attempts to create purchase orders either directly from the job budget using the action “Create Purchase Orders,” or from requisition or request for</li> </ul>

Field	Description								
	<p>quote lines assigned to a job. If you specify "All Activities," purchase orders can only be created for the job if the current budget has been approved. This means that in the window Job Budgets, the action "Create Purchase Orders" is only available if the current budget has been approved. In the windows Requisitions and Requests for Quote, the action "Create Purchase Order" is only available if the table part does not contain any lines assigned to the job in question.</p> <p>If you specify a blank value, the attribute does not have any effect. If you specify "Turnover Activities," the action "Create Purchase Orders" in the window Job Budgets and the action "Create Purchase Order" in the windows Requisitions and Requests for Quote are only available if the current job budget has been approved or if the action will not result in the creation of any purchase order lines that are related to the job in question and contain activities of the type "Turnover Activities."</p> <p>Example: A requisition contains the following lines:</p> <table> <tr> <th>Job No.</th><th>Activity Type</th></tr> <tr> <td>1</td><td>Turnover</td></tr> <tr> <td>1</td><td>Outlay</td></tr> <tr> <td>2</td><td>Turnover</td></tr> </table> <p>For job number 1 this parameter attribute is set to "Turnover Activities." For job number 2, the attribute is set to a blank value. The action "Create Purchase Order" cannot be used for this requisition, as it would result in a purchase order line with a turnover activity assigned to job number 1. Please note that Maconomy disallows the action completely, meaning that although the line with the outlay activity and the line assigned to job 2, where the attribute is set to blank, do not conflict with the attribute on the individual jobs, Maconomy does not create a purchase order for these lines. Similar functionality applies to the attribute value "Outlay Activities."</p> <ul style="list-style-type: none"> <li>■ Check Budget against Quote — For this attribute, you can specify "Yes" or "No." If you specify "Yes," Maconomy will issue a warning when the quote is approved if the quote price deviates from the budgeted billing price of the latest approved revision of the budget. If you specify "No," no such warning will be issued.</li> <li>■ Default Amount Activity — Every task must derive an activity. When a task is created automatically from the job budget, you can set a default derived activity for the task if the line type in the budget is specified as "Amount." A workflow can be set up where tasks must be approved before registrations can be made on them. This allows nonfinance people, such as a project manager, to create the tasks in the job budget using default activities for later approval (and probable reassignment of activities) by a finance person. Maconomy checks that the activity you specify here is of the correct type.</li> </ul>	Job No.	Activity Type	1	Turnover	1	Outlay	2	Turnover
Job No.	Activity Type								
1	Turnover								
1	Outlay								
2	Turnover								

Field	Description
	<ul style="list-style-type: none"> <li>Default Outlay Activity — The functionality of this job parameter attribute is similar to that of the attribute “Default Amount Activity” above, but applies to budget lines of the type “Outlay.”</li> <li>Default Time Activity — The functionality of this job parameter attribute is similar to that of the attribute “Default Amount Activity” above, but applies to budget lines of the type “Time.”</li> <li>Detailed Time Budget — If you are working with a project with many tasks and many employees, the number of budget lines can increase significantly as there is typically a line for each combination of task and employee. This makes it difficult to review the budget and can be cumbersome to work with. Select this attribute to estimate time in a budget matrix that displays a row for each task and columns for employees or employee categories. Also, this attribute introduces a split between budgeting time and amount separately. The budgeting workspace splits the budgeting into three tabs: Time, Amount, and Full Budget. The following windows support this: <ul style="list-style-type: none"> <li>Time Budgets window — This window allows for budgeting of time activities for a given budget type. The table part displays time-related lines. Columns have been added to the table part to hold the employees and/or employee categories.</li> <li>Amount Budgets window — This window allows for estimation of amount activities for a given budget type. The table part displays amount-related lines.</li> <li>Time Budget Categories window — Use this window to specify which employee categories or specific employees should be available as columns in the Time Budgets window.</li> <li>Time Budget Details window — Use this window to display the price breakdown for a given budget time line. When adding hours in the budget matrix, lines in this window will be created and you can adjust details about the hours and prices.</li> <li>Time Budget Revisions and Amount Budget Revisions windows — These windows display revisions of budgets.</li> </ul> <p>Time budgeting in a budget matrix is available in the Budgeting section in the Jobs workspace.</p> </li> <li>Keep Purchase Billing Price Upon Recalculation — This attribute and the attribute “Keep Purchase Cost Price Upon Recalculation” below control how Maconomy should act when you recalculate the budget, and the purchase currency differs from the base currency — but only if the cost or billing price was not found through the usual price lookup mechanism of Maconomy, but was entered manually (or, in the case of the billing price, was calculated as a markup percentage). The issue is the following: what happens to the cost</li> </ul>

Field	Description
	<p>and billing price if the exchange rate has changed since the last time the budget line was calculated? Using these job parameter attributes, you can specify that Maconomy should keep the price from the purchase currency rather than the base currency.</p> <p>For example: The base currency is GBP. A budget line specifies a billing price of EUR 400 for a time activity, which is entered manually. Since the budget line was created, the exchange rate has changed. If the job parameter attribute "Keep Purchase Billing Price Upon Recalculation" is true, Maconomy will keep the EUR 400 and adjust the billing price in base when you recalculate the budget. If the attribute were false, Maconomy would keep the base billing price in GBP and adjust the billing price in EUR when the budget is recalculated.</p> <ul style="list-style-type: none"> <li>■ <b>Keep Purchase Cost Price Upon Recalculation</b> — The functionality of this job parameter attribute is similar to that of the attribute "Keep Purchase Billing Price Upon Recalculation" above, but applies to the purchase cost. For example: The base currency is GBP. A budget line specifies a Euro purchase for EUR 5000, which is entered manually. Since the budget line was created, the exchange rate has changed. If the job parameter attribute "Keep Purchase Cost Price Upon Recalculation" is true, Maconomy will keep the EUR 5000 and adjust the cost in base when you recalculate the budget. If the attribute was false, Maconomy would keep the base cost in GBP and adjust the cost in EUR when the budget is recalculated.</li> <li>■ <b>Limit Purchase Amount to Budget</b> — For this attribute, you can specify "All Activities," "Turnover Activities," "Outlay Activities," or a blank value. The attribute determines whether purchase orders assigned to a given job are allowed to cause job budget figures to be exceeded. The attribute comes into play when amounts are entered or changed on purchase order lines assigned to a job, or on budget lines for which purchase orders have been created. This can either be done manually in the window Purchase Orders or automatically as a result of using the action "Create Purchase Order" in the window Requests for Quote. The functionality is determined by a combination of the values in this attribute and the attribute "Limit Purchase on Line or Sum Level." In the attribute "Limit Purchase on Line or Sum Level," you specify whether the budget limit check should be made specifically against the budget line referenced in the field "Budget Line No." on the purchase order line in question, or against the budget total of the job. In this attribute, you specify whether the functionality should apply to all activity types, to outlay or turnover activities only, or whether the functionality should be disabled. Below is a description of the functionality using different combinations of the two attributes. When a purchase order line assigned to an activity is created, Maconomy identifies a line in the current budget of the job in question to which the</li> </ul>

Field	Description
	<p>purchase order line corresponds. The number of this budget line is stamped on the purchase order line and is used in the process of determining whether the purchase order causes the budget to be exceeded.</p> <p>The functionality is as follows, depending on the settings of the two attributes mentioned above. The description is based on the situation where the user is entering an amount on a purchase order line assigned to an activity and thereby to a job budget line:</p> <ul style="list-style-type: none"> <li>■ All Activities, Limit on Line: Maconomy issues an error message if the amount on the purchase order line causes the cost price on the job budget line to which the purchase order line is assigned to be exceeded. Any other purchase order lines assigned to the same budget line are also included in this calculation.</li> <li>■ Outlay Activities, Limit on Line: As above. However, an error message is only issued if the activity on the line is an outlay activity.</li> <li>■ Turnover Activities, Limit on Line: As above. However, an error message is only issued if the activity on the line is a turnover activity.</li> <li>■ All Activities, Limit on Sum: Maconomy issues an error message if the amount on the purchase order line causes the total cost price of the turnover and outlay activities on the job budget to be exceeded.</li> <li>■ Outlay Activities, Limit on Sum: The attributes only apply when the activity on the purchase order line is an outlay activity. If it is, Maconomy checks if the sum of the amount on the line plus the amounts on any other purchase order lines for outlay activities on the same job exceeds the total cost price of all lines with outlay activities in the budget of the job in question. If it does, an error message is issued.</li> <li>■ Turnover Activities, Limit on Sum: As above. However, functionality applies to turnover activities instead of outlay activities.</li> </ul> <p>Although the description above is based on scenarios where the user manually enters an amount on a purchase order line, similar functionality applies when amounts are indirectly entered on purchase orders, and when it is necessary to ensure that budget changes have not caused existing purchase orders to exceed the new budget. Therefore, the functionality also applies in the following situations:</p> <ul style="list-style-type: none"> <li>■ When using the action "Create Purchase Orders" in the window Job Budgets or the action "Create Purchase Order" in the windows Requisitions and Requests for Quote, because these actions cause the creation of purchase order lines with amounts.</li> <li>■ When using the actions "Submit Purchase Order" and "Approve Purchase Order" in the window Purchase Orders, because the budget may have changed since the last change to purchase order lines.</li> </ul>

Field	Description
	<p>In both cases, please note that if but one line causes the budget related to that line to be exceeded, the whole action is cancelled. This means that if you have, for example, selected the action "Create Purchase Order" for a request for quote, and one of the lines would cause the budget to be exceeded, no purchase order is created, even for lines that pertain to different jobs or lines that do not cause any budgets to be exceeded. Please also note that the attributes "Limit Purchase, Currency Margin" and "Limit Purchase, Percentage Margin" can be used for allowing the budget to be exceeded by a certain margin.</p> <p>The functionality also applies when changing amounts in the window Job Budgets, where Maconomy checks if the new amount will cause the budget to be exceeded by existing purchase orders.</p> <ul style="list-style-type: none"> <li>Limit Purchase on Line or Sum level — For this attribute, you can specify "Limit on Line" or "Limit on Sum." For a description of the functionality of the attribute, see the attribute "Limit Purchase Amount to Budget."</li> <li>Limit Purchase, Currency Margin — This system parameter is used in connection with the budget limit control described for the attribute "Limit Purchase Amount to Budget." In this parameter, you can enter an amount by which purchases are allowed to exceed job budgets. The margin can be specified as an amount in the currency of the job in question (in this attribute) or a percentage (in the attribute "Limit Purchase, Percentage Margin"). In this way, you can specify a margin allowing a budget violation of, for example, 100 currency units, a given percentage, or both.</li> </ul> <p>Maconomy uses the margin (amount or percentage) resulting in the greater amount, thus allowing the greater budget violation. The amount specified in the parameter is automatically converted into the currency of the job using the exchange rate table for purchases.</p> <ul style="list-style-type: none"> <li>Limit Purchase, Percentage Margin — For a description of the functionality of this attribute, see the attribute "Limit Purchase, Currency Margin."</li> <li>Postpone Copying of Template Job Budgets — Create a job from a template job that carries a job budget. Set this attribute to "Yes" if you do not want to copy the template job budget to the new job upon job creation. This setting enables job creation to perform faster, as the copy job budget process is delayed until the project manager needs the template job budget added to the new job.</li> <li>Price Control from Budgets — This attribute lets the job baseline budget control the job specific price list lines.</li> <li>Standard Price Employee Category — This attribute is used to select an employee category for price calculation if no employee or employee category is specified on a budget line. If detailed time budgeting is used, this attribute is used for price calculation for the non-allocated hours.</li> </ul> <p><b>Employee Revenue Distribution</b></p>

Field	Description
	<ul style="list-style-type: none"> <li>Activity for Revenue Distribution — This attribute is used for specifying an activity for the revenue recognition job entries. If the job is set up with a task list, then the activity can be derived from the task instead.</li> <li>Allow use of Revenue Distribution — Set this attribute to "Yes" to use the employee revenue distribution functionality.</li> <li>Even Distribution upon Invoicing — If this attribute is set to "Yes", Maconomy performs redistribution after printing invoices (except for invoices on account).</li> <li>Even Distribution upon Job Closing — If this attribute is set to "Yes", Maconomy performs redistribution when the job is closed (more precisely, all the jobs with the given job parameter).</li> </ul> <p><b>Events</b></p> <ul style="list-style-type: none"> <li>Job Processing — For this attribute, you can specify an existing option type. For jobs assigned to this job parameter, the options for job processing status in the windows Events and Job Events in the Contact Management module will be based on the options in the option type specified in this field.</li> <li>Result Type — For this attribute, you can specify an existing option type. For jobs assigned to this job parameter, the options for results in the windows Events and Job Events in the Contact Management module will be based on the options in the option type specified in this field.</li> </ul> <p><b>Invoice Preparation</b></p> <ul style="list-style-type: none"> <li>Default Invoice Basis — This attribute is used to select the default basis for the invoice to be created by the <b>Prepare Invoice</b> action. The options are to prepare the invoice from the budget, or from the actuals with either Close All or Delimit.</li> <li>Include Budgets from Sub Jobs in case of Main Job Invoicing — If you set this attribute to "Yes", clicking the <b>Prepare Invoice</b> action includes the budget from sub jobs if the job is set up with main job invoicing and you prepare an invoice from the budget.</li> <li>Limit for Invoicing on Account, as % of Budget — This attribute allows you to specify a limit for how much can be invoiced on account as a percentage of the budgeted billing price.</li> </ul> <p><b>On Account Reconciliation</b></p> <ul style="list-style-type: none"> <li>Activity for job closing — For this attribute, you can enter an existing, invoiceable amount activity to be used for the closing of fixed-price jobs. Any difference between the quote price for a fixed-price job and the printed job invoices on account will be posted on this activity when closing the job, if you have specified an activity number in this field.</li> <li>Allow "Close All" in Job Invoice Allocation — For this attribute, you can on some jobs control the use of "Close All" for each individual job.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li> <p>■ Allow Invoicing on Account Only — For this attribute, you can specify whether or not Maconomy should allow job entries which are set up to be included in the fixed-price job to be invoiced on account only. If you enter the value “Yes” for this attribute, all fixed-price registrations on a job assigned to this parameter must be invoiced by means of on account invoices, and these will only be closed when the job is closed. If you have selected the value “Yes” for this attribute, you must hence also select the value “Yes” for the attribute “Create Invoice Upon Job Closing.”</p> <p>If you enter the value “No” for this attribute, there will be no restrictions as regards the way in which fixed-price registrations should be invoiced.</p> </li> <li> <p>■ Allow Moving Entries To/From Invoicing — If this attribute is enabled, you can move job entries from the Job Invoice Allocation single dialog workspace and make these available for invoicing.</p> </li> <li> <p>■ Carry Forward Full Amount on Invoices On Account — When you print an invoice on account, Maconomy sets the amount for reconciliation for subsequent invoices by default. This attribute enables you to change the default behavior, so that Maconomy does not set invoices on account for reconciliation unless you directly set an amount for reconciliation in any of the following workspaces: Invoice Selection, Blanket Invoice Selection, or Job Invoices on Account.</p> </li> <li> <p>■ Create invoice upon job closing — For this attribute, you can specify whether or not Maconomy should automatically create an invoice based on the quote price less amounts invoiced on account, that is, a zero invoice, when closing a fixed-price job. Any difference between the quote price and the sales price of the registered job entries is posted on the activity specified in the attribute “Activity For Job Closing” which is also identified by the job parameter type “Fixed Price Job Set-Up.”</p> <p>By specifying values for this attribute and the attribute “Allow Invoicing On Account Only” it is thus possible to, for example, specify that “normal” invoicing is allowed on fixed price jobs, but an invoice should still be created when the job is closed. Note that in this parameter you cannot use the combination of “Create Invoice Upon Job Closing” having the value “No” and “Allow Invoicing On Account Only” having the value “Yes.”</p> </li> <li> <p>■ Delimit Invoices On Account By Activity Type — With this attribute set to “Yes,” you can delimit invoices on account by activity. For example, you can set up two default tasks that derive a time activity and an amount activity and, through job invoice allocation, you can reconcile time invoices on account against time registrations and amount invoices on account against amount registrations.</p> </li> <li> <p>■ Delimit Invoices On Account By Employee — With this attribute set to “Yes,” you can delimit invoices on account by employee.</p> </li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ Delimit Invoices On Account By Job — Set this attribute to "Yes" to delimit invoices on account by job in job invoice allocation. This is applicable for job collections which share invoices on account and you want to finely control which jobs reconcile shared invoices on account.</li> <li>▪ Detailed Job Invoice Allocation — If this attribute is enabled, you can divide job entries and invoices on account into groups controlled by activities. You can have up to five groups.</li> <li>▪ Delimit Invoices On Account By Invoice Date — Setting this attribute to "Yes" will delimit the invoices on account for reconciliation by invoice date.</li> <li>▪ Job Invoice Allocation — With this attribute set to "Yes," job entries included in the fixed price will not be invoiced, but they will appear in the window Job Invoice Allocation. The default value is "No."</li> <li>▪ Job Invoice Allocation upon Job Closing — With this attribute set to "Yes," invoice allocation will take place when closing the job, provided that the invoice allocation will close open entries and invoices on account. For a fixed-price job the job can be closed if the fixed price equals the amount invoiced as part of the fixed price. This attribute can only be set to "Yes" if the attribute Job Invoice Allocation is set to "Yes."</li> <li>▪ On Account Reconciliation across Bill to Customers — If this attribute is set to "No," Maconomy will only reconcile invoices on account against invoices with the same Bill-to Customer, unless the job is also set up to fixed price invoicing and to create an invoice upon closing of the job. This is specified by the job parameter attributes "Create invoice upon job closing" and "Invoicing Method."  If this attribute is set to "Yes," Maconomy will reconcile invoices on account against all invoices on account of the job. The default value is "No."</li> </ul> <p><b>Overhead Cost</b></p> <ul style="list-style-type: none"> <li>▪ Exclude Overhead from Cost Price — If this attribute is set to "Yes", Maconomy excludes the overhead rate when looking up cost prices. This means that the entries for the job will have no overhead cost. In the case of intercompany transactions, this attribute controls the exclusion of overhead from the cost of the executing company.</li> <li>▪ Exclude Overhead from Intercompany Price — If this attribute is set to "Yes", Maconomy excludes the overhead rate when looking up intercompany prices. This attribute only affects intercompany transactions, and can only be set to "Yes" if the "Exclude Overhead from Cost Price" attribute is also set to "Yes".</li> <li>▪ Post Offset for Overhead Cost Separately — If this attribute is set to "Yes", Maconomy posts time on the job differently in the general ledger. The cost at base salary rate is posted using the existing posting reference for offset for cost, and the cost at the overhead cost rate is posted using a new posting reference.</li> </ul>

Field	Description
	<p><b>Invoicing On Account</b></p> <ul style="list-style-type: none"> <li>Activity required for Invoicing on Account — For this attribute you can specify whether an activity must be specified for invoices on account. If the job is set up with a task list, a task must be specified. Note that tasks are often set up to derive an activity and, in that case, setting this attribute to “Yes” requires that tasks be set up on invoices on account.</li> <li>Allow Invoice on Account in Multiple Currencies — If this job parameter attribute is set to “No,” the invoice currency on all bill-to customers in the window Bill To Customer Distribution will be the currency of the job and cannot be changed. If this job parameter attribute is set to “Yes,” every bill-to customer will by default be invoiced on account in the currency of the customer, regardless of the job currency. The invoice currency can be changed on every bill-to customer on the job. Notice, however, that changing the job parameter attribute for a job will not change the invoice currency on existing bill-to customers. Notice also that the attribute on job parameters already in use by existing jobs can always be set to “Yes,” thereby allowing this functionality. The opposite is less likely to happen: Changing the attribute to “No” is only allowed if jobs using the job parameter actually all have bill-to customers that only use an invoice currency equal to the job currency of the assigned job (this includes template jobs), and no previous invoices use another invoice currency. An error message will explain if one of the existing jobs blocks for setting the attribute to No.</li> <li>Allow Job Pre-Invoices — Select Yes to indicate that users are allowed to print pre-invoices on this job, or No to restrict printing. This attribute can be changed for an existing job even if it has pre-invoices on it already. This enables you to use pre-invoicing on specific stages of a job.</li> <li>Base Currency as Job Currency — For this attribute you can specify that all jobs with multi-currency invoicing are created with base currency as job currency.</li> <li>Default Activity for Invoicing on Account 1/2 — You use these attributes for stating default activity numbers when you create invoicing on account. The default activities are only applied if the job parameter attribute "Job Dimensions Required in On Account Invoicing" is set to "Yes."</li> <li>Use Job Pre-Invoices by Default — Select Yes to indicate that Maconomy should set the type to Pre-Invoice rather than Invoice on Account.</li> </ul> <p><b>Invoice Selection</b></p> <ul style="list-style-type: none"> <li>Allow Combined T&amp;M and On Account Invoicing — Set this parameter to <b>Yes</b> to enable the combination of T&amp;M and on account invoicing on an</li> </ul>

Field	Description
	<p>invoice. If enabled, the option for "T&amp;M and On Account" is an option for the <b>Invoice Type</b> field in Invoice Selection..</p> <ul style="list-style-type: none"> <li>■ Allow Multiple Drafts — For this attribute you can specify whether or not it should be allowed to create multiple drafts. By default, this attribute is set to "No."</li> <li>■ Approval of Invoicing Plan Lines — For this attribute, you can specify whether or not approval of invoicing plan lines is required before the lines can be invoiced. If you assign this parameter with the value "Yes," the field "Approved" in the table part of the window Invoicing Plans must be marked on a given line before it can be invoiced.</li> <li>■ 'Close All' resets unit prices — If this attribute is enabled, clicking the <b>Close All</b> action in the Invoice Selection workspace resets the billing price to the original value in job entries for invoicing. You can enable or disable this attribute at any time for existing jobs.</li> <li>■ Combine T&amp;M and On Account by Default — Copy to come.</li> <li>■ Default Activity in Invoicing Plan — Attributes for stating default activity numbers when doing invoicing on account in Invoice Selection. The default activities are only applied if the job parameter attribute "Job Dimensions Required in On Account Invoicing" has the value "Yes."</li> <li>■ Invoice Draft Approval Required — If this attribute is enabled, Maconomy requires approval of invoice drafts.</li> <li>■ Invoice Editing Required — For this attribute, you can specify if invoices created for jobs using the job parameter in question must be edited in the window Invoice Editing before being printed. This means that if you specify "Yes," the actions for printing the invoice are not available until the action "Close Editing" has been selected in the window Invoice Editing.</li> <li>■ Invoice Editing Required for Invoicing on Account — If this attribute is set to "Yes", Maconomy requires you to edit draft invoices on account . However, it may not be necessary for this attribute to be enabled if you prepare invoices on account from the On Account Invoice Selection workspace, or if you prepare invoices in batches by transferring them from invoicing plans.</li> <li>■ Invoice Editing Required for Zero Invoices — This attribute is only taken into consideration if the attribute "Invoice Editing Required" is set to "Yes." In this attribute, you can specify whether invoice editing is also required for zero invoices reconciling on account invoices. This means that if you set the attribute to "No," zero invoices reconciling on account invoices do not have to be edited in the window Invoice Editing before being printed. If you set the parameter to "Yes," all invoices including zero invoices reconciling on account invoices must be edited.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Invoice Name From Plan — For this attribute, you can specify whether the invoice name on the job is filled in with the description on the line that is transferred from the plan when using the action "Transfer Invoicing Plan." If more than one line is transferred, then Maconomy only gets the description from one of the lines. This is also the case if the lines derive from different bill-to customers on the job.</li> <li>Invoice Reporting Codes Required — Set this attribute to "Yes" to not close invoice editing without invoice reporting codes.</li> <li>Preferred Invoice Date from Plan — For this attribute, you can specify whether or not Maconomy should transfer the preferred invoice date from an assigned invoicing plan to the field "Preferred Inv. Date" in the window "Invoice Selection," when you select the action "Transfer Invoicing Plan." If the assigned invoicing plan consists of several lines, Maconomy will transfer the date of the line most recently created. The date considered for invoicing plan lines which are assigned job phases or milestones is the completion date of the current phase/milestone.</li> <li>Split by Invoicing Group — If you enable this attribute, you can split sub-jobs into groups when using main job invoicing. This allows Maconomy to produce one invoice for each group. Set up groups using the <b>Invoicing Group</b> field in the bill to customers of the main job. This is done in the Bill To Customer Distribution workspace. You can create two or more lines with the same bill to customer by assigning different Appropriations, which are labels used for referring to a source of funding)</li> <li>Transfer Invoicing Plan to Invoice Selection — For this attribute, you can specify whether or not the invoicing plan should be transferred to Invoice Selection.</li> <li>Validate Invoice Reporting Code Foundation — Set this attribute to "Yes" to not close invoice editing unless billing price and the invoice reporting codes billing price foundation match.</li> </ul> <p><b>Job Descriptions</b></p> <ul style="list-style-type: none"> <li>Note Type — For this attribute, you can specify an existing note type. For jobs assigned to the job parameter type in question, the options for headings in the window Job Descriptions will be based on the heading options in the note type specified in this field.</li> </ul> <p><b>Planning</b></p> <ul style="list-style-type: none"> <li>Budget Time by Employee — If this attribute is set to "True", you need to provide an employee number on job budget lines for time activities in the planning budget.</li> </ul>

Field	Description
	<p>On jobs with a job parameter where the "Duplicate Lines (time) on Planning Budget" attribute is enabled, the definition of duplicate is changed to include the <b>Employee</b> field if the "Budget Time by Employee" attribute is also enabled on the job.</p> <p>In general, job progress evaluation performs better if you do not allow duplicate lines. If you have duplicate lines but the duplicate lines have distinct employees, then it is possible to change the setup to Budget Time by Employee and not allow duplicate lines for time.</p> <p>If the <b>Create Budget Lines for Unbudgeted Tasks</b> check box is selected when running a job progress evaluation, and this attribute is also enabled for the job, you will need to create new lines with an employee number (from the actuals).</p> <ul style="list-style-type: none"> <li>■ Budget Time by Employee Category — Set this attribute to "Yes" for the planning budget to require a unique task, activity, and employee category on job budget lines.</li> <li>■ Prefill time sheet lines — For this attribute, you can specify to what extent the planning made for a given job in the window "Detailed Planning" in the Resource Planning module should be transferred to time sheet lines at the creation of time sheets. Only detailed planning lines with allocations of the booking type "Confirmed" can be transferred. The attribute can have one of these four values: <ul style="list-style-type: none"> <li>■ Do Not Create Lines — On jobs for which this attribute is specified, Maconomy will not automatically transfer time sheet lines based on detailed resource plans at the creation of day- or week-based time sheets in the windows Daily Time Sheets or Time Sheets, respectively.</li> <li>■ Do Not Prefill — On jobs for which this attribute is specified, time sheet lines are automatically created on the basis of a detailed resource plan, but these will not be prefilled with the planned number of hours.</li> <li>■ Per Period — On jobs for which this attribute is specified, time sheet lines are automatically created on the basis of a detailed resource plan. The number of hours planned for the period covered by the time sheet (that is, a month for monthly time sheets and a (split) week for weekly time sheets) is displayed for each day in the column Fixed Hours in the card part of the window "Time Sheets," whereas the lines in the table part only display the job numbers derived from the detailed resource plan. The number of hours planned is thus not specified in the fields on the lines in the table part. On daily time sheet lines, the number of hours expected for the period covered by the monthly/weekly time sheet covering the day in question is inserted.</li> <li>■ Per Day — On jobs for which this attribute is specified, the planned number of hours for each day is specified on both weekly time sheet lines and daily time sheet lines.</li> </ul> </li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Specify estimated time to completion — For this attribute, you can specify whether or not employees must enter an estimate of time to completion for the job in question on their time sheets. The attribute can have one of these three values: <ul style="list-style-type: none"> <li>■ None means that users are not allowed to enter the required time to completion on time sheet lines assigned to the job in question.</li> <li>■ Optional means that it is optional for each user to enter the required time to completion on time sheet lines for the job in question.</li> <li>■ Mandatory means that each user must enter the required time to completion on time sheet lines for the job in question. Having selected this value, it will not be possible to submit a time sheet containing lines (for a time activity) for the job in question unless the required time to completion has been specified.</li> </ul> </li> <li>■ Duplicate lines (time) on planning budget — For this attribute, you can specify whether or not it should be possible to create two planning budget lines for a given job referring to the same time activity and task. If you specify the value “No,” it will thus not be possible to have two planning budget lines referring to the same combination of job, time activity and task. By means of this attribute you can avoid ambiguity as to which planning budget line a given registration on, for example, a time sheet on the job should refer.</li> <li>■ Duplicate lines (amount) on planning budget — For this attribute, you can specify whether or not it should be possible to create two planning budget lines for a given job referring to the same amount activity and task. If you specify the value “No,” it will thus not be possible to have two planning budget lines referring to the same combination of job, amount activity and task. By means of this attribute you can avoid ambiguity as to which planning budget line a given registration on, for example, a time sheet on the job should refer.</li> <li>■ Hours per Man Day — For this attribute, you can specify the number of hours to be suggested in the field “Hours per Man Day” in the window Jobs.</li> <li>■ Baseline Comparison — For this attribute, you can specify whether or not jobs should use a baseline budget for assessing job progress. If you specify the value “No,” the original estimate of the job is used for making progress evaluations. If you specify the value “Yes,” a baseline budget (the type of which is determined by the attribute “Baseline Budget Type” below) is used as the basis of job progress evaluation. The advantage of this is that you can evaluate the progress based on both time and amounts, and the baseline budget can be changed to reflect changes in the scope of a job. For more information, please see the description of the window “Job Progress.”</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ <b>Baseline, Budget Type</b> — For this attribute, you can specify the budget type to be used as baseline budget. You must select a value for this attribute if the value of the attribute “Baseline Comparison” above is “Yes.” Job budget types are created in the window Popup Fields in the Set-Up module.</li> <li>■ <b>Pre-fill Time Sheets</b> — This attribute allows Do Not Create Lines, Do Not Prefill, Per Period, or Per Day values. The Do Not Create Lines value will turn off the functionality. The other values will create time sheet lines for resource detailed planning of employees, when the employee creates time sheets.</li> <li>■ <b>Standard Week Calendar</b> — For this attribute, you can specify the week calendar to be used for planning purposes in the Job Cost module. For instance, when changing the duration of a task in the window Job Budgets, the planned ending date will be moved accordingly. If a standard week calendar is specified for the job, the date will be moved by the specified number of working days as defined by the week calendar, instead of simply using calendar days. Week calendars are managed in the window “Week Calendars” in the Set-Up module.</li> <li>■ <b>Use Imported Budget Line Resource Allocation</b> - Enable this parameter attribute to use the Update Job Budget Resource Allocations workspace. When this attribute is enabled, you cannot add a budget by employee or employee category in the planning budget.  If you select a job parameter where this attribute is enabled on a job with a planning budget, Maconomy checks whether the budget has no lines on time or amount activities with an employee or employee category.</li> </ul> <p><b>Pricing Principle</b></p> <ul style="list-style-type: none"> <li>■ <b>Fixed-Price Basis</b> — For this attribute, you can specify whether the fixed price of a job should be transferred from the latest approved job budget of the type specified in the parameter attribute “Fixed-Price Budget Type,” or whether it should be transferred from the quote of the job. The attribute can thus have one of the values “Budget” or “Quote.” The attribute can be used for both fixed- price jobs and time and material jobs. The “fixed price” of a time and material job is hence either the total budgeted billing price of the latest approved budget of the job or the approved quote price of the job.</li> <li>■ <b>Fixed-Price Budget Type</b> — For this attribute, you can specify which budget type to apply, if you have selected the value “Budget” for the attribute “Fixed-Price Basis.” This attribute can only be given a value corresponding to one of the user-defined job budget types created in the window “Popup Fields” in the Set-Up module.</li> <li>■ <b>Fixed-Price Inclusion Setup</b> — For this attribute, you can specify what is included in the fixed price for a job. You can select any of the following values:</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ Exclude Outlays — If you select this value, Maconomy excludes outlays (cost type defined on activity) from the fixed price.</li> <li>■ By Job Allocation Combination — If you select this value, a job allocation combination on the job controls what is included in the fixed price.</li> <li>■ By Task — If you select this value, the value of the <b>Included in Fixed Price</b> field in the task controls what is included in the fixed price.</li> <li>■ Include All — If you select this value, Maconomy includes all registrations in the fixed price.</li> <li>■ Invoicing Method — For this attribute, you can specify whether a job should be a time and material job or a fixed-price job.  <p>If you specify the option "Time and Material" for this attribute, Maconomy invoices the billing price of the actual costs entered in the windows Job Journal, Time Sheets, Expense Sheets, and so on, on jobs assigned this attribute.</p> <p>If you select the option "Fixed-Price," you should note that fixed-price jobs are invoiced according to two principles, which depend on whether the attribute "Allow Invoicing On account Only" in the job parameter type "Fixed-Price Job Set-Up" has been given the value "Yes" or "No." If that attribute is given the value "No," the customer on the assigned job is invoiced up to the agreed quote price, which is specified in the windows "Jobs," "Job Price Information," or "Job Budgets." In the window "Invoice Selection" you can select the action "Transfer Fixed Price." This will write the invoice selection up or down to match the quote price, less previously invoiced job entries.</p> <p>If the attribute "Create Invoice Upon Job Closing" is assigned the value "Yes," Maconomy will print a zero invoice upon the closing of a job. This invoice reconciles the printed invoices on account with the quote price. Any difference between the actual billing price and the quote price of the job is posted on the activity specified in the attribute "Activity for Job Closing" in the job parameter type "Fixed-Price Job Set-Up." With the "actual billing price" of the job is understood the billing price of the activities entered on the job in the windows "Job Journal," "Time Sheets," "Expense Sheets," and so on.</p> <p>The difference between these invoicing principles is reflected in several windows in Maconomy: "Invoice Selection," "Itemize Invoice Selection," and "Approve Invoice Selection" in the Job Cost module, and the window "Sales Orders" in the Sales Order module. In the latter window it is required that fixed-price jobs be invoiced in the Job Cost module. For more information about fixed-price jobs, please see the description of the windows mentioned and the description of the action "Close Job" in the window "Jobs."</p> </li> </ul> <p><b>Registration</b></p>

Field	Description
	<ul style="list-style-type: none"> <li>Automatically approve employee control lines at creation — For this attribute, you can specify whether employees added to employee control lists in the window “Employee Control” should be approved automatically. If you specify “No,” the employee added must be approved in the windows “Employee Control” or “Employee Control Lines.”</li> <li>Automatically Approve Project Manager’s Expense Sheet Lines — For this attribute, you can specify whether expense sheet lines belonging to the employee who is the project manager of the job specified on the line should automatically be approved. This way, the project manager does not have to manually approve his or her own expense sheet lines. Specify “Yes” if the lines should automatically be approved and “No” if the lines should be approved manually.</li> <li>Automatically Approve Project Manager’s Time Sheet Lines — For this attribute, you can specify whether time sheet lines belonging to the employee who is the project manager of the job specified on the line should automatically be approved. This way, the project manager does not have to manually approve his or her own time sheet lines. Specify “Yes” if the lines should automatically be approved and “No” if the lines should be approved manually.</li> <li>Block Time and Expense Registrations Before Job Start Date — If this job parameter is set to yes, then employee will receive an error message if they try to register time or expenses before the job start date.</li> <li>Notify Employee if listed in Employee Control — If this attribute is set to “Yes”, employees are notified via a To-Do when they are listed in the Employee Control workspace.</li> <li>Project Manager Can Register Time and Expenses Outside Allowed Period — If this job parameter is set to yes, then the project manager may register time and expenses before the job starting date.</li> <li>Standard invoicing action for job entries on time and material jobs — For this attribute, you can specify a standard action to be applied to job entries on time and material jobs in connection with invoice selection. In the window Invoice Selection, the field “Action” in the table part allows you to specify whether to carry forward, invoice, or write off each entry. The value specified in this parameter attribute will be suggested in the field “Action” in the table part of the window “Invoice Selection” if the job in question is a time and material job.</li> <li>Time Registration Rounding To Multiple Of Unit — This attribute allows you to specify how Maconomy should handle an attempt to enter time that is not a multiple of the chosen unit. You can choose one of the following options: <ul style="list-style-type: none"> <li>Round to the nearest multiple of the unit.</li> </ul> </li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Round up to the nearest multiple of the unit.</li> <li>Round down to the nearest multiple of the unit.</li> <li>Leave the field blank if there should be no rounding. This option means you will get an error message if you try to enter time which is not a multiple of the specified unit.</li> <li>Time Registration Unit In Days — This number decides the rounding of registration in days. For example, if this value is set to 0.5 then time sheet registrations are rounded to half or full days.</li> <li>Time Registration Unit In Minutes — If a positive number of minutes (non-zero) is entered as a unit, every time registration on the jobs with the given parameter must be a multiple of this number. When the unit is zero, this restriction is disabled.</li> <li>Use Daily Description as Description Text on Job Entries — If this attribute is set to “Yes,” you specify that the Description (text) field on the Job Entry should be set to Daily Description instead of Entry Text, and the Daily Description field is not empty.</li> </ul> <p><b>Revenue Recognition</b></p> <ul style="list-style-type: none"> <li>Capitalization Method — For this attribute, you can specify whether a job assigned this job parameter should be capitalized at cost or at billing price. You can thus choose among the two options “At Cost” and “At Billing Price.” A job will only be capitalized if it belongs to a job group that is marked in the field “Capitalize Expenses” in the window Job Groups.</li> <li>Activity for Job Revenue Adjustment — For this attribute, you can specify an invoiceable amount activity to be used for entering revenue adjustments in connection with jobs using overrun handling or jobs using revenue recognition by completion percentage. However, if you are performing detailed revenue recognition by activity or task, the activity specified in this field will not be used for the posting of adjustment entries, if account references can be derived from the field “Open Billing Price, Adjustment” on the relevant activities. Please see the description of the action “Approve Revenue Recognition” in the window “Job Revenue Recognition Details” for a detailed description of how Maconomy determines where adjustment entries should be posted when performing detailed revenue recognition.</li> <li>Limit Revenue — For this attribute, you can specify whether the revenue to be recognized on time and material jobs using revenue recognition by completion percentage should be limited by the “fixed price” specified for the jobs. If you enter the value “Yes” in this attribute, you can specify the desired maximum completion percentage limit to apply to the relevant jobs in the attribute “Compl. % Limit” in this job parameter.</li> </ul> <p>If the revenue to be recognized on a time and material job is not limited, the completion percentage of a time and material job being revenue recognized</p>

Field	Description
	<p>can be larger than 100% meaning that more than the “fixed price” of the job can actually be recognized as revenue. However, as a fixed-price job can never be revenue-recognized for more than 100% of the job's fixed price, the revenue to be recognized on such jobs will always be limited.</p> <ul style="list-style-type: none"> <li> <b>Calculate Completion Percentage From</b> — In this attribute, you can specify the basis for the calculation of completion percentages calculated on jobs using revenue recognition by completion percentage. The calculation can be based on one of the two options “Cost Price” and “Billing Price.” <p>If you select the option “Cost Price” in this attribute, the completion percentage of a given job will be calculated on the basis of the budgeted cost price from the latest approved revision of the budget type specified in either the attribute “Completion Percentage, Budget Type” or the job attribute “Fixed Price Budget Type.”</p> <p>If you select the option “Billing Price” in this attribute, the completion percentage of a given job will be calculated on the basis of the budgeted billing price of the latest approved revision of the budget type specified in either the attribute “Completion Percentage, Budget Type” or the job attribute “Fixed Price Budget Type.” See the introduction to the window “Revenue Recognition” for a thorough description of how Maconomy calculates the completion percentage and the amounts to be revenue recognized when you have selected one of the options in this attribute.</p> </li> <li> <b>Detail by</b> — In this attribute, you can specify whether revenue recognition by completion percentage should be calculated on a more detailed level than the job level for jobs assigned this job parameter. You can enter one of the following values in this attribute: “Activity,” “Task,” “Location,” “Entity,” “Project,” “Purpose,” “Specification 1-3,” or “Local Specification 1-3.” If the value of this attribute is, for example, set to “Task,” the revenue recognition of the job will be based on completion percentages calculated for each individual task specified on the job. See the introduction to the window “Job Revenue Recognition Details” for more information about how to use detailed revenue recognition on jobs. <p>Note that you can only specify a value in this field if you have specified “Yes” for the attribute “Revenue Recognition By Completion Percentage” in this job parameter. Moreover, if you want a job to use detailed revenue recognition, the job must also be assigned a job parameter of the type “Pricing Principle” in which it is specified that the “fixed price” of the job is determined by the job's budget, rather than the quote price of the job. If you leave this field blank, revenue recognition by completion percentage will be calculated at the job level, insofar as you have specified the value “Yes” in the attribute “Revenue Recognition By Completion Percentage.”</p> </li> <li> <b>Detail by</b> — The functionality of this attribute is similar to that of the above attribute also called “Detail By.” If you enter values in both of these attributes, revenue recognition of a job assigned this job parameter will be </li> </ul>

Field	Description
	<p>based on completion calculations of both of the values specified in the two attributes. This means that if you have entered “Task” in the other attribute and “Activity” in this attribute, revenue recognition on a job will be based on the completion percentage of each combination of task and activity registered on the job. An example of this combination is illustrated in the introduction to the window “Job Revenue Recognition Details.”</p> <p>If you have entered a value in the other “Detail By” attribute, the value in this field must be different from the value entered in the other attribute. Also note that there is no ordering or priority between the two attributes. This means that specifying, for example, “Task” and “Purpose” will generate the same results as if you specify “Purpose” and “Task.”</p> <p>See the introduction to the window “Job Revenue Recognition Details” for information about how to use detailed revenue recognition on jobs.</p> <ul style="list-style-type: none"> <li>■ Evaluation of Work in Progress — Copy to come.</li> <li>■ Completion % Limit — For this attribute, you can specify a completion percentage limit to apply to the jobs assigned to this job parameter. The value in this field will only have effect, if you have specified the value “Yes” in the attribute “Limit Revenue.”</li> </ul> <p>On fixed-price jobs, the completion percentage limit can have a value between 0% and 100%, whereas the value can be anything from 0% and up on time and material jobs. If, for example, you enter the value “120%” in this attribute, the completion percentage limit for fixed-price jobs assigned to this attribute will be 100%, whereas the limit will be 120% for time and material jobs. This is because it is not possible to recognize more revenue than the fixed price on a fixed-price job. If you enter the value “85%,” the revenue recognized on both fixed-price jobs and time and material jobs will not exceed 85% of the fixed price of the jobs. If you specify the value “0” in this attribute, you cannot recognize any revenue by completion percentage on fixed-price jobs and time and material jobs assigned to this job parameter.</p> <p>If the revenue to be recognized on a time and material job is not limited, the completion percentage of a time and material job being revenue recognized can be larger than 100%, meaning that more than the “fixed price” of the job can actually be recognized as revenue. However, a fixed-price job can never be revenue-recognized for more than 100% of the job’s fixed price.</p> <p>The value specified in this attribute only applies as the default value for the jobs assigned this parameter. This means that the percentage entered in this attribute can be manually changed by the user in the windows “Job Revenue Recognition” and “Job Revenue Recognition Details.”</p> <ul style="list-style-type: none"> <li>■ Completion Percentage, Budget Type — In this attribute, you can specify a budget type to be used when calculating the completion percentage of a job. The functionality of this attribute is useful if you need to let one particular job budget type determine the fixed price of a job, while another job budget type is used for calculating the completion percentage of a job.</li> </ul>

Field	Description
	<p>Specifying a budget type in this attribute thus allows you to separate the fixed-price budget of a job from the ongoing budget of a job. If you do not enter a value in this attribute, the completion percentage of a job will be based on the budget specified in the attribute "Fixed Price Budget Type." See the introduction to the window "Job Revenue Recognition" for further information about the use of this attribute.</p> <ul style="list-style-type: none"> <li> <b>Revenue Recognition By Completion Percentage</b> — For this attribute, you can choose whether revenue on a job should be recognized according to completion percentage. Revenue recognition means that the entries of the job are registered as revenue in the G/L module.           <p>You can only specify the value "Yes" for this attribute if you have chosen the value "At Billing Price" for the attribute "Capitalization Method."</p> <p>If you specify the value "No" for this attribute, and you have selected capitalization at billing price, Maconomy revenue recognizes the value of all registered entries on the job at their billing price, for example, employees' registrations on the job in the window "Time Sheets." The display of the value of a job thus created is only correct if the registrations actually reflect how far the job processing is.</p> <p>If you specify the value "Yes" for this attribute, any revenue can be recognized on a job according to the degree of completion of the job. The completion percentage is calculated or specified on a current basis for each job in the two windows "Job Revenue Recognition" and "Job Revenue Recognition Details."</p> <p>However, as the revenue to be recognized on a time and material job should not necessarily be limited to the "fixed price" of the job, you can specify whether revenue should be limited in the attribute "Limit Revenue." If you want to specify a limit to the completion percentage for the revenue to be recognized on jobs, this limit can be defined in the attribute "Compl. % Limit" in this job parameter. See the descriptions of these two attributes for more information about the possibilities for limiting the revenue to be recognized on both fixed-price jobs and time and material jobs.</p> <p>As you can recognize revenue by completion percentage on both fixed-price jobs and time and material jobs, you should see the introduction to the window "Job Revenue Recognition" for information about the setting up and handling of revenue recognition by completion percentage on these two types of jobs.</p> </li> <li> <b>Handling of Overruns</b> — For this attribute, you can specify whether a job assigned this job parameter should handle overruns. An overrun occurs when the costs registered on a job exceed the agreed fixed price of the job. The "fixed price" of a time and material job can either be the budgeted billing price of the latest approved job budget or the approved quote price of the time and material job.           </li> </ul>

Field	Description
	<p>To handle overruns, Maconomy must be set up to capitalize jobs at billing price. This is done in the attribute Capitalization Method.</p> <p>If the value "Yes" is specified for this attribute, the capitalization of a given job's billing price is limited to the effective fixed price of the job. The basis of the effective fixed price of both time and material jobs and fixed-price jobs is specified in the job parameter type "Pricing Method" for the attribute "Fixed Price Basis." Any adjustments are automatically made when posting is carried out as described below. The amount activity on which overrun adjustments are to be registered is specified in the attribute "Activity for Job Revenue Adjustments" in this job parameter. If the fixed price of a job is changed, Maconomy also adjusts (that is, creates, increases, or reduces) any overruns on the job. This means that the job is written up or down according to the agreed fixed price.</p> <p>The following paragraphs describe the entries made by Maconomy when you register entries giving rise to overruns on a fixed-price job. As this procedure is identical to the procedure applying to time and material jobs, special considerations applying to time and material jobs are described after the following example.</p> <p>Assume that a fixed-price job is created with a quote price of USD 6,000. As the job progresses, you enter registrations on the job using the job journal, time sheets, and so on. These entries are posted as usual to the account for work in progress. You register work and expenses for a total of USD 7,000 on the job, thus creating an overrun. The USD 1,000 by which the WIP account exceeds the fixed price is credited on the account for adjustment of work in progress (which is specified by means of a dimension combination in the window "Job Groups"), while the same amount is debited on the account for open sales price adjustment. The account for open sales price adjustment is specified by means of a dimension combination in the window "Activities" for the activity specified in the attribute "Activity for Job Revenue Adjustment" in the job parameter type "Revenue Recognition" if you use posting by activity, while it is specified in the window "Posting References" in the G/L module if you do not use posting by activity.</p> <p>At the same time, Maconomy writes down the job, creating the necessary job entries.</p> <p>Next, assume that the quote price is increased, for instance to USD 8,000. This means that there is no longer an overrun, as you have still only registered entries for USD 7,000 on the account for work in progress. Maconomy will then automatically debit the account for WIP adjustment for the USD 1,000, while the account for open sales price adjustment is credited the same amount. This way, the overrun is cancelled until the registrations on the job cause the WIP account to exceed the fixed price.</p> <p>If the same G/L account is used for the registration of work in progress and WIP adjustment, the balance on this account will never exceed the fixed price. The same applies to the open sales price if the same G/L account is</p>

Field	Description
	<p>used both for registration of open sales price and for adjusting the open sales price.</p> <p>Maconomy automatically creates any necessary entries caused by overruns. You can view these entries along with all the regular job entries in the window "Job Card."</p> <p>For time and material jobs it applies that the invoice basis of the job should always be the basis for the invoicing on the job. Therefore, as revenue adjustment entries should not adjust the invoice basis of the job, any revenue adjustment entries created will be closed immediately after creation and hence they will not have any effect on the invoice basis of the job. If changes on the job result in overruns being cancelled, the automatic creation of reversing journals ensures that the relevant entries are adjusted in the same way as it applies to fixed price jobs.</p> <p>When closing a time and material job with handling of overruns, Maconomy automatically creates a job revenue recognition journal which when posted ensures that the revenue recognized on the job is equal to the amount invoiced on the job.</p> <ul style="list-style-type: none"> <li>Recognize Revenue by Completion Percentage — This attribute recognizes revenue of a fixed price job by the completion percentage. This parameter requires job capitalization at billing price.</li> <li>Revenue Adjustment at Missing Budget — For this attribute, you can specify whether a registration on a detail level should be considered at approval of a revenue recognition, if the detail level in question is not assigned a budget line that contains an amount which is included in the fixed price of the relevant job. If this attribute is assigned the value "No," Maconomy will not make a revenue adjustment journal when selecting the action "Approve Revenue Recognition" in the window "Job Revenue Recognition Details," if no budget line assigned to the job contains a specification of a corresponding detail level which is to be included in the fixed price of the job. This means that if detailed revenue recognition is to be carried out on the basis of, for example, activities, and you have made a registration on an activity for which there is no corresponding budget line, Maconomy will ignore the registration in question and hence not create an adjustment journal for the detail level in question when the action "Approve Revenue Recognition" is selected.</li> </ul> <p>If you specify the value "Yes" in this attribute, Maconomy will make a revenue adjustment at every detail level, even though no corresponding budget line has been created for the job in question. This means that if you have, for example, registered GBP 100 on a given detail level for which no corresponding budget line has been created, the fixed price on the line in the window "Job Revenue Recognition Details" will be zero. When approving the revenue recognition in the window, the amount registered will be compared to the amount budgeted hence resulting in a removal of the revenue and a resetting to zero of the line.</p>

Field	Description
	<ul style="list-style-type: none"> <li> <p><b>Evaluate Work in Progress</b> — For this attribute, you can specify if it should be possible to evaluate the WIP of a job in the window “Evaluation of Work in Progress.” The attribute can have one of two values: “Yes” or “No.” You cannot select “Yes” if the job parameters “Handling of Overrun” or “Recognize Revenue by Completion Percentage” of the job parameter type “Revenue Recognition” are set, or if the job parameter attribute “Fixed-Price” of the “Invoicing Method” job parameter of the job parameter type “Pricing Method” is set to “Yes.” Also, the job must be capitalized at billing price.</p> <p>For jobs where this attribute is set to “Yes,” it is possible to revenue-recognize an amount or a percentage of the open entries of jobs without a job budget. For instance, you can choose to recognize 85% of the registered entries on a job (the open billing price) as revenue. When the job is closed, a revenue adjustment journal is created which ensures that the revenue recognized on the job is equal to the amount actually invoiced on the job.</p> <p>Jobs where this attribute is set to “No” will not be displayed in the window “Evaluation of Work in Progress.”</p> <p>For more information, please see the description of the window “Evaluation of Work in Progress.”</p> </li> <li> <p><b>Posting of Contract Deviation and Posting of Invoice Deviation</b> — For these attributes, you can specify a posting method for job cost entries in the general ledger. In the Job Cost module, there is a distinction between three types of billing prices: The Billing Price is the price which is actually invoiced to a customer. The Contracted Billing Price is the price which was agreed with the customer, usually reflected in a job price list. The Standard Billing Price is an estimated target price which can be used as a standard of measure when analyzing job performance (see also the section “Price Types” in “Appendix A”). Using these attributes, you can have deviations between these billing prices reflected in the General Ledger, for example, for use in G/L reports.</p> <p>Note that it is only possible to select the attribute “Posting of Contract Deviation” if one or both of the system parameters “Use standard billing price for amount activities” or “Use standard billing price for time activities” has been marked in the Set-Up module.</p> <p>Even though these two attributes are described together, they are independent of each other. The attribute “Posting of Contract Deviation” has influence on the postings at the time of registration of the job entries, and the attribute “Posting of Invoice Deviation” has influence on the postings at the time of invoicing of the job entries. However, it is easier to describe the effect of the attributes when they are combined in the examples below, as each example shows both registration and invoicing for completeness.</p> </li> </ul>

Field	Description																																						
	<p>The effect of the posting method depends on whether the job group to which the job belongs is capitalized and, if it is, on the capitalization principle of the current job. The posting principle of each attribute is described below using the same example: Consider a job on which time has been registered, and which is now ready to be invoiced. Let the following facts apply:</p> <table><tr><td>Standard Billing Price (performance target)</td><td>200</td></tr><tr><td>Standard Up/Down</td><td>20</td></tr><tr><td>Contracted Billing Price (as agreed with customer)</td><td>220</td></tr><tr><td>Up/Down</td><td>-10</td></tr><tr><td>Billing Price (actual)</td><td>210</td></tr></table> <p>In the example, the cost factor is omitted for clarity, as the posting of costs is not affected by these job parameter attributes. Furthermore, the affected posting references are emphasized.</p> <p>Note that the relevant posting references can both be defined in the window "Posting References" in the G/L module and per activity in the table part of the window "Activities." If the field "Post by Activity" is marked in the window "System Information" in the Set-Up module, the references in the window "Activities" are used. If the field is not marked, the references in the window "Posting References" are used.</p> <p>Posting of Contract Deviation = "No"; Posting of Invoice Deviation = "No" — On jobs for which both these attributes have the value "No," the following postings take place when a job is invoiced:</p> <table><tr><th colspan="4">Capitalization Method: At Billing Price</th></tr><tr><th>Event</th><th>Accounts</th><th>Debit</th><th>Credit</th></tr><tr><td rowspan="2">Registration</td><td>Open Billing Price</td><td></td><td>220</td></tr><tr><td>Work in Progress</td><td>220</td><td></td></tr><tr><td rowspan="4">Invoice</td><td>Open Billing Price</td><td>220</td><td></td></tr><tr><td>Work in Progress</td><td></td><td>220</td></tr><tr><td>Item Sales</td><td></td><td>210</td></tr><tr><td>A/R Control Account</td><td>210</td><td></td></tr></table>	Standard Billing Price (performance target)	200	Standard Up/Down	20	Contracted Billing Price (as agreed with customer)	220	Up/Down	-10	Billing Price (actual)	210	Capitalization Method: At Billing Price				Event	Accounts	Debit	Credit	Registration	Open Billing Price		220	Work in Progress	220		Invoice	Open Billing Price	220		Work in Progress		220	Item Sales		210	A/R Control Account	210

Field	Description																				
	<table><tr><th colspan="4">Capitalization Method: At Cost Price Or without capitalization</th></tr><tr><th>Event</th><th>Accounts</th><th>Debit</th><th>Credit</th></tr><tr><td></td><td>Item Sales</td><td></td><td>210</td></tr><tr><td></td><td>Invoice Deviation</td><td>10</td><td></td></tr><tr><td></td><td>A/R Control Account</td><td>210</td><td></td></tr></table> <ul style="list-style-type: none"><li>■ Posting of Standard Billing Price — A standard billing price can be used as a measuring point for performance analyses in which you compare the actual, registered billing price with the standard billing price. In this way, the standard billing price acts as a target price which should be achieved for this activity. The standard billing price is derived in the same way as the regular billing price, except that the item price list system is not used.<ul style="list-style-type: none"><li>■ Set this parameter to <b>No</b> to track this target price for items or services outside of the company.</li><li>■ Set this parameter to <b>Yes</b> to post this price for items or services for the job.</li></ul></li><li>■ Posting References Based on Job Balance — Select this attribute to enable the job balance to determine the posting reference. When you post a job entry or an invoice/credit memo on account and capitalize at billing price, Maconomy reflects the amount posted either in an Asset account (Accrued Revenue) or in a Liability account (Deferred Revenue). You must combine these two accounts to view the job balance between work in progress and invoiced on account.<p>If you post an entry that shifts the job balance from negative to positive, the amount you posted is split such that Deferred Revenue is reflected as zero, with the remaining amount reflected as an increase in Accrued Revenue. The opposite happens when the job balance is shifted from positive to negative. The amount you posted is split such that Accrued Revenue is reflected as zero, with the remaining amount reflected as an increase in Deferred Revenue. In effect, it is the current job balance that determines the posting reference.</p></li><li>■ Revenue Recognize According to Approved Budget — For this attribute, you can specify if it should be possible to perform revenue recognition by completion percentage on the basis of the latest approved revision of the job budget or on the basis of the latest revision (whether approved or not). If the latest approved revision is used as the basis, the budget must be approved whenever the budget is changed and you wish to perform revenue recognition. Consequently, a great number of job budget revisions are generated if you perform revenue recognition often. By setting the value</li></ul>	Capitalization Method: At Cost Price Or without capitalization				Event	Accounts	Debit	Credit		Item Sales		210		Invoice Deviation	10			A/R Control Account	210

Alloc. — In this attribute, you can specify an activity to be used when writing a job up or down in the Job Invoice Allocation window. For more information, please see the description of the Transfer Write-Up/Down to Fixed Allocation Combination attribute.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Allow only Write-Up/Down at Close All, Job Inv. Alloc. — With this attribute set to Yes you can only write a job up or down in the window Job Invoice Allocation by selecting the Close All option on the allocation lines. This makes it impossible to write the job up or down by adjusting the quantities or billing prices on the allocation lines.</li> <li>Allow Write-Up/Down at Transfer of Billing Price Only — If this attribute is selected (value is “Yes”), you can only write a job up or down in the Invoice Selection window by selecting the Transfer Desired Sales Price action or Transfer Fixed Price action. This makes it impossible to write the job up or down by adjusting the quantities or billing prices on the invoice lines directly in the Invoice Selection window or Itemize Invoice Selection window. Furthermore, it will not be possible to select the action Transfer Budget action in the Invoice Selection window. You can only select this attribute if the Transfer Write-Up/Down to Fixed Allocation Combination action is selected.</li> <li>Entity for Write-Up/Down — The functionality of this field is similar to that of the Activity for Write-Up/Down field above.</li> <li>Entity for Write-Up/Down, Job Inv. Alloc. — In this attribute, you can specify an entity to be used when writing a job up or down in the Job Invoice Allocation window. For more information, please see the description of the Transfer Write-Up/Down to Fixed Allocation Combination attribute.</li> <li>Local Spec. 1-3 for Write-Up/Down — The functionality of these fields is similar to that of the field “Activity for Write-Up/Down” above.</li> <li>Local Spec. 1-3 for Write-Up/Down, Job Inv. Alloc. — Copy to come.</li> <li>Location for Write-Up/Down — The functionality of this field is similar to that of the field “Activity for Write-Up/Down” above.</li> <li>Location for Write-Up/Down, Job Inv. Alloc. — In this attribute, you can specify a location to be used when writing a job up or down in the Job Invoice Allocation window. For more information, please see the description of the Transfer Write-Up/Down to Fixed Allocation Combination attribute.</li> <li>Project for Write-Up/Down — The functionality of this field is similar to that of the field “Activity for Write-Up/Down” above.</li> <li>Project for Write-Up/Down, Job Inv. Alloc. — In this attribute, you can specify a project to be used when writing a job up or down in the Job Invoice Allocation window. For more information, please see the description of the Transfer Write-Up/Down to Fixed Allocation Combination attribute.</li> <li>Purpose for Write-Up/Down — The functionality of this field is similar to that of the field “Activity for Write-Up/Down” above.</li> <li>Purpose for Write-Up/Down, Job Inv. Alloc. — Copy to come.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Spec. 1-3 for Write-Up/Down — The functionality of these fields is similar to that of the field “Activity for Write-Up/Down” above.</li> <li>Spec. 1-3 for Write-Up/Down, Job Inv. Alloc. — Copy to come.</li> <li>Task for Write-Up/Down — The functionality of this field is similar to that of the Activity for Write-Up/Down field above.</li> <li>Task for Write-Up/Down, Job Inv. Alloc. — In this attribute, you can specify a task to be used when writing a job up or down in the Job Invoice Allocation window. For more information, please see the description of the Transfer Write-Up/Down to Fixed Allocation Combination attribute.</li> <li>Transfer Write-Up/Down to Fixed Allocation Combination — If this attribute is selected (value is “Yes”), the actions “Transfer Desired Sales Price” and “Transfer Fixed Price” create a job entry with the difference between the desired sales price and the total current sales price on the work in progress that has been selected for invoicing in the window Invoice Selection. In this way, a write-up or write-down on the jobs for which the current job parameter is selected will be placed and subsequently posted on a fixed allocation combination which is also defined in this job parameter. This means that any deviation from the price originally calculated by Maconomy on the basis of job price lists, markup percentages, and so on, will be reflected in the invoice ultimately sent to the customer. How the price is reflected in the invoice depends on the invoice layout selected for the job. Often, the write-up/-down will be shown as a separate line in the invoice. When a new desired sales price or a fixed price is transferred in the window “Invoice Selection,” Maconomy checks if the desired sales price or fixed price corresponds to the calculated price of work in progress (registered entries). If this attribute is “No,” Maconomy will adjust the registered quantities or unit billing prices to match the desired sales price. If this attribute is “Yes,” Maconomy instead creates a line marked for direct invoicing with the calculated difference (credit or debit). The allocation combination of the new invoice line is specified in the other attributes to this job parameter. Moreover, if the attribute “Allow Write-Up/Down at Transfer of Billing Price Only” is “Yes,” it is not possible to create write-ups or write-downs directly by adjusting the prices and quantities on existing invoice lines.</li> <li>Transfer Write-Up/Down to Fixed Allocation Combination, Job Inv. Alloc. — Copy to come.</li> </ul> <p><b>Time Transfer</b></p> <ul style="list-style-type: none"> <li>Unit in Minutes — If you specify a non-zero number of minutes on this parameter, then time on time sheets in hours will be transferred as rounded up to a multiple of the specified number of minutes.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Unit in Days — If you specify a non-zero number of days on this parameter, then time on time sheets in days will be transferred as rounded up to a multiple of the specified number of days.</li> <li>Upper Limit in Minutes — If you specify a non-zero number of minutes on this parameter, then time on time sheets in hours will be limited to the specified number of minutes per entry per day.</li> <li>Upper Limit in Days — If you specify a non-zero number of days on this parameter, then time on time sheets in days will be limited to the specified number of days per entry per day.</li> <li>Cost Based on Rounded Time — This is a Yes/No parameter. If you choose 'Yes' in this parameter, job entries will be created with a registered total cost based on the cost rate and the rounded quantity for time (rounded up to multiple of one of "Time Transfer Unit" attributes described above. If you choose 'No', the registered total cost will be based on the original, unrounded quantity.</li> </ul> <p><b>Surcharges</b></p> <ul style="list-style-type: none"> <li>Action on Missing Surcharges, Budget — This attribute controls how Maconomy will react if you approve job budgets without surcharge and the job is set up to apply a surcharge. For budgets, the action applies to "Submit Budget". <ul style="list-style-type: none"> <li>[blank] — If the value is left blank, then the user is not given any message upon forgotten surcharge calculation when approving the job budget.</li> <li><b>Warn</b> — (Warning) Select this option so that the user receives a warning but can continue processing.</li> <li><b>Stop</b> — (Error) Select this option so that the user receives an error, and cannot go forward until the error is resolved.</li> <li><b>Calculate</b> — (None) Select this option so the user receives no message, but surcharges are <i>automatically</i> calculated when the user <i>approves</i> the job budget (if the user did not already perform the surcharge calculation before approval).</li> </ul> <p>Setup for a job can change anytime.</p> </li> <li>Action on Missing Surcharges, On Account — The attribute controls how Maconomy will react if you approve account invoicing without surcharge and the job is set up to apply a surcharge. <ul style="list-style-type: none"> <li>[blank] — If the value is left blank, then the user is not given any message upon forgotten surcharge calculation when approving the account invoicing.</li> </ul> </li> </ul>

The dimensions of the underlying basis for the calculation of surcharge (i.e. the job budget lines, job entries or on account entries selected for invoicing) are not kept. Instead, the job surcharge entries receive dimensions derived only from the standard task for surcharge and the dimensions specified on the</li> </ul>

Field	Description
	<p>surcharge rule line. Maconomy first takes the dimensions specified on the surcharge rule line, then overwrites by the standard task for surcharge (if any).</p> <p>Select <b>Yes</b> to indicate that the surcharge entry will get the "same" dimensions as the entry for which it charges., the standard task for surcharge, and the dimensions on the surcharge rule line. Maconomy first takes the dimensions from the job entry (or on account entry), then overwrites by the dimensions specified on the surcharge rule line (if any).</p> <div style="border: 1px solid blue; padding: 5px;"> <p><b>Note:</b> This setting can only be set to No when "Apply Surcharge at Invoicing, T&amp;M" is set to <b>Yes</b>.</p> <p>This setting affects the calculation of surcharge in job budgets and the calculation of surcharge at invoicing. <b>It does not affect surcharges applied at registration.</b></p> </div> <p><b>Value</b></p>
Field	Description
<b>Value</b>	<p>In this field, you can specify the value to apply to the attribute on the line in question. For attribute values which have been predefined by Maconomy, this field will contain a default value, which can be changed manually. In such situations, you can only choose among the values defined in the Maconomy system, for example, "At Cost" or "At Billing Price" for the attribute "Capitalization Method." Other attribute values, such as option lists used in connection with events and job descriptions are not predefined in the system and must thus be created by the user before they can be assigned an attribute in this window.</p> <p>As it is possible to define several different job parameters of a given type, you can, for example, define several parameters of the type "Revenue Recognition" all having different values for the available attributes.</p> <p>Changing a value for an attribute is only possible if no job is assigned the job parameter in question. The values available for each attribute are displayed in the field "Value Examples."</p> <p>See the below description of the field "Type" for further information on available values.</p>
<b>Type</b>	<p>This field shows the available types to choose from when entering a value for an attribute in the field "Value." The field is automatically filled in by Maconomy. Examples of values displayed in this field are "Yes" and "No"; values which are, for example, available for the attributes "Handling of Overruns" and "Include Outlays in Fixed-Price," whereas the predefined values "At Cost" and "At Billing Price" are the values available for the attribute "Capitalization Method." Other value examples are text, which could, for example, be a number of an activity, which would be a valid value for the attribute "Activity for Job Revenue Adjustment" or an option list, which would be available for the attribute "Header Type" in the job parameter type "Job Descriptions."</p>

Field	Description
<b>Value Example</b>	This field shows examples of values of the type displayed in the field “Type” on the line in question. The values displayed in this field cannot be changed manually.
<b>Remarks</b>	In this field, you can enter a remark for the attribute in question.
<b>Change Allowed Even If Used</b>	Some job parameter attributes are flexible so that you can change them even if the parameter is selected on some jobs. This field shows which attributes have this property. A check mark in this field indicates that this parameter attribute can be changed even if it is used.

## Job Parameter Derivation Fields Workspace

Use this workspace to control whether job parameters are rederived when you change the fields for a job.

Note that the settings in this workspace affect all of your jobs.

When you change a field in any job-related workspace, it might be appropriate to change the job's parameters as well. For this reason, Maconomy, by default, rederives job parameters every time that you make such a change.

Because this process can be time consuming, you have the option to turn off the **Always Derive Job Parameters** option in this workspace.

If you turn off this option, Maconomy only derives job parameters for a job once, when the job is created. You still have the option to rederive job parameters manually. For information about this, see the description of the Job Parameter Selection workspace.

However, in your Maconomy setup, you might have specified that some fields govern the use of certain job parameters. For example, a job parameter might depend on the value of the **Popup 5** field. If you change the value in the pop-up field, you want the job parameter to change accordingly, without having to remember to rederive the job parameters manually. For this purpose, you can add job parameter derivation fields in the Job Parameter Derivation Fields sub-tab in this workspace.

If you deselect the **Always Derive Job Parameters** field in the Job Parameter Derivation Fields tab and add the **Popup 5** field in the Job Parameter Derivation fields sub-tab, Maconomy rederives job parameters if, and only if, you change the **Popup 5** field.

### Job Parameter Derivation Fields Tab

This section includes the fields and descriptions for the Job Parameter Derivation Fields tab.

#### Job Parameter Derivation Island

Field	Description
<b>Always Derive Job Parameters</b>	The field is marked by default, meaning that Maconomy will rederive job parameters for a job whenever it is changed in any way for example, if the

Field	Description
	<p>job name is changed, or a different value is selected in one of the job pop-up fields.</p> <p>If you unmark the field and leave the table part empty, Maconomy will never rederive job parameters for a job unless you do so manually in the window Job Parameter Selection.</p>

### Job Parameter Derivation Fields Sub-Tab

This section includes the fields and descriptions for the Job Parameter Derivation Fields sub-tab.

Field	Description
<b>Internal Field Name</b>	<p>If the field “Always Derive Job Parameters” is unmarked, you can specify the internal name of a job field here. If, for instance, you want to rederive job parameters whenever the budget type is changed for the job, enter the field “CurrentBudgetType” in this field. You can search for any of the properties (for example, internal name or external name) of all the fields in the JobHeader relation by pressing Ctrl+G.</p> <p>When you press Return, the external name of the field is displayed in the field “External Field Name”; in this case, the name is “Current Budget.” From now on, whenever the current budget type is changed on the job in the window Job Budgets, Maconomy will rederive the job parameters for the job.</p>
<b>External Field Name</b>	<p>This field shows the external name of the internal field name entered in the field “Internal Field Name” above.</p>

## Job Groups Workspace

Use this workspace to enter information, primarily related to capitalization setup, for job groups.

You must create at least one job group in this workspace before you can begin setting up jobs in the Jobs workspace. You cannot delete a job group after you create it.

In Maconomy, jobs are organized into groups. For each group, you use this workspace to designate whether you will capitalize costs or post them as expenses. You can also specify a job number if the budget is to be used as the standard for all new jobs that belong to the current job group.

For auditing purposes, you should print and file this workspace every time that you change job group information.

## Job Groups Tab

This section includes the fields and descriptions for the Job Groups tab.

## Job Group Island

Field	Description
<b>Name</b>	Enter the name of the job group here. This name is the unique identifier of the group, and you must enter a name. There is no limit to the number of characters you can type here. You can change the name of an existing job group, but you cannot delete a group once it has been created. The name must be specified.

## Capitalize Island

Field	Description
<b>Capitalize Expenses</b>	<p>In this field, you specify whether to capitalize expenses or post them to a P &amp; L account. This is referred to as a job's capitalization status. If this field is marked, expenses are capitalized (that is, posted to a balance sheet account, typically an account for Work in Progress or WIP). This means costs are held in inventory until the job is invoiced. If this field is not marked, costs from amount activities are expensed immediately (posted to a Profit &amp; Loss account).</p> <p>When a job is created in the window Jobs, the capitalization status is retrieved from the job group. The capitalization status of an existing job is not changed if the job group status is changed here.</p>
<b>Work in Progress, Time</b>	<p>In this field, enter the number of a dimension combination containing the account on which you want to register work in progress for time activities. The dimension combination can also contain other dimension values to be used in this connection.</p> <p>You can enter a dimension combination number regardless of whether the "Capitalize Expenses" field is marked. If it is not, the posting reference will be used for finding a capitalization account for jobs that were created while the job group was capitalized.</p>
<b>Work in Progress, Amount</b>	<p>In this field, enter the number of a dimension combination containing the account on which you want to register work in progress for amount activities. The dimension combination can also contain other dimension values to be used in this connection.</p> <p>You can enter a dimension combination number regardless of whether the "Capitalize Expenses" field is marked. If it is not, the posting reference will be used for finding a capitalization account for jobs that were created while the job group was capitalized.</p>
<b>Work in Progress, Adjustment, Time</b>	<p>In this field, enter the number of a dimension combination containing the account on which you want to register adjustments to work in progress for time activities. The dimension combination can also contain other dimension values to be used in this connection. The posting reference is used for</p>

Field	Description
	<p>handling of overruns, revenue recognition by completion, evaluation of work in progress, and employee revenue distribution.</p> <p>You can enter a dimension combination number regardless of whether the "Capitalize Expenses" field is marked. If it is not, the posting reference will be used for finding a capitalization account for jobs that were created while the job group was capitalized.</p>
<b>Work in Progress, Adjustment, Amount</b>	<p>In this field, enter the number of a dimension combination containing the account on which you want to register adjustments to work in progress for amount activities. The dimension combination can also contain other dimension values to be used in this connection. The posting reference is used for handling of overruns, revenue recognition by completion, evaluation of work in progress, and employee revenue distribution.</p> <p>You can enter a dimension combination number regardless of whether the "Capitalize Expenses" field is marked. If it is not, the posting reference will be used for finding a capitalization account for jobs that were created while the job group was capitalized.</p>

### Standard Budget Island

Field	Description
<b>Job</b>	<p>In this field, you can enter a job number. The job budget from the specified job will automatically be copied to a job created within the current job group. The budget of the job selected as standard cannot be deleted.</p> <p>If the system parameter "Recalculate Job Budget When Copying" in the window System Parameters in the Set-Up module is not marked, a simple line-by-line copying of the budget is made. However, currency amounts will be recalculated to the new job's currency. If "Recalculate Job Budget When Copying" is marked, Maconomy will recalculate the budget when it is copied. This means that the price fields (costs and billing prices in base and currency plus Net Cost, Base), the field "Markup %," and the fields concerning purchase orders are not copied, but are recalculated on the basis of information of the job concerning the customer, the employees, and the job price list. That is why the new budget does not necessarily show the same amounts as the budget that it was copied from. For more information about currency conversion in the Job Cost module, please see "Appendix A: Price Calculation in the Job Cost Module."</p> <p>Note that you cannot enter the number of a template job in this field.</p> <p>This field shows the name of the selected job. You cannot change the name here.</p>

### Standard Values Island

Field	Description
<b>Employee Control</b>	<p>In this field, you can select if you want to apply employee control when creating a job from the current job group. The selection can be changed on the individual jobs. You can select two forms of employee control for a job:</p>

Field	Description
	<ol style="list-style-type: none"> <li>1. By specifying that job entries can only be made for employees who are included in the job's budget of the type specified by means of the system parameters "Use Fixed Budget Type for Employee Control" and "Budget Type No. for Employee Control." If, for instance, the system parameter "Use Fixed Budget Type for Employee Control" has been marked, and the system parameter "Budget Type No. for Employee Control" indicates the budget type "Standard," a job registration for a given employee is only allowed if the employee in question appears in the latest revision of the job's budget of the type "Standard." This control can be strengthened to only include employees who are included in the job's approved budget of the type in question.</li> <li>2. By specifying that only employees listed in the job's employee control list can make registrations on the job. This is the preferred method. For more information, please see the description of the window Employee Control.</li> </ol> <p>Also see the description of the field "Employee Control" in the window Jobs.</p>

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

## Activities Workspace

Use this workspace to enter information about job activities.

You assign each job entry to an activity, which is used to categorize the job expenses. Some examples are Drawing, Driving, Materials, and External Consultants. The activities that are associated with job entries determine the general ledger accounts to which the entries are posted.

You can create a chart of activities to record every type of job activity used in the Job Cost module. Having arranged your job entries by activity type, you can compare budget estimates with actual figures. The activities also provide a basis for invoicing.

If you have many activities that use the same rules for posting to general ledger accounts, you can simplify set up by using job posting references. You can set up job posting references in the Job Posting References workspace and then refer to them from the Activities workspace. You can also refer to a general job posting reference and still add lines in this workspace for exceptions to the job posting reference.

If you select **Post by Activity** in the System Information workspace, you must specify in the Job Posting Reference Lines sub-tab a number of dimension combinations that refer to the G/L accounts to which Maconomy should post entries about the individual activities. The sub-tab contains a line for each department that you created in the Posting References workspace in the G/L module. For more information, see the description of the **Department** field in this workspace. For auditing purposes, you should print and file this workspace every time that you change an activity.

## Activities Tab

This section includes the fields and descriptions for the Activities tab.

## Activity Island

Field	Description																																	
Activity No.	<p>In this field, you enter the number of the new activity.</p> <p>When you design your activity chart, it is important to systematically number activities and use the same number of characters for all activities. Please note that Maconomy’s standard printouts only show five characters (this can be changed with Maconomy’s layout editing tools).</p>																																	
Description	<p>In this field, you enter the name of the activity. The text is shown with the activity number on all activity printouts and in several windows to minimize the risk of entering a wrong activity number.</p> <p>The text you enter is furthermore created as an entry in the window Language Texts in the Set-Up module. It is then possible to assign a translation of the activity description to the languages used in Maconomy. This makes it possible, for example, to send an invoice to a German company with the activity descriptions in German. For more information about activity descriptions in other languages, please see the description of the window Language Texts in the Set-Up module.</p>																																	
Activity Type	<p>In this field, you select an activity type for the activity. There are three types to choose from: “Time,” “Amount” and “Summary.” You cannot change the selected value in this field on existing activities. Time activities are used for recording hours in time sheets, and amount activities are used for recording other costs of a job (that is, items and services not related to employee hours, such as commissioned work and internal use of materials).</p> <table><tr><th>Activity No.</th><th>Name</th><th>Type</th></tr><tr><td>101</td><td>Draft</td><td>Time</td></tr><tr><td>102</td><td>Layout</td><td>Time</td></tr><tr><td>103</td><td>Typography</td><td>Time</td></tr><tr><td>199</td><td>Text</td><td>Summary</td></tr><tr><td>...</td><td></td><td></td></tr><tr><td>501</td><td>Mileage, own car</td><td>Amount</td></tr><tr><td>502</td><td>Cab</td><td>Amount</td></tr><tr><td>503</td><td>Courier</td><td>Amount</td></tr><tr><td>599</td><td>Transport</td><td>Summary</td></tr><tr><td>...</td><td></td><td></td></tr></table>	Activity No.	Name	Type	101	Draft	Time	102	Layout	Time	103	Typography	Time	199	Text	Summary	...			501	Mileage, own car	Amount	502	Cab	Amount	503	Courier	Amount	599	Transport	Summary	...		
Activity No.	Name	Type																																
101	Draft	Time																																
102	Layout	Time																																
103	Typography	Time																																
199	Text	Summary																																
...																																		
501	Mileage, own car	Amount																																
502	Cab	Amount																																
503	Courier	Amount																																
599	Transport	Summary																																
...																																		

Field	Description
<b>Cost Type</b>	<p>In this field, you can select a cost type for the current activity.</p> <p>You cannot change the cost type of existing activities. You can choose between the following values: "Turnover," "Outlays," or blank according to the following guidelines:</p> <ul style="list-style-type: none"> <li>▪ If the activity type is "Time" — You can only select the cost type "Turnover."</li> <li>▪ If the activity type is "Amount" — You can choose between the cost types "Turnover" and "Outlays." If you select the type "Outlays," the current amount activity will be used for registering outlays, that is, expenses incurred on behalf of customers. The difference between outlay activities and regular amount activities is that outlay activities are not included in the job turnover, and consequently in the gross margin calculation of the job. In printouts and in turnover reports such as the window Print Job Report, amounts entered on outlay activities will be displayed separately.</li> </ul> <p>If a margin is made on an outlay, the margin can be entered on an amount activity of the type "Turnover" or possibly as a job surcharge using a job surcharge rule, and the margin will then be included in the job's turnover.</p> <ul style="list-style-type: none"> <li>▪ If the activity type is "Summary" — You can only select the cost type blank.</li> </ul>
<b>Allocation Group</b>	<p>Select an Allocation Group in this popup field. The application uses this group in the Job Invoice Allocation window to present an overview of the allocation split by allocation group. It also affects the Balance action in the Job Invoice Allocation window; see the description of the Job Invoice Allocation window for more information.</p>
<b>Invoice</b>	<p>In this field, you indicate whether the current activity is normally one that is to be invoiced to the client. If you mark this field, Maconomy will automatically suggest that job entries for the activity should be invoiced. When creating an entry for the activity in question, a billing price is automatically displayed for the activity in the field "Billing Price to Inv." in the window Invoice Selection and in the fields "Billing Price, Curr." and "Billing Price, Base" the window Job Budgets. The amount in the field "Billing Price to Inv." can be changed on the invoice and on the job budget.</p> <p>If you do not mark this field, Maconomy will not suggest a price in the field "Billing Price to Inv." in the window Invoice Selection or in the fields "Billing Price, Curr." and "Billing Price, Base" in the External Invoice window Job Budgets. It will then not be possible to enter a billing price for these activities.</p> <p>This field must be marked in order for entries to the given activity to be capitalized. This is true even if the job is assigned to a job group that is to be capitalized. This is because noninvoiceable entries are treated as closed job entries and will only be recorded as costs. They will not be available for further processing.</p>

Field	Description
	To use this functionality, you will have to set up the list of groups in Popup Fields, set up the allocation group on all relevant activities, and set the 'Detailed Job Invoice Allocation' job parameter to Yes. The parameter is of type "On Account Reconciliation."
<b>External Invoice</b>	<p>This field is used to specify how entries registered for the activity are to be posted in a general journal. The field can only be marked for amount activities, and only if the field "Invoice" above has also been marked. Upon posting of an entry to an activity with a mark in this field, Maconomy will create a closed job entry with a cost of zero, specifying the amount as billing price (a credit results in a positive billing price). In addition, the amount is posted to the account specified as the Sales account by means of a dimension combination in the table part of this window.</p> <p>This field can be used to record job income that is to be treated as an increase in the job's billing price. For example, this function can be used by advertising agencies who wish to express a media commission as an increase in the job's billing price rather than a reduction in the job's cost.</p>
<b>Employee Utilization</b>	Here you may indicate the employee utilization type. Select from pop-up type "Employee Utilization" as defined in the Popup Types window.

### Company Island

Field	Description
<b>Company</b>	<p>In this field, you can specify the number of the company to be used as executing company. If a company in Maconomy owns, for example, a copier, this copier can be created as an amount activity with the company in question registered as owner in this field. When the activity is used on a job, Maconomy will create intercompany entries between the job's company and the company in this field (the executing company) when posting, if the two companies are different. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company. If you do not specify a company in this field, Maconomy will use the employee's company as executing company when registering. If no employee is specified, the job's company will be used.</p> <p>If you change the company number in this field, or you enter a company number in the empty field, the value in the field "Base Currency" may be changed. This happens if another base currency has been selected in the window Company Information for the company in question. If this is the case, please note that the values in the price fields in the island Price are not changed, but are now shown in the new base currency. It is therefore recommended to adjust the price fields right away if the selected company has a different base currency.</p> <p>This field also shows the name of the specified company.</p>

Field	Description
<b>Base Currency</b>	This field displays the currency used as base currency in the company specified in the field "Company No." above. See the field "Base Currency" in the window Company Information in the G/L module for a detailed description of the concepts of company base currency and enterprise currency.

### Dimension Combination Island

Field	Description
<b>Dimension Combination</b>	<p>In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the window Dimension Combinations.</p> <p>If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the current activity. However, any dimension derivation values specified in this island will be used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the activity.</p>

### Derived Dimensions Island

Field	Description
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location if you want a value to be derived from the current activity. If you also want the specified value to overwrite existing values for the dimension, complete the field "Overwrite." If you do not choose overwriting, the dimension value will only be derived if the dimension field for which derivation is taking place has neither been completed manually nor by entering a registration code.</p> <p>Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used rather than the value (if any) found for this dimension in the dimension combination in question. This means that the dimension combination only applies to this dimension if you have not entered a value in this field.</p> <p>Please note that if a dimension combination has been specified in the field "Dim. Comb. No.," a mark in the field "Overwrite" will only have effect if you have also entered a dimension value. If you mark the field "Overwrite" but you do not enter a dimension value in this field, the "Overwrite" field is ignored, as dimension values and overwriting specification are always retrieved together from the same dimension derivation island, dimension combination or dimension combination line.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the windows Dimension Derivation and Dimension Combinations for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.

Field	Description
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

### Creation Island

Field	Description
<b>Create from Activity No.</b>	<p>You use this field to specify the activity number you wish to use as a template and copy from to create the activity. All the information from the existing activity will be copied to the new activity, except activity number, description and anything you have entered yourself.</p> <p>Table lines with activity references will also be copied.</p>

### Outlay Settlement Island

Field	Description
<b>Settle via Vendor</b>	<p>In this field, you can specify for amount activities whether the outlays made by employees on the current activity should be reimbursed via a vendor. The outlays are registered in the window Expense Sheets. In the window Employees in the Set-Up module, each employee can be assigned to a vendor, so that the A/P module can be used for handling reimbursements for the employees. In practice, this means that when an expense sheet is transferred, Maconomy creates entries on the vendor to which the employee in question is assigned, instead of on the account for outlay settlement specified by means of a dimension combination in the window Posting References in the G/L module. The vendor entries created in this process must be approved for payment before reimbursement can take place unless the system parameter "Automatically approve expense sheets for payment" has been marked, in which case the vendor entries are approved automatically.</p>

### Sales Orders Island

Field	Description
<b>Create Order</b>	<p>If you mark this field, job budget lines created using the current activity will have a mark in the field "Create Sales Order" on the job budget line. This field can only be marked for amount activities.</p>

**Print Control Island**

Field	Description
<b>Statistics 1-4</b>	In these fields, you can enter an optional code for the activity. The statistics codes can be selected or deselected in the selection criteria for various printouts of which activities are a part.

**Access Level Island**

Field	Description
<b>Access Level</b>	<p>In this field, you can enter an access level. A user only has access to the current activity if he has been assigned to this level or a level above this in the window User Access Levels. This access control ensures that when working with for instance a job entry, you can only enter an activity to which you have access, and in this window you can only see and edit the activities to which you have access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. For further information about the standard access control configuration, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If you do not specify an access level, any user can register time and expenses on the activity.</p> <p>This field also shows a description of the access level.</p>

**Activity Usage Island**

Field	Description
<b>Allow Time Registration</b>	<p>Select this field to make the activity available for time registration in windows such as Time Sheets and SpeedSheet.</p> <p>This field is the default value for the corresponding field on tasks if you created a task with the Overwrite Activity field selected. You cannot allow time registration for Amount activities if the "Disallow reg. on amount act. in time sheets" field is selected in the Systems Parameter window.</p> <p>You cannot allow time registration for Summary activities.</p>
<b>Allow Expense Registration</b>	<p>Select this field to make the activity available for the registration of expenses.</p> <p>This field is the default value for the corresponding field on tasks if you created a task with the Overwrite Activity field selected. You cannot allow expense registration for Time activities.</p>
<b>Allow Mileage Registration</b>	<p>Select this field to make the activity available for mileage registration.</p> <p>This field is the default value for the corresponding field on tasks if you created a task with the Overwrite Activity field selected.</p> <p>You cannot allow mileage registration for Time activities.</p>
<b>Allow Purchasing</b>	Select this field to make the activity available in purchasing-related windows.

Field	Description
	This field is the default value for the corresponding field on tasks if you created a task with the Overwrite Activity field selected. You cannot allow purchasing for Time activities.
<b>Allow Invoicing on Account</b>	Select this field to make the activity available in invoicing on account-related windows. This field is the default value for the corresponding field on tasks if you created a task with the Overwrite Activity field selected.
<b>Allow Invoicing Plan</b>	Select this field to make the activity available in job invoicing plans. This field is the default value for the corresponding field on tasks if you created a task with the Overwrite Activity field selected.

**Remarks Island**

Field	Description
<b>Remarks</b>	In these fields you can enter any remarks concerning the current activity. The fields are for information only.

**Status Island**

Field	Description
<b>Blocked</b>	In this field, you specify whether or not the activity is blocked. If the field is marked, the activity is blocked and cannot be used in any other windows in the Job Cost module.

**Rates Island**

Field	Description
<b>Time Unit</b>	Use this field to specify the time unit for prices on time activities.
<b>Cost</b>	In this field, you enter the cost rate per piece for amount activities. This amount is suggested when you budget and when you make job entries in the window Job Journal. If there is no amount in this field, Maconomy uses the cost of the item whose item number is entered in the "Item No." field. If there is neither an amount here nor a number in the "Item No." field, a zero cost value will be suggested for the amount activity. If the activity is a time activity, you cannot enter a value here, as activity costs are always based on employees.
<b>Intercompany Price</b>	In this field, you can enter an intercompany price which will be used as the cost of 1 unit of the current activity if the executing company and the company responsible for the job in question are not identical.

Field	Description
<b>Billing Price</b>	<p>If the activity is a time activity, a billing rate per hour is entered here. This amount is suggested in budgeting, and is used for entries in the window Job Journal. This is the case if you have indicated in the "Hourly Rate" field in the window System Information that the hourly rate is to be based on the activity. If the hourly rate is not based on the activity, Maconomy alerts you if you enter a value here.</p> <p>If you do not enter a value in this field, and if the hourly rate is based on the activity, Maconomy will look for the billing price of an item number in the "Item No." field. If no amount is entered here, and no item number is entered in the "Item No." field, Maconomy will suggest a zero billing price for the time activity in Job Budgets and in Job Journal entries.</p> <p>If this is an amount activity, enter a billing price per unit here. This will be suggested in budgeting and in recording entries in the Job Journal.</p> <p>As with time activities, if you leave this field blank, Maconomy will use the billing price of the item in the "Item No." field. If no billing price is entered here, and no item number is present, Maconomy will suggest a zero billing price in Job Budgets and in Job Journal entries.</p> <p>For more information about price calculation, please see "Appendix A: Price Calculation in the Job Cost Module."</p>
<b>Markup %</b>	<p>In this field, you enter the markup percentage of cost to be used in calculating the billing price of job costs entered in the Job Journal, the window Vendor Invoices (and allocated in the window Invoice Allocation), or the General Journal. The value entered here is used if you wish to add a profit to sale of goods and services in conjunction with jobs that do not involve direct employee hours or the inventory system.</p> <p>This field only applies to amount activities. If you enter a values in the fields "Cost" and "Billing Price," Maconomy will always calculate a markup percentage and show it in this field.</p>
<b>Standard Billing Price</b>	<p>In this field, you can enter a standard billing price for the current activity. A standard billing price can be used as a measuring point for performance analyses in which you compare the actual, registered billing price with the standard billing price. In this way, the standard billing price acts as a target price which should be achieved for this activity. The standard billing price is derived in the same way as the regular billing price, except for the fact that the item price list system is not used.</p> <p>For more information about price calculation, please see "Appendix A: Price Calculation in the Job Cost Module."</p>
<b>Standard Markup %</b>	<p>The functionality of this field is similar to that of the field "Markup %" above, except for the fact that it relates to a standard markup percentage. The standard markup percentage is used to calculate a standard billing price which is described above.</p>
<b>Item</b>	<p>In this field, you enter the number of an item, whose cost and billing prices will be suggested in budgeting and in entries in the window Job Journal. If the activity is a time activity, Maconomy will use only the item's billing price (not</p>

Field	Description
	<p>the cost). This occurs only if you have indicated in the “Hourly Rate” field in System Information that the activity’s hourly rate be determined by the activity (rather than by employee).</p> <p>This field provides the ability to establish uniform pricing of activities, in that a single item (used to determine price) can be assigned to several activities. Pricing for all these activities can then be controlled by re-pricing the given item.</p> <p>The billing price of the item is entered in a price list in the Inventory module. In order for Maconomy to suggest the item’s billing price as described above, you must assign the same price list to the job for which the activity is being used. When calculating the price, Maconomy includes any relevant quantity discounts, but not item or customer discount agreements.</p> <p>An item’s billing price is not used if you have entered a billing price in the “Billing Price” field. Likewise, its cost will not be used if a value has been entered in the “Cost” field.</p> <p>Maconomy verifies that the item number you enter is that of an item which is not discontinued, and that the field “Activity No.” is blank for the item in the window Item Information Card in the Inventory module.</p>
<b>Job Price Group</b>	<p>In this field, you enter the number of a job price group. The current activity is assigned to the specified job price group. When a reference is made to a job price group on a line in a job price list, all activities assigned to the job price group in question will determine the price on the current job price list line. For a more detailed description of job price groups, please refer to the description of the window Job Price Groups.</p>
<b>Tax Code</b>	<p>If you do not use tax tables (that is, the field “Use Tax Tables” is not marked in the System Information window), select in this field the tax code to be used when invoicing or crediting job entries for the activity.</p> <p>You can add up to three different tax codes if necessary. To enable multiple tax codes, the system parameters “Show Three Tax Levels” and/or “Show Two Tax Levels” must be marked in the System Parameters window. When multiple tax codes are enabled, the “Tax Code” field will be replaced by the following fields: “Tax Code 1,” “Tax Code 2,” and, if enabled, “Tax Code 3.” For further information on multiple tax codes, please see the description in “Tax Codes.”</p> <p>If you are not applying differentiated tax rates (rates by inventory item), a blank value in this field will indicate that the job entry associated with the given activity will be posted to the account for non-taxed item sales, specified by means of a dimension combination either in this window or in the Posting References window in the G/L module (see the description of the “Department” field in the table part of this window). You should only enter a value here for activities of the Time or Amount type.</p> <p>If you use differentiated tax and tax tables, the tax code is found by means of a tax table. For further information on this functionality, see the description of the “Reporting Code” field.</p>

Field	Description
	The tax codes that appear in this window are defined in the Tax Codes window in the G/L module.
<b>Item Tax Code</b>	<p>In this field, you can select an item tax code created in the window Popup Fields. Maconomy uses the field to determine which tax code to use for calculation of tax on the current activity, as the reporting code is one of the tax code selection criteria in the window Tax Tables in the G/L module. In the selection, Maconomy uses the tax table specified in the window Company Information for the company responsible for the job. The tax code, however, is only transferred from a tax table, if the field "Use Tax Tables" has been selected in the window System Information, and only if the company responsible for job has been assigned a tax table. If no tax table has been assigned to the responsible company, or if differentiated tax has been selected but not the use of tax tables, Maconomy transfers the tax code specified for each activity in the window Activities. If neither the field "Use Tax Tables" nor the field "Differentiated Tax" has been marked, Maconomy uses the standard tax code, which is specified in the window System Information in the Set-Up module.</p> <p>If you use tax tables, and the system parameter "Get on account tax code from tax table" is marked, the tax code to be transferred to on account invoices is found in a tax table. But instead of using the item tax in this field, Maconomy uses the on account tax code in the field "On Account Tax Code" in the window System Information in the Set-Up module (along with various other information) to point out the relevant tax table line. If the system parameter "Get on account tax code from tax table" is not marked, the standard tax code specified in the window System Information is always used as the tax code on invoices on account. For further information about the information used to point out the correct tax code, please see the description of the window Tax Tables in the G/L module.</p> <p>The reporting code is used in connection with posting of job entries to determine which tax report entries to create when posting on the current job. Based on the tax report entries, it is possible to create tax reports showing tax and tax basis postings associated with a given tax report field. However, this type of reporting can only be done, if extended tax reporting has been selected in the window System Information.</p>

### Posting Island

Field	Description
<b>Job Posting Reference Name</b>	In this field, you specify a job posting reference to use for the activity (they are set up in the Job Posting References window.)
<b>Description</b>	If you enter a Job Posting Reference Name, the corresponding description will be retrieved and shown in this field.

## Registrations Island

Field	Description
<b>Limit, Time Sheets</b>	<p>In this field, you can enter the daily maximum quantity to be registered by a given employee on the activity on time sheets. This means that the combined quantity registered for this activity on time sheets and daily time sheets on a given day by a certain employee cannot exceed the quantity specified in this field. If the field is left blank, registrations on the activity in question are not limited to a certain number.</p> <p>The value for this field is in hours or days, depending on the time unit selected in the <b>Time Unit for Prices</b> field.</p>
<b>Limit, Expense Sheets</b>	<p>In this field, you can enter the daily maximum quantity to be registered by a given employee on the activity on expense sheets. If the field is left blank, registrations on the activity in question are not limited to a certain number.</p>
<b>Employee Required</b>	<p>If you mark this field, an employee number must be specified when making registrations to the amount activity displayed in the window. On time activities this field is always marked and cannot be removed. If this field is marked, an employee number must be entered in windows such as Job Journal, Job Reallocation, Invoice Selection, General Journal, Invoice Allocation, Purchase Orders, and so on, when registering amounts on the activity in question. Thus, the effect of the field applies in all those windows in which you can make registrations on activities and employees. In this connection, you should note that it is not possible to use activities requiring an employee number in windows in which no field for specifying an employee number exists, for example, the windows Sales Orders, Subscription Orders, and Credit Memos.</p> <p>The field can be marked for an amount activity even though registrations without a specification of an employee number have already been made for the activity in question.</p> <p>The default value of this field when creating an activity is marked for time activities and unmarked for amount activities.</p>
<b>Quantity 1 from Quantity on Expense Sheet</b>	<p>If you mark this field, the quantity entered in the field "Quantity" on an expense sheet line is automatically transferred to the field "Quantity 1" on the same line. This is useful if you want to transfer the quantity to the General Ledger, as the number entered in the field "Quantity" is not transferred to G/L. For instance, if the current activity concerns mileage, you would often want the number of miles transferred to the General Ledger for reporting. Marking this field makes it unnecessary to repeat the entry of miles in the field "Quantity 1." Please note that if a value has already been entered in the field "Quantity 1," the value in the field "Quantity" is not transferred.</p> <p>Marking this field for time activities would normally not be useful.</p>
<b>Quantity 2 from Quantity on Expense Sheet</b>	<p>The functionality of this field is similar to that of the field "Quantity 1 from Quantity on Expense Sheet," but transfers the quantity to the field "Quantity 2" instead.</p>

Field	Description
<b>Expense Justification Help Text</b>	<p>The information in this field is available on the expense sheet line and informs the user about the type of information required to complete the Expense Justification field.</p> <p>If this field is not empty the user will have to complete the Expense Justification before submitting the expense sheet.</p>
<b>Accrual Type</b>	<p>In this field, you can select an accrual type to automatically be suggested on entries to the current activity. The field can only be completed for amount activities. This means that each time, for example, a job entry is created for the current activity in the window Job Journal, the accrual type in this field will be suggested on the entry where it can, however, be changed.</p> <p>Please note that when accrual type has been selected in this field, all entries to the activity in question must be accrued, meaning that the field "Accrual Type" cannot be blanked for entries to such an activity. This also means that activities where a value has been selected in this field cannot be used on time sheets.</p>
<b>Progress by Quantity</b>	<p>Select this check box to indicate if task progress for an amount activity is tracked according to quantity rather than cost price.</p> <p>If this field is selected, then a job estimate to completion for an expense on this activity is based on quantity rather than cost price, and the corresponding job budget line quantity field is updated from changes to the estimate.</p>

### Texts Island

Field	Description
<b>Job Budget Line Texts</b>	<p>In this field, you can specify the default description to be used for the activity when entered on a job budget line. The following options are available:</p> <ul style="list-style-type: none"> <li>Copy Activity Text — If you select this option, leaving the field "Description" empty on a job budget line on which the current activity is specified will cause Maconomy to copy the activity description (in the field "Description" in this window) to the field "Description" on the job budget line. The activity description will not overwrite any manually entered description on the budget line.</li> <li>Copy Task Description — If you select this option, leaving the field "Description" empty on a job budget line on which the current activity is specified will cause Maconomy to copy the task description (in the field "Description" in the window Task Lists or Job Private Task Lists) to the field "Description" on the Time and Expense Sheet Lines AP, GL, Job Journal Line Texts job budget line. However, the task description will not overwrite any manually entered description on the budget line.</li> <li>Do Not Prefill — If you select this option, Maconomy will copy neither the activity nor the task description to job budget lines. Hence, the field</li> </ul>

Field	Description
	<p>“Description” must always be completed manually on job budget lines where the current activity is entered.</p>
<b>Time and Expense Sheet Lines Texts</b>	<p>The functionality of this field is similar to that of the field “Job Budget Line Texts.” However, this field pertains to descriptions on time and expense sheet lines instead of job budget lines.</p>
<b>AP, GL, Job Journal Line Texts</b>	<p>The functionality of this field is similar to that of the field “Job Budget Line Texts.” However, this field pertains to descriptions on A/P, G/L and job journal related entry lines, for instance general journal lines, invoice allocation lines, purchase order lines, request for quote lines and requisition lines.</p>
<b>On Account Invoicing Line Texts</b>	<p>In this field, you can specify the default description to be used for the activity when entered on invoice on account lines. The following options are available:</p> <ul style="list-style-type: none"> <li>▪ <b>Copy Activity Text</b> — If you select this option, leaving the field “Description” empty on an invoice on account line on which the current activity is specified will cause Maconomy to copy the activity description (in the field “Description” in this window) to the field “Description” on the invoice on account line. The activity description will not overwrite any manually entered description on the invoice on account line.</li> <li>▪ <b>Copy Task Description</b> — If you select this option, leaving the field “Description” empty on an invoice on account line on which the current activity is specified will cause Maconomy to copy the task description (in the field “Description” in the window Task Lists or Job Private Task Lists) to the field “Description” on the invoice on account line. However, the task description will not overwrite any manually entered description on the invoice on account line.</li> <li>▪ <b>Do Not Prefill</b> — If you select this option, Maconomy will copy neither the activity nor the task description to invoice on account lines. Hence, the field “Description” must always be completed manually on invoice on account lines where the current activity is entered.</li> </ul>

### Standard Job Budget Text Island

Field	Description
<b>Name</b>	<p>If the name of a standard job budget text is entered in this field, Maconomy will apply this standard text whenever the current activity is used in the windows Job Planning or Job Budgets. The standard text will be transferred to job budget lines to which the current activity is attached. When in use, it is possible to see and edit the text in the window Job Budget Texts.</p>

**Standard Note Island**

Field	Description
<b>Note</b>	<p>In this field, you can specify the number of a note created in the window Notes in the Set-Up module. The field is used for adding a number of extra fields in which the user can enter information about the activity on the purchase lines (lines in the table part of the windows Requisitions, Requests for Quote and Purchase Orders). This could, for example, be useful if the activity information is too generic and therefore does not provide sufficiently specific information. For instance, if the activity is for a print job, the basic information about the activity is static, but each time a printing job is ordered, you may wish to also register such information as the paper quality, binding, and so on. It is therefore useful to add a number of fields so that a user ordering a print job is allowed to enter this information. You may have many types of generic activities in your system, and most likely they do not all require the same additional information. Therefore Maconomy allows you to use this functionality to extend any activity by any number of fields.</p> <p>An activity is assigned additional fields by assigning the activity to a note where the headings in the table part represent the additional fields in which the user should enter specific information about the specific activity ordered on a given purchase line. Whenever the activity is entered on a purchase line, a copy of the note specified on the activity is automatically created and assigned to the purchase line in question. However, if the system parameter “Standard note is derived from Activity before Task” is not marked, and a standard note has been specified for the task specified on the purchase line, the note assigned to the purchase line will be a copy of the one specified on the task in question. In the window Notes, the user can then enter the required information in the table part of the note assigned to the purchase line. The information entered in the note will also appear on external printouts.</p> <p>For a description on how to set up standard notes for activities and tasks, see the description of the system parameter “Standard note is derived from Activity before Task” in the Set-Up module.</p> <p>This field also shows a description of the specified note.</p>

**Default Values Island**

Field	Description
<b>‘Included in Fixed Price’ on Tasks</b>	<p>If this field is selected, tasks created with this activity will have the corresponding field selected. This field and the job parameter Fixed Price Inclusion Setup determines whether registrations on a certain task are included in fixed price.</p> <p>Changing the field will not invoke any update of existing tasks.</p>
<b>‘External Cost’ on Job Journals lines</b>	<p>If this field is selected, job journal lines created with this activity will have the corresponding field selected. This field determines whether registration costs are reallocated along in case the entry is reallocated later.</p> <p>Changing this field will not invoke any update of existing job journal lines.</p>

**User Island**

See the chapter “Getting Started” for a description of the fields in the island User.

## Job Posting Reference Lines Sub-Tab

This section includes the fields and descriptions for the Job Posting Reference Lines sub-tab.

Field	Description
<b>Line No.</b>	This field shows the line number in the table part.
<b>Department</b>	<p>This field shows the name of a department created in the window Posting References in the G/L module.</p> <p>The table part of this window is used for designating various posting references by department for the relevant activity. These posting references are only used if sales and cost of sales are posted by activity. You select this in the field "Post by Activity" in the window System Information in the Set-Up module. The posting references are made by means of dimension combinations created in the window Dimension Combinations in the G/L module. These dimension combinations can contain references to both accounts and other dimension values to be used when posting. For further information on the functionality of dimension combinations, see the description of the window Dimension Combinations in the G/L module.</p> <p>When creating a time or amount activity, Maconomy automatically creates a line in the table part for each department. For summary activities, the table part is empty. If you later create more departments, you must manually create lines in the table part corresponding to these. The departments are shown as pop-up values when you create lines.</p> <p>It is the selection of a department on a job that determines the set of posting references to be used in connection with the relevant activities.</p> <p>If the "Department from Employee" field in the window System Information is marked, Maconomy will use the posting reference "Offset" of the employee's department (instead of the job's department) when making entries to time activities.</p>
<b>Job Group</b>	You can select a job group that will be a target group for the line.
<b>Employee Type</b>	You can select an employee type that will be a target group for the line.
<b>Item Group</b>	You can select an item group that will be a target group for the line.
<b>Transaction Type Group No.</b>	You can specify a transaction type group number that will be a target group for the line.
<b>Accrual</b>	You can select whether this line is used for accrued registrations, non-accrual registrations, or all registrations.

Field	Description
<b>Job Invoice Allocation</b>	You can specify whether the line is to be used for “normal” invoices, job invoice allocations, or both.
<b>Offset Account</b>	<p>In this field, enter the number of a dimension combination containing the G/L account to be used as an offset in posting job journals where the given activity is used together with the relevant department. The dimension combination can also contain references to other dimension values to be used in this connection.</p> <p>For the sake of clarity, the following description of the posting of the activity’s prices uses the term “account.” Rather than accounts, posting references are actually used, where an account number and any other dimension values are found by means of a dimension combination.</p> <p>When posting job entries for capitalized jobs, the activity’s cost is credited to the account referred to in the dimension combination specified here. If you have chosen to capitalize “At Cost” (in the window Job Parameters), the cost is debited to the WIP account assigned to the job’s job group. If you have chosen to capitalize “At Billing Price,” the cost is debited to the account specified in the “Open Cost” field in this window.</p> <p>If “Post Hours in Job Journal” or “Post Amount in Job Journal” is chosen (for time or amount activities, respectively), the activity’s cost will be posted to the account referred to in the dimension combination in this field, for non-capitalized jobs. The P&amp;L account will be debited by the equivalent amount.</p> <p>If “Department from Employee” is chosen in the window System Information, the account entered here will be used for the department given for the employee, when entering to time activities.</p>
<b>Offset Account, Overhead Cost</b>	This posting reference is used for posting time on a job (time sheets and job journal) if an overhead rate has been specified, and if the job is set up with a job parameter of type Overhead Cost where the Post Offset for Overhead Cost Separately line is selected.
<b>P&amp;L</b>	<p>In this field, enter the number of a dimension combination containing the G/L account to be used for entries in the window General Journal, for invoice allocations in the window Invoice Allocation, for item deliveries (for orders marked as “Invoice in Job Cost”) and for jobs being posted to Profit &amp; Loss (instead of being capitalized). The dimension combination can also contain references to other dimension values to be used in this connection. Job expenses (at cost) for the activity are then posted to the account and any other dimension values referred to in the dimension combination specified in this field.</p> <p>The account information card of the account referenced here contains a reference to a tax code. This tax code will be applied for registration of ingoing tax when you make registrations for the current activity. However, if you use tax tables, the tax code is found by means of the relevant tax table. For further information on this, see the description of the field “Reporting Code” in the card part.</p>

Field	Description
	When you select "Post Hours in Job Journal" or "Post Amount in Job Journal" in System Information, Maconomy posts job journal entries to the account and any other dimension values in the dimension combination, if the entries are not being capitalized.
<b>Cost Price</b>	In this field you may enter the number of a dimension combination for the posting of cost price to an account.
<b>Open Cost Price</b>	<p>In this field, enter the number of a dimension combination containing the number of the G/L account to be used if the job is being capitalized and if you have selected the capitalization method "At Billing Price" in the job parameter type "Revenue Recognition" for the job in question. The dimension combination can also contain references to other dimension values to be used in this connection.</p> <p>For the sake of clarity, the following description of the posting of the activity's prices uses the term "account." Rather than accounts, posting references are actually used, where an account number and any other dimension values are found by means of a dimension combination.</p> <p>When the job entry is posted, the cost is debited to this account and any other dimension values in the dimension combination. If the job entry is posted via job journal, the cost is credited to the "Offset Account." If the job entry is posted via a general journal, the cost is credited the set-off account specified in the general journal. If the job journal is posted via an allocated vendor invoice journal, the cost is credited to the vendor control account.</p> <p>When the job is invoiced, entry cost is credited to this account and the cost of sales account is debited by the cost.</p>
<b>Billing Price, Taxable</b>	In this field you may enter the number of a dimension combination for the posting of billing price to an account.
<b>Billing Price, Tax Exempt</b>	In this field you may enter the number of a dimension combination for the posting of billing price to an account.
<b>Billing Price, Export</b>	In this field you may enter the number of a dimension combination for the posting of billing price to an account.
<b>Open Billing Price</b>	<p>In this field, enter the number of a dimension combination containing the G/L account to be used if the job is being capitalized and if you have selected the capitalization method "At Billing Price" in the job parameter type "Revenue Recognition" for the job in question. The dimension combination can also contain references to other dimension values to be used in this connection.</p> <p>When a job entry is posted, the billing price is credited to this account and any other dimension values specified in the dimension combination, and debited to the WIP account.</p>

Field	Description
	When the job is invoiced, the billing price is debited to this account and any other dimension values specified in the dimension combination, and credited to the WIP account.
<b>Open Billing Price, Adjustment</b>	<p>In this field, enter the number of a dimension combination containing the G/L account to be used if the job is being capitalized and if you have selected the capitalization method "At Billing Price" in the job parameter type "Revenue Recognition" for the job in question. The dimension combination can also contain references to other dimension values to be used in this connection.</p> <p>If the job parameters assigned to a job specifies that overruns should be handled, this account and any other dimension values in the dimension combination will be used for adjusting the open billing price when overruns are registered on the job. An overrun occurs when the costs registered on the job exceed the fixed quote price of the job. The adjustment itself is carried out automatically when the job entries are posted. For further information, please see the description of the system parameter attribute "Handling of Overruns" in the window Job Parameters.</p> <p>The activity used in connection with overruns on jobs is specified in the job parameter attribute "Activity for Job Revenue Adjustment" in the window Job Parameters. The activity must be an invoiceable amount activity.</p>
<b>Cost Price Transferred Internally</b>	In this field, enter the number of a dimension combination containing the number of the G/L account to be used if costs on job entries are transferred between dimensions as a result of a job transfer carried out in the window Job Transfer. The posting reference is used when posting a job transfer journal created for a job using capitalization at billing price and for which the field "Post By Activity" has been marked in the window System Information. When posting such a journal, postings are made to the accounts for open cost and open billing price as well as to this account and the account for sales transferred internally.
<b>Billing Price Transferred Internally</b>	In this field you may enter the number of a dimension combination for the posting of billing price to an account.
<b>Standard Billing Price</b>	Same as the field with the same name in the Job Posting References sub-tab.
<b>Standard Billing Price, Offset</b>	Same as the field with the same name in the Job Posting References sub-tab.
<b>Invoice Deviation</b>	In this field, enter the number of a dimension combination containing the number of the G/L account to be used for posting the difference between the contracted billing price and the billing price actually invoiced. This dimension combination is used for jobs for which the job parameter attributes "Posting of Contract Deviation" is set to "No" and "Posting of

Field	Description
	Invoice Deviation" is set to "Yes." For more information, please see the description of the job parameter type "Revenue Recognition."
<b>Contract Deviation</b>	In this field, enter the number of a dimension combination containing the number of the G/L account to be used for posting the difference between the standard billing price and the contracted billing price. This dimension combination is used for jobs for which the job parameter attributes "Posting of Contract Deviation" is set to "Yes" and "Posting of Invoice Deviation" is set to "No." For more information, please see the description of the job parameter type "Revenue Recognition."
<b>Contract Deviation, Offset</b>	In this field, enter the number of a dimension combination containing the number of the G/L account to be used for posting the offset of the difference between the contracted billing price and the actual billing price. This dimension combination is used for jobs for which the job parameter attributes "Posting of Contract Deviation" is set to "Yes" and "Posting of Invoice Deviation" is set to "No." For more information, please see the description of the job parameter type "Revenue Recognition."
<b>P&amp;L, Intercompany</b>	<p>In this field, enter the number of a dimension combination containing the G/L account to be used for intercompany entries in the window General Journal, for invoice allocations in the window Invoice Allocation, for item deliveries (for orders marked as "Invoice in Job Cost") and for jobs being posted to Profit &amp; Loss (instead of being capitalized). The dimension combination can also contain references to other dimension values to be used in this connection. Job expenses (at cost) for the activity are then posted to the account and any other dimension values referred to in the dimension combination specified in this field.</p> <p>When you select "Post Hours in Job Journal" or "Post Amount in Job Journal" in System Information, Maconomy posts job journal entries to the account and any other dimension values in the dimension combination, if the entries are not being capitalized.</p>
<b>Cost Price, Intercompany</b>	In this field you may enter the number of a dimension combination for the posting of cost price to an account.
<b>Open Cost Price, Intercompany</b>	In this field, enter the number of a dimension combination containing the number of the G/L account to be used if open costs on job entries involve two companies. The posting reference is used for registering the cost of the responsible company (that is, the intercompany price) on non-invoiced job entries. When the entries are invoiced, the amounts are moved from this account to the account "Cost of Sales, Intercompany." This means that the posting reference "Item Sales, Intercomp." can be balanced with the sum of the two posting references "Open Cost, Intercomp." and "Cost of Sales, Intercomp."
<b>Billing Price, Intercompany</b>	In this field you may enter the number of a dimension combination for the posting of billing price to an account.

Field	Description
<b>Job Accrual</b>	You can select whether this line is used for accrued registrations, non-accrued registrations, or all registrations.
<b>Invoice Discount</b>	This field shows the invoice discount deducted from the invoice.
<b>Invoiced On Account</b>	This field shows the total amount invoiced on account.
<b>Popup 1-5</b>	You can use these fields to enter further target groups for the line.
<b>Customer Popup 1-5</b>	You can use these fields to enter further target groups for the line.
<b>Employee Popup 1-5</b>	You can use these fields to enter further target groups for the line.

## Actions

This section shows the Actions available in the Activities workspace.

### Top Tab

Field	Description
<b>Update Task Usage</b>	If you change the setup of task usage on an activity, use this action to update all the tasks that derive the given activity to ensure that all maintain the same usage settings.

## Task Lists Workspace

Use this workspace to create a task list, which represents the steps in a workflow. You can assign a task list to one or more jobs.

This functionality is typically relevant if you work with a number of standard workflows, each consisting of a number of tasks. A task list reflects a workflow, and by using task lists you can specify which workflow is to be used on a given job. For each job entry, you can specify which task is being performed on the job. This also enables you to report on the tasks that are performed on each job.

You assign the task list to each job individually. If you specify a task list, all entries and budget lines related to a given job require that you assign a task from the list the job in question. You can block tasks that should no longer be used, and you can limit the access to using tasks in the task lists using Maconomy's extended access control system.

You can assign a task list to more than one job, in which case it is called a shared task list and is maintained in this workspace. You can also make a task list specific to a single job, in which case it is called a job-specific (or job-private) task list and is maintained in the Job Tasks workspace or

in this workspace. For more information about using shared vs. job-private task lists, see the description of the Job Tasks workspace.

You can copy an existing task list and use it as a template for a new task list.

All users can create and edit tasks. However, if you set the task up to derive an amount or time activity, you must have permission to change amount and time activities, respectively, as defined in the Actions workspace in the Set-Up module. If you have permission to create and edit tasks that derive time and amount activities, the new or edited task might require the approval of another user, either in this workspace or the Approve Tasks workspace. For more information, see the description of the Approve Tasks workspace.

## Task Lists Tab

This section includes the fields and descriptions for the Task Lists tab.

### Task List Island

Field	Description
<b>Name</b>	In this field, you can enter a name for a task list when creating one. Maconomy checks that the specified task list does not already exist. The name is a unique identification of the task list.
<b>Description</b>	In this field, you can enter a short description of the task list.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can assign the task list to an access level. A user only has access to the current task list (and thereby using the tasks in the task list) if he has been assigned to this level or a level above this in the window User Access Levels. This access control ensures that when working with for instance a job entry, you can only enter a task from a task list to which you have access, and in this window you can only see and edit the task lists to which you have access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to tasks and task lists may depend on other factors. For further information about the standard access control configuration, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If you do not specify an access level, any user can register time and expenses on the tasks available in the task list. You can only specify an access level to which you have access yourself.</p> <p>This field also shows a description of the access level.</p>

**Daily Descriptions Island**

Field	Description
<b>Use Daily Descriptions</b>	<p>Select this check box to use daily descriptions on the task. You can add a description to any combination of task, activity, and day in the time sheet.</p> <p>This field acts as a default value for tasks created in the current task list.</p> <p>If the task list is assigned to one or more jobs, changing the value of the field also changes the default setting for the jobs that use the task list. You can select or deselect the corresponding field in the sub-tab for each task individually.</p> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> If you are creating a task (that is not included in the current task list) from a time or amount budget line, the value in this check box automatically uses the same value for daily descriptions in the Tasks tab.</p> </div>

**Dimension Combination Island**

Field	Description
<b>Dimension Combination</b>	<p>In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the window Dimension Combinations.</p> <p>If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from tasks in the current task list. The values in this dimension combination will be used in cases where Maconomy is deriving dimension values from a task in the current list, but where no value can be derived for one or several dimensions from the task line in question. When deriving values from a task as a result of a registration being made, Maconomy uses the following list of priorities to find a dimension value to be derived for each dimension:</p> <ol style="list-style-type: none"> <li>1. If a value has been specified for the dimension in question on the task line, this value is used along with the line's specification of whether to overwrite.</li> <li>2. If no dimension value had been specified on the task, Maconomy will attempt to find a value for the dimension in the dimension combination specified on the task line (if any). If a dimension combination has been specified on the task line, the following list of priorities is used for finding a value in the dimension combination: <ol style="list-style-type: none"> <li>a. If a value has been specified for the dimension on the topmost line comprising the company to which the registration pertains, this value is used along with the line's specification of whether to overwrite.</li> <li>b. If no dimension value was found in the table part of the dimension combination, Maconomy uses the value specified in the card part of the dimension combination, along with the card part's specification of whether to overwrite.</li> </ol> </li> </ol>

Field	Description
	<ol style="list-style-type: none"> <li>3. If no value could be found for the dimension in the dimension combination of the task line or if no dimension combination has been specified on the task line Maconomy uses the value (if any) specified in the card part of the task list, along with the card part's specification of whether to overwrite.</li> <li>4. If no value has been specified in the card part of the task list, either, Maconomy will attempt to find a value for the dimension in the dimension combination specified in the card part of the task list (if any). The method used for finding a value here is similar to the one described in item 2.</li> <li>5. If no value could be found for the dimension in the dimension combination in the task list's card part or if no dimension combination has been specified in the card part of the task list no value is derived for the dimension in question from the task.</li> </ol> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the windows Dimension Derivation and Dimension Combinations for further information about dimension derivation.</p>

### Derived Activity Island

Field	Description
<b>Activity</b>	<p>In this field, you can enter the number of a standard activity which is equivalent to one of the activities created in the window Activities. If you subsequently enter new information on a job assigned to this task list, and you do not specify an activity on the job itself, the activity number from this field will be copied to the job provided that no activity number for the current task is entered in the table part of this window.</p> <p>If you also mark the field "Overwrite," the activity in this field will overwrite any manually entered activity on the line.</p>

### Derived Dimensions Island

Field	Description
<b>Location</b>	<p>In this field, you can enter the number of a location. This location will be used when deriving dimension values from those tasks in the list where no location has been specified. Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used rather than the value (if any) found for this dimension in the dimension combination in question.</p> <p>When deriving values from a task as a result of a registration being made, Maconomy uses the following list of priorities to find a dimension value to be derived for the dimension Location:</p> <ol style="list-style-type: none"> <li>1. If a location has been specified on the task line, this location is used along with the line's specification of whether to overwrite.</li> </ol>

Field	Description
	<p>2. If no location had been specified on the task, Maconomy will attempt to find a value for the dimension in the dimension combination specified on the task line (if any). If a dimension combination has been specified on the task line, the following list of priorities is used for finding a location in the dimension combination:</p> <ol style="list-style-type: none"> <li>If a location has been specified on the topmost line comprising the company to which the registration pertains, this location is used along with the line's specification of whether to overwrite.</li> <li>If no location was found in the table part of the dimension combination, Maconomy uses the location specified in the card part of the dimension combination, along with the card part's specification of whether to overwrite.</li> </ol> <p>3. If no location could be found in the dimension combination of the task line or if no dimension combination has been specified on the task line Maconomy uses the location (if any) specified in the card part of the task list, along with the card part's specification of whether to overwrite.</p> <p>4. If no location has been specified in the card part of the task list, either, Maconomy will attempt to find a location in the dimension combination specified in the card part of the task list (if any). The method used for finding a location here is similar to the one described in item 2.</p> <p>5. If no location could be found in the dimension combination in the task list's card part or if no dimension combination has been specified in the card part of the task list no location is derived from the task.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L Module" as well as the description of the windows Dimension Derivation and Dimension Combinations for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Activity No." above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Activity No." above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Activity No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Activity No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Activity No." above.

**Job Island**

Field	Description
<b>Job Specific</b>	<p>This field is marked by Maconomy if this current task list is job specific. A shared task list is automatically copied to a new task list and made job-specific if the task list is changed in the context of a job, for example in the window Job Tasks or by creating a task directly from a job budget. For more information, see the window Job Tasks.</p> <p>If the field is not marked, you can make the current task list job-specific manually by entering a job number in the field "Job No." in this island.</p>
<b>Job</b>	<p>This field shows the number and name of the job to which the current job-specific task list is assigned, if the task list is job-specific. See also the field "Job Specific" above.</p> <p>You cannot enter a job number if the task list is currently used by multiple jobs. Also, you cannot enter a job number if the job already uses a task list.</p>

**Standard Tasks Island**

Field	Description
<b>Time Budgeting</b>	In this field, you can enter a task to be used by default when time-related budget lines on jobs.
<b>Amount Budgeting</b>	In this field, you can enter a task to be used by default when creating amount-related budget lines on jobs.
<b>Registration</b>	In this field, you can enter a task to be used by default when making registrations on jobs. When you make registrations on a job assigned to this task list and if you do not enter a task on the job in question, the task from this field is automatically copied to the registration.
<b>Revenue Recognition</b>	<p>In this field, you can enter a task to be used by default at the creation of a revenue recognition adjustment. At overrun adjustment or revenue adjustment on the basis of completion percentage on jobs to which a task list is assigned, the task from this field is automatically copied to the adjustment entry.</p> <p>Maconomy will also use the task specified in this field on revenue recognition entries in connection with the closing of fixed-price jobs for which the system has been set up to automatically create an invoice upon job closing. The value of the job parameter attribute is specified in the job parameter type "Fixed-Price Job Set-Up" in the window Job Parameters.</p> <p>If you enter a derived activity on the task in question, you can register the revenue adjustment on another activity than the one specified in the job parameter attribute "Activity for Job Revenue Adjustment" in the job parameter type "Fixed-Price Set-Up." However, you should not enter other derived dimensions on the task in question as this could lead to wrong postings in the G/L module.</p>

Field	Description
<b>Mileage</b>	In this field, the user may enter a task name which will be used as standard for these kinds of registrations if the user does not actively give a task name upon registering.
<b>Invoicing Plan</b>	In this field, the user may enter a task name which will be used as standard for these kinds of registrations if the user does not actively give a task name upon registering.
<b>Invoicing On Account 1</b>	In this field, the user may enter a task name which will be used as standard for these kinds of registrations if the user does not actively give a task name upon registering.
<b>Invoicing On Account 2</b>	In this field, the user may enter a task name which will be used as standard for these kinds of registrations if the user does not actively give a task name upon registering.
<b>Write Up/Down, Invoice Selection</b>	In this field, the user may enter a task name which will be used as standard for these kinds of registrations if the user does not actively give a task name upon registering.
<b>Write Up/Down, Job Inv. Allocation</b>	In this field, the user may enter a task name which will be used as standard for these kinds of registrations if the user does not actively give a task name upon registering.
<b>Special Tax</b>	In this field, the user may enter a task name which will be used as standard for these kinds of registrations if the user does not actively give a task name upon registering.
<b>Employee Revenue Distribution</b>	Use this field to specify a standard task for the revenue adjustment entries created from Employee Revenue Distribution window.
<b>Surcharge</b>	Use this field to specify a task for the job surcharge.

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

### Tasks Sub-Tab

This section includes the fields and descriptions for the Tasks sub-tab.

Field	Description
<b>Task</b>	In connection with the creation of a task list, you can enter the name of the current task into this field. Maconomy checks that the specified task already exists on the current task list. It is allowed to specify tasks which are assigned to other task lists.

Field	Description
<b>Description</b>	In this field, you can enter a short description of the task.
<b>Blocked</b>	In this field, you can specify if the current task is blocked. If it is blocked, no entries can be registered on the task. Blocking or unblocking a task does not revoke any approval of the task.
<b>Derived Act. No.</b>	<p>In this field, you can enter an activity number for the current task. If you enter a number, it will be applied in connection with a job to which the current task list is assigned, provided that no activity number is entered by the user. If no number is entered in this field, the activity number entered in the card part of this window, if any, will be used.</p> <p>Note that to enter, change or delete an amount or time activity in this field, you need permission in the window Actions in the Set-Up module to change amount or time activities.</p>
<b>Overwrite Activity</b>	In this field, you can specify if the activity shown in the field "Derived Act. No." should overwrite any manually entered activity.
<b>Activity Name</b>	This field shows the activity text entered for the activity in the window Activities.
<b>Activity Type</b>	This field shows the activity type of the activity as specified in the window Activities.
<b>Job Price Group No.</b>	In this field you enter the number of a job price group. The current task is assigned to the specified job price group. When a reference is made to a job price group on a line in a job price list, all tasks assigned to the job price group in question will determine the price on the current job price list line. For a more detailed description of job price groups, please refer to the description of the window Job Price Groups.
<b>Included in Fixed Price</b>	<p>This field and the job parameter Fixed Price Inclusion Setup determines whether registrations on a certain task are included in the fixed price.</p> <p>When a task is created, the value of this field will be set from the default value coming from the derived activity, or if the task does not derive an activity, it will be set to true.</p> <p>Modification of this field can only be done if no jobs are using the task list.</p>
<b>Allow Time Registration</b>	<p>Select this field to make the activity available for time registration in windows such as Time Sheets and SpeedSheet.</p> <p>This field is the default value for the corresponding field on tasks if you created a task with the Overwrite Activity field selected. You cannot allow time registration for Amount activities if the "Disallow reg. on amount act. in time sheets" field is selected in the Systems Parameter window.</p> <p>You cannot allow time registration for Summary activities.</p>
<b>Allow Expense Registration</b>	Select this field to make the activity available for the registration of expenses.

Field	Description
	This field is the default value for the corresponding field on tasks if you created a task with the Overwrite Activity field selected. You cannot allow expense registration for Time activities.
<b>Allow Mileage Registration</b>	Select this field to make the activity available for mileage registration. This field is the default value for the corresponding field on tasks if you created a task with the Overwrite Activity field selected. You cannot allow mileage registration for Time activities.
<b>Allow Purchasing</b>	Select this field to make the activity available in purchasing-related windows. This field is the default value for the corresponding field on tasks if you created a task with the Overwrite Activity field selected. You cannot allow purchasing for Time activities.
<b>Allow Invoicing on Account</b>	Select this field to make the activity available in invoicing on account-related windows. This field is the default value for the corresponding field on tasks if you created a task with the Overwrite Activity field selected.
<b>Allow Invoicing Plan</b>	Select this field to make the activity available in job invoicing plans. This field is the default value for the corresponding field on tasks if you created a task with the Overwrite Activity field selected.
<b>Requisition Type</b>	Select the type of requisition: Values may be added in Requisition Types such as Taxi, Car, or Courier.
<b>Access Level</b>	In this field, you can enter an access level on the task in question. A user only has access to the current task if he has been assigned to this level or a level above this in the window User Access Levels. This access control ensures that when working with for instance a job entry, you can only enter a task to which you have access, and in this window you can only see and edit the tasks to which you have access.
<b>Budget Update Access Level</b>	In this field, you can enter an access level on the task in question to restrict its use in the window Job Budgets. A user only has access to the current task if he has been assigned to this level or a level above this in the window User Access Levels. This access control ensures that when working on the budget you can only enter a task to which you have access, and in this window you can only edit the tasks to which you have access. If you do not have the specified access level, then you can still see the budget lines with that task, but you will not be able to change (or create) budget lines with the given task.
<b>Use Daily Descriptions</b>	If you mark this field, making registrations on the current task in the window Time Sheets will require that you complete the "Daily Description" field also. Marking or unmarking this field overrules the setting of the corresponding field in the card part. For more information about daily descriptions, see the description of the island Daily Descriptions in the card part of this window.
<b>Approved</b>	If you mark this field, the current task is approved. If you remove the mark, the approval is revoked. Only users who have been allowed to approve

Field	Description
	<p>tasks in the window Actions in the Set-Up module can add or remove the mark in this field.</p> <p>You can define whether tasks need to be approved or not, and whether approval is needed for activities of the type Amount, Time, or both types. This is determined on a system-wide level in the window System Information in the Set-Up module. Users cannot make registrations on tasks that are not approved.</p>
<b>Approved by</b>	This field shows the name of the user who last approved the current task. If the task is not approved, the field is blank.
<b>Approval Date</b>	This field shows the date of the latest approval of the current task. If the task is not approved, the field is blank.
<b>Standard Note No.</b>	<p>In this field, you can specify the number of a note created in the window Notes in the Set-Up module. The field is used for adding a number of extra fields in which the user can enter information about the task on purchase lines (lines in the table part of the windows Requisitions, Requests for Quote and Purchase Orders) where the current note is used. This could, for example, be useful if the task information is too generic and therefore does not provide sufficiently specific information. For instance, if the task is for consultancy services, the basic information about the task is static, but each time a consultancy service is ordered, you may wish to also register such information as the type of work in question, the skill level required, and so on. It is therefore useful to add a number of fields so that a user ordering a consultancy service is allowed to enter this information. Once the line has been created and a note has automatically been assigned to it, you can enter the additional information by opening the window Notes in the Set-Up module, selecting the note assigned to the purchase line, and specifying the relevant data in the table part. You may have many types of generic tasks in your system, and most likely they do not all require the same additional information. Therefore Maconomy allows you to extend any task by any number of additional fields.</p> <p>Fields are added assigning the task to a note where the headings in the table part represent the additional fields in which the user should enter specific information about the specific task specified on a given purchase line. Whenever the task is entered on a purchase line, a copy of the note specified on the task is automatically created and assigned to the purchase line in question. However, if the system parameter "Standard note is derived from Activity before Task" is marked, and a standard note has been specified for the activity specified on the purchase line, the note assigned to the purchase line will be a copy of the one specified on the activity in question. In the window Notes, the user can then enter the required information in the table part of the note assigned to the purchase line. The information entered in the note will also appear on external printouts.</p> <p>For a description on how to set up standard notes for activities and tasks, see the description of the system parameter "Standard note is derived from Activity before Task" in the Set-Up module.</p>

Field	Description
<b>Note Description</b>	This field shows a description of the note specified in the field "Standard Note No." above.
<b>Statistics 1-4</b>	In these fields, you can enter an optional code for the task. The statistics codes can be selected or deselected in the selection criteria for various printouts of which tasks are a part.
<b>Dim. Comb. No.</b>	<p>In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the window Dimension Combinations.</p> <p>If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the current task. However, any dimension derivation values specified on the current line will be used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the line.</p> <p>If Maconomy is deriving dimension values from the task, and a value can be found neither in the dimension combination nor on the line itself, Maconomy will attempt to find a value for the dimension in the card part. In the card part, the dimension value can also be specified in a dimension field or through a dimension combination. For a detailed description of the procedure used when Maconomy derives dimension values from tasks, please see the description of the fields "Dim. Comb. No." and "Location" in the card part of this window, and the description of the field "Derived Location" in the table part.</p>
<b>Derived Location</b>	<p>In this field, you can enter the name of a location. This location will be used when deriving dimension values from the current task. Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used rather than the value (if any) found for this dimension in the dimension combination in question.</p> <p>When deriving values from a task as a result of a registration being made, Maconomy uses the following list of priorities to find a dimension value to be derived for the dimension Location:</p> <ol style="list-style-type: none"> <li>1. If a location has been specified on the task line, this location is used along with the line's specification of whether to overwrite.</li> <li>2. If no location had been specified on the task, Maconomy will attempt to find a value for the dimension in the dimension combination specified on the task line (if any). If a dimension combination has been specified on the task line, the following list of priorities is used for finding a location in the dimension combination: <ol style="list-style-type: none"> <li>a. If a location has been specified on the topmost line comprising the company to which the registration pertains, this location is used along with the line's specification of whether to overwrite.</li> </ol> </li> </ol>

Field	Description
	<p>b. If no location was found in the table part of the dimension combination, Maconomy uses the location specified in the card part of the dimension combination, along with the card part's specification of whether to overwrite.</p> <p>3. If no location could be found in the dimension combination of the task line or if no dimension combination has been specified on the task line Maconomy uses the location (if any) specified in the card part of the task list, along with the card part's specification of whether to overwrite.</p> <p>4. If no location has been specified in the card part of the task list, either, Maconomy will attempt to find a location in the dimension combination specified in the card part of the task list (if any). The method used for finding a location here is similar to the one described in item 2.</p> <p>5. If no location could be found in the dimension combination in the task list's card part or if no dimension combination has been specified in the card part of the task list no location is derived from the task.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the windows Dimension Derivation and Dimension Combinations for further information about dimension derivation.</p>
<b>Overwrite Location</b>	The functionality of this field is similar to that of the field "Overwrite Activity" above.
<b>Derived Entity</b>	The functionality of this field is similar to that of the field "Derived Act. No." above.
<b>Overwrite Entity</b>	The functionality of this field is similar to that of the field "Overwrite Activity" above.
<b>Derived Project</b>	The functionality of this field is similar to that of the field "Derived Act. No." above.
<b>Overwrite Project</b>	The functionality of this field is similar to that of the field "Overwrite Activity" above.
<b>Derived Purpose</b>	The functionality of this field is similar to that of the field "Derived Act. No." above.
<b>Overwrite Purpose</b>	The functionality of this field is similar to that of the field "Overwrite Activity" above.
<b>Derived Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Derived Act. No." above.

Field	Description
<b>Overwrite Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Overwrite Activity” above.
<b>Derived Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Derived Activity No.” above.
<b>Overwrite Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Overwrite Activity” above.

## Actions

This section shows the Actions available in the Task Lists workspace.

### Top Tab

Field	Description
<b>Copy Task List</b>	When you select this action, Maconomy copies the contents of the task list specified in the field “Task List” in the card part of the window into the current task list. If the field “Overwrite when duplicated” in the card part is marked, a task in the current task list will be overwritten if there is a task with an identical name in the copied list; otherwise, the task is left out from the copied list. If the field “Overwrite Derived Dimensions” is marked, the dimension derivations specified in the card part of this window will be overwritten by the corresponding dimension derivations from the copied task list. The copied tasks do not replace the current list, but are added to the list.
<b>Mark All for Daily Descriptions</b>	When you select this action, the field “Use Daily Descriptions” in the card part is marked, and all tasks in the table part are marked in the field “Use Daily Descriptions.” For more information about daily descriptions, see the description of the island Daily Descriptions in the card part of this window.
<b>Unmark All for Daily Descriptions</b>	When you select this action, the field “Use Daily Descriptions” in the card part is unmarked, and all tasks in the table part are unmarked in the field “Use Daily Descriptions.” For more information about daily descriptions, see the description of the island Daily Descriptions in the card part of this window.

## Approve Tasks Workspace

Use this workspace to approve changes to tasks, if your Maconomy settings require approval when someone creates or edits a task.

You can define whether tasks need to be approved or not, and whether approval is needed for activities of the type Amount, Time, or both types. You set this up in the **Task Approval** field in

the System Information workspace in the Set-Up module. Users cannot make entries on tasks that are not approved.

In the Approve Tasks tab in this workspace, you can define selection criteria to select a certain group of tasks, for example, all tasks from a certain range of task lists or jobs. In the Tasks sub-tab, you can perform operations on individual tasks, for instance approve them. The sub-tab is identical to the sub-tab in the Task Lists workspace; the **Task List** field is the only additional field in this workspace. However, you cannot add or delete tasks in this workspace.

Using the **Approve All Possible** action, you can approve all tasks to which you have access in one operation. To approve tasks in this workspace you must be given this permission in the Actions workspace in the Set-Up module.

## Approve Tasks Tab

This section includes the fields and descriptions for the Approve Tasks tab.

### Selection Criteria Island

Field	Description
<b>Show Lines</b>	When you mark this field, the lines matching the criteria specified in this island are shown in the table part of this window.
<b>Job No.</b>	In these fields, you can specify a range of job numbers, if you wish to limit the number of lines shown in the table part of this window. The table part will only display tasks on task lists referenced by the jobs within the specified range of job numbers. If you do not enter a range, job numbers will not be considered in the selection.
<b>Project Manager No.</b>	In these fields, you can specify a range of employee numbers. The table part will only display tasks on task lists referenced by jobs for which the employees within the specified range are project managers. If you do not enter a range, project managers will not be considered in the selection.
<b>Task</b>	In these fields, you can specify a range of task names. The table part will only display tasks with names within the specified range. If you do not enter a range, task names will not be considered in the selection.
<b>Task List</b>	In these fields, you can specify a range of task lists. The table part will only display tasks belonging to task lists within the specified range. If you do not enter a range, task lists will not be considered in the selection.
<b>Activity No.</b>	In these fields, you can specify a range of activity numbers. The table part will only display tasks deriving activities within the specified range. If you do not enter a range, activity numbers will not be considered in the selection.
<b>Show Only with Overwrite Activity</b>	If you mark this field, the table part only shows tasks where the field "Overwrite Activity" is marked.
<b>Include Approved</b>	If you mark this field, the table part includes tasks which have already been approved, even if they are blocked and the field "Include Blocked" below is not marked.

Field	Description
<b>Include Blocked</b>	If you mark this field, the table part includes tasks which have been blocked, even if they have been approved and the field "Include Approved" above is not marked.
<b>Include Opportunity Tasks</b>	If you mark this field, the table part includes opportunity tasks, that is tasks created for opportunity budgets.

### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Job No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Job No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Job No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Job No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Job No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Job No." above.

### Tasks Sub-Tab

This section includes the fields and descriptions for the Tasks sub-tab.

Field	Description
<b>Task List</b>	This field shows the name of the task list to which the current task is assigned.
<b>Task</b>	In this field you can change the name of the current task.
<b>Description</b>	In this field you can change the description of the current task.
<b>Derived Act. No.</b>	In this field, you can enter an activity number for the current task. If you enter a number, it will be applied in connection with a job to which the current task list is assigned, provided that no activity number is entered manually. If no number is entered in this field, the activity number entered in the card part of this window, if any, will be used.

Field	Description
	Note that to enter, change, or delete an amount or time activity in this field, you need permission in the window Actions in the Set-Up module to change amount or time activities.
<b>Overwrite Activity</b>	In this field, you can specify if the activity shown in the field "Derived Act. No." should overwrite any manually entered activity.
<b>Approved</b>	If you mark this field, the current task is approved. If you remove the mark, the approval of the current task is revoked. Only users who have been allowed to approve tasks in the window Actions in the Set-Up module can add or remove the mark in this field.
<b>Blocked</b>	In this field, you can specify if the current task is blocked. If it is blocked, no entries can be registered on the task. Blocking or unblocking a task does not revoke any approval of the task.
<b>Approved by</b>	This field shows the name of the user who last approved the current task. If the task is not approved, the field is blank.
<b>Approval Date</b>	This field shows the date of the latest approval of the current task. If the task is not approved, the field is blank.
<b>Dim. Comb. No.</b>	<p>In this field, you can enter the number of a dimension combination of the type "Dimension Derivation" created in the window Dimension Combinations.</p> <p>If you specify a dimension combination, Maconomy will use the values in this dimension combination when deriving dimensions from the current task. However, any dimension derivation values specified on the current line will be used instead of those specified for the same dimensions in the dimension combination. This means that the dimension combination only applies to the dimensions for which no value has been entered on the line. For more information, see the description of the corresponding field in the window Task Lists.</p>
<b>Activity Name</b>	This field shows the activity text entered for the activity in the window Activities.
<b>Activity Type</b>	This field shows the activity type of the activity as specified in the window Activities.
<b>Derived Location</b>	<p>In this field, you can enter the name of a location. This location will be used when deriving dimension values from the current task. Even if you have specified a dimension combination in the field "Dim. Comb. No." above, a value entered in this field will be used rather than the value (if any) found for this dimension in the dimension combination.</p> <p>For more information, see the description of the corresponding field in the window Task Lists.</p>
<b>Overwrite Location</b>	In this field, you can specify if the location shown in the field "Derived Location" should overwrite any manually entered location. The functionality of this field is similar to that of the field "Overwrite Location" above.

Field	Description
<b>Derived Entity</b>	The functionality of this field is similar to that of the field "Derived Location" above.
<b>Overwrite Entity</b>	The functionality of this field is similar to that of the field "Overwrite Location" above.
<b>Derived Project</b>	The functionality of this field is similar to that of the field "Derived Location" above.
<b>Overwrite Project</b>	The functionality of this field is similar to that of the field "Overwrite Location" above.
<b>Derived Purpose</b>	The functionality of this field is similar to that of the field "Derived Location" above.
<b>Overwrite Purpose</b>	The functionality of these fields is similar to that of the field "Overwrite Location" above.
<b>Derived Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Derived Location" above.
<b>Overwrite Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Overwrite Location" above.
<b>Derived Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Derived Location" above.
<b>Overwrite Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Overwrite Location" above.
<b>Job Price Group No.</b>	In this field you can enter or change the number of a job price group to which the current task is assigned. In the window Job Price Lists you can make a reference to a job price group on a line in a job price list. All tasks assigned to the job price group in question will take the price on the current job price list line. For a more detailed description of job price groups, please refer to the description of the window Job Price Groups.
<b>Statistics 1-4</b>	In these fields, you can enter an optional code for the task. The statistics codes can be selected or deselected in the selection criteria for various printouts of which tasks are a part.
<b>Access Level Name</b>	In this field, you can enter an access level on the task in question. A user only has access to the current task if he has been assigned to this level or a level above this in the window User Access Levels. This access control ensures that when working with for instance a job entry, you can only enter a task to which you have access, and in this window you can only see and edit the tasks to which you have access.
<b>Standard Note No.</b>	In this field, you can specify the number of a note created in the window Notes in the Set-Up module. The field is used for adding a number of extra fields in which the user can enter information about the task on

Field	Description
	purchase lines (lines in the table part of the windows Requisitions, Requests for Quote, and Purchase Orders) where the current note is used. For more information, see the description of the corresponding field in the window Task Lists.
<b>Note Description</b>	This field shows a description of the note specified in the field “Standard Note No.” above.
<b>Use Daily Descriptions</b>	For more information, see the description of the corresponding field in the window Task Lists.

## Actions

This section shows the Actions available in the Approve Tasks workspace.

### Top Tab

Field	Description
<b>Approve All Possible</b>	When you select this action, you approve all tasks in the table part which you have access to approving. You have access to approving a task if you have been given access to approving tasks in the window Actions in the Set-Up module.

## Job Price Lists Workspace

Use this workspace to enter and maintain price lists for employee, activity, task, and allocation combinations.

You can define cost prices, billing prices, intercompany prices, markup percentages, and overtime charges. You can assign a price list to jobs.

This workspace displays one issue of the price list at a time. Each price list issue is identified by a job price name and an issue number. You can browse through the issues.

You assign a price list to each job in the Job Price Information workspace. Note, however, that lines in the price list can be superseded by price lines that you entered directly for the job in the Job Price Information workspace. You use price lists in all of the Job Cost workspaces where Maconomy calculates prices based on employee number and activity—for example, the Job Journal, Job Budgets, and Time Sheets workspaces.

When you press Return on a line in the sub-tab of a workspace where Maconomy calculates prices, and you specified a price list for the job in question, Maconomy searches the price list to find a cost price, an intercompany price, a billing price, and a markup percentage. Maconomy picks the prices based on the combination of activity, employee, task, and dimension values specified on the line. In addition, if you entered an overtime specification on the line, Maconomy calculates an additional overtime charge. If the price list line from which Maconomy calculated the original price does not include an overtime specification, Maconomy scans the price list for a line that has an overtime specification and an allocation combination that does not contradict that of the original line, and adds the overtime charge to the price.

If several lines in the Job Price List Lines sub-tab of this workspace match the combination of employee, activities, task, and dimension values that you entered on a line in, for example, a job budget, Maconomy picks the prices from the price list line that has the lowest line number. If you did not specify an amount on the line that has the lowest number, Maconomy does not pick the price from the next matching price list line. Instead, Maconomy retrieves the price from another workspace. For example, Maconomy retrieves the price from the employee's information card if the activity is a time activity.

You can select a line for adjustment or deletion by selecting the **Marked** field on the relevant line in the Job Price List Lines sub-tab. If you want to select all of the lines, you can use the **Mark Lines** action in the action menu. If you need to adjust cost prices, intercompany prices, billing prices, or markup percentages, enter the new prices in the Adjust Job Price List island and then use the **Adjust Marked** action. When you use this action, Maconomy updates all of the lines for which you select the **Marked** field, according to the values that you enter in the Adjust Job Price List island. However, you can change the values on the lines manually.

If you need to delete some or all lines in a job price list, use the **Delete Marked** action. When you do this, Maconomy automatically deletes all of the lines for which you select the **Marked** field.

You can copy the lines from an existing job price list to a new price list using the **Copy Job Price List** action. You identify the job price list to be copied in the Copy Job Price List island.

Use the **Delete Job Price List** action to delete the currently displayed issue of the job price list. However, you cannot delete the latest issue of a price list.

## Job Price Lists Tab

This section includes the fields and descriptions for the Job Price Lists tab.

### Job Price List Island

Field	Description
<b>Name</b>	In this field, you can enter the name of the current price list. The field must be completed. It is possible to change the name of an existing job price list. This will cause the names of all issues of the job price list to be changed. When the job price list has been created, it cannot be deleted again (it is, however, possible to delete issues of the job price list). For this reason, you should remember to select currencies in the island Currency, if applicable, before you press Return to create the job price list, as the currency selections cannot be changed after creating the job price list.
<b>Issue</b>	This field shows the number of the price list issue currently shown in the window.
<b>Period</b>	This field shows the period in which the currently displayed issue of the job price list is valid. The period is shown as a starting date and an ending date. If no period is shown, the displayed issue is the only issue of the job price list. If only an ending date is shown, the displayed issue is the first issue of the job price list, and if only a starting date is shown, the displayed issue is the latest issue of the job price list.

Field	Description
<b>Default Time Unit</b>	Use this field to specify the default time unit for prices on time activities. You must fill in this field in both the tab and sub-tab. When you create a line in the sub-tab, the field is auto-populated with the default value from this field. Price calculation relies on the time unit specified on the line.
<b>Description</b>	In this field, you can enter a description of the current job price list. The description is shown when you select the price list in the windows Customer Information Card and Job Price Information.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can specify an access level. A user only has access to the current job price list if he or she is granted access to this level or a higher level in the window User Access Levels in the Set-Up module. Only users with access to the price list can see and edit the price list in this window, and select it in other windows. If no access level is specified, all users have access to the current job price list.</p> <p>Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to job price lists may depend on other factors. For further information about the standard access control configuration, please see the section “Introduction to the Access Control System” in the Set-Up module.</p> <p>This field also shows the description of the specified access level.</p>

### Adjust Job Price List Island

Field	Description
<b>New Markup %</b>	<p>In this field, you can enter a markup percentage to apply to all lines having a mark in the field “Marked” in the table part of the window. The markup percentage specified in this field is applied to the relevant lines when you select “Adjust Marked” in the Action menu. However, the percentage assigned to each line can be changed manually on the lines, if needed.</p> <p>Please note that the markup percentage in this field does not apply to the standard billing price. To change the markup percentage of the New Standard Markup % standard billing price, use the field “New Standard Markup %” below.</p> <p>Note that if you want to adjust the markup percentage on the lines; and the adjustment percentages specified in the rows showing the cost, intercompany, and billing prices are all 0; the cost, intercompany, and billing prices on the lines in the table part are not reset to zero, but will keep their current prices when you adjust the markup percentage.</p> <p>See also the description of the below field “Cost Price” for further information on this island.</p>

Field	Description
<b>New Standard Markup %</b>	The functionality of this field is similar to that of the field “New Markup %” above, but applies to the standard billing price percentage.
<b>New Intercompany Price %</b>	The functionality of this field is similar to that of the field “New Markup %” above, but applies to the intercompany billing price percentage.
<b>Cost</b>	<p>In these three fields, you can enter a new cost price, an adjustment percentage to the existing cost price, and specify a rounding unit. Changes specified in this island are applied to the lines in the table part of the window by selecting the action “Adjust Marked.” However, you should note that changes only apply to lines on which the field “Marked” has been selected.</p> <p>If you enter only an adjustment percentage and/or a rounding unit and select the action “Adjust Marked,” Maconomy adjusts the existing cost prices on the selected lines in accordance with the values specified. If you want to assign new cost prices of a certain amount to all selected lines, this is done by simply specifying the new cost price in the field “New Price” and selecting the action “Adjust Marked.”</p> <p>Note that if you enter a value in the fields “New Price” or “New Markup %,” the fields “Adjustment, %” and “Rounding” are automatically blanked (reset to zero) when you press Return, and if you enter a value in one of the fields “Adjustment, %” and “Rounding,” the fields “New Price” and “New Markup %” are automatically blanked. The changes made can be inspected in the corresponding fields in the table part of the window. The prices assigned to the lines can be changed manually.</p> <p>If you change prices on a job price list, these changes only apply to new entries made on the basis of the price list. Historical data is thus not affected by a change in the prices on an assigned job price list.</p>
<b>Intercompany Price</b>	In these fields, you can enter a new intercompany price and an adjustment percentage to the existing intercompany price and specify a rounding unit. The functionality of these fields is similar to that of the field “Cost Price” above.
<b>Billing Price</b>	In these fields, you can enter a new billing price and an adjustment percentage to the existing billing price and specify a rounding unit. The functionality of these fields is similar to that of the field “Cost Price” above.
<b>Standard Billing Price</b>	In these fields, you can enter a new standard billing price and an adjustment percentage to the existing standard billing price and specify a rounding unit. The functionality of these fields is similar to that of the field “Cost Price” above. For more information about the standard billing price, please see the field “Standard Billing Price” in the table part below.

**Adjust Overtime Charge Island**

Field	Description
<b>New Charge %, Overhead</b>	<p>Enter an overtime charge percentage for the overhead rate to apply to all sub-tab lines on which the <b>Marked</b> field has been selected. The overtime charge percentage specified in this field is applied to the relevant lines when you use the <b>Adjust Marked</b> action. However, the percentage assigned to each line can be changed manually on the lines, if needed.</p> <p>Note that if you specify zero as a value in this field or any of the fields in this island, marked lines in the sub-tab will not be changed to zero when you adjust them. Entering a zero value means that the corresponding fields on marked sub-tab lines should be left as they are.</p>

Field	Description
<b>New Charge %, Base Salary</b>	<p>Enter an overtime charge percentage for the base salary rate to apply to all sub-tab lines on which the <b>Marked</b> field has been selected. The overtime charge percentage specified in this field is applied to the relevant lines when you use the <b>Adjust Marked</b> action. However, the percentage assigned to each line can be changed manually on the lines, if needed.</p> <p>Note that if you specify zero as a value in this field or any of the fields in this island, marked lines in the sub-tab will not be changed to zero when you adjust them. Entering a zero value means that the corresponding fields on marked sub-tab lines should be left as they are.</p>
<b>New Charge %, Intercompany Price</b>	The functionality of this field is similar to that of the field “Overtime Charge %, Base Salary” above.
<b>New Charge %, Billing Price</b>	The functionality of this field is similar to that of the field “Overtime Charge %, Base Salary” above.
<b>Charge, Cost</b>	The functionality of this field is similar to that of the field “Overtime Charge %, Base Salary” above, but applies to the field “Overtime Charge, Cost.”
<b>Charge, Intercompany Price</b>	The functionality of this field is similar to that of the field “Overtime Charge %, Base Salary” above.
<b>Charge, Billing Price</b>	The functionality of this field is similar to that of the field “Overtime Charge %, Base Salary” above.

**Selection Criteria Island**

Field	Description
<b>Activity No.</b>	In these fields, you can specify a range of activity numbers. The table part only shows lines with activity numbers within the specified range,

Field	Description
	and lines with no activity number. Leave these fields blank to view lines with any activity number.
<b>Activity Type</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Price Group, Act.</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Employee No.</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Empl. Category</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Employee Type</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Price Group, Empl.</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Task</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Price Group, Task</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Responsible Company</b>	Enter a range of responsible companies to limit the lines shown in the Job Price List Lines sub-tab to match the range specified.
<b>Executing Company</b>	Enter a range of executing companies to limit the lines shown in the Job Price List Lines sub-tab to match the range specified.
<b>Overtime Spec.</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Cost</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Billing Price</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Intercompany Price</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Markup %</b>	The functionality of this field is similar to that of the field "Activity No." above. Show Only Marked If you mark this field, the table part will only display lines having a mark in the field "Marked."

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

**Currency Island**

Field	Description
<b>Currency, Cost</b>	In this field, you can enter the currency of the job price list for cost. The currency cannot be changed on an existing job price list. If the currency on a job is not identical to the one in the job price list assigned to the job, the exchange rate table for purchase valid at the time of registration is used for currency conversion.
<b>Currency, Intercomp.</b>	In this field, you can enter the currency of the job price list for intercompany prices. The currency cannot be changed on an existing job price list. If the currency on a job is not identical to the one in the job price list assigned to the job, the enterprise exchange rate table valid at the time of registration is used for currency conversion.
<b>Currency, Sales</b>	In this field, you can enter the currency of the job price list for sales prices. The currency cannot be changed on an existing job price list. If the currency on a job is not identical to the one in the job price list assigned to the job, the exchange rate table for sales valid at the time of registration is used for currency conversion.

**Selection Criteria, Dimensions Island**

Field	Description
<b>Location</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Entity</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Project</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Activity No." above.
<b>Specification 1-3</b>	The functionality of these fields is similar to that of the field "Activity No." above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Activity No." above.

**Job Price List Lines Sub-Tab**

This section includes the fields and descriptions for the Job Price List Lines sub-tab.

Field	Description
<b>Line No.</b>	When you create a line, you can specify the number of the line here. The other lines in the sub-tab are renumbered accordingly. If you do not enter a number, the line is added at the bottom of the table.

Field	Description
<b>Act. No.</b>	In this field, you can enter the number of an activity for which you want to calculate a price or a markup. If you leave this field blank, the activity number is not included in the combination of factors that cause the line to be used on an entry in, for example, a job journal. Note that for a job price list line to be activated when you are making job entries, all completed fields on the price list line must match the job entry.
<b>Activity Type.</b>	In this field, you can enter the type of an activity for which you want to calculate a price or a markup. You can choose one of the predefined values "Time" or "Amount." If you leave this field blank, and if you have specified an activity number in the <b>Act. No.</b> field on the line, Maconomy automatically derives the type of the activity specified.
<b>Price Group, Act.</b>	The functionality of this field is similar to that of the <b>Act. No.</b> field.
<b>Empl.</b>	The functionality of this field is similar to that of the <b>Act. No.</b> field.
<b>Employee Category No.</b>	The functionality of this field is similar to that of the <b>Act. No.</b> field.
<b>Employee Type</b>	The functionality of this field is similar to that of the <b>Act. No.</b> field. In cases where a job budget line in the Job Budgets workspace has been assigned to an employee category, but not to an employee, Maconomy compares the employee type specified as a membership criterion with the value in this field. The current job price list line is only used if the employee type on the category is blank, if this field is blank, or if both fields have the same value.
<b>Price Group. Empl.</b>	The functionality of this field is similar to that of the <b>Act. No.</b> field. In cases where a job budget line in the Job Budgets workspace has been assigned to an employee category, but not to an employee, Maconomy compares the job price group that belongs to the employee category with the value in this field when the price is calculated from a general job price list.
<b>Task</b>	The functionality of this field is similar to that of the <b>Act. No.</b> field.
<b>Price Group, Task</b>	The functionality of this field is similar to that of the <b>Act. No.</b> field.
<b>Responsible Company</b>	Enter the number of the responsible company for which you want to calculate a price or a markup. If you leave this field blank, the responsible company is not included in the combination of factors that cause the line to be used on an entry in, for example, a job journal.
<b>Executing Company</b>	Enter the number of the executing company for which you want to calculate a price or a markup. If you leave this field blank, the activity number executing company is not included in the combination of factors that cause the line to be used on an entry in, for example, a job journal.

Field	Description
<b>Marked</b>	<p>This field is used for selecting a line for adjustment or deletion. You can select this field can be marked or by using the <b>Mark Lines</b> action.</p> <p>When you have selected a number of fields as “Marked,” you can adjust the cost, intercompany and billing prices, the markup percentage, or the overtime charge specifications on the marked lines by entering the appropriate values in the Adjust Job Price List and Adjust Overtime Charge islands and subsequently using the <b>Adjust Marked</b> action. In this way, all selected lines are updated in accordance with the values specified in the Adjust Job Price List and Adjust Overtime Charge islands.</p> <p>If you want to deselect the lines that were marked, you can use the <b>Unmark Lines</b> action. However, if you want to deselect only a few lines, you can manually remove the selection in the <b>Marked</b> field on the lines in question.</p> <p>If you want to delete all or some of the lines in the sub-tab, you can use the <b>Delete Marked</b> action. When you use this action, all lines whose <b>Marked</b> field is selected are deleted from the job price list in question. See the description of the relevant actions for further information about these actions.</p>
<b>Location</b>	The functionality of this field is similar to that of the <b>Act. No.</b> field.
<b>Entity</b>	The functionality of this field is similar to that of the <b>Act. No.</b> field.
<b>Project</b>	The functionality of this field is similar to that of the <b>Act. No.</b> field.
<b>Purpose</b>	The functionality of this field is similar to that of the <b>Act. No.</b> field.
<b>Spec. 1-3</b>	The functionality of this field is similar to that of the <b>Act. No.</b> field.
<b>Local Spec. 1-3</b>	The functionality of this field is similar to that of the <b>Act. No.</b> field.
<b>Cost</b>	<p>The cost price specified in this field can be split into base salary rate and overhead rate, which are used for time activities. Note that this is optional: if no base salary rate and no overhead rate are specified, then the cost price is interpreted as the base salary rate. If a cost price and a base salary rate and/or overhead rate are specified, the cost price must equal the base salary rate plus the overhead rate.</p> <p>The value specified in this field is the cost per hour or day, depending on the following:</p> <ul style="list-style-type: none"> <li>■ The time unit specified in the line</li> <li>■ The time unit specified in the Job Price Lists tab (if the time unit is not specified in the line)</li> </ul>

Field	Description
<b>Base Salary Rate</b>	<p>A nonzero base salary rate in the price list overrides a base salary rate on employees and employee categories. The base salary rate is only used for time activities. If no base salary rate and no overhead rate have been specified, the cost price on the line is interpreted as the base salary rate.</p> <p>The value specified in this field is the base salary rate per hour or day, depending on the following:</p> <ul style="list-style-type: none"> <li>▪ The time unit specified in the line</li> <li>▪ The time unit specified in the Job Price Lists tab (if the time unit is not specified in the line)</li> </ul>
<b>Overhead Rate</b>	<p>A nonzero overhead rate in the price list overrides an overhead cost rate on employees and employee categories. The overhead rate is only used for time activities.</p> <p>The value specified in this field is the overhead rate per hour or day, depending on the following:</p> <ul style="list-style-type: none"> <li>▪ The time unit specified in the line</li> <li>▪ The time unit specified in the Job Price Lists tab (if the time unit is not specified in the line)</li> </ul>
<b>Intercompany Price</b>	<p>In this field, you can enter an intercompany price to be used for the current combination of activity, employee, task, and dimension values on job entries in workspaces such as Job Journal. The amount is entered in the currency selected in the <b>Currency, Intercomp.</b> field in the Currency island. If you do not enter a value here, Maconomy finds the intercompany price using the order of priorities described in “Appendix A: Price Calculation in the Job Cost Module,” even if another line with a higher line number matches the job entry.</p> <p>You cannot enter both an intercompany price and an intercompany price percentage on the same line. If you specify an intercompany price on a line on which an intercompany price percentage has already been specified, the intercompany percentage is set to 0 (and vice versa).</p> <p>The value specified in this field is the intercompany price per hour or day, depending on the following:</p> <ul style="list-style-type: none"> <li>▪ The time unit specified in the line</li> <li>▪ The time unit specified in the Job Price Lists tab (if the time unit is not specified in the line)</li> </ul>
<b>Intercompany Price %</b>	<p>In this field, you can enter an intercompany price percentage to be used for the current combination of activity, employee, task, and dimension values on job entries in workspaces such as Job Journal.</p> <p>If you specify an intercompany price percentage, the intercompany price on each job entry is calculated as the specified percentage of the billing price on the entry in question.</p>

Field	Description
	You cannot enter both an intercompany price percentage and an intercompany price on the same line. If you specify a percentage on a line on which an intercompany price has already been specified, the intercompany price is set to 0 (and vice versa).
<b>Billing Price</b>	<p>In this field, you can enter a billing price to be used for the current combination of activity, employee, and dimension values on job entries in workspaces such as Job Budgets. The amount is entered in the currency selected in the <b>Currency, Sales</b> field in the Currency island. If you do not enter a value here, Maconomy finds the cost using the order of priorities described in "Appendix A: Price Calculation in the Job Cost Module," even if another line with a higher line number matches the job entry.</p> <p>The value specified in this field is the billing price per hour or day, depending on the following:</p> <ul style="list-style-type: none"> <li>▪ The time unit specified in the line</li> <li>▪ The time unit specified in the Job Price Lists tab (if the time unit is not specified in the line)</li> </ul>
<b>Markup %</b>	<p>In this field, you can enter a markup percentage to be used for the current combination of activity, employee, task, and dimension values on job entries in workspaces such as, Job Budgets. If you do not enter a value here, Maconomy finds the markup percentage using the order of priorities described in "Appendix A: Price Calculation in the Job Cost Module," even if another line with a higher line number matches the job entry.</p> <p>Note that there is no connection between the <b>Billing Price</b> and <b>Markup %</b> fields in this workspace. This means that the billing price on a line is not calculated from the cost when you enter a markup percentage on the same line.</p>
<b>Base Salary Markup %</b>	If the <b>Use markup % for time activities</b> system parameter is selected, markup percentages in price lists are also applied to time entries. In this field, you can specify a markup percentage relative to the base salary rate.
<b>Standard Billing Price</b>	<p>The functionality of this field is similar to that of the <b>Billing Price</b> field. Contrary to the entered billing price, the standard billing price cannot be changed in workspaces such as Job Budgets and Job Journal. The difference between the standard billing price, the entered billing price, and the invoiced billing price (as found in the Invoice Selection workspace) can be used for performance analyses. For more information, see "Appendix A: Price Calculation in the Job Cost Module."</p> <p>The value specified in this field is the standard billing price per hour or day, depending on the following:</p> <ul style="list-style-type: none"> <li>▪ The time unit specified in the line</li> <li>▪ The time unit specified in the Job Price Lists tab (if the time unit is not specified in the line)</li> </ul>

Field	Description
<b>Standard Markup %</b>	The functionality of this field is similar to that of the <b>Markup %</b> field, but applies to the standard billing price only.
<b>Standard Base Salary Markup %</b>	This is similar to the preceding field, but for specifying the standard billing price as a markup percentage applied to the base salary rate.
<b>Activity Name</b>	This field shows the name of the activity specified in the <b>Act. No.</b> field on the line in question.
<b>Task Description</b>	This field shows the description of the task specified in the <b>Task</b> field on the line in question. However, you should note that if several descriptions exist for the task specified in the <b>Task</b> field on the line, this field is automatically blanked by Maconomy.
<b>Employee Name</b>	This field shows the name of the employee specified in the <b>Employee</b> field on the current line.
<b>Overtime Spec.</b>	<p>In this pop-up field, you can select an overtime specification for the current line. Overtime specifications are defined in the Popup Fields workspace in the Set-Up module.</p> <p>When entering time, for example, in a time sheet, a user can specify that the work was performed using overtime, for instance, during the weekend. The price for that entry is then found in the following way:</p> <ol style="list-style-type: none"> <li>1. The basic price is found for the current combination of activity, employee, task, and so on, on the time sheet line.</li> <li>2. If a matching overtime specification (for example, "Weekend") is entered on the price list line on which Maconomy found the price, the amounts or percentages entered in the <b>Overtime Charge</b> fields are added to the price.</li> <li>3. If no matching overtime specification is found on the line, Maconomy scans the price list for a line with the overtime specification in question that does not contradict the allocation combination from the time sheet line. For instance, the job price list may contain a line that is blank except for the overtime specification "Weekend" and some percentage specifications in the <b>Overtime Charge %</b> fields.</li> <li>4. On the basis of this, the final price is calculated and used in subsequent billings.</li> <li>5. If no matching overtime specification is found in the price list, no overtime is calculated.</li> </ol> <p>You can choose to enter the addition to the price as an amount or as a percentage of the original price. Additions to cost, intercompany price, and billing price can be entered separately.</p>

Field	Description
<b>Overtime Charge %, Overhead</b>	<p>Enter a value to determine the percentage of the overhead rate before it is added to the cost of the job entry as calculated by the current price list. This applies only if you have specified an overtime specification in the <b>Overtime Spec.</b> field.</p> <p>You can enter a value that is greater than or equal to -100%.</p> <p>Note that if you enter zero as a value, this indicates that the field should be left as is, and no calculations will occur.</p>
<b>Overtime Charge %, Base Salary</b>	<p>Enter a value to determine the percentage of the base salary rate should be added to the cost of the job entry as calculated by the current price list. This applies only if you have specified an overtime specification in the <b>Overtime Spec.</b> field.</p> <p>You can enter a value that is greater than or equal to -100%.</p> <p>Note that if you enter zero as a value, this indicates that the field should be left as is, and no calculations will occur.</p>
<b>Overtime Charge, Cost</b>	<p>If an overtime specification has been selected in the <b>Overtime Spec.</b> pop-up field, you can enter in this field an amount that should be added to the cost of a job entry as calculated by the current price list.</p> <p>The value specified in this field is the cost per hour or day, depending on the following:</p> <ul style="list-style-type: none"> <li>▪ The time unit specified in the line</li> <li>▪ The time unit specified in the Job Price Lists tab (if the time unit is not specified in the line)</li> </ul> <p>For more information about overtime specifications, see the description of the <b>Overtime Spec.</b> field.</p>
<b>Overtime Charge %, Intercompany</b>	<p>The functionality of this field is similar to that of the <b>Overtime Charge %, Cost</b> field, but specifies the addition to the intercompany price.</p>
<b>Overtime Charge, Intercompany</b>	<p>The functionality of this field is similar to that of the <b>Overtime Charge %, Cost</b> field, but specifies the addition to the intercompany price.</p> <p>The value specified in this field is the intercompany overtime charge per hour or day, depending on the following:</p> <ul style="list-style-type: none"> <li>▪ The time unit specified in the line</li> <li>▪ The time unit specified in the Job Price Lists tab (if the time unit is not specified in the line)</li> </ul>
<b>Overtime Charge %, Billing</b>	<p>The functionality of this field is similar to that of the <b>Overtime Charge %, Cost</b> field, but specifies the addition to the billing price.</p>
<b>Overtime Charge, Billing</b>	<p>The functionality of this field is similar to that of the <b>Overtime Charge %, Cost</b> field, but specifies the addition to the billing price.</p>

Field	Description
	<p>The value specified in this field is the billing overtime charge per hour or day, depending on the following:</p> <ul style="list-style-type: none"> <li>▪ The time unit specified in the line</li> <li>▪ The time unit specified in the Job Price Lists tab (if the time unit is not specified in the line)</li> </ul>
<b>Time Unit</b>	Use this field to specify the time unit for prices on time activities. You must fill in this field in both the tab and sub-tab. When you create a line here, the field is auto-populated with the default value from the tab. Price calculation relies on the time unit specified on the line.
<b>Currency, Cost</b>	In this field, you can specify the currency of the cost price. If blank, the cost is in the currency specified in the tab.
<b>Currency, Intercomp.</b>	Similar to <b>Currency, Cost</b> , but for intercompany price.
<b>Currency, Sales</b>	Similar to <b>Currency, Cost</b> , but for the sales price.

## Actions

This section shows the Actions available in the Job Price Lists workspace.

### Top Tab

Field	Description
<b>New Issue</b>	<p>When you use this action, an issue of the current price list is created. All lines and fields from the previous issue are copied to the new issue. However, any lines that cannot be transferred are skipped when creating the issue. Price list lines that pertain to employees who have been blocked since the last edition was created are thus not included in the new edition.</p> <p>You can only use this action if you have entered a starting date for the new issue in the <b>Start Date</b> field. See the description of that for more information about job price list issues.</p>
<b>Mark Lines</b>	When you use this action, all lines displayed in the sub-tab are marked; that is, Maconomy selects the <b>Marked</b> field on each line. Having specified a line as "Marked," you can adjust or delete it. See the description of the <b>Marked</b> field in the sub-tab of this workspace for information about the functionality of this field. If you want to unmark one or more lines, manually remove the mark in the <b>Marked</b> field.
<b>Unmark Lines</b>	When you use this action, all lines with a mark in the <b>Marked</b> field are unmarked. The functionality of this action is useful if you have, for example, copied lines from a job price list on which all lines were marked. If you do not want to have all these lines marked on the new job price list, the lines can easily be unmarked by using this action.

Field	Description
<b>Adjust Marked</b>	<p>Use this action to apply any non-zero value specified in the fields under the Adjust Overtime Cost island to selected lines in the sub-tab.</p> <p>If you have specified new prices as amounts rather than percentage adjustments, this action displays an error if the marked lines include lines with different time units (following the logic that the time unit is taken from the tab if it is blank on a line in the sub-tab).</p> <p>This applies only if you have specified an overtime specification in the <b>Overtime Spec.</b> field.</p>
<b>Delete Marked</b>	When you use this action, all lines with a mark in the <b>Marked</b> field are deleted.
<b>Copy job price list</b>	<p>When you use this action, the lines from the job price list specified in the Copy Job Price List island in the tab of this workspace are copied to the current job price list. To avoid duplicate lines, Maconomy only copies those lines that are different from already existing lines on the source price list. If the job price list to which new lines are copied is assigned another currency than the currency used on the source price list, Maconomy automatically converts the copied amounts into the currency used on the target price list by using the current day's exchange rate.</p>

## Job Price Groups Workspace

Use this workspace to enter and maintain job price groups.

Each job price group is made up of activities, employees, and tasks that are all priced in the same way.

This window is used for creating and maintaining job price groups. A job price group can be made up of activities, employees, and tasks, all pointing to a specific price in a job price list. If, for instance, a whole group of employees has the same cost price, these employees can be put together in a job price group. Hereafter, you only need to create one single line for employees with the same cost price in the window Job Price Lists by simply specifying the job price group instead of one line per employee.

Use selection criteria to specify which price groups you want to see in the sub-tab of the workspace. The groups are created in the sub-tab. Maconomy assigns activities, tasks, and employees to job price groups using the **Job Price Group No** field in the Activities, Job Tasks, Task Lists, and Employees workspaces.

## Job Price Groups Tab

This section includes the fields and descriptions for the Job Price Groups tab.

### Selection Criteria Island

Field	Description
<b>Price Group No.</b>	In these fields, you can specify a range of job price group numbers, if you want to limit the number of lines shown in the table part of this window. The table will display lines within the range specified here. If you do not specify a range, all job price groups will be displayed in the table part when you press Return.

## Job Price Groups Sub-Tab

This section includes the fields and descriptions for the Job Price Groups sub-tab.

Field	Description
<b>Price Group No.</b>	In this field, you can specify the number of the job price group you want to create. Maconomy verifies that the number entered is not in use. The number of existing price groups cannot be changed.
<b>Description</b>	In this field, you can enter a description of the job price group.
<b>Access Level</b>	<p>In this field, you can specify the name of an access level. A user only has access to the current job price group if he or she is granted access to this level or a higher level in the window User Access Levels in the Set-Up module. Only users with access to the current job price group can see and edit the price group in this window. In other windows, for example, the windows Activities and Employees, it is only possible to assign an employee, activity or task to job price groups to which the user has access. In addition, the selection of job price groups in the window Job Price Lists will be limited to the job price groups to which the user has access.</p> <p>Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. For further information about the standard access control configuration, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If no access level is specified, all users have access to the current job price group.</p>

## Job Surcharge Rules Workspace

Use this workspace to enter and maintain job surcharge rules.

Each rule determines when Maconomy automatically applies surcharges for spent goods, such as office supplies. Maconomy applies surcharges to budgeted amounts as well as actual job costs.

You can apply surcharges to jobs or to customers. If you apply a surcharge rule to a customer, it is automatically applied to all of the jobs associated with the customer.

For each job surcharge rule, you can define a set of criteria that determine when Maconomy is to automatically create surcharges for consumable goods such as paper, pens, and so on.

Maconomy creates surcharges when you budget on jobs and post job-cost-related journals. By assigning a job surcharge rule to a customer in the A/R module, you can ensure that the same surcharge rule applies to all jobs that you create for the same customer.

A job surcharge rule calculates one or more surcharges that are either added as the last line or lines on the job invoice or added to the line or lines that derive the job surcharge. Maconomy calculates the surcharge as a percentage of the activities that you enter.

In the Job Surcharge Rules Lines sub-tab, you can define a number of ranges of activity numbers, employees, and dimension values. If you assigned a job surcharge rule to a job, and the entry of an activity in the job budget falls within the ranges that you defined on one of the lines in the surcharge rule in question, Maconomy calculates a job surcharge that is displayed on a new line. At posting, a surcharge appears as an extra job entry. Maconomy retrieves the dimension values on the extra entry from the dimension derivation fields on the surcharge rule line that was activated at the entry of the job budget line.

If you do not specify a derived activity number or derived dimension values, Maconomy adds the job surcharge to the job entry that activates the rule.

Note that Maconomy only displays the surcharge in the G/L module if the value of the **Capitalization Method** job parameter attribute in the **Revenue Recognition** job parameter type for the job in question is **At Billing Price**, because the cost of a job entry that Maconomy creates from a surcharge line is 0. For more information about capitalization methods, see the description of the **Capitalization Method** job parameter attribute in the Job Parameters workspace.

## Job Surcharge Rules Tab

This section includes the fields and descriptions for the Job Surcharge Rules tab.

### Job Surcharge Rule Island

Field	Description
<b>Name</b>	In this field, you can enter the name of the job surcharge rule you are creating. In the window Customer Information Card, you can assign a customer to this rule by specifying a name in the field "Job Surcharge Rule." The rule will then be used as standard for the customer in question.
<b>Description</b>	In this field, you can enter a description of the rule.
<b>Blocked</b>	Mark this field to block the current rule. A blocked job surcharge rule cannot be used in budgeting, job invoicing, and posting.

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

**Selection Criteria Island**

Field	Description
<b>Show Lines</b>	When you mark this field, the lines matching the criteria specified in this island are shown in the table part of this window.
<b>Activity Type</b>	Use this field to restrict on the rule lines shown in the table. If this field is completed, then the table only includes rules that either do not restrict on activity type or which restrict on the same activity type as this type.
<b>Activity No.</b>	In this field, you can specify an activity number, if you wish to limit the number of lines shown in the table part of this window. The table part displays the lines whose range of activity numbers includes the specified values. If you do not specify an activity number, the activity numbers will not apply on the lines shown in the table part.
<b>Employee No.</b>	The functionality of this field is similar to the functionality of the field "Activity No." above.
<b>Task</b>	The functionality of this field is similar to the functionality of the field "Activity No." above.
<b>Entry Date</b>	Use the field to restrict on the rule lines shown in the table. The table only includes rules either without restriction on the entry date or with a restriction on entry date range which includes this date.

**Selection Criteria, Dimensions Island**

Field	Description
<b>Location</b>	The functionality of this field is similar to the functionality of the field "Activity No." above.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Activity No." above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Activity No." above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Activity No." above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Activity No." above.

**Job Surcharge Rule Lines Sub-Tab**

This section includes the fields and descriptions for the Job Surcharge Rule Lines sub-tab.

Field	Description
<b>% Sales Price</b>	If the specified allocation combination activates the job surcharge rule, a surcharge is calculated using the value in this field. If, for instance, you enter

Field	Description
	"5" in this field, the job surcharge is calculated as 5 percent of the sales price of the activities causing the job surcharge.
<b>Activity Type</b>	Use this field to specify that the given surcharge line only applies to Time or Amount activities.
<b>Activity No. From</b>	Using this field and the field "Activity No. To," you can specify a range of activities. A job registration must fall within this range to activate the current job surcharge rule line. If you do not enter a range, activity numbers are not considered in determining whether the current line is to be activated. Note that in order for the line to be activated, the registration must lie within all ranges specified on the surcharge rule line.
<b>Activity No. To</b>	Using this field and the field "Activity No. From," you can specify a range of activities. A job registration must fall within this range to activate the current job surcharge rule line. If you do not enter a range, activity numbers are not considered in determining whether the current line is to be activated. Note that for the line to be activated, the registration must lie within all ranges specified on the surcharge rule line.
<b>Employee No. From</b>	The functionality of this field is similar to that of the field "Activity No. From" above.
<b>Employee No. To</b>	The functionality of this field is similar to that of the field "Activity No. To" above.
<b>Task From</b>	The functionality of this field is similar to that of the field "Activity No. To" above.
<b>Task To</b>	The functionality of this field is similar to that of the field "Activity No. To" above.
<b>Entry Date From</b>	Use the field to specify that the surcharge line only applies to entries with an entry date including and after a given date. Surcharge at invoicing on account is calculated as of the preferred invoice date or current date, if the former is blank. Surcharge on job budgets is calculated as of the current date.
<b>Entry Date To</b>	The end of the date range described above.
<b>Location From</b>	The functionality of this field is similar to that of the field "Activity No. From" above.
<b>Location To</b>	The functionality of this field is similar to that of the field "Activity No. To" above.
<b>Entity From</b>	The functionality of this field is similar to that of the field "Activity No. From" above.
<b>Entity To</b>	The functionality of this field is similar to that of the field "Activity No. To" above.

Field	Description
<b>Project From</b>	The functionality of this field is similar to that of the field "Activity No. From" above.
<b>Project To</b>	The functionality of this field is similar to that of the field "Activity No. To" above.
<b>Purpose From</b>	The functionality of this field is similar to that of the field "Activity No. From" above.
<b>Purpose To</b>	The functionality of this field is similar to that of the field "Activity No. To" above.
<b>Spec. 1-3 From</b>	The functionality of these fields is similar to that of the field "Activity No. From" above.
<b>Spec. 1-3 To</b>	The functionality of these fields is similar to that of the field "Activity No. To" above.
<b>Derived Activity No.</b>	<p>In this field, you can enter the activity number to be used on job surcharges created from the current surcharge rule line. If you enter a time activity, you must also enter an employee. If you want job surcharges to be the last lines on quotes and invoices, the activities used for job surcharges should be assigned high numbers, as the lines are sorted by number. This field must be completed.</p> <p>If you do not enter an activity number, but you specify other dimensions to be derived from the line, surcharges created from the current line will be assigned the activity number of the entry activating the surcharge. If you neither specify an activity number nor any other dimension values (including employee and task) on the line, surcharges created from the current line will be added to the job entry activating the job surcharge.</p>
<b>Derived Employee No.</b>	<p>In this field, you can enter the employee number to be used on job surcharges created from the current surcharge rule line, if a time activity has been specified on the line.</p> <p>If you do not enter an employee number, but you specify other dimensions to be derived from the line, surcharges created from the current line will be assigned the employee number of the entry activating the surcharge. If you neither specify an employee number nor any other dimension values (including activity number and task) on the line, surcharges created from the current line will be added to the job entry activating the job surcharge.</p>
<b>Derived Task</b>	<p>In this field, you can enter the task to be used on job surcharges created from the current surcharge rule line. Please note that if you specify a task, the current surcharge rule line will only be used in connection with registrations on jobs assigned to task lists which contain the task specified in this field.</p> <p>If you do not enter a task name, but you specify other dimensions to be derived from the line, surcharges created from the current line will be assigned the task of the entry activating the surcharge. If you neither specify a task nor any other dimension values (including activity number and employee) on the line, surcharges created from the current line will be added to the job entry activating the job surcharge.</p>

Field	Description
<b>Derived Location</b>	In this field, enter the location to be used on job surcharges created from the current surcharge rule line. If you do not enter a location, the location on the surcharge will be retrieved from the budget line which caused the surcharge.  If you do not enter a location, but you specify other dimensions, to be derived from the line, surcharges created from the current line will be assigned the location of the entry activating the surcharge. If you neither specify a location nor any other dimension values on the line (including activity number, employee, and task), surcharges created from the current line will be added to the job entry activating the job surcharge.
<b>Derived Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Derived Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Derived Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Derived Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

## Job Parameter Selection Rules Workspace

Use this workspace to set up rules that control which job parameters are used with which jobs.

When you create a job, the job parameter selection rules control:

- Which job parameters can be applied to the job.
- Which attribute values can be used in the job parameters.
- Default values for these attributes.

In the Job Parameter Selection Rules tab, enter the name and description of the rule and a priority level. In the **Job Criterion** field, identify the jobs to which this rule will apply.

In the Parameter Selection Rule Lines sub-tab, define the job parameters that are valid when this rule is applied. Specify default values for the parameters in the **Standard Value** field.

For example, assume that you have a job parameter selection rule that includes a job parameter of the **Revenue Recognition** type that has the **Capitalization Method** attribute with the default value of **At Cost**. Maconomy automatically assigns this value to any job that you create using this job parameter selection rule.

Using job parameter selection rules, you can define exactly which job parameter attribute values should be assigned to new jobs and which job parameter attribute values should be considered valid for the jobs. You can specify that a certain set of job parameter selection rules should be valid, for example, for all jobs that belong to one particular company.

When you create a new job, Maconomy derives the relevant values for the job based on the job parameter selection rules. Then, each time that you make changes to a given job, Maconomy

rederives all of the values that are determined by job parameters (unless you turn off this feature in the Job Parameter Derivation Fields Workspace).

When you create a job and Maconomy derives the relevant job parameter attribute values for the job, Maconomy displays this information in the Job Parameter Selection workspace.

### Example

Assume that you have created a number of job parameters in the Job Parameters workspace. These job parameters are now to be combined in a number of job parameter selection rules. Before you create your rules, you create a number of selection criterion specifications of the **Job** type in the Selection Criterion Specifications workspace in the Set-Up module. You create the following selection criterion specifications:

Selection Criterion Specification No.	US
Description	Jobs belonging to a US company

Selection Criterion Specification No.	German
Description	Jobs belonging to a German company

Next you assign each of these selection criterion specifications to a job parameter selection rule.

- For jobs that match the US selection criterion specification, you define that the following job parameters should be valid: **Capitalization = At Billing Price**, **Pricing Principle = Time and Material**, and **Events = No Events**.
- For jobs that match the German selection criterion specification, you specify: **Fixed Price Set-Up = Fixed Quote Excl. Outlays** and **Pricing Principle = Fixed-Price**.

Now, when you use the US selection criteria, Maconomy will use the US parameters and when you use the German selection criteria, Maconomy will use the German parameters.

### Priorities

Each job parameter selection rule must have a priority, defined in the **Priority** field in the Job Parameter Selection Rules tab. The lower the number, the higher the priority.

Maconomy uses these priority numbers when multiple rules could be applied to the same job. Using the example above, when you create a job that belongs to a German company, Maconomy applies the rule that uses the values **Fixed-Price** and **Fixed Quote Excl. Outlays**.

However, because this rule does not define all available job parameter types, Maconomy attempts to find the remaining job parameter type values in other job parameter selection rules. This search is based on the selection criterion specification and the priority that you defined for each job parameter selection rule.

When Maconomy finds valid job parameters for all of the job parameter types, Maconomy uses these to set up the job.

### Defaults

If you create a job to which no selection criterion specifications apply, Maconomy automatically uses the default job parameter selection rule. This rule contains default values for all of the available job parameter types.

You cannot assign the default rule to any selection criterion specification.

The priority specified for the default rule determines when the rule is applied. This means that you can set up the default job parameter selection rule to be the first rule that Maconomy considers when it derives job parameter attribute values.

### Rederived Values

Each time that you change the fields for a job, Maconomy automatically rederives the job parameters for the job (unless you turn off this feature in the Job Parameter Derivation Fields Workspace).

### Parameter Selection Rules Tab

This section includes the fields and descriptions for the Job Parameter Selection Rules tab.

#### Job Parameter Selection Rule Island

Field	Description
<b>Rule No.</b>	This field shows the identification number of the job parameter selection rule. The number is automatically applied by Maconomy and cannot be changed manually.  Note that rule number "1" is a default job parameter selection rule containing default values for all job parameters available in the system. This job parameter selection rule can be interpreted as "a selection criterion specification that matches all jobs." This default rule is thus used when Maconomy is to derive values for a certain job, and no other rules match the job in question. No selection criterion specification can be assigned this default rule. However, you should note that the priority specified on this rule determines when in the process of derivation the values defined in this rule should be applied. The user can manually define the priority of all job parameter selection rules created.
<b>Description</b>	In this field, you can enter a description of the job parameter selection rule in question.
<b>Priority</b>	<p>In this field, you can specify the priority of the job parameter selection rule in question. The priority is determined by a number for which it applies that the lower the number, the higher the priority.</p> <p>An example of the use of the priority specified in this field could be: You have created two job parameter selection rules, R1 and R2. If a given job matches both these rules, the priorities specified in these two rules will determine which of the rules is to be considered valid for the job in question; that is, if R2 has been given a higher priority than R1, the job parameters specified in R2 will be considered valid for the job in question. If R2 does not contain a specification of any valid job parameters of a given type, the valid job parameters of that type will be taken from the next selection rule matching the job; that is, Maconomy searches the rules by decreasing priority.</p> <p>You can change the priority number of a job parameter selection rule in this field. However, you should note that if you change the priority number of a given rule to another number which is already in use on an existing selection rule, that selection rule and any other rules with higher numbers, that is, lower priorities, will</p>

Field	Description
	<p>have their priorities revised by one number as the priority number of the rule in question is changed.</p> <p>An example could be the following:</p> <p>You have created 4 rules with the following priorities:</p> <ul style="list-style-type: none"> <li>▪ x, priority 1</li> <li>▪ y, priority 2</li> <li>▪ z, priority 3</li> <li>▪ w, priority 4</li> </ul> <p>and you create a rule r with the priority number 3, which is already in use on rule z. Rule z will then have its priority changed from 3 to 4, and rule w will have its priority changed from 4 to 5.</p>

### Message Island

Field	Description
<b>Action</b>	<p>In this field, you can select the action to be taken by Maconomy when the job parameter selection rule in question is activated, that is, when a job is created and Maconomy is to derive the different job parameters from the valid job parameter selection rules to the job in question. The functionality is used to warn or prevent users from creating jobs having certain characteristics. You can choose among the following three options:</p> <ul style="list-style-type: none"> <li>▪ <b>Ignore</b> — This is the default value assigned to all job parameter selection rules upon creation. If you select this option, no action will be taken by Maconomy when the job parameter selection rule in question is activated. In other words, Maconomy will not issue any warnings/messages when a job is created on the basis of a job parameter selection rule assigned this action.</li> <li>▪ <b>Issue Warning</b> — If you select this action, Maconomy will issue a warning/message when the job parameter selection rule in question is activated, that is, when you create a job, Maconomy will issue warnings/messages informing you from which job parameter selection rules the relevant job parameters to be assigned to the new job are derived. See the description of the below field “Message” for information on the contents of such messages.</li> <li>▪ <b>Issue Error</b> — If you select this action, Maconomy will issue an error message when the job parameter selection rule in question is activated. Having selected this action for a job parameter selection rule, it will thus not be possible to create jobs which have characteristics determined by the selection criterion specification specified on the relevant job parameter selection rule. However, the job might still be created if some other job</li> </ul>

Field	Description
	parameter selection rule matches the job in question and has a lower priority number, that is, higher priority, than the job parameter selection rule assigned with this action. See the description of the below field "Message" for information on the contents of such messages.
<b>Message Text</b>	In this field, you can specify a message text to be displayed when the job parameter selection rule in question is activated. Note that a message text is not displayed for job parameter selection rules assigned the action "Ignore." Hence, this field is only relevant for the actions "Issue Warning" and "Issue Error." If you do not specify a text in this field, system-generated messages are displayed when job parameter selection rules assigned the actions "Issue Warning" or "Issue Error" are activated.

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

### Job Criterion Island

Field	Description
<b>Selection Criterion Specification No.</b>	<p>In this field, you can specify a selection criterion specification number of the type "Job." If you specify a value in this field, and if a given job is identified by the selection criterion specification entered in this field, the job parameters defined in the table part of the window will be considered valid for the job in question. However, you should note that this only applies if the valid job parameters are not being determined by another selection criterion specification having a higher priority.</p> <p>By means of selection criterion specifications, you can thus, for example, specify that a certain set of job parameter selection rules should be valid for all jobs belonging to one certain company, whereas another set of parameter selection rules should be valid for jobs belonging to another company. If you do not specify a selection criterion specification in this field, the job parameter selection rule is interpreted as a rule matching all jobs, and the priority specified on the rule thus determines when in the process of derivation the rule is considered by Maconomy.</p> <p>Note that Maconomy is provided with a default job parameter selection rule containing default values for all job parameters available in the system. This job parameter selection rule can be interpreted as "a selection criterion specification that matches all jobs." This default rule is thus used when Maconomy is to derive values for a certain job and no other rules match the job in question. No selection criterion specification can be assigned this default rule.</p>
<b>Description</b>	This field shows a description of the selection criterion specification specified in the above field "Selection Criterion Specification No."

## Remarks Island

In these fields, you can enter remarks to the job parameter selection rule in question.

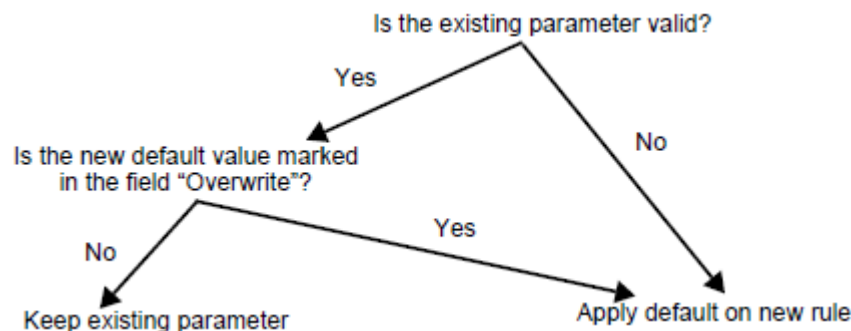

## Parameter Selection Rule Lines Sub-Tab

This section includes the fields and descriptions for the Parameter Selection Rule Lines sub-tab.

Field	Description
<b>Parameter Type</b>	This field displays the job parameter type of the job parameter specified in the field "Parameter Name." The value in this field cannot be changed manually.
<b>Parameter Name</b>	<p>In this field, you can enter the name of a job parameter created in the window Job Parameters. This field is used to specify which job parameters should be valid for jobs meeting the conditions specified in the card part of the window. The available job parameters can be found by using the action "Find Job Parameter" in the Find menu.</p> <p>It is not mandatory to enter parameters for all job parameter types created in the system in one job parameter selection rule. If you do not specify values for all job parameter types in a job parameter selection rule, the method for deriving parameters to jobs, as well as the priorities and selection criterion specifications specified for each job parameter selection rule ensure that one default parameter value is derived for each parameter type to each job when created.</p> <p>You can enter more than one of the values of a given job parameter type attribute in a job parameter selection rule; that is, you can, for example, enter both of the values "At Cost" and "At Billing Price" for the job parameter type "Revenue Recognition" in one job parameter selection rule, but only one of these values can be assigned the value "Default." Specifying both of the above-mentioned values in a job parameter selection rule means that both values are considered valid for jobs meeting the criteria specified in the assigned selection criterion specification. However, only the value defined as the default will be derived to a job when it is created or changed. In this connection you should note that if you want to manually change the parameters derived to a job in the window Job Parameter Selection, you can only enter parameters specified in the relevant job parameter selection rules. In other words, if no job parameter selection rule contains the job parameter attribute value "At Cost" for the job parameter type "Capitalization Method," it will not be possible to specify that a given job should be capitalized at cost. See the description of the below field "Default Value" for further information.</p> <p>If you delete a line on a job parameter selection rule which is already in use on one or more jobs, the jobs to which the parameter which has now been deleted or changed was derived will continue to have the "old" value until an action results in a change of job parameter selection rule for the job in question or until the "old" parameter is manually changed for the job in question in the window Job Parameter Selection.</p>
<b>Description</b>	This field shows the description of the parameter specified in the field "Parameter Name."

Field	Description																								
<b>Standard Value</b>	<p>In this field, you can specify whether a given job parameter should be assigned a default value. If you mark this field for a given job parameter, a job meeting the conditions specified in the card part of the window will be assigned this job parameter and the specified value when the job is created.</p> <p>For each type of job parameter entered in the table part of the window, one line must be defined as default value. If you have, for example, specified two lines of the job parameter type “Revenue Recognition” having the parameter names “At Cost” and “At Billing Price,” you must mark the field “Default” for one of these job parameters or alternatively remove the job parameter type from the job parameter selection rule by deleting it. Note that you cannot mark a blocked job parameter as default.</p> <p>Note that when the parameters of a job are re-derived, the parameter marked as default will be applied to the job, even if the user creating/modifying the job does not have access to the default parameter. See also the description of the field “Overwrite” below.</p>																								
<b>Overwrite</b>	<p>If you mark this field, the job parameter marked as default will overwrite any other valid job parameter of the given type, when job parameters are rederived to a certain job. The functionality of this field is only relevant when rederivation of parameters gives rise to using another job parameter selection rule than the one previously used for deriving parameters to a given job, that is, if the job parameter selection rule from which job parameters are rederived to a given job is the same as the rule previously used on that job, the field “Overwrite” will not have any effect.</p> <p>An example of the functionality of this field can be illustrated as follows: You have created the following two job parameter selection rules:</p> <p>Rule No. 101:</p> <table><tr><th>Parameter Type</th><th>Parameter Name</th><th>Default</th><th>Overwrite</th></tr><tr><td>T 1</td><td>A</td><td>Ⓔ</td><td></td></tr><tr><td>T 1</td><td>B</td><td></td><td></td></tr></table> <p>Rule No. 102:</p> <table><tr><th>Parameter Type</th><th>Parameter Name</th><th>Default</th><th>Overwrite</th></tr><tr><td>T 1</td><td>A</td><td></td><td></td></tr><tr><td>T 1</td><td>C</td><td>Ⓔ</td><td>Ⓔ</td></tr></table> <p>You create a job. At the creation of the job, job parameters are derived to the job from rule no. 101. As the parameter A is specified as default value for the parameter type T1 on rule no. 101, the parameter A is assigned to the new job. You then make a change to the job resulting in a rederivation of job parameters to the job. The change made on the job means that parameters are now rederived from job parameter selection rule no. 102. As rule no. 102 includes</p>	Parameter Type	Parameter Name	Default	Overwrite	T 1	A	Ⓔ		T 1	B			Parameter Type	Parameter Name	Default	Overwrite	T 1	A			T 1	C	Ⓔ	Ⓔ
Parameter Type	Parameter Name	Default	Overwrite																						
T 1	A	Ⓔ																							
T 1	B																								
Parameter Type	Parameter Name	Default	Overwrite																						
T 1	A																								
T 1	C	Ⓔ	Ⓔ																						

Field	Description
	<p>the parameter type T1 having the parameters A and C; C marked as default value and overwrite, the parameter C will be the new valid parameter of the type T1 derived and assigned to the job in question.</p> <p>If the parameter C in rule no. 102 had been marked as default value, but had not been marked in the field "Overwrite," the parameter C would not be assigned the job as default value, as the parameter A already assigned to the job is also valid on rule no. 102. The fact that the parameter A of the parameter type T1 on the rule no. 101 is also valid on rule no. 102 thus means that at rederivation from rule no. 102, the parameter A is the parameter derived and assigned to the job, even though parameter A is not marked as default value on rule 102. The functionality of this field can also be illustrated as follows:</p>  <pre> graph TD     Q1{Is the existing parameter valid?}     Q2{Is the new default value marked in the field "Overwrite?"}     Q1 -- Yes --&gt; Q2     Q1 -- No --&gt; A2[Apply default on new rule]     Q2 -- No --&gt; A1[Keep existing parameter]     Q2 -- Yes --&gt; A2   </pre> <p>The field can only be marked for job parameters marked as default parameters.</p>
<b>Blocked</b>	This field shows whether or not the current job parameter is blocked. A job parameter is blocked in the window Job Parameters and the mark in this field can thus not be changed here.
<b>Remarks 1-5</b>	These fields show remarks, if any, assigned to the job parameter in question. The remarks are entered in the window Job Parameters and cannot be changed here.

### Actions

This section shows the Actions available in the Job Parameter Selection Rules workspace.

#### Top Tab

Field	Description
<b>Copy Rule</b>	<p>When you select this action, Maconomy copies the table part lines from the job parameter selection rule specified in the island Copy Rule to the rule currently displayed in this window. However, Maconomy only copies parameters that do not already exist on the new job parameter selection rule.</p> <p>Note that when you copy a job parameter selection rule, the marks in the fields "Standard Value" and "Overwrite" might change for already existing lines, as copied lines are interpreted as new lines.</p>

## Invoice Layout Rules Workspace

Use this workspace to enter and maintain invoice layout rules, which determine the invoice's level of detail, the headers and subtotals shown, and more.

You must specify an invoice layout rule for every job. When a new job is created, the invoice layout rule can be taken from the one specified (if any) for the customer to which the job belongs.

Maconomy uses a job's invoice layout rule to suggest a layout for invoices in the Invoice Selection workspace and the Invoice Editing workspace, and for the customer's quotes in the Quote Editing workspace. However, you must accept the suggestions in every case.

You can set up invoices and invoice selections at four levels and arrange them according to dimensions and budget structure. For example, you can display tasks on the first level and employees on the second level.

Maconomy always displays at least one amount line on an invoice. You can indicate that an invoice be printed without any amount lines (for example, if you select a blank value in the **Level 1** field for invoices). In such cases, Maconomy still prints the total invoice amount on a line above the total.

### Invoice Layout Rules Tab

This section includes the fields and descriptions for the Invoice Layout Rules tab.

#### Invoice Layout Rule Island

Field	Description
<b>Name</b>	In this field, you can specify the name of the current invoice layout rule. Note that an invoice layout rule cannot be deleted, once it has been created. However, the name can be changed in this field at any time.
<b>Description</b>	In this field, you can enter a description of the rule.

#### Quote Island

Field	Description
<b>Incl. Text Lines</b>	In this field, you can select whether text lines created in the Job Budget Texts workspace are to be transferred from a job budget to the quote when the actions "Transfer to Quote" and "Print Quote" are used in the Job Budgets workspace.
<b>Create Quote Directly From Budget</b>	In this field, you can specify whether the layout of a quote is to include lines from the budget. If you select this field, the quote contains the same lines as the budget, in the same order, and you cannot make selections in the remaining fields in this island except for the "Total Price Only" field.  If the "Filter Budget Lines on Transfer to Quote" system parameter is selected, the budget lines are also filtered when you use the "Transfer to Quote" action. This means that irrelevant lines are omitted from the budget. Such lines may exist if the current job was created using a job template. The job template

Field	Description
	<p>functionality allows you to set up template budgets that are automatically copied to new jobs. In some cases, it is an advantage to create a large number of lines in the template budgets, taking into account all possible activities and costs. The budget responsible of each job then only needs to fill in quantities and prices on the relevant budget lines, leaving irrelevant lines untouched. However, if the job budget lines are not filtered, irrelevant lines must be manually deleted from the quote after they have been transferred from the budget. A budget line is deemed relevant (and not filtered away) in the following cases:</p> <ul style="list-style-type: none"> <li>▪ The total billing price is different from 0.</li> <li>▪ A text line or group of text lines where the following line will be transferred, including the case where the text line or group of text lines is located at the very bottom of the budget.</li> <li>▪ A subtotal which sums a group of lines of which at least one is transferred.</li> </ul>
<b>Transfer from Budget</b>	<p>Select a dimension to transfer from each job budget line to quote lines. You can choose up to two dimensions to transfer.</p> <p>The following dimensions are available for selection:</p> <ul style="list-style-type: none"> <li>▪ Blank (no value is transferred)</li> <li>▪ Task</li> <li>▪ Activity</li> <li>▪ Location</li> <li>▪ Entity</li> <li>▪ Project</li> <li>▪ Purpose</li> <li>▪ Specification 1-10</li> <li>▪ Local Spec. 1-10</li> <li>▪ Employee No.</li> <li>▪ Employee Category No.</li> </ul>
<b>Use External Description</b>	<p>If this field is selected, the External Description field on job budget lines is used when transferring budget lines to quotes. For budget lines where the external description is empty, the text in the existing description field is transferred. The default value when creating budget lines for the external description is the existing (internal) description.</p>
<b>Time</b>	<p>The selections made in this column concern time activities.</p>
<b>Amount</b>	<p>The selections made in this column concern amount activities.</p>

Field	Description
<b>Level 1</b>	<p>In this field, you can specify the level of detail in quotes using the current layout rule. You cannot select a level of detail for one type of activity and blank for the other; either complete both fields or leave them both blank.</p> <p>The following options are available:</p> <ul style="list-style-type: none"> <li>Blank — No lines are shown on the quote. This means that the quote only contains one line showing the total billing price from the job budget.</li> <li>Registration — The layout shows information about each budget line on a job. This means that one line is created for each job budget line.</li> <li>Activity — The layout shows information about a job, summed by activity. This means that one line is created for each activity in the job budget.</li> <li>Summary Activity — The layout only shows information about those summary activities which are affected by the activities in the job budget. This means that one line is created for each summary activity in the job budget.</li> </ul>
<b>Total Price Only</b>	<p>If you select this field, Maconomy leaves out unit price and quantity by default from time and/or amount activities on the quote lines. This choice can, however, be changed for the individual lines in the Quote Editing workspace.</p>
<b>Total Price Only, On Account</b>	<p>Two Boolean fields are available for time and amount. Use these fields to select if invoice drafts should use "total price only" for on account invoices. The default value is <b>true</b>, corresponding to current functionality.</p> <div style="border: 1px solid blue; padding: 5px;"> <p><b>Note:</b> Unlike the other fields in this island, this field does not depend on whether "Use for invoicing on account" is selected or not.</p> </div>

### Invoice Preparation Island

Field	Description
<b>Group Budget Lines</b>	<p>If you select this field, the Prepare Invoice action in the Invoice Preparation workspace groups the budget lines using the dimensions specified in Levels 1 to 4 in the Invoice Selection island of the Invoice Layout Rules workspace. For example, if you choose to group the invoice by Task, the Prepare Invoice action sets the budget for invoicing on account with one line per task and with the budgeted billing price for each task.</p> <p>If you do not select this field, the Prepare Invoice action shows the budget lines as they appear in the Job Budgets workspace.</p> <p>Percentage invoicing is available only if you select the Group Budget Lines field.</p>

Field	Description
<b>Use Line Ordering from Budget</b>	<p>If you selected Group Budget Lines, selecting this field arranges the lines based on their order in the budget.</p> <p>If you do not select this field, the budget lines are arranged using the dimension number/name that you used to group them, such as the task name.</p>
<b>Keep Descriptions from Budget</b>	<p>If you selected Group Budget Lines, the Prepare Invoice action in the Invoice Preparation workspace uses the internal and external descriptions from the budget instead of the standard descriptions.</p> <p>If you do not select this field, the Prepare Invoice action uses the internal and external descriptions from the dimensions that you used to group the budget lines.</p>

### Registration Specification Island

Field	Description
<b>Time</b>	If Registration is selected as a specification level for Time entries, Field1 must not be empty. The fields are filled from left to right, meaning that if Field2 is left blank, Field3 cannot have a value. Default values are Text for Field1 and blank for the others.
<b>Amount</b>	If Registration is selected as a specification level for Amount entries, Field1 must not be empty. The fields are filled from left to right, meaning that if Field2 is left blank, Field3 cannot have a value. Default values are Text for Field1 and blank for the others.

### Combined T&M and On Account Island

Field	Description
<b>Position</b>	<p>When you approve an invoice selection, and the Invoice Type field is set to "T&amp;M and On Account," the draft invoice includes both of these items. Use the Position field to determine the layout, as follows:</p> <ul style="list-style-type: none"> <li>▪ <b>On Account First</b> — Select this option to place on account lines above the lines for T&amp;M.</li> <li>▪ <b>T&amp;M First</b> — Select this option to place the T&amp;M lines above the lines for the on account specification.</li> <li>▪ <b>Together</b> — Select this option to place the T&amp;M and on account lines together. This option applies the invoice layout rule to both T&amp;M and on account.</li> </ul> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> The settings in this field affect both summary and detailed specification.</p> </div>
<b>T&amp;M Text</b>	This field allows you to specify the text in a header for the T&M specification on invoices. If the field is left blank, no header is inserted. Each entry in this T&M Invoice Header popup field is associated with a language text, and the text on the

Field	Description
	<p>invoice depends on both the chosen header in this field and the language of the invoice, as set up under Language Texts.</p> <div> <b>Note:</b> Headers and subtotals for T&amp;M and On Account do not appear if the <b>Position</b> field is set to "Together". </div>
<b>T&amp;M Header</b>	If this check box is selected, a header is inserted for the T&M portion on invoices which include both T&M and on account invoicing.
<b>T&amp;M Subtotal</b>	If this check box is selected, a subtotal is inserted for the T&M portion on invoices which include both T&M and on account invoicing.
<b>On Account Text</b>	This field is similar to the <b>T&amp;M Text</b> field in that it is a popup with entries associated with language texts. This field is for indicating the text for the header and/or subtotal for the on account portion on invoices.

Field	Description
<b>On Account Header</b>	If this check box is selected, a header is inserted for the on account portion on invoices which include both T&M and on account invoicing.
<b>On Account Subtotal</b>	If this check box is selected, a subtotal line is inserted for the on account portion on invoices which include both T&M and on account invoicing.

### Blanket Invoicing Island

Field	Description
<b>Job Heading</b>	Select this check box to include a heading that shows the time unit for each job on blanket invoices. This is especially relevant if the "Allow Blanket Invoicing Hours and Days" system parameter is selected because then blanket invoices can include a mixture of jobs invoiced in days and jobs invoiced in hours.
<b>Job Invoice Name, Heading</b>	If you select this field, a line for each job is inserted on blanket invoices with the line showing the invoice name of that job. The text on the invoice line placed in front of the invoice name is set up in Language Texts on the record with key1 @JobInvoiceNameLine.
<b>Job Subtotal</b>	If you select this field and perform blanket invoicing or crediting, a subtotal is printed below each group of invoice/credit memo lines that belong to the same job.
<b>Main Job Invoicing</b>	If you select this field on an invoice layout rule and apply the rule to a main job, the main job and its subjobs are approved and invoiced (or credited) together. This has an impact in the following workspaces:

Field	Description
	<ul style="list-style-type: none"> <li>Invoice Selection — When you approve a main job for which an invoice layout rule with a mark in this field has been selected, the whole main job/subjob structure is approved (if any other requirements for approval have also been fulfilled).</li> <li>Approve Invoice Selection — If a main job (that uses an invoice layout rule on which this field is marked) is included in the job selection criteria, the invoice selection for that job and the associated subjobs are approved when you use the “Approve” action. A subjob is only approved if the associated main job is also included in the job selection criteria.</li> <li>Invoice Editing — The full invoice (main job and subjobs) is displayed in this workspace, and a draft invoice that includes both main and subjobs can be printed.</li> </ul> <p>For more information, see the description of the respective windows.</p> <p>You can approve a mix of jobs where some subjobs are in credit and some are in debit. The result of the combined Main Job Invoice Selection Combine Invoice Lines job invoicing determines whether Maconomy prints an invoice or a credit memo to the customer.</p> <p>Note that you cannot change this field if you have already invoiced a job to which the current invoice layout rule applies.</p> <p>Also note that if this field is selected, you cannot invoice any subjobs if you do not have access to the main job. Conversely, if you have access to the main job, you can invoice all associated subjobs regardless of special access restrictions.</p> <p>This field cannot be selected for jobs specified as fixed-price jobs, that is, where “Fixed Price” has been selected in the “Invoicing Method” job parameter attribute in the “Pricing Method” job parameter type for the job in question.</p>
<b>Main Job invoice Selection</b>	<p>This field can only be selected if the “Main Job Invoicing” field is also selected. If this field is selected, invoice selection is performed from the main job only. This means that in the Invoice Selection workspace you cannot select a subjob that is subordinate to a main job that uses an invoice layout rule on which this field is selected, but only the main job. When you create an invoice selection for the main job, all entries on the main job and the associated subjobs are summarized and displayed in the sub-tab. The layout of the invoice selection lines is based on the invoice layout rule assigned to the main job.</p>
<b>Combine Invoice Printout Lines</b>	<p>This field can only be selected if the “Main Job Invoicing” field is also selected. If this field is selected, all lines from a main job and the associated subjobs are summarized and combined on the printed invoice, and the invoice layout rule of the main job is applied.</p> <p>If this field is not selected, the invoice lines from the main job and the subjobs are printed separately, using the invoice layout rule selected for each job.</p>

**Invoice Island**

Field	Description
<b>Create Invoice from Quote</b>	In this field, you can specify whether the layout of an invoice is to include lines from the quote. If you select this field, the invoice contains the same lines as the quote, in the same order, and therefore the only other relevant field in this island is "Total Price Only."
<b>Period Indication</b>	In this field, you can specify for jobs invoiced on the basis of time and material whether the invoice layout is to include a header that indicates the period covered by the invoice/credit memo. For invoices, the period is determined by the first and last entry dates of the entries included in the invoice. For credit memos with restored job entries, the period covers the first and last entry dates of the entries included in the invoice being credited, whereas the period is today's date on credit memos without restored job entries. You can choose to have the period specified by dates, week numbers, or months. Maconomy automatically inserts the period text as a header in the invoice, and it can be edited as a normal text line in the Invoice Editing workspace. In the Language Texts workspace in the Set-Up module a language-dependent text can be configured to precede the period indication.
<b>Show Items Separately</b>	If you select this field, Maconomy collects job entries that have identical item numbers and descriptions into one invoice line when invoicing cost of sales on a job. In this way, the cost of sales is shown more clearly and independent of the posting of deliveries on the job. The field can only be selected if you have selected a level of detail in the field "Level 1."
<b>Show Time Quantity in Subtotals</b>	If you select this field, the number of hours can appear on subtotal invoice lines.
<b>Split Invoice Lines on Unit Billing Price</b>	<p>If this field is selected, Maconomy splits job entries with different unit billing price onto different lines on the invoice. Thus, instead of showing an average unit price, multiple lines are created for each of the unit prices.</p> <p>If the system is set up to keep quantity upon write-up/down, then Maconomy updates the unit billing price on the job entries when you change the billing price for invoicing in the sub-tab of the Invoice Selection workspace, provided that the Close Balance field is selected. In this case, Maconomy adjusts the job entries to have the same unit billing price.</p>

**General Island**

Field	Description
<b>Show Line Amounts</b>	In this field, you can specify whether external printouts that contain lines should show the extended price on each line. If you select this field, an extended price is shown on quote and order confirmation lines created from budget lines by using the "Transfer to Quote" action in the Job Budgets workspace. In addition, an extended price is shown on invoice lines created using the "Approve Invoice Selection" action in the Invoice Selection workspace.

Field	Description
	<p>If the values in the fields “Level 1” are blank, this field is not relevant.</p> <p>Note that quotes, order confirmations, and invoices that do not have line amounts are taxed with the tax rate for the full amount. It is therefore recommended that you select this field and select values in the “Level 1” fields if you are working with differentiated tax or with tax-exempt activities.</p>
<b>Show Base Salary Cost</b>	Select this check box to show base salary costs on the detailed invoice specification. This field works similarly to the related field in the Invoice Layout Rules workspace; see that description for details.
<b>Show Markup Separately</b>	<p>Select this check box to show a possible markup separately, on its own line in the draft. You can specify whether you want Maconomy to show the markup on amount activities on a separate line in quotes and order confirmations. If you select this field, the layout of quote lines and order confirmation lines created by using the “Transfer to Quote” action in the Job Budgets workspace shows the cost price instead of the billing price. Similarly, only the cost price is shown on invoice selections created by using the “Approve for Invoicing” action. The difference between the billing price and the cost price (that is, the markup) of each line is summed and shown separately on the bottom line.</p> <p>If the job is set up to make a detailed invoice specification, this field also affects the detailed invoice specification.</p> <p>Surcharge entries created by the action Calculate Surcharge are excluded from the markup that is shown separately.</p>
<b>Show Write Down Separately</b>	<p>Select this check box to show a possible write-down separately, on its own line in the draft.</p> <p>If the job is set up to make a detailed invoice specification, this also affects the detailed invoice specification.</p> <p>If the invoice layout rule is set up to show amounts on lines, the draft invoice that is created when you approve an invoice selection on a job shows the amount that is being invoiced, including any write-up/down that you may have selected. You can show write-down on a single, separate line and then instead show the billing price excluding write down on the specification. This is enabled by selecting this field.</p> <p>The text on this line (such as Courtesy discount) can be set up in the Language Texts workspace on the entry with key1 @JobWriteDownLine.</p> <p>Surcharge entries created by the action Calculate Surcharge are excluded from the write down that is shown separately.</p>
<b>Time Unit</b>	Use this field to specify the time unit for quotes and invoices. If you leave this field blank, the time unit on the job determines the time unit on printed quotes and invoices.

### Invoice Selection Island

Field	Description
<b>Time and Amount Act. on Separate Lines</b>	If you select this field, Maconomy groups time and amount activities on separate invoice selection lines. If, for example, you group invoice lines by Task and Employee, you will get two lines per employee if the employee has entered on both time and amount activities. This allows you to handle time and amount entries differently in the Invoice Selection workspace.
<b>Time</b>	The selections made in the fields “Level 1” and “Level 2” in this column concern time activities.
<b>Amount</b>	The selections made in the fields “Level 1” and “Level 2” in this column concern amount activities.
<b>Level 1</b>	<p>In this field, you can specify the level of detail on the first level on invoice selections that use the current layout rule. You cannot select a level of detail for one type of activity and blank for the other; either complete both fields or leave them both blank. The following options are available:</p> <ul style="list-style-type: none"> <li>Activity — The layout shows information about a job, summed by activity. This means that one line is created for each activity on which entries have been made on the job.</li> <li>Employee — The layout shows information about a job, summed by employee. This means that one line is created for each employee specified in job entries on the job.</li> <li>Task — The layout shows information about a job, summed by task. This means that one line is created for each task that has been performed in connection with the job.</li> <li>&lt;other dimensions&gt; — The layout shows information about a job, summed by dimension value. This means that one line is created for each dimension value on which entries have been made on the job.</li> <li>Task Group 1-6 — The layout shows information about a job, summed by its work breakdown structure. This means that one line is created for each line that is associated with the selected task group level. For more information about work breakdown structure and task groups, see the descriptions under “Job Tasks” and under “Job Budgets.”</li> </ul>
<b>Level 2-4</b>	In these fields, you can specify the level of detail on subsequent levels on invoice selections using the current layout rule. The functionality of these fields is similar to the functionality of the “Level 1” field.

### Invoice Level Details Island

Field	Description
<b>Time</b>	The selections made in the fields “Level 1” and “Level 2” in this column concern time activities.

Field	Description
<b>Amount</b>	The selections made in the fields “Level 1” and “Level 2” in this column concern amount activities.
<b>Subtotal</b>	If you select one or more of these fields, and you have selected a specification on all relevant levels in the following fields, the invoice layout shows subtotals for the selected levels.
<b>Level 1</b>	<p>In this field, you can specify the level of detail on the first level on invoice selections that use the current layout rule. You cannot select a level of detail for one type of activity and blank for the other; either complete both fields or leave them both blank. The following options are available:</p> <ul style="list-style-type: none"> <li>■ Activity — The layout shows information about a job, summed by activity. This means that one line is created for each activity on which entries have been made on the job.</li> <li>■ Employee — The layout shows information about a job, summed by employee. This means that one line is created for each employee specified in job entries on the job.</li> <li>■ Task — The layout shows information about a job, summed by task. This means that one line is created for each task that has been performed in connection with the job.</li> <li>■ &lt;other dimensions&gt; — The layout shows information about a job, summed by dimension value. This means that one line is created for each dimension value on which entries have been made on the job.</li> <li>■ Task Group 1-6 — The layout shows information about a job, summed by its work breakdown structure. This means that one line is created for each line that is associated with the selected task group level. For more information about work breakdown structure and task groups, see the descriptions under “Job Tasks” and under “Job Budgets.”</li> <li>■ Job — The layout shows information about a job, summed by job. This means that one line is created for each job included on a blanket invoice.</li> <li>■ Overtime Specification — The layout shows information about a job, summed by overtime specification as indicated on the time sheet.</li> <li>■ Employee Category — The layout shows information about a job, summed by the primary employee category.</li> <li>■ Entry Date — The layout shows information about a job, summed by entry date. Job entries created for direct invoicing get the preferred invoice date as entry date (current date if no preferred invoice date is specified).</li> </ul>
<b>Level 2-4</b>	In these fields, you can specify the level of detail on subsequent levels on invoices that use the current layout rule. The functionality of these fields is similar to the “Level 1” field.

Field	Description
<b>Total Price Only</b>	If you select this field, the corresponding fields in the sub-tab of the Invoice Editing workspace is marked. This means that the “Quantity” and “Billing Price” fields are not included in the invoice journal and the invoice because only the total price is shown.
<b>Use for On Account Invoicing</b>	When this check box is selected, the setup in the group of fields is used when generating the lines for invoicing on account. Lines are grouped up to four levels with sub-totals for each level, as specified. When the check box is not selected, the lines are generated directly from the lines in the sub-tab part of the workspace for on account invoice selection.

### User Island

See the chapter “Getting Started” for a description of the fields in the User island.

## Invoice Detail Layout Rules Workspace

In the Jobs workspace, you can assign a rule regarding detailed invoice layout.

The selected rule applies to invoices that you print for the job.

### Detailed Invoice Layout Rule Tab

This section includes the fields and descriptions for the Detailed Invoice Layout Rule tab.

### Invoice Details Layout Rule Island

Field	Description
<b>Name</b>	This field shows the name of the rule.
<b>Description</b>	Enter a description of the rule.

### Invoice Island

Field	Description
<b>Period Indication</b>	<p>Select a value in this field to control whether to show a period indication on the detailed invoice specification. Valid values are Date, Week, and Month.</p> <p>The field works similar to the related field in the Invoice Layout Rules window. Please see that description for details.</p>
<b>Show Items Separately</b>	<p>Use this field to control whether to show items separately on the detailed invoice specification. Select this field to show items separately.</p> <p>The field works similar to the related field in the Invoice Layout Rules window. Please see that description for details.</p>

Field	Description
<b>Split on Unit Billing Price</b>	Select this check box to split invoice lines on the unit billing price on the detailed invoice specification. The field works similar to the related field in the Invoice Layout Rules window. Please see that description for details.
<b>Show No. of Hours in Subtotals</b>	Select this check box to show the number of hours in subtotals on the detailed invoice specification.
<b>Check same Hours as in Summary</b>	If you select this field, Maconomy verifies that the total number of hours is equal on the detail level and on the summary level.

### Registration Specification Island

Field	Description
<b>Time</b>	The selections made in this row concern time activities.
<b>Amount</b>	The selections made in this row concern amount activities.
<b>Fields 1 – 3</b>	The field works similar to the related field in the Invoice Layout Rules window. Please see that description for details.
<b>Separator</b>	Select separator values from the drop-down in both fields: Space, Comma, Period, Dash, Semicolon, Colon, Slash, Backslash.

### Blanket Invoicing Island

Field	Description
<b>Job Heading</b>	Select this check box to show the job heading on the detailed invoice specification.
<b>Job Invoice Name</b>	Select this check box to insert a line for each job on blanket invoices, with that line showing the invoice name of that job. You can do this if you use the Invoice Name field for a client PO number or other reference. The text on the invoice line placed in front of the invoice name is set up in Language Texts on the record with key1 @JobInvoiceNameLine.
<b>Job Subtotal</b>	Select this check box to show the job subtotal on the detailed invoice specification.

### General Island

Field	Description
<b>Show Line Amounts</b>	Select this check box to show line amounts on the detailed invoice specification.

Field	Description
	The field works similar to the related field in the Invoice Layout Rules window. Please see that description for details.
<b>Show Base Salary Cost</b>	Select this check box to show base salary costs on the detailed invoice specification. The field works similar to the related field in the Invoice Layout Rules window. Please see that description for details.
<b>Apply to On Account Invoices</b>	Detailed layout rules are applied to T&M invoices and invoices that combine T&M and On Account. On the latter, the detailed layout rule is applied to both the T&M lines and the On Account lines on the invoice. If this check box is selected, the detailed layout rule is also applied to on account invoices (without T&M).

### Invoice Level Details Island

Field	Description
<b>Time</b>	The selections made in the “Level” fields in this column concern time activities.
<b>Amount</b>	The selections made in the “Level” fields in this column concern amount activities.
<b>Subtotal</b>	Select this check box to show the job subtotal on the detailed invoice specification.
<b>Level 1 - 3</b>	In this field, you can specify the level of detail on the first level on invoice selections using the current layout rule. You cannot select a level of detail for one type of activity and blank for the other; either complete both fields or leave them both blank. The field works similar to the related field in the Invoice Layout Rules window. Please see that description for details.
<b>Level 4</b>	This field has the same definition as Levels 1-3, however, there is no subtotal field for Level 4.
<b>Total Price Only</b>	If you select this field, Maconomy will leave out unit price and quantity by default from time and/or amount activities on the quote lines. This choice can, however, be changed for the individual lines in the window Quote Editing.
<b>Use for On Account Invoicing</b>	Same as the check box with the same name in the Invoice Layout Rules tab of the Invoice Layout Rules single dialog workspace, but for the detailed specification.

**Combined T&M and On Account Island**

Field	Description
<b>T&amp;M Text</b>	Same as the field with the same name in the Invoice Layout Rules tab of the Invoice Layout Rules single dialog workspace, but for the detailed specification.
<b>T&amp;M Header</b>	Same as the check box with the same name in the Invoice Layout Rules tab of the Invoice Layout Rules single dialog workspace, but for the detailed specification.
<b>T&amp;M Subtotal</b>	Same as the check box with the same name in the Invoice Layout Rules tab of the Invoice Layout Rules single dialog workspace, but for the detailed specification.
<b>On Account Text</b>	Same as the field with the same name in the Invoice Layout Rules tab of the Invoice Layout Rules single dialog workspace, but for the detailed specification.
<b>On Account Header</b>	Same as the check box with the same name in the Invoice Layout Rules tab of the Invoice Layout Rules single dialog workspace, but for the detailed specification.
<b>On Account Subtotal</b>	Same as the check box with the same name in the Invoice Layout Rules tab of the Invoice Layout Rules single dialog workspace, but for the detailed specification.

**User Island**

See the chapter “Getting Started” for a description of the fields in the island User.

## Job Invoice Customer Aggregation Workspace

Use this workspace to restore missing lines in the Blanket Invoice Selection workspace.

Under certain circumstances, a line for a bill-to customer may be missing from the List of Blanket Invoice Collections tab in the Blanket Invoice Selection workspace. This happens when you have not invoiced the customer during the last 12 months, you use blanket invoicing, and you include the following fields in the panel that displays the list of bill-to customers:

- Total amount invoiced for time-and-material invoices
- Total amount invoiced on account
- Total on account reconciliation

Use the fields in this workspace to restore missing lines.

## Job Invoice Customer Aggregation Tab

This section includes the fields and descriptions for the Job Invoice Customer Aggregation tab.

### Maintain for Passive Jobs Island

Field	Description
<b>Include Closed and Blocked Jobs</b>	Select this check box to include both closed and blocked jobs.
<b>Job Created Date</b>	Enter a range of to and from dates to capture a range of dates. Jobs that were created within this range are included within the calculation.
<b>Aggregation for Year</b>	Enter the year for which to run the aggregation.

## Actions

This section shows the Actions available in the Job Invoice Customer Aggregation workspace.

### Top Tab

Field	Description
<b>Maintain for Passive Jobs</b>	The job and customer will again be included in the Job Blanket Invoice Selection and Blanket Invoice Selection views.

## Job Allocation Combinations Workspace

Use this workspace to enter and maintain rules that govern the allocation combinations that are allowed for job entries.

An allocation combination is the combination of dimension values that you use when you create a job entry. You can set up rules governing allocation combinations and apply the rules to jobs.

A rule serves three purposes:

- It controls which combinations of dimension values are allowed when you create a job entry. For example, it can determine that only activities in a certain range can be used when you enter time on a time sheet or post a job journal.
- It controls whether a job entry with certain dimensions will be included in the fixed price of a job.
- It determines which dimensions can be used in a job entry and which are mandatory to include in a job entry.

**Note:** The rules do not apply to budget journal entries in the Budget Journal workspace in the Budget module.

**Note:** The **Fixed Price Contract Budget** job parameter must have the **Include Outlays in Fixed Price** attribute set to **Yes** or the job allocation combinations are ignored.

Use the Job Allocation Combinations tab to specify the dimensions that you can and must specify manually when you create entries for the jobs that are assigned this rule. In the Lines sub-tab, enter the combinations of activities, dimension values, and tasks that are allowed.

If you want to create general allocation combination rules to apply to all of the jobs in Maconomy, or to jobs that belong to certain companies, you can create these rules in the G/L Allocation Combinations and Company Allocation Combinations workspaces in the G/L module. Maconomy then applies all of the rules—from the Job Allocation Combinations workspace, the G/L Allocation Combinations workspace, and the Company Allocation Combinations workspace—to the relevant jobs.

You can also specify rules that control whether entries are included in the fixed price of both fixed-price jobs and time and-materials jobs. Entries that are not included in the fixed price are invoiced separately.

For this to work, the job must be set up with a Pricing Principle job parameter with the Fixed-Price Inclusion attribute set to **By Job Allocation Combination**. This functionality applies to all fixed-price jobs that you assign to the job allocation combination in question, and to those time and materials jobs that you assign to the job allocation combination and that you set up to use revenue recognition by completion percentage and/or to handle overruns.

If you create a completely blank line, Maconomy displays a warning, because that type of line would allow all allocation combinations on job entries.

## Job Allocation Combinations Tab

This section includes the fields and descriptions for the Job Allocation Combinations tab.

### Job Allocation Island

Field	Description
<b>Name</b>	In this field, you can enter the name of the current compilation of allocation rules. Maconomy checks that the specified allocation rule already exists. The name will thus act as a unique identification of the individual allocation combination, and it is therefore advisable to use the search function in the Find menu when an already existing combination is required.
<b>Verify Combinations</b>	In this field, you can define whether or not it should only be possible to enter information on the combinations of activities, specifications, and tasks specified in the table part of the window. If you mark this field, you can only enter information in, for example, a job journal in accordance with the information specified on the lines of the job allocation combination rule assigned to the job in question. Note that this field is closely linked to the field "Verify Combinations" in the table part of the window. If you have marked this field, you can mark the field "Verify Combinations" on one or more lines in the table part of the window. In this way, you can define that only some of the lines in the table part should be verified by Maconomy when registering

Field	Description
	<p>entries on a job assigned to the job allocation combination rule in question, whereas other lines with other combinations should not be verified.</p> <p>Marking this field thus activates the selections made in the table part of this window. If you do not mark this field, all combinations will be allowed.</p> <p>Define fixed price combinations By marking this field, you define whether certain job allocation combinations specified in the table part of the window should be excluded from the fixed price of a job. If you mark this field, you can mark the field "Not Included in Fixed Price" on one or more lines in the table part of the window thus excluding entries related to combinations on the marked lines from the fixed price of a given job assigned to the job allocation combination rule in question. This functionality applies to both fixed price jobs and to those time and material jobs which have been set up to handle overruns or to recognize revenue by completion percentage. See the description of the window Job Parameters for information about setting up jobs with the desired parameters.</p> <p>Note that if you remove the mark in this field, all marks, if any, in the field "Not Included in Fixed Price" on the lines in the table part are automatically removed by Maconomy.</p>

### Registration Control Island

Field	Description
<b>Location</b>	<p>In these fields, you can specify whether it is allowed or required to manually enter a value for the dimension Location.</p> <p>In the column "Allowed," you can specify that it is possible to enter a value for the dimension Location in manually entered entries to jobs assigned to the current allocation combination rule. If you do not mark the field, the dimension must be derived, and Maconomy will reject the manual specification of a value for the dimension Location.</p> <p>In the column "Required," you can specify that it is mandatory to manually enter a value for the dimension Location in entries to jobs assigned to the current allocation combination rule. If you mark the field, you must manually enter a value in the field "Location" on registration lines, as dimension derivation is not allowed. When you mark this field, the field "Allowed" is automatically marked too.</p> <p>See the chapter "Introduction to the G/L Module" and the window Dimension Derivations for a further description of dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.

Field	Description
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

### Lines Sub-Tab

This section includes the fields and descriptions for the Lines sub-tab.

Field	Description
<b>Verify Combinations</b>	In this field, you can define whether the line in question should be used for specifying allowed allocation combinations. Having marked this field on a line, Maconomy thus verifies whether the combinations entered on, for example, a job journal are allowed in accordance with the information specified on the line in the relevant job allocation combination rule. Note that this field can only be marked, if the field "Verify Combinations" in the card part of the window has been marked.
<b>Excluded from Fixed Price</b>	In this field, you define whether the dimension combinations on the line in question should be excluded from the fixed price of a job assigned to the job allocation combination rule in question. If you mark this field, entries composed by the combination on the line are not included in the fixed price of a job using this rule. Note that this field can only be marked, if the field "Define Fixed Price Combinations" in the card part of the window has been marked.
<b>Act. No. From</b>	This field and the field "Act. No. To" represent a range of activities. If the field "Allow Combination" is marked, and you post to jobs assigned to the current allocation rule, you are allowed to post to the job if the activity of the job is within the specified range. The interval of activities can be further limited by the ranges specified for tasks and G/L dimensions in the rest of the table.  It is only possible to enter a range in this field, if the field "Allow Dimension Intervals" in the window System Information in the Set-Up module is marked.
<b>Act. No. To</b>	The functionality of this field is similar to that of the field "Act. No. from" described above.
<b>Task From</b>	The functionality of this field is similar to that of the field "Act. No. from" described above.
<b>Task To</b>	The functionality of this field is similar to that of the field "Act. No. from" described above.

Field	Description
<b>Location From</b>	The functionality of this field is similar to that of the field “Act. No. From” above.
<b>Location To</b>	The functionality of this field is similar to that of the field “Act. No. To” above.
<b>Entity From</b>	The functionality of this field is similar to that of the field “Act. No. From” above.
<b>Entity To</b>	The functionality of this field is similar to that of the field “Act. No. To” above.
<b>Project From</b>	The functionality of this field is similar to that of the field “Act. No. From” above.
<b>Project To</b>	The functionality of this field is similar to that of the field “Act. No. To” above.
<b>Purpose From</b>	The functionality of this field is similar to that of the field “Act. No. From” above.
<b>Purpose To</b>	The functionality of this field is similar to that of the field “Act. No. To” above.
<b>Spec. 1-3 From</b>	The functionality of these fields is similar to that of the field “Act. No. From” above.
<b>Spec. 1-3 To</b>	The functionality of these fields is similar to that of the field “Act. No. To” above.
<b>Local Spec. 1-3 From</b>	The functionality of these fields is similar to that of the field “Act. No. From” above.
<b>Local Spec. 1-3 To</b>	The functionality of these fields is similar to that of the field “Act. No. To” above.

## Job Posting References Workspace

Use this workspace to specify job posting references.

You can then refer to these job posting references from the Activities workspace.

A job posting reference specifies the general ledger accounts to which certain types of entries should be posted under certain conditions (depending on the department, employee type, job group, item group, and so on).

In the Activities workspace, you can set up the accounts and conditions for each activity separately. However, if many activities share the same rules, it is easier to set up a job posting reference in this workspace. Instead of copying many lines in the sub-tab of the Activities workspace, you can refer to the references that you set up in this workspace.

## Job Posting References Tab

This section includes the fields and descriptions for the Job Posting References tab.

### Job Posting Reference Island

Field	Description
<b>Reference Name</b>	In this field, you specify the name of the job posting reference.
<b>Description</b>	In this field, you can specify a description of the job posting activity.

### Access Level Island

Field	Description
<b>Access Level</b>	In this field, you can specify an access level. If you specify an access level, the description will also be visible in this field.

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

## Job Posting Reference Lines Sub-Tab

This section includes the fields and descriptions for the Job Posting Reference Lines sub-tab.

The fields in the table part are the same as the fields in the table part of the Activities windows.

Field	Description
<b>Line No.</b>	This field shows which specific journal line generated the job revenue journal line.
<b>Department</b>	<p>This field shows the name of a department created in the Posting References window in the G/L module.</p> <p>The table part of this window is used for designating various posting references by department for the relevant activity. These posting references are only used if sales and cost of sales are posted by activity. You select this in the field “Post by Activity” in the System Information window in the Set-Up module.</p> <p>When creating a time or amount activity, Maconomy automatically creates a line in the table part for each department. For summary activities, the table part is empty. If you later create more departments, you must manually create lines in the table part corresponding to these. The departments are shown as pop-up values when you create lines.</p> <p>It is the selection of a department on a job that determines the set of posting references to be used in connection with the relevant activities.</p>

Field	Description
	If the "Department from Employee" field in the System Information window is marked, Maconomy will use the posting reference "Offset" of the employee's department (instead of the job's department) when making entries to time activities.
<b>Job Group</b>	You can select a job group that will be a target group for the line.
<b>Employee Type</b>	You can select an employee type that will be a target group for the line.
<b>Item Group</b>	You can select an item group that will be a target group for the line.
<b>Transaction Type Group No.</b>	You can specify a transaction type group number that will be a target group for the line.
<b>Accrual</b>	You can select whether this line is used for accrued registrations, non-accrued registrations, or all registrations.
<b>Job Invoice Allocation</b>	You can specify whether the line is to be used for "normal" invoices, job invoice allocations, or both.
<b>Offset Account</b>	<p>In this field, enter the number of a dimension combination that contains the G/L account to be used as an offset in posting job journals where the given activity is used together with the relevant department. The dimension combination can also contain references to other dimension values to be used in this connection.</p> <p>For the sake of clarity, the following description of the posting of the activity's prices uses the term "account." Rather than accounts, posting references are actually used, where an account number and any other dimension values are found by means of a dimension combination.</p> <p>When posting job entries for capitalized jobs, the activity's cost is credited to the account referred to in the dimension combination specified here. If you have chosen to capitalize "At Cost" (in the Job Parameters window), the cost is debited to the WIP account assigned to the job's job group. If you have chosen to capitalize "At Billing Price," the cost is debited to the account specified in the "Open Cost" field in this window.</p> <p>If "Post Hours in Job Journal" or "Post Amount in Job Journal" is chosen (for time or amount activities, respectively), the activity's cost will be posted to the account referred to in the dimension combination in this field, for non-capitalized job. The P&amp;LL account will be debited by the equivalent amount.</p> <p>IF "Department from Employee" is chosen in the System Information window, the account entered here will be used for the department given for the employee, when entering to time activities.</p>

Field	Description
<b>Offset Account, Overhead Cost</b>	This posting reference is used for posting time on a job (time sheets and job journal) if an overhead rate has been specified, and if the job is set up with a job parameter type of "Overhead Cost" where the "Post Offset for Overhead Cost Separately" line is selected.
<b>P&amp;L</b>	<p>In this field, enter the number of a dimension combination that contains the G/L account to be used for entries in the General Journal window, for invoice allocations in the Invoice Allocation window, for item deliveries (for orders marked as "Invoice in Job Cost"), and for jobs being posted to Profit &amp; Loss (instead of being capitalized). The dimension combination can also contain references to other dimension values to be used in this connection. Job expenses (at cost) for the activity are then posted to the account and any other dimension values referred to in the dimension combination specified in this field.</p> <p>The account information card of the account referenced here contains a reference to a tax code. This tax code will be applied for registration of ingoing tax when you make registrations for the current activity. However, if you use tax tables, the tax code is found by means of the relevant tax table. For further information on this, see the description of the "Reporting Code" field in the card part.</p> <p>When you select "Post Hours in Job Journal" or "Post Amount in Job Journal" in the System Information window, Maconomy posts job journal entries to the account and any other dimension values in the dimension combination, if the entries are not being capitalized.</p>
<b>Cost Price</b>	In this field, enter the number of a dimension combination that contains the G/L account to which you want to post cost of sales relating to the given activity and given department. This only applies if the field "Post by Activity" in the System Information window has been marked. The dimension combination can also contain references to other dimension values to be used in this connection. Note that cost of sales only occurs for jobs that are capitalized.
<b>Open Cost Price</b>	This field shows the open cost price.
<b>Billing Price, Taxable</b>	In this field you may enter the number of a dimension combination for the posting of billing price to an account.
<b>Billing Price, Tax Exempt</b>	In this field you may enter the number of a dimension combination for the posting of billing price to an account.
<b>Billing Price, Export</b>	In this field you may enter the number of a dimension combination for the posting of billing price to an account.
<b>Open Billing Price</b>	In this field, enter the number of dimension combination that contains the G/L account to be used if the job is being capitalized and if you have selected the capitalization method "At Billing Price" in the job parameter

Field	Description
	<p>type "Revenue Recognition" for the job in question. The dimension combination can also contain references to other dimension values to be used in this connection.</p> <p>When a job entry is posted, the billing price is credited to this account and any other dimension values specified in the dimension combination, and debited to the WIP account.</p> <p>When the job is invoiced, the billing price is debited to this account and any other dimension values specified in the dimension combination, and credited to the WIP account.</p>
<b>Open Billing Price, Adjustment</b>	<p>In this field, enter the number of a dimension combination containing the G/L account to be used if the job is being capitalized and if you have selected the capitalization method "At Billing Price" in the job parameter type "Revenue Recognition" for the job in question. The dimension combination can also contain references to other dimension values to be used in this connection.</p> <p>If the job parameters assigned to a job specify that overruns should be handled, this account and any other dimension values in the dimension combination will be used for adjusting the open billing price when overruns are registered on the job. An overrun occurs when the costs registered on the job exceed the fixed quote price of the job. The adjustment itself is carried out automatically when the job entries are posted. For further information, please see the description of the system parameter attribute "Handling of Overruns" in the Job Parameters window.</p> <p>The activity used in connection with overruns on jobs is specified in the job parameter attribute "Activity for Job Revenue Adjustment" in the Job Parameters window. The activity must be an invoiceable amount activity.</p>
<b>Cost Price Transferred Internally</b>	<p>In this field, enter the number of a dimension combination that contains the number of the G/L account to be used if costs on job entries are transferred between dimensions as a result of a job transfer carried out in the Job Transfer window. The posting reference is used when posting a job transfer journal created for a job using capitalization at billing price and for which the field "Post By Activity" has been marked in the System Information window. When posting such a journal, postings are made to the accounts for open cost and open billing price as well as to this account and the account for sales transferred internally.</p>
<b>Billing Price Transferred Internally</b>	<p>In this field you may enter the number of a dimension combination for the posting of billing price to an account.</p>
<b>Standard Billing Price</b>	<p>This posting reference is used upon posting of invoices if the job attribute is turned on.</p>

Field	Description
<b>Standard Billing Price, Offset</b>	This posting reference is used upon posting of invoices if the job attribute is turned on.
<b>Invoice Deviation</b>	In this field, enter the number of a dimension combination that contains the number of the G/L account to be used for posting the difference between the contracted billing price and the billing price actually invoiced. This dimension combination is used for jobs for which the job parameter attributes "Posting of Contract Deviation" is set to "No" and "Posting of Invoice Deviation" is set to "Yes." For more information, please see the description of the job parameter type "Revenue Recognition."
<b>Contract Deviation</b>	In this field, enter the number of a dimension combination that contains the number of the G/L account to be used for posting the difference between the standard billing price and the contracted billing price. This dimension combination is used for jobs for which the job parameter attributes "Posting of Contract Deviation" is set to "Yes" and "Posting of Invoice Deviation" is set to "No." For more information, please see the description of the job parameter type "Revenue Recognition."
<b>Contract Deviation, Offset</b>	In this field, enter the number of a dimension combination that contains the number of the G/L account to be used for posting the offset of the difference between the contracted billing price and the actual billing price. This dimension combination is used for jobs for which the job parameter attributes "Posting of Contract Deviation" is set to "Yes" and "Posting of Invoice Deviation" is set to "No." For more information, please see the description of the job parameter type "Revenue Recognition."
<b>P&amp;L Intercompany</b>	<p>In this field, enter the number of a dimension combination that contains the G/L account to be used for intercompany entries in the General Journal window, for invoice allocations in the Invoice Allocation window, for item deliveries (for orders marked as "Invoice in Job Cost") a, and for jobs being posted to Profit &amp; Loss (instead of being capitalized). The dimension combination can also contain references to other dimension values to be used in this connection. Job expenses (at cost) for the activity are then posted to the account and any other dimension values referred to in the dimension combination specified in this field.</p> <p>When you select "Post Hours in Job Journal" or "Post Amount in Job Journal" in the System Information window, Maconomy posts job journal entries to the account and any other dimension values in the dimension combination, if the entries are not being capitalized.</p>
<b>Cost Price, Intercompany</b>	In this field you may enter the number of a dimension combination for the posting of cost price to an account.
<b>Open Cost Price, Intercompany</b>	In this field, enter the number of a dimension combination that contains the number of the G/L account to be used if open costs on job entries involve two companies. The posting reference is used for registering the cost of the responsible company (that is, the intercompany price) on non-

Field	Description
	invoiced job entries. When the entries are invoiced, the amounts are moved from this account to the account "Cost of Sales, Intercompany." This means that the posting reference "Item Sales, Intercomp." Can be balanced with the sum of the two posting references "Open Cost, Intercomp." And "Cost of Sales, Intercom."
<b>Billing Price, Intercompany</b>	In this field you may enter the number of a dimension combination for the posting of billing price to an account.
<b>Job Accrual</b>	You can select whether this line is used for accrued registrations, non-accrued registrations, or all registrations.
<b>Invoice Discount</b>	This field shows the invoice discount deducted from the invoice.
<b>Invoiced On Account</b>	This field shows the total amount invoiced on account.
<b>Work in Progress, Unrealized Exchange Rate Variance</b>	Enter a dimension combination to allow the selection of a dimension combination for posting of unrealized exchange rate variance on WIP.
<b>Invoiced on Account, Unrealized Exchange Rate Variance</b>	Enter a dimension combination to allow the selection of a dimension combination for posting of unrealized exchange rate variance IOA.
<b>Work in Progress, Variance, Time</b>	Enter a dimension combination to allow the selection dimension combination for posting of the offset unrealized exchange rate variance on WIP (time related).
<b>Work in Progress, Variance, Amount</b>	Enter a dimension combination to allow the selection dimension combination for posting of the offset unrealized exchange rate variance on WIP (amount related).
<b>Invoiced on Account, Variance</b>	Enter a dimension combination to allow the selection dimension combination for posting of the offset unrealized exchange rate variance on IOA.s
<b>Popup 1-5</b>	You can use these fields to enter further target groups for the line.
<b>Customer Popup 1-5</b>	You can use these fields to enter further target groups for the line.

Field	Description
<b>Employee Popup 1-5</b>	You can use these fields to enter further target groups for the line.

## Time Sheet References Workspace

Use this workspace to specify the activity references that employees can use in the Time Sheets workspace.

When you enter time in the Time Sheets workspace, you can enter values in the **Time Activity 1-3** fields and the **Amount Activity 1 - 4** fields, in addition to the Monday - Sunday fields. These fields let you record time and expense amounts that are independent of the activity entered on the current time sheet line. Instead, the time and expense amounts are associated with activities specified in the Time Sheet References workspace.

These references are to activities that you have already set up in the Activities workspace.

### Examples

Assume that you entered the following information in the Time Sheet References workspace:

- In the **Time Activity 1** field, you specified the **Transport** activity. In the **Time Activity 2** field, you entered the activity **Working after hours**.
- In the **Amount Activity 1** field, you entered the activity **Subsistence Allowance**.

**Example 1**—In the sub-tab of the Time Sheets workspace, you specify a job number, an activity number (used for meetings with customer), and a quantity (6 hours) in the Monday column. In the **Time Activity 1** field on the same line, you enter the quantity 2. The result is that 6 hours of customer meeting time is entered, along with 2 units of the activity **Transport**.

**Example 2**—A consultant works for 10 hours for a customer. Two of those hours are after normal working hours. The employee is also entitled to subsistence allowance. In the Time Sheets workspace, she registers 10 hours of the activity **External Meetings**. In the **Time Activity 2** field on the same line, she enters the amount 2, for two hours of working after hours. Finally, in the **Amount Activity 1** field, she enters the quantity 1, for one unit of subsistence allowance. This way, the consultant does not need to enter working after hours and subsistence allowance on separate lines in the time sheet.

### Time Sheet References Tab

This section includes the fields and descriptions for the Time Sheet References tab.

#### Time Activities Island

Field	Description
<b>Time Activity 1-3</b>	In these fields, you specify the number of the time activities which you wish to use in the fields "Time Activity 1-3" in the table part of the window Time Sheets. The time activity can be defined in the window Activities in the Job Cost module.

### Amount Activities Island

Field	Description
<b>Amount Activity 1-4</b>	In these fields, you can specify the number of the amount activities which you wish to use in the fields "Amount Activities 1-4" in the table part of the window Time Sheets. The amount activities can be defined in the window Activities in the Job Cost module.

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

## Standard Job Budget Texts Workspace

Use this workspace to create and maintain the standard job budget texts used in the Job Budget Texts workspace.

If you assign a standard job budget text to an activity in the Activities workspace, Maconomy automatically enters the text into any line in the job budget where the activity is specified.

### Standard Job Budget Texts Tab

This section includes the fields and descriptions for the Standard Job Budget Texts tab.

### Standard Job Budget Text Island

Field	Description
<b>Name</b>	In this field, you enter a name for the list of text lines below.
<b>Description</b>	In this field, you can describe the standard budget text.

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

### Lines Sub-Tab

This section includes the fields and descriptions for the Lines sub-tab.

Field	Description
<b>Description</b>	In this field, you enter the desired text lines.

## Standard Invoice Text Lists Workspace

Use this workspace to create standard texts that are used in Invoice Editing and On Account Invoice Selection.

Each text has a code. When you enter the code on a line in Invoice Editing, Maconomy automatically enters the text into the line.

When you create a text list, you can select it on a job in the **Standard Invoice Text List** field in the Jobs workspace. You can also set this up on template jobs and pass it on to the jobs that you create from the template. In addition, you can change to another list in the Invoice Editing workspace.

### Standard Invoice Text List Tab

This section includes the fields and descriptions for the Standard Invoice Text List tab.

#### Text List Island

Field	Description
<b>Name</b>	Enter the name of the list of standard texts.
<b>Description</b>	Enter a description of the list.
<b>Access Level</b>	Enter the access level of the list. This controls which lists you can view and edit, and which lists you have access to when selecting a list on a job. Once a job has a reference to a list, it can be used from Invoice Editing without any further access control.

#### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

### Standard Text Sub-Tab

This section includes the fields and descriptions for the Standard Text sub-tab.

Field	Description
<b>Code</b>	This field shows a brief code or mnemonic for the standard text.
<b>Text</b>	This field shows the standard text, which is inserted in Invoice Editing when you enter the corresponding code.
<b>Created by</b>	This field shows the name of user who created the line.
<b>Created on</b>	This field shows the date the line was created.

Field	Description
<b>Changed by</b>	This field shows the name of user who changed the line.
<b>Changed on</b>	This field shows the date the line was changed.
<b>Version</b>	This field shows the number of times this information has been changed.

## Mileage Rules Workspace

Use this workspace to define the rules used in the Mileage Sheets workspace.

Each mileage rule is linked to a specific activity that you set up in the Activities workspace.

The benefit of setting up mileage rules is to avoid having to enter the same information several times in the Mileage Sheets workspace. After you set up the mileage rules:

- The unit price and activity number are used to fill in these fields in the Mileage Sheet that you create.
- The task is always the default task for mileage entry for the specific job.

### Mileage Rules Tab

This section includes the fields and descriptions for the Mileage Rules tab.

#### Country Island

Field	Description
<b>Country No.</b>	In this field, you specify the country number. The number is derived from the setup window Countries.
<b>Name</b>	This field shows the country name.

### Mileage Rules Sub-Tab

This section includes the fields and descriptions for the Mileage Rules sub-tab.

Field	Description
<b>Rule No.</b>	In this field you can enter a mileage rule number. You can set up as many rules as you want for each country.
<b>Name</b>	In this field you can enter a name for the mileage rule.
<b>Description</b>	In this field, you can enter a description of the mileage rule to supplement the Name field.

Field	Description
<b>Act. No.</b>	In this field you can specify the activity number associated with this mileage rule.
<b>Company No.</b>	In this field you can specify the number of the company that uses this specific mileage rule number.
<b>Start Date</b>	In this field you can enter the first day when the mileage rule should apply.
<b>End Date</b>	In this field you can enter the last day when the mileage rule should apply.
<b>Minimum</b>	In this field you can specify the lower limit (km/miles) for which this specific mileage rule applies.
<b>Maximum</b>	In this field you can specify the upper limit (km/miles) for which this specific mileage rule applies.
<b>Vehicle</b>	In this field you can specify whether the vehicle used is a company car or a private car.
<b>Mileage Rate</b>	In this field you can enter the specific rate that applies to this mileage rule. This rate will be suggested as the "Unit Price, Currency" on the mileage sheet line if the line satisfies the mileage rule.
<b>Currency</b>	In this field you can specify the currency of the Mileage Rate.
<b>Remarks</b>	In this field you can enter additional remarks about the mileage rule.

## Customer Tax Return Types Workspace

Use this workspace to set up the tax return types to be used for entering customer tax returns for a specific year.

### Tax Return Year Tab

This section includes the fields and descriptions for the Tax Return Year tab.

#### Year Island

Field	Description
<b>Year</b>	This field displays the year for which the customer tax return types are valid.

#### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

## Tax Return Type Sub-Tab

This section includes the fields and descriptions for the Tax Return Type sub-tab.

Field	Description
<b>Name</b>	Use this field to enter the tax return type name. This is a mandatory field which opens in new state.
<b>Description</b>	Use this field to enter a tax return type description.
<b>Original Due Date</b>	Use this field to enter a due date for the tax return type. This is a mandatory field.
<b>Extension Due Date</b>	Use this field to enter a tax return type extension date.

## Resource Planning Overview

In this module, you can perform detailed planning based on job budgets, including planning the internal and external use of resources, time frames, and so on.

In addition, you can generate reports to give you an overview of each job's use of time, employee plans, available time, and so forth.

The workspaces in this module are only available if you have acquired Maconomy's Resource Planning add-on. However, if you have acquired the Human Resource add-on, you have access to the skill-related workspaces in the Set-Up submenu.

### Allocation Section

This section includes the fields and descriptions for the Allocation workspaces.

### Employee Absence Calendars Workspace

Use this workspace to maintain information about each employee's absences.

The Employee Absence Calendars tab contains information about the employee. In the Absence Calendar Lines sub-tab you can enter information about the dates on which the employee in question is absent, as well as the reason for the absence, for example, illness, leave of absence, vacation, and so on.

When you have entered the relevant absence, you can submit the absence calendar lines as an indication that they now contain the correct information and are ready for approval. You do this using the **Submit** field on the lines in question and then using the **Submit Absence** action. The person who is responsible for approving the lines can then approve them using a similar method, making the absence lines effective. For more information about the approval procedure and effective absence calendar lines, see "Calendar Lines Entering into Effect."

You create absence type definitions in the Popup Fields workspace in the Set-Up module.

If you want to delimit the Absence Calendar Lines sub-tab to display only specific periods of absence or types, you can enter a range for this in the Selection Criteria island. If you enter a specific range of time, all new lines that you enter must overlap the date that you specified as the first day of absence.

### Employee Absence Calendars Tab

This section includes the fields and descriptions for the Employee Absence Calendars tab.

#### Employee Information Island

Field	Description
<b>Employee No.</b>	This field displays the number of the employee to whom the lines in the table part are assigned.
<b>Name</b>	This field displays the name of the current employee.

**Secretary Island**

Field	Description
<b>Employee No.</b>	This field displays the number of the secretary assigned to the employee in question.
<b>Name</b>	This field displays the name of the secretary assigned to the employee in question.

**Absence Approver Island**

Field	Description
<b>Absence Approver</b>	These fields display the number and name of the absence approver of the employee in question.

**Supervisor Island**

Field	Description
<b>Employee No.</b>	This field displays the number of the employee's supervisor.
<b>Name</b>	This field displays the name of the employee's supervisor.

**Mentor Island**

Field	Description
<b>Employee No.</b>	This field displays the number of the tutor assigned to the employee in question.
<b>Name</b>	This field displays the name of the tutor assigned to the employee in question.

**Selection Criteria Island**

Field	Description
<b>Show Absence After</b>	In this field, you can enter a date for which table lines should be displayed in the table part of the window. Only lines specifying absence which overlaps the specified date will be displayed. Maconomy suggests today's date.
<b>Absence Type</b>	In this field, you can enter an absence type if you wish to delimit the lines displayed in the table part of the window. Only lines of the specified absence type will be displayed.

**Vacation Period island**

Field	Description
<b>Name</b>	Copy to come.
<b>Period</b>	Copy to come.

Field	Description
<b>Time Unit</b>	This field shows the time unit of the vacation period of the date selected.

**Available Time island**

Field	Description
<b>Available Time</b>	This field shows the quantity per absence type based on the value in the <b>Time Unit</b> field.

## Absence Calendar Lines Sub-Tab

This section includes the fields and descriptions for the Absence Calendar Lines sub-tab.

Field	Description
<b>First Day of Absence</b>	In this field, you can enter the first day of the current absence period. If you enter an absence date which overlaps dates for which planning lines have been created in the window Detailed Planning, Maconomy will issue a warning, and the planned number of hours on the days in question will be deleted when the line becomes effective.
<b>Duration</b>	<p>Enter the duration of the current absence period. If you enter an absence period which overlaps dates for which planning lines have been created in the Detailed Planning workspace, Maconomy issues a warning, and the planned number of hours on the specified days are deleted when the line becomes effective.</p> <p>This field accepts a decimal number. The number is interpreted as hours or days according to the value in the <b>Time Unit</b> field.</p> <p>If the time unit is days:</p> <ul style="list-style-type: none"> <li>▪ The value is limited to be a positive increment of 0.5.</li> <li>▪ The value counts days, including non-working days.</li> </ul> <p>Thus, registering a duration of two and a half days starting Friday covers Saturday and Sunday, with no actual absence.</p> <p>If the time unit is hours:</p> <ul style="list-style-type: none"> <li>▪ Any positive decimal number is accepted.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>The value counts working hours thus skips non-working days. Thus, registering a duration of 20 hours starting Friday extends into Monday and Tuesday (counting absences on those working days).</li> </ul>
<b>Last Day of Absence</b>	<p>Enter the last day of the current absence period. If you entered a value in the <b>Duration</b> field, Maconomy automatically calculates the last day of absence on the basis of the first day of absence and the duration.</p> <p>If you enter an absence period which overlaps dates for which planning lines have been created in the Detailed Planning workspace, Maconomy issues a warning, and the planned number of hours on the days in question are deleted when the line becomes effective.</p> <div> <p><b>Note:</b> Regardless of time unit, this field and the <b>Duration</b> field is kept in sync according to hours or days.</p> </div> <p>You can register absences for a period that covers more than one Vacation Period. The first day of absence decides the required time unit. Thus, this alone may lead to a vacation period with registrations on both hours and days.</p>
<b>Absence Type</b>	In this field, you can select the reason for the absence, for example, vacation or illness. Absence types are created in the window Popup Fields in the Set-Up module.
<b>First Day is Half Day</b>	Select this check box if the first day of absence is only half a day. If you selected <b>Hours</b> as the Time Unit value upon registration, selecting this check box calculates the appropriate number of hours in the <b>Hours, First Day</b> field.
<b>Last Day is Half Day</b>	<p>Select this check box if the last day of absence is only half a day.</p> <div> <p><b>Attention:</b> Always use the <b>Last Day is Half Day</b> field to record a single half day. This allows an additional registration with the same starting date and <b>First Day is Half Day</b> field selected.</p> </div> <p>If you selected <b>Hours</b> as the Time Unit value upon registration, selecting this check box calculates the appropriate number of hours in the <b>Hours, Last Day</b> field.</p>
<b>Temporary</b>	If you mark this field, the specified absence will be considered as tentatively planned and will therefore not affect the planning, even if absence approval is used, and the line is approved. If a planning line is created in the window Detailed Planning for the employee in question for a date covered by an absence line which is marked as temporary, Maconomy will issue a warning. However, if absence approval is used, a warning is only issued if the absence line in question is approved.
<b>Remarks</b>	In this field, you can enter a remark to the absence.

Field	Description
<b>Substitute 1 – 5</b>	These fields can be used to support the handling of substitute approvals. If you want a specific employee—in addition to the holder of approval to be able to approve absence calendar lines created on the basis of the current approval setup, you can enter the number of the employee in these fields. This employee is then granted the possibility of approving the absence calendar line.
<b>Time Unit</b>	<p>This field shows the time unit of the absence calendar line.</p> <p>When a new absence calendar line is created, the value is initialized according to the vacation calendar appropriate for the context employee and context selected date, or current date if no context date is available.</p> <p>You can change the value in the creation step in order to comply with another intended vacation period when selecting the actual starting date.</p> <p>The correct value according to the appropriate vacation period setup is calculated when the user saves the new line. If the initial or user selected value differs from the appropriate value AND a time value field (such as <b>Duration</b>, <b>Hours</b>, <b>First Day</b>, and <b>Hours</b>, <b>Last Day</b>) is not zero, then an error message displays stating that you must change the time unit value and reconsider the quantities selected according to the changed time unit. This ensures that the time unit is selected according to the vacation period upon creation. Later updates to the registration does not change the time unit.</p>
<b>Hours, First Day</b>	Enter the number of hours of absence on the first day of absence. If you enter a value of zero, the first day is a full day of absence. An error message appears to prevent the use of this field if the selected time unit is days. An error message also appears if you simultaneously edit this field and select the <b>First Day is Half Day</b> field. If you edit this field, the <b>First Day is Half Day</b> field is automatically recalculated.
<b>Hours, Last Day</b>	Enter the number of hours of absence on the last day of absence. If you enter a value of zero, the first day is a full day of absence. An error message appears to prevent the use of this field if the selected time unit is days. An error message also appears if you simultaneously edit this field and select the <b>Last Day is Half Day</b> field. If you edit this field, the <b>Last Day is Half Day</b> field is automatically recalculated.
<b>Submit</b>	In this field, you can mark the current line for submission. When the action “Submit Absence” is selected, only lines on which this field is marked are submitted. For further information about the effects of submitting a line, see the description of that action.
<b>Submitted</b>	This field shows whether the current line has been submitted.
<b>Submitted by</b>	If the current line has been submitted, this field shows the name of the user who submitted the line.
<b>Date Submitted</b>	If the current line has been submitted, this field shows the date on which the submission took place.

Field	Description
<b>Approve</b>	In this field, you can mark the current line for approval. When the action “Approve Absence” is selected, only lines on which this field is marked are approved. For further information about the effects of approving a line, see the description of that action, as well as the introduction to this window.
<b>Approved</b>	This field shows whether the current line has been approved.
<b>Approved by</b>	If the current line has been approved, this field shows the name of the user who approved the line.
<b>Approval Date</b>	If the current line has been approved, this field shows the date on which the approval took place.
<b>Reject</b>	In this field, you can mark the current line for rejection. When the action “Reject Absence” is selected, only lines on which this field is marked are rejected. For further information about the effects of rejecting a line, see the description of that action.
<b>Rejected</b>	This field shows whether the current line has been rejected.
<b>RejectedBy</b>	If the current line has been rejected, this field shows the name of the user who rejected the line.
<b>Rejected on</b>	If the current line has been rejected, this field shows the date on which the rejection took place.
<b>Reopen</b>	In this field, you can mark the current line for reopening. When the action “Reopen Absence” is selected, only lines on which this field is marked are reopened. For further information about the effects of reopening a line, see the description of that action.
<b>Reopened</b>	This field shows whether the current line has been reopened.
<b>Synchronized with Time Sheets</b>	This field shows whether time sheet lines have been created automatically upon approval for the entire absence period. You cannot change this value.
<b>Working Time</b>	<p>This field shows a decimal number in hours or days, according to the current value of the <b>Time Unit</b> field. If the time unit is hours, the value in this field is equal to the value in the <b>Duration</b> field.</p> <p>If the time unit is days:</p> <ul style="list-style-type: none"> <li>▪ The value counts working days. Thus, a duration of 2½ days starting Friday shows the working time of one day (Friday).</li> </ul> <p>If the time unit is hours:</p> <ul style="list-style-type: none"> <li>▪ The value counts working hours. Thus, a duration of 20 hours starting Friday shows a working time of 20 hours (always equal to duration).</li> </ul>

## Actions

This section shows the actions available in the Employee Absence Calendars workspace.

### Top Tab

Field	Description
<b>New Absence Entry</b>	<p>Use this action to create an absence entry. Maconomy automatically selects a value in the <b>Time Unit</b> field upon creation. The value is set according to the vacation period for the current user employee and current date.</p> <p>If you enter a value but did not change the initially displayed time unit, and this time unit differs from the final time unit as defined by the vacation period, an error message appears stating you must explicitly select another time unit and reconsider the values.</p> <p>You can register an absence for a period that extends over more than one employee revision that may include changing Absence Hours per Day, week calendar, and working hours.</p>
<b>Submit Absence</b>	<p>This action is only available to the currently selected employee, his or her secretary, the employee who is specified as absence approver for the currently selected employee, and the supervisor of the selected employee. Furthermore, users for whom the field "Submit Absence" in the window Actions has been marked can select this action.</p>
<b>Approve Absence</b>	<p>When you select this action, all lines in the table part that are marked for submission in the <b>Submit</b> field are submitted as an indication that the lines now contain the desired information and are ready to be approved.</p> <p>This action is only available to the employee who is specified as absence approver for the currently selected employee and to the supervisor of the selected employee. Furthermore, users for whom the <b>Approve and Reject Absence</b> field in the Actions window has been marked can select the action.</p> <p>When you select this action, all lines in the table part that are marked for approval in the <b>Approve</b> field are approved, causing the lines to take effect (unless the <b>Temporary</b> field is marked). Please note that if a line being approved covers one or more dates overlapping with the detailed planning of the employee, this causes the planned hours on the days in question to be deleted as described in "Calendar Lines Entering into Effect".</p> <p>If the approval is cancelled at a later point, the cancellation does not cause any planned hours deleted in the process described above to be restored. When approval has been cancelled for a line, the line must be resubmitted and approved again to become effective.</p> <p>When a line has been approved, the only field that can be changed on the line in question is the <b>Temporary</b> field. However, unmarking this field on an approved line will not cause the line to become effective, as the approval will then be cancelled, and the line must be resubmitted and approved before becoming effective.</p> <p>If the <b>Automatically Create Time Sheet Lines from Approved Absence</b> system parameter is selected, then selecting this action updates the time</p>

Field	Description
	sheet(s) with the approved absence. If the time sheet is in days, the absence is registered as 1.0 for each day of absence (0.5 for half days).
<b>Reject Absence</b>	<p>This action is only available to the employee who is specified as absence approver for the currently selected employee and to the supervisor of the selected employee. Furthermore, users for whom the field "Approve and Reject Absence" in the window Actions has been marked can select the action.</p> <p>When you select this action, all lines in the table part that are marked for rejection in the field "Reject" are rejected as an indication that the absence on the lines in question is not accepted. This causes the lines to be closed without affecting the planning.</p> <p>Once a line has been rejected, changing information on the line causes the rejection and submission of the line to be cancelled. This means that the employee can change the information and resubmit it for approval without having to first reopen the line or create one.</p>
<b>Reopen Absence</b>	<p>This action is only available to the employee who is specified as absence approver for the currently selected employee and to the supervisor of the selected employee. Furthermore, users for whom the field "Reopen Absence" in the window Actions has been marked can select the action.</p> <p>When you select this action, all lines in the table part that are marked for reopening in the field "Reopen" are reopened, causing them to no longer be rejected, submitted, or approved. If a previously approved line is reopened, it is once again possible to change the information on it. When the relevant changes have been made, the line must be resubmitted and approved to become effective.</p>
<b>Rederive Substitutes</b>	This action is used to re-derive substitutes on open approval tasks based on the current Absence Calendar Lines. Any substitutes referenced on the approval task will be transferred and overwrite the substitutes that are currently specified.

## Absence Calendar Lines Workspace

Use this workspace to view information about one absence calendar line at a time.

This workspace contains the same information as the Employee Absence Calendar Lines workspace, but oriented in a different way.

Choose an absence line from the List of Absence Calendar Lines tab. In the sub-tab below, Maconomy displays information about the employee, the absence, and the status of the line (submitted, approved, and so on).

You can change a limited amount of information, and submit, approve, reject, and reopen absence calendar lines.

## Absence Calendar Lines Tab

This section includes the fields and descriptions for the Absence Calendar Lines tab.

**Employee Information Island**

Field	Description
<b>Employee</b>	These fields show the name and number of the employee to which the current absence calendar line pertains.

**Absence Island**

Field	Description
<b>First Day of Absence</b>	This field shows the first day in the range of dates covered by the current absence calendar line.
<b>Duration</b>	<p>Enter the duration of the current absence period. If you enter an absence period which overlaps dates for which planning lines have been created in the Detailed Planning workspace, Maconomy issues a warning, and the planned number of hours on the specified days are deleted when the line becomes effective.</p> <p>This field accepts a decimal number. The number is interpreted as hours or days according to the value in the <b>Time Unit</b> field.</p> <p>If the time unit is days:</p> <ul style="list-style-type: none"> <li>▪ The value is limited to be a positive increment of 0.5.</li> <li>▪ The value counts days, including non-working days.</li> </ul> <p>Thus, registering a duration of two and a half days starting Friday covers Saturday and Sunday, with no actual absence.</p> <p>If the time unit is hours:</p> <ul style="list-style-type: none"> <li>▪ Any positive decimal number is accepted.</li> <li>▪ The value counts working hours thus skips non-working days.</li> </ul> <p>Thus, registering a duration of 20 hours starting Friday extends into Monday and Tuesday (counting absences on those working days).</p>
<b>Last Day of Absence</b>	<p>Enter the last day of the current absence period. If you entered a value in the <b>Duration</b> field, Maconomy automatically calculates the last day of absence on the basis of the first day of absence and the duration.</p> <p>If you enter an absence period which overlaps dates for which planning lines have been created in the Detailed Planning workspace, Maconomy issues a warning, and the planned number of hours on the days in question are deleted when the line becomes effective.</p>

Field	Description
	<p><b>Note:</b> Regardless of time unit, this field and the <b>Duration</b> field is kept in sync according to hours or days.</p> <p>You can register absences for a period that covers more than one Vacation Period. The first day of absence decides the required time unit. Thus, this alone may lead to a vacation period with registrations on both hours and days.</p>
<b>Absence Type</b>	In this field, you can select the reason for the absence, for example, vacation or illness. Absence types are created in the window Popup Fields in the Set-Up module.
<b>Working Time</b>	<p>This field shows a decimal number in hours or days, according to the current value of the <b>Time Unit</b> field. If the time unit is hours, the value in this field is equal to the value in the <b>Duration</b> field.</p> <p>If the time unit is days:</p> <ul style="list-style-type: none"> <li>The value counts working days. Thus, a duration of 2½ days starting Friday shows the working time of one day (Friday).</li> </ul> <p>If the time unit is hours:</p> <ul style="list-style-type: none"> <li>The value counts working hours. Thus, a duration of 20 hours starting Friday shows a working time of 20 hours (always equal to duration).</li> </ul>
<b>First Day is Half Day</b>	Select this check box if the first day of absence is only half a day. If you selected <b>Hours</b> as the Time Unit value upon registration, selecting this check box calculates the appropriate number of hours in the <b>Hours, First Day</b> field.
<b>Last Day is Half Day</b>	<p>Select this check box if the last day of absence is only half a day.</p> <p><b>Attention:</b> Always use the <b>Last Day is Half Day</b> field to record a single half day. This allows an additional registration with the same starting date and <b>First Day is Half Day</b> field selected.</p> <p>If you selected <b>Hours</b> as the Time Unit value upon registration, selecting this check box calculates the appropriate number of hours in the <b>Hours, Last Day</b> field.</p>
<b>Temporary</b>	If you mark this field, the specified absence will be considered as tentatively planned and will therefore not affect the planning, even if absence approval is used, and the line is approved. If a planning line is created in the window Detailed Planning for the employee in question for a date covered by an absence line which is marked as temporary, Maconomy will issue a warning. However, if absence approval is used, a warning is only issued if the absence line in question is approved.
<b>Remarks</b>	In this field, you can enter a remark to the absence.

Field	Description
<b>Time Unit</b>	<p>This field shows the time unit of the absence calendar line.</p> <p>When a new absence calendar line is created, the value is initialized according to the vacation calendar appropriate for the context employee and context selected date, or current date if no context date is available.</p> <p>You can change the value in the creation step in order to comply with another intended vacation period when selecting the actual starting date.</p> <p>The correct value according to the appropriate vacation period setup is calculated when the user saves the new line. If the initial or user selected value differs from the appropriate value AND a time value field (such as <b>Duration</b>, <b>Hours</b>, <b>First Day</b>, and <b>Hours</b>, <b>Last Day</b>) is not zero, then an error message displays stating that you must change the time unit value and reconsider the quantities selected according to the changed time unit. This ensures that the time unit is selected according to the vacation period upon creation. Later updates to the registration does not change the time unit.</p>
<b>Hours, First Day</b>	<p>Enter the number of hours of absence on the first day of absence. If you enter a value of zero, the first day is a full day of absence. An error message appears to prevent the use of this field if the selected time unit is days. An error message also appears if you simultaneously edit this field and select the <b>First Day is Half Day</b> field. If you edit this field, the <b>First Day is Half Day</b> field is automatically recalculated.</p>
<b>Hours, Last Day</b>	<p>Enter the number of hours of absence on the last day of absence. If you enter a value of zero, the first day is a full day of absence. An error message appears to prevent the use of this field if the selected time unit is days. An error message also appears if you simultaneously edit this field and select the <b>Last Day is Half Day</b> field. If you edit this field, the <b>Last Day is Half Day</b> field is automatically recalculated.</p>
<b>Submitted</b>	<p>This field shows whether the current line has been submitted.</p>
<b>Submitted by</b>	<p>If the current line has been submitted, this field shows the name of the user who submitted the line.</p>
<b>Date Submitted</b>	<p>If the current line has been submitted, this field shows the date on which the submission took place.</p>
<b>Approved</b>	<p>This field shows whether the current line has been approved.</p>
<b>Approved by</b>	<p>If the current line has been approved, this field shows the name of the user who approved the line.</p>
<b>Approval Date</b>	<p>If the current line has been approved, this field shows the date on which the approval took place.</p>
<b>Rejected</b>	<p>This field shows whether the current line has been rejected.</p>

Field	Description
<b>Rejected by</b>	If the current line has been rejected, this field shows the name of the user who rejected the line.
<b>Rejected on</b>	If the current line has been rejected, this field shows the date on which the rejection took place.
<b>Reopened</b>	This field shows whether the current line has been reopened.
<b>Synchronized with Time Sheets</b>	This field shows whether time sheet lines have been created automatically upon approval for the entire absence period. You cannot change this value.

## Actions

This section shows the Actions available in the Absence Calendar Lines workspace.

### Top Tab

Field	Description
<b>New Absence Calendar Line</b>	<p>Use this action to create an absence entry line. Maconomy automatically selects a value in the <b>Time Unit</b> field upon creation. The value is set according to the vacation period for the current user employee and current date.</p> <p>If you enter a value but did not change the initially displayed time unit, and this time unit differs from the final time unit as defined by the vacation period, an error message appears stating you must explicitly select another time unit and reconsider the values.</p> <p>You can register an absence for a period that extends over more than one employee revision that may include changing Absence Hours per Day, week calendar, and working hours.</p>
<b>Submit Absence</b>	<p>This action is only available to the currently selected employee, his or her secretary, the employee who is specified as absence approver for the currently selected employee, and the supervisor of the selected employee. Furthermore, users for whom the field "Submit Absence" in the window Actions has been marked can select the action.</p> <p>When you select this action, the current absence line is submitted as an indication that it now contains the desired information and is ready to be approved.</p>
<b>Approve Absence</b>	<p>This action is only available to the employee who is specified as absence approver for the currently selected employee and to the supervisor of the selected employee. Furthermore, users for whom the field "Approve and Reject Absence" in the window Actions has been marked can select the action.</p> <p>When you select this action, the current absence line is marked for approval, causing it to become effective (unless the field "Temporary" has been marked). Please note that if a line being approved covers one or more dates overlapping with the detailed planning of the employee, this causes the planned hours on the</p>

Field	Description
	<p>days in question to be deleted as described in “Calendar Lines Entering into Effect.”</p> <p>When a line has been approved, the only field that can be changed on the line in question is the field “Temporary.” However, unmarking this field on an approved line will not cause the line to become effective, as the approval will then be cancelled, and the line must be resubmitted and approved before becoming effective.</p> <p>The cancellation of the approval does not cause any planned hours deleted in the process described above to be restored.</p> <p>When approval has been cancelled for a line, the line must be resubmitted and approved again to become effective.</p>
<b>Reject Absence</b>	<p>This action is only available to the employee who is specified as absence approver for the currently selected employee and to the supervisor of the selected employee. Furthermore, users for whom the field “Approve and Reject Absence” in the window Actions has been marked can select the action.</p> <p>When you select this action, the current absence line is rejected as an indication that the absence is not accepted. This causes the line to be closed without affecting the planning.</p> <p>Once a line has been rejected, changing information on the line causes the rejection and submission of the line to be cancelled. This means that the employee can change the information and resubmit it for approval without having to first reopen the line or create one.</p>
<b>Reopen Absence</b>	<p>This action is only available to the employee who is specified as absence approver for the currently selected employee and to the supervisor of the selected employee. Furthermore, users for whom the field “Reopen Absence” in the window Actions has been marked can select the action.</p> <p>When you select this action, the current absence is reopened, causing it to no longer be rejected, submitted, or approved. If a previously approved absence is reopened, it is once again possible to change the information on it. When the relevant changes have been made, the line must be resubmitted and approved to become effective.</p>

## Employee Absence Overview Workspace

Use this workspace to review an employee's absences for the duration of the employee's vacation calendar.

The Absence Details sub-tab shows each day in the vacation calendar. Each day on which the employee is absent is color-coded to reflect the type of absence and whether the absence is submitted and/or approved.

## Employee Absence Overview Tab

This section includes the fields and descriptions for the Employee Absence Overview tab.

Field	Description
<b>Show Vacation Period No.</b>	Enter a vacation period number for which absence will be shown in the sub-tab.
<b>Description</b>	This field shows the description of the selected vacation period.

## Absence Detail Sub-Tab

Field	Description
<b>Month</b>	This field shows the name of the month on the current line.
<b>Year</b>	This field shows the year on the current line.
<b>Monday - Sunday</b>	Each field corresponds to one day of the month and contains the number of that day within the month.

## Team Absence Overview Workspace

Use this workspace to review the absences, during a single month, for all employees on a team.

The Absence Details sub-tab shows each day in the month that you select. Each day on which a team member is absent is color-coded to reflect the type of absence and whether the absence is submitted and/or approved.

## Team Absence Overview Tab

This section includes the fields and descriptions for the Team Absence Overview tab.

Field	Description
<b>Show Month</b>	Enter the number of a month within a year for which absence will be shown in the sub-tab.
<b>Show Year</b>	Enter the year for which absence will be shown in the sub-tab.
<b>Team Number</b>	Enter a team number. Employees who belong to this team will be shown in the sub-tab. You can only enter a team that is marked for use with absence management and of which the selected employee is a member.
<b>Team Name</b>	This field shows the name of the selected team.

### Absence Details Sub-Tab

This section includes the fields and descriptions for the Absence Details Sub-Tab.

Field	Description
<b>Team Member</b>	Enter the number of an employee who is a member of the specified team to be shown in the sub-tab.
<b>Employee Name</b>	This field shows the name of the employee on the current line.
<b>Mon - Sun</b>	Each field shows one day of the month and contains the number of that day within the month.

### Approver Absence Overview Workspace

Use this workspace to review the absences, during a single month, for all employees who have the same absence approver.

The Absence Details sub-tab shows each day in the month that you select. Each day on which an employee is absent is color-coded to reflect the type of absence and whether the absence is submitted and/or approved.

### Approver Absence Overview Tab

This section includes the fields and descriptions for the Approver Absence Overview tab.

Field	Description
<b>Show Month</b>	Select a month for which absence will be shown in the sub-tab.
<b>Show Year</b>	Enter the year for which absence will be shown in the sub-tab.

### Absence Details Sub-Tab

This section shows fields and descriptions for the Absence Details sub-tab.

Field	Description
<b>Employee No.</b>	This field shows the number of the employee on the current line.
<b>Employee Name</b>	This field shows the name of the employee on the current line.
<b>Monday - Sunday</b>	Each field corresponds to one day of the month and contains the number of that day within the month.

## Absence Entry Overview Workspace

Use this workspace to review all absence entries.

Choose an absence line from the List of Absence Entries tab. In the sub-tab below, Maconomy displays information about the employee, the absence, and the status of the line (submitted, approved, and so on).

You can change a limited amount of information, and submit, approve, reject, and reopen absence calendar lines

### Absence Entry Overview Tab

This section includes the fields and descriptions for the Absence Entry Overview tab.

Field	Description
<b>Employee Number</b>	Enter the employee number for this entry.
<b>Entry Type</b>	Enter the entry type.
<b>Absence Type</b>	Enter the absence type for this entry. When you create a Carry Forward registration, the value in this field may be added as allowance to the current period, if allowance in the previous period can cover this.
<b>Entry Date</b>	Enter the date of this entry. The meaning of this field is dependent on the type of entry. For entries of type Allowance or Carry Forward with a positive Number of Days, this field (together with Valid Till) determines the period in which the allowance granted by this entry can be used. For entries of type Allowance and Carry Forward with a negative Number of Days, that number will be deducted from entries valid on this Entry Date. For entries of type Allowance Request, this field specifies the date for the request. For entries of type Absence, this field (together with Valid Till) shows the employee's period of absence.
<b>Valid Till</b>	Enter the date after which this entry expires. This field can only be completed for entries of type Allowance or Carry Forward with a positive number of days.
<b>Time Registered</b>	Enter the duration of the current absence period. If you enter an absence period which overlaps dates for which planning lines have been created in the Detailed Planning workspace, Maconomy issues a warning, and the planned number of hours on the specified days are deleted when the line becomes effective.  This field accepts a decimal number. The number is interpreted as hours or days according to the value in the <b>Time Unit</b> field. If the time unit is days: <ul style="list-style-type: none"> <li>The value is limited to be a positive increment of 0.5.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>The value counts days, including non-working days. Thus, registering a duration of two and a half days starting Friday covers Saturday and Sunday, with no actual absence.</li> </ul> <p>If the time unit is hours:</p> <ul style="list-style-type: none"> <li>Any positive decimal number is accepted.</li> <li>The value counts working hours thus skips non-working days. Thus, registering a duration of 20 hours starting Friday extends into Monday and Tuesday (counting absences on those working days).</li> </ul>
<b>Time Used</b>	The field shows the used allowance on an allowance entry. The value displayed is in hours or days, according to the value of the <b>Time Unit</b> field.
<b>Time Unit</b>	This field shows the time unit of the absence entry.
<b>Reason</b>	Enter the reason for this entry.
<b>Submitted</b>	This field shows whether the current line has been submitted.
<b>Submitted by</b>	If the current line has been submitted, this field shows the name of the user who submitted the line.
<b>Date Submitted</b>	If the current line has been submitted, this field shows the date when it was submitted.
<b>Approved</b>	This field shows whether the current line has been approved.
<b>Approved by</b>	If the current line has been approved, this field shows the name of the user who approved the line.
<b>Approval Date</b>	If the current line has been approved, this field shows the date when it was approved.
<b>Rejected</b>	This field shows whether the current line has been rejected.
<b>Rejected by</b>	If the current line has been rejected, this field shows the name of the user who rejected the line.
<b>Rejected on</b>	If the current line has been rejected, this field shows the date when it was rejected.
<b>Reason for Rejection</b>	If the current line has been rejected, this field shows the reason for its rejection.
<b>Entry Date</b>	Enter the entry date for the new Allowance entry.

Field	Description
<b>Valid Till</b>	Enter the date after which the new Allowance entry will expire.
<b>Number of Days</b>	Enter the number of days granted on the new Allowance entry.
<b>Reason</b>	Enter the reason for approval of this entry.

### Employee Allowance Sub-Tab

This section includes the fields and descriptions for the Absence Calendar Lines sub-tab.

Field	Description
<b>Employee No.</b>	This field shows the number of the employee on the current line.
<b>Employee Name</b>	This field shows the name of the employee on the current line.
<b>Allowance, Prev. Period</b>	This field shows the number of days of absence allowance for the employee in the previous period.
<b>Carried Forward, Prev. Period</b>	This field shows the number of days that have been carried forward to the previous period (from an earlier period).
<b>Available, Prev. Period</b>	This field shows the number of days of allowance remaining at the end of the previous period. These days could potentially be transferred to the current period as carry-forward days.
<b>Approved Allowance, Cur. Period</b>	This field shows the number of days of allowance that have been approved for this employee in the current period.
<b>Unapproved Allowance Adjustments , Cur. Period</b>	This field shows the number of days of allowance that have been submitted but not approved for this employee in the current period.
<b>Unsubmitted Allowance Adjustments , Cur. Period</b>	This field shows the number of days of allowance that have been created but not submitted for this employee in the current period.
<b>Total Allowance , Cur. Period</b>	Enter the number of days of allowance that the employee should be granted for the current period. This field shows the difference between approved and unsubmitted allowance. You can change it to a value greater or less than the approved allowance, resulting in creation of a positive or negative allowance entry for this employee.

Field	Description
<b>Approved Carry Forward, Cur. Period</b>	This field shows the number of days that have been carried forward from the previous period to the current one for this employee.
<b>Unapproved Carry Forward Adjustments , Cur. Period</b>	This field shows the number of days that will be carried forward from the previous period to the current one for this employee when the Approve Adjustment action is run.
<b>Unsubmitted Carry Forward Adjustments , Cur. Period</b>	This field shows the number of days that will be carried forward from the previous period to the current one for this employee when the actions Submit Adjustment and Approve Adjustment are run.
<b>Total Carry Forward, Cur. Period</b>	Enter the number of days to be carried forward from the previous period to the current one. This field shows the difference between approved and open carry forward days. It can be changed to a value greater or less than the approved carry forward days, which will result in a positive or negative carry forward entry being created for this employee.

## Actions

Field	Description
<b>New Absence Entry</b>	<p>Use this action to create an absence entry. Maconomy automatically selects a value in the <b>Time Unit</b> field upon creation. The value is set according to the vacation period for the current user employee and current date.</p> <p>If you enter a value but did not change the initially displayed time unit, and this time unit differs from the final time unit as defined by the vacation period, an error message appears stating you must explicitly select another time unit and reconsider the values.</p> <p>You can register an absence for a period that extends over more than one employee revision that may include changing Absence Hours per Day, week calendar, and working hours.</p>
Field	Description
<b>Submit Absence Entry</b>	<p>When you select this action, the selected absence entry is submitted as an indication that it now contains the desired information and is ready to be approved. The availability of this action is dependent on Entry Type.</p> <p>Additionally, this action is only available to the currently selected employee, that employee's secretary, the employee who is specified as absence approver for the currently selected employee, and the supervisor of the selected employee. Furthermore, users for whom the field "Submit Absence" in the Actions window has been marked can select this action.</p>

Field	Description
<b>Approve Absence Entry</b>	When you select this action, the selected absence entry is approved, causing it to take effect. The availability of this action is dependent on Entry Type. Additionally, this action is only available to the employee who is specified as absence approver for the currently selected employee and to the supervisor of the selected employee. Furthermore, users for whom the field "Approve and Reject Absence" in the Actions window has been marked can select this action.
<b>Reject Allowance Request</b>	This action rejects an entry of type Allowance Request. A reason for rejection can be specified in the field Reason. This action is only enabled for entries of type Allowance Request. This action is only available to the employee who is specified as absence approver for the currently selected employee and to the supervisor of the selected employee. Furthermore, users for whom the field "Approve and Reject Absence" in the Actions window has been marked can select this action.
<b>Reopen Absence Entry</b>	When you select this action, the current entry is reopened, and as a result it is no longer rejected, submitted, or approved. If a previously approved entry is reopened, it is once again possible to change the information on it. When the relevant changes are made, the entry must be resubmitted and approved to become effective. Some entries cannot be reopened. Entries of type Absence or Allowance Request cannot be reopened. Allowance and Carry Forward entries cannot be reopened if the allowance days they grant have already been used by an employee. The availability of this action is dependent on Entry Type. This action is only available to the employee who is specified as absence approver for the currently selected employee and to the supervisor of the selected employee. Furthermore, users for whom the field "Reopen Absence" in the Actions window has been marked can select this action.

## Absence Transfer Workspace

Use this workspace to adjust allowance for a period and carry forward days from a previous period for employees in batch.

### Absence Transfer Tab

This section includes the fields and descriptions for the Absence Transfer Tab.

Field	Description
<b>Vacation Calendar</b>	This field shows the number of the vacation calendar that includes the vacation period to be edited.
<b>Period Number, Current Period</b>	Enter the number of the vacation period to be edited.
<b>Description, Current Period</b>	This field shows the description of the selected vacation period.

Field	Description
<b>Period Start, Current Period</b>	This field shows the starting date of the current period.
<b>Period End, Current Period</b>	This field shows the ending date of the current period.
<b>Time Unit, Current Period</b>	This field shows the time unit of the vacation period shown as Current Period. The value cannot be changed here.
<b>Period Number, Previous Period</b>	This field shows the number of the previous period.
<b>Description, Previous Period</b>	This field shows the description of the previous vacation period.
<b>Period Start, Previous Period</b>	This field shows the starting date of the previous period.
<b>Period End, Previous Period</b>	This field shows the ending date of the previous period.
<b>Time Unit, Previous Period</b>	This field shows the time unit of the vacation period shown as Previous Period. The value cannot be changed here.
<b>Absence Type</b>	Enter an absence type to show absence allowance for.
<b>Show Lines</b>	When selected, the lines in the table part are shown.
<b>From/To Employee No.</b>	Enter a range of employee numbers for filtering in the table part.
<b>From/To Company No.</b>	Enter a range of company numbers for filtering in the table part.

#### Batch Allowance Adjustment Wizard

Field	Description
<b>Default Allowance, Current Period</b>	This field shows the default number of days of allowance to be set for employees in this vacation period. The value of this field is taken from the 'Default Allowance' field on the vacation period.
<b>New Allowance</b>	Enter the number of days of absence allowance. This number will be transferred to all employees in the table part when the action Batch Allowance Adjustment is run. This field will, by default, contain the number from the 'Default Allowance' field on the vacation period.

## Employee Yearly Allowance Sub-Tab

This section shows the fields and descriptions for the Employee Yearly Allowance sub-tab.

Field	Description
<b>Employee No.</b>	This field shows the number of the employee on the current line.
<b>Employee Name</b>	This field shows the name of the employee on the current line.
<b>Time Unit, Prev. Period</b>	This field shows the time unit of the previous period.
<b>Absence Hours per Day, Prev. Period</b>	<p>This field shows the value of the <b>Absence Hours per Day</b> field as described in the Employee Revisions sub-tab in the Employees workspace. The exact value shown is from the employee revision valid on the first day of the previous vacation period, but several employee revisions each with differing Absence Hours per Day may exist in the previous vacation period.</p> <p>The appropriate employee revision's Absence Hours per Day is invoked upon batch allowance adjustments.</p>
<b>Allowance, Prev. Period</b>	This field shows in the time unit of the previous vacation period.
<b>Carried Forward, Prev. Period</b>	<p>This field shows the number of days or hours that have been carried forward to the previous period (from an earlier period).</p> <p>The displayed value depends on the selected time unit for the previous period</p>
<b>Available, Prev. Period</b>	<p>This field shows the number of days or hours of allowance remaining at the end of the previous period. These days could potentially be transferred to the current period as carry-forward days.</p> <p>The displayed value depends on the selected time unit for the previous period.</p>
<b>Time Unit, Cur. Period</b>	This field shows the time unit of the current period.
<b>Absence Hours per Day, Cur. Period</b>	<p>This field shows the value of the <b>Absence Hours per Day</b> field as described in the Employee Revisions sub-tab in the Employees workspace.</p> <p>The exact value shown is from the employee revision valid on the first day of the current vacation period.</p>
<b>Approved Allowance, Cur. Period</b>	This field shows the allowance that has been approved for this employee in the time unit selected for the current period.

Field	Description
<b>Unapproved Allowance Adjustments , Cur. Period</b>	This field shows the allowance that has been submitted but not approved for this employee in the time unit selected for the current period.
<b>Unsubmitted Allowance Adjustments , Cur. Period</b>	This field shows the allowance that has been created but not submitted for this employee in the time unit selected for the current period.
<b>Total Allowance, Cur. Period</b>	<p>Enter the allowance to be granted to the employee for the current period. This field shows the difference between approved and unsubmitted allowance. You can change it to a value greater or less than the approved allowance, resulting in creation of a positive or negative allowance entry for this employee.</p> <p><b>Note:</b> Ensure that you are entering the correct value according to the time unit selected for the current period.</p>
<b>Approved Carry Forward, Cur. Period</b>	This field shows the allowance that has been carried forward from the previous period to the current one for this employee. The displayed value is shown in the time unit of the current period.
<b>Unapproved Carry Forward Adjustments, Cur. Period</b>	This field shows the allowance that will be carried forward from the previous period to the current one for this employee when the <b>Approve Adjustment</b> action is run. The displayed value is shown in the time unit of the current period.
<b>Unsubmitted Carry Forward Adjustments, Cur. Period</b>	This field shows the allowance that will be carried forward from the previous period to the current one for this employee when the <b>Submit Adjustment</b> and <b>Approve Adjustment</b> actions are run. The displayed value is shown in the time unit of the current period.
<b>Total Carry Forward, Cur. Period</b>	<p>Enter the allowance to be carried forward from the previous period to the current one. This field shows the difference between approved and open carry forward days. It can be changed to a value greater or less than the approved carry forward days, which will result in a positive or negative carry forward entry being created for this employee.</p> <p><b>Note:</b> Ensure that you are entering the correct value according to the time unit selected for the current period.</p>

## Actions

Field	Description
<b>Batch Allowance Adjustment</b>	<p>Use this action to create allowance entries with values according to the time unit of the current vacation period.</p> <div> <b>Note:</b> The <b>Available Prev. Period</b> value in the time unit of the previous vacation period may differ from the time unit of the current vacation period. </div>
<b>Submit Adjustment</b>	This action submits all unsubmitted allowance and carry forward entries for employees shown in the table part.
<b>Approve Adjustment</b>	This action approves all unapproved allowance and carry forward entries for employees shown in the table part.

## Employee Calendars Workspace

Use this workspace to maintain a detailed plan for one employee, one day at a time.

In the Detailed Planning workspace, you can make plans for an employee per planning slot—for example, specifying that the employee is to work on a given task for three hours on a given day. In the Employee Calendars workspace, you can further refine that planning slot by specifying the exact times on which the employee should work on the task. For instance, if the task involves a meeting from 1:00 PM to 4:00 PM, you can specify that in this workspace and add a remark.

In the Employee Calendars tab, enter a date for which you want to see the plan. If the employee is absent on that day, the employee's first day of absence is shown in the Absence island.

In the Planning Slots sub-tab, enter specific times for the hours planned on the given day. You can adjust the plan by specifying a time range that does not match the planned number of hours.

## Employee Calendars Tab

This section includes the fields and descriptions for the Employee Calendars tab.

## Employee Information Island

Field	Description
<b>Employee No.</b>	This field shows the number of the employee to whom the current absence calendar line pertains.
<b>Name</b>	This field shows the name of the employee shown in the field "Employee No." above.

**Absence Island**

Field	Description
<b>First Day of Absence</b>	This field shows the first day in the range of dates covered by the current absence calendar line.
<b>Time Unit</b>	This field shows the time unit of the absence.
<b>Duration</b>	In this field, you can enter the duration of the current absence period. If you enter an absence period which overlaps dates for which planning lines have been created in the window Detailed Planning, Maconomy will issue a warning, and the planned number of hours on the days in question will be deleted when the line becomes effective.
<b>Last Day of Absence</b>	In this field, you can enter the last day of the current absence period. If you enter a value in the field "Duration," Maconomy will automatically calculate the last day of absence on the basis of the first day of absence and the duration.  If you enter an absence period which overlaps dates for which planning lines have been created in the window Detailed Planning, Maconomy will issue a warning, and the planned number of hours on the days in question will be deleted when the line becomes effective.
<b>Absence Type</b>	In this field, you can select the reason for the absence, for example, vacation or illness. Absence types are created in the window Popup Fields in the Set-Up module.
<b>First Day is Half Day</b>	Select this field if the first day of an absence is a half day.
<b>Last Day is Half Day</b>	Select this field if the last day of an absence is a half day, or to indicate any single half day.
<b>Hours, First Day</b>	Enter the number of hours of absence on the first day of absence. If you enter a value of zero, the first day is a full day of absence. An error message appears to prevent the use of this field if the selected Time Unit is "Days". An error message also appears if you simultaneously edit this field and select the <b>First Day is Half Day</b> field. If you edit this field, the <b>First Day is Half Day</b> field is automatically recalculated.
<b>Hours, Last Day</b>	Enter the number of hours of absence on the last day of absence. This field behaves similarly to the <b>Hours, First Day</b> field.
<b>Temporary</b>	If you mark this field, the specified absence will be considered as tentatively planned and will therefore not affect the planning, even if absence approval is used, and the line is approved. If a planning line is created in the window Detailed Planning for the employee in question for a date covered by an absence line which is marked as temporary, Maconomy will issue a warning. However, if absence approval is used, a warning is only issued if the absence line in question is approved.
<b>Remarks</b>	In this field, you can enter a remark to the absence.

Field	Description
<b>Submitted</b>	This field shows whether the absence has been submitted.
<b>Submitted by</b>	If the absence has been submitted, this field shows the name of the user who submitted the absence.
<b>Date Submitted</b>	If the absence has been submitted, this field shows the date on which the submission took place.
<b>Approved</b>	This field shows whether the absence has been approved.
<b>Approved by</b>	If the absence has been approved, this field shows the name of the user who approved the absence.
<b>Approval Date</b>	If the absence has been approved, this field shows the date on which the approval took place.
<b>Rejected</b>	This field shows whether the absence has been rejected.
<b>Rejected by</b>	If the absence has been rejected, this field shows the name of the user who rejected the absence.
<b>Rejected on</b>	If the absence has been rejected, this field shows the date on which the rejection took place.
<b>Reopened</b>	This field shows whether the absence has been reopened.
<b>Synchronized with Time Sheets</b>	This field shows whether time sheet lines have been created automatically upon approval for the entire absence period. You cannot change this value.

### Day Island

Field	Description
<b>Date</b>	In this field, you can enter a date to see the planning information for the current employee on the date in question.
<b>Day of the Week</b>	This pop-up field displays the weekday of the current date. You can change the currently displayed date by changing the value in this field. Note that if you change the weekday to a previous day, the date is adjusted to that weekday in the following week.
<b>Week</b>	This field displays the week number of the current date. You can change the currently displayed date by changing the value in this field. The date changes to the Monday in the specified week.
<b>Year</b>	This field displays the year of the current date. You can change the currently displayed date by changing the value in this field. The date changes to the Monday in the specified week of the specified year.

## Planning Slots Sub-Tab

This section includes the fields and descriptions for Planning Slots sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number specified in the current planning slot.
<b>Job Name</b>	This field shows the name of the current job.
<b>Task</b>	This field shows the task specified in the current planning slot.
<b>Task Description</b>	This field shows the description of the current task.
<b>Act. No.</b>	This field shows the activity specified in the current planning slot.
<b>Activity Name</b>	This field shows the name of the current activity.
<b>Quantity</b>	This field shows the number of hours planned for the current employee on the current date. If you change this field, and a starting time has been specified, the ending time will be recalculated to reflect the new number of hours.
<b>Booking Type</b>	<p>In this field, you can specify the type of the allocation on the planning line. The types are "Preliminary," "Requested," and "Confirmed." By specifying a booking type, you can indicate whether the planned hours should be considered tentative or permanent. Allocations of the type "Confirmed" are considered permanent, whereas the less restricted preliminary allocations are preliminary. Requested bookings are allocations that either could not be converted from "Preliminary" to "Confirmed," or allocations that are to be reviewed by some other person before they are converted to "Confirmed." See the introduction to the window for further details.</p> <p>The default value of the field is "Confirmed," and this type will be suggested for planning lines with no relation to planning budget lines. If the current planning line was created on the basis of a planning budget line, the planning line automatically inherits the allocation type of the related planning budget line. Any subsequent changes made to the allocation type of the related budget line are automatically transferred to the planning line. This means that the value of this field is automatically overwritten with the new type selected for the planning budget line upon approval of the budget line.</p> <p>The value of the field can be changed to "Preliminary" or "Requested" as required, but it can only be changed to "Confirmed" if the current allocation does not conflict with other confirmed allocations. If a conflict occurs so that the current allocation and one or more other confirmed allocations would cause the planning time of the employee on the current line to be exceeded,</p>

Field	Description
	<p>the allocation type of the current line will automatically be set to "Requested." Note that if you change the allocation type, allocations on dates before the date specified in the field "Never Before" will not be converted.</p> <p>If you change the booking type on a planning line from "Confirmed" to "Preliminary," the hours on the line will be reallocated within the time span of the confirmed allocations. However, if the field "Keep Distribution" in the card part is marked, the hours are reallocated as described in this field.</p> <p>Note that you cannot create more than three versions, one of each booking type, of planning lines which are similar, that is, have the same combination of job, activity, task, and employee and/or employee category.</p>
<b>Started</b>	In this field, you can enter a starting time for the activity in the current planning slot. If you change this field, the ending time will be recalculated to reflect the length of the planning slot as specified in the field "Quantity."
<b>Finished</b>	In this field, you can enter an ending time for the activity in the current planning slot. If you change this field, the number of hours in the field "Quantity" will be recalculated to reflect the number of hours between the starting and ending times.
<b>Remarks</b>	In this field, you can enter any remarks concerning the current planning slot.
<b>Description</b>	This field shows the description from the corresponding line in the detailed plan.

## Actions

This section shows the Actions available in the Employee Calendars workspace.

### Top Tab

Field	Description
<b>Delete Absence</b>	When you select this action, any absence entry as shown in the island Absence is deleted.
<b>Submit Absence</b>	<p>This action is only available to the currently selected employee, his or her secretary, the employee who is specified as absence approver for the currently selected employee, and the supervisor of the selected employee. Furthermore, users for whom the field "Submit Absence" in the window Actions has been marked can select the action.</p> <p>When you select this action, the absence specified in the island Absence is submitted as an indication that it now contains the desired information and is ready to be approved.</p>

Field	Description
<b>Approve Absence</b>	<p>This action is only available to the employee who is specified as absence approver for the currently selected employee and to the supervisor of the selected employee. Furthermore, users for whom the field “Approve and Reject Absence” in the window Actions has been marked can select the action.</p> <p>When you select this action, the absence in the island Absence is approved, causing it to become effective (unless the field “Temporary” has been marked). Please note that if an approved absence line covers one or more dates overlapping with the detailed planning of the employee, this causes the planned hours on the days in question to be deleted as described in “Calendar Lines Entering into Effect.”</p> <p>When a line has been approved, the only field that can be changed on the line in question is the field “Temporary.” However, unmarking this field on an approved line will not cause the line to become effective, as the approval will then be cancelled, and the line must be resubmitted and approved before becoming effective.</p> <p>The cancellation of the approval does not cause any planned hours deleted in the process described above to be restored. When approval has been cancelled for an absence line, the line must be resubmitted and approved again to become effective.</p>
<b>Reject Absence</b>	<p>This action is only available to the employee who is specified as absence approver for the currently selected employee and to the supervisor of the selected employee. Furthermore, users for whom the field “Approve and Reject Absence” in the window Actions has been marked can select the action.</p> <p>When you select this action, the absence in the island Absence is rejected as an indication that the absence is not accepted. This causes the absence line to be closed without affecting the planning.</p> <p>Once an absence line has been rejected, changing information on the line causes the rejection and submission of the line to be cancelled. This means that the employee can change the information and resubmit it for approval without having to first reopen the line or create one.</p>
<b>Reopen Absence</b>	<p>This action is only available to the employee who is specified as absence approver for the currently selected employee and to the supervisor of the selected employee. Furthermore, users for whom the field “Reopen Absence” in the window Actions has been marked can select the action.</p> <p>When you select this action, the absence in the island Absence is reopened, causing it to no longer be rejected, submitted, or approved. If a previously approved line is reopened, it is once again possible to change the information on it. When the relevant changes have been made, the line must be resubmitted and approved to become effective.</p>

## Detailed Planning Workspace

Use this workspace to plan the use of your company's employees, either as independent plans or as a refinement of existing job budgets' long-term plans.

Maconomy automatically remembers your selection criteria when you open this workspace again. In addition, if you select the **Remember all settings in det. plan. windows** system parameter, Maconomy remembers all of the settings in this workspace and the Detailed Employee Planning workspace, including starting date, ranges, and so on.

If you create a job budget for a job in the Job Cost module, this workspace enables you to do more detailed planning to define exactly who should perform which tasks, for how long, and on which dates.

Use the Detailed Planning tab to enter a planning start date and specify whether you want planning to be done on a weekly or daily basis. You can also define the period of the time horizon for which you want to plan by entering the number of units (days/weeks). For example, if you select that four units should be displayed, you can make plans for four weeks in the Planning Lines sub-tab. You can also indicate whether or not lines should be shown in the sub-tab. For performance reasons, it might be advantageous not to have lines shown before you want to work in the sub-tab.

The Planning Lines sub-tab consists of a grid structure with slots; each planning slot specifies a period of either a week or a day, depending on your selection in the Detailed Planning tab. For example, if you select "Week" in the tab, each planning slot unit in the sub-tab corresponds to a week. If you enter the starting date as May 1, 2015, you can then enter hours for the week numbers 18, 19, 20, and 21 in the four slots.

You can create a detailed plan as an independent plan by manually entering the job number, task number, and activity number on a planning line. If you do this and then select the **Automatically assign planning lines to budgets** system parameter, Maconomy tries to link the manually entered line to an existing line in the latest approved revision of the planning budget. To do this, use the same method that is described in the Job Progress workspace in the Job Cost module. The number of the matching job budget line is shown in the sub-tab. If Maconomy fails to find a matching job budget line, or if the matching job budget line has already been assigned to a planning line, Maconomy interprets the manually entered line as an additional task that is not mentioned in the planning budget.

You can also choose to create a detailed plan based on job budget lines. Then when you use the **Create Plan from Job Budgets** action Maconomy suggests what should be included in the detailed planning. The suggestion is based on the latest approved revision of all planning budgets that describe tasks that are to be performed within a range of dates that overlap the time range that the workspace displays.

If you create planning lines using this action, Maconomy transfers information from the relevant job budget lines and displays them on the planning lines that you created. The transferred information covers data on the job in question, the employees assigned to the job, and the planned number of hours. After you do this transfer, you can only change this information on the job budget line in question, but Maconomy transfers potential changes to the assigned planning lines in this workspace.

After you create detailed planning lines from job budgets, you can allocate the transferred number of hours to the specified employee on the new planning lines. If you created the planning lines from job budget lines that specify an employee category instead of a specific employee, you can allocate the number of hours that you transferred to planning lines to one or more employees who

belong to the category in question. This enables you to plan for several employees to work on the same task created based on a job budget line. You can thus choose to create a long-term plan by using a job budget, which you can later refine by allocating the planned number of hours to the employees in question, when you have decided exactly who should perform the task.

Another way to transfer planning lines to this workspace is to have Maconomy automatically allocate hours on planning lines in the Job Planning workspace in the Job Cost module. You cannot move or delete automatically allocated lines. For more information, see the description of the Job Planning workspace.

If you plan more hours on a task in this workspace than are specified on the job budget line on which the planning is based, you can set Maconomy up to issue a message. You can also let Maconomy solve the situation by removing the overtime hours from one of those employees who has been allocated hours on the task by selecting a method in the **Resolve Exceeding Task Allocation** field.

When you maintain information in the planning process, you can use the **Distribute Quantity** action to enter the number of hours that an employee is supposed to work on a planning line. Depending on the distribution method that you select in the Distribution island, Maconomy then distributes the hours for the employee in question on the line of the job, activity, and task from the specified starting date and ahead in time. Maconomy makes this distribution based on the principle of avoiding overtime, if possible. If this is not possible, Maconomy tries to distribute the hours of overtime on normal working days, if you specified in the System Information workspace that overtime is allowed. If this is not sufficient, Maconomy distributes potential overtime on days that are not typically working days, such as Saturdays and Sundays. However, for each date, you can never allocate more hours to an employee than the employee's maximum number of working hours according to the employee revision that applies on the date in question. For more information about employee revisions, see "Date-Dependent Employee Revisions" in the introduction to the Employees workspace.

During the planning process, you can always see the planned number of hours for each employee and whether one or more employees have been allocated too many or too few hours (compared to the hours during which the employees in question are available in the period) in the Employee Availability island. When you create or change a detailed plan, this island displays information about the employees' work load. This enables you to always see if you have allocated to one or more employees too many or too few hours within the specified time frame. You can set Maconomy up to give a warning if you have allocated too many hours to an employee in a given week, compared to the employee's planning time. See "Central Concepts of Resource Planning" for more information on planning time.

Maconomy also issues a warning if you allocate hours in a planning slot to an employee who is not available during the period for which you are planning. This ensures that you cannot plan hours for an employee without being aware that the employee in question will be absent during the planned period. Maconomy transfers information about employees' absence periods from effective lines in the Employee Absence Calendars workspace. For more information about effective absence calendar lines, see "Calendar Lines Entering into Effect."

When you allocate hours to an employee on a planning line, you can select a booking type of each allocation: **Confirmed**, **Requested**, or **Preliminary**. By specifying a booking type, you can indicate whether the planned hours should be considered tentative or permanent. It may, for example, be uncertain whether a given project will be realized or how much time is needed for its completion; but on the other hand, you may want to signal that certain resources may be required for a certain period in the detailed planning. By creating allocations of the booking type

**Preliminary**, you can reserve the resources that are required for such a project on a preliminary basis.

Maconomy considers allocations of the booking type **Confirmed** to be permanent, whereas less restricted allocations should be of the type **Preliminary**. Allocations of the type **Requested** are allocations that Maconomy either could not convert from **Preliminary** to **Confirmed**, or allocations that are to be reviewed by some other person before they are converted to **Confirmed**.

You can convert allocations of any booking type into another booking type if this does not create a conflict with other allocations. This means that you cannot convert a preliminary allocation, for example, to a confirmed allocation if the converted allocation together with any other confirmed allocations to the same employee would cause the planning time of that employee to be exceeded. For each task you can create three versions of allocations: one for each booking type. You can select or change the booking type in the detailed planning in this workspace or at the planning budget level in the Job Planning workspace in the Job Cost module. You can do this for either each planning line, or for a selection of planning lines by means of the actions **Convert to Preliminary**, **Convert to Requested**, or **Convert to Confirmed**.

Similarly, in the job planning you can do the conversion for one budget line or for all of the budget lines of the planning budget. To obtain an overview of any conflicting or potentially conflicting allocations, you can print a conflict report in the Reporting menu in this module.

Note that if you do not want to use the functionality of booking types, the **Use Confirmed Bookings Only** system parameter allows you to omit the use of the three booking types; all allocations are then automatically of the type **Confirmed**.

If you need to modify a large number of resource plan allocations, you do not need to enter the changes manually. Instead, you can delete a large number of detailed planning allocations or redistribute the allocations to another employee using the **Delete Allocations** and **Replace Employee** actions. You can specify a selection of planning lines to be deleted/reallocated using the selection criteria in this workspace and by entering the date range for which you want to delete the selected lines in the Delete Allocation island. You can also choose to delete/transfer all of the allocations on planning lines that have a specific employee by entering an employee number in this island.

Note that you can select individual lines as "locked." Maconomy then shows a warning if you try to delete or move locked allocations, which are typically used for fixtures such as customer meetings, which you cannot move without affecting a third party.

You cannot perform allocations for planning lines that are derived from budget lines that have been put on hold in the Job Planning workspace in the Job Cost module.

If you specify skill requirements, either in the Skill Requirements workspace or in the Job Planning workspace in the Job Cost module, the detailed planning reflects this. When you allocate hours to an employee on a task in the Detailed Planning workspace, Maconomy checks whether the employee in question has the skills that are required for the task that you specified on the current job budget line. Similar functionality applies in the Job Cost module, so that when you approve a job's planning budget, Maconomy checks each new or modified skill requirement against the employees who you allocated to perform the tasks specified on the lines.

When planning with consideration to skill requirements, you can use the Task Staffing workspace to look up employees who have skills that match the requirements of the tasks that you are planning. When performing searches, Maconomy takes into account the skills, skill levels, and employee category specified on the planning budget line, as well as the available time and potential overtime for each employee. You can select employees who are included in the search

as required, and then you can transfer them to the detailed resource plan by means of the **Transfer to Plan** action.

As part of the planning process, time sheet users or project managers can enter an estimated time-to-completion when revising a planning budget in the Job Cost module. When you approve the revised planning budget, any estimates for a task are displayed in the detailed planning, and you then know whether you should add any resources to or remove them from each task in the detailed planning. For each estimate specified for a task, you must also enter a date. This date stamping is used in the detailed planning to inform Maconomy as of which date the estimate should be implemented in the detailed plan.

In addition, you can choose to have Maconomy automatically create time sheet lines based on the detailed planning. You do this by specifying values in the **Pre-fill Time Sheet Lines** job parameter attribute. In this job parameter, you can define whether time Maconomy should create time sheet lines automatically, and to which extent the planning performed in this workspace should be transferred to time sheet lines when you create time sheets. When you create a time sheet for a day or a week in the Time Sheets or Daily Time Sheets workspaces, Maconomy determines whether the detailed planning contains any allocations of the booking type **Confirmed** for the employee for the day/week in question. If this is the case, Maconomy creates a number of time sheet lines that correspond to the detailed planning lines for this day/week. This means that for all of the planning lines that specify that the employee in question will be working on a specific task, the system creates a corresponding time sheet line.

You can print a detailed plan for each employee or for each job, on a weekly or daily basis. The printout shows the employee load, the number of hours allocated to each job, and to which employees, and so on. The printout also shows the number of hours still to be planned for each task, compared to the number of hours specified on the assigned job budget lines.

## Detailed Planning Tab

This section includes the fields and descriptions for the Detailed Planning tab.

### Plan Island

Field	Description
<b>Start Date</b>	In this field, you can specify the date on which the detailed planning should start. If "Week" has been selected in the field "Planning Unit," the starting date will always be the Monday in the week in question.
<b>Day of the Week</b>	This field displays on which weekday the starting date falls. If "Week" has been selected in the field "Planning Unit," this field will have the value "Monday." If "Day" has been selected as planning unit, this field can contain any weekday. If you change the value in this field, Maconomy will adjust the starting date in the field "Starting Date" to the first coming weekday that corresponds to the weekday in this field, and which is equal to or after the date already specified in the field "Starting Date."
<b>Week</b>	In this field, you can enter a week number. If you enter a week number, the starting date will be adjusted to the first weekday in the specified week in the year specified in the field "Year." If you do not enter a specific week, this field will display the week number of the current week.

Field	Description
<b>Year</b>	In this field, you can enter a year. If you do not enter a specific year, this field will display the year of the starting date entered in the field "Starting Date."
<b>Planning Unit</b>	<p>This field can have either the value "Week" or the value "Day," and it defines the time span to be displayed in the window. If, for example, you select the value "Week," each planning slot unit in the table part will indicate a period covering a week. If you have selected the value "4" in the field "Units Shown," you can plan four weeks ahead in time.</p> <p>Moreover, the value in this field indicates whether the number of hours in the fields in the island Employee Availability are shown per day or per week.</p> <p>Maconomy remembers the value selected in this field by the user in question and displays the same value the next time that the user opens this window.</p>
<b>Number of Units Shown</b>	This field can have a value between 1 and 10. The value in this field specifies the number of planning slots to be included in the planning section shown in the table part of the window. If the planning unit is specified as, for example, a week, and you enter the value "4" in this field, it means that it will be possible to plan for 4 weeks ahead, which also means that you can only enter hours in the first four planning slots.

### Availability Overview Island

In this island you can select up to ten employees for planning. It will only be possible to select employees set up with the **Hour** Time Unit.

Field	Description
<b>Employee Information No.</b>	In these fields, you can enter the numbers of ten employees. Each time that this window is opened, Maconomy remembers and shows the values in these fields previously entered by the user opening the window. See also the description of the <b>Keep</b> field.
<b>Employee Information Name</b>	This field displays the name of the employee specified in the field "Employee No."
<b>Planning Time, Day</b>	This column shows the planning time for the employee specified in the field "Employee No." for the detailed plan's first planning unit. The unit in this field will be either "Day" or "Week," depending on the value selected in the field "Planning Unit." See "Central Terms in The Resource Planning Module" in the introduction to this module for further information on planning time.
<b>Planning Time, Total</b>	This column shows the total planning time for the employee specified in the field "Employee No." for the selected time span defined in the island Plan. See "Central Terms in The Resource Planning Module" in the introduction to this module for further information on planning time.
<b>Planned Time, Day</b>	This column shows the number of hours planned for the employee in the detailed plan's first planning unit. The unit in this field will be either "Day" or "Week," depending on the value selected in the field "Planning Unit."

Field	Description
<b>Planned Time, Total</b>	This column shows the total number of hours planned for the employee in the selected time span of the detailed plan. The selected time span is defined in the island Plan.
<b>Remaining Time, Day</b>	This column shows the remaining time available, compared to the time planned for the employee specified in the field "Employee No." The value in this field is thus calculated as the value in the field "Planning Time, Unit," minus the value in the field "Planned time, Unit." A negative value in this field means that the employee is planned to work for more hours than his fixed number of working hours. The unit in this field will be either "Day" or "Week," depending on the value selected in the field "Planning Unit."
<b>Remaining Time, Total</b>	This column displays the total remaining time available, compared to the planned time of the time span for the employee. The value in this field is thus calculated as the value in the field "Planning Time, Total," minus the value in the field "Planned time, Total." A negative value in this field means that the employee is planned to work for more hours than his fixed number of working hours.
<b>Load %, Day</b>	This column shows the employee's work load in percentages per day/week for the first unit. The load percentage corresponds to the part of the employee's planning time for which hours have been planned. This means that if the employee's planning time is 30 hours per week, and 15 hours have been planned for the employee in the week in question, this field will contain the value 50%.
<b>Load %, Total</b>	This column shows the employee's total work load in percentages for the selected time span defined in the field "Units Shown." The load percentage corresponds to the part of the employee's planning time for which hours have been planned. This means that if the employee's planning time is 30 hours per week, and 15 hours have been planned for the employee in the week in question, this field will contain the value 50%.
<b>Keep</b>	<p>If you mark this field, Maconomy is not allowed to automatically change the employee shown on the current line. When you change information on a line in the table part of the window, Maconomy checks whether the employee entered on the line is shown in the island Employee Availability. If this is not the case, Maconomy will, if possible, insert this employee into the island Employee Availability. In this case, Maconomy will select an unused row if the field "Keep" is not marked for the row in question, and if there is an unused row. If all rows are in use, Maconomy will select the "oldest" row, that is, the row containing an employee for whom changes have not been made for the longest period in time.</p> <p>By marking this field, you can ensure that information about the employee specified on the line in question will be maintained and thus always shown in the island Employee Availability.</p>

**Selection Criteria Island**

Field	Description
<b>Show Lines</b>	In this field, you can mark whether or not the table part of the window should show the lines matching the criteria specified in this island. For performance reasons, it can be advantageous not to have lines shown before all selection criteria have been specified.
<b>Empl. Category No.</b>	In these fields, you can enter a range of employee category numbers. Only planning lines assigned to employee category numbers within the specified range will be shown in the table part of the window.
<b>Empl. No.</b>	In these fields, you can enter a range of employee numbers. Only planning lines assigned to employees with numbers within the specified range will be shown in the table part of the window.
<b>Project Manager No.</b>	In this field, you can enter a project manager number. Only planning lines assigned to jobs having the specified employee as project manager will be shown in the table part of the window.
<b>Job No.</b>	In these fields, you can enter a range of employee numbers. Only planning lines assigned to job numbers within the specified range will be shown in the table part of the window.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. Only planning lines assigned to company numbers within the specified range will be shown in the table part of the window.
<b>Activity No.</b>	In these fields, you can enter a range of activity numbers. Only planning lines assigned to activity numbers within the specified range will be shown in the table part of the window.
<b>Task</b>	In these fields, you can enter a range of task numbers. Only planning lines assigned to task numbers within the specified range will be shown in the table part of the window.
<b>Booking Type</b>	In this field, you can select one of the three booking types "Preliminary," "Requested," or "Confirmed." Only planning lines having the specified booking type will be shown in the table part of the window and will be affected when you select the actions "Delete Allocations," "Replace Employee" or one of the three actions for converting the booking type. If the field is left blank, planning lines with allocations of any of the three types will be shown in the table part and will be affected by the above actions. For more information about booking types, see "Booking Type."

**Transfer to Slot Island**

Field	Description
<b>Started</b>	In this field, you can enter a starting time which you want to transfer to the planning slot. If you enter a starting time in this field, it will be transferred to the planning slot when you change the number of hours for a day on a line in the table part of the window. Once the starting time has been transferred to the planning slot, the field is

Field	Description
	cleared so that you do not accidentally transfer the starting time to other planning slots. Note that you can only transfer a starting time when the planning unit is "Day." The times can be viewed and edited in the window Employee Calendars.
<b>Finished</b>	In this field, you can enter a finishing time which you want to transfer to the planning slot. For more information, see the description of the field "Started" above. Note that you cannot enter a starting and a finishing time at the same time.
<b>Remarks</b>	In this field, you can enter a remark which you want to transfer to the planning slot. For more information, see the description of the field "Started" above.

### Allocation Island

Field	Description
<b>Range</b>	<p>The two pop-up fields in this field determine the date range within which Maconomy should distribute hours in the detailed planning when hours are specified in the field "Distribute Quantity" in the table part. In the first field, you can select an option determining the starting date of the date range. Note that if the date specified in the field "Never Before" below is before the starting date in this field, the distribution of hours will never be before that date, regardless of the option selected in this field. The default value of the first field is "Planned Starting Date," but you can choose from the following options:</p> <ul style="list-style-type: none"> <li>▪ <b>First Within View</b> — If you select this option, Maconomy will distribute the entered number of hours as from the first date within the selected planning span, that is, the date specified in the field "Start Date" in the island Plan.</li> <li>▪ <b>First Possible Starting Date</b> — If you select this option, Maconomy will distribute the specified number of hours as from the date specified as the first possible starting date for the task. If no such date has been specified, the date specified in the field "Never Before" will be used. If that date is also blank, Maconomy will use the date specified in the field "Start Date" in the island Plan.</li> <li>▪ <b>Planned Starting Date</b> — If you select this option, distribution of hours will take place as from the date specified as the planned starting date for the task. If no such date has been specified, the date specified in the field "Never Before" will be used. If that date is also blank, Maconomy will use the date specified in the field "Start Date" in the island Plan.</li> </ul> <p>In the other field of the range, you can select an option determining the ending date of the date range within which Maconomy should distribute hours in the detailed planning when hours are specified in the field "Distribute Quantity" in the table part. The selected ending date of the range can never be before the starting date selected in the first option in this field or in the field "Never Before."</p>

Field	Description
	<p>The default value of the field is “Within View,” but you can select among the following options:</p> <ul style="list-style-type: none"> <li>▪ <b>Last Within View</b> — If you select this strategy, Maconomy will distribute the entered number of hours within the period covered by the starting date selected in this island and the last date of the time span selected in the island Plan. If, for example, Maconomy is to distribute 80 hours, and the period defined by the starting date selected and the ending date of the time span is, for example, five days, Maconomy will distribute all 80 hours equally on the plan’s five days, even if this means that the employee in question will be assigned overtime working hours. If overtime is not allowed, Maconomy will issue an error message telling you that distribution of the specified number of hours on the employee in question is not possible.</li> <li>▪ <b>Planned Ending Date</b> — If you select this strategy, Maconomy will distribute the specified number of hours within the period covered by the starting date selected in this island and the planned ending date entered on the line. If no planned ending date has been entered, there will be no upper limit for the period within which Maconomy will distribute the number of hours. If the number of hours cannot be distributed without resulting in overtime for a given employee, distribution can only be carried out if overtime is allowed. Please note that use of this strategy might mean that the hours distributed might exceed the selected planning span.</li> <li>▪ <b>Last Possible Ending Date</b> — This strategy corresponds to the strategy “Before Planned Ending Date” described above, only will Maconomy use the date specified as “Last possible ending date” instead of the planned ending date.</li> </ul> <p>Note that regardless of the selected strategy, Maconomy will never distribute so many hours to a given employee on a given date that the total distribution for the employee on this date exceeds the employee’s maximum number of working hours for the date. The employee’s maximum working hours for the employee on a given date is found in the employee revision applying on the date in question. For further information about employee revisions, see “Date-Dependent Employee Revisions” in the introduction to the window Employees.</p> <p>In addition, Maconomy will never distribute hours on a task before the date specified in the field “Estimate Date” in the table part, if an estimate has been specified for the task.</p>
<b>Never Before</b>	<p>In this field, you can enter a date. This date will be used as the starting date when Maconomy distributes hours specified in the field “Distribute Quantity” in the table part, regardless of whether any starting date has been specified in the first range field above. In other words, Maconomy will never distribute hours before the date in this field. By default, the date will be today’s date, but you can change it. If the date is blank, the first date used for distribution will be determined by the date specified in the field “Start Date” in the island Plan.</p>

Field	Description
	Note that if you convert the allocation type of a planning line, either manually or by means of the actions in this window, allocations on dates before the date specified in this field will not be converted.
<b>Method</b>	<p>In this field, you can select a distribution method to be used when allocating hours to a given employee. The following options are available:</p> <ul style="list-style-type: none"> <li>▪ <b>Early Allocation</b> — If you select this option, Maconomy will allocate as many hours as possible as early in the plan as possible, when a number of hours is specified in the field “Distribute Quantity” on a line in the table part of the window. If the specified number of hours cannot be allocated within the available planning time of the employee in question, you can choose that Maconomy should attempt to allocate the remaining number of hours on days off (for example, weekends) by marking the field “Include Days Off” in this island. If the specified number of hours can still not be allocated as desired, you can choose how Maconomy should react to such situations in the field “Unattainable.”</li> <li>▪ <b>Even Allocation</b> — If you select this option, Maconomy will allocate the number of hours specified in the field “Distribute Quantity” evenly on the line within the time span defined in the window. If you have, for example, specified that the window should show 5 units of the type “Week,” and you enter 100 hours in the field “Distribute Quantity,” 20 hours will be allocated to the employee specified on the line for each of the 5 weeks. If the employee in question is absent in 1 of the weeks covered by the time span within which the hours must be allocated, the hours will not be allocated to the week in question, and instead the 100 hours are allocated to the 5 remaining weeks, that is, 25 hours for each week.  If the specified number of hours cannot be allocated within the available planning time of the employee in question, you can choose whether or not Maconomy should attempt to allocate the remaining number of hours on days off (for example, weekends) by marking the field “Include Days Off” in this island. If the specified number of hours can still not be allocated as desired, you can choose how Maconomy should react to such situations in the island Unattainable.</li> <li>▪ <b>Fixed Allocation</b> — If you select this option, a fixed number of hours can be allocated to each unit within the plan from a specified starting date/week until a specified ending date/week, or until all requested hours have been allocated. The number of hours to be allocated on a planning line with repeating allocation is specified in the below field “Fixed Number of Hours.”</li> </ul> <p>The distribution method selected in this field applies to the planning unit specified in the field “Planning Unit,” that is, the planning unit determines how the distribution method should be applied to the planning lines. In this connection you should note that if the current planning unit is “Week,” the selected method will apply to weeks, but within each week the hours are</p>

Field	Description
	applied to the days as if the distribution method “Early Allocation” had been selected. If the current planning unit is “Days,” the selected method will apply as described in the above options.
<b>Fixed Number of Hours</b>	If the distribution method “Repeating Allocation” has been selected, you must specify the number of hours to be repeatedly allocated to each relevant unit in this field. See the above description of the distribution method “Repeating Allocation” for further information on the functionality of this field.
<b>Include Days Off</b>	If you mark this field, Maconomy will include days off for the allocation of the hours specified. Specifying that days off should be Unattainable considered implies that if all hours specified could not be distributed on working days including any allowed overtime registered for the employee in question, Maconomy will attempt to distribute any remainder of hours on days off (nonworking days, for example, weekends). If only part of the hours can be allocated this way, Maconomy will issue an error message. If this field is not marked, days off are considered equal to absence days, on which no hours can be allocated to an employee. Note that this option cannot be selected for the distribution method “Repeating Allocation.”
<b>Unattainable</b>	<p>In this field, you can choose how the system should react if a requested number of hours cannot be allocated to the employee in question. You can select one of the following two options:</p> <ul style="list-style-type: none"> <li>▪ <b>Cancel Allocation</b> — If you select this option, the requested allocation is automatically cancelled, and Maconomy will issue an error message.</li> <li>▪ <b>Allocate Best Number of Hours</b>— If you select this option, Maconomy will attempt to allocate as many hours as possible in accordance with the specifications entered in the window. The hours which could not be allocated will automatically be cut off, and Maconomy will issue a message informing you how many hours were allocated and how many hours were cut off.</li> </ul>

### Delete Allocation Island

Field	Description
<b>Employee</b>	In these fields, you can specify the name and number of an employee to be used when either of the actions “Delete Allocations” or “Replace Employee” is selected. Depending on which of the two actions you select, the hours allocated in the detailed planning to the employee specified in these fields will be either deleted or transferred to the employee specified in the “Employee” fields in the island Replace Allocation. If an employee has not been specified in these fields, allocations for all employees matching the selection criteria in the island “Selection Criteria” will be deleted/transferred when one of the above actions is selected.
<b>Date Range</b>	In these fields, you can enter a date range. This date range specifies the period for which allocations will be deleted or reallocated, respectively, when selecting the actions “Delete Allocations” or “Replace Employee.” This date range will

Field	Description
	<p>always be used in connection with these two actions, regardless of the time span selected in the island Plan.</p> <p>The default values of these fields cover the period from the current date to the end of the time span specified in the island Plan, but you can change the dates as required. Note, however, that if you leave the first or last of these two fields blank, all allocations included in the selection criteria and assigned to the employee specified in this island, if any, will be deleted/reallocated back or forward in time, respectively.</p>

### Replace Allocation Island

Field	Description
<b>Employee</b>	<p>In these fields, you must specify the name and number of the employee to whom the hours allocated to the employee specified in the "Employee" fields in the island Delete Allocation should be transferred when the action "Replace Employee" is selected.</p>

### Redistribute Allocation Island

Field	Description
<b>Keep Distribution</b>	<p>This field is used in connection with the action "Replace Employee" to specify whether or not the hours to be transferred to a new employee should be reallocated using the existing allocation of hours on weeks/days.</p> <p>If this field is marked, the allocations in question will be transferred directly to the new employee with no changes to the existing allocation of hours on weeks/days, that is, for each day only the employee will be changed, not the number of hours allocated. However, if the planning unit selected in the island "Plan" is "Week," the allocations in question are considered kept as long as each week covered by the allocation period is reallocated as many hours as originally planned. This means that the hours may be reallocated within each week with consideration to any other hours planned for the employee on the days in question.</p> <p>If this field is not marked, the existing allocations will be transferred to the new employee within the period in which the hours were originally allocated. The hours to be reallocated will be transferred in either of two ways: If an identical planning line already exists for the employee, the hours will be reallocated automatically within the period in question. If an identical line does not exist, the system will create a planning line, and the hours to be reallocated will be added to the value of the field "Distribute Quantity" on the line.</p> <p>See also the description of the action "Replace Employee."</p>

## Properties Island

Field	Description
<b>Use Previous Ranges</b>	In this field, you can select which range of job budget lines to be included when the action "Create Plan from Job Budgets" is used. This field is also used for determining which planning lines should be shown in the table part of the window. If you mark this field, Maconomy will include all job budget lines on which the date in the field "First Possible Starting Date" in the window Job Budgets is earlier than the last date of the selected planning section. If you do not mark this field, the date specified in the field "Planned Starting Date" will be used instead of the date in the field "First Possible Starting Date."
<b>Ignore Blank Dates</b>	This field is used in connection with the field "Use Previous Ranges" above. If you mark this field, Maconomy will not include planning lines having a blank value in the field "First Possible Starting Date." Alternatively, if the field "Use Previous Ranges" is not marked, Maconomy will not include planning lines having a blank value in the field "Planned Starting Date."
<b>Resolve Exceeding Task Alloc.</b>	<p>In this field, you can specify the strategy to be used when more hours have been planned on a given task in this window than specified on the job budget line that forms the basis of the planning. If you select a strategy in this field, Maconomy will try to solve the situation by removing the exceeding hours from one or more of those employees to whom hours on the task have been distributed in one of the following ways:</p> <ul style="list-style-type: none"> <li> <b>Remove Smallest Allocations First</b> — If you select this strategy, Maconomy will remove hours from the employee(s) who have been allocated the fewest number of hours on the task in a slot (if there are allocations of hours which are not provided with a specification of an employee, these allocations will always be removed first).            If, for example, employee A has been allocated a total of 100 hours on the task (with for example 0.5 hours on a Friday), and another employee has been allocated a total of 10 hours (2 days of 5 hours), Maconomy will remove the half-hour from employee A, as this is the smallest single allocation.         </li> <li> <b>Remove Most Loaded First</b> — If you select this strategy, Maconomy will reduce the number of hours for any employees who have been allocated the most hours compared to the defined planning time. Allocations of hours with a specification of an employee are removed before allocations without a specification of an employee. When there are more allocations with the same value, Maconomy will select the employees who do not have the employee category specified for the task as their primary category.            See the description of planning time in "Central Terms in The Resource Planning Module" in the introduction to this module for information about the calculation of planning time.         </li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Remove External First</b> — If you select this strategy, Maconomy will reduce the number of hours for the employees who are not assigned to the company responsible for the job in question, and who are therefore regarded as external. When there are several external employees, Maconomy will select the employees who do not have the employee category specified for the task as their primary category.</li> </ul> <p>When all task allocations for these employees have been deducted, and if there are still exceeding task allocations, Maconomy will use the strategy "Remove Most Loaded First" as described above.</p> <p>As the default, this field has the value specified for the corresponding field in the window System Information. However, the value can be changed manually in this window.</p> <p>Note that if an estimated time-to-completion has been specified for a task, Maconomy will only remove allocations on the task that are after the estimate date. In addition, Maconomy will never remove hours allocated on dates before the date specified in the field "Never Before" in the island Allocation.</p>

### Planning Lines Sub-Tab

This section includes the fields and descriptions for the Planning Lines sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number assigned to the current planning line, if it has been created on the basis of a job budget. If you create an independent detailed plan, you can enter a job number in this field. If the system parameter "Automatically assign planning lines to budgets" is marked, Maconomy will try to link the manually entered line to an existing line in the latest approved revision of the planning budget, as described in the introduction to this window.
<b>Empl. No.</b>	<p>In this field, you can enter the number of the employee for whom you want to plan the specified number of hours on the job, activity, and task specified on the line. If you change the contents of this field, the system will check whether the new employee specified matches any skill requirements created for the task on the line in the window Skill Requirements. If requirements have been created which the employee does not meet, a warning will be issued for each unmet requirement.</p> <p>If the planning line is created for a job which uses automatic allocation and transferred using this action "Create Plan from Job Budgets," and if the line does not have an employee specified, the current task will be allocated automatically if you enter an employee in this field.</p>
<b>Employee Name</b>	This field shows the name of the employee entered in the "Empl. No." field.

Field	Description
<b>Empl. Category No.</b>	<p>This field shows the number of the employee category assigned to the current planning line. If an employee has been specified in the field "Empl. No.," this employee must belong to the specified employee category. If the current planning line refers to a job budget line, the employee category number must be the same as the number specified on the job budget line. If no employee category number has been specified on the job budget line, you are free to enter any number in this field. Employee categories are created in the window Employee Categories in the Set-Up module.</p>
<b>Booking Type</b>	<p>In this field, you can specify the type of the allocation on the planning line. The types are "Preliminary," "Requested," and "Confirmed." By specifying a booking type, you can indicate whether the planned hours should be considered tentative or permanent. Allocations of the type "Confirmed" are considered permanent, whereas the less restricted preliminary allocations are preliminary. Requested bookings are allocations that either could not be converted from "Preliminary" to "Confirmed," or allocations that are to be reviewed by some other person before they are converted to "Confirmed." See the introduction to the window for further details.</p> <p>The default value of the field is "Confirmed," and this type will be suggested for planning lines with no relation to planning budget lines. If the current planning line was created on the basis of a planning budget line, the planning line automatically inherits the allocation type of the related planning budget line. Any subsequent changes made to the allocation type of the related budget line are automatically transferred to the planning line. This means that the value of this field is automatically overwritten with the new type selected for the planning budget line upon approval of the budget line.</p> <p>The value of the field can be changed to "Preliminary" or "Requested" as required, but it can only be changed to "Confirmed" if the current allocation does not conflict with other confirmed allocations. If a conflict occurs so that the current allocation and one or more other confirmed allocations would cause the planning time of the employee on the current line to be exceeded, the allocation type of the current line will automatically be set to "Requested." Note that if you change the allocation type, allocations on dates before the date specified in the field "Never Before" will not be converted.</p> <p>If you change the booking type on a planning line from "Confirmed" to "Preliminary," the hours on the line will be reallocated within the time span of the confirmed allocations. However, if the field "Keep Distribution" in the card part is marked, the hours are reallocated as described in this field.</p> <p>Note that you cannot create more than three versions, one of each booking type, of planning lines which are similar, that is, have the same combination of job, activity, task, and employee and/or employee category.</p>
<b>Quantity, Remaining</b>	<p>This field shows the number of hours that remain to be planned after the estimate date, compared to the estimated time-to-completion for the job budget line referring to the current planning line.</p> <p>As an example, 100 hours may be budgeted on a planning budget line. Now 80 hours are planned in the detailed plan before the date 01/03/2004, and 20</p>

Field	Description
	<p>hours after 01/03/2004. Then the value of this field is 0, since 100 hours have been planned (and 100 hours is required by the job budget line). Then assume that it is specified on the job budget line that as of 01/03/2004, the estimated time-to-completion is 40 hours. Since only 20 hours have been planned for this task after the date 01/03/2004, it means that an additional 20 hours should be planned. Therefore, this field will now show a quantity of 20.</p> <p>If no such estimate has been made for the planning budget line, this field shows the number of hours that remain to be planned in the detailed planning, compared to the quantity budgeted on the planning line.</p> <p>If the value in this field is lower than zero, it means that more hours have been planned than specified on the relating job budget line.</p>
<b>Distribute Quantity</b>	<p>When a number of hours is entered in this field, Maconomy will first remove all distributions already made on the current planning line. Then Maconomy distributes the entered number of hours for the specified employee on the current line's job, activity, and task from the entered starting date and ahead in time on the basis of the strategy and distribution method selected in the island Allocation in the card part of the window. You can only enter a number in this field if you have specified an employee in the field "Empl. No." This field is automatically reset when Maconomy has distributed the hours.</p> <p>Maconomy distributes the hours on the basis of the principle of avoiding overtime. If this is not possible, Maconomy will try to distribute overtime equally on working days. If this is not sufficient, potential overtime is distributed on days which are typically not working days, such as Saturdays and Sundays. If you have defined that overtime is not allowed in the field "Overtime, Empl." in the window System Information in the Set-Up module, Maconomy will issue an error message if it is not possible to plan the current number of hours without using overtime.</p> <p>Note that Maconomy will never distribute so many hours to a given employee on a given date that the total distribution for the employee on this date exceeds the employee's maximum number of working hours for the date. The employee's maximum working hours for the employee on a given date are found in the employee revision applying on the date in question. For further information about employee revisions, see "Date-Dependent Employee Revisions" in the introduction to the window Employees.</p> <p>In addition, if an estimated time-to-completion has been specified for a given task, Maconomy will never distribute hours on the task before the date specified in the field "Estimate Date" in the table part, regardless of the strategy selected in the card part.</p>
<b>Total</b>	This field shows the total number of hours distributed on the current planning line for the entire plan.
<b>Act. No.</b>	This field shows the activity number assigned to the current planning line, if it has been created on the basis of a job budget. If you create an independent detailed plan, you can enter an activity number in this field.

Field	Description
<b>Task</b>	This field shows the task assigned to the current planning line, if it has been created on the basis of a job budget. If you create an independent detailed plan, you can enter a task in this field.
<b>Locked</b>	<p>By marking this field, you specify that the current planning line is "locked." This means that Maconomy will show a warning if you try to delete or move the allocation on the line. Locking is typically used for fixtures such as customer meetings, and so on, which cannot be moved without affecting a third party.</p> <p>In the window Job Planning in the Job Cost module, you can mark a whole task this way. If you do that, all planning lines created on the basis of the task will be marked as locked. You can, however, unmark individual planning lines.</p> <p>Note that you cannot change this field if the planning line is a result of automatic resource allocation in the window Job Planning.</p>
<b>Day/Week</b>	<p>This field displays the number of hours during which the current employee should work on the job, activity, and task in question in the first planning unit covered by the plan's planning span.</p> <p>This unit can indicate either a day or a week, depending on what has been specified in the field "Planning Unit" in the card part of the window. If the current planning unit is "Week," the heading of this field will be "&lt;week number&gt;, &lt;the starting date of the week&gt;" — for example, "20, 05-10-2004." The week number displayed in this field will be the starting week specified in the island Plan. If the planning unit selected is "Day," the heading of this field is determined by the format selected in the field "Detailed Plan Column Title Format" in the window System Information in the Set-Up module. The format can be "&lt;weekday&gt; &lt;date&gt;" ("Mon 05-10-2004"), "&lt;weekday&gt; &lt;day in month&gt;" ("Mon 10"), or simply "&lt;day in month&gt;" ("10").</p>
<b>Quantity, Orig.</b>	This field shows the number of hours specified on the job budget line which forms the basis for the current planning line. If the planning line is created automatically by means of the action "Create Plan from Job Budgets," the value in this field is transferred from the job budget line in question.
<b>Est. Time to Compl.</b>	This field shows the latest approved estimated time-to-completion for the planning budget line on which the current planning line is based. If this field is blank, no estimated time-to-completion has been specified for the planning budget line on which the current planning line is based.
<b>Estimate Date</b>	<p>If an estimate has been specified for the current planning budget line, this field will show the date as of which the estimate applies. If this field is blank, no estimated time-to-completion has been specified for the planning budget line on which the current planning line is based.</p> <p>Empl. Category Name This field shows the name of the employee category specified in the field "Empl. Category No."</p>
<b>Planned Starting Date</b>	In this field, you can enter the planned starting date for the task specified on the current planning line. If this line has been created on the basis of a job budget line, the planned starting date can only be changed on the job budget line in question in the window Job Budgets in the Job Cost module.

Field	Description
<b>Planned Ending Date</b>	The functionality of this field is similar to that of the field "Planned Starting Date."
<b>First Possible Starting Date</b>	The functionality of this field is similar to that of the field "Planned Starting Date."
<b>Last Possible Ending Date</b>	The functionality of this field is similar to that of the field "Planned Starting Date."
<b>First Planned Date</b>	This field displays the date of the first allocation, if any, on the current line.
<b>Latest Planned Date</b>	This field displays the date of the last allocation, if any, on the current line.
<b>Budget Type</b>	This field shows the budget type of the job budget of the job budget line on the basis of which the current planning line is created.
<b>Budget Revision No.</b>	This field shows the revision number of the job budget line on the basis of which the current planning line is created.
<b>Budget Line No.</b>	If the current planning line is created on the basis on a job budget, this field shows the line number of the job budget line on the basis of which the current planning line was created. Note that if the budget uses hierarchical table structure, the budget line number will be in "dotted notation," for example "1.2," as described in "Hierarchical Table Part Structure" in the chapter "Getting Started with the Java™ Client."
<b>Description</b>	This field shows the description of the job budget line on the basis of which the current planning line is created.
<b>Activity Name</b>	This field shows the name of the activity specified in the field "Activity No." on the current line.
<b>Task Description</b>	This field shows the description of the task specified in the field "Task" on the current line.

## Actions

This section shows the Actions available in the Detailed Planning workspace.

### Top Tab

Field	Description
<b>Previous Unit</b>	With this action, you can move the planning span back in time so that the current plan's starting date will be changed to one planning unit before the existing starting date. This action does not affect automatically allocated lines.
<b>Next Unit</b>	With this action, you can move the planning span ahead in time so that the current plan's starting date will be changed to one planning unit after the existing starting date. This action does not affect automatically allocated lines.
<b>Create Plan from Job Budgets</b>	<p>With this action, you can create a number of planning lines on the basis of a range of job budget lines. If you select this action, Maconomy will look through all jobs that might potentially contribute to new planning lines.</p> <p>When Maconomy decides whether or not a planning line is to be included in the creation of planning lines, the following are considered:</p> <ul style="list-style-type: none"> <li>Only non-completed job budget lines which belong to the latest approved revision of the planning budget for a given job are included.</li> <li>Only job budget lines covered by the selection criteria in the sub-tab are included, and only if they have the value specified in the <b>Use Previous Ranges</b> and <b>Ignore Blank Dates</b> fields.</li> </ul> <p>If no planning lines refer to the current job budget line (neither within nor outside the selected planning span), a planning line is created. Unless the job budget line contains a specific employee, no employee number is inserted and the planner must manually define an employee number. Maconomy will not try to distribute the number of hours in question. Instead, the number of hours on the job budget line is shown in the <b>Quantity, Remaining</b> field on the planning line.</p> <p>If a planning line already refers to the job budget line in question, Maconomy calculates the number of hours planned before, as well as after, the selected starting date of the detailed plan. If the number of hours planned before the selected starting date is larger than or equal to the number of hours specified on the job budget line, all distributions assigned to the line after the plan's selected starting date are removed. Otherwise, Maconomy creates a planning line having the value in the <b>Quantity, Remaining</b> field as the difference between the number of hours on the job budget line and the number of hours already distributed for this job budget line before the selected starting date of the detailed plan. Note that this might result in a negative quantity in the <b>Quantity, Remaining</b> field, meaning that the negative quantity must be removed from the plan.</p> <p>If the job budget line has been put on hold in the Job Planning workspace, it is not considered.</p>

Field	Description
	<ul style="list-style-type: none"> <li>Only jobs with time in hours are included.</li> <li>Replace Employee — When you select this action, Maconomy replaces the employees on planning lines covered by the selection criteria and the date range selected in the island “Delete Allocation” with the employee specified in the field “New Employee No.” in the island Replace Allocation. This is done by reallocating all hours on the planning lines in question to the new employee. If a specific employee has been entered in the field “Employee No.” in the island Delete Allocation, only planning lines with this employee, and which meet the selection criteria and date range specified, will be reallocated. Before performing the replacement, Maconomy first issues a warning informing you how many hours and weeks/days will be transferred. If the field “Keep Distribution” in the field Redistribute Allocation is marked, the hours to be reallocated will be directly transferred to the new employee with no changes to the existing allocation of hours on weeks/days. Note that the reallocation of hours for each date is only made if the resulting allocations do not conflict with employee’s maximum number of working hours for the date (found in the employee revision applying on the date in question) and if the allocations do not conflict with any criteria specified on the planning lines or corresponding job budget lines in question. If an employee category has, for example, been specified, replacement is only made if the new employee belongs to the specified category. Likewise, if skill requirements have been specified for job budget lines, and these requirements are not met by the new employee, Maconomy issues a warning. Employees on planning lines originating from job budget lines with an assigned employee cannot be replaced. Note also that you cannot replace employees on automatically allocated planning lines. For further information about employee revisions, see “Date-Dependent Employee Revisions” in the introduction to the window Employees.</li> </ul>
<b>Delete Allocations</b>	<p>When you select this action, Maconomy deletes the planning lines in the table part that meet the selection criteria specified in the island “Selection Criteria” and the date range specified in the island “Delete Allocation.” If an employee has been specified in the field “Employee No.” in the island Delete Allocation in the card part, only allocations to this employee will be deleted. Otherwise, all planning lines that meet the selection criteria and date range specified will be deleted.</p> <p>Before performing the deletion, the system issues a warning informing you how many hours and weeks/days will be deleted.</p> <p>Note that automatically allocated planning lines from the window Job Planning cannot be deleted using this action.</p>

Field	Description
<b>Delete Completed Lines</b>	When you select this action, Maconomy deletes all planning lines which are covered by the selection criteria specified in the island Selection Criteria and which refer to job budget lines marked as "Completed." Job budget lines are marked as completed in the window Job Planning. This action does not affect automatically allocated lines.
<b>Convert to Preliminary</b>	When you select this action, Maconomy converts the allocation types of all planning lines in the table part into "Preliminary." Note that allocations on dates before the date specified in the field "Never Before" will not be converted.
<b>Convert to Requested</b>	When you select this action, Maconomy converts the allocation types of all planning lines in the table part into "Requested." Note that allocations on dates before the date specified in the field "Never Before" will not be converted.
<b>Convert to Confirmed</b>	<p>When you select this action, Maconomy converts the allocation types of all planning lines in the table part from "Preliminary" to "Confirmed."</p> <p>If the conversion of the allocation type on a budget line would conflict with other confirmed allocations for the employee allocated on the line — that is, the current allocation and one or more other confirmed allocations would cause the planning time of the employee on the current line to be exceeded — this line will, instead, be converted into "Requested" and a warning will be issued.</p> <p>Note that allocations on dates before the date specified in the field "Never Before" will not be converted.</p>

## Detailed Employee Planning Workspace

Use this workspace to plan the use of your company's employees.

This workspace contains a subset of the functionality that is available in the Detailed Planning workspace. You typically use this workspace to support the corresponding component in the Maconomy Portal.

This workspace contains a subset of the functionality that is available in the Detailed Planning workspace. You typically use this workspace to support the corresponding component in the Maconomy Portal.

For this reason, this section describes only the differences between this workspace and the Detailed Planning workspace. However, the description of the individual fields is included in this workspace. For a complete overview of detailed resource planning in Maconomy, see the description of the Detailed Planning workspace.

- In this workspace, you can only view and plan for one employee at a time.
- You can see and manipulate the planning allocations for each day for an entire month at a time.
- The planning unit is always **Day**.

## Detailed Employee Planning Tab

This section includes the fields and descriptions for the Detailed Employee Planning tab.

### Allocation Island

Field	Description
Range	<p>The two pop-up fields in this field determine the date range within which Maconomy should distribute hours in the detailed planning for the current employee when hours are specified in the field "Distribute Quantity" in the table part. In the first field, you can select an option determining the starting date of the date range. Note that if the date specified in the field "Never Before" below is before the starting date in this field, the distribution of hours will never be before that date, regardless of the option selected in this field.</p> <p>The default value of the first field is "Planned Starting Date," but you can choose from the following options:</p> <ul style="list-style-type: none"> <li>▪ <b>First Within View</b> — If you select this option, Maconomy will distribute the entered number of hours as from the first date within the selected planning span, that is, the date specified in the field "Start Date" in the island Plan.</li> <li>▪ <b>First Possible Starting Date</b> — If you select this option, Maconomy will distribute the specified number of hours as from the date specified as the first possible starting date for the task. If no such date has been specified, the date specified in the field "Never Before" will be used. If that date is also blank, Maconomy will use the date specified in the field "Start Date" in the island Plan.</li> <li>▪ <b>Planned Starting Date</b> — If you select this option, distribution of hours will take place as from the date specified as the planned starting date for the task. If no such date has been specified, the date specified in the field "Never Before" will be used. If that date is also blank, Maconomy will use the date specified in the field "Start Date" in the island Plan.</li> </ul> <p>In the other field of the range, you can select an option determining the ending date of the date range within which Maconomy should distribute hours in the detailed planning for the current employee when hours are specified in the field "Distribute Quantity" in the table part. The selected ending date of the range can never be before the starting date selected in the first option in this field or in the field "Never Before."</p> <p>The default value of the field is "Within View," but you can select among the following options:</p> <ul style="list-style-type: none"> <li>▪ <b>Last Within View</b> — If you select this strategy, Maconomy will distribute the entered number of hours within a period of one month from the starting date selected in this island. Maconomy will distribute all hours equally within that month, even if this means that the</li> </ul>

Field	Description
	<p>employee in question will be assigned overtime working hours. If overtime is not allowed, Maconomy will issue an error message telling you that distribution of the specified number of hours on the employee in question is not possible.</p> <ul style="list-style-type: none"> <li>▪ <b>Planned Ending Date</b> — If you select this strategy, Maconomy will distribute the specified number of hours within the period covered by the starting date selected in this island and the planned ending date entered on the line. If no planned ending date has been entered, there will be no upper limit for the period within which Maconomy will distribute the number of hours. If the number of hours cannot be distributed without resulting in overtime for a given employee, the allocation can only be carried out if overtime is allowed. Please note that the use of this strategy might mean that the hours allocated exceed the planning span.</li> <li>▪ <b>Last Possible Ending Date</b> — This strategy corresponds to the strategy “Before Planned Ending Date” described above, only will Maconomy use the date specified as “Last possible ending date,” instead of the planned ending date.</li> </ul> <p>Note that regardless of the selected strategy, Maconomy will never distribute so many hours to a given employee on a given date that the total distribution for the employee on this date exceeds the employee’s maximum number of working hours for the date. The employee’s maximum working hours for a given date are found in the employee revision applying on the date in question. For further information about employee revisions, see “Date-Dependent Employee Revisions” in the introduction to the window Employees.</p> <p>In addition, Maconomy will never distribute hours on a task before the date specified in the field “Estimate Date” in the table part if an estimate has been specified for the task.</p>
<b>Never Before</b>	<p>In this field, you can enter a date. This date will be used as the starting date when Maconomy distributes hours specified in the field “Distribute Quantity” in the table part, regardless of whether any starting date has been specified in the first range field above. In other words, Maconomy will never distribute hours before the date in this field. By default, the date will be today’s date, but you can change it. If this date is blank, the first date used for distribution will be determined by the date specified in the field “Start Date” in the island Plan.</p> <p>Note that if you convert the allocation type of a planning line, either manually or by means of the actions in this window, allocations on dates before the date specified in this field will not be converted.</p>
<b>Method</b>	<p>In this field, you can select a distribution method to be used when allocating hours to a given employee. The following options are available:</p> <ul style="list-style-type: none"> <li>▪ <b>Early Allocation</b> — If you select this option, Maconomy will allocate as many hours as possible as early in the plan as possible when a number</li> </ul>

Field	Description
	<p>of hours is specified in the field “Distribute Quantity” on a line in the table part of the window. If the specified number of hours cannot be allocated within the available planning time of the employee in question, you can choose that Maconomy should attempt to allocate the remaining number of hours on days off (for example, weekends) by marking the field “Include Days Off” in this island. If the specified number of hours still cannot be allocated as desired, you can choose how Maconomy should react to such situations in the field “Unattainable.”</p> <ul style="list-style-type: none"> <li>▪ <b>Even Allocation</b> — If you select this option, Maconomy will allocate the number of hours specified in the field “Distribute Quantity” evenly on the line within the time span defined in the window. If the specified number of hours cannot be allocated within the available planning time of the employee in question, you can choose whether or not Maconomy should attempt to allocate the remaining number of hours on days off (for example, weekends) by marking the field “Include Days Off” in this island. If the specified number of hours still cannot be allocated as desired, you can choose how Maconomy should react to such situations in the field “Unattainable.”</li> <li>▪ <b>Fixed Allocation</b> — If you select this option, a fixed number of hours can be allocated to each unit within the plan from a specified starting date until a specified ending date, or until all requested hours have been allocated. The number of hours to be allocated on a planning line with repeating allocation is specified in the field “Fixed Number of Hours.” Within the planning span, the hours are applied to the days as if the distribution method “Early Allocation” had been selected.</li> </ul>
<b>Fixed Number of Hours</b>	If the distribution method “Fixed Allocation” has been selected, you must specify the number of hours to be repeatedly allocated to each day in this field. See the above description of the distribution method “Fixed Allocation” for further information on the functionality of this field.
<b>Include Days Off</b>	If you mark this field, Maconomy will include days off for the allocation of the hours specified. Specifying that days off should be considered implies that if all hours specified cannot be distributed on working days, including any allowed overtime registered for the employee in question, Maconomy will attempt to distribute any remainder of hours on days off (nonworking days, for example, weekends). If only part of the hours can be allocated this way, Maconomy will issue an error message. If this field is not marked, days off are considered equal to absence days, on which no hours can be allocated to an employee. Note that this option cannot be selected for the distribution method “Fixed Allocation.”
<b>Unattainable</b>	In this field, you can choose how the system should react if a requested number of hours cannot be allocated to the employee in question. You can select one of the following two options:

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Cancel Allocation</b> — If you select this option, the requested allocation is automatically cancelled, and Maconomy will issue an error message.</li> <li>▪ <b>Allocate Best Number of Hours</b> — If you select this option, Maconomy will attempt to allocate as many hours as possible in accordance with the specifications entered in the window. The hours which could not be allocated will automatically be cut off, and Maconomy will issue a message informing you how many hours were allocated and how many hours were cut off.</li> </ul>

### Delete Allocation Island

Field	Description
<b>Date Range</b>	<p>In these fields, you can enter a date range. This date range specifies the period for which allocations will be deleted or reallocated, respectively, for the current employee when selecting the action “Delete Allocations” or “Replace Employee.” This date range will always be used in connection with these two actions, regardless of the time span selected.</p> <p>The default values of these fields cover the period from the current date to the end of the time span specified, but you can change the dates as required. Note, however, that if you leave the first or last of these two fields blank, all allocations included in the selection criteria and assigned to the current employee, if any, will be deleted/reallocated backward or forward in time, respectively.</p>

### Replace Allocation Island

Field	Description
<b>New Employee No.</b>	In this field, you must specify the number of the employee to whom the hours allocated to the current employee should be transferred when the action “Replace Employee” is selected. Only employees with the <b>Hour</b> time unit can be selected.
<b>Name</b>	This field displays the name of the employee specified in the field “New Employee No.” above.

### Redistribute Allocation Island

Field	Description
<b>Keep Distribution</b>	<p>This field is used in connection with the action “Replace Employee” to specify whether or not the hours to be transferred to a new employee should be reallocated using the existing allocation of hours on days.</p> <p>If this field is marked, the allocations in question will be transferred directly to the new employee with no changes to the existing allocation of hours on days; that is, for each day only the employee will be changed; not the number of hours allocated.</p>

Field	Description
	<p>If this field is not marked, the existing allocations will be transferred to the new employee within the period in which the hours were originally allocated. The hours to be reallocated will be transferred in either of two ways: If an identical planning line already exists for the employee, the hours will be reallocated automatically within the period in question. If an identical line does not exist, the system will create a planning line, and the hours to be reallocated will be added to the value of the field "Distribute Quantity" on the line.</p> <p>See also the description of the action "Replace Employee."</p>

### Properties Island

Field	Description
<b>Use Previous Ranges</b>	<p>In this field, you can select which range of job budget lines should be included when the action "Create Plan from Job Budgets" is used. This field is also used for determining which planning lines should be shown in the table part of the window. If you mark this field, Maconomy will include all job budget lines on which the date in the field "First Possible Starting Date" in the window Job Budgets is earlier than the last date of the selected planning section. If you do not mark this field, the date specified in the field "Planned Starting Date" will be used instead of the date in the field "First Possible Starting Date."</p>
<b>Ignore Blank Dates</b>	<p>This field is used in connection with the field "Use Previous Ranges" above. If you mark this field, Maconomy will not include planning lines having a blank value in the field "First Possible Starting Date." Alternatively, if the field "Use Previous Ranges" is not marked, Maconomy will not include planning lines having a blank value in the field "Planned Starting Date."</p>
<b>Resolve Exceeding Task Alloc.</b>	<p>In this field, you can specify the strategy to be used in cases when more hours have been planned on a given task in this window than specified on the job budget line that forms the basis of the planning. If you select a strategy in this field, Maconomy will try to solve the situation by removing the excess hours from one or more of those employees to whom hours on the task have been distributed in one of the following ways:</p> <ul style="list-style-type: none"> <li> <b>Remove Smallest Allocations First</b> — If you select this strategy, Maconomy will remove hours from the employee(s) who have been allocated the fewest number of hours on the task in a slot (if there are allocations of hours which are not provided with a specification of an employee, these allocations will always be removed first).  <p>If, for example, employee A has been allocated a total of 100 hours on the task (with, for example, 0.5 hours on a Friday), and another employee has been allocated a total of 10 hours (2 days of 5 hours), Maconomy will remove the half-hour from employee A, as this is the smallest single allocation.</p> </li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Remove Most Loaded First</b> — If you select this strategy, Maconomy will reduce the number of hours for those employees who have been allocated the most hours, compared to the defined planning time. Allocations of hours with a specification of an employee are removed before allocations without a specification of an employee. When there are more allocations with the same value, Maconomy will select the employees who do not have the employee category specified for the task as their primary category. See the description of planning time in the “Central Concepts of Resource Planning” in the introduction to this module for information about the calculation of planning time.</li> <li>▪ <b>Remove External First</b> — If you select this strategy, Maconomy will reduce the number of hours for the employees who are not assigned to the company being responsible for the job in question, and who are, therefore, regarded as external. In situations where there are several external employees, Maconomy will select the employees who do not have the employee category specified for the task as their primary category. When all task allocations for these employees have been deducted, and if there are still excess task allocations, Maconomy will use the strategy “Remove Most Loaded First” as described above.</li> </ul> <p>As the default, this field has the value specified for the corresponding field in the window System Information. However, the value can be changed manually in this window.</p> <p>Note that if an estimated time-to-completion has been specified for a task, Maconomy will only remove allocations on the task that are after the estimate date. In addition, Maconomy will never remove hours allocated on dates before the date specified in the field “Never Before” in the island Allocation.</p>

### Employee Information Island

Field	Description
<b>Employee No.</b>	This field shows the number of the current employee.
<b>Name</b>	This field shows the name of the employee in the field “Employee No.”

### Plan Island

Field	Description
<b>Start Date</b>	In this field, you can specify the date on which the detailed planning should start.

### Selection Criteria Island

Field	Description
<b>Show Lines</b>	In this field, you can mark whether or not the table part of the window should show the lines matching the criteria specified in this island. For performance reasons, it can be advantageous not to have lines shown before all selection criteria have been specified.
<b>Empl. Category No.</b>	In these fields, you can enter a range of employee category numbers. Only planning lines assigned to employee category numbers within the specified range will be shown in the table part of the window.
<b>Project Manager No.</b>	In this field, you can enter a project manager number. Only planning lines assigned to jobs having the specified employee as project manager will be shown in the table part of the window.
<b>Job No.</b>	In these fields, you can enter a range of job numbers. Only planning lines assigned to job numbers within the specified range will be shown in the table part of the window.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. Only planning lines assigned to company numbers within the specified range will be shown in the table part of the window.
<b>Activity No.</b>	In these fields, you can enter a range of activity numbers. Only planning lines assigned to activity numbers within the specified range will be shown in the table part of the window.
<b>Task</b>	In these fields, you can enter a range of task numbers. Only planning lines assigned to task numbers within the specified range will be shown in the table part of the window.
<b>Booking Type</b>	In this field, you can select one of the three booking types "Preliminary," "Requested," or "Confirmed." Only planning lines having the specified booking type will be shown in the table part of the window and will be affected when you select the actions "Delete Allocations," "Replace Employee," or one of the three actions for converting the booking type. If this field is left blank, planning lines with allocations of any of the three types will be shown in the table part and will be affected by the above actions. For more information about booking types, see "Booking Type."

### Transfer to Slot Island

Field	Description
<b>Started</b>	In this field, you can enter a starting time which you want to transfer to the planning slot. If you enter a starting time in this field, it will be transferred to the planning slot when you change the number of hours for a day on a line in the table part of the window. Once the starting time has been transferred to the planning slot, the field is cleared so that you do not accidentally transfer the starting time to other planning slots. Note that you can only transfer a starting time when the planning unit is "Day." The times can be viewed and edited in the window Employee Calendars.

Field	Description
<b>Finished</b>	In this field, you can enter a finishing time which you want to transfer to the planning slot. For more information, see the description of the field “Started” above. Note that you cannot enter a starting and a finishing time at the same time.
<b>Remarks</b>	In this field, you can enter a remark which you want to transfer to the planning slot. For more information, see the description of the field “Started” above.

## Planning Lines Sub-Tab

This section includes the fields and descriptions for the Planning Lines sub-tab.

Field	Description
<b>Job No.</b>	This field shows the job number assigned to the current planning line, if it has been created on the basis of a job budget. If you create an independent detailed plan, you can enter a job number in this field. If the system parameter “Automatically assign planning lines to budgets” is marked, Maconomy will try to link the manually entered line to an existing line in the latest approved revision of the planning budget, as described in the introduction to the window Detailed Planning.
<b>Empl. Category No.</b>	This field shows the number of the employee category assigned to the current planning line. The current employee must belong to the specified employee category. If the current planning line refers to a job budget line, the employee category number must be the same as the number specified on the job budget line. If no employee category number has been specified on the job budget line, you are free to enter any number in this field. Employee categories are created in the window Employee Categories in the Set-Up module.
<b>Booking Type</b>	<p>In this field, you can specify the type of the allocation on the planning line. The types are “Preliminary,” “Requested,” and “Confirmed.” By specifying a booking type, you can indicate whether the planned hours should be considered tentative or permanent. Allocations of the type “Confirmed” are considered permanent, whereas the less restricted preliminary allocations are preliminary. Requested bookings are allocations that either could not be converted from “Preliminary” to “Confirmed,” or allocations that are to be reviewed by some other person before they are converted to “Confirmed.” See the introduction to the window Detailed Planning for further details.</p> <p>The default value of the field is “Confirmed,” and this type will be suggested for planning lines with no relation to planning budget lines. If the current planning line was created on the basis of a planning budget line, the planning line automatically inherits the allocation type of the related planning budget line. Any subsequent changes made to the allocation type of the related budget line are automatically transferred to the planning line. This means that the value of this field is automatically overwritten with the new type selected for the planning budget line upon approval of the budget line.</p> <p>The value of this field can be changed to “Preliminary” or “Requested” as required, but it can only be changed to “Confirmed” if the current allocation</p>

Field	Description
	<p>does not conflict with other confirmed allocations. If a conflict occurs so that the current allocation and one or more other confirmed allocations would cause the planning time of the current employee to be exceeded, the allocation type of the current line will automatically be set to "Requested." Note that if you change the allocation type, allocations on dates before the date specified in the field "Never Before" will not be converted.</p> <p>If you change the booking type on a planning line from "Confirmed" to "Preliminary," the hours on the line will be reallocated within the time span of the confirmed allocations. However, if the field "Keep Distribution" in the card part is marked, the hours are reallocated as described in this field.</p> <p>Note that you cannot create more than three versions, one of each booking type, of planning lines which are similar, that is, have the same combination of job, activity, task, and employee and/or employee category.</p>
<b>Quantity, Remaining</b>	<p>This field shows the number of hours that remain to be planned after the estimate date, compared to the estimated time-to-completion for the job budget line referring to the current planning line.</p> <p>As an example, 100 hours may be budgeted on a planning budget line. Now 80 hours are planned in the detailed plan before the date 01/03/2004, and 20 hours after 01/03/2004. Then the value of this field is 0, since 100 hours have been planned (and 100 hours are required by the job budget line). Then assume that it is specified on the job budget line that as of 01/03/2004 the estimated time-to-completion is 40 hours. Since only 20 hours have been planned for this task after the date 01/03/2004, it means that an additional 20 hours should be planned. Therefore, this field will now show a quantity of 20.</p> <p>If no such estimate has been made for the planning budget line, this field shows the number of hours that remain to be planned in the detailed planning, compared to the quantity budgeted on the planning line.</p> <p>If the value in this field is less than zero, it means that more hours have been planned than specified on the relating job budget line.</p>
<b>Distribute Quantity</b>	<p>When a number of hours is entered in this field, Maconomy will first remove all distributions already made on the current planning line. Then Maconomy distributes the entered number of hours for the current employee on the current line's job, activity, and task from the entered starting date and ahead in time on the basis of the strategy and distribution method selected in the island Allocation in the card part of the window. This field is automatically reset when Maconomy has distributed the hours.</p> <p>Maconomy distributes the hours on the basis of the principle of avoiding overtime. If this is not possible, Maconomy will try to distribute overtime equally on working days. If this is not sufficient, potential overtime is distributed on days which are typically not working days, such as Saturdays and Sundays. If you have defined that overtime is not allowed in the field "Overtime, Empl." in the window System Information in the Set-Up module, Maconomy will issue an error message if it is not possible to plan the current number of hours without using overtime.</p>

Field	Description
	<p>Note that Maconomy will never distribute so many hours to a given employee on a given date that the total distribution on this date exceeds the employee's maximum number of working hours for the date. The employee's maximum working hours on a given date is found in the employee revision applying on the date in question. For further information about employee revisions, see "Date-Dependent Employee Revisions" in the introduction to the window Employees.</p> <p>In addition, if an estimated time-to-completion has been specified for a given task, Maconomy will never distribute hours on the task before the date specified in the field "Estimate Date" in the table part, regardless of the strategy selected in the card part.</p>
<b>Total</b>	This field shows the total number of hours distributed on the current planning line for the entire plan.
<b>Act. No.</b>	This field shows the activity number assigned to the current planning line if it has been created on the basis of a job budget. If you create an independent detailed plan, you can enter an activity number in this field.
<b>Task</b>	This field shows the task assigned to the current planning line, if it has been created on the basis of a job budget. If you create an independent detailed plan, you can enter a task in this field.
<b>Locked</b>	<p>By marking this field, you specify that the current planning line is "locked." This means that Maconomy will show a warning if you try to delete or move the allocation on the line. Locking is typically used for fixtures such as customer meetings, and so on, which cannot be moved without affecting a third party.</p> <p>In the window Job Planning in the Job Cost module, you can mark a whole task this way. If you do that, all planning lines created on the basis of the task will be marked as locked. You can, however, unmark individual planning lines.</p> <p>Note that you cannot change this field if the planning line is a result of automatic resource allocation in the window Job Planning.</p>
<b>Day 1</b>	<p>This field displays the number of hours during which the current employee should work on the job, activity, and task in question in the first planning unit covered by the plan's planning span.</p> <p>The heading of this field is determined by the format selected in the field "Detailed Plan Column Title Format" in the window System Information in the Set-Up module. The format can be "&lt;weekday&gt; &lt;date&gt;" (for example, "Mon 05-10-2004"), "&lt;weekday&gt; &lt;day in month&gt;" ("Mon 10"), or simply "&lt;day in month&gt;" ("10").</p>
<b>Day 2</b>	<p>This field corresponds to the field "Day 1" described above. If the selected time span is just one day, this field contains the value zero, which cannot be changed.</p> <p>The actual title of the field will be the date following the weekday specified as the starting date in the island Plan.</p>

Field	Description
<b>Day 3-31</b>	The functionality of these fields is similar to that of the field “Day 2” above.
<b>Quantity, Orig.</b>	This field shows the number of hours specified on the job budget line which forms the basis for the current planning line. If the planning line is created automatically by means of the action “Create Plan from Job Budgets,” the value in this field is transferred from the job budget line in question.
<b>Est. Time to Compl.</b>	This field shows the latest approved estimated time-to-completion for the planning budget line on which the current planning line is based. If the field is blank, no estimated time-to-completion has been specified for the planning budget line on which the current planning line is based.
<b>Estimate Date</b>	If an estimate has been specified for the current planning budget line, this field will show the date as of which the estimate applies. If the field is blank, no estimated time-to-completion has been specified for the planning budget line on which the current planning line is based.
<b>Empl. Category Name</b>	This field shows the name of the employee category specified in the field “Empl. Category No.”
<b>Planned Starting Date</b>	In this field, you can enter the planned starting date for the task specified on the current planning line. If this line has been created on the basis of a job budget line, the planned starting date can only be changed on the job budget line in question in the window Job Budgets in the Job Cost module.
<b>Planned Ending Date</b>	The functionality of this field is similar to that of the field “Planned Starting Date.”
<b>First Possible Starting Date</b>	The functionality of this field is similar to that of the field “Planned Starting Date.”
<b>Last Possible Ending Date</b>	The functionality of this field is similar to that of the field “Planned Starting Date.”
<b>First Planned Date</b>	This field displays the date of the first allocation, if any, on the current line.
<b>Latest Planned Date</b>	This field displays the date of the last allocation, if any, on the current line.
<b>Budget Type</b>	This field shows the budget type of the job budget to which the job budget line on the basis of which the current planning line is created.
<b>Budget Revision No.</b>	This field shows the revision number of the job budget line on the basis of which the current planning line is created.

Field	Description
<b>Budget Line No.</b>	If the current planning line is created on the basis on a job budget, this field shows the line number of the job budget line on the basis of which the current planning line was created. Note that if the budget uses a hierarchical table structure, the budget line number will be in "dotted notation," for example "1.2," as described in "Hierarchical Table Part Structure" in the chapter "Getting Started with the Java™ Client."
<b>Description</b>	This field shows the description of the job budget line on the basis of which the current planning line is created. However, the content of this field can be changed manually if the current line was not created on the basis of a job budget line.
<b>Activity Name</b>	This field shows the name of the activity specified in the field "Activity No." on the current line.
<b>Task Description</b>	This field shows the description of the task specified in the field "Task" on the current line.
<b>Job Name</b>	This field shows the name of the job specified in the field "Job No." on the current line.

## Actions

This section shows the Actions available in the Detailed Employee Planning workspace.

### Top Tab

Field	Description
<b>Previous Unit</b>	With this action, you can move the planning span backward in time so that the current plan's starting date will be changed to one planning unit before the existing starting date.
<b>Next Unit</b>	With this action, you can move the planning span ahead in time so that the current plan's starting date will be changed to one planning unit after the existing starting date.
<b>Create Plan from Job Budgets</b>	<p>With this action, you can create a number of planning lines on the basis of a range of job budget lines. If you select this action, Maconomy will look through all jobs that might potentially contribute to new planning lines.</p> <p>When Maconomy decides whether or not a planning line is to be included in the creation of planning lines, the following are considered:</p> <ul style="list-style-type: none"> <li>Only non-completed job budget lines which belong to the latest approved revision of the planning budget for a given job will be included.</li> <li>Only job budget lines covered by the selection criteria in the table part of the window will be included, and only if they have the value specified in the fields "Use Previous Ranges" and "Ignore Blank Dates."</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>■ If no planning lines refer to the current job budget line (neither within nor outside the selected planning span), a planning line will be created. Unless the job budget line contains a specific employee, no employee number will be inserted, and the planner must manually define an employee number. Maconomy will not try to distribute the number of hours in question. Instead, the number of hours on the job budget line will be shown in the field "Quantity, Remain." on the planning line.</li> <li>■ If a planning line already refers to the job budget line in question, Maconomy will calculate the number of hours planned before, as well as after, the selected starting date of the detailed plan. If the number of hours planned before the selected starting date is larger than or equal to the number of hours specified on the job budget line, all distributions assigned to the line after the plan's selected starting date will be removed. Otherwise, Maconomy will create a planning line having the value in the field "Quantity, Remain." as the difference between the number of hours on the job budget line and the number of hours already distributed for this job budget line before the selected starting date of the detailed plan. Note that this might result in a negative quantity in the field "Quantity, Remain.," meaning that the negative quantity must be removed from the plan.</li> <li>■ If the job budget line has been put on hold in the window Job Planning, it will not be considered.</li> </ul>
<b>Replace Employee</b>	<p>When you select this action, Maconomy replaces the employees on planning lines covered by the selection criteria and the date range selected in the island "Delete Allocation" with the employee specified in the field "New Employee No." in the island Replace Allocation. This is done by reallocating all hours on the planning lines in question to the new employee. Only planning lines with the current employee, and which meet the selection criteria and date range specified, will be reallocated.</p> <p>Before performing the replacement, Maconomy first issues a warning informing you how many hours and days will be transferred.</p> <p>If the field "Keep Distribution" in the window Redistribute Allocation is marked, the hours to be reallocated will be directly transferred to the new employee with no changes to the existing allocation of hours on days.</p> <p>Note that the reallocation of hours is only made if the resulting allocations do not conflict with the maximum number of hours for the new employee, as well as any criteria specified on the planning lines or corresponding job budget lines in question. If an employee category has, for example, been specified, replacement is only made if the new employee belongs to the specified category. Likewise, if skill requirements have been specified for job budget lines, and these requirements are not met by the new employee, Maconomy issues a warning.</p> <p>Employees on planning lines originating from job budget lines with an assigned employee cannot be replaced. Note also that you cannot replace employees on automatically allocated planning lines.</p>

Field	Description
<b>Delete Allocations</b>	<p>When you select this action, Maconomy deletes the planning lines in the table part that meet the selection criteria specified in the island "Selection Criteria" and the date range specified in the island "Delete Allocation," for the current employee.</p> <p>Before performing the deletion, the system issues a warning informing you how many hours and days will be deleted.</p> <p>Note that automatically allocated planning lines from the window Job Planning cannot be deleted using this action.</p>
<b>Delete Completed Lines</b>	<p>When you select this action, Maconomy deletes all planning lines which are covered by the selection criteria specified in the island Selection Criteria and which refer to job budget lines marked as "Completed." Job budget lines are marked as completed in the window Job Planning.</p>
<b>Convert to Preliminary</b>	<p>When you select this action, Maconomy converts the allocation types of all planning lines in the table part into "Preliminary." Note that allocations on dates before the date specified in the field "Never Before" will not be converted.</p>
<b>Convert to Requested</b>	<p>When you select this action, Maconomy converts the allocation types of all planning lines in the table part into "Requested." Note that allocations on dates before the date specified in the field "Never Before" will not be converted.</p>
<b>Convert to Confirmed</b>	<p>When you select this action, Maconomy converts the allocation types of all planning lines in the table part from "Preliminary" to "Confirmed."</p> <p>If the conversion of the allocation type on a budget line would conflict with other confirmed allocations for the employee allocated on the line — that is, the current allocation and one or more other confirmed allocations would cause the planning time of the employee on the current line to be exceeded — this line will, instead, be converted into "Requested," and a warning will be issued.</p> <p>Note that allocations on dates before the date specified in the field "Never Before" will not be converted.</p>

## Skill Requirements Workspace

Use this workspace to assign skills to a job's planning budget lines on which you have specified time activities.

You can define the skills that are required for employees to be assigned to a task that you specified in the planning budget.

The tab displays information about the current job budget line and the employee who is assigned to it. In the sub-tab, you can create a list of skill requirements that should be met for the job budget line in question. You can specify whether a skill is mandatory, preferred, undesired, or disallowed, as well as which level of the skill the employee who will perform the work on the task should possess.

The functionality in this workspace also applies to the Job Planning workspace in the Job Cost module. However, in that workspace you can only enter one skill requirement for each budget line. Entering information in the **Skill No.**, **Level**, and **Requirement Type** fields in that workspace

corresponds to creating a line in the Skill Requirements sub-tab in this workspace. If you change a requirement in either of the two workspaces, the change is also reflected in the other workspace.

If you use this workspace together with the Job Planning or Job Budgets workspaces, this workspace automatically displays the job budget line that you are currently browsing in the Job Cost module.

You can modify, delete, or insert from a job budget line a skill requirement if the budget line belongs to the latest budget revision, but you have not yet approved the revision. If you have submitted the budget, Maconomy gives you a warning, and the budget is no longer submitted. Thus you should resubmit it after you modify the skill requirement on the budget line so that it can be approved.

### Skill Requirements Tab

This section includes the fields and descriptions for the Skill Requirements tab.

#### Job Budget Line Island

Field	Description
<b>Job</b>	This field displays the name and number of the job.
<b>Activity</b>	This field displays the name and number of the activity specified on the job budget line.
<b>Task</b>	This field displays the task specified on the job budget line.
<b>Task Description</b>	This field displays the description of the task specified on the job budget line.
<b>Line No.</b>	This field displays the line number of the job budget line.
<b>Description</b>	This field displays a description of the job budget line.
<b>Revision No.</b>	This field displays the revision number of the job budget line.

#### Staffing Island

Field	Description
<b>Employee Category No.</b>	This field displays the number of the employee category specified on the job budget line.
<b>Employee Category Name</b>	This field displays the name of the employee category specified on the job budget line.

Field	Description
<b>Employee No.</b>	This field displays the number of the employee specified on the job budget line.
<b>Name</b>	This field displays the name of the employee specified on the job budget line.

### Skill Requirements Sub-Tab

This section includes the fields and descriptions for the Skill Requirements sub-tab.

Field	Description
<b>Type</b>	This field shows the type of the skill specified in the field "Skill No." on the line.
<b>Skill No.</b>	In this field, you can enter the number of a skill to assign the job budget line to a specific skill. You can enter a skill which is not assigned to the employee specified on the job budget, if any, but Maconomy will issue a warning unless the field "Requirement Type" below has the value "Preferred" or "Undesired." If the value of this field is "Disallowed," a warning is issued if the employee possesses the skill at the level specified in the field "Level" or a level above it. It is not possible to specify a grouping skill in this field.
<b>Skill Name</b>	This field shows the name of the skill specified in the field "Skill No." above.
<b>Level</b>	In this field, you can enter the required level of the skill specified for the job budget line. This means that an employee assigned to the task on the job budget line should possess the skill at this level or better. Note that if you specify a level which does not comply with the one specified for the employee on the job budget line, a warning will be issued.
<b>Requirement Type</b>	<p>In this field, you can specify to what degree employees should possess the skill level to be allowed to be assigned to the task. If an employee has been specified on the job budget line in the card part, Maconomy will issue a warning each time the skill requirement is entered or changed in a way so that the specified employee does not meet the skill requirement. The default value of the field is "Mandatory," but you can choose among the following options:</p> <ul style="list-style-type: none"> <li>▪ <b>Mandatory</b> — If you select this value, only employees possessing the skill at the specified level or higher should be assigned to the task.</li> <li>▪ <b>Preferred</b> — This value means that employees possessing the skill at the specified level or higher are preferred to employees who do not.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Undesired</b> — This option means that employees that either do not possess the specified skill at all or possess the skill at a level below the specified level are preferred to employees who do.</li> <li>▪ <b>Disallowed</b> — If you select this value, only employees that do not possess the skill at the specified level or higher should be assigned to the task. This means that only employees that either do not possess the specified skill at all or possess the skill at a level below the one specified for the skill should be assigned to the task.</li> </ul>
<b>Main Skill 1 No.</b>	This field shows the number of the skill which is the immediate main skill of the current skill.
<b>Main Skill 1 Name</b>	This field shows the name of the skill which is the immediate main skill of the current skill.
<b>Main Skill 2 No.</b>	This field shows the number of the skill which is the main skill of the skill specified in the field "Main Skill 1 No." above.
<b>Main Skill 2 Name</b>	This field shows the name of the skill which is the main skill of the skill specified in the field "Main Skill 1 No." above.
<b>Main Skill 3 No.</b>	This field shows the number of the skill which is the immediate main skill of the skill specified in the field "Main Skill 2 No." above.
<b>Main Skill 3 Name</b>	This field shows the name of the skill which is the immediate main skill of the skill specified in the field "Main Skill 2 No." above.
<b>Main Skill 4 No.</b>	This field shows the number of the skill which is the immediate main skill of the skill specified in the field "Main Skill 3 No." above.
<b>Main Skill 4 Name</b>	This field shows the name of the skill which is the immediate main skill of the skill specified in the field "Main Skill 3 No." above.
<b>Top-level Skill No.</b>	This field shows the number of the top-level skill of the current skill.
<b>Top-level Skill Name</b>	This field shows the name of the top-level skill of the current skill.
<b>Remarks</b>	In this field, you can enter some remarks regarding the current skill requirement.

## Task Staffing Workspace

Use this workspace with the Detailed Planning workspace to perform searches for employees who have skills that match the skill requirements of the tasks that you are planning.

You create these requirements tasks by assigning skills to tasks in the Skill Requirements workspace or in the Job Planning workspace in the Job Cost module. You can also book employees for a specific number of hours within a specific period.

The Task Staffing tab displays a job budget line; use the **Search** action to have Maconomy search for employees who match the skill requirements and employee category specified on that job budget line. You can modify each search using selection criteria, such as available hours and potential overtime for an employee. The Skill Search Results sub-tab shows the results of each search.

When you have found a suitable employee, you can book him or her for a specific number of hours within a specific period. You do this by entering the number of hours, the period, and other booking information in the Booking island, and then using the **Book** action.

When you perform a search, Maconomy takes into account the skills, skill levels, and employee category specified on the job budget line, as well as the available time and potential overtime for each employee. Maconomy also checks whether employees have already been allocated hours on the job budget line by means of the detailed planning, because employees who are already allocated on the task in question are never included in search results. The results of a search show to what degree the employee on the line matches the skill and skill level requirements of the job budget line, including the number of skill level requirements that could not be met and the number of skill level requirements for which the employee is overqualified. It also displays the potential load percentage of the employee in question, as well as any potential extra overtime hours he or she must work if he or she is allocated for the task on the budget line.

Based on this information in the search results, Maconomy automatically finds the employee in the search results who best matches the search criteria if the current planning budget line belongs to the latest approved revision of its job budget. Maconomy prioritizes as follows: The highest skill match percentage of an employee has the highest priority. If two employees have the same skill match percentage, Maconomy gives priority to the employee who has the highest number of hours available. If further criteria are needed to find the best-suited employee, Maconomy prioritizes in the following order: the fewest hours of potential overtime, the highest level match percentage, and the smallest number of unmet skill levels. Maconomy automatically selects the employee who is best suited for the task according to this prioritization to be transferred to the detailed resource planning, but you can select other employees as required. You can then transfer the selected employees in the search results to the detailed resource plan using the **Transfer to Plan** action.

If you have not entered skills and skill levels for the current planning budget line, you can use this workspace to perform searches based on employee search criteria. You can then choose to search for, for example, employees who will not have any potential overtime if you allocate them to the task on the budget line, or employees for whom at least a specific number of hours is available.

Note that the search results only provide an up-to-date picture when the search is performed, and after some time they may no longer be relevant, because some of the employees shown in the Skill Search Results sub-tab may have been allocated for other purposes, or their skills may have been changed in the meantime. In addition, if you change the selection criteria in the Task Staffing tab, the search results in the sub-tab are not automatically updated. To see the results of the modified selection criteria, use the **Search** action again.

You can use the **Allocate Automatically** action to have Maconomy allocate an employee to the current task automatically.

Note that job budget lines that you have put on hold in the Job Planning workspace in the Job Cost module are not displayed in this workspace.

The information in the Task Staffing tab in this workspace is shared with the Browse Employee Skills workspace, where you can perform searches for employees who match up to ten skills and selection criteria, rather than matching the criteria on a job budget line.

### Task Staffing Tab

This section includes the fields and descriptions for the Task Staffing tab.

#### Job Budget Line Island

Field	Description
<b>Job</b>	This field displays the name and number of the job.
<b>Activity</b>	This field displays the name and number of the activity specified on the line.
<b>Task</b>	This field displays the task specified on the job budget line.
<b>Task Description</b>	This field displays a description of the task specified on the job budget line.
<b>Line No.</b>	This field displays the line number of the job budget line.
<b>Employee Category No.</b>	This field displays the number of the employee category assigned to the job budget line.
<b>Employee Category Name</b>	This field displays the name of the employee category assigned to the job budget line.
<b>Description</b>	This field displays a description of the job budget line.
<b>Revision No.</b>	This field displays the revision number of the job budget line.

#### Show Island

Field	Description
<b>Show Lines</b>	When this field is marked, the table part will show the employees who match the criteria set up in the island Employee Criteria, allowing you to book them to the current task.

#### Customer Island

Field	Description
<b>Customer No.</b>	This field displays the customer number.

Field	Description
<b>Name</b>	This field displays the name of the customer.

**Booking Island**

Field	Description
<b>Employee No.</b>	In this field, you can enter the number of the employee to be booked on the current job budget line according to the information in this island when the action "Book" is selected.
<b>No. Hours</b>	In this field, you can specify the number of hours during which the employee specified in the field above should be booked on the current job budget line when the action "Book" is selected.
<b>Method</b>	In this field, you can select a distribution method to be used when the action "Book" is selected. The functionality of the field corresponds to that of the field "Method" in the window Detailed Planning.
<b>Planning Unit</b>	In this field, you can select a planning unit which can be either "Week" or "Day." The planning unit is used if the distribution method selected in the field "Method" above is either "Fixed Allocation" or "Even Allocation" and determines whether the number of hours booked when the action "Book" is selected should be interpreted as the number of hours to be allocated on each day or within each week. If the booking method is "Even Allocation," and the planning unit is "Day," this means that an even number of hours is booked for each day in the relevant range of dates (until the specified number of hours has been booked). If the booking method is "Even Allocation," and the planning unit is "Week," an even number of hours is allocated within each week, but the number of hours booked on the individual days within each week is not necessarily evenly allocated, as the hours are applied to the days as if the distribution method "Early Allocation" had been selected. If the distribution method is "Fixed Allocation," and the planning unit is "Day," the number of hours specified in the field "Hours for Fixed Allocation" is allocated to each day within the relevant range of dates (until the specified number of hours has been booked), while the planning unit "Week" causes the specified number of hours to be allocated to each week, the number of hours booked on the individual days within each week once again being allocated as if the distribution method "Early Allocation" had been selected.
<b>Within Planned Range</b>	If you mark this field, the period within which hours are booked when the action "Book" is selected will be the period from the starting date to the planned ending date of the current job budget line. If you do not mark this field, the period will run from the starting date until the specified number of hours has been booked, regardless of the planned ending date of the budget line. However, in neither case will hours be allocated to dates before the date specified in the field "Never Before" (if any).
<b>Never Before</b>	In this field, you can enter a date to be used as the starting date when Maconomy distributes hours as a result of selecting the action "Book,"

Field	Description
	regardless of whether any starting date on the current job budget line exists. In other words, Maconomy will never distribute hours before the date in this field.
<b>Hours for Fixed Allocation</b>	If the distribution method “Fixed Allocation” has been selected, you must specify the number of hours to be repeatedly allocated to each planning unit in this field. See the above description of the distribution method “Fixed Allocation” for further information on the functionality of this field.
<b>Include Days Off</b>	If you mark this field, Maconomy will include days off for the allocation of the hours allocated when the action “Book” is selected. Specifying that days off should be considered implies that if all hours specified cannot be distributed on working days, including any allowed overtime registered for the employee in question, Maconomy will attempt to distribute any remainder of hours on days off (nonworking days, for example, weekends). If only part of the hours can be allocated this way, Maconomy will issue an error message. If this field is not marked, days off are considered equal to absence days, on which no hours can be allocated to an employee. Note that this option cannot be selected for the distribution method “Fixed Allocation.”
<b>Unattainable</b>	In this field, you can choose how the system should react if the action “Book” is selected, and the requested number of hours cannot be allocated to the employee in question. You can select one of the following options: <ul style="list-style-type: none"> <li>▪ <b>Cancel Allocation</b> — If you select this option, the requested allocation is automatically cancelled, and Maconomy will issue an error message.</li> <li>▪ <b>Allocate Best Number of Hours</b>— If you select this option, Maconomy will attempt to allocate as many hours as possible in accordance with the specifications entered in this window. The hours which could not be allocated will automatically be cut off, and Maconomy will issue a message informing you how many hours were allocated and how many hours were cut off.</li> </ul>

### Workload Island

Field	Description
<b>Quantity</b>	This field shows the number of hours budgeted for the job budget line.
<b>Est. Time to Compl.</b>	This field shows the latest estimated number of hours to completion for the current job budget line. If no progress estimate has been made, the field shows the entire budgeted quantity.
<b>Hereof Planned</b>	This field shows the number of hours that have already been planned for the job budget line in the window Detailed Planning. If an estimate-to-completion has been specified for the budget line, the field shows the number of hours planned on or after the estimate date.
<b>Remains for Planning</b>	This field shows the difference between the values in the fields “Est. Time to Completion” and “Hereof Planned.” This means that if an estimate-to-completion has been specified, this field expresses the number of hours

Field	Description
	remaining to be planned after the estimate date. However, if more hours than estimated to completion have been planned after the estimate date, the value of the field will be zero, instead of a negative amount. If no estimate-to-completion has been specified for the job budget line, this field expresses the number of hours that remain to be planned for the whole period of the job budget line.
<b>Planned Range</b>	These fields show the date range between the planned starting date and the planned ending specified for the job budget line.
<b>Broadest Range</b>	These fields show the date range between the first possible starting date and the last possible ending date specified for the job budget line.

### Employee Criteria Island

Field	Description
<b>Employee No.</b>	In these fields, you can enter a range of employee numbers. Only employees with employee numbers within the specified range will be included in the search results.
<b>Primary Category</b>	If you mark this field, only employees having the employee category specified on the job budget line as primary category will be included in the search results. If no employee category has been specified on the job budget line, all employees matching the remaining criteria in this island will be included in the search results.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. Only employees assigned to companies within the specified range will be included in the search results.
<b>Employee Type</b>	In this pop-up field, you can select an employee type. Only employees belonging to the specified type will be included in the search results.
<b>Department</b>	In this pop-up field, you can select a department. Only employees assigned to the specified department will be included in the search results.
<b>Min. Hours Available</b>	In this field, you can enter a minimum number of hours to specify that the search results should only show employees who are available for at least this number of hours within the time frame specified in the fields "Date Range," and who match the other selection criteria.
<b>Overtime Acceptance</b>	In this field, you can specify to what extent overtime is accepted when Maconomy calculates the hours available for an employee to see if the employee matches the search criteria specified in this island. The option "None" is the default value of the field, but you can select among the following options:

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>None</b> — If you select this strategy, Maconomy will calculate the hours available without taking overtime into account.</li> <li>▪ <b>Moderate</b> — This option means that the hours available are calculated by taking overtime into account. However, overtime is considered only on regular working days, that is, not including weekends and national holidays.</li> <li>▪ <b>High</b> — If you select this option, the hours available are calculated by taking overtime into account. Overtime may be considered for all days, both regular working days and weekends, and so on.</li> </ul> <p>Note that overtime will never be considered on dates for which an employee has been specified as absent in the employee absence calendar. For further information about effective absence calendar lines, see “Calendar Lines Entering into Effect.”</p>
<b>Overtime Threshold</b>	<p>In this field, you can enter a maximum number of overtime hours to be considered when Maconomy calculates the number of hours available for an employee to see if this employee matches the search criteria. If an employee matches the criterion in the field “Min. Hours Available” by taking overtime into consideration, this employee is not considered to match the search criteria if the total amount of overtime exceeds the threshold specified in this field.</p> <p>If you enter a value of “0” in this field, there will be no limit to the number of overtime hours when Maconomy calculates the number of hours available for an employee. If overtime should be entirely disallowed, the field “Overtime Acceptance” should have the value “None.”</p>
<b>Date Range</b>	<p>In these fields, you can enter a date range. The number of available hours and overtime for an employee will be calculated within this date range. Maconomy will automatically suggest the interval between the planned starting date and the planned ending of the job budget line, however with a few exceptions:</p> <ul style="list-style-type: none"> <li>▪ If no planned starting date or planned ending date has been specified on the job budget line, the first possible ending and last possible ending date are used.</li> <li>▪ If, after this, the first date of the interval is blank, today’s date will be used. If the ending date of the interval is blank, this field will default to one month after the starting date of the interval.</li> <li>▪ If the starting date of the interval is before today’s date, this date will default to today’s date, instead. If both the starting date and ending date of the interval are before today’s date, the ending date will default to one month after today’s date.</li> </ul>
<b>Skill Deviation Acceptance</b>	<p>In this field, you can specify which strategy to apply when Maconomy considers skill requirements as one of search criteria determining which employees should be shown in the search results. Employees will be considered to match the skill requirements, and thereby be shown, if the</p>

Field	Description																				
	<p>employees match the other search criteria specified in this window and match the skill requirements according to the value in this field.</p> <p>The option “Moderate” is the default value of the field, but you can select among the following options:</p> <ul style="list-style-type: none"><li>▪ <b>None</b> — If you select this option, Maconomy will only show employees who meet all of the specified skill requirements when performing searches.</li><li>▪ <b>Moderate</b> — This option means that Maconomy will show employees who meet all of the specified skill requirements or employees who do not meet the requirements of the type “Preferred” and “Undesired” when performing searches.</li><li>▪ <b>High</b> — If you select this option, Maconomy will show all employees, disregarding whether or not they meet the specified skill requirements, when performing searches.</li></ul> <p>By selecting a strategy in this field, you can have Maconomy also include employees who do not meet skill requirements in the search. In this case, an employee possessing only a mandatory skill will be taken into account in the search, and the user will be informed that the skill requirements have not been met.</p> <p>The following table shows how the requirement type specified for the job budget line and the strategy selected in the search criteria will together affect search results. The different options of this field are shown horizontally, and the various requirement types are shown vertically. “EL” represents the level possessed by an employee for a given skill, and “SR” is the skill requirement of the job budget line. An employee will be included in the search results shown in the table part if the following criteria are met:</p> <table><tr><th></th><th>None</th><th>Moderate</th><th>High</th></tr><tr><th>Mandatory</th><td>EL ≥ SR</td><td>EL ≥ SR</td><td>Always shown</td></tr><tr><th>Preferred</th><td>EL ≥ SR</td><td>Always shown</td><td>Always shown</td></tr><tr><th>Undesired</th><td>EL &lt; SR</td><td>Always shown</td><td>Always shown</td></tr><tr><th>Disallowed</th><td>EL &lt; SR</td><td>EL &lt; SR</td><td>Always shown</td></tr></table> <p>This can be illustrated by an example: A skill is assigned a level list of the levels 1-5, 5 being the best. A skill requirement is then created for a job budget line with this skill and level 4 being mandatory. If the value of this field is then set to “None,” an employee must have at least level 4 to be included in the search results. If, on the other hand, the value of this field is changed to “High,” the search results will show the employee, regardless of whether or not he meets the skill requirements. For skills which are not assigned a graded level list, “≥” is replaced by “=” and “&lt;” by “!” in the above table, which means that the employee must have exactly the skill level required by the job budget line to be included in the search results.</p>		None	Moderate	High	Mandatory	EL ≥ SR	EL ≥ SR	Always shown	Preferred	EL ≥ SR	Always shown	Always shown	Undesired	EL < SR	Always shown	Always shown	Disallowed	EL < SR	EL < SR	Always shown
	None	Moderate	High																		
Mandatory	EL ≥ SR	EL ≥ SR	Always shown																		
Preferred	EL ≥ SR	Always shown	Always shown																		
Undesired	EL < SR	Always shown	Always shown																		
Disallowed	EL < SR	EL < SR	Always shown																		

**Employee Criteria, Dimensions Island**

Field	Description
<b>Location</b>	In these fields, you can enter a range of location numbers. Only employees assigned to locations within the specified range will be included in the search results.
<b>Entity</b>	In these fields, you can enter a range of entity numbers. Only employees assigned to entities within the specified range will be included in the search results.
<b>Project</b>	In these fields, you can enter a range of projects. Only employees assigned to projects within the specified range will be included in the search results.
<b>Purpose</b>	In these fields, you can enter a range of purposes. Only employees assigned to purposes within the specified range will be included in the search results.
<b>Specification 1-3</b>	In these fields, you can enter a range of specifications. Only employees assigned to specifications within the specified range will be included in the search results.
<b>Local Spec. 1-3</b>	In these fields, you can enter a range of local specifications. Only employees assigned to specifications within the specified range will be included in the search results.

**Skill Search Results Sub-Tab**

This section includes the fields and descriptions for the Skill Search Results sub-tab.

Field	Description
<b>Employee No.</b>	This field shows the number of the employee on the line who matches the skill requirement and selection criteria specified.
<b>Name</b>	This field displays the name of the employee in the field "Employee No." above.
<b>Transfer to Plan</b>	If you mark this field, the employee information on the current line is transferred to the detailed resource plan for the job budget line displayed in the card part when you select the action "Transfer to Plan." When a search is performed by means of the action "Search," Maconomy automatically marks the employee in the search results who matches the search criteria the best and, thus, is suggested as the employee best suited for the job. However, other employees can be marked as required. Employees already planned to work on the job cannot be marked and transferred.
<b>Primary Category No.</b>	This field displays the number of the employee's primary category.
<b>Category Name</b>	This field displays the name of the employee's primary category.

Field	Description
<b>Skill Match %</b>	This field shows for an employee how many of the skills specified on a job budget line he possesses. The degree is displayed as a fraction, calculated as the number of skills possessed by the employee divided by the total number of skills specified on the job budget line.
<b>Hours Available</b>	This field shows the number of hours the employee is available within the date range defined in the selection criteria. Only the number of hours of available planning time is considered.
<b>Required Overtime</b>	This field shows how many hours of overtime the current employee should work to be available for the number of hours required within the specified date range. The overtime hours needed are calculated as the difference between the number of hours the employee is available and the number of hours planned for him in the window Detailed Planning.
<b>Potential Overtime</b>	This field displays the potential number of overtime hours for the current employee within the specified date range, assuming that the number of hours specified in the field "Min. Hours Available" is added to the current workload of this employee. The value in this field is the sum of the existing number of overtime hours for the employee within the specified date range and the number specified in the field "Required Overtime" above.
<b>Potential Load Percentage</b>	<p>This field shows the potential load of the current employee within the specified date range, assuming that the number of hours specified in the field "Min. Hours Available" is added to the current workload of this employee. The higher the number in this field, the greater the workload of the employee. A number that exceeds 100 means that the employee will have to work overtime.</p> <p>The load percentage corresponds to the part of the employee's planning time for which hours have been planned. This means that if the employee's planning time is 30 hours per week, and 15 hours have been planned for the employee in the week in question, this field will contain the value 50 %.</p>
<b>Level Match %</b>	<p>This field shows to what degree the current employee matches the skill levels required on the job budget line. This value is calculated as the average of the level match % of each skill requirement specified for the job budget line. For each requirement, the level match % is calculated as follows:</p> <ul style="list-style-type: none"> <li>■ If the skill level of an employee is exactly as required, the value is 100%. The value will also be 100% if an employee does not possess a skill level which has been specified as undesired or disallowed on the job budget line.</li> <li>■ If the employee does not possess a mandatory or preferred skill at all, the value is 0%.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>Otherwise, the level of the employee in question will be either below or above the mandatory level, and the level match % will be below 100% to indicate that the employee would be either underqualified or overqualified for the task on the job budget line.</li> </ul> <p>In this case, the level match % is calculated by using the calculation value specified in the window Level Lists for each level on the list assigned to the required skill. The calculation value is used to specify the distance between the levels on the list. For the level farthest away from the required level on the list, the level match % is 0%, and for the other levels, Maconomy calculates the level match % as a percentage of the difference between the required level and the current level.</p>
<b>Assigned</b>	This field shows whether the employee is already assigned to this task in Detailed Planning. You cannot change this value.
<b>Assigned in Future</b>	This field displays whether the employee is already assigned to this task in Detailed Planning, but for a future starting date. You cannot change this value.
<b>Number of Skill Deviations</b>	This field displays the number of skill level requirements specified on the current job budget line which cannot be met by the current employee, that is, the employee has been assigned a lower skill level than required for the skills in question. This field is only relevant if the field "Skill Deviation Acceptance" is marked.
<b>Number of Overqualifications</b>	This field displays the number of skill level requirements specified on the current job budget line for which the current employee is overqualified, that is, the employee has been assigned a higher skill level than required for the skills in question. This field is only relevant if the field "Skill Deviation Acceptance" is marked.

## Actions

This section shows the Actions available in the Task Staffing workspace.

### Top Tab

Field	Description
<b>Search</b>	<p>When you select this action, Maconomy searches for employees for the task who match the requirements specified for the current job budget line, and the search criteria entered in the Employee Criteria island. The results of the search are displayed in the sub-tab, and the results of the previous search are deleted.</p> <p>This action excludes employees with the <b>Day</b> time unit.</p>

Field	Description
<b>Reset Search Criteria</b>	When you select this action, the contents of the editable fields of the card part of the window will be cleared.
<b>Reset Search Result</b>	When you select this action, the search results in the table part of the window will be cleared.
<b>Transfer to Plan</b>	<p>When you select this action, Maconomy automatically creates lines in the detailed planning for the employees with a mark in the field "Transfer to Plan" on lines in the table part of the window. Only marked employees on planning budget lines belonging to the latest approved revision of their job budget will be transferred.</p> <p>The transferred employees are automatically allocated on the task specified on the job budget line in the card part of this window. The lines can be viewed and edited in the window Detailed Planning.</p> <p>Employees already planned to work on the job, as well as deleted employees, cannot be marked and transferred.</p>
<b>Book</b>	<p>This action is only available when the current job budget line is part of the latest approved revision of the planning budget of the job in question. When you select this action, Maconomy distributes the number of hours specified in the field "No. Hours" for the employee specified in the island Booking. The hours are allocated on the current job budget line from the entered starting date and ahead in time on the basis of the information in the island Booking. However, no hours are allocated to days before any date specified in the field "Never Before." In addition, if an estimated time-to-completion has been specified for the job budget line, Maconomy will never distribute hours before the estimate date specified for the job budget line, regardless of the strategy and method selected.</p> <p>Maconomy distributes the hours on the basis of the principle of avoiding overtime. If this is not possible, Maconomy will try to distribute overtime equally on working days. If this is not sufficient, potential overtime is distributed on days which are typically not working days, such as Saturdays and Sundays. If you have defined that overtime is not allowed in the field "Overtime, Empl." in the window System Information in the Set-Up module, Maconomy will issue an error message if it is not possible to plan the current number of hours without using overtime.</p> <p>Note that Maconomy will never distribute so many hours to a given employee on a given date that the total distribution on this date exceeds the employee's maximum number of working hours for the date. The employee's maximum working hours on a given date are found in the employee revision applying on the date in question. For further information about employee revisions, see "Date-Dependent Employee Revisions" in the introduction to the window Employees.</p>
<b>Book Automatically</b>	This action is only available when the current task in the card part fulfills the following criteria:

Field	Description
	<ul style="list-style-type: none"> <li>It has a starting date or a latest estimate date.</li> <li>It has an ending date.</li> <li>An allocation method has been selected for the task in the Booking island.</li> <li>It has no more than one associated detailed planning line, which has been created using automatic allocation in the window Job Planning in the Job Cost module.</li> <li>An employee is specified in the island Booking.</li> </ul> <p>When these criteria are met, and you select this action, the employee selected in the card part is automatically allocated to work on the task. If a detailed planning line exists for the task, and it was previously created using automatic allocation, the allocation is deleted and an allocation is created. If the employee on the previously created allocation was different from the employee specified in this window, the previous employee will be substituted with the new one.</p>
<b>Remove from Plan</b>	<p>This action is only available when the current job budget line is part of the latest approved revision of the planning budget of the job in question. When this action is selected, the bookings of the employee specified in the island Booking are removed from the resource plans of the current job budget line. However, only bookings after the date specified in the field "Never Before" are removed.</p>

## Task Search Workspace

Use this workspace to perform searches for tasks that match the availability and skills of a certain employee.

The Task Search tab displays one employee at a time. Use the **Search** action to have Maconomy search for tasks that match the skills and availability defined for the employee in question. You can modify each search via a number of different selection criteria, such as how precisely the tasks should match the skills of the employee, or that the task should require a certain number of hours. The Search Results sub-tab displays the results of each search.

In many respects, this workspace is similar to the Task Staffing workspace. However, the starting point is different: In the Task Staffing workspace, you begin with a task and search for employees who fit the criteria for performing that task. In this workspace, you begin with an employee and search for tasks that match his or her availability and skills profile.

In the following, the term "task" is intended as the equivalent of a job budget line.

When you have found a suitable task for an employee, you can book him or her for a specific number of hours within a specific period by entering the required number of hours for a task in the Task Search tab, specifying the period and various other booking information in the Booking island, and using the **Book** action.

When you perform a search, Maconomy evaluates the lines of the latest approved revision of the planning budget of every job that the selection criteria identify. Maconomy only evaluates lines on which time activities are specified. For every line, Maconomy looks for a task, taking into account

the skills required, the employee category, and the timing information specified on the job budget line, and compares this to the skills and the available time and potential overtime for the employee in the Task Search tab. The results of a search display the degree to which the task on the line matches the skills of the employee, including the number of skill level requirements that are not met and the number of skill level requirements for which the employee is overqualified. It also displays the number of hours as yet unstaffed.

Based on this information in the search results, you can pick the task that suits the employee best. You can then enter the number of hours of the employee's time you want to allocate to each task in the Search Results tab and use the **Book** action to allocate the employee to the tasks in the detailed resource plan.

If you have not entered skills and skill levels for the current planning budget line, Maconomy disregards employees' skills when you perform the search. For instance, you can search for tasks to be completed within a certain date, and where the number of unstaffed hours is less than a particular number of hours.

Note that the search results only provide an up-to-date picture when you perform the search, and after some time they may no longer be relevant because some of the tasks displayed in the Search Results sub-tab may have been allocated to other employees, or their skill specifications may have been changed. In addition, if you change the selection criteria in the Task Search tab, the search results in the sub-tab are not automatically updated. To see the results of the modified selection criteria, use the **Search** action again.

Note that job budget lines that you put on hold in the Job Planning workspace in the Job Cost module are not displayed in this workspace.

## Task Search Tab

This section includes the fields and descriptions for the Task Search tab.

### Employee Information Island

Field	Description
<b>Employee No.</b>	This field shows the number of the current employee.
<b>Name</b>	This field shows the name of the employee.
<b>Primary Employee Category</b>	This field displays the name and number of the primary employee category to which the employee is assigned.

### Booking Island

Field	Description
<b>Method</b>	In this field, you can select a distribution method to be used when the action "Book" is selected. The functionality of the field corresponds to that of the field "Method" in the window Detailed Planning.

Field	Description
<b>Planning Unit</b>	In this field, you can select a planning unit which can be either “Week” or “Day.” The planning unit is used if the distribution method selected in the field “Method” above is either “Fixed Allocation” or “Even Allocation” and determines whether the number of hours booked when the action “Book” is selected should be interpreted as the number of hours to be allocated on each day or within each week. If the booking method is “Even Allocation,” and the planning unit is “Day,” this means that an even number of hours is booked for each day in the relevant range of dates (until the specified number of hours has been booked). If the booking method is “Even Allocation,” and the planning unit is “Week,” an even number of hours is allocated within each week, but the number of hours booked on the individual days within each week is not necessarily evenly allocated, as the hours are applied to the days as if the distribution method “Early Allocation” had been selected. If the booking method is “Fixed Allocation,” and the planning unit is “Day,” the number of hours specified in the field “Hours for Fixed Allocation” is allocated to each day within the relevant range of dates (until the specified number of hours has been booked), while the planning unit “Week” causes the specified number of hours to be allocated to each week, the number of hours booked on the individual days within each week once again being allocated as if the distribution method “Early Allocation” had been selected.
<b>Within Planned Range</b>	If you mark this field, the period within which hours are booked when the action “Book” is selected will be the period from the starting date to the planned ending date of the current job budget line. If you do not mark this field, the period will run from the starting date until the specified number of hours has been booked, regardless of the planned ending date of the budget line. However, in neither case will hours be allocated to dates before the date specified in the field “Never Before” (if any).
<b>Never Before</b>	In this field, you can enter a date to be used as the starting date when Maconomy distributes hours as a result of selecting the action “Book,” regardless of whether any starting date on the current job budget line exists. In other words, Maconomy will never distribute hours before the date in this field.
<b>Hours for Fixed Allocation</b>	If the distribution method “Fixed Allocation” has been selected, you must specify the number of hours to be repeatedly allocated to each planning unit in this field. See the above description of the distribution method “Fixed Allocation” for further information on the functionality of this field.
<b>Include Days Off</b>	If you mark this field, Maconomy will include days off for the allocation of the hours allocated when the action “Book” is selected. Specifying that days off should be considered implies that if all hours specified cannot be distributed on working days, including any allowed overtime registered for the employee in question, Maconomy will attempt to distribute any remainder of hours on days off (nonworking days, for example, weekends). If only part of the hours can be allocated this way, Maconomy will issue an error message. If this field is not marked, days off are considered equal to absence days, on which no hours can be allocated to an employee. Note that this option cannot be selected for the distribution method “Fixed Allocation.”

Field	Description
<b>Unattainable</b>	<p>In this field, you can choose how the system should react if the action “Book” is selected, and the requested number of hours cannot be allocated to the employee in question. You can select one of the following options:</p> <ul style="list-style-type: none"> <li>▪ <b>Cancel Allocation</b> — If you select this option, the requested allocation is automatically cancelled, and Maconomy will issue an error message.</li> <li>▪ <b>Allocate Best Number of Hours</b> — If you select this option, Maconomy will attempt to allocate as many hours as possible in accordance with the specifications entered in this window. The hours which could not be allocated will automatically be cut off, and Maconomy will issue a message informing you how many hours were allocated and how many hours were cut off.</li> </ul>

### Selection Criteria Island

Field	Description
<b>Job No.</b>	<p>In these fields, you can enter a range of job numbers. Only lines from the latest approved revision of the planning budget for jobs with numbers within the specified range will be included in the search results.</p> <p>The entered range will be remembered. That means that if you enter a range, close the window, and open it again, the range will be reentered into these fields. However, the range will only be remembered for the remaining part of the day. This applies to all fields in this island.</p>
<b>Company No.</b>	<p>In these fields, you can enter a range of company numbers. Only budget lines from jobs for which a company within the specified range is the responsible company will be included in the search results.</p>
<b>Primary Cat. Only</b>	<p>If you mark this field, only job budget lines for which an employee category is specified which is equal to the primary employee category of the current employee are included in the search results.</p>
<b>Date Range</b>	<p>In these fields, you can enter a date range. Only budget lines where the planned range (that is, the interval between the planned starting date and the planned ending date) overlaps the date range specified in these fields will be included in the search results. The default date range is from today's date and 30 days ahead.</p>
<b>Unstaffed Hours &lt;</b>	<p>In this field, you can specify a number of hours. Only budget lines where the number of unstaffed hours is less than or equal to the specified number of hours will be included in the search results.</p>
<b>Limit Search Results</b>	<p>If you mark this field, the number of search results will be limited to the number specified in the field “Max. No. of Results” below. Limiting the number of search results makes the search faster, and often it is only relevant to see a limited number of tasks.</p>

Field	Description
<b>Max. Search Results</b>	<p>In this field, you can specify the maximum number of results that you want Maconomy to find. This means that as soon as Maconomy has found the specified number of results, the search is interrupted. Searching for tasks is a complicated routine, and limiting the number of results that Maconomy returns can save the Maconomy server some work, resulting in better overall performance. The default value is 5.</p> <p>Note that the limit specified here is only observed if the field “Limit Search Results” above is marked.</p>
<b>Skill No.</b>	In this field, you can specify a skill number. If you do so, only budget lines for which the specified skill has been entered (either preferred skill or mandatory skill), regardless of skill level, are included in the search results.
<b>Skill Name</b>	In this field, you can specify the name of the skill.
<b>Skill Deviation Acceptance</b>	<p>In this field, you can specify which strategy to apply when Maconomy considers skill requirements as one of search criteria determining which tasks should be shown in the search results.</p> <p>The functionality of this field is similar to that of the field “Skill Deviation Acceptance” in the window Task Staffing.</p>

#### Selection Criteria, Dimensions Island

Field	Description
<b>Location</b>	In these fields, you can enter a range of location numbers. Only budget lines for jobs on which a location with a number within the specified range is specified will be included in the search results.
<b>Entity</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Project</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Purpose</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Specification 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field “Location” above.

## Search Results Sub-Tab

This section includes the fields and descriptions for the Search Results sub-tab.

Field	Description
<b>Unstaffed</b>	This field displays the number of hours still remaining to be staffed for the current task (job budget line).
<b>Book Hours</b>	In this field you can enter the number of hours you want to allocate for the current employee to the task on the current line when the action "Book" is selected. By default, this field shows the number of unstaffed hours (shown in the field "Unstaffed" above). If the number of unstaffed hours is negative (the task is overbooked), this field shows zero hours.
<b>Skill Match %</b>	This field shows the degree to which the current employee possesses the skills required to perform the task on the current line. The degree is displayed as a fraction, calculated as the number of skills possessed by the employee divided by the total number of skills specified on the job budget line.
<b>Level Match %</b>	<p>This field shows the degree to which the current employee matches the skill levels required to perform the task on the current line. The value is calculated as the average of the level match % of each skill requirement specified for the job budget line. For each requirement, the level match % is calculated as follows:</p> <ul style="list-style-type: none"> <li>■ If the skill level of an employee is exactly as required, the value is 100%. The value will also be 100% if an employee does not possess a skill level which has been specified as undesired or disallowed on the job budget line.</li> <li>■ If the employee does not possess a mandatory or preferred skill at all, the value is 0%.</li> <li>■ Otherwise, the level of the employee in question will be either below or above the mandatory level, and the level match % will be below 100% to indicate that the employee would be either underqualified or overqualified for the task on the job budget line.</li> </ul> <p>In this case, the level match % is calculated by using the calculation value specified in the window Level Lists for each level on the list assigned to the required skill. The calculation value is used to specify the distance between the levels on the list. For the level farthest away from the required level on the list, the level match % is 0%, and for the other levels, Maconomy calculates the level match % as a percentage of the difference between the required level and the current level.</p>
<b>Assigned</b>	This field shows whether the employee is already assigned to this task in Detailed Planning. You cannot change this value.

Field	Description
<b>Assigned in Future</b>	This field shows whether the employee is already assigned to this task in Detailed Planning, but for a future starting date. You cannot change this value.
<b>Number of Skill Deviations</b>	This field displays the number of skill level requirements specified on the current job budget line which could not be met by the current employee; that is, the employee has been assigned a lower skill level than required for the skills in question. This field is only relevant if the value of the field "Skill Deviation Acceptance" is other than "None."
<b>Number of Overqualifications</b>	This field displays the number of skill level requirements specified on the current job budget line for which the current employee is overqualified; that is, the employee has been assigned a higher skill level than required for the skills in question. This field is only relevant if the value of the field "Skill Deviation Acceptance" is other than "None."
<b>Job No.</b>	This field shows the number of the job to which the current job budget line belongs.
<b>Job Name</b>	This field shows the name of the job to which the current job budget line belongs.
<b>Empl. Cat. No.</b>	This field shows the number of the employee category specified on the current job budget line.
<b>Empl. Cat. Name</b>	This field shows the name of the employee category specified on the current job budget line.
<b>Act. No.</b>	This field shows the number of the activity specified on the current job budget line.
<b>Description</b>	This field shows the description specified on the current job budget line.
<b>Task</b>	This field shows the number of the task specified on the current job budget line.
<b>Task Description</b>	This field shows the description of the task specified on the current job budget line.
<b>Quantity</b>	This field shows the quantity of hours specified on the current job budget line.
<b>Est. Time to Compl.</b>	This field shows the estimated time-to-completion specified on the current job budget line.
<b>Estimate Date</b>	This field shows the estimate date specified on the current job budget line.
<b>Planned Starting Date</b>	This field shows the planned starting date specified on the current job budget line.

Field	Description
<b>Planned Ending Date</b>	This field shows the planned ending date specified on the current job budget line.
<b>Activity Name</b>	This field shows the name of the activity specified on the current job budget line.
<b>Remarks 1-10</b>	These fields show the remarks specified on the current job budget line.
<b>Booking Type</b>	This field shows the booking type specified on the current job budget line.

## Actions

This section shows the Actions available in the Task Search workspace.

### Top Tab

Field	Description
<b>Search</b>	When you select this action, the previous results shown in the sub-tab are deleted, and Maconomy searches for job budget lines matching the requirements specified for the current employee and the search criteria entered in the Selection Criteria island.  This action only searches for tasks on jobs with the <b>Hour</b> time unit.
<b>Reset Search Criteria</b>	When you select this action, the contents of the editable fields of the card part of the window will be cleared.
<b>Reset Search Result</b>	When you select this action, the search results in the table part of the window will be cleared.

### Bottom Tab

Field	Description
<b>Transfer To Plan</b>	Note that this action is executed for the current line in the table part, that is, the line in which the cursor is placed.  When you select this action, Maconomy creates a planning line in the detailed resource plan, linking the current employee to the current job budget line. No booking is made. If the employee already exists in the detailed resource plan, Maconomy does not create a line.
<b>Book</b>	Note that this action is executed for the current line in the table part, that is, the line in which the cursor is placed.  This action is only available when the current job budget line is part of the latest approved revision of the planning budget of the job in question. When you select this action, Maconomy distributes the number of hours specified in the field "Book

Field	Description
	<p>Hours” for the current employee. The hours are allocated on the current job budget line from the entered starting date and ahead in time on the basis of the information in the island Booking. However, no hours are allocated to days before any date specified in the field “Never Before.” In addition, if an estimated time-to-completion has been specified for the job budget line, Maconomy will never distribute hours before the estimate date specified for the job budget line, regardless of the strategy and method selected.</p> <p>Maconomy distributes the hours on the basis of the principle of avoiding overtime. If this is not possible, Maconomy will try to distribute overtime equally on working days. If this is not sufficient, potential overtime is distributed on days which are typically not working days, such as Saturdays and Sundays. If you have defined that overtime is not allowed in the field “Overtime, Empl.” in the window System Information in the Set-Up module, Maconomy will issue an error message if it is not possible to plan the current number of hours without using overtime.</p> <p>Note that Maconomy will never distribute so many hours to a given employee on a given date that the total distribution for the employee on this date exceeds the employee’s maximum number of working hours for the date. The employee’s maximum working hours on a given date are found in the employee revision applying on the date in question. For further information about employee revisions, see “Date-Dependent Employee Revisions” in the introduction to the window Employees.</p>
<b>Remove from Plan</b>	<p>Note that this action is executed for the current line in the table part, that is, the line in which the cursor is placed.</p> <p>This action is only available when the current job budget line is part of the latest approved revision of the planning budget of the job in question. When this action is selected, the bookings of the current employee are removed from the resource plan of the current job budget line. However, only bookings after the date specified in the field “Never Before” are removed.</p>

## Absence Administration Procedures

The steps below provide a general workflow for the absence management process.

### To manage absences, complete the following steps:

1. Choose a vacation calendar in the filter. All employees using that vacation calendar display in the table part.
2. Select the new period to work within the card part.
3. Select the absence type. Each type of absence must be processed separately. The table part displays the total and remaining allowances for the previous period, with an initial allowance and carry forward days for the selected period.
4. Edit the values for the selected period for each employee, as needed.  
Use the Apply Suggestions wizard to quickly set an initial allowance for the new period for all employees. However, carry forward days must always be entered manually.

5. After you enter the values, you can then submit and approve them, using the appropriate actions. Upon approval, Maconomy makes the new allowance available to the listed employees, while days carried forward are deducted from the previous period and placed in the new one.

**Reopen Action**

After approval is carried out, the values for this period can no longer be changed. If the assigned allowance has not yet been booked yet by the employee, use the Reopen action to undo approval, if needed.

**Booking Vacation**

This process can be carried out either before or after the end of the vacation year. However, employees are not able to book any vacation in the new period until some allowance is assigned.

## Lookup Section

This section includes the fields and descriptions for the Lookup workspaces.

### Browse Employee Skills Workspace

Use this workspace to find employees who have certain skills.

The Browse Employee Skills tab provides the Skill Requirements island, where you can enter up to ten skill requirements as search criteria. You can also modify a search using selection criteria, such as employee category and time available for each employee. However, it is not necessary to specify both skill requirements and employee selection criteria as search criteria to perform a search. Use the **Search** action to perform the search. The Skill Search Results sub-tab displays the search results.

The functionality of this workspace corresponds to that of the Task Staffing workspace, except that this workspace enables you to search for employees who match selection criteria, whereas in the Task Staffing workspace you search for skills that match the criteria on a job budget line. See also the Task Staffing workspace for more information.

The results of a search display for each employee to what degree the employee matches the search criteria, including the number of skill level criteria that are not met and the number of skill level criteria for which the employee is overqualified. It also displays the employee's potential load percentage, as well as any potential extra overtime hours.

Based on this information, Maconomy automatically orders the employees in the search results according to how well they meet the search criteria, displaying the employee with the highest match first in the Skill Search Results sub-tab. When ordering the search results, Maconomy prioritizes as follows: The highest skill match percentage of an employee has the highest priority. If two employees have the same skill match percentage, Maconomy gives priority to the one who has the highest number of available hours. If further criteria are needed to find the best-suited employee, Maconomy prioritizes in the following order: the fewest hours of potential overtime, the highest level match percentage, and the lowest number of unmet skill levels.

The search results only provide an up-to-date picture when the search is performed, and after some time they may no longer be relevant, because some of the employees shown in the Skill Search Results sub-tab may have been allocated for other purposes, or their skills may have been changed. In addition, if you change the selection criteria in the Browse Employee Skills tab,

the search results in the sub-tab are not automatically updated. To see the results of the modified selection criteria, use the **Search** action again.

## Browse Employee Skills Tab

This section includes the fields and descriptions for the Browse Employee Skills tab.

### Skill Requirements Island

Field	Description
<b>Skill No.</b>	In this field, you can enter the number of a skill. The search results will only include employees who possess the level specified in the field "Level" for this skill. You can insert the skill number on any free line, and the information will automatically be moved to the next free line in the island. If you delete a skill number in this field, the entire line will be deleted, and any lines following it will be moved up.
<b>Name</b>	This field shows the name of the skill specified in the field "Skill No." above.
<b>Level</b>	In this field, you can enter the required level for this skill. The search results will only include information on employees who possess the specified level of the skill.
<b>Description</b>	This field shows a description of the specified level.
<b>Requirement Type</b>	<p>In this field, you can specify to what degree employees should possess the skill level specified to be included in the search results. You can choose among the following options:</p> <ul style="list-style-type: none"> <li>▪ <b>Mandatory</b> — If you select this value, only employees possessing the skill at the specified level or higher will be included in the search results.</li> <li>▪ <b>Preferred</b> — This value means that employees possessing the skill at the specified level or higher are preferred to employees who do not, but that all employees are included in the search results if they match the other search criteria specified. Note that this value has the same meaning as the option "Mandatory" if the field "Skill Deviation Acceptance" is set to "None."</li> <li>▪ <b>Undesired</b> — This option means that employees who either do not possess the specified skill at all or possess the skill at a level below the specified level are preferred to employees who do, but that all employees are included in the search results if they match the other search criteria specified. Note that this value has the same meaning as the option "Disallowed" if the field "Skill Deviation Acceptance" is set to "None."</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Disallowed</b> — If you select this value, only employees who do not possess the skill at the specified level or higher will be included in the search results. This means that only employees who either do not possess the specified skill at all or possess the skill at a level below the one specified for the skill will be included in the search results.</li> </ul>
<b>Skill Deviation Acceptance</b>	<p>In this field, you can specify which strategy to apply when Maconomy considers skill requirements as one of the search criteria determining which employees should be shown in the search results. Employees will be considered matching the skill requirements, and thereby be shown, if they match the search criteria specified in this window and match the skill requirements according to the value in this field.</p> <p>The option “Moderate” is the default value of the field, but you can select among the following options:</p> <ul style="list-style-type: none"> <li>▪ <b>None</b> — If you select this option, Maconomy will only show employees who meet all of the specified skill requirements when performing searches.</li> <li>▪ <b>Moderate</b> — This option means that Maconomy will show employees who meet all of the specified skill requirements or employees who do not meet the requirements of the type “Preferred” and “Undesired” when performing searches.</li> <li>▪ <b>High</b> — If you select this option, Maconomy will show all employees, disregarding whether or not they meet the specified skill requirements, when performing searches.</li> </ul> <p>By selecting a strategy in this field, you can have Maconomy also include employees who do not meet skill requirements in the search. In this case, an employee only possessing a mandatory skill will be taken into account in the search, and the user will be informed that the skill requirements have not been met. See also the field “Skill Deviation Acceptance” in the window Task Staffing for examples of how the requirement type specified for the job budget line and the strategy selected in the search criteria will together affect search results.</p>

### Employee Criteria Island

Field	Description
<b>Employee No.</b>	In these fields, you can enter a range of employee numbers. Only employees with numbers within the specified range will be included in the search results.
<b>Employee Category</b>	In these fields, you can enter a category name and number. Only employees assigned to the employee category with this name and number will be included in the search results.

Field	Description
<b>Primary Employee Category</b>	If you mark this field, only employees having the employee category specified in the field "Employee Category No." above as primary category will be included in the search results.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. Only employees assigned to companies with numbers within the specified range will be included in the search results.
<b>Employee Type</b>	In this pop-up field, you can specify an employee type. Only employees assigned to this type will be included in the search results.
<b>Department</b>	In this pop-up field, you can specify a department. Only employees assigned to this department will be included in the search results.
<b>Min. Hours Available</b>	In this field, you can enter a minimum number of hours to specify that the search results should only show employees who are available for at least this number of hours within the time frame specified in the fields "Date Interval," and who match the other selection criteria.
<b>Overtime Acceptance</b>	<p>In this field, you can specify to what extent overtime is accepted when Maconomy calculates the hours available for an employee to see if the employee matches the search criteria specified in this island. The option "None" is the default value of the field, but you can select among the following options:</p> <ul style="list-style-type: none"> <li>▪ <b>None</b> — If you select this strategy, Maconomy will calculate the hours available without taking overtime into account.</li> <li>▪ <b>Moderate</b> — This option means that the hours available are calculated by taking overtime into account. However, overtime is considered only on regular working days, that is, not including weekends and national holidays.</li> <li>▪ <b>High</b> — If you select this option, the hours available are calculated by taking overtime into account. Overtime may be considered for all days, both regular working days and weekends, and so on.</li> </ul> <p>Note that overtime will never be considered on dates for which an employee has been specified as absent on an effective line in the employee absence calendar. For further information about effective absence calendar lines, see "Calendar Lines Entering into Effect."</p>
<b>Overtime Threshold</b>	<p>In this field, you can enter a maximum number of overtime hours to be considered when Maconomy calculates the number of hours available for an employee to see if this employee matches the search criteria. If an employee matches the criterion in the field "Min. Hours Available" by taking overtime into consideration, this employee is not considered to match the search criteria if the total amount of overtime exceeds the threshold specified in this field.</p> <p>If you enter a value of "0" in this field, there will be no limit to the number of overtime hours when Maconomy calculates the number of hours available for</p>

Field	Description
	an employee. If overtime should be entirely disallowed, the field "Overtime Acceptance" should have the value "None."
<b>Date Range</b>	<p>In these fields, you can enter a date range. The number of available hours and overtime for an employee will be calculated within this date range. Maconomy will automatically suggest the interval between the planned starting date and the planned ending of the job budget line, however with a few exceptions:</p> <ul style="list-style-type: none"> <li>▪ If no planned starting date or planned ending date has been specified on the job budget line, the first possible ending and last possible ending date are used.</li> <li>▪ If, after this, the first date of the interval is blank, today's date will be used. If the ending date of the interval is blank, this field will default to one month after the starting date of the interval.</li> <li>▪ If the starting date of the interval is before today's date, this date will default to today's date, instead. If both the starting date and ending date of the interval are before today's date, the ending date will default to one month after today's date.</li> </ul>

#### Employee Criteria, Dimensions Island

Field	Description
<b>Location</b>	The functionality of these fields is similar to that of the fields "Company No." in the Employee Criteria island.
<b>Entity</b>	The functionality of these fields is similar to that of the fields "Company No." in the Employee Criteria island.
<b>Project</b>	The functionality of these fields is similar to that of the fields "Company No." in the Employee Criteria island.
<b>Purpose</b>	The functionality of these fields is similar to that of the fields "Company No." in the Employee Criteria island.
<b>Specification 1</b>	The functionality of these fields is similar to that of the fields "Company No." in the Employee Criteria island.

#### Skill Search Results Sub-Tab

This section includes the fields and descriptions for the Skill Search Results sub-tab.

Field	Description
<b>Employee No.</b>	This field shows the number of the employee on the line who matches the skill requirement and selection criteria specified.
<b>Name</b>	This field displays the name of the employee in the field "Employee No." above.

Field	Description
<b>Transfer to Plan</b>	If you mark this field, the employee information on the current line is transferred to the detailed resource plan for the job budget line displayed in the card part when you select the action "Transfer to Plan." When a search is performed by means of the action "Search," Maconomy automatically marks the employee in the search results who matches the search criteria the best and, thus, is suggested as the employee best suited for the job. However, other employees can be marked as required. Employees already planned to work on the job cannot be marked and transferred.
<b>Primary Category No.</b>	This field displays the number of the employee's primary category.
<b>Category Name</b>	This field displays the name of the employee's primary category.
<b>Skill Match %</b>	This field shows for an employee how many of the skills specified on a job budget line he possesses. The degree is displayed as a fraction, calculated as the number of skills possessed by the employee divided by the total number of skills specified on the job budget line.
<b>Hours Available</b>	This field shows the number of hours the employee is available within the date range defined in the selection criteria. Only the number of hours of available planning time is considered.
<b>Required Overtime</b>	This field shows how many hours of overtime the current employee should work to be available for the number of hours required within the specified date range. The overtime hours needed are calculated as the difference between the number of hours the employee is available and the number of hours planned for him in the window Detailed Planning.
<b>Potential Overtime</b>	This field displays the potential number of overtime hours for the current employee within the specified date range, assuming that the number of hours specified in the field "Min. Hours Available" is added to the current workload of this employee. The value in this field is the sum of the existing number of overtime hours for the employee within the specified date range and the number specified in the field "Required Overtime" above.
<b>Potential Load Percentage</b>	<p>This field shows the potential load of the current employee within the specified date range, assuming that the number of hours specified in the field "Min. Hours Available" is added to the current workload of this employee. The higher the number in this field, the greater the workload of the employee. A number that exceeds 100 means that the employee will have to work overtime.</p> <p>The load percentage corresponds to the part of the employee's planning time for which hours have been planned. This means that if the employee's planning time is 30 hours per week, and 15 hours have been planned for the employee in the week in question, this field will contain the value 50 %.</p>

Field	Description
<b>Level Match %</b>	<p>This field shows to what degree the current employee matches the skill levels required on the job budget line. This value is calculated as the average of the level match % of each skill requirement specified for the job budget line. For each requirement, the level match % is calculated as follows:</p> <ul style="list-style-type: none"> <li>▪ If the skill level of an employee is exactly as required, the value is 100%. The value will also be 100% if an employee does not possess a skill level which has been specified as undesired or disallowed on the job budget line.</li> <li>▪ If the employee does not possess a mandatory or preferred skill at all, the value is 0%.</li> <li>▪ Otherwise, the level of the employee in question will be either below or above the mandatory level, and the level match % will be below 100% to indicate that the employee would be either underqualified or overqualified for the task on the job budget line.</li> </ul> <p>In this case, the level match % is calculated by using the calculation value specified in the window Level Lists for each level on the list assigned to the required skill. The calculation value is used to specify the distance between the levels on the list. For the level farthest away from the required level on the list, the level match % is 0%, and for the other levels, Maconomy calculates the level match % as a percentage of the difference between the required level and the current level.</p>
<b>Number of Skill Deviations</b>	<p>This field displays the number of skill level requirements specified on the current job budget line which cannot be met by the current employee, that is, the employee has been assigned a lower skill level than required for the skills in question. This field is only relevant if the field "Skill Deviation Acceptance" is marked.</p>
<b>Number of Overqualifications</b>	<p>This field displays the number of skill level requirements specified on the current job budget line for which the current employee is overqualified, that is, the employee has been assigned a higher skill level than required for the skills in question. This field is only relevant if the field "Skill Deviation Acceptance" is marked.</p>

## Actions

This section shows the Actions available in the Browse Employee Skills workspace.

### Top Tab

Field	Description
<b>Search</b>	This action searches for employees matching the restrictions on skills and available time in the tab. The result of the search is displayed in the sub-tab. This action excludes employees with the <b>Day</b> time unit.
<b>Reset Search Criteria</b>	When you select this action, the contents of the editable fields of the card part of the window will be cleared.
<b>Reset Search Result</b>	When you select this action, the search results in the table part of the window will be cleared.

## Reporting Section

This section includes the fields and descriptions for the Reporting workspaces.

### Print Employee Load Workspace

Use this workspace to print a report that shows how many hours each employee has been allocated on the relevant jobs.

Maconomy creates this report based on information from the Detailed Planning workspace.

The report shows information as an analysis in three levels, based on user-defined selection criteria that cover time ranges, employees, and jobs. For each of these levels, you can select from the values **Day**, **Week**, **Employee**, **Employee Category**, or **Job**.

The planned number of hours on jobs can, for example, be grouped by week numbers that are grouped by employees, which are again grouped by jobs. In this case, the upper level shows the selected time span, split on weeks. The next level shows the selected employees, by employee number, placed under the relevant week numbers. The third level shows the planned number of hours per job, grouped on employee, split on the relevant week numbers. The following figure shows the selected groupings.

Using the groupings illustrated in this example, the report shows the following totals:

- For the first level, it shows a total for the week (independent of job number and employee), showing the total number of hours available, planned, and at disposal, respectively.
- For the second level, it shows a total for the employee in week number 1 (independent of job number). The total shows the employee's work load percentage for the week, which is the difference between the total number of hours planned for the employee and the planning time of the employee.
- For level three, it shows a workload percentage by job, compared to the employee's total planning time in week number 1. This enables you to see the workload of the employee assigned to the job in question.

In this example, all of the hours shown for the second and third levels are hours that are planned for the week specified in level one. The information on one level is thus always relative to information on higher levels.

Using these three levels and the selection criteria for "Week," "Day," "Employee," "Employee Category," or "Job," you can perform various analyses of the detailed planning, depending on which information you want to include in the analyses.

This enables you to obtain an overview of the number of employees for whom planning has been performed on a particular project and information on the workload for each of these employees. The report thus shows each employee's planning time, time at disposal, and workload percentage.

Because the report includes only planned time for employees, it does not cover planning lines on which an employee has not been specified. Note that if an employee's time is planned directly in the Job Budgets workspace, this information does not appear in the workload report, unless this is also specified on a planning line.

You can delimit the printout to include, for example, only certain jobs, certain employees, or allocations of a certain booking type.

## Print Employee Load Tab

This section includes the fields and descriptions for the Print Employee Load tab.

### Time Selection Criteria Island

Field	Description
<b>Planning Date</b>	In these fields, you can enter a range of planning dates. The printout will only include information on dates within the specified range. If you enter a range of dates and a week in the field "Planning Week/Year," the report will only include the part of the week specified in these fields, if the range of dates does not cover the entire week. If you enter a week number in the field "Planning Week/Year," but no range of dates in these fields, the date will automatically be set to the Monday in the specified week.
<b>Planning Week/Year</b>	In these fields, you can enter a range of planning week/years. The printout will only include information on week/years within the specified range. See also the above description of the field "Planning Date."

### Employee Selection Criteria Island

Field	Description
<b>Employee No.</b>	In these fields, you can enter a range of employee numbers. Only employees with numbers within the specified range will be included on the printout.
<b>Employee Category No.</b>	In these fields, you can enter a range of employee category numbers. Only employees assigned to a primary employee category with a number within the specified range will be included on the printout.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. Only employees assigned to companies with numbers within the specified range will be included on the printout.
<b>Location</b>	In these fields, you can enter a range of locations. Only employees assigned to locations within the specified range will be included on the printout.
<b>Entity</b>	The functionality of these fields is similar to that of the field "Location."
<b>Project</b>	The functionality of these fields is similar to that of the field "Location."
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Location."
<b>Spec.1-3</b>	The functionality of these fields is similar to that of the field "Location." Local Spec. 1-3 The functionality of these fields is similar to that of the field "Location."

## Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.
<b>Level 1</b>	In this pop-up field, you can select the information to be shown on the first level of the printout. You can choose between the options "Week," "Day," "Employee," "Employee Category," or "Job."
<b>Level 2</b>	In this pop-up field, you can select the information to be shown on the second level of the printout. You can choose between the options "Week," "Day," "Employee," "Employee Category," or "Job."
<b>Level 3</b>	In this pop-up field, you can select the information to be shown on the third level of the printout. You can choose between the options "Week," "Day," "Employee," "Employee Category," or "Job."
<b>Load % Above</b>	<p>This field and the field "Load % Below" are used to specify a range of load percentages. An employee's load percentage for a given period is calculated on the basis of the relation between the number of hours planned for the employee in the window Detailed Planning and the employee's planning time.</p> <p>If the value in this field is equal to the value in the field "Load % Below," the printout will include all employees regardless of their load percentage.</p> <p>If the value in this field is less than the value in the field "Load % Below," the printout will include only employees with a load percentage higher than the value in this field and less the value in the field "Load % Below."</p> <p>If the value in this field is higher than the value in the field "Load % Below," the printout will include only employees with a load percentage higher than the value in this field or less than the value in the field "Load % Below."</p>
<b>Load % Below</b>	This field and the field "Load % Above" are used to specify a range of load percentages. See the preceding description of the field "Load % Above" for more information on this functionality of this field.
<b>Include Preliminary Bookings</b>	If you mark this field, allocations of the booking type "Preliminary" will be included in the printout.
<b>Include Requested Bookings</b>	If you mark this field, allocations of the booking type "Requested" will be included in the printout.
<b>Include Confirmed Bookings</b>	If you mark this field, allocations of the booking type "Confirmed" will be included in the printout.

### Job Selection Criteria Island

Field	Description
<b>Job No.</b>	In these fields, you can enter a range of job numbers. The printout will only include employees assigned to jobs within the specified range.
<b>Job Group</b>	In this pop-up field, you can enter a job group. The printout will only include employees assigned to jobs belonging to the selected job group.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. The printout will only include employees assigned to jobs with a responsible company within the specified range.
<b>Sales Rep. No.</b>	In this field, you can enter the number of a sales representative. The printout will only include employees assigned to jobs to which the specified sales representative is assigned.
<b>Project Manager No.</b>	In this field, you can enter the number of a project manager. The printout will only include employees assigned to jobs to which the specified project manager is assigned.
<b>Popup 1-5</b>	In these fields, you can select additional information on jobs. The printout will only include employees assigned to jobs on which the selected pop-up values are specified.
<b>Location</b>	In these fields, you can enter a range of locations. The printout will only include employees assigned to jobs with locations within the specified range.
<b>Entity</b>	The functionality of these fields is similar to that of the field "Location."
<b>Project</b>	The functionality of these fields is similar to that of the field "Location."
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Location."
<b>Spec 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."

## Print Planning Conflicts Workspace

Use this workspace to print a report that provides an overview of jobs that have conflicting or potentially conflicting allocations to employees in the detailed planning.

Conflicts arise in the detailed planning if two or more allocations of the **Confirmed** type to the same employee cause the planning time of this employee to be exceeded, making the employee overbooked. A conflict is potential if the conversion of an allocation from the booking type **Preliminary** or **Requested** to **Confirmed** and other confirmed allocations to the same employee cause this employee to be overbooked. For a description of the different booking types, see the introduction to the Detailed Planning workspace.

Maconomy creates the conflict report based on information from the detailed resource planning and presents the information that it extracts as an analysis in three levels. The report displays information on the levels of job, time, and employee. The time level can be either week or day, depending on the time unit that you define in the selection criteria. The data from the lower levels is grouped by the data from the upper levels.

As illustrated previously, all of the information shown for the second and third levels is for the job identified in level one. The information on one level is thus always relative to information on higher levels.

On the employee level, the conflict information that is displayed covers the number of preliminary, requested, and confirmed allocations of hours; the number of potential overtime hours; the allowed number of overtime hours for the employee; and the potential load percentage—that is, the number of hours of the employee's planning time for which he will be allocated if all of the preliminary allocations for the employee are converted to confirmed allocations.

On the job level, the report displays a list of allocations that conflict with the current job. The conflicting allocations are listed by booking type, that is, **Preliminary**, **Requested**, and **Confirmed** allocations. For each booking type, the report shows for the job in question the number of hours allocated and the potential load percentage of the employee allocated, that is, the load percentage if the employee's involvement in the job is cancelled.

This information on the employee and job levels allows you to foresee conflicts in the period examined. Based on this information, you can take actions to either avoid or try to solve conflicts by redistributing allocations to other employees, or, if the conflicts are potential, by not converting preliminary allocations to confirmed.

In addition to using the three levels, you can modify the report by specifying a planning unit, that is, whether the time unit on level two should be a day or a week. Finally, you can set a lower limit for the load percentage of employees so that only employees who have workloads that are above a certain percentage are included in the report.

## Print Planning Conflicts Tab

This section includes the fields and descriptions for the Print Planning Conflicts tab.

### Selection Criteria Island

Field	Description
<b>Job No.</b>	In these fields, you can enter a range of job numbers. The printout will only include conflict information on jobs within the specified range.
<b>Project Manager No.</b>	In this field, you can enter the number of a project manager. The printout will only include conflict information for jobs to which the specified project manager is assigned.
<b>Date</b>	In these fields, you can enter a range of dates. The printout will only include resource allocations within the specified date range.
<b>Planning Unit</b>	In this field, you can select a planning unit (day or week). The printout will group conflict information for each job by the specified time unit.

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.
<b>Min. Load %</b>	In this field, you can enter a load percentage. The printout will only include employees with a potential load percentage above the specified percentage.
<b>Include Preliminary Conflict Bookings</b>	In this field, you can choose whether or not conflicting allocations of the booking type "Preliminary" should be included in the report.
<b>Include Requested Conflict Bookings</b>	In this field, you can choose whether or not conflicting allocations of the booking type "Requested" should be included in the report.
<b>Include Confirmed Conflict Bookings</b>	In this field, you can choose whether or not conflicting allocations of the booking type "Confirmed" should be included in the report.

### Actions

This section shows the Actions available in the Print Planning Conflicts workspace.

### Top Tab

Field	Description
<b>Print</b>	Use this action to print the planning conflicts report.

## Print Resource Requirement Workspace

Use this workspace to print a report that shows the future resource requirements within given employee categories.

The report shows the planned hours, the available hours, and the requested hours for each employee category. If the employee resources have more available time than the planned tasks require, the report shows a negative requirement, which indicates that there will be a future surplus of available time for employees.

Maconomy creates this report based on information on planning budgets of jobs and the sum of the relevant employees' planning time within a given period. By comparing the number of hours planned but not yet allocated to employees within an employee category on planning budget lines to the available planning time of employees, the report presents you with an analysis of any gaps in future staffing.

The information that Maconomy extracts is presented as an analysis in three levels, based on user-defined selection criteria. The report displays the requirements in the levels of time and

employee category. The time level can be week, month, or quarter. After you define these criteria, the third level, **Job**, is of interest. This level provides you with the information that you need for assessing the importance of meeting the requirements, and groups the requirements by job, by project manager, or by customer, depending on the angle from which you need to examine resource requirements within the specified period.

Either grouping can be the first, second, or third level, but you cannot repeat the same criterion on two different levels. The data from the lower levels is grouped by the data from the upper levels. Note that resource requirements that you entered as unallocated time do not apply to one particular job, and, therefore, only planned time is shown on job-specific and lower levels.

As an example of an analysis, the required number of hours can be grouped by week number, which is grouped by employee category, which is again grouped by job. In this case, the upper level shows the selected time span, the next level shows the selected employee categories placed under the relevant week number, and the last level shows the requested number of hours per job, grouped by employee category, split on the relevant week numbers. The selected groupings are shown in the following figure.

Using the groupings shown in this example, the report shows the following totals:

- For the first level, a total is shown for the week (independent of job number and employee category), displaying the total number of planned, available, and required hours, respectively.
- For the second level, a total is shown for the employee category in week number 1 (independent of job number).
- For level three, the results are shown by job, compared to the total planning time of the employee category in week number 1. This enables you to see the work planned for each employee category for the job in question.

In this example, all of the hours shown for the second and third levels are hours planned and requested for the week specified in level one. The information on one level is, thus, always relative to information on higher levels.

Using these three levels and the selection criteria for **Time**, **Employee**, or **Job**, you can perform various analyses, depending on which information you want to include in the analyses. In this

way, you can extract information in a report that gives you an overview of the future resource requirements within a specified period of time for certain jobs, customers, or project managers. The analysis allows you to foresee any shortcomings in employee resources in the period examined. Based on this information, you can deal with, for example, extra workloads in peak seasons, because you can now foresee how many extra resources are needed according to planned tasks, and then hire free-lance staff.

In addition to using these three levels, you can modify the report by, for example, specifying whether or not it should include only the latest approved budgets and whether it should include allocations of a certain booking type. By specifying a revision code in the job selection criteria you can indicate that only a certain revision of the job budgets should be included. You can also specify whether the probability percentage of the job budgets should be included in the calculation. Finally, you can set an upper or lower limit for what the report should include. This limit applies to each level in the report so that only data that exceeds this limit is shown on the printout. You can, for example, define a lower limit for the resource requirements of ten, which means that the report only displays information on jobs that request more than ten hours of resources.

When Maconomy calculates available time, the report is based on the assumption that the budgeted number of hours is distributed evenly throughout the date range of the job planning. Similarly, the hours that are available within each employee category are assumed to have been allocated evenly within the date range in question. In addition, the report always places available time in each employee's primary category. However, if the selection criteria exclude a specific employee's primary category, available time is reported for each of the categories within the selection criteria to which that employee belongs.

### Print Resource Requirement Tab

This section includes the fields and descriptions for the Print Resource Requirement tab.

#### Time Selection Criteria Island

Field	Description
<b>Date Range</b>	In these fields, you can enter a range of dates. The printout will only include information on dates within the specified range. If you enter a week number in the field "Time Unit/ Year," but no range of dates in these fields, the date will automatically be set to the Monday in the specified week.
<b>Time Range Type</b>	In this pop-up field, you can specify which type of interval to use for the report. The options available are "Week," "Month," or "Quarter."
<b>Time Unit/ Year</b>	In these fields, you can enter a range of weeks, months, or quarters. The printout will only include information within the specified range. See also the description of the field "Time Range" above.

**Employee Selection Criteria Island**

Field	Description
<b>Employee Category No.</b>	In these fields, you can enter a range of employee category numbers. The printout will only include information on resource requirements for employees belonging to employee categories with a number within the specified range.
<b>Employee Type</b>	In this pop-up field, you can select an employee type. The printout will only include information on resource requirements for employees belonging to the specified type.
<b>Department No.</b>	In this pop-up field, you can select a department. The printout will only include information on resource requirements for employees assigned to the specified department.
<b>Company No.</b>	In these fields, you can enter a range of company numbers. The printout will only include information on resource requirements for employees assigned to companies with numbers within the specified range.
<b>Location</b>	In these fields, you can enter a range of locations. The printout will only include information on resource requirements for employee assigned to locations within the specified range.
<b>Entity</b>	The functionality of these fields is similar to that of the field "Location."
<b>Project</b>	The functionality of these fields is similar to that of the field "Location."
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Location."
<b>Spec.1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Primary Category Only</b>	If this field is marked, only hours available within primary categories will be included.

**Print Control Island**

Field	Description
<b>Layout</b>	In this field, you can select which layout to use for the printout. If no additional layouts for the current printout have been added in the window Print Layout in the Set-Up module, "Standard" is the only option.
<b>Level 1</b>	In this pop-up field, you can select the information to be shown on the first level of the printout. You can choose between the options "Time Range," "Employee Category," "Job," "Customer," and "Project Manager."

Field	Description
<b>Level 2</b>	In this pop-up field, you can select the information to be shown on the second level of the printout. You can choose between the options "Time Range," "Employee Category," "Job," "Customer," and "Project Manager."
<b>Level 3</b>	In this pop-up field, you can select the information to be shown on the third level of the printout. You can choose between the options "Time Range," "Employee Category," "Job," "Customer," and "Project Manager."
<b>Resource Requirement Above</b>	In this field, you can enter a number of hours. The printout will only show information on resource requirements which exceed the specified number of hours.
<b>Resource Requirement Below</b>	In this field, you can enter a number of hours. The printout will only show information on resource requirements which are below the specified number of hours.
<b>Include Preliminary Bookings</b>	If you mark this field, allocations of the booking type "Preliminary" will be included in the printout.
<b>Include Requested Bookings</b>	If you mark this field, allocations of the booking type "Requested" will be included in the printout.
<b>Include Confirmed Bookings</b>	If you mark this field, allocations of the booking type "Confirmed" will be included in the printout.

### Job Selection Criteria Island

Field	Description
<b>Job No.</b>	In these fields, you can enter a range of job numbers. The printout will only include information on resource requirements for jobs within the specified range.
<b>Job Group</b>	In this pop-up field, you can enter a job group. The printout will only include information on resource requirements for jobs belonging to the selected job group.
<b>Project Manager No.</b>	In this field, you can enter the number of a project manager. The printout will only include information on resource requirements for jobs to which the specified project manager is assigned.
<b>Customer Group</b>	In this field, you can enter a customer group. The printout will only include information on resource requirements for jobs to which customers within the specified customer group are assigned.
<b>Customer No.</b>	In these fields, you can enter a range of customer numbers. The printout will only include information on resource requirements for jobs to which

Field	Description
	customers with customer numbers within the specified range are assigned.
<b>Popup 1-5</b>	In these fields, you can select additional information on jobs. The printout will only include information on resource requirements for jobs on which the selected pop-up values are specified.
<b>Company No.</b>	In these fields, you can specify a range of company numbers. The printout will only include information on resource requirements for jobs assigned to responsible companies with company numbers within the specified range.
<b>Location</b>	In these fields, you can enter a range of locations. The printout will only include information on resource requirements for jobs with locations within the specified range.
<b>Entity</b>	The functionality of these fields is similar to that of the field "Location."
<b>Project</b>	The functionality of these fields is similar to that of the field "Location."
<b>Purpose</b>	The functionality of these fields is similar to that of the field "Location."
<b>Spec 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location."
<b>Budget Revision Code</b>	In this field, you can enter the number of a revision code. The printout will include information on the specified revision code of the job budgets. If you do not mark this field, the report will include information on the latest job budget revisions.
<b>Latest Appr. Budget</b>	If you mark this field, the printout will only include information on resource requirements from job budgets belonging to the latest approved revision.
<b>Include Probability</b>	If this field is marked, the requirement will be calculated as hours budgeted, multiplied by the probability % of the jobs in question.

## Set-Up Section

This section includes the fields and descriptions for the Set-Up workspaces.

### Level Lists Workspace

Use this workspace to create lists of levels that define a number of skill grading scales.

This can be practical if two employees possess the same skill, but at different levels. For example, two employees might speak Japanese, but not equally fluently. By assigning a list of

levels to each skill you can specify to what degree each employee possesses the skill. Skill levels could, for example, be **Novice**, **Some**, **Fluent**, and **Expert**.

When you create a skill level list, you provide a name and a grading method. The list can be graded or nongraded, depending on the nature of the skill levels that the list covers. You then create the levels in the Levels sub-tab.

A level list such as **Novice**, **Some**, **Trained**, and **Experienced** constitutes a graded list; **Experienced** is clearly a better level than **Novice**. However, in other cases it does not make sense to grade the skill levels. For the skill **Driver's License**, for example, it is not necessary to indicate how well employees master the skill, but merely whether they possess the skill or not. You would likely assign to this skill a nongraded level list consisting of the levels **Yes** and **No**.

In the Levels sub-tab, for each level you must provide a calculation value. This value is relevant for graded level lists and is used to define the distance between the levels on the list when Maconomy performs a number of calculations. As you create the levels in the list, Maconomy automatically orders the levels in the list according to their calculation values, inserting the level with the lowest calculation value first. Note that for lists graded by the method **Best First**, a low calculation value is best, whereas for lists using the method **Best Last**, a high calculation value is best.

You can insert into and delete levels from a list. However, if you insert a level into a list, the calculation value of the existing levels following the new one is increased by one. If you delete a level, the calculation value of the following levels is reduced by a value corresponding to the difference between the level that you delete and the level that immediately follows it.

You assign level lists to skills in the Skills workspace. If you apply a graded level list to skills that you set up in a skill hierarchy, you can tell Maconomy to calculate a level for a skill. For more information on skill hierarchies and automatic level calculation, see the Skills workspace.

## Level Lists Tab

This section includes the fields and descriptions for the Level Lists tab.

### Level List Island

Field	Description
<b>Name</b>	In this field, you can specify the name of the level list.
<b>Description</b>	In this field, you can enter a description of the level list.
<b>Grading Method</b>	<p>In this field, you can specify whether or not the levels assigned to the level list should be graded. The default value of the field is "Best last," but you can change this value, as no skills are assigned to the list. The options for this field are:</p> <ul style="list-style-type: none"> <li>▪ <b>Non-graded</b> — If you select this option, the levels of the level list are not graded, and it will not be possible to have Maconomy calculate the average level for skills assigned to this level list.</li> </ul>

Field	Description
	<ul style="list-style-type: none"> <li>▪ <b>Best First</b> — If this option is selected, the levels assigned to the level list are graded. This means that the levels which occur first in the list are considered better than the last ones.</li> <li>▪ <b>Best Last</b> — If this option is selected, the levels assigned to the level list are graded. The levels which occur last in the list are considered better than the first ones.</li> </ul>

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In these fields, you can assign the level list to an access level. A user only has access to the level list (and thereby use of the levels in the level list) if he has been assigned to this level or a level above this in the window User Access Levels. This access control ensures that when working with skills, you can only assign a level list to skills to which you have access, and in this window you can only see and edit the level lists to which you have access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to levels and level lists may depend on other factors. For further information about the standard access control configuration, see “Introduction to the Access Control System” in the Set-Up module.</p> <p>If you do not specify an access level, any user has access to the levels available in the level list. You can only specify an access level to which you have access yourself.</p>

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

### Levels Sub-Tab

This section includes the fields and descriptions for the Levels sub-tab.

Field	Description
<b>Level</b>	In this field, you can enter the name of the level on the current line.
<b>Description</b>	In this field, you can enter a description of the level on the current line.
<b>Calculation Value</b>	If the level list is graded, that is, the option in the field “Grading Method” is either “Best first” or “Best last,” you can specify a calculation value in this field. This value is used when the system calculates to what degree an employee matches the skill requirements on a job budget line in the windows Task Staffing and Browse Employee Skills, as well as for calculations in connection with automatic level specification.

Field	Description
	<p>By default, the value of the field will be “1” on the first line of the level list, “2” on the second line, and so forth, but the default value can be changed. However, the calculation values of the list must always be in increasing order. For a level list for which the field “Grading Method” is set to “Best first,” this means that a low calculation value corresponds to a better level than a high calculation value, whereas for a list with the option “Best last,” a high calculation value represents a better level than a low calculation value.</p> <p>If the calculation value is changed, an employee associated with a skill assigned to this level list will have the level of that skill reevaluated for levels being automatically calculated. This reevaluation may imply that an employee who previously matched a skill requirement no longer matches that requirement and vice versa.</p>

## Skills Workspace

Use this workspace to create skills for planning purposes.

When you create a skill, you must provide a type for the new skill. Examples of types could be **Languages**, **Travel Preferences**, or **Technical**, but you can create other types. In addition, you must specify which level list to apply. You can then assign the skill to employees in the Employee Skills workspace, where for each employee you can specify at which level he or she possesses the skill.

If you have entered this skill information, you can specify on a planning budget that only employees who have specific skills at a certain level should be allocated to a task when you perform detailed planning. You do this in the Skill Requirements workspace.

In the Skill Hierarchy island, you can structure skills in a hierarchy to define whether a skill represents a general knowledge of a field or is highly specialized. This workspace shows a line for each skill that is a subskill of the current skill. When you create a skill, you can place it in a hierarchy by entering a main skill for the skill in this island. If this main skill is in a hierarchy itself, the hierarchy is adjusted to include the new skill. If, for example, the main skill is in a hierarchy with one main skill above it, this becomes the top-level skill of the new skill, and it is shown in this island.

Two different skills in a skill hierarchy do not need to use the same level list, so you can, for example, use one level list for very specialized skills and another level list for more general skills.

If you use a graded level list in a skill hierarchy, you can have Maconomy automatically deduce a level for skills at a higher hierarchy level, provided that the skills apply the same level list. For more information on skill hierarchies, see “Skills” in the introduction to the module.

You can delete a skill if you have not associated the skill with an employee or a skill requirement. If you delete a skill that has subskills, Maconomy gives you a warning, and it updates the skill hierarchy to which it belongs so that all of the subskills of the skill are moved up in the hierarchy. The skills that are immediate subskills of the current skill become subskills of the main skill to the deleted skill. If the current skill has no main skill, each of the subskills becomes a top-level skill of its own skill hierarchy. You change the status of a subskill by editing the **Main Skill** field in the Skills tab in this workspace.

You can print skills out by number and/ or type.

## Skills Tab

This section includes the fields and descriptions for the Skills tab.

## Skill Island

Field	Description
<b>Skill</b>	In these fields, you specify the name and number of the skill.
<b>Type</b>	In this field, you can specify the type of the skill. Skills types are created in the window Popup Fields.
<b>Grouping Skill</b>	If you mark this field, the skill is only intended for grouping other skills in a skill hierarchy and cannot be assigned to an employee, just as it should not be assigned a level list. For example, a skill could be used as the general denominator "Databases" for a number of subskills concerning specific databases. In this case, "Databases" denotes a skill group, and it would not be possible to assign an employee with this skill, whereas the employee could be assigned to one or more of the subskills.

## Skill Hierarchy Island

Field	Description
<b>Level</b>	This field displays the level at which the skill is placed in the skill hierarchy to which it is assigned. If the skill is at the top level of the skill hierarchy, the value of this field is "1." A skill without subskills or main skills, that is, which is situated in a hierarchy with just this one skill, will also belong to level 1.
<b>Number of Subskills</b>	This field displays the number of subskills of the skill, that is, the number of skills immediately below the skill in the skill hierarchy. If the value of this field is "0," the skill is at the bottom of the hierarchy.
<b>No.</b>	This field displays the skill number of the main skills of the skill in the fields "Main Skills 1-4" and "Top-level Skill" below.
<b>Name</b>	This field displays name of the main skills of the skill in the fields "Main Skills 1-4" and "Top-level Skill" below.
<b>Main Skill 1</b>	In this field, you can specify a main skill for the skill. The main skill should be the skill immediately above the current skill in the skill hierarchy. This means that you cannot enter the current skill or any subskills to it in this field. If the current skill has been assigned to any employees, the value of this field cannot be changed.
<b>Main Skill 2</b>	This field shows the main skill of the skill in the field "Main Skill 1" above. If no parent exists at this level, this field will be empty.
<b>Main Skill 3</b>	This field shows the main skill of the skill in the field "Main Skill 2" above. If no parent exists at this level, this field will be empty.
<b>Main Skill 4</b>	This field shows the main skill of the skill in the field "Main Skill 3" above. If no parent exists at this level, this field will be empty.

Field	Description
<b>Top-level Skill</b>	This field shows the top-level skill of the current skill. If the skill is at level 1 in the skill hierarchy, this field will be empty.

### Level Specification Island

Field	Description
<b>Level List</b>	In these fields, you specify which level list to apply for the skill using the skill name and number. You can change the values of these fields as long as no employees have been associated with the skill and no skill requirements refer to this skill. If the current skill has been marked as a grouping skill in the field "Grouping Skill," the skill should not be assigned a level list.
<b>Automatic Level Specification</b>	<p>In this field, you can specify whether Maconomy should automatically calculate a level for the skill, if it is positioned above the bottom level in a skill hierarchy. The default value of this field is "Blank," but you can choose among the following options:</p> <ul style="list-style-type: none"> <li>▪ <b>Blank</b> — This option means that automatic level specification will not be used, and that a level for the skill must be specified manually by the user.</li> <li>▪ <b>Lowest Level</b> — This value means that the level of this skill will automatically be set to the lowest level specified for all of its subskills for a given employee.</li> <li>▪ <b>Average Level</b> — If you select this value, the level of the skill will automatically be set to the average of the levels of all of its subskills for a given employee. If a subskill in the hierarchy is not possessed by the employee, this subskill is weighted as follows: If the bottom skill in the hierarchy uses the lowest level on the level list, the subskill will be assigned this level. Otherwise, Maconomy will use the calculation values of the levels on the level list to calculate the average difference of the levels between the bottom skill and the lowest level on the list. This value is then subtracted from the level of the bottom skill, and the results will be assigned to the subskill.</li> </ul> <p>If you have selected a strategy in this field, you do not need to specify a level of this skill on employees, as the level is automatically derived, provided that you have assigned at least one subskill of the hierarchy to an employee in the window Employee Skills. As an example, imagine a simple hierarchy with three skills: Skill (1) has the subskills (2) and (3), and they apply a level list consisting of the levels "1"-8." If an employee is given level 6 for skill (2) and level 8 for skill (3), the system automatically calculates a level for skill (1), if you select a strategy in this field on skill (1). If you select the value "Average Level," for instance, skill (1) is automatically given level 7 for this employee.</p>

Field	Description
	You cannot use automatic level specification for a skill if it is assigned a nongraded level list, or if any of its subskills apply a level list which is different from the one specified for this skill.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In these fields, you can assign the skill to an access level. A user only has access to the skill if he has been assigned to this level or a level above this in the window User Access Levels. This access control ensures that when working with skills, you can only assign a level list to skills to which you have access, and in this window you can only see and edit the skills to which you have access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to levels and level lists may depend on other factors. For further information about the standard access control configuration, see "Introduction to the Access Control System" in the Set-Up module.</p> <p>If you do not specify an access level, any user has access to the skill. You can only specify an access level to which you have access yourself.</p>

## Employee Skills Workspace

Use this workspace to specify an employee's skills.

You can assign to each employee one or more skills and a rating for each of them.

You create this rating by defining a list of levels that specifies for each employee the degree to which he or she has mastered the skill in question. The tab includes general information about the employee, and the sub-tab displays a list of the skills that the employee in question possesses, sorted by skill types.

You can require that a task be performed by an employee who has specific skills at a certain level. You do this in the Skill Requirements workspace by assigning skills to jobs' planning budgets lines on which you have specified time activities. When you allocate hours on a task for an employee in the Detailed Planning workspace, Maconomy checks whether the employee in question has the skills required for the task that you specified on the current job budget line. Similar functionality applies in the Job Cost module, so that when you approve a job's planning budget, Maconomy checks each new or modified skill requirement against the employees who are allocated to perform the tasks specified on the lines.

Note that if you delete a skill level for an employee who has been allocated hours in the detailed planning on lines that require that he or she possesses the skill at this level, Maconomy issues a warning.

## Employee Skills Tab

This section includes the fields and descriptions for the Employee Skills tab.

### Employee Information Island

Field	Description
<b>Employee No.</b>	This field shows the number of the employee.
<b>Name</b>	This field displays the name of the employee.
<b>Blocked</b>	This field displays whether or not the employee is blocked for registration.
<b>Position</b>	This field displays the position of the employee. The information originates from the window Employees in the Set-Up module.
<b>Profession</b>	The functionality of this field is similar to that of the field "Position" above.
<b>Education</b>	The functionality of this field is similar to that of the field "Position" above.
<b>Date Employed</b>	The functionality of this field is similar to that of the field "Position" above.
<b>Termination Date</b>	The functionality of this field is similar to that of the field "Position" above.
<b>Department</b>	The functionality of this field is similar to that of the field "Position" above.
<b>Primary Employee Category No.</b>	The functionality of this field is similar to that of the field "Position" above.
<b>Employee Type</b>	The functionality of this field is similar to that of the field "Position" above.

### Company Island

Field	Description
<b>Company</b>	These fields display the name and number of the company to which the employee is assigned.

### Extra Fields Island

Field	Description
<b>Popup 1-5</b>	These fields display the contents of the fields "Popup 1" to "Popup 5" assigned to the employee in the card part of the window Employees in the Set-Up module.

## User Island

See the chapter “Getting Started” for a description of the fields in the User island.

## Employee Skills Sub-Tab

This section includes the fields and descriptions for the Employee Skills sub-tab.

Field	Description
<b>Skill Type</b>	This field shows the type of the skill specified in the field “Skill No.” on the line.
<b>Skill No.</b>	By entering the number of a skill in this field, you can assign the employee to a skill.
<b>Skill Name</b>	This field shows the name of the skill.
<b>Level</b>	<p>In this field, you can enter the level of the current skill to specify how well the employee masters the skill. The level must be an option included in the level list assigned to the skill.</p> <p>If automatic level specification has been selected for this skill in the window Skills, the level of the skill will automatically be calculated, provided that at least one of its subskills has also been associated with the employee. Maconomy will recalculate the level of the skill if one or more of the subskills are associated with the employee, or if the level of one of its subskills is changed. The value of the field cannot be changed by the user, unless there are no subskills associated with this skill. If the skill has no subskills, the level of the skill must be specified manually in this field.</p>
<b>Skill Acquired On</b>	In this field, you can enter the date when the employee acquired the current skill.
<b>Level Acquired On</b>	In this field, you can enter the date when the employee acquired the current skill level. If the current level is changed, this field will be changed to today’s date by default, but you can change the date.
<b>Main Skill 1 No.</b>	This field shows the number of the skill which is the immediate main skill of the current skill.
<b>Main Skill 1 Name</b>	This field shows the name of the skill which is the immediate main skill of the current skill.
<b>Main Skill 2 No.</b>	This field shows the number of the skill which is the immediate main skill of the skill specified in the field “Main Skill 1 No.” above.
<b>Main Skill 2 Name</b>	This field shows the name of the skill which is the immediate main skill of the skill specified in the field “Main Skill 1 No.” above.
<b>Main Skill 3 No.</b>	This field shows the number of the skill which is the immediate main skill of the skill specified in the field “Main Skill 2 No.” above.
<b>Main Skill 3 Name</b>	This field shows the name of the skill which is the immediate main skill of the skill specified in the field “Main Skill 2 No.” above.

Field	Description
<b>Main Skill 4 No.</b>	This field shows the number of the skill which is the immediate main skill of the skill specified in the field "Main Skill 3 No." above.
<b>Main Skill 4 Name</b>	This field shows the name of the skill which is the immediate main skill of the skill specified in the field "Main Skill 3 No." above.
<b>Top-level Skill No.</b>	This field shows the number of the top-level skill of the current skill.
<b>Top-level Skill Name</b>	This field shows the name of the top-level skill of the current skill.
<b>Course No.</b>	In this field, you can enter the number of a course. This is the course which qualified the current employee for the skill on the current line.
<b>Course Name</b>	This field shows the name of the course which qualified the employee for the current skill.
<b>Remarks</b>	In this field, you can enter some remarks regarding the current employee skill.

## SD\_RP\_Employee\_SkillsWS\_Actions

This section shows the Actions in the Employee Skills workspace.

### Top Tab

Field	Description
<b>Import Empl. Skills from Talent Management</b>	Use this action to import an employee's skills from Talent Management, and create a background task to add, update, or remove an employee's skills in Maconomy.

## Absence Types Workspace

Use this workspace to create and maintain absence types for employee absences.

Use absence types to specify the type of absence entered in the Employee Absence Calendars workspace in the Resource Planning Module.

In the Absence Type Derivations sub-tab, you can specify on which dimensions absence can be entered if Maconomy creates time sheet lines automatically from approved absences (see the "Automatically Create Time Sheet Lines from Approved Absence" system parameter).

## Absence Type Tab

This section includes the fields and descriptions for the Absence Type tab.

### Absence Type Island

Field	Description
<b>Title</b>	This field shows the title of the absence type.
<b>Company</b>	This field shows the company number of the absence type. If no company number is entered, the settings apply to all employees for whom there is no company-specific Absence Type.
<b>Description</b>	This field shows a description of the absence type.

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

## Absence Type Derivations Sub-Tab

This section includes the fields and descriptions for the Absence Type Derivations sub-tab.

Field	Description
<b>Description</b>	This field shows a description of the absence type.
<b>Job No. (Derived)</b>	An absence time sheet line will get this job number.
<b>Task (Derived)</b>	An absence time sheet line will get this task name.
<b>Activity No. (Derived)</b>	An absence time sheet line will get this activity number if not overwritten upon derivation.
<b>Location (Derived)</b>	An absence time sheet line will get these dimension values if not overwritten upon derivation.
<b>Entity (Derived)</b>	An absence time sheet line will get this Entity dimension value if not overwritten upon derivation.
<b>Project (Derived)</b>	An absence time sheet line will get this Project dimension value if not overwritten upon derivation.
<b>Purpose (Derived)</b>	An absence time sheet line will get this Purpose dimension value if not overwritten upon derivation.
<b>Spec 1 – 10 (Derived)</b>	An absence time sheet line will get these Specification 1 to 10 dimension values if not overwritten upon derivation.

Field	Description
<b>Local Spec. 1 – 10 (Derived)</b>	An absence time sheet line will get these Local Spec. 1 to 10 dimension values if not overwritten upon derivation.
<b>Valid From</b>	In this field the administrator can add a date from which the line criteria are valid.
<b>Valid To</b>	In this field the administrator can add a date to which the line criteria are valid.
<b>From Company No.</b>	Employees belonging to this company will match the criteria.
<b>To Company No.</b>	Employees belonging to this company will match the criteria.
<b>From Supervisor No. – To Supervisor No.</b>	Employees having a supervisor with an employee number in this range will match the criteria.
<b>From Employee No. – To Employee No.</b>	Employees having a number in this range will match the criteria.
<b>Employee Type</b>	In this field you can select an employee type.
<b>Department</b>	In this field you can select a department.
<b>From Location – To Location</b>	Employees having a Location dimension in this range will match the criteria.
<b>From Entity – To Entity</b>	Employees having an Entity dimension in this range will match the criteria.
<b>From Project – To Project</b>	Employees having a Project dimension in this range will match the criteria.
<b>From Purpose – To Purpose</b>	Employees having a Purpose dimension in this range will match the criteria.
<b>From Spec. 1-10 – To Spec. 1-10</b>	Employees having Specification 1 to 10 dimensions in these ranges will match the criteria.
<b>From Local Spec. 1-10 – To Local Spec. 1-10</b>	Employees having Local Spec. 1 to 10 dimensions in these ranges will match the criteria.

## Vacation Calendars Workspace

Use this workspace to set up vacation calendars and vacation periods.

Absence is managed on a periodic basis. Each employee is assigned a vacation calendar which defines periods where absence accounting takes place. At any time before or during a period,

you can perform a batch-mode, year-end process to adjust or grant an initial allowance to employees and transfer days from the previous period to the next one. You can also import balances using standard Maconomy import functionality.

Vacation calendars are used to define periods in which absence can be booked. A vacation period can correspond to a calendar year (such as from January to December) or cover an arbitrary period (such as a fiscal period that runs from the beginning of May to end of following April), depending on how vacation is managed in a given company. A vacation calendar can be global or company-specific.

Vacation calendars also hold certain settings which determine how allowance and booking are handled. These are defined for each period separately.

Use the **Vacation Calendars tab** to add or modify existing vacation calendars, including adding the availability of different absence types.

Use the **Vacation Period tab** to add or modify existing vacation periods that are used in the calendars, such as setting period start and end dates.

## Vacation Calendar Tab

This section includes the fields and descriptions for the Vacation Calendars tab.

Field	Description
<b>Vacation Calendar No.</b>	Enter the number that identifies the vacation calendar.
<b>Description</b>	Enter a description for the vacation calendar.
<b>Company No.</b>	Enter a company number for the vacation calendar. If no company number is specified, this vacation calendar is a global one that can be used by employees in any company. Otherwise, the calendar can only be used by employees in the specified company.
<b>Open Code</b>	This field specifies the code to use for color-coding absence for restricted types in the calendar when the absence has not yet been submitted. If no value is specified, the default code is "1."
<b>Submitted Code</b>	This field specifies the code to use for color-coding absence for restricted types in the calendar when the absence has been submitted, but not yet approved. If no value is specified, the default code is "2."
<b>Rejected Code</b>	This field specifies the code to use for color-coding absence for restricted types in the calendar when the absence has been rejected. If no value is specified, the default code is "3."
<b>Approved Code</b>	This field specifies the code to use for color-coding absence for restricted types in the calendar when the absence has been approved. If no value is specified, the default code is "4."
<b>Absence Type 1 - 5</b>	In this field, you can select an absence type to show absence statistics for in the window Employee Absence Calendars. The absence types defined here will be shown for employees using this vacation calendar.

## Vacation Period Sub-Tab

This section includes the fields and descriptions for the Vacation Period sub-tab.

Field	Description
<b>Vacation Period No.</b>	Enter the number that identifies the vacation period.
<b>Description</b>	Enter a description for the vacation period.
<b>Period Start</b>	Enter the date of the first day in this period.
<b>Period End</b>	Enter the date of the last day in this period.
<b>Default Allowance, Days</b>	Enter the number of days of initial absence allowance for this period. This number will be used as a default value when assigning allowance for employees at the beginning of a vacation period in <b>Time &amp; Expenses » Absence Administration » Periodic Balance » Absence Transfer</b> . This field is not influenced by the <b>Time Unit</b> field.
<b>Maximum Days, Carry Forward</b>	Enter the maximum number of days that can be carried forward from one vacation period to another.
<b>Valid Till, Carry Forward</b>	Enter the date when the days that are carried forward from the previous period should expire. An employee can only use carried-forward days up to this date.
<b>Allow Booking Over Period End</b>	<p>Select this check box to allow absence registrations to start in one vacation period and end in another vacation period.</p> <div> <p><b>Note:</b> If each period uses a different time unit, this leads to a vacation period with registrations on both hours and days. It is not recommended to select this check box if the current vacation period and next vacation period are set up to accept registrations in different time units. This allows you to avoid a vacation period with a mix of hours and days registrations.</p> </div>
<b>Time Unit</b>	<p>select one of the following options from the drop-down list:</p> <ul style="list-style-type: none"> <li>Hours</li> <li>Days</li> </ul> <p>Absence registrations of any absence type created within the period are registered using the selected time unit.</p> <p>Information on absence registrations in this period are shown in hours or days, according to the current value of this field.</p>

Field	Description
	The value can be changed and subsequent registrations in the vacation period will follow this time unit. Thus, a vacation period can have mixed time unit registrations. However, it is not recommended to have a vacation period with a mix of hours and days registrations.
<b>Suggested Maximum days for Absence Booking</b>	Enter the suggested maximum number of days that can be booked with a single absence request. A warning will be given when approving requests that cover more than the number of days that is specified in this field.

## Human Resources Overview

This chapter describes the Human Resource module. This module is an add-on to Standard Maconomy.

The HR module supports the HR-related functions within your company. For instance, you can store information about the employment terms of each employee, including compensation, stock option plans, and position history. In addition, you can use the facilities in the HR module to plan and manage recruitments, enabling you to maintain well-structured and documented hiring processes.

### Registration Section

Use this section to enter employee positions, set up compensation agreements, set up and edit stock option agreements, create personnel requisitions, and enter information about course participants.

### Applicant Single Dialog Workspace

Use this workspace to create applicants for a personnel requisition.

Field	Description

#### Applicants Sub-Tab

Use this section to create a line for each applicant for the position, specifying the contact person representing the applicant.

Field	Description
<b>Contact Person No.</b>	In this field, you must specify the number of the contact person representing the applicant when creating an applicant registration line. Contact persons are created in the window Contact Persons in the Contact Management module.
<b>Name</b>	This field shows the name of the contact person specified in the field "Contact Person No." above.
<b>Employee No.</b>	If the contact person specified in the field "Contact Person No." above is assigned to an employee, that is, the person applying for the position on the personnel requisition is already an employee in your organization, this field shows the employee number of the employee in question. If the contact person is not assigned to an employee, this field is blank.
<b>E-mail</b>	This field shows the e-mail address of the contact person specified on the current line. The e-mail address of contact persons is specified in the window Contact Persons in the Contact Management module.
<b>Result</b>	In this field, you can specify the result or outcome of the current step in the hiring process pertaining to the current applicant, for instance "Invite to Interview" or "Reject." The field corresponds to the field "Result" on the

Field	Description
	<p>currently open event in the event flow assigned to the current applicant registration line. Therefore, the options available in the field are the ones available in the option list specified in the field “Result Type” on the event in question.</p> <p>When you mark the field “Closed” on the current line, the result specified in this field will determine the next step in the process. For further information about this and for information about the correlation between applicant registration lines and event flows, see the introduction to the window “Personnel Requisition Types.”</p>
<b>Closed</b>	<p>Mark this field to proceed to the next step in the hiring process for the current applicant. The field corresponds to the field “Closed” on the currently open event in the event flow assigned to the current applicant registration line. Therefore, marking this field on the current line will cause Maconomy to close the event in question and run the action “Create Secondary Events” for the event flow in question. Thereby, the result specified in the field “Result” will determine the next step in the process.</p> <p>Please note that this requires that the system has been set up as described in the introduction to the window “Personnel Requisition Types.” In particular, the functionality described above is based on the assumption that the field “Create Secondary Events when Closing” is marked on the event flow type specified in the card part of the personnel requisition. If it is not, marking this field will not cause you to proceed to the next step, as Maconomy will then not automatically create an event representing the next step.</p> <p>For further information about this and for information about the correlation between applicant registration lines and event flows, see the introduction to the window “Personnel Requisition Types.”</p>
<b>Status</b>	This field shows the last result entered in the field “Result” on the current line.
<b>Next Step</b>	<p>This field shows a short description of the current step in the hiring procedure pertaining to the current applicant registration line, that is, the step which must be carried out in order to proceed in the process. When you have carried out this step, enter the outcome in the field “Result” and mark the field “Closed” to proceed to the next step.</p> <p>The text is retrieved from the field “Description” on the open event in the event flow assigned to the current applicant registration line.</p>
<b>Total Time Consumption</b>	<p>In this field, you can specify the number of hours the employee in the field “Employee No., Time Sheet” has spent working on the current step in the hiring procedure. The field shows the value from the field “Accumulated Time” on the open event in the event flow assigned to the current applicant registration line, and changing the value in this field causes the field on the event to be updated accordingly, and vice versa.</p> <p>You can use this field if you want time spent on recruitment activities to automatically be transferred to time sheets using the action “Transfer to Time Sheet” in the window Event Flows. When this action is selected, the</p>

Field	Description
	<p>accumulated time on each event in the selected event flow is transferred to time sheets for the employees specified on the individual events in the flow. For further information, see the description of the action "Transfer to Time Sheet."</p>
<b>Job No.</b>	<p>In this field, you can specify the job on which the time spent on the current step in the hiring process of the current applicant registration line should be posted. The field shows the value from the field "Job No." on the open event in the event flow assigned to the current applicant registration line, and changing the value in this field causes the field on the event to be updated accordingly, and vice versa.</p> <p>You can use this field if you want time spent on recruitment activities to automatically be transferred to time sheets using the action "Transfer to Time Sheet" in the window Event Flows. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question, that is, the employee specified in the field "Employee No., Time Sheet" on the current applicant registration line. In the time sheet, the time is registered on a line with the combination of job number, activity and task specified on the event in question. For further information, see the description of the action "Transfer to Time Sheet."</p> <p>When you create a line, Maconomy suggests the value from the corresponding field in the card part of the window. Each time you enter a new step in the hiring process, Maconomy suggests the value specified in the corresponding field in the card part of the event flow assigned to the current line, but you can change the job number here.</p>
<b>Task</b>	<p>In this field, you can specify the task on which the time spent on the current step in the hiring process of the current applicant registration line should be posted. The field shows the value from the field "Task" on the open event in the event flow assigned to the current applicant registration line, and changing the value in this field causes the field on the event to be updated accordingly, and vice versa.</p> <p>You can use this field if you want time spent on recruitment activities to automatically be transferred to time sheets using the action "Transfer to Time Sheet" in the window Event Flows. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question, that is, the employee specified in the field "Employee No., Time Sheet" on the current applicant registration line. In the time sheet, the time is registered on a line with the combination of job number, activity and task specified on the event in question. For further information, see the description of the action "Transfer to Time Sheet."</p> <p>Maconomy suggests the value specified in the corresponding field in the card part of the window but you can change the task number here.</p>
<b>Activity No.</b>	<p>In this field, you can specify the activity on which the time spent on the current step in the hiring process of the current applicant registration line should be</p>

Field	Description
	<p>posted. The field shows the value from the field “Activity No.” on the open event in the event flow assigned to the current applicant registration line, and changing the value in this field causes the field on the event to be updated accordingly, and vice versa.</p> <p>You can use this field if you want time spent on recruitment activities to automatically be transferred to time sheets using the action “Transfer to Time Sheet” in the window Event Flows. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question, that is, the employee specified in the field “Employee No., Time Sheet” on the current applicant registration line. In the time sheet, the time is registered on a line with the combination of job number, activity and task specified on the event in question. For further information, see the description of the action “Transfer to Time Sheet.”</p> <p>Maconomy suggests the value specified in the corresponding field in the card part of the window but you can change the activity number here.</p>
<b>Employee No., Time Sheet</b>	<p>In this field, you can specify the employee who is to handle the current step in the hiring process of the current applicant registration line. The field shows the value from the field “Employee No.” on the open event in the event flow assigned to the current applicant registration line, and changing the value in this field causes the field on the event to be updated accordingly, and vice versa.</p> <p>You can also use this field if you want time spent on recruitment activities to automatically be transferred to time sheets using the action “Transfer to Time Sheet” in the window Event Flows. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question, that is, the employee specified in this field. In the time sheet, the time is registered on a line with the combination of job number, activity and task specified on the event in question. For further information, see the description of the action “Transfer to Time Sheet.”</p> <p>Maconomy suggests the value specified in the corresponding field in the card part of the window but you can change the employee number here.</p>
<b>Selected Value 1-10</b>	<p>In these fields, you can specify a number of values for further specification of the current personnel requisition. You can only use values available in the respective option lists specified in the fields “Option List 1-5” in the card part of the window. If a given option list field in the card part has been left blank, any text can be entered in the corresponding value field. The fields can be used for further specification of the applicant registration line.</p> <p>Maconomy suggests the values specified in the corresponding value fields in the card part of the window but you can change the values here.</p>
<b>Document Archive No.</b>	<p>In this field, you can assign a document archive to the current applicant registration line. By assigning a document archive to an applicant registration line, you can keep track of the various documents related to the applicant registration, for example, application, resume, correspondence, contracts, and</p>

Field	Description
	so on. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.
<b>Description</b>	This field shows a description of the document archive specified in the field "Archive No." above.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.

## Employee Positions Single Dialog Workspace

Use this workspace to enter positions that are available to employees in your company.

The Employee Positions tab displays information about the currently selected employee. The Employee Positions sub-tab displays the previous positions in the company that the current employee held, and thus functions as an employee position history. This enables you to see information about previous positions held by an employee.

**Note:** Each tab field functions the same as the corresponding field in the tab in the Employees workspace. Updating information here causes the corresponding information to be updated accordingly, and vice-versa.

Browse through the employees created in the Employees single dialog workspace in the Set-up module.

You can add employee positions for any employee created in the Employees single dialog workspace in the Set-up module.

When an employee changes to another position, such as for a promotion, enter the new position by adding a line in the sub-tab, entering the effective date in the **Date Employed** field, and entering additional information about the person's employment in the new position.

Define the time period during which the employee is to hold the position on a given line by entering the employment date and leaving the termination date blank (if the position runs for an indefinite period) or by entering both the employment date and a termination date (if the end of the period is known). If you leave the termination date blank on a given line and add a line with a later employment date, Maconomy automatically populates the termination date for the line with the earlier employment date, so that the period on that line ends on the day before the employment date on the new line. This prevents the periods from overlapping.

When a person's employment with the company is terminated, enter information about the termination in the line where you specify a termination position. A termination position is a regular position that you create in the Position Information Card single dialog workspace with the **Termination** field selected.

By adding a line with a termination position, you can, for example, enter information about the reason for the termination and store documents that pertain to the termination. When you enter a termination position in a line in the Employee Positions sub-tab, Maconomy automatically populates the **Last Working Day** and **Last Payday** fields with the date that you entered in the **Termination Date** field, resulting in a period of only one day. Maconomy does this because the

termination position represents a point in time, rather than a period. However, you can change the dates in the line to match any agreements made with the employee regarding the termination.

You can also skip the creation of a termination position line, instead entering a termination date for the last position that the employee held. However, using that method means that you cannot keep information about the termination separate from the last position. For instance, you must store any documents that pertain to the termination in the same archive as the documents that pertain to the last position, which makes it difficult to see what pertains to the position and what pertains to the termination.

## Employee Positions Tab

This section shows information about the currently selected employee.

### Employee Information Island

Field	Description
<b>Employee No.</b>	This field displays the number of the current employee.
<b>Name</b>	In this field, you can specify the name of the current employee.
<b>Initials</b>	In this field, you can specify the initials of the current employee
<b>Blocked</b>	<p>If you mark this field, the employee is blocked. For further information, see the description of the field "Blocked" in the window Employees.</p> <p>Sometime sub-bullets appear</p> <p>When sub-bullets appear within a Reference Topic, I would like to retain their sub-bullet formatting.</p>
<b>Department</b>	In this field, you can specify the department to which the employee belongs. For further information, see the description of the field "Department" in the window Employees.
<b>Position</b>	If you do not wish to register position history in the table part, you can specify in this field the position currently held by the employee instead. The field is for reference only.
<b>Week Calendar No.</b>	<p>In this field, you can specify the number of a week calendar created in the window Week Calendars in the Set-Up module. This way, you can indicate the week calendar applying to the employee during his or her employment in the position on the line. Maconomy continuously updates the employee's information card in the window Employees with the week calendar specified on the position line with the latest starting date, unless you leave the field blank, in which case the employee information is not updated.</p> <p>Changing the week calendar in the window Employees does, however, not cause the position line with the latest starting date to be updated accordingly. Therefore, if you want the week calendar used by Maconomy, for example, for looking up the number of working hours in a given week to be different</p>

Field	Description												
	<p>from the one specified on the latest position line, you must specify the relevant week calendar in the window Employees.</p> <table><tr><th colspan="3">Approval Principle — Time</th></tr><tr><th>Supervisor</th><th>Project Manager</th><th>Approval Required for Transfer</th></tr><tr><td>None/Optional</td><td>None/Optional</td><td>None — The user only has to submit or temporarily submit the time sheet.</td></tr><tr><td>Mandatory</td><td>None/Optional</td><td>The supervisor has to release or approve the time sheet in the window Time Sheets, thus transferring all of the lines on the time sheet. The time sheet is only released if the field “Transf. Non-Appr. Time Sheets” has been marked in the window System Information.</td></tr></table>	Approval Principle — Time			Supervisor	Project Manager	Approval Required for Transfer	None/Optional	None/Optional	None — The user only has to submit or temporarily submit the time sheet.	Mandatory	None/Optional	The supervisor has to release or approve the time sheet in the window Time Sheets, thus transferring all of the lines on the time sheet. The time sheet is only released if the field “Transf. Non-Appr. Time Sheets” has been marked in the window System Information.
Approval Principle — Time													
Supervisor	Project Manager	Approval Required for Transfer											
None/Optional	None/Optional	None — The user only has to submit or temporarily submit the time sheet.											
Mandatory	None/Optional	The supervisor has to release or approve the time sheet in the window Time Sheets, thus transferring all of the lines on the time sheet. The time sheet is only released if the field “Transf. Non-Appr. Time Sheets” has been marked in the window System Information.											
Date Employed	In this field, you can specify the date on which the employee was hired. The field is for information only.												
Termination Date	In this field, you can specify the date on which the employee's employment with the company was or is to be terminated. The date in this field may be updated when a value is entered in the field “Termination Date” on a table line containing a termination position. For further information on this, see the description of the field “Termination Date” in the table part. For further information on the effects of the termination date, see the description of the field “Termination Date” in the window Employees.												
Notice Date	If the employee has been terminated or has resigned, you can enter the date on which the employee was given or gave notice in this field.												

**SD\_HR\_Company Island**

Field	Description
<b>Company</b>	In these fields, you can specify the name and number of the company in which the employee is employed.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.

Field	Description	
	Field	Description
	Document Count	This field displays the number of documents in the Document Archive.

### Employee Positions Sub-Tab

This section shows the individual positions held by the current employee throughout his or her employment with the company, and the table part thus functions as an employee position history

Field	Description
<b>Position No.</b>	In this field, you can specify the number of a position created in the window Position Information Card.
<b>Name</b>	In this field, you can specify the name of the position on the current line. Maconomy suggests the name specified on the information card of the position entered in the field "Position No." on the line, but you can change the name here.
<b>Description</b>	In this field, you can enter a description of the current position.
<b>Date Employed</b>	In this field, you can enter the date on which the employee takes up the position on the current line. When creating a line with a termination position, Maconomy automatically transfers the value from the field "Termination Date" to this field, unless you have manually specified another date. This is done because the termination position represents a point in time rather than a period.
<b>Termination Date</b>	<p>In this field, you can specify the date at which the employee ceases to hold the position specified on the current line. However, if a termination position has been specified on the line, this field represents the date on which the employee's employment with the company was/is to be terminated. As a termination usually represents a point in time rather than a period, Maconomy automatically transfers the value from this field to the fields "Engagement Date," "Last Working Day," and "Last Payday" when creating a line with a termination position, unless you have manually specified other values.</p> <p>If a termination position has been specified on the line, the field "Termination Date" in the card part is automatically updated each time you change the date in this field. However, if the table part contains more than one line with a termination position, the card part is only updated if you enter a termination date later than that of the other lines with termination positions.</p>
<b>Termination</b>	This field shows whether the position specified on the current line is a termination position. Positions are marked as termination positions in the window Position Information Card. For further information on the use of termination positions and their functionality, please see the introduction to this

Field	Description
	window and the description of the field "Termination" in the window Position Information Card.
<b>Last Working Day</b>	In this field, you can specify the employee's last working day in the position specified on the line. When creating a line with a termination position, Maconomy automatically transfers the value from the field "Termination Date" to this field, unless you have manually specified another date. This is done because the termination position represents a point in time rather than a period.
<b>Last Payday</b>	In this field, you can specify the employee's last payday related to the position specified on the line. When creating a line with a termination position, Maconomy automatically transfers the value from the field "Termination Date" to this field, unless you have manually specified another date.
<b>Week Calendar No.</b>	<p>In this field, you can specify the number of a week calendar created in the window Week Calendars in the Set-Up module. This way, you can indicate the week calendar applying to the employee during his or her employment in the position on the line. Maconomy continuously updates the employee's information card in the window Employees with the week calendar specified on the position line with the latest starting date, unless you leave the field blank, in which case the employee information is not updated.</p> <p>Changing the week calendar in the window Employees does, however, not cause the position line with the latest starting date to be updated accordingly. Therefore, if you want the week calendar used by Maconomy, for example, for looking up the number of working hours in a given week to be different from the one specified on the latest position line, you must specify the relevant week calendar in the window Employees.</p>
<b>Selected Value 1-5</b>	In these fields, you can specify a number of values for further specification of the employee position, for instance to indicate the reason for the position change. You can only select values available in the respective option lists specified in the island Option List Fields in the information card of the position specified on the current line. If a given option list field in the position information card has been left blank, any text can be entered in the corresponding value field.
<b>Date 1-5</b>	In these fields, you can specify a number of dates pertaining to the current employee position. The fields are for information only.
<b>Remark 1-3</b>	In these fields, you can specify a number of remarks pertaining to the current employee position. The fields are for information only.
<b>Document Archive No.</b>	In this field, you can assign a document archive to the employee position on the current line. The document archive assigned to an employee position can, for example, contain files such as the employment contract, termination papers, or other documents relevant to the employee position. You can only specify a document archive to which you have been granted access. Document archives are created in the window Document Archives in the Set-

Field	Description
	Up module. See the description of that window for further information on the use of document archives.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.
<b>Approved</b>	This field shows whether the current employee position has been approved. The approval of employee positions is not part of standard Maconomy functionality, but if you wish to be able to approve employee positions, you can set up a workflow using the Workflow module, allowing you to add an approval action to, for example, Portal components in which positions are registered.
<b>Approved by</b>	This field shows the name of the user who approved the current employee position. If the position has not been approved, this field is blank. For further information, see the field "Approved" above.
<b>Approval Date</b>	This field shows the date on which the current employee position was approved. If the position has not been approved, this field is blank. For further information, see the field "Approved" above.
<b>Created by</b>	This field shows the name of the user who created the information on the current line.
<b>Created on</b>	This field shows the date on which the information on the current line was created.
<b>Changed by</b>	This field shows the name of the last user who changed the information on the current line.
<b>Changed on</b>	This field shows the last date on which the information on the current line was changed.
<b>Version</b>	This field shows the version number of the current line, indicating how many times information has been changed on the line. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

## Actions

This section shows the Actions available with this window.

### Top Tab

Field	Description
<b>Attach Document to Employee</b>	This action allows you to attach a document to the employee in the card part.

## Bottom Tab

Field	Description
<b>Attach Document to Employee Position</b>	This action allows you to attach a document to the employee position in the table part.

## Compensation Agreements Single Dialog Workspace

Use this workspace to set up compensation agreements with employees, board members, and others.

Compensation includes standard salaries, bonuses, and company cars. The compensation of each employee and board member in your system can include more than one of these forms. You can therefore set up multiple compensation agreements to calculate in various ways.

The Compensation Agreements tab displays information about the currently selected contact person. Use the Compensation Agreements sub-tab to create a line for each compensation agreement that you make with the contact person.

Before you create a compensation agreement in this workspace, create the person for whom this agreement is intended using the Contact Persons workspace in the Contact Management module. A contact person is any type of person who is related to the company, including employees, board members, partners, and so on.

The Compensation Agreements tab in this workspace displays information about the currently selected contact person. The Compensation Agreements sub-tab functions as a history of previous agreements with this contact person. To enter information in the sub-tab, create a line for each compensation agreement with the contact person. Enter the following details:

- The number of a specific compensation type — Created in the Compensation Agreement Types workspace, the compensation type is a compensation agreement template from which Maconomy retrieves certain default information when creating agreements.
- The effective period of the agreement.
- The time unit to use.
- The frequency with which compensation is paid.
- The value of the agreement — For example, the amount offered as salary in the currency specified in the line.

When an agreement becomes invalid, for example, because it was renegotiated, add the lines for the new period but do not delete the existing lines. If necessary, change the ending date of the existing lines.

Maconomy uses the length of the period, the frequency, and the time unit to calculate a total agreement value, or the total amount that the agreement represents. If you enter a total agreement value for the whole period, Maconomy calculates the value per time unit. For more information, see the description of the **Time Unit** and **Amount, Currency** fields.

The value that you enter for a compensation agreement does not need to be a fixed amount. It can also depend on the value of another agreement. For example, a compensation package can consist of a fixed salary of 5,000 (in the monetary currency used) plus an additional 10% of the salary as a bonus. To prepare a template for this type of package, use the Compensation Types

workspace to create a compensation type with one or more subordinate compensation types. When you enter this compensation type in a compensation agreement line, Maconomy automatically creates an agreement line for each subordinate compensation type and assigns each line to the agreement line that contains the main compensation type. All you need to do is enter the value for the agreement line with the main compensation type and the relevant percentages or values for the automatically created agreement lines. To continue the preceding example, the compensation agreement would consist of a line with the value **5000** in the **Amount, Currency** field, and another line whose value in the **Parent Agreement** field refers to the fixed salary line (that is, the agreement line that contains the main compensation type) and contains the value **10** in the % field. As an alternative, enter the target value of the dependent agreement (500) and have Maconomy calculate the percentage (10%) based on the target value and the fixed amount (5,000).

After you enter one or more compensation agreement types with subordinate compensation types in the Compensation Agreements sub-tab, add any number of additional agreements where you enter a subordinate type. Maconomy then automatically assigns the new line to the line that has the relevant main compensation type and calculates the value of the new line based on the value of the line that has the main compensation type. For more information about setting up compensation types, see the description of the Compensation Types workspace.

You can only delete a given line in this workspace if no other lines in the Compensation Agreements sub-tab refer to this line in the **Parent Agreement No.** field.

## Compensation Agreements Tab

This section shows information about the currently selected contact person.

### Contact Person Island

Field	Description
<b>Contact Person No.</b>	This field shows the number of the currently selected contact person. The contact person does not necessarily have to be assigned to an employee. This allows you to create compensation agreements for, for example, board members and partners.
<b>Employee Number.</b>	This field shows the number of the employee assigned to the contact person specified in the field "Contact Person No." above, that is, the employee with whom the agreement is made. If the contact person is not assigned to an employee, this field is blank.
<b>Name</b>	This field shows the name of the contact person specified in the field "Contact Person No." above.
<b>Country</b>	This field shows the country to which the current contact person belongs.
<b>Blocked</b>	This field shows if the current contact person has been blocked. It is not possible to create or edit agreements for blocked contact persons.

**Total Island**

Field	Description
<b>Reporting Currency</b>	In this field, you can specify the currency in which you want the amount in the field "Total Value" below to be displayed.
<b>Total Value</b>	This field shows the total value of the agreements currently shown in the table part. The field shows the sum of the values in the field "Value of Agreement, Currency" on the lines in the table part, converted into the currency specified in the field "Reporting Currency" above.

**Employee Information Island**

Field	Description
<b>Responsible Employee</b>	This field shows the number of the employee responsible for the current contact person. For further information, see the description of the field "Responsible Employee" in the window Contact Persons in the Contact Management module.
<b>Name</b>	This field shows the name of the employee shown in the field "Employee No." above.

**Selection Criteria Island**

Field	Description
<b>Compensation Category</b>	In this field, you can select a compensation category. The table part will only show compensation agreements belonging in the selected category, and when creating lines, this category is suggested in the field "Category." Compensation categories are created in the window Popup Fields in the Set-Up module.
<b>Compensation Type No.</b>	In this field, you can specify a range of compensation type numbers. The table part will only show compensation agreements pertaining to types within the specified range.
<b>Company No.</b>	In this field, you can specify a range of company numbers. The table part will only show compensation agreements pertaining to companies within the specified range.
<b>Period</b>	In this field, you can specify a range of dates. The table part will only show compensation agreements whose period covers at least one date within the specified range.

## Compensation Agreements Sub-Tab

In this section, you can create a line for each compensation agreement made with the contact person.

Field	Description
<b>Compensation Type No.</b>	<p>When creating an agreement line, enter in this field the number of a compensation type created in the card part of the window Compensation Types. The compensation type contains template information which will be transferred to the fields on the current line. Furthermore, if there are subordinate compensation types assigned to the compensation type specified here, Maconomy automatically creates a line for each subordinate compensation type. On these lines, the field "Parent Agreement" will automatically contain a reference to the line which you created.</p> <p>Once one or more compensation agreement types with subordinate compensation types has been specified in the table part, you can add any number of additional agreements where you specify a subordinate type. Doing so will cause Maconomy to automatically assign the new line to the line with the relevant main compensation type, so that the value of the new line can be calculated on the basis of the value of the line with the main compensation type. Please note, however, that on subordinate lines, the date range specified in the fields "Starting Date" and "Ending Date" must be within the range specified for the line with the main compensation type to which the subordinate lines are assigned. For further information on setting up compensation types, see the description of the window Compensation Types.</p>
<b>Name</b>	This field shows the name of the compensation type specified on the line.
<b>Category</b>	<p>In this field, you can specify the category of the current compensation agreement. You can choose from the categories created in the pop-up type "Compensation Categories" in the window Popup Fields. Compensation categories are used for grouping compensation elements, making it possible to, for example, only view compensations of a given category in the table part.</p> <p>If a value has been specified in the field "Compensation Category" in the island Selection Criteria in the card part, Maconomy suggests this category when you create a line. If no compensation category has been specified in the card part, Maconomy suggests the category of the compensation type specified on the line.</p>
<b>Starting date</b>	In this field, you can specify the date from which the current compensation agreement is effective. Together, this field and the field "Ending Date" on the line compose the period in which the agreement applies. Based on the length of this period and the time unit specified in the field "Time Unit" on the line, Maconomy will calculate the number of time units covered by this period, and insert this number into the field "Number of Time Units," which is automatically updated if you subsequently change the period or the time

Field	Description
	<p>unit. For further information about the effects of the number of time units, see the description of the field “Number of Time Units.”</p> <p>Maconomy suggests the starting date entered on the compensation type specified in the field “Compensation Type No.” on the line. This default starting date is specified in the window Compensation Types. Please note, however, that no two lines with the same compensation type can have the same starting date.</p>
<b>Ending Date</b>	<p>In this field, you can specify the last date on which the current compensation agreement applies. For information on the functionality of the field, see the description of the field “Starting Date” above.</p> <p>Maconomy suggests the default ending date specified for the compensation type specified in the field “Compensation Type No.” on the line. This default ending date is specified in the window Compensation Types.</p>
<b>Time Unit</b>	<p>In this field, you can specify a time unit representing the frequency at which the value of the current agreement is paid out. Based on the length of the period specified by means of the fields “Starting Date” and “Ending Date” on the line and the time unit specified here, Maconomy will calculate the number of time units covered by the period, and insert this number into the field “Number of Time Units,” which is automatically updated if you subsequently change the period or the time unit. For further information about the effects of the number of time units, see the description of the field “Number of Time Units.”</p> <p>Time units are created in the window Popup Fields.</p>
<b>Number of Time Units</b>	<p>In this field, you can specify the number of times the value of the current agreement should be paid out. The number of time units is used in the calculation of the total agreement value in the field “Value of Agreement, Currency,” as the total agreement value is calculated as follows:</p> $\text{Number of Time Units} \times \text{Value of Agreement, Currency}$ <p>Therefore, changing the number of time units will affect the total value of the agreement.</p> <p>When you specify a period and a time unit in the fields “Starting Date,” “Ending Date,” and “Time Unit,” Maconomy will automatically calculate the number of time units covered by the period, and insert this number into this field. However, you can change the number manually, for example, if the current compensation agreement is not a period related compensation. If, for instance, the compensation is a one-time fee, you can specify “1” in this field. Changing the number of time units does not affect the period or time unit on the line.</p>
<b>Currency</b>	<p>In this field, specify the currency in which the compensation agreement value in the field “Amount, Currency” should be specified.</p>
<b>Amount, Currency</b>	<p>In this field, specify the value of the current agreement per time unit, expressed in the currency specified in the field “Currency” on the current line. If, for instance, the current agreement represents a monthly salary,</p>

Field	Description
	<p>you can specify "Month" in the field "Time Unit," and the monthly salary in this field. As an alternative, you can specify the total agreement value for the whole period of the agreement in the field "Value of Agreement, Currency," causing Maconomy to calculate the value per time unit and insert it into this field. The value per time unit will thus be calculated as the total agreement value divided by the number of time units.</p> <p>If the field "Parent Agreement" contains a reference to another compensation agreement line, the agreement value can also be specified as a percentage of the value of the referenced agreement. This is done by specifying the desired percentage in the field "%." Maconomy will then calculate the amount value of the current agreement per time unit and insert it into this field. However, if you manually specify an amount in this field on a line which refers to another compensation agreement, Maconomy will calculate the relevant percentage based on the specified amount and the value of the referenced agreement, and insert the calculated percentage into the field "%." Similarly, if you specify a value in the field "Value of Agreement, Currency," Maconomy will calculate the value per time unit and insert it into this field, causing the field "%" to be updated accordingly. This allows you to enter a target amount value for the agreement and have Maconomy calculate the relevant percentage. Furthermore, as you can enter an amount value instead of a percentage, the value of compensation agreement lines assigned to another compensation agreement line (whether created manually or automatically) does not have to depend on the manually created line. This means that you can use compensation types with subordinate compensation types as a means of creating template compensation packages.</p>
%	<p>If the value of the current agreement should be based on the value of another agreement that is, the field "Parent Agreement" contains a reference to another compensation agreement line, you can specify in this field the value of the current agreement expressed as a percentage of the value of the referenced compensation agreement. If you do so, Maconomy calculates the amount value of the current agreement and inserts it into the field "Amount, Currency." However, if you manually specify an amount in the field "Amount, Currency" or the field "Value of Agreement, Currency" on a line which refers to another compensation agreement, Maconomy will calculate the relevant percentage based on the specified amount and the value of the referenced agreement, and insert the calculated percentage into this field.</p> <p>For further information on specifying agreement values, see the description of the field "Amount, Currency."</p>
<b>Agreement Value, Currency</b>	<p>In this field, specify the total value of the current agreement for the whole period specified on the line, expressed in the currency specified in the field "Currency." For further information on the functionality of the field and how to enter values for compensation agreements, see the description of the field "Amount, Currency" above.</p>

Field	Description
<b>Pay by</b>	In this field, you can specify the first date on which the value per time unit on the current line should be paid out.
<b>Agreement Date</b>	In this field, you can specify the date on which the agreement was negotiated with the contact person.
<b>Company No.</b>	In this field, you can specify the number of the company to which the compensation agreement pertains.
<b>Company Name</b>	This field shows the name of the company shown in the field "Company No." above.
<b>Estimated Amount, Currency</b>	In this field, you can specify the amount which, prior to negotiating compensations with the contact person, is expected to be granted on the compensation agreement line. Maconomy suggests the amount from the corresponding field on the compensation type specified on the line. Conductors of wage negotiations can use this amount as a guideline when negotiating the compensation amount.
<b>Estimated Agreement Value, Currency</b>	In this field, you can specify the total agreement value which, prior to negotiating compensations with the contact person, is expected to be granted on the compensation agreement line. Maconomy suggests the amount from the corresponding field on the compensation type specified on the line. Conductors of wage negotiations can use this amount as a guideline when negotiating the agreement value to be entered in the field "Value of Agreement, Currency."
<b>Minimum Amount, Currency</b>	In this field, you can specify the minimum amount which conductors of wage negotiations are allowed to grant contact persons on compensation agreement lines with the current type. If an amount lower than this amount is entered in the field "Amount, Currency," Maconomy displays an error message. Maconomy suggests the amount from the corresponding field on the compensation type specified on the line.
<b>Maximum Amount, Currency</b>	In this field, you can specify the maximum amount which conductors of wage negotiations are allowed to grant contact persons on compensation agreement lines with the current type. If an amount higher than this amount is entered in the field "Amount, Currency," Maconomy displays an error message. Maconomy suggests the amount from the corresponding field on the compensation type specified on the line.
<b>Estimated %</b>	In this field, you can specify the percentage which, prior to negotiating compensations with the contact person, is expected to be granted on the compensation agreement line. Maconomy suggests the percentage from the corresponding field on the compensation type specified on the line. Conductors of wage negotiations can use this percentage as a guideline when negotiating the percentage to be entered in the field "%."

Field	Description
	You can only specify a value in this field if the current compensation agreement is a subordinate agreement.
<b>Minimum %</b>	<p>In this field, you can specify the minimum percentage which conductors of wage negotiations are allowed to grant contact persons on the current compensation agreement line. Prior to negotiating compensations with the contact person, conductors of wage negotiations can use this percentage as a guideline when negotiating the percentage to be entered in the field “%.”</p> <p>Maconomy suggests the percentage from the corresponding field on the compensation type specified on the line.</p> <p>You can only specify a value in this field if the current compensation agreement is a subordinate agreement.</p>
<b>Maximum %</b>	<p>In this field, you can specify the maximum percentage which conductors of wage negotiations are allowed to grant contact persons on the current compensation agreement line. Prior to negotiating compensations with the contact person, conductors of wage negotiations can use this percentage as a guideline when negotiating the percentage to be entered in the field “%.”</p> <p>Maconomy suggests the percentage from the corresponding field on the compensation type specified on the line.</p> <p>You can only specify a value in this field if the current compensation agreement is a subordinate agreement.</p>
<b>Deferral %</b>	If any deferrals apply to the current compensation agreement, you can specify the relevant percentage in this field. If you specify a percentage, Maconomy will calculate a deferral amount based on the agreement value and the percentage specified.
<b>Deferral Amount, Currency</b>	If any deferrals apply to the current compensation agreement, you can specify the relevant deferral amount in this field. If you specify an amount, Maconomy will calculate a deferral percentage based on the agreement value and the deferral amount specified.
<b>Payment Currency</b>	In this field, you can specify the currency in which the compensation should be paid out.
<b>Payment Currency Exchange Rate</b>	<p>In this field, you can specify the exchange rate between the currency specified in the field “Payout Currency” and the currency specified in the field “Currency” on the current line. Based on this exchange rate and the value in the field “Agreement Value, Currency,” Maconomy will calculate a value for the field “Agreement Value, Payment Currency.”</p> <p>If you do not specify a value, Maconomy will calculate a value for the field “Agreement Value, Payment Currency” using the exchange rate valid on the date specified in the field “Exchange Rate Date” on the line. The exchange rate valid on that date is looked up in the standard sales exchange rate table specified in the window System Information.</p>

Field	Description
<b>Exchange Rate Date</b>	<p>In this field, you can specify the exchange rate date to be used for calculating a value for the field "Agreement Value, Payment Currency." The field is only used if you do not specify a value in the field "Payment Currency Exchange Rate."</p> <p>If no payment currency exchange rate is specified on the line, Maconomy will calculate a value for the field "Agreement Value, Payment Currency" using the exchange rate valid on the date specified in this field. The exchange rate valid on this date is looked up in the standard sales exchange rate table specified in the window System Information.</p>
<b>Agreement Value, Payment Currency</b>	<p>In this field, you can specify the total agreement value in the payment currency specified on the line. If you specify a value in the field "Payment Currency Exchange Rate," Maconomy will calculate a value for this field based on the exchange rate and the value in the field "Agreement Value, Currency." If you do not specify a payment currency exchange rate, a value is calculated using the exchange rate valid on the date specified in the field "Exchange Rate Date." The exchange rate valid on that date is looked up in the standard sales exchange rate table specified in the window System Information.</p>
<b>Next Follow-Up</b>	<p>In this field, you can specify the next date on which to follow up on the current compensation agreement, for instance the next negotiation date.</p>
<b>Description</b>	<p>This field shows the description of the next follow up date, as entered in the Next Follow Up field.</p>
<b>Access Level</b>	<p>In these fields, you can specify an access level. You only have access to the current compensation agreement if you have been assigned to the same or a higher level in the window Access Levels. This means that in this window, a given user can only see the compensation agreements to which he or she has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to compensation agreements may depend on other factors. For more information about this, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If no access level is specified, all users have access to the current compensation agreement.</p>
<b>Description</b>	<p>This field shows the description of the selected access level, as entered in the window Access Levels.</p>
<b>Agreement No.</b>	<p>This field shows the agreement number of the current agreement line. When you create a compensation agreement line, a number is automatically retrieved from the Compensation Agreement Series in the window Number Series in the Set-Up module.</p>
<b>Parent Agreement</b>	<p>If the current line represents a subordinate agreement, this field shows the number of the agreement line to which the current line is assigned. If you manually add a new line, specifying an agreement type which is a subordinate to one of the agreement types specified on the other lines,</p>

Field	Description
	<p>Maconomy automatically completes this field with the number of the line containing the main agreement type in question, thus assigning the new line to the relevant main line. If the line contains a main compensation agreement type, this field is blank.</p> <p>If this field contains a value, specifying a value in the field “%” on the line will cause the fields “Amount, Currency” and “Value of Agreement, Currency” to be calculated on the basis of the percentage specified and the field “Amount, Currency” on the agreement referenced in this field. For further information on this, see the description of the field “%.”</p>
<b>Selected Value 1-5</b>	<p>In these fields, you can specify a number of values for further specification of the current compensation agreement, for instance to indicate the reason for a raise. You can only use values available in the respective option lists specified in the fields “Option List 1-5” in the window Compensation Types for the compensation type specified on the current line. If a given option list field in the compensation type has been left blank, any text can be entered in the corresponding value field.</p> <p>Maconomy suggests the values specified in the corresponding value fields in the window Compensation Types for the compensation type specified on the current line.</p>
<b>Date 1-5</b>	<p>In these fields, you can specify a number of dates relating to the current compensation agreement. Maconomy suggests the dates specified in the corresponding fields in the window Compensation Types for the compensation type specified on the current line.</p>
<b>Amount 1-5</b>	<p>In these fields, you can specify a number of amounts relating to the current compensation agreement. Maconomy suggests the amounts specified in the corresponding fields in the window Compensation Types for the compensation type specified on the current line. The amounts are for information and reporting purposes only, and have no influence on the value of the compensation agreement.</p>
<b>Real 1-5</b>	<p>In these fields, you can specify a number of figures relating to the current compensation agreement. The figures are for information and reporting purposes only, and have no influence on the value of the compensation agreement.</p>
<b>Remarks 1-3</b>	<p>In these fields, you can enter additional remarks about the current compensation agreement.</p>
<b>Approved</b>	<p>This field shows whether the current compensation agreement has been approved using the action “Approve Compensation Agreement.”</p>
<b>Approved by</b>	<p>This field shows the name of the user who approved the current compensation agreement using the action “Approve Compensation Agreement.” If the agreement has not been approved, this field is blank. For further information, see the field “Approved” above.</p>
<b>Approval Date</b>	<p>This field shows the date on which the current compensation agreement was approved using the action “Approve Compensation Agreement.” If the</p>

Field	Description
	agreement has not been approved, this field is blank. For further information, see the field "Approved" above.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.
<b>Created by</b>	This field shows the name of the user who created the information on the current line.
<b>Created on</b>	This field shows the date on which the information on the current line was created.
<b>Changed by</b>	This field shows the name of the last user who changed the information on the current line.
<b>Changed on</b>	This field shows the last date on which the information on the current line was changed.
<b>Version</b>	This field shows the version number of the current line, indicating how many times information has been changed on the line. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

#### User Island

Field	Description
<b>Created by</b>	This field shows the name of the user who initially created the information in the window.
<b>Date</b>	This first Date field shows the date on which the information was originally created.
<b>Updated by</b>	This field shows the name of the user that made the latest change.
<b>Date</b>	This second Date field shows the date on which the information was last changed.
<b>Version</b>	This field shows a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

## Actions

This section shows the Actions available with this window.

### Bottom Tab

Field	Description
<b>Approve Compensation Agreement</b>	When you select this action, the compensation agreement on the currently selected line is approved, causing the field "Approved" on the line to be marked and the fields "Approved on" and "Approved by" to be completed. Approval is used in the Maconomy Portal where you can set up Maconomy's Workflow functionality to include approval as part of working with compensation agreements.
<b>Remove Approval</b>	When you select this action, the approval of the compensation agreement on the currently selected line is removed, causing the field "Approved" on the line to be unmarked and the fields "Approved on" and "Approved by" to be blanked.

## Stock Option Agreements Single Dialog Workspace

Use this workspace to set up stock option agreements with your employees and others.

You assign stock option agreements to contact persons so that you can create stock option agreements for employees as well board members and partners. To create agreements for your employees, you must assign each employee to a contact person. Here, the term "contact person" includes employees and other company-related persons.

A stock option agreement is an agreement that the company will grant the employee or company-related person (for instance, a board member) a given number of stock options of a given type within a certain period. For example, a stock option agreement could say that the company grants the employee Hugo Rune 2,000 options for B-shares at a given price over the next two years.

When you create a stock option agreement, enter the contact person who represents the employee or company-related person for whom the agreement is intended, and enter a stock option agreement type. The stock option agreement type determines the stock type and contains template information that Maconomy transfers to the new agreement. The agreement type also functions as a framework of defined rules with which the agreements classified under that type must comply. For instance, the agreement type defines the total number of shares to be allocated to the agreements classified under it, and Maconomy ensures that the number of shares granted to a specific agreement does not exceed the remaining number of shares that are available for that agreement type. For more information, see the description of the fields in the Stock Option Agreement Types workspace.

You can set up a detailed vesting plan for the options granted in the agreement. For example, you can set up a plan wherein the first 1,000 options vest after one year, the next 500 vest after 18 months, and the remaining options vest after two years. Set up the vesting plan in the Stock Option Agreement Lines sub-tab, where you enter a line for each vesting period, including the number of options to vest in that period. You also use this sub-tab to enter the exercisings that the contact person for the agreement must perform. When a contact person wants to exercise an option, you select the line that contains the shares to be exercised, enter the relevant number of shares and the market price per share on the current day, and select **Exercise** in the

**Transaction Type** field. Maconomy ensures that the options for the selected line have vested and that the number of shares exercised does not exceed the number of shares granted on that line. When you use the **Register Transaction** action, the exercising is stored in the database and appears in the Stock Option Exercisings workspace, where you can see all exercisings performed by the specific contact person.

You can also cancel stock options. For example, if an employee leaves the company, thereby forfeiting shares not yet exercised, cancel the employee's remaining shares by entering a **Cancellation** transaction type for the employee's remaining number of shares. The method for entering cancellations is similar to that for entering exercises in that you must provide values for the same fields. However, leave the **Share Price** field blank for cancellations. Just like exercises, cancellations are stored in the database and appear in the Stock Option Exercisings workspace.

**Note:** The stock option information, exercises, and cancellations that you enter in this workspace are for information and reporting purposes only. No entries are made in Maconomy's G/L module, and the entries therefore have no effects on your accounts.

## Stock Option Agreements Tab

Use this section to set up stock option agreements with your employees and with other company-related persons.

### Stock Option Agreement Island

Field	Description
<b>Agreement No.</b>	In this field, you can specify an identification number when creating a stock option agreement. Both letters and numbers can be used in the identification number. If you do not specify a value, the agreement is assigned the next available number from the number series "Stock Option Agreement Series" in the window Number Series in the Set-Up module. Once the agreement has been created, the number can no longer be changed.
<b>Agreement Type</b>	In this field, you must specify a stock option agreement type when creating a stock option agreement. The stock option agreement type contains certain template information which is transferred to the new agreement, but can subsequently be changed for the agreement. Furthermore, the agreement type functions as a framework for all agreements of the type in question, meaning that the information on each agreement must comply with the overall rules defined on its agreement type. For instance, the number of shares granted on a given agreement cannot exceed the remaining number of shares available for the agreement type in question. For further information, see the description of the fields in the window Stock Option Agreement Types.
<b>Share No.</b>	This field shows the number of the stock which the current stock option agreement concerns. The stock number is determined by the stock option agreement type and cannot be changed here.

Field	Description
<b>Currency</b>	This field shows the currency in which the stock shown in the field “Share No.” above is traded. The value is retrieved from the window Stock Information Card and cannot be changed here.
<b>Share Denomination</b>	In this field, you can specify the share denomination value of the options granted on the current agreement. Maconomy suggests the value from the corresponding field on the stock option agreement type to which the current agreement belongs, but you can change it here. For further information about share denomination, see the description of the field “Share Denomination” on in the window Share Information Card.
<b>Purchase Price of Shares</b>	In this field, you can specify the share price at which the stock options on the agreement are granted to the contact person, that is, the price at which the contact person should be allowed to purchase shares when exercising stock options under the agreement. Maconomy suggests the stock purchase price specified on the stock option agreement type of the current agreement, but you can change the price for the current agreement here.
<b>Number of Shares</b>	In this field, you can specify the total number of options to be granted to the contact person under the current stock option agreement. Maconomy suggests the number of shares per agreement specified on the stock option agreement type of the current agreement, but you can change the number for the agreement here. Maconomy ensures that this number does not exceed the remaining number of shares available for the agreement type of the current agreement. Furthermore, when setting up a vesting plan in the table part, Maconomy ensures that the total number of shares granted in the table part does not exceed this number.
<b>Earliest Exercising Date Allowed</b>	In this field, you can specify the earliest exercising date allowed for shares under the current agreement. The first and last exercising dates comprise a period within which the options granted on the current agreement may be exercised. When setting up a vesting plan in the table part, the first and last exercising dates on each line must be within this period. Maconomy suggests the earliest exercising date on the stock option agreement type of the current agreement, but you can change the date for the agreement here.
<b>Last Exercising Date Allowed</b>	In this field, you can specify the last exercising date allowed on the current agreement. For further information on the functionality of the field, see the description of the field “First Exercising Date” above.
<b>Agreement Date</b>	In this field, you can specify the default agreement date to be used in stock option agreements of the current type. The agreement date represents the date on which a given stock option agreement is legally binding.

### Option List Fields Island

Field	Description
<b>List</b>	In these fields, you can specify the option lists containing the values that should be available for further specification in the fields “Value 1-5” in this island as well as on lines

Field	Description
	in the table part. This means that the fields "Value 1-5" in this island and on lines in the table part can only be completed with options available in the corresponding option lists specified here. If you leave a given field empty, any value can be specified in the corresponding value field.
<b>Value</b>	<p>In these fields, you can specify a number of values for further specification of the agreement. You can only specify values available in the respective option lists specified in this island. If a given option list field in the position information card has been left blank, any text can be entered in the corresponding value field. The fields can be used for further specification of the agreement.</p> <p>If you enter a value in a given value field, this value will be suggested in the corresponding field in the table part of the window when creating table lines.</p>

### Amount Island

Field	Description
<b>Amount 1-5</b>	<p>In these fields, you can specify a number of amounts relating to the current stock option agreement. Maconomy suggests the values from the corresponding fields on the stock option agreement type of the current agreement, but you can change them here.</p> <p>If you enter a value in a given value field, this value will be suggested in the corresponding field in the table part of the window when you create table lines.</p>

### Remarks Island

In these fields, you can enter additional remarks about the current agreement.

### Contact Person Island

Field	Description
<b>Contact Person</b>	In these fields, you must specify the name and number of the contact person to whom the agreement pertains when creating a stock option agreement. The contact person does not necessarily have to be assigned to an employee. This allows you to create stock option agreements, for example, board members and partners. Only contact persons who are not assigned to a contact company can be specified.
<b>Employee No.</b>	This field shows the number of the employee assigned to the contact person specified in the field "Contact Person No." above, that is, the employee with which the agreement is made. If the contact person is not assigned to an employee, this field is blank.

### Company Island

Field	Description
<b>Company</b>	In these fields, you can specify the name and number of the company to which the stock option agreement pertains.

**Access Level Island**

Field	Description
<b>Access Level</b>	<p>In these fields, you can specify an access level. You only have access to the current stock option agreement if you have been assigned to the same or a higher level in the window Access Levels. This means that on, for example, stock option agreement reports, users can only see stock option agreements to which they have access. Furthermore, in this window, a given user can only see the stock option agreements to which he or she has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to stock option agreements may depend on other factors. For more information about this, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If no access level is specified, all users have access to the current stock option agreement.</p>

**Status Island**

Field	Description
<b>Approved</b>	This field shows whether the current compensation agreement has been approved using the action "Approve Compensation Agreement."
<b>Approved by</b>	This field shows the name of the user who approved the current compensation agreement using the action "Approve Compensation Agreement." If the agreement has not been approved, this field is blank. For further information, see the field "Approved" above.
<b>Approval Date</b>	This field shows the date on which the current compensation agreement was approved using the action "Approve Compensation Agreement." If the agreement has not been approved, this field is blank. For further information, see the field "Approved" above.
<b>Closed</b>	This field shows whether the current compensation agreement has been closed.
<b>Date Closed</b>	This field shows the date on which the current compensation agreement was closed. If the agreement has not been closed then this field is blank.

**Dates Island**

Field	Description
<b>Dates 1-5</b>	In these fields, you can specify a number of dates relating to the current stock option agreement. Maconomy suggests the values from the corresponding fields on the stock option agreement type of the current agreement, but you can change them here. The fields are for information only. If you enter a value in a given value field, this value will be suggested in the corresponding field in the table part of the window when you create table lines.

## Stock Options Agreement Lines Sub-Tab

Use this section to register the exercisings made by the contact person to whom the agreement pertains.

Field	Description
<b>Earliest Exercising Date Allowed</b>	<p>In this field, you can specify the first date on which the contact person is allowed to start exercising the options on the current line. The earliest exercising date can therefore be considered the vesting date. The first and last exercising dates comprise a period within which the options granted on the current line may be exercised, meaning that when registering stock option exercisings for the current line, Maconomy will only accept a posting date within this period.</p> <p>The first and last exercising dates on each line must be within the period specified in the fields “First Exercising Date” and “Last Exercising Date” in the card part. If you leave one of the fields blank when creating a new line, Maconomy suggests the value from the corresponding field in the card part, but you can change the date suggested.</p>
<b>Last Exercising Date Allowed</b>	<p>In this field, you can specify the last date on which the contact person is allowed to start exercising the shares on the current line. For further information on the functionality of the field, see the description of the field “First Exercising Date” above.</p>
<b>Number of Shares</b>	<p>In this field, you can specify the number of options which the contact person is allowed to exercise within the period specified in the fields “First Exercising Date” and “Last Exercising Date” on the current line. Maconomy checks that the number on the current line plus the sum of the numbers on the other lines in the table part does not exceed the number of shares specified in the field “Number of Shares” in the card part.</p> <p>When you create a line, Maconomy suggests the number of shares remaining to be allocated in order to reach the number of shares specified in the card part.</p>
<b>Purchase Price of Shares</b>	<p>In this field, specify the price at which the options on the current line are offered to the contact person, that is, the price at which the contact person can exercise the options on the current line. Maconomy suggests the stock purchase price specified in the card part of the window, but you can change the price for each line here.</p>
<b>Share Denomination</b>	<p>In this field, you can specify the share denomination value per share granted on the current agreement. Maconomy suggests the value from the corresponding field in the card part of the window, but you can change it here. For further information about share denomination, see the description of the field “Share Denomination” in the window Share Information Card.</p>
<b>Number of Shares Available</b>	<p>This field shows the number of shares available for exercising on the current line, that is, the difference between the number in the field “No. of Shares” and the number of shares already exercised or cancelled on the current line (see the fields “Number Exercised” and “Number Cancelled”).</p>

Field	Description
<b>Transaction Type</b>	<p>When the contact person wants to exercise stock options, the registration of the exercising takes place on the table line containing the options which the contact person wants to exercise. An exercising is registered by selecting "Exercise" in this field, entering the number of shares to be exercised in the field "Number of Shares, Transaction," and specifying the date on which the exercising takes place in the field "Posting Date." Once this information has been entered on all lines for which options are to be exercised, select the action "Register Transaction" to carry out the transaction. This causes the specified shares to be registered as exercised and the field "Number Available" on each line to be updated. Maconomy creates a stock option agreement transaction entry for each line on which shares were exercised. These entries can be viewed in the window Stock Option Exercisings, allowing you to keep track of the exercisings made by each contact person.</p> <p>It is also possible to cancel stock options. If, for instance, an employee leaves the company, thus forfeiting the shares that he or she has not yet exercised, you can cancel the employee's remaining options by registering a cancellation transaction for the remaining number of shares. The procedure for cancelling options is similar to registering exercisings. However, you specify "Cancellation" in this field instead of "Exercising." When you select the action "Register Transaction," the number of shares specified in the field "Number of Shares, Transaction" is cancelled, causing the available number of shares on the line to be reduced accordingly. Maconomy creates a stock option agreement transaction entry for each line on which cancellations were registered.</p> <p>Both exercisings and cancellations specified in the table part are carried out when the action "Register Transaction" is selected.</p>
<b>Posting Date, Transaction</b>	<p>When registering exercisings and cancellations on a given line, specify in this field the date on which the shares are to be exercised or cancelled. For further information on exercising and cancelling options, see the description of the field "Transaction" above.</p>
<b>Number of Shares, Transaction</b>	<p>When registering exercisings and cancellations on a given line, specify in this field the number of shares to be exercised or cancelled, depending on the type of transaction. For further information on exercising and cancelling options, see the description of the field "Transaction" above.</p>
<b>Stock Market Price, Transaction</b>	<p>When registering exercisings and cancellations on a given line, specify in this field the market price of the shares at the time at which the transaction takes place. If you leave the field blank and if a share price applying to the date specified in the field "Posting Date" on the current line has been specified for the stock in question, Maconomy suggests that price. Share prices for stocks on specific dates are specified in the table part of the window Stock Information Card. For further information on exercising and cancelling options, see the description of the field "Transaction" above.</p>
<b>Number Exercised</b>	<p>This field shows the total number of shares exercised on the current line. Each time a transaction of the type "Exercising" is carried out for the line, Maconomy adds the number of shares exercised to this field.</p>

Field	Description
<b>Total Canceled</b>	<p>This field shows the total number of cancelled, exercised shares for the line. Each time a transaction of the type "Cancellation" is carried out for the line, Maconomy adds the number of shares cancelled to this field.</p> <p>Last Possible exercise date In this field, you can specify a deadline for entering exercising information on the current line. Whereas the fields "First Exercising Date" and "Last Exercising Date" comprise a period within which the posting date of all exercisings on the line must fall, this field is used for specifying the last date on which exercising registration can be entered on the current line. This means that after this date, it is no longer possible to specify "Exercising" in the field "Transaction." However, cancellations can still be entered after the deadline.</p> <p>The field is used if, for example, an employee has resigned and must decide whether to exercise his or her options by a certain date.</p> <p>When this date has passed, the options can no longer be exercised.</p>
<b>Selected Value 1-5</b>	<p>In these fields, you can specify a number of values for further specification of the agreement. You can only specify values that are available in the respective option lists specified on the card. If a given option list field on the card has been left blank, any text can be entered in the corresponding value field. The fields can be used for further specification of the agreement.</p> <p>If a value has been entered in the corresponding field in the card, this value will be suggested when you create a line.</p>
<b>Date1-5</b>	<p>In these fields, you can specify a number of dates that relate to the current stock option agreement type. When a stock option agreement of the current type is created, the dates specified in this field are also suggested in the corresponding fields in the card part of the new agreement.</p>
<b>Amount 1-5</b>	<p>In these fields, you can specify a number of amounts that relate to the current stock option agreement type. When a stock option agreement of the current type is created, the amounts specified in this field are also suggested in the corresponding fields in the card part of the new agreement.</p>
<b>Remarks 1-5</b>	<p>In these fields, you can specify a number of remarks about the current stock option agreement. The fields are for information only.</p>

## Actions

This section shows the Actions available with this window.

### Top Tab

Field	Description
<b>Register Transaction</b>	<p>When you select this action, Maconomy carries out the transactions specified on the individual lines in the table part.</p> <p>This means that for lines where the field "Transaction" contains the value "Exercising," Maconomy registers the exercising of the number of shares</p>

Field	Description
	<p>specified in the field "Number of Shares, Transaction" on the lines in question. Similarly, for lines where the field "Transaction" contains the value "Cancellation," Maconomy registers the cancellation of the number of shares specified in the field "Number of Shares, Transaction." For further information on specifying exercisings and cancellations on a line, please see the description of the field "Transaction."</p> <p>For each line for which a transaction is registered, Maconomy creates a stock option agreement transaction entry with information about whether it is an exercising or a cancellation, the number of shares involved, entry date, stock market value per share, and so on, allowing you to run reports on the individual transactions made.</p> <p>The entries can subsequently be viewed and edited in the window Stock Option Exercisings which shows all of the transactions made for a given stock option agreement. However, no registrations are made in Maconomy's G/L module, and the registrations therefore have no effects on your accounts. The entries are for information and reporting purposes only.</p>

## Stock Option Exercisings Single Dialog Workspace

Use this workspace to view and edit the individual exercisings and cancellations entered on a stock option agreement.

The Stock Option Exercisings tab displays information about the currently selected stock option agreement, retrieved from the Stock Option Agreements workspace. The Stock Option Agreement Entries sub-tab displays the stock option agreement transaction entries that have been entered for this agreement. You can edit the information in the sub-tab, if needed.

Maconomy creates a stock option agreement transaction entry each time that you enter a stock option exercising or cancellation using the **Register Transaction** action in the Stock Option Agreements workspace. For more information about this process, see the description of the **Register Transaction** action and the **Transaction Type** field in the Stock Option Agreements workspace.

Edit the stock option agreement transaction entries in the Stock Option Agreement Entries sub-tab. This makes it easy to correct entries that contain wrong information. When you change information in an entry, Maconomy updates the information in the stock option agreement line under which this transaction was originally entered. For example, if you reduce the number of options exercised for a given entry in the sub-tab, Maconomy increases the number of options available for exercising in the stock option agreement line.

You cannot manually create or delete lines in the sub-tab. You can only create lines using the **Register Transaction** action in the Stock Option Agreements workspace.

## Stock Option Exercisings Tab

This section shows information about the currently selected stock option agreement, retrieved from the window Stock Option Agreements.

### Stock Option Agreement Island

Field	Description
<b>Agreement No.</b>	This field shows the identification number of the current stock option agreement.
<b>Agreement Type</b>	This field shows the agreement type of the current stock option agreement.
<b>Share No.</b>	This field shows the number of the stock which the current stock option agreement concerns.
<b>Currency</b>	This field shows the currency in which the stock shown in the field "Stock No." above is traded.
<b>Share Denomination</b>	This field shows the share denomination value per share of the current stock according to the card part of the current stock option agreement. For further information about share denomination, see the description of the field "Share Denomination" in the window Share Information Card.
<b>Purchase Price of Shares</b>	This field shows the share price at which the stock options on the agreement are granted to the contact person, that is, the price at which the contact person is allowed to purchase shares when exercising stock options under the agreement.
<b>Number of Shares</b>	In this field, you can specify the total number of options to be granted to the contact person under the current stock option agreement. Maconomy suggests the number of shares per agreement specified on the stock option agreement type of the current agreement, but you can change the number for the agreement here. Maconomy ensures that this number does not exceed the remaining number of shares available for the agreement type of the current agreement. Furthermore, when setting up a vesting plan in the table part, Maconomy ensures that the total number of shares granted in the table part does not exceed this number.
<b>Earliest Exercising Date Allowed</b>	This field shows the earliest exercising date allowed for shares under the current agreement. For further information, see the description of the corresponding field in the window Stock Option Agreements.
<b>Last Exercising Date Allowed</b>	This field shows the last exercising date allowed for shares under the current agreement. For further information, see the description of the corresponding field in the window Stock Option Agreements.
<b>Agreement Date</b>	This field shows the agreement date of the current agreement. This date represents the date on which the agreement is legally binding.

**Option List Fields Island**

Field	Description
<b>List</b>	These fields show the option lists containing the values available for further specification in the fields "Value 1-5" on lines in the table part. This means that the fields "Value 1-5" on lines in the table part can only be completed with options available in the corresponding option lists specified here. If you leave a given field empty, any value can be specified in the corresponding value field. The option lists also contain the values available in the fields "Selected Value 1-5" in this island, but as the fields in the card part are all closed, you cannot enter information in these fields. Information for the value fields in this island can only be entered in the card part of the window Stock Option Agreements.
<b>Value</b>	These fields show the options selected in the corresponding fields in the card part of the window Stock Option Agreements. For further information, see the description of the corresponding fields in the window Stock Option Agreements.

**Amount Island**

Field	Description
<b>Amount 1-5</b>	These fields show a number of amounts pertaining to the current stock option agreement. The information cannot be changed here but can be entered in the corresponding fields in the card part of the window Stock Option Agreements. For further information, see the description of the corresponding fields in the window Stock Option Agreements.

**Remarks Island**

These fields show a number of remarks about the current stock option agreement. The information cannot be changed here but can be entered in the corresponding fields in the card part of the window Stock Option Agreements. For further information, see the description of the corresponding fields in the window Stock Option Agreements.

**Contact Person Island**

Field	Description
<b>Contact Person</b>	These fields show the name and number of the contact person to whom the agreement pertains.
<b>Employee No.</b>	This field shows the number of the employee assigned to the contact person specified in the field "Contact Person No." above, that is, the employee to which the agreement pertains.

**Company Island**

Field	Description
<b>Company</b>	These fields show the name and number of the company to which the stock option agreement pertains.

**Access Level Island**

Field	Description
<b>Access Level</b>	<p>In these fields, you can specify an access level. You only have access to the current stock option agreement if you have been assigned to the same or a higher level in the window Access Levels. This means that on, for example, stock option agreement reports, users can only see stock option agreements to which they have access. Furthermore, in this window, a given user can only see the stock option agreements to which he or she has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to stock option agreements may depend on other factors. For more information about this, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If no access level is specified, all users have access to the current stock option agreement.</p>

**Status Island**

Field	Description
<b>Approved</b>	This field shows whether the current compensation agreement has been approved using the action "Approve Compensation Agreement."
<b>Approved by</b>	This field shows the name of the user who approved the current compensation agreement using the action "Approve Compensation Agreement." If the agreement has not been approved, this field is blank. For further information, see the field "Approved" above.
<b>Approval Date</b>	This field shows the date on which the current compensation agreement was approved using the action "Approve Compensation Agreement." If the agreement has not been approved, this field is blank. For further information, see the field "Approved" above.
<b>Closed</b>	This field shows whether the current compensation agreement has been closed.
<b>Date Closed</b>	This field shows the date on which the current compensation agreement was closed. If the agreement has not been closed then this field is blank.

**Dates Island**

Field	Description
<b>Date1-5</b>	These fields show a number of dates pertaining to the current stock option agreement. The information cannot be changed here but can be entered in the corresponding fields in the card part of the window Stock Option Agreements. For further information, see the description of the corresponding fields in the window Stock Option Agreements.

**User Island**

Field	Description
<b>Created by</b>	This field shows the name of the user who initially created the information in the window.
<b>Date</b>	This first Date field shows the date on which the information was originally created.
<b>Updated by</b>	This field shows the name of the user that made the latest change.
<b>Date</b>	This second Date field shows the date on which the information was last changed.
<b>Version</b>	This field shows a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

**Stock Option Agreement Entries Sub-Tab**

This section shows the individual stock option agreement transaction entries registered for the agreement in question.

Field	Description
<b>Entry Type</b>	<p>This field shows whether the current entry represents an exercising or a cancellation of options. You can change the exercising type, for example, to correct an erroneous registration. If you change the transaction type, the stock option agreement line on which the transaction resulting in the current entry was originally registered is updated accordingly. This means that the numbers in the fields “Number Exercised” and “Number Cancelled” are updated to reflect the changes in the entry.</p> <p>For information about exercisings and cancellations, please see the description of the field “Transaction Type” and the action “Register Transaction” in the window Stock Option Agreements.</p>
<b>Entry Date</b>	This field shows the date on which the shares on the current entry were exercised or cancelled. You can change the date, for example, to correct an erroneous registration.
<b>Number of Shares</b>	This field shows the number of shares exercised or cancelled on the current entry. You can change the number, for example, to correct an erroneous registration. If you change the number of shares, the stock option agreement line on which the transaction resulting in the current entry was originally registered is updated accordingly. This means that the numbers in the fields “Number Exercised” and “Number Cancelled” are updated to reflect the changes in the entry.
<b>Share Denomination</b>	In this field, you can specify the nominal value per share of the options exercised or cancelled on the current entry. You can change the number, for example, to correct an erroneous registration.

Field	Description
<b>Purchase Price of Shares</b>	This field shows the price at which the option on the current line was offered to the contact person. This means that if the entry represents an exercising, this field shows the price at which the contact person purchased the shares.
<b>Market Price of Shares</b>	This field shows the market price of the shares at the time at which the transaction resulting in the current entry took place.
<b>Selected Value 1-5</b>	These fields show the options selected in the corresponding fields in the card part of the window Stock Option Agreements. For further information, see the description of the corresponding fields in the window Stock Option Agreements.
<b>Date1-5</b>	These fields contain a number of dates relating to the current entry. You can change the dates, for example, to correct an erroneous registration.
<b>Amount 1-5</b>	These fields contain a number of amounts relating to the current entry. You can change the amounts, for example, to correct an erroneous registration.
<b>Remarks 1-5</b>	These fields contain a number of remarks relating to the current entry. You can change the remarks, for example, to correct an erroneous registration.

## Personnel Requisitions Single Dialog Workspace

Use this workspace to create personnel requisitions to manage hiring procedures. Personnel requisitions ensure that the correct procedure is followed for all applicants, so that each time that you need to hire staff, you can, for example, invite suitable applicants to an interview and send rejection notices to the others.

Use the Personnel Requisition tab to enter general information about the available position and the personnel requisition type. Use the Applicants sub-tab to create a line for each applicant for the position, entering the contact person who represents the applicant.

Maconomy uses the event flow and event plan functionality to manage the handling of each application. This correlation between applicant entry lines and event flows is described in the introduction to the Personnel Requisition Types workspace, which also explains how to set up event flow types and event plans to support the hiring procedures in your company. The descriptions of this workspace and its fields are therefore based on the assumption that you have set the system up as suggested in the introduction to the Personnel Requisition Types workspace.

In the Personnel Requisition tab, enter general information about the position to be filled and the relevant personnel requisition type. The personnel requisition type contains template information that Maconomy uses to automatically populate certain fields in the tab when you create a personnel requisition. However, you can change the information after you create the requisition. The template information from the personnel requisition type includes an event flow type that identifies the event plan to be used in managing the hiring procedure for each applicant.

In the Applicants sub-tab, create a line for each applicant for the position, entering the contact person who represents the applicant. In other words, create applicants as contact persons using the Contact Persons workspace in the Contact Management module before you enter them in this workspace. Each time that you add an applicant, Maconomy creates an event flow that follows the specified personnel requisition type and assigns it to the contact person who represents the applicant. Maconomy then uses the **Create Events from Plan** action on the new event flow to create the event that corresponds to the first step in the hiring procedure.

Using the event flow and event plan functionality, Maconomy keeps track of the status of each applicant and the next step to be taken according to procedure. Maconomy also keeps each applicant entry line updated appropriately. The **Next Step** field displays the next step to take. In the **Result** field, enter the outcome of that step.

When you have defined the outcome of a step as well as other relevant information, select the **Closed** field to continue to the next step. Maconomy updates the line to show the next step (if applicable) based on the result of the step that you closed. After you select the applicant to be hired for the position, use the **Create Employee** action in the Contact Persons workspace to convert the contact person into an employee. If the contact person is already an employee, update the information in the Employee Positions workspace.

## Personnel Requisitions Tab

Use this section to specify general information about the position to be filled and the relevant personnel requisition type.

### Personnel Requisition Island

Field	Description
<b>Requisition No.</b>	In this field, you must specify a personnel requisition number when creating a personnel requisition. Both letters and numbers can be used in the identification number. If you do not specify a number, the personnel requisition is assigned the next available number in the Personnel Requisition series specified in the window Number Series. Once the personnel requisition has been created, the number can no longer be changed.
<b>Description</b>	In this field, you can specify the name of the current personnel requisition.
<b>Requisition Type No.</b>	In this field, specify the type of the current personnel requisition when creating a requisition. The personnel requisition type contains template information which is transferred to the fields on the current requisition.
<b>Event Flow Type</b>	In this field, you can specify the event flow type to be used on the event flows created for the individual applicant registration lines in the table part. Each time you create an applicant registration line in the table part, Maconomy will create an event flow of this type and assign it to the contact person on the line in question. As the event flow type contains a reference to the event plan from which events are automatically created in the event flow of each applicant, the event flow type is also used for indicating which hiring procedure should be followed for the current requisition.

Field	Description
	Maconomy suggests the event flow type specified on the personnel requisition type in the field "Requisition Type No." above, but you can change it for the current requisition, for example, if you wish to follow a different procedure than indicated by the personnel requisition type.
<b>Position</b>	In these fields, you can specify the name and number of the position which the current personnel requisition concerns, that is, the position to be filled. Maconomy suggests the position specified on the personnel requisition type entered in the field "Requisition No." above, but you can change it for the current requisition.
<b>Replacement for Employee</b>	If the person hired for the position to which the current requisition pertains is to replace a given employee, specify in these fields the name and number of the employee in question. The fields are for information only.

#### Terms Island

Field	Description
<b>Planned Monthly Salary</b>	In this field, you can specify the monthly salary which the company is planning to offer the person hired in connection with the current personnel requisition. If you specify a planned monthly salary, Maconomy automatically calculates a value for the field "Planned Annual Salary" based on the planned monthly salary specified, and vice versa.
<b>Planned Annual Salary</b>	In this field, you can specify the annual salary which the company is planning to offer the person hired in connection with the current personnel requisition. If you specify a planned annual salary, Maconomy automatically calculates a value for the field "Planned Monthly Salary" based on the planned annual salary specified, and vice versa.
<b>Monthly Salary</b>	When the position on the current requisition has been filled, you can specify in this field the monthly salary agreed upon with the person hired. If you specify an annual salary, Maconomy automatically calculates a value for the field "Annual Salary" based on the monthly salary specified, and vice versa.
<b>Annual Salary</b>	When the position on the current requisition has been filled, you can specify in this field the annual salary agreed upon with the person hired. If you specify an annual salary, Maconomy automatically calculates a value for the field "Monthly Salary" based on the annual salary specified, and vice versa.
<b>Found Market Salary Level</b>	In this field, you can specify whether the pay statistics for the type of position to be filled has been checked in order to be able to offer a suitable salary.
<b>Incl. Overtime</b>	In this field, you can specify whether the salary information specified in this island includes any overtime which the person hired has to take on or if overtime is to be paid separately.
<b>Expected Date of Hire</b>	In this field, you can specify the date on which you expect to hire a person for the open position.

### Advertising Island

Field	Description
<b>Advertising Source</b>	In this field, you can specify how the job opening was advertised, for example, internally, in local papers, on web pages, and so on.
<b>Advertising Costs</b>	In this field, you can specify how much it cost to advertise the job opening to which the current requisition pertains.

### Status Island

Field	Description
<b>Approved</b>	This field shows whether the current compensation agreement has been approved using the action "Approve Compensation Agreement."
<b>Approved by</b>	This field shows the name of the user who approved the current compensation agreement using the action "Approve Compensation Agreement." If the agreement has not been approved, this field is blank. For further information, see the field "Approved" above.
<b>Approval Date</b>	This field shows the date on which the current compensation agreement was approved using the action "Approve Compensation Agreement." If the agreement has not been approved, this field is blank. For further information, see the field "Approved" above.
<b>Closed</b>	This field shows whether the current compensation agreement has been closed.
<b>Date Closed</b>	This field shows the date on which the current compensation agreement was closed. If the agreement has not been closed then this field is blank.

### Option List Fields Island

Field	Description
<b>List</b>	In these fields, you can specify the option lists containing the values that should be available for further specification in the fields "Value" in this island as well as on lines in the table part. This means that the fields "Value" in this island and on lines in the table part can only be completed with options available in the corresponding option lists specified here. If you leave a given field empty, any value can be specified in the corresponding value field.
<b>Value</b>	In these fields, you can specify a number of values for further specification of the personnel requisition. You can only specify values available in the respective option lists specified in this island. If a given option list field has been left blank, any text can be entered in the corresponding value field.  If you enter a value in a given value field, this value will be suggested in the corresponding field in the table part of the window when creating table lines.

**User Island**

Field	Description
<b>Created by</b>	This field shows the name of the user who initially created the information in the window.
<b>Date</b>	This first Date field shows the date on which the information was originally created.
<b>Updated by</b>	This field shows the name of the user that made the latest change.
<b>Date</b>	This second Date field shows the date on which the information was last changed.
<b>Version</b>	This field shows a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

**Executing Company Island**

Field	Description
<b>Executing Company</b>	<p>In these fields, you can specify the name and number of the company responsible for conducting the recruitment on the current personnel requisition. Maconomy suggests the company specified on the personnel requisition type entered in the field "Requisition Type No." above, but you can change it for the current requisition.</p> <p>If you specify a value in the field "Job No.," you must specify in this field the number of the company responsible for the job in question.</p>

**Job Cost Island**

Field	Description
<b>Job</b>	<p>In these fields, you can specify the job on which the time spent on recruitment for the position on the current personnel requisition should be posted. Maconomy suggests the value from the corresponding field on the personnel requisition type of the current requisition.</p> <p>You can use these fields if you want time spent on the recruitment to automatically be transferred to time sheets using the action "Transfer to Time Sheet" in the window Event Flows. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question, that is, the employee specified in the field "Employee No., Time Sheet" on the applicant registration line to which the event in question is assigned. In the time sheet, the time is registered on a line with the combination of job number, activity and task specified on the event in question. For further information, see the description of the action "Transfer to Time Sheet."</p> <p>When you create an applicant registration line, Maconomy suggests this value in the corresponding field on the line in question. If you specify a job, you must specify in</p>

Field	Description
	the field "Executing Company" in the island Executing Company the name and number of the company responsible for the job in question.
<b>Activity No.</b>	<p>In this field, you can specify the activity on which the time spent on recruitment for the position on the current personnel requisition should be posted. Maconomy suggests the value from the corresponding field on the personnel requisition type of the current requisition.</p> <p>You can use this field if you want time spent on the recruitment to automatically be transferred to time sheets using the action "Transfer to Time Sheet" in the window Event Flows. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question, that is, the employee specified in the field "Employee No., Time Sheet" on the applicant registration line to which the event in question is assigned. In the time sheet, the time is registered on a line with the combination of job number, activity and task specified on the event in question. For further information, see the description of the action "Transfer to Time Sheet."</p> <p>When you create an applicant registration line, Maconomy suggests this value in the corresponding field on the line in question.</p>
<b>Task</b>	<p>In this field, you can specify the task on which the time spent on recruitment for the position on the current personnel requisition should be posted. Maconomy suggests the value from the corresponding field on the personnel requisition type of the current requisition.</p> <p>You can use this field if you want time spent on the recruitment to automatically be transferred to time sheets using the action "Transfer to Time Sheet" in the window Event Flows. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question, that is, the employee specified in the field "Employee No., Time Sheet" on the applicant registration line to which the event in question is assigned. In the time sheet, the time is registered on a line with the combination of job number, activity and task specified on the event in question. For further information, see the description of the action "Transfer to Time Sheet."</p> <p>When you create an applicant registration line, Maconomy suggests this value in the corresponding field on the line in question.</p>

### Requisitioner Island

Field	Description
<b>Requisitioner</b>	In these fields, you can specify the name and number of the employee who requested that a new person be hired. The fields are for information only.

### Recruitment Employee Island

Field	Description
<b>Recruitment</b>	In these fields, you can specify the name and number of the employee who recruited the person hired in connection with the current requisition. If an

Field	Description
	employee is created from the contact person representing one of the applicants by using the action "Create Employee" in the window Contact Persons, the information in these fields is transferred to the employee created.

**Supervisor Island**

Field	Description
<b>Employee</b>	In these fields, you can specify the name and number of the employee who will be the supervisor of the person hired in connection with the current requisition. If an employee is created from the contact person representing one of the applicants by using the action "Create Employee" in the window Contact Persons, the information in these fields is transferred to the employee created.

**Dimension Combination Island**

Field	Description
<b>Dim. Comb. No.</b>	In this field you can enter a dimension combination number to be assigned to the employee.

**Derived Company Island**

Field	Description
<b>Company No.</b>	In this field, you can specify the number of the company responsible for conducting the recruitment on the current personnel requisition.

**Derived Account Island**

Field	Description
<b>Account No.</b>	In this field you can enter an account number to be assigned to the employee.
<b>Overwrite</b>	copy to come.

**Derived Dimensions Island**

Field	Description
<b>Location</b>	In this field, you can enter a location to be assigned to the employee.
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.

Field	Description
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec.1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Overwrite</b>	copy to come.

**Access Level Island**

Field	Description
<b>Access Level</b>	<p>In these fields, you can specify an access level. You only have access to the current personnel requisition if you have been assigned to the same or a higher level in the window Access Levels. This means that in other windows, users can only refer to personnel requisitions to which they have access. Furthermore, in this window, a given user can only see the personnel requisitions to which he or she has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to personnel requisitions may depend on other factors. For more information about this, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If no access level is specified, all users have access to the current personnel requisition.</p>

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In these fields, you can assign a document archive name and number to the current personnel requisition. By assigning a document archive to a personnel requisition, you can keep track of the various documents related to the requisition. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.

## Applicants Sub-Tab

Use this section to create a line for each applicant for the position, specifying the contact person representing the applicant.

Field	Description
<b>Contact Person No.</b>	In this field, you must specify the number of the contact person representing the applicant when creating an applicant registration line. Contact persons are created in the window Contact Persons in the Contact Management module.
<b>Name</b>	This field shows the name of the contact person specified in the field "Contact Person No." above.
<b>Employee No.</b>	If the contact person specified in the field "Contact Person No." above is assigned to an employee, that is, the person applying for the position on the personnel requisition is already an employee in your organization, this field shows the employee number of the employee in question. If the contact person is not assigned to an employee, this field is blank.
<b>E-mail</b>	This field shows the e-mail address of the contact person specified on the current line. The e-mail address of contact persons is specified in the window Contact Persons in the Contact Management module.
<b>Result</b>	<p>In this field, you can specify the result or outcome of the current step in the hiring process pertaining to the current applicant, for instance "Invite to Interview" or "Reject." The field corresponds to the field "Result" on the currently open event in the event flow assigned to the current applicant registration line. Therefore, the options available in the field are the ones available in the option list specified in the field "Result Type" on the event in question.</p> <p>When you mark the field "Closed" on the current line, the result specified in this field will determine the next step in the process. For further information about this and for information about the correlation between applicant registration lines and event flows, see the introduction to the window "Personnel Requisition Types."</p>
<b>Closed</b>	<p>Mark this field to proceed to the next step in the hiring process for the current applicant. The field corresponds to the field "Closed" on the currently open event in the event flow assigned to the current applicant registration line. Therefore, marking this field on the current line will cause Maconomy to close the event in question and run the action "Create Secondary Events" for the event flow in question. Thereby, the result specified in the field "Result" will determine the next step in the process.</p> <p>Please note that this requires that the system has been set up as described in the introduction to the window "Personnel Requisition Types." In particular, the functionality described above is based on the assumption that the field "Create Secondary Events when Closing" is marked on the event flow type specified in the card part of the personnel requisition. If it is not, marking this field will not cause you to proceed to the next step, as Maconomy will then not automatically create an event representing the next step.</p>

Field	Description
	For further information about this and for information about the correlation between applicant registration lines and event flows, see the introduction to the window "Personnel Requisition Types."
<b>Status</b>	This field shows the last result entered in the field "Result" on the current line.
<b>Next Step</b>	<p>This field shows a short description of the current step in the hiring procedure pertaining to the current applicant registration line, that is, the step which must be carried out in order to proceed in the process. When you have carried out this step, enter the outcome in the field "Result" and mark the field "Closed" to proceed to the next step.</p> <p>The text is retrieved from the field "Description" on the open event in the event flow assigned to the current applicant registration line.</p>
<b>Total Time Consumption</b>	<p>In this field, you can specify the number of hours the employee in the field "Employee No., Time Sheet" has spent working on the current step in the hiring procedure. The field shows the value from the field "Accumulated Time" on the open event in the event flow assigned to the current applicant registration line, and changing the value in this field causes the field on the event to be updated accordingly, and vice versa.</p> <p>You can use this field if you want time spent on recruitment activities to automatically be transferred to time sheets using the action "Transfer to Time Sheet" in the window Event Flows. When this action is selected, the accumulated time on each event in the selected event flow is transferred to time sheets for the employees specified on the individual events in the flow. For further information, see the description of the action "Transfer to Time Sheet."</p>
<b>Job No.</b>	<p>In this field, you can specify the job on which the time spent on the current step in the hiring process of the current applicant registration line should be posted. The field shows the value from the field "Job No." on the open event in the event flow assigned to the current applicant registration line, and changing the value in this field causes the field on the event to be updated accordingly, and vice versa.</p> <p>You can use this field if you want time spent on recruitment activities to automatically be transferred to time sheets using the action "Transfer to Time Sheet" in the window Event Flows. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question, that is, the employee specified in the field "Employee No., Time Sheet" on the current applicant registration line. In the time sheet, the time is registered on a line with the combination of job number, activity and task specified on the event in question. For further information, see the description of the action "Transfer to Time Sheet."</p> <p>When you create a line, Maconomy suggests the value from the corresponding field in the card part of the window. Each time you enter a new step in the hiring process, Maconomy suggests the value specified in the</p>

Field	Description
	corresponding field in the card part of the event flow assigned to the current line, but you can change the job number here.
<b>Task</b>	<p>In this field, you can specify the task on which the time spent on the current step in the hiring process of the current applicant registration line should be posted. The field shows the value from the field "Task" on the open event in the event flow assigned to the current applicant registration line, and changing the value in this field causes the field on the event to be updated accordingly, and vice versa.</p> <p>You can use this field if you want time spent on recruitment activities to automatically be transferred to time sheets using the action "Transfer to Time Sheet" in the window Event Flows. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question, that is, the employee specified in the field "Employee No., Time Sheet" on the current applicant registration line. In the time sheet, the time is registered on a line with the combination of job number, activity and task specified on the event in question. For further information, see the description of the action "Transfer to Time Sheet."</p> <p>Maconomy suggests the value specified in the corresponding field in the card part of the window but you can change the task number here.</p>
<b>Activity No.</b>	<p>In this field, you can specify the activity on which the time spent on the current step in the hiring process of the current applicant registration line should be posted. The field shows the value from the field "Activity No." on the open event in the event flow assigned to the current applicant registration line, and changing the value in this field causes the field on the event to be updated accordingly, and vice versa.</p> <p>You can use this field if you want time spent on recruitment activities to automatically be transferred to time sheets using the action "Transfer to Time Sheet" in the window Event Flows. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question, that is, the employee specified in the field "Employee No., Time Sheet" on the current applicant registration line. In the time sheet, the time is registered on a line with the combination of job number, activity and task specified on the event in question. For further information, see the description of the action "Transfer to Time Sheet."</p> <p>Maconomy suggests the value specified in the corresponding field in the card part of the window but you can change the activity number here.</p>
<b>Employee No., Time Sheet</b>	<p>In this field, you can specify the employee who is to handle the current step in the hiring process of the current applicant registration line. The field shows the value from the field "Employee No." on the open event in the event flow assigned to the current applicant registration line, and changing the value in this field causes the field on the event to be updated accordingly, and vice versa.</p>

Field	Description
	<p>You can also use this field if you want time spent on recruitment activities to automatically be transferred to time sheets using the action “Transfer to Time Sheet” in the window Event Flows. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question, that is, the employee specified in this field. In the time sheet, the time is registered on a line with the combination of job number, activity and task specified on the event in question. For further information, see the description of the action “Transfer to Time Sheet.”</p> <p>Maconomy suggests the value specified in the corresponding field in the card part of the window but you can change the employee number here.</p>
<b>Selected Value 1-10</b>	<p>In these fields, you can specify a number of values for further specification of the current personnel requisition. You can only use values available in the respective option lists specified in the fields “Option List 1-5” in the card part of the window. If a given option list field in the card part has been left blank, any text can be entered in the corresponding value field. The fields can be used for further specification of the applicant registration line.</p> <p>Maconomy suggests the values specified in the corresponding value fields in the card part of the window but you can change the values here.</p>
<b>Document Archive No.</b>	<p>In this field, you can assign a document archive to the current applicant registration line. By assigning a document archive to an applicant registration line, you can keep track of the various documents related to the applicant registration, for example, application, resume, correspondence, contracts, and so on. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.</p>
<b>Description</b>	<p>This field shows a description of the document archive specified in the field “Archive No.” above.</p>
<b>Document Count</b>	<p>This field displays the number of documents in the Document Archive.</p>

## Actions

This section shows the Actions available with this window.

### Top Tab

Field	Description
<b>Attach Document to Personnel Requisition</b>	<p>This action allows you to attach a document to the personnel requisition in the card part.</p>

## Course Participants Single Dialog Workspace

Use this workspace to enter information about the participants in your courses.

The Course Participants tab contains general information about the selected course. In the Course Participants sub-tab, enter the individual participants for the course.

**Note:** The information in the Course Participants tab comes from the Course Information Card workspace. Changes that you make here update that information as well.

Throughout this description, the term "participant" is used to mean any contact person who is specified in a line in this workspace, whether enrolled or not.

You create courses in the Course Information Card workspace. After you create a course, start inviting participants to the course and enter the people who enroll. If too many people want to enroll, you can maintain a waiting list.

In the Course Participants sub-tab, enter the individual participants in the current course. For each line, enter a contact person who represents a potential participant. This means that a contact person entered in a line is not entered as enrolled until you select the **Enrolled** field in the line. This enables you to create a list of contact persons to be invited to the course and let these potential participants enroll individually.

In each line, enter information about whether the participant has been invited to the course, whether that participant has enrolled, and so on. Use the Selection Criteria Island to limit the number of participants that the Course Participants sub-tab displays. For example, you can limit the participants you want to view to those on the waiting list.

Maconomy's Resource Management Portal module offers a functionality that automates most of the enrollment procedure and allows invited participants to enroll through a link sent by e-mail. For more information about this, see the description of the Course component in the Portal Modules manual.

After a course is completed, the trainers can evaluate and enter the skill levels that the individual participants acquired. Use the **Transfer Skill** action to transfer the skill level information to the Employee Skills workspace, thus automatically updating skill data for employees in your system.

This workspace also provides a number of actions for easily entering all participants currently displayed in the Course Participants sub-tab as invited, enrolled, and so on.

### Course Participants Tab

This section shows general information about the currently selected course.

#### Course Island

Field	Description
<b>Course No.</b>	This field shows the number of the currently selected course.
<b>Name</b>	In this field, you can enter a description of the current course.

Field	Description
<b>Course Type No.</b>	This field shows the number of the course type of the current course.
<b>Blocked</b>	This field shows whether the current course has been blocked. When a given course is blocked, it is no longer possible to change information in the card or table part of this window.
<b>Trainer No.</b>	If the trainer on the current course is an employee in your company, you can specify in this field the number of the employee in question. If you specify an employee number, Maconomy automatically completes the field "Trainer Name" with the name of the employee in question. If the trainer is not an employee, leave this field blank and manually enter the name of the trainer in the field "Trainer Name."
<b>Trainer</b>	If the trainer on the current course is not an employee in your company, specify in this field the name of the trainer. If the trainer is an employee, leave this field blank and specify the number of the employee in question in the field "Trainer No." above. This causes Maconomy to automatically complete this field with the name of the employee in question.

### Course Period Island

Field	Description
<b>Starting Date</b>	In this field, you can specify the date on which the current course is scheduled to start.
<b>Ending Date</b>	In this field, you can specify the date on which the current course is scheduled to end.
<b>Started</b>	In this field, you can specify the time at which the current course is scheduled to start, either on the starting date of the course or generally on each day throughout the course, depending on your use of the system.
<b>Finished</b>	In this field, you can specify the time at which the current course is scheduled to end, either on the ending date of the course or generally on each day throughout the course, depending on your use of the system.

### Skill Island

Field	Description
<b>Skill</b>	In these fields, you can specify the name and number of the skill to which the current course pertains, that is, the skill which the participants will acquire at a certain level by participating in the course. When the course has been completed, the trainer or trainers can specify the acquired skill level for each participant and select the action "Transfer Skill" to transfer the skill levels to the window Employee Skills, thus automatically updating skill data for employees in your system. For further information, see the description of the action "Transfer Skill."

Field	Description
<b>Skill Type</b>	This field shows the type of the skill specified in the field "Skill No." above.

**Course Description Island**

Field	Description
<b>Description 1-5</b>	In these fields, you can specify a number of texts describing the current course.
<b>www</b>	In this field, you can specify a web address pertaining to the current course.

**Participants Island**

Field	Description
<b>Max. Number of Participants</b>	<p>In this field, you can specify the maximum number of participants allowed on the current course. If you specify a number, Maconomy automatically ensures that the number of participants enrolled for the current course does not exceed the specified number. If you do not wish to limit the number of participants allowed, specify 0.</p> <p>Participants are enrolled for courses by marking the field "Enrolled" in the table part of the window.</p>
<b>Number Enrolled</b>	This field shows how many participants have enrolled for the current course. Participants are registered as enrolled by marking the field "Enrolled" in the table part of the window.
<b>Max. Number on Waiting List</b>	<p>In this field, you can specify the maximum number of people allowed on the waiting list for the current course. If you specify a number, Maconomy automatically ensures that the number of participants on the waiting list does not exceed the specified number. If you do not wish to limit the size of the waiting list, specify 0.</p> <p>Participants are put on the waiting list by marking the field "On Waiting List" in the table part of the window.</p>
<b>Number on Waiting List</b>	This field shows how many participants are currently on the waiting list for the current course. Participants are registered on the waiting list by marking the field "On Waiting List" in the table part of the window.
<b>Closed for Enrollment</b>	Select this field to close the course for enrollment. When a course is closed for enrollment it will not be possible to enroll more participants in the course.

**Option List Fields**

Field	Description
<b>List</b>	<p>In these fields, you can specify the option lists containing the values that should be available for further specification in the fields “Value” in this island. This means that the fields “Value” in this island can only be completed with options available in the corresponding option lists specified here. If you leave a given field empty, any value can be specified in the corresponding value field.</p> <p>Maconomy suggests the option lists and values specified in the window Course Types for the course type of the current course.</p>
<b>Value</b>	<p>In these fields, you can specify a number of values for further specification of the current course. You can only use values available in the respective option lists specified in this island. If a given option list field has been left blank, any text can be entered in the corresponding value field. The fields can be used for further specification of the current course.</p> <p>Maconomy suggests the values specified in the window Course Types for the course type of the current course.</p>

**Selection Criteria Island**

Field	Description
<b>Contact Person No.</b>	In these fields, you can specify a range of contact person numbers. The table part will only show lines pertaining to contact persons within the specified range.
<b>Employee No.</b>	In these fields, you can specify a range of employee numbers. The table part will only show lines pertaining to contact persons assigned to employees within the specified range. Lines with contact persons that do not represent employees are not shown if you specify a range of employee numbers.
<b>Show Invited Only</b>	If you mark this field, the table part will only show lines on which the field “Invited” has been marked.
<b>Show Not Invited Only</b>	If you mark this field, the table part will exclude lines on which the field “Invited” has been marked.
<b>Show Enrolled Only</b>	If you mark this field, the table part will only show lines on which the field “Enrolled” has been marked.
<b>Show Enrolled Incl. Waiting List</b>	If you mark this field, the table part will only show lines on which either the field “Enrolled” or the field “On Waiting List” has been marked.

**Course Location Island**

In this island, you can specify the address at which the course is to take place as well as various contact information (for example, phone number and e-mail address) pertaining to the course location or course administration.

Field	Description
<b>Attn.</b>	In this field, you can specify an attention person.
<b>Country</b>	In this field, you can specify the name of the country in which the lesson is to take place. Maconomy suggests the value from the corresponding field in the card part of the window.
<b>Phone</b>	In this field, you can specify the phone number which participants should use in relation to the current lesson, for instance the phone number of the trainer or the location at which the lesson is to take place. Maconomy suggests the value from the corresponding field in the card part of the window.
<b>Fax</b>	In this field, you can specify the fax number which participants should use in relation to the current lesson, for instance the fax number of the trainer or the location at which the lesson is to take place. Maconomy suggests the value from the corresponding field in the card part of the window.
<b>Telex</b>	In this field, you can specify the telex number which participants should use in relation to the current lesson, for instance the telex number of the trainer or the location at which the lesson is to take place. Maconomy suggests the value from the corresponding field in the card part of the window.
<b>E-mail</b>	In this field, you can specify the e-mail address which participants should use in relation to the current lesson, for instance the e-mail address of the trainer or the location at which the lesson is to take place. Maconomy suggests the value from the corresponding field in the card part of the window.

### Access Level Island

Field	Description
<b>Access Level</b>	Here you can enter an access level created in the window Access Levels. Users only have access to information about the current course, and can only refer to it in other windows if they have been assigned to this or a higher access level in the window User Access Levels in the Set-Up module. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to courses may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.  If you do not specify an access level, all users will have access to see information about the current course.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In these fields, you can assign a document archive name and number to the current course. By assigning a document archive to a course, you can keep track of the various documents related to the course. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.

**Company Island**

Field	Description
<b>Company</b>	These fields show the name and number of the company to which the course pertains.

**Job Cost Island**

Field	Description
<b>Job No.</b>	In this field, you can specify the number of a job if the current course is related to a given job or the course activities should be registered on a given job. However, as no automatic posting is made in connection with courses, the field is for information only.
<b>Job Name</b>	This field shows the name of the job specified in the field "Job No." above.
<b>Activity No.</b>	In this field, you can specify the number of an activity if the current course is related to a given activity or the course activities should be registered on a given activity in the Job Cost system. However, as no automatic posting is made in connection with courses, the field is for information only.
<b>Task</b>	In this field, you can specify the name of a task if the current course is related to a given task or the course activities should be registered on a given task. However, as no automatic posting is made in connection with courses, the field is for information only.

**User Island**

Field	Description
<b>Created by</b>	This field shows the name of the user who initially created the information in the window.
<b>Date</b>	This first Date field shows the date on which the information was originally created.

Field	Description
<b>Updated by</b>	This field shows the name of the user that made the latest change.
<b>Date</b>	This second Date field shows the date on which the information was last changed.
<b>Version</b>	This field shows a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

## Course Participants Sub-Tab

Use this section to register the individual participants at the current course.

Field	Description
<b>Contact Person No.</b>	In this field, you can specify the number of the contact person representing the course participant. If the specified contact person is an employee, that is, an employee number is specified for the contact person in the window Contact Persons, the number of the employee in question is automatically transferred to the field "Employee No."
<b>Employee No.</b>	If the contact person specified on the current line is an employee, that is, an employee number is specified for the contact person in the window Contact Persons, the number of the employee in question is shown in this field.
<b>Name</b>	This field shows the name of the contact person specified on the current line.
<b>Invited</b>	In this field, you can specify whether the current contact person has been invited to the course. Mark the field to indicate that the contact person has been invited. Maconomy's Resource Management Portal module offers functionality that automates most of the enrollment procedure and allows invited participants to enroll through a link sent by e-mail. For further information on this, see the section on the Course component in the Portal Modules manual.
<b>Enrolled</b>	In this field, you can specify whether the current contact person has enrolled to the course. Mark the field to indicate that the contact person has enrolled. If you mark the field, today's date is automatically inserted into this field "Enrollment Date."  Maconomy's Resource Management Portal module offers functionality that automates most of the enrollment procedure and allows invited participants to enroll through a link sent by e-mail. For further information on this, see the section on the Course component in the Portal Modules manual.
<b>On Waiting List</b>	In this field, you can specify whether the current contact person is on the waiting list, for instance because the maximum number of participants has already been reached. Mark the field to indicate that the contact person is on the waiting list.

Field	Description
<b>Enrollment Date</b>	In this field, you can specify the date on which the current participant enrolled for the course. If you mark the field "Enrolled," today's date is automatically inserted into this field.
<b>Blocked</b>	Mark this field if you wish to block the current participant. When the field is marked, it is not possible to change information on the current line. Please note that although blocked, participants marked as enrolled are counted in the total number of participants enrolled in the current course.
<b>Participation %</b>	Upon completion of the course, you can specify in this field the participation percentage of the current participant, that is, the amount of time the participant was present compared to the total running time of the course.
<b>Completed</b>	Upon completion of the course, you can specify in this field whether the current participant completed the course. The action "Transfer Skill" only applies to lines on which this field is marked.
<b>Skill Level</b>	<p>In this field, you can specify in this field the level at which the participant acquired the skill which the course concerned, that is, the skill specified in the card part. This way, the trainer can evaluate the skills acquired by the individual participants and enter the information here. Using the action "Transfer Skill," you can have Maconomy transfer the skill level information to the window Employee Skills upon course completion, thus automatically updating skill data for employees in your system.</p> <p>If no skill has been specified in the card part, you cannot enter a skill level in this field.</p>
<b>Skill Description</b>	This field shows a description of the skill specified in the field "Skill Level," if any.
<b>Skill Text</b>	Upon completion of the course, you can enter in this field a text describing the skills acquired by the participant.
<b>Skill transferred</b>	<p>In this field, you can specify whether the skill level acquired by the current participant has been transferred to your employee skill management system, typically the window Employee Skills in Maconomy. Using the action "Transfer Skill," you can have Maconomy automatically transfer the skill level information to the window Employee Skills, thus automatically updating skill data for employees in your system.</p> <p>If you need to edit the skill level for a given participant after transferring skills, you can unmark this field and specify the relevant skill level, and then press Enter before selecting the action "Transfer Skill" again.</p>
<b>Document Archive No.</b>	In this field, you can assign a document archive to the current course participant registration. By assigning a document archive to a course participant registration, you can keep track of the various documents related to the participant registration, for example, enrollment forms, and so on. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.

Field	Description
<b>Description</b>	This field shows a description of the document archive specified in the field "Archive No." above.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.
<b>Job No.</b>	In this field, you can specify the number of a job if the participation of the current participant is related to a given job or the course activities of the current participant should be registered on a given job. However, as no automatic posting is made in connection with courses, the field is for information only.
<b>Activity No.</b>	In this field, you can specify the number of an activity if the participation of the current participant is related to a given activity or the course activities of the current participant should be registered on a given activity. However, as no automatic posting is made in connection with courses, the field is for information only.
<b>Task</b>	In this field, you can specify the number of a task if the participation of the current participant is related to a given task or the course activities of the current participant should be registered on a given task. However, as no automatic posting is made in connection with courses, the field is for information only.
<b>Selected Value 1-10</b>	In these fields, you can specify a number of values for further specification of the current course participant. You can only use values available in the respective option lists specified in the card part of the window. If a given option list field has been left blank, any text can be entered in the corresponding value field.  Maconomy suggests the values specified in the corresponding fields in the card part of the window.
<b>E-mail</b>	This field shows the e-mail address of the contact person specified on the current line.

## Actions

This section shows the Actions available with this window.

### Top Tab

Field	Description
<b>Invite Participants</b>	When you select this action, Maconomy marks the field "Invited" on all participants shown in the table part.
<b>Enroll to Course</b>	When you select this action, Maconomy marks the field "Enrolled" on all participants shown in the table part.

Field	Description
<b>Enroll to Waiting List</b>	When you select this action, Maconomy marks the field "On Waiting List" on all participants shown in the table part.
<b>Cancel Enrolments</b>	When you select this action, Maconomy deselects the field "Enrolled" on all participants shown in the table part.
<b>Transfer Skill</b>	<p>When you select this action, Maconomy transfers the skill information specified in the table part to the window Employee Skills, thus automatically updating skill data for employees in your system. Information is only transferred for participants registered as employees in your system. This means that the action only includes lines on which the field "Employee No." contains a value. Furthermore, the action only affects participants for whom the field "Course Completed" has been marked and for which the field "Skill Transferred" has not. For each of these lines, Maconomy runs the following procedure:</p> <p>If the employee already possesses the skill specified in the card part of the window, the value in the field "Skill Level" on the current line is transferred to the line in the window Employee Skills on which the skill in question is registered. Please note that the skill level is transferred even if it is located on a lower level in the skill level list. For further information on skill level lists, see the window Level Lists in the Resource Planning module.</p> <p>If the employee in question does not already possess the skill specified in the card part of the window, an employee skill line with the skill in question is created before transferring the skill level.</p>
<b>Attach Document to Course</b>	This action allows you to attach a document to the course in the card part.

#### Bottom Tab

Field	Description
<b>Attach Document to Participant</b>	This action allows you to attach a document to the course participant in the table part.

## User Masking Workspace

Use this workspace to enter user masking information.

User masking enables you to mask personal information that is related to former employees. This feature deletes some relevant records according to your specifications and masks relevant fields in other records. You provide a masking value that replaces the instances of the user and/or employee information that you select to be masked.

See the *Deltek Maconomy 2.2.x Enhancements Guide* for related procedures.

## User Masking Tab

Use this section to set default values for user masking.

### Set default values Island

Field	Description
<b>User mask</b>	Enter the string to use to mask user names. You can enter any string, with a maximum length of 50 characters. The masking routine replaces the selected user names with this string. You must enter a value in this field.
<b>Employee mask</b>	Enter the string to use to mask employee names. The masking routine replaces all employee names that have the selected numbers with this string. You can enter any string, with a maximum length of 50 characters. You must enter a value in this field.

## User Masking Sub-Tab

Use this section to associate a user name and employee number with user masking.

Field	Description
<b>User Name</b>	<p>Enter or search for the user name(s) that you want to mask. The masking routine replaces occurrences of this user name with the value that you enter in the <b>User mask</b> field.</p> <p>The value in this column is not validated. This enables you to locate and mask information for user names that have already been removed from Maconomy, but that still exist in various locations, such as change logs and database tables. You can specify just user names, just employee numbers, or both user names and employee numbers.</p>
<b>Employee No.</b>	<p>Enter or search for the employee number(s) whose associated names you want to mask. The masking routine replaces all employee names that have the selected numbers with the value that you enter in the <b>Employee mask</b> field.</p> <p>The value in this column is validated; the employee number must exist in Maconomy.</p> <p>You can specify just employee numbers, just user names, or both employee numbers and user names.</p>

## Actions

This section describes the action(s) associated with user masking.

Field	Description
<b>Perform User and Employee Masking</b>	Select this action to run the masking routine according to the masking specifications that you provide.

## Company Masking Single Dialog Workspace

Use this single dialog workspace to enter company masking information.

### Company Masking Tab

Use this section to set default values for company masking.

#### Set default values Island

Field	Description
<b>User mask</b>	Enter the string to use to mask all user names for the specified company. You can enter any string, with a maximum length of 50 characters. The masking routine replaces all user names associated with the specified company with this string. You must enter a value in this field.
<b>Employee mask</b>	Enter the string to use to mask all employee names for the specified company. The masking routine replaces all employee names associated with the specified company with this string. You can enter any string, with a maximum length of 50 characters. You must enter a value in this field.

### Company Masking Sub-Tab

Use this section to specify companies whose user and employee information you want to mask.

Field	Description
<b>Company No.</b>	Enter the number of the company whose user and employee information you want to mask. If you want to mask user and employee information for more than one company, you can enter several company numbers.

### Actions

This section describes the action(s) associated with company masking.

Field	Description
<b>Perform Company Masking</b>	Runs the masking routine according to the masking specifications you provide. All user and employee information associated with the specified company are masked. If you click this action after specifying several company numbers in the Company Masking sub-tab, all user and employee information associated with the specified companies are masked.

## Employee Revisions Single Dialog Workspace

Use this workspace to show the employee revisions.

### Employee Revision Selection Criteria Tab

Use this section to choose the selection criteria to display the employee revisions.

#### Employee Revision Selection Criteria Island

Field	Description
<b>Selection Criteria</b>	<p>Choose the selection criteria to display the employee revisions:</p> <ul style="list-style-type: none"> <li>■ <b>Previous</b>— If you select this criteria, the previous employee revisions display.</li> <li>■ <b>Current</b> — This criteria is selected by default. It displays the current employee revision.</li> <li>■ <b>Next</b> — If you select this criteria, the next employee revisions displays.</li> <li>■ <b>All Revisions</b> — If you select this criteria, the system shows all revisions. Using null dates in both From Date and To Date also selects all revisions. Thus, no revisions are shown when the <b>Selection Criteria</b> field is left blank.</li> <li>■ <b>Within Range</b> — If you select this criteria, Maconomy uses the dates that you set in the <b>Selection Range</b> field. If any revision overlaps the range fully or partly, it will be included.</li> </ul>
<b>Selection Range</b>	Select the date range of the employee revisions.

### Employee Revisions Sub-Tab

Use this section to enter information related to the employee revisions.

Field	Description
<b>From Date</b>	Enter or select the starting date of the employee revisions.
<b>To Date</b>	Enter or select the ending date of the employee revisions.
<b>Is Current</b>	This field is automatically selected if the line contains the current revision.
<b>Change Description</b>	Enter a short description of the employee revision.
<b>Name 1</b>	Enter the employee's name.

Field	Description
<b>Title</b>	Enter the employee's personal title, for example, Mr., Ms., or Dr.
<b>Names 2-5</b>	Enter the names of the employees.
<b>Phone</b>	Enter the contact number of the current employee.
<b>Soc. Security No.</b>	Enter the employee's social security number. This field is for reference only. If you entered social security number validation rules for the employee's country in the Rules of Validation workspace in Set-Up module, Maconomy verifies that the social security number complies with the validation rules.
<b>Country</b>	Enter the employee's country of residence.
<b>Blocked</b>	Select the check box to block the employee. A blocked employee cannot be used in any other workspaces.
<b>Time Unit</b>	Specify the unit of time for the employee, as either Hour or Day. This field affects the interpretation of every field that represents time on the employee and is the Time Unit on new time sheets created by (or for) the employee in the period covered by the current employee revision.
<b>Cost</b>	Enter the employee's cost per hour or day (depending on the Time Unit). If the field is blank, Maconomy uses the cost of the item in the <b>Item No.</b> field. If both fields are blank, the cost for time activities for this employee is considered zero.
<b>Base Salary Rate</b>	This field shows the base salary rate for the employee. If you change this field, Maconomy updates the Cost with the sum of this field and the overhead rate. The base salary rate is per hour or day, depending on the Time Unit.
<b>Overhead Rate</b>	This field shows the overhead cost rate allocated to the employee. If you change this field, Maconomy updates the Cost with the sum of this field and the base salary rate. The overhead rate is per hour or day, depending on the Time Unit.
<b>Overhead Rate %</b>	This field shows all the costs associated with the employee that is not strictly his salary.
<b>Overhead Rate as %</b>	Select the check box to show the percentage of all the costs associated with the employee that is not strictly his salary.
<b>Overhead Maintenance</b>	This field indicates whether the overhead maintenance cost is being updated by a batch update or employee specific. Note that it is not possible to delete a revision if you selected batch update.

Field	Description
<b>Intercompany Price</b>	Enter a price to use as the cost when the employee registers hours on a job assigned to another company than the one in which the employee is employed. However, the calculation of cost prices may also depend on other factors. The intercompany price is per hour or day, depending on the Time Unit.
<b>Billing Price</b>	Enter the billing price per hour for entries registered by the current employee. The billing price is per hour or day, depending on the Time Unit.
<b>Sales Employee</b>	Select the check box to mark the employee as a sales employee.
<b>Item No.</b>	Enter a warehouse item, from which the sales price and cost is suggested in budgeting, and which is used in job journal entries for this employee. Maconomy verifies that the item you enter exists in the system and is not discontinued.
<b>Account Manager</b>	Select the check box to mark the employee as an account manager.
<b>Zip Code</b>	Enter the zip code of the employee.
<b>Postal District</b>	Enter the name of the postal district in which the current employee resides.
<b>Profession</b>	Enter the employee's profession. This is for reference only.
<b>Education</b>	Enter the employee's education. This is for reference only.
<b>Position</b>	Enter the employee's position. This is for reference only.
<b>Alternative Job Title</b>	Enter a job title with a different classification level than <b>Position</b> field.
<b>EEO Classification</b>	Use this field for equal employment opportunity tracking.
<b>Bank Name</b>	Enter the name of the employee's bank. This field is for reference only.
<b>Reg. No.</b>	Enter the registration number of the employee's bank. This field is for reference only.
<b>Bank Acc. No.</b>	Enter the employee's bank account number. This field is for reference only.
<b>Date Employed</b>	Enter the date when the employee started working. This is for reference only.

Field	Description
<b>Termination Date</b>	Enter the date the employment was terminated.
<b>Time Sheet Start Date</b>	Enter the date the employee starts using timesheets. Maconomy automatically keeps the field synchronized with the <b>Date Employed</b> field unless you manually enter a different value.
<b>Time Sheet End Date</b>	Enter the date the employee stops using timesheets. Maconomy automatically keeps the field synchronized with the <b>Termination Date</b> field unless you manually enter a different value.
<b>Check-in</b>	Select if the current employee is expected to check in for work. The possible entries are: <ul style="list-style-type: none"> <li>▪ <b>Disabled</b></li> <li>▪ <b>Optional</b></li> <li>▪ <b>Required</b></li> <li>▪ <b>Required with Balance</b></li> </ul>
<b>Base Salary, Code</b>	Enter a base salary code that denotes a salary group, and so on. The field is for reference only.
<b>Base Salary</b>	Enter the base salary rate for the employee. If you change this field, Maconomy updates the Cost with the sum of this field and the overhead rate. The amount must be entered in the base currency of the company. The base salary rate is per hour or day, depending on the Time Unit.
<b>Salary Supplement, Code</b>	Enter a salary supplement code that denotes a salary group, and so on. The field is for reference only.
<b>Salary Supplement</b>	Enter the employee's salary supplement, if applicable. The amount must be entered in the base currency of the company.
<b>Overtime Rate, Code</b>	Enter the overtime rate code that denotes a salary group, and so on. The field is for reference only.
<b>Overtime Rate</b>	Enter the employee's hourly rate for overtime work. The amount must be entered in the base currency of the company.
<b>Withholding Rate</b>	Enter the employee's withholding rate. This field is for reference only.
<b>Allowance per Month</b>	Enter the employee's monthly tax allowance, if applicable. This field is for reference only.
<b>Allowance per Fortnight</b>	Enter the employee's fortnightly tax allowance, if applicable. This field is for reference only.
<b>Allowance per Week</b>	Enter the employee's weekly tax allowance, if applicable. This field is for reference only.

Field	Description
<b>Allowance per Day</b>	Enter the employee's daily tax allowance, if applicable. This field is for reference only.
<b>Tax Allowance Card</b>	Select the check box if the employee has a valid tax allowance card. This field is for reference only.
<b>Tax Allowance</b>	Enter the employee's total tax allowance. This field is for reference only.
<b>Pension Plan, Company</b>	Select the check box if the employee joined a company pension plan. The field is for reference only.
<b>Pension Type, Company</b>	Enter the employee's company pension plan. The fields are for reference only.
<b>Pension Amount, Company</b>	Enter the amount to be paid to the employee's company pension.
<b>Pension Plan, Personal</b>	Select the check box if the employee has a private pension plan. The field is for reference only.
<b>Pension Type, Personal</b>	Enter the employee's private pension plan. The field is for reference only.
<b>Pension Amount, Personal</b>	Enter the amount to be paid to the employee's private pension.
<b>Remarks 1-5</b>	Enter information related to the current employee.
<b>Supervisor, No.</b>	Enter the number of a senior employee. Unless you give the user the access to all time sheets in the Actions workspace, the user will only have access to changing, creating, approving, and printing his or her own time sheets and those of junior employees.
<b>Maximum Working Time</b>	Enter the maximum number of time per day that can be entered for the employee in the Time Sheets workspace in the Job Cost module. This field is per hour or day, depending on the Time Unit.
<b>Absence Hours per Day</b>	Enter the maximum number of absence hours per day. By default, the value in this field is zero.
<b>Use Fixed Working Time as Maximum</b>	Select the check box to automatically set the fixed working time as maximum and override the maximum working time.
<b>Employee Type</b>	Select the employee type that you created in the Popup Fields workspace.
<b>Willing to Relocate</b>	Select the check box to indicate that the employee is willing to relocate.

Field	Description
<b>Employment No.</b>	Enter the employment number of the employee associated with the entry. If the employee has several functions in the company, you can use this number to indicate one of the functions.
<b>Subcontractor Vendor, No.</b>	Select a subcontractor vendor number (if any) for the employee. Job entries posted for the employee have the reconciliation subcontractor number assigned accordingly.
<b>Department</b>	Enter the department to which the employee belongs.
<b>Secretary, No.</b>	Enter the number of a secretary assigned to the employee. Among the tasks of a secretary can be entering the employee's time sheets and transferring them for further editing in the Job Journal single dialog workspace.
<b>Fixed Working Time, Monday-Sunday</b>	Enter the employee's working hours for each day. If you change an existing working time, a warning message displays stating that absence registrations using allowance already exist for the period (employee revision), and changing the value may require allowance adjustment.
<b>Minimum Working Time</b>	Enter the minimum amount of working time to be calculated for the employee.
<b>Deviation Allowed</b>	Specify the amount to use for calculating the minimum amount of time, which the employee must specify for each day in a time sheet. The minimum number of hours is calculated as the fixed working time less the number in this field.
<b>Week Calendar No.</b>	Enter or select a week calendar to assign to the current employee.
<b>Job Price Group No.</b>	Enter or select the number of the job price group assigned to the current employee.
<b>Popup 1-5</b>	Select various information about the employee. For each field, you can choose from the options created as values Employee Popup 1 - Employee Popup 5 in the Popup Fields single dialog workspace.
<b>Statistics 1-4</b>	Enter a number of statistics codes for further specification of the employee. For example, you can use the statistics codes as selection criteria in a number of printouts.
<b>Vendor No.</b>	Specify the number of a vendor, thus associating the employee with a vendor in the A/P module. This way, outlay reimbursements to a given employee can be handled through the A/P module.
<b>Primary Employee Category No.</b>	This field shows the number of the primary employee category of the employee.
<b>Reduction %</b>	Enter a reduction percentage of the employee's available time, "planning time," as part of the fixed amount of working time.

Field	Description
<b>Document Archive No.</b>	Assign a document archive number to the employee in question.
<b>E-mail</b>	Specify the e-mail address of the employee. The field is for reference only.
<b>Personal Email Address</b>	Enter the contact person's personal e-mail address.
<b>E-mail when responsible for approval</b>	Select the check box if the employee prefers to be notified if he is responsible for approval, for example, a purchase order or an expense sheet. The field is for information only, as Maconomy does not automatically notify the employee.
<b>E-mail when responsible for invoice allocation</b>	Select the check box if the employee prefers to be notified if he is responsible for allocating an invoice. The field is for information only, as Maconomy does not automatically notify the employee.
<b>Standard Billing Price</b>	Enter the standard billing price per hour for entries registered by the current employee. The standard billing price is used if the <b>Use standard billing price for time activities</b> system parameter is enabled, otherwise the standard billing price is set to equal the registered billing price.
<b>Initials</b>	Specify the initials by which the employee is known in the company. Maconomy checks that other employees do not use the initials in the system.
<b>Maiden Name</b>	Enter the employee's maiden name.
<b>Name in Local Alphabet</b>	Enter the employee's name in their local alphabet.
<b>Gender</b>	In this field, you can specify the gender of the employee. You can select any of the following values: <ul style="list-style-type: none"> <li>■ <b>Male</b></li> <li>■ <b>Female</b></li> <li>■ <b>Diverse</b></li> <li>■ <b>Prefer not to classify</b></li> </ul>
<b>Date of Birth</b>	Enter the employee's date of birth.
<b>Mobile</b>	Specify the primary mobile phone number of the current employee. The field is for reference only.
<b>Mobile 2</b>	Specify the secondary mobile phone number of the current employee. The field is for reference only.

Field	Description
<b>Phone 2</b>	Specify the secondary phone number of the current employee. The field is for reference only.
<b>Notice Date</b>	Enter the date when the employee is given notice if he was terminated or the date when he gave notice if he resigned.
<b>Retirement Date</b>	Specify the date when the employee has retired or is expected to retire.
<b>Date 1-5</b>	Specify a number of dates related to the current employee.
<b>Amount 1-5</b>	Specify a number of amounts related to the current employee.
<b>Option List 1-10</b>	Select a number of option lists containing values that you wish to use for further specification of the employee.
<b>Selected Value 1-10</b>	Specify values available in the respective option lists you specified. If you have not entered an option list in one of the <b>Option List</b> fields, you can enter any value in the corresponding value field.
<b>Text 1-5</b>	Enter additional text to apply to the employee in question.
<b>Real 1-5</b>	Specify a number of figures relating to the current employee.
<b>Boolean 1-5</b>	Assign attributes to the current employee.
<b>Absence Approver, No.</b>	Specify the number of the employee responsible for approving absence for the current employee.
<b>Fixed Number of Absence Hours, Monday-Sunday</b>	Enter how many hours the current employee is expected to be absent for each day in the week.
<b>Working Hours Range</b>	This field shows the range of the actual working hours.
<b>Permitted Deviation, Work Hours</b>	Specify the maximum permitted difference between the actual working hours and the number of registered hours. The difference is shown in the <b>Balance</b> field in the time sheet. This field cannot be completed for employees with Day as Time Unit.
<b>Checked in, Expected Time, Monday-Sunday</b>	Enter the time when the current employee is expected to check in for work.
<b>Checked Out, Expected Time, Monday-Sunday</b>	Enter the time when the current employee is expected to check out from work.

Field	Description
<b>Mentor No.</b>	Enter the number of a mentor assigned to the employee, for instance to help train the employee. The mentor assigned in this field is automatically granted read-only access to the time and expense sheets of the employee in question.
<b>Substitute 1-5</b>	These fields show the substitute approvers who support the handling of substitute approvals.
<b>Must Use Time Sheets</b>	Select the check box to require the current employee to create time sheets.
<b>Posting Reference, Commission</b>	Enter the number of a dimension combination that contains the G/L account to use when posting general journals from commission calculations in the Commission Calculation single dialog workspace.
<b>Posting Reference, Commission Offset</b>	Enter the number of a dimension combination that contains the G/L account to use when posting general journals from commission calculations in the Commission Calculation single dialog workspace.
<b>Transfer Location</b>	Select the check box to derive the location of the dimension Account from the current employee.
<b>Transfer Entity</b>	Select the check box to derive the entity of the dimension Account from the current employee.
<b>Transfer Project</b>	Select the check box to derive the project of the dimension Account from the current employee.
<b>Transfer Purpose</b>	Select the check box to derive the purpose of the dimension Account from the current employee.
<b>Transfer Spec. 2-3</b>	Select the check box to derive the entries of these fields for the dimension Account from the current employee.
<b>Transfer Local Spec. 1-3</b>	Select the check box to derive the entries of these fields for the dimension Account from the current employee.
<b>Description</b>	Enter information that describes the current employee.
<b>Selected Value</b>	Enter or choose a value from the selected option list.
<b>Dimension Comb. No.</b>	Enter the number of a dimension combination of the Dimension Derivation type created in the Dimension Combinations single dialog workspace.
<b>Dim. Comb., Description</b>	Enter the description of the dimension combination.
<b>Account No.</b>	Enter the employee's bank account number. This field is for reference only.

Field	Description
<b>Account Name</b>	Enter the employee's bank account name. This field is for reference only.
<b>Overwrite Account</b>	Select the check box to overwrite the existing account.
<b>Local Account No.</b>	Enter the employee's local account number.
<b>Local Account, Description</b>	Enter a description of the employee's local account number.
<b>Overwrite Local Account</b>	Select the checkbox to require local account set on the employee to overwrite local accounts set on higher-level relations.
<b>Entity</b>	Enter a value for the dimension Entity if you want a value to be derived from the current employee.
<b>Entity, Description</b>	Enter a description of the Entity assigned to the employee.
<b>Overwrite Entity</b>	Select this check box to control whether the Entity can be overwritten by the derived Entity specified on this account.
<b>Project</b>	Enter a value for the dimension Project if you want a value to be derived from the current employee.
<b>Project, Description</b>	Enter a description of the Project assigned to the employee.
<b>Overwrite Project</b>	Select this check box to control whether the Project can be overwritten by the derived Project specified on this account.
<b>Purpose</b>	Enter a value for the dimension Purpose if you want a value to be derived from the current employee.
<b>Purpose, Description</b>	Enter a description of the Purpose assigned to the employee.
<b>Overwrite Purpose</b>	Select this check box to control whether the Purpose can be overwritten by the derived Purpose specified on this account.
<b>Spec. 2-3</b>	Enter a value for the dimension Specification if you want a value to be derived from the current employee.
<b>Spec. 2-3, Description</b>	Enter a description of the Specification assigned to the employee.
<b>Overwrite Spec. 2-3</b>	Select this check box to control whether the Specification can be overwritten by the derived Specification indicated on this account.
<b>Local Spec. 1-3</b>	Enter a value for the dimension Local Specification if you want a value to be derived from the current employee.

Field	Description
<b>Local Spec. 1-3, Description</b>	Enter a description of the Local Specification assigned to the employee.
<b>Overwrite Local Spec. 1-3</b>	Select this check box to control whether the Local Specification can be overwritten by the derived Local Specification indicated on this account.

## Set-Up Section

Use this section to set up company positions, compensation types, company-operated stock types and stock option agreement types, and personnel requisition types, as well as template information for new courses and lesson plans.

## Position Information Card Single Dialog Workspace

Use this workspace to set up the positions that you use to operate your company and to enter general information about each position.

You assign positions such as support consultant, secretary, or software engineer to employees in the Employee Positions workspace, where the Employee Positions sub-tab enables you to enter the individual positions in the company held by a given employee. When you create a line in the Employee Positions workspace, Maconomy transfers certain information from the position information card; the information in this workspace thus functions as a template for employee positions.

### Position Information Card Tab

Use this window to set up information for different positions in your company.

### Position Island

Field	Description
<b>Position No.</b>	In these fields, you must specify a position name and number when creating a position. Both letters and numbers can be used in the position name and number. Once the position has been created, the number can no longer be changed.
<b>Description</b>	Here you can enter a description of the position.
<b>Termination</b>	Mark this field if the current position represents termination rather than an actual position.  In the table part of the window Employee Positions contains the individual positions held by a given employee throughout his or her employment with the company, and the table part of that window thus functions as an employee position history. This makes it possible to see information about previous positions held by the employee. When registering this position history, you create one line for each position held by the employee in a given period. However, you

Field	Description
	<p>may also want to add a separate line when the employment is terminated, for example, to register information about the reason for the termination and for storing any documents pertaining to the termination. Therefore, you can set up so-called termination positions in this window.</p> <p>When a termination position, that is, a position where this field has been marked is entered on a line in the window Employee Positions, Maconomy automatically completes the fields "Termination Date," "Last Working Day" and "Last Payday" with the date entered in the field "Engagement Date," as the termination position represents a point in time rather than a period. However, you can change the dates on the line to match any agreements made with the employee.</p>

### User Island

Field	Description
<b>Created by</b>	This field shows the name of the user who initially created the information in the window.
<b>Date</b>	This first Date field shows the date on which the information was originally created.
<b>Updated by</b>	This field shows the name of the user that made the latest change.
<b>Date</b>	This second Date field shows the date on which the information was last changed.
<b>Version</b>	This field shows a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

### Option List Fields Island

Field	Description
<b>Option List 1-5</b>	In these fields, you can specify the option lists containing the values that should be available for further specification in the fields "Value 1-5" on employee agreement lines with the current position. This means that when entering the current position on a line in the table part of the window Employee Positions, the fields "Value 1-5" on that line can only be completed with options available in the corresponding option lists specified here. If you leave a given field empty, any value can be specified in the corresponding value field on employee agreement lines with the current position.

### Remarks Island

In these fields, you can enter additional remarks about the current position.

## Compensation Types Single Dialog Workspace

Use this workspace to set up the compensation types that you use to operate your company.

A compensation type is a template for compensation agreements that you create in the Compensation Agreements workspace.

Compensation includes standard salaries, bonuses, company cars, and so on. The compensation for each contact person (for example, employees, partners, and so on) in your system can include more than one of these forms. Because it is likely that many of the compensation agreements consist of the same elements—for example, a fixed salary plus a bonus—it is very useful to create templates for these agreements, thus ensuring that the relevant compensation forms are automatically included in all agreements of each type.

Each compensation type consists of one main compensation type that you enter in the Compensation Types tab, and any number of subordinate compensation types that you enter in the Compensation Types sub-tab. The main element typically involves compensation with a fixed amount; the subordinate compensation types are the additional elements automatically granted to the contact person when the main compensation type is part of the compensation package. When you enter a compensation type in a line in the Compensation Agreements sub-tab of the Compensation Agreements workspace, Maconomy copies the information from the Compensation Types tab to the new line. In addition, Maconomy creates a line for each subordinate compensation type entered for that main type. As a result, using compensation types as templates for compensation packages that consist of multiple compensation types makes it easier to enter the individual compensation agreements with your contact persons.

Using main and subordinate compensation elements also enables you to make the value of one compensation element depend on the value of another element. This is true for bonuses whose value is expressed as a percentage of another element. For instance, if you want to set up a compensation type for a monthly salary of 5,000 (in the monetary currency used) and a bonus of 10% of the monthly salary, set up the salary in the Compensation Types tab and create a Compensation Types sub-tab line with the bonus. When you enter the compensation type for a contact person, Maconomy also automatically creates the line with the bonus in the Compensation Agreements workspace, and you can enter the desired 10%. Because Maconomy assigns the automatically created line to the line that contains the main compensation element, Maconomy calculates the value of the bonus line as 10% of the value on the main compensation element line. However, the value of a sub-element does not necessarily have to be calculated from the main element. It can have a fixed value.

If you enter a main compensation type in the Compensation Agreements sub-tab of the Compensation Agreements workspace, Maconomy automatically creates agreement lines that have the subordinate compensation types that belong to the specified main type. These automatically created agreement lines' functionality is similar to that of the agreement lines that contain the main compensation types, and they have the same options for amount and percentage specification. Therefore, the Compensation Types sub-tab of this workspace contains the same fields as the Compensation Types tab.

You do not enter concrete amounts and percentages in this workspace because you should be able to enter separate amounts and bonus percentages in the agreements that you make with each contact person. However, in the Value Limits island, you can enter guidelines and frameworks to be followed by the person who conducts wage negotiations.

## Compensation Types Tab

Use this section to set up the compensation types you use in your company.

### Compensation Type Island

Field	Description
<b>Compensation Type No.</b>	In this field, you must specify an identification number when creating a compensation type. Both letters and numbers can be used in the identification number. Once the compensation type has been created, the number can no longer be changed.
<b>Name</b>	In this field, you can specify the name of the compensation type.
<b>Category</b>	In this field, you can select the category of the current compensation type. You can choose from the categories created in the pop-up type "Compensation Categories" in the window Popup Fields. Compensation categories are used for grouping compensation elements, making it possible to, for example, only view compensations of a given category in the window Compensation Agreements.
<b>Starting Date</b>	In this field, you can specify the default starting date to be suggested on new compensation agreement lines on which the current compensation type is specified. For information on the effects of the starting date on compensation agreement lines, see the description of the corresponding field in the table part of the window Compensation Agreements.
<b>Ending Date</b>	In this field, you can specify the default ending date to be suggested on new compensation agreement lines on which the current compensation type is specified. For information on the effects of the ending date on compensation agreement lines, see the description of the corresponding field in the table part of the window Compensation Agreements.
<b>Time Unit</b>	In this field, you can specify the default time unit to be suggested on new compensation agreement lines on which the current compensation type is specified. For information on the effects of the time unit on compensation agreement lines, see the description of the corresponding field in the table part of the window Compensation Agreements.
<b>Number of Time Units</b>	In this field, you can specify the number of times the value of the current agreement should be paid out. changing the number of time units will affect the total value of the agreement.
<b>Pay by</b>	In this field, you can specify the default pay by date to be suggested on new compensation agreement lines on which the current compensation type is specified. For information on the effects of the pay by date on compensation agreement lines, see the description of the corresponding field in the table part of the window Compensation Agreements.
<b>Blocked</b>	In this field, you can specify whether the current compensation type is blocked. When a compensation type is blocked, it is not possible to create

Field	Description
	compensation agreement lines with the type in question or edit existing agreements with the current compensation type.

**Option List Fields Island**

Field	Description
<b>List</b>	In these fields, you can specify the option lists containing the values that should be available for further specification in the fields "Value" in this island and on compensation agreement lines with the current type. This means that the fields "Value" in this island can only be completed with options available in the corresponding option lists specified here. Furthermore, when entering the current type on a line in the table part of the window Compensation Agreements, the fields "Value 1-5" on that line can only be completed with options available in the corresponding option lists specified here. If you leave a given field empty, any value can be specified in the corresponding value field.
<b>Value</b>	<p>In these fields, you can specify a number of values for further specification of the current compensation type and individual compensation agreements of the type in question. You can only use values available in the respective option lists specified in this island. If a given option list field in the compensation type has been left blank, any text can be entered in the corresponding value field.</p> <p>When a compensation agreement with the current type is created, the values are also suggested in the corresponding fields on the new agreement.</p>

**Remarks Island**

In these fields, you can enter additional remarks about the current compensation type.

**Company Island**

Field	Description
<b>Company</b>	In these fields, you can specify the name and number of the company to which the compensation type pertains. The contents of these fields determine which users have access to see information about the compensation type. In the window Company Information in the G/L module it is possible to assign each company to an access level. A user only has access to see information about a compensation type if he has granted access to the access level in the window User Access Levels in the Set-Up module to which the company is assigned or a superordinate level. In addition, the user must have access to the access level specified in the island Access Level in order to have access to the current compensation type. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to compensation types may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In these fields, you can specify the name and description of an access level. You only have access to the current compensation type if you have been assigned to the same or a higher level in the window User Access Levels. This means that on, for example, compensation agreement lines, users can only specify compensation types to which they have access and in this window, a given user can only see the compensation types to which he or she has access. In addition, the user must have access to the access level specified for the company specified in the island Company in order to have access to the current compensation type. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to compensation types may depend on other factors. For more information about this, please see the section "Introduction to the Access Control System" in the Set-up module.</p> <p>If no access level is specified, all users have access to the current compensation type.</p>

### Value Limits Island

Field	Description
<b>Currency</b>	In this field, you can specify the currency in which the amounts in this island are to be specified.
<b>Estimated Amount, Currency</b>	<p>In this field, you can specify the amount which is expected to be negotiated on compensation agreements of the current type. The amount is transferred to the corresponding field on compensation agreement lines where the current compensation type is specified.</p> <p>Conductors of wage negotiations can use this amount as a guideline to negotiating the right compensation amount.</p>
<b>Minimum Amount, Currency</b>	<p>In this field, you can specify the minimum amount which conductors of wage negotiations are allowed to grant on compensation agreements of the current type. The amount is transferred to the corresponding field on compensation agreements where the current compensation type is specified.</p> <p>Conductors of wage negotiations can use this amount as a guideline when negotiating the compensation amount.</p>
<b>Maximum Amount, Currency</b>	<p>In this field, you can specify the maximum amount which conductors of wage negotiations are allowed to grant on compensation agreements of the current type. The amount is transferred to the corresponding field on compensation agreement lines where the current compensation type is specified.</p> <p>Conductors of wage negotiations can use this amount as a guideline when negotiating the compensation amount.</p>

## Amount Island

Field	Description
<b>Amount 1-5</b>	In these fields, you can specify a number of amounts relating to the current compensation type. When a compensation agreement with the current type is created, the amounts specified in this island are also suggested in the corresponding fields on the new agreement. The amounts are for information and reporting purposes only, and have no influence on the values of the compensation agreements of the current type.

## User Island

Field	Description
<b>Created by</b>	This field shows the name of the user who initially created the information in the window.
<b>Date</b>	This first Date field shows the date on which the information was originally created.
<b>Updated by</b>	This field shows the name of the user that made the latest change.
<b>Date</b>	This second Date field shows the date on which the information was last changed.
<b>Version</b>	This field shows a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

## Compensation Types Sub-Tab

The functionality of fields in this section is identical to that of the corresponding fields in the card part. See that section for definitions.

## Share Information Card Single Dialog Workspace

Use this workspace to set up the stock types that you use to operate your company, such as A-shares, B-shares, and employee shares.

Use the Share Information Card tab to enter the basic information about the individual stock types, such as nominal value per share and the currency in which they are traded. On each line in the Price of Shares sub-tab, you can enter the share price applied on a given date.

Stocks are used for setting up stock option agreement types and stock option agreements, allowing you to grant stock options to employees and other company-related persons, and keep track of their stock option exercisings. When you set up stock option agreement types, the information in this workspace functions as a template; Maconomy transfers information from the stock information card when you enter a stock in the Stock Option Agreement Types workspace.

In the Share Information Card tab of this workspace, enter the basic information about the individual stock type. On each line in the Price of Shares sub-tab, enter the share price that applies on a given date. When you enter a stock option exercising in the Stock Option

Agreements workspace, Maconomy checks whether the stock information card of the stock contains a market price that is valid on the posting date of the exercising, and uses this price if no other price is entered manually. For more information, see the description of the **Stock Market Price, Transaction** field in the Stock Option Agreements workspace.

### Share Information Card Tab

Use this section to specify the basic information about the individual stock types, such as their nominal value per share and the currency in which they are traded.

#### Share Island

Field	Description
<b>Share</b>	In these fields, you must specify a stock name and number when creating a stock. Both letters and numbers can be used in the stock name and number. Once the stock has been created, the number can no longer be changed.
<b>Description</b>	In this field, you can enter a description of the stock.
<b>Share Denomination</b>	In this field, you can specify the share denomination value of the current stock, expressed in the currency specified in the field "Currency" above.
<b>Currency</b>	In this field, you can specify the currency in which the share denomination specified in the field below is expressed.
<b>Blocked</b>	In this field, you can specify whether the current stock is blocked. When a stock is blocked, it is no longer possible to create stock option agreement types for that stock, nor is it possible to create stock option agreements for existing agreement types pertaining to that stock. However, existing stock option agreements pertaining to the stock in question are not blocked for stock option exercising, meaning that it is possible to exercise options pertaining to a blocked stock.

#### Access Level Island

Field	Description
<b>Access Level</b>	<p>In these fields, you can specify the name and description of an access level. You only have access to the current stock if you have been assigned to the same or a higher level in the window User Access Levels. This means that on, for example, stock option agreement types and stock option agreements, users can only specify stocks to which they have access. Furthermore, a given user can only see the stock information card for stocks to which the user has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to stocks may depend on other factors. For more information about this, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If no access level is specified, all users have access to the current stock.</p>

**Remarks Island**

In these fields, you can enter additional remarks about the current stock.

**Option List Fields Island**

Field	Description
<b>List</b>	<p>In these fields, you can specify the option lists containing the values that should be available for further specification in the fields “Value” in this island as well as on lines in the table part. This means that the fields “Value” in this island and on lines in the table part can only be completed with options available in the corresponding option lists specified here. If you leave a given field empty, any value can be specified in the corresponding value field.</p> <p>Furthermore, when you create a stock option agreement type for the current stock, the values in these fields are transferred to the corresponding fields on the new stock option agreement type.</p>
<b>Value</b>	<p>In these fields, you can specify a number of values for further specification of the current stock. You can only use values available in the respective option lists specified in this island. If a given option list field in the position information card has been left blank, any text can be entered in the corresponding value field.</p> <p>If you enter a value in a given value field, this value will be suggested in the corresponding field in the table part of the window when creating table lines.</p> <p>Furthermore, when you create a stock option agreement type for the current stock, the values in these fields are transferred to the corresponding fields on the new stock option agreement type.</p>

**User Island**

Field	Description
<b>Created by</b>	This field shows the name of the user who initially created the information in the window.
<b>Date</b>	This first Date field shows the date on which the information was originally created.
<b>Updated by</b>	This field shows the name of the user that made the latest change.
<b>Date</b>	This second Date field shows the date on which the information was last changed.
<b>Version</b>	This field shows a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

## Price of Shares Sub-Tab

Use this section to enter the share price applying on a given date.

Field	Description
<b>Date</b>	In this field, enter the date on which the share price on the current line applies. This information is used when registering stock option exercisings in the window Stock Option Agreements. When registering a stock option exercising in that window, Maconomy checks if the stock information card of the stock in question contains a market price valid on the posting date of the exercising, and uses this price if no other price is specified manually. For further information, see the description of the field "Stock Market Price, Transaction" in the window Stock Option Agreements.
<b>Price of Shares</b>	In this field you can enter the share price that applies on the date.
<b>Selected Value 1-5</b>	In these fields, you can specify a number of values for further specification of the share price, for instance to indicate an assumed reason for the price change. You can only use values available in the respective option lists specified in the island Option List Fields in the card part. If a given option list field in the card part has been left blank, any text can be entered in the corresponding value field.
<b>Remarks 1-5</b>	In these fields, you can specify a number of remarks pertaining to the current share price registration. The fields are for information only.

## Stock Option Agreement Types Single Dialog Workspace

Use this workspace to set up the stock option agreement types that you use to operate your company.

These agreement types are templates for stock option agreements that you make with your employees and others in the Stock Option Agreements workspace.

For instance, if you have a stock option program that grants employees a total of 20,000 options for your B-shares at a given price within a given period, set up the stock option program in this workspace. In the Stock Option Agreements workspace, use the stock option agreement type as a basis for the individual agreements with your employees. Maconomy automatically transfers the information about the stock option agreement type to the individual agreements. However, you can change the information about each stock option agreement; if an agreement made with a given employee should vary from the defaults of the stock option agreement type, you can change the information for that agreement.

## Stock Option Agreement Types Tab

Use this section to set up the stock option agreement types you use in your company.

### Stock Option Agreement Type Island

Field	Description
<b>Stock Option Agreement Type</b>	In this field, you must specify an identification number when creating a stock option agreement type. Both letters and numbers can be used in the identification number. Once the agreement type has been created, the number can no longer be changed.
<b>Name</b>	In this field, you can specify the name of the current stock option agreement type.
<b>Description</b>	Here you can enter a description of the stock option agreement type.
<b>Share No.</b>	In this field, specify the stock which the current stock option agreement type concerns.
<b>Currency</b>	This field shows the currency in which the stock specified in the field "Stock No." above is traded. The value is retrieved from the window Stock Information Card and cannot be changed here.
<b>Share Denomination</b>	In this field, you can specify the default share denomination value per share to be used in stock option agreements of the current type. Maconomy suggests the value from the corresponding field on the information card of the stock to which the agreement type pertains, but you can change it here.
<b>Purchase Price of Shares</b>	In this field, you can specify the default share price to be used in stock option agreements of the current type, that is, the price at which stock option agreement holders should be allowed to purchase shares when exercising stock options in agreements of the current type. The information is transferred to new stock option agreements made with employees and other company related persons, but can be changed on the individual agreements.
<b>Number of Shares Per Agreement</b>	In this field, you can specify the default number of share options to be granted on each stock option agreement of the current type. The information is transferred to new stock option agreements made with employees and other company related persons, but can be changed on the individual agreements.
<b>Number of Shares, Total</b>	In this field, you can specify the maximum total number of shares to be granted on stock option agreements of the current type. If you wish to allocate a total of, for example, 50,000 share options to the employees in your company, for instance granting each employee between 500 and 1,000 shares, you can specify 50,000 in this field, and Maconomy will ensure that the sum of shares granted on stock option agreements of the current type does not exceed this number. On stock option agreements, the number of options granted is specified in the field "No. of Shares."

Field	Description
<b>Number of Stocks, Granted</b>	This field shows the total number of stocks granted on stock option agreements of the current type. The number represents the sum of the field "Number of Shares" on all stock option agreements of the current type.
<b>Number of Stocks Remaining</b>	This field shows the total number of stocks available for allocation on stock option agreements of the current type. The number represents the difference between the field "Total No. of Shares" and the field "Number of Shares Granted."
<b>Issue Date</b>	In this field, you can specify the day on which the options on the current agreement type were/are to be issued.
<b>Agreement Date</b>	In this field, you can specify the default agreement date to be used in stock option agreements of the current type. The agreement date of a stock option agreement represents the date on which the agreement is legally binding.
<b>Earliest Exercising Date Allowed</b>	In this field, you can specify the earliest exercising date to be suggested on stock option agreements of the current type. The first and last exercising dates comprise a range of dates within which the options granted on a given stock option agreement must be exercised. The date is transferred to new stock option agreements made with employees and other company related persons in the window Stock Option Agreements, but can be changed on the individual agreements. For further information on the effects of the first and last exercising dates, please see the description of the field "First Exercising Date" in the window Stock Option Agreements.
<b>Last Exercising Date Allowed</b>	In this field, you can specify the last exercising date to be suggested on stock option agreements of the current type. For further information on the functionality of the field, see the description of the field "First Exercising Date" above.
<b>Valid From</b>	In this field, you can specify the first validity date of the stock option agreement type. The first and last validity dates comprise a range of dates within which it is possible to create and edit stock option agreements of the current type in the window Stock Option Agreements. This means that outside this period it is not possible to create stock option agreements of the current type or edit information in the card part of stock option agreements of the current type. However, options can be granted and exercised on stock option agreements of the current type outside the validity period, as long as they are granted and exercised within the exercising date range of the agreements in question.
<b>Valid To</b>	In this field, you can specify the last validity date of the stock option agreement type. For further information on the functionality of the field, see the description of the field "Valid from" above.
<b>Blocked</b>	In this field, you can specify whether the current stock option agreement type is blocked. When a stock option agreement type is blocked, it is not

Field	Description
	possible to create stock option agreements of the type in question. However, existing agreements can still be edited.

**Amount Island**

Field	Description
<b>Amount 1-5</b>	In these fields, you can specify a number of amounts relating to the current stock option agreement type. When a stock option agreement of the current type is created, the amounts specified in this island are also suggested in the corresponding fields in the card part of the new agreement.

**User Island**

Field	Description
<b>Created by</b>	This field shows the name of the user who initially created the information in the window.
<b>Date</b>	This first Date field shows the date on which the information was originally created.
<b>Updated by</b>	This field shows the name of the user that made the latest change.
<b>Date</b>	This second Date field shows the date on which the information was last changed.
<b>Version</b>	This field shows a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

**Company Island**

Field	Description
<b>Company</b>	In these fields, you can specify the name and number of the company to which the stock option agreement type pertains. The contents of these fields determine which users have access to see information about the stock option agreement type. In the window Company Information in the G/L module it is possible to assign each company to an access level. A user only has access to see information about a stock option agreement type if he has granted access to the access level in the window Access Levels in the Set-Up module to which the company is assigned or a superordinate level. In addition, the user must have access to the access level specified in the island Access Level in order to have access to the current stock option agreement type. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to stock option agreement types may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.

**Access Level Island**

Field	Description
<b>Access Level</b>	<p>In these fields, you can specify the name and description of an access level. You only have access to the current stock option agreement type if you have been assigned to the same or a higher level in the window User Access Levels. This means that on, for example, stock option agreements, users can only specify stock option agreement types to which they have access. Furthermore, in this window, a given user can only see the stock option agreement types to which he or she has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to stock option agreement types may depend on other factors. For more information about this, please see the section “Introduction to the Access Control System” in the Set-Up module.</p> <p>If no access level is specified, all users have access to the current stock option agreement type.</p>

**Option List Fields Island**

Field	Description
<b>List</b>	<p>In these fields, you can specify the option lists containing the values that should be available for further specification in the fields “Value” in this island. This means that the fields “Value” in this island can only be completed with options available in the corresponding option lists specified here. If you leave a given field empty, any value can be specified in the corresponding value field.</p> <p>When a stock option agreement of the current type is created, the option lists and values specified in this island are also suggested in the corresponding fields in the card part of the new agreement.</p> <p>When you create a stock option agreement type, Maconomy suggests the values from the corresponding fields on the information card of the stock specified for the new agreement type.</p>
<b>Value</b>	<p>In these fields, you can specify a number of values for further specification of the current stock option agreement type. You can only use values available in the respective option lists specified in this island. If a given option list field in the position information card has been left blank, any text can be entered in the corresponding value field.</p> <p>When a stock option agreement of the current type is created, the option lists and values specified in this island are also suggested in the corresponding fields in the card part of the new agreement.</p> <p>When you create a stock option agreement type, Maconomy suggests the values from the corresponding fields on the information card of the stock specified for the new agreement type.</p>

**Dates Island**

Field	Description
<b>Date 1-5</b>	In these fields, you can specify a number of dates relating to the current stock option agreement type. When a stock option agreement of the current type is created, the dates specified in this island are also suggested in the corresponding fields in the card part of the new agreement.

**Remarks Island**

In these fields, you can enter additional remarks about the current agreement type.

## Personnel Requisition Types Single Dialog Workspace

Use this workspace to set up the personnel requisition types that you use to operate your company.

A personnel requisition type is a template for the creation of personnel requisitions. More importantly, it is a tool for setting up a structured procedure to use when hiring a certain type of employee, or hiring employees for a specific office.

In your organization, you may have different hiring procedures that depend on the type of employee to be hired or the office for which a new employee is to be hired. For instance, hiring a new creative consultant might require a more detailed hiring process than hiring a new warehouse employee. In addition, procedures in one office can differ from the procedures in another office because of regional legal requirements or similar reasons. Maconomy enables you to set up personnel requisition types to support each type of hiring procedure.

In the Personnel Requisitions workspace, you create a line for each applicant who applies for the specific job. In each line, enter a contact person who represents the applicant. This means that you must create applicants as contact persons before you can enter them in a personnel requisition. In the **Result** field of each line, enter information about the steps taken in relation to each applicant (for example, that a letter requesting an interview has been sent to the applicant, or that the applicant was rejected). Each time that a step is completed, select the **Closed** field to continue to the next step. Maconomy continuously provides you with the result options that are relevant to the current step. For example, if an interview with an applicant has been conducted, Maconomy might provide you with the options **Rejection** and **Invite to second interview**. If the applicant is invited to a second interview, the options in the **Result** field are different. At this stage, the options could be **Send contract**, **Rejection**, or **Invite to third interview**.

Maconomy uses the event flow and event plan functionality to manage the individual steps in the hiring procedure for each applicant and the options available for each step. To set up personnel requisition types, you must understand the correlation between applicant lines in the sub-tab of personnel requisitions and the event flows and event plans. Before you continue with this section, you should familiarize yourself with the event flow and event plan functionality by reading the introduction to the Contact Management Module and the descriptions of the Event Flow and Event Plans workspaces.

Each time that you create an applicant line in the Applicants sub-tab of the Personnel Requisition workspace, Maconomy automatically creates an event flow in the Event Flows workspace and assigns the contact person who represents the applicant to the new event flow. Maconomy assigns the event flow to the event flow type entered in the tab of the current personnel requisition. Maconomy uses the automatically created event flow for entering the progress in the

handling of the specific applicant; each event in the event flow corresponds to a step in the hiring procedure—either the current step or a previous, completed one. In the Personnel Requisitions workspace, the line that contains the current applicant always displays selected information from the event that is open in this event flow, and thus always displays information about the next step to be taken. On this line, enter the outcome of the current step—for example, that the job interview resulted in the applicant qualifying for the next interview round—and select the **Closed** field to indicate that the step has been completed. Enter the outcome of the current step in the **Result** field of the relevant applicant entry line, which corresponds to the **Result** field of the event that is currently open in the event flow that is assigned to the applicant entry line. The options that are available in the field therefore depend on the result type that you enter for this event.

For the setup of the system to function as described, the following conditions must be met:

- You must set up an event plan for the automatic creation of events when an event is closed. The event plan must also contain a template for the creation of a single initial event.
- The setup of the event plan should ensure that no more than one secondary event can be created based on a given result.
- Automatically created event flows should have the **Create Secondary Events when Closing** field selected to ensure that Maconomy automatically creates events from the event plan when an event is closed.

Set up the event flow type that you enter for a personnel requisition type with the **Create Secondary Events when Closing** field selected. This causes the corresponding field to be selected on all event flows that are created as a result of adding applicant entry lines to personnel requisitions of the current type. Thus, each time that you select the **Closed** field on an event in an event flow of the current type, Maconomy uses the **Create Secondary Events** action, resulting in the automatic creation of events, if relevant. Because the **Closed** field on an application entry line in the Personnel Requisitions workspace corresponds to the **Closed** field on the open event in the event flow that is assigned to that line, selecting a step as completed in the Personnel Requisitions workspace results in the creation of an event that represents the next step in the procedure.

The events that are created as a result of closing an event (marking a step as closed) are based on an event plan that Maconomy automatically assigns to the event flow. The event plan also determines the result types to be assigned to the individual events that are created in the flow, thereby indicating the options available in the **Result** field on the individual applicant entry lines. This event plan is located through the event flow type that you entered in the Personnel Requisitions tab of the personnel requisition. Because a given applicant entry line displays information about the event that is currently open in the event flow that is assigned to that entry line, it is important that you set up the event templates in the event plan so that a given event result does not result in more than one secondary event.

Use the Personnel Requisition Types workspace to set up template information for personnel requisitions. For each personnel requisition type, you can enter template information that is suggested for new personnel requisitions of that type. This template information includes an event flow type. By creating an event plan for a hiring procedure used in your company, assigning that plan to the event flow type that you enter on a personnel requisition type, and using that personnel requisition type for the same hiring procedure, you can use personnel requisition types to ensure that the correct procedure is followed for all of the applicants on a personnel requisition.

## Personnel Requisition Types Tab

Use this section to set up a personnel requisition type, which is a template for the creation of personnel requisitions.

### Personnel Requisition Type Island

Field	Description
<b>Requisition Type No.</b>	In this field, you must specify an identification number when creating a personnel requisition type. Both letters and numbers can be used in the identification number. Once the personnel requisition type has been created, the number can no longer be changed.
<b>Event Flow Type</b>	<p>In this field, you can specify the event flow type to be used on the event flows created for the individual applicant registration lines in the table part. Each time you create an applicant registration line in the table part, Maconomy will create an event flow of this type and assign it to the contact person on the line in question. As the event flow type contains a reference to the event plan from which events are automatically created in the event flow of each applicant, the event flow type is also used for indicating which hiring procedure should be followed for the current requisition.</p> <p>Maconomy suggests the event flow type specified on the personnel requisition type in the field "Requisition Type No." above, but you can change it for the current requisition, for example, if you wish to follow a different procedure than indicated by the personnel requisition type.</p>
<b>Position</b>	In these fields, you can specify the name and number of the position to be suggested in the corresponding field on personnel requisitions of the current type. Entering values in these fields is useful if the current personnel requisition type should be used when hiring people for a given position.
<b>Blocked</b>	In this field, you can specify whether the current personnel requisition type is blocked. When a personnel requisition type is blocked, it is not possible to create personnel requisitions of the type in question.

### Executing Company Island

Field	Description
<b>Company</b>	<p>In these fields, you can specify the name and number of the company responsible for conducting the recruitment on personnel requisitions of the current type. Entering values in these fields is useful if the current personnel requisition type should be used when hiring people for a given company in the system or if a given company should, for example, always be in charge of hiring people for the position specified in the field "Position No."</p> <p>The contents of these fields also determine which users have access to see information about the personnel requisition type. In the window Company Information in the G/L module it is possible to assign each company to an access level. A user only has access to see information about a personnel requisition type if he has granted access to the access level in the window Access Levels in the Set-</p>

Field	Description
	Up module to which the company is assigned or a superordinate level. In addition, the user must have access to the access level specified in the island Access Level in order to have access to the current personnel requisition type. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to personnel requisition types may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section “Introduction to the Access Control System” in the Set-Up module.

### User Island

Field	Description
<b>Created by</b>	This field shows the name of the user who initially created the information in the window.
<b>Date</b>	This first Date field shows the date on which the information was originally created.
<b>Updated by</b>	This field shows the name of the user that made the latest change.
<b>Date</b>	This second Date field shows the date on which the information was last changed.
<b>Version</b>	This field shows a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

### Job Cost Island

Field	Description
<b>Job</b>	In these fields, you can specify the name and number of the job to be suggested in the corresponding field on personnel requisitions of the current type. For further information on the effect of the job number specified on courses, see the description of the field “Job No.” in the window Personnel Requisitions.
<b>Activity No.</b>	In this field, you can specify the number of the activity to be suggested in the corresponding field on personnel requisitions of the current type. For further information on the effect of the activity number specified on personnel requisitions, see the description of the field “Activity No.” in the window Personnel Requisitions.
<b>Task</b>	In this field, you can specify the name of the task to be suggested in the corresponding field on personnel requisitions of the current type. For further information on the effect of the task specified on personnel requisitions, see the description of the field “Task” in the window Personnel Requisitions.

**Access Level Island**

Field	Description
<b>Access Level</b>	<p>In these fields, you can specify the name and description of an access level. You only have access to the current personnel requisition type if you have been assigned to the same or a higher level in the window User Access Levels. This means that on, for example, personnel requisitions, users can only specify personnel requisition types to which they have access. Furthermore, in this window, a given user can only see the personnel requisition types to which he or she has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to personnel requisition types may depend on other factors. For more information about this, please see the section “Introduction to the Access Control System” in the Set-Up module.</p> <p>If no access level is specified, all users have access to the current personnel requisition type.</p>

**Option List Fields Island**

Field	Description
<b>List</b>	<p>In these fields, you can specify the option lists containing the values that should be available for further specification in the fields “Value” in this island and on personnel requisitions of the current type. This means that the fields “Value” in this island can only be completed with options available in the corresponding option lists specified here. If you leave a given field empty, any value can be specified in the corresponding value field. Furthermore, when creating a personnel requisition of the current type in the window Compensation Agreements, the values are suggested in the corresponding option list fields.</p>
<b>Value</b>	<p>In these fields, you can specify a number of values for further specification of the current personnel requisition type. You can only use values available in the respective option lists specified in this island. If a given option list field in the compensation type has been left blank, any text can be entered in the corresponding value field.</p> <p>When a personnel requisition of the current type is created, the values are also suggested in the corresponding fields on the new personnel requisition.</p>

**Course Types Single Dialog Workspace**

Use this workspace to set up course types that you can use as templates for new courses.

You must assign each course that you create in the Course Information Card workspace to a course type. When you create a course, Maconomy copies the information from that course type to the new course.

## Course Types Tab

Use this window to set up course types that contain template information for new courses.

### Course Type Island

Field	Description
<b>Course Type</b>	In these fields, you must specify the course type name and number when creating a course type. Both letters and numbers can be used in the course type name and number. Once the course type has been created, the number can no longer be changed.
<b>Blocked</b>	Mark this field if it should no longer be possible to create courses of the current type.

### Course Description Island

Field	Description
<b>Description 1-5</b>	In these fields, you can specify a number of course description texts to be suggested on courses of the current type.
<b>www</b>	In this field, you can specify the web address to be suggested on courses of the current type.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In these fields, you can specify the name and description of an access level. You only have access to the current personnel requisition type if you have been assigned to the same or a higher level in the window User Access Levels. This means that on, for example, personnel requisitions, users can only specify personnel requisition types to which they have access. Furthermore, in this window, a given user can only see the personnel requisition types to which he or she has access. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to personnel requisition types may depend on other factors. For more information about this, please see the section “Introduction to the Access Control System” in the Set-Up module.</p> <p>If no access level is specified, all users have access to the current personnel requisition type.</p>

### Option List Fields Island

Field	Description
<b>List</b>	In these fields, you can specify the option lists containing the values that should be available for further specification in the fields “Value” in this island. This means that the fields “Value” in this island can only be completed with options available in the

Field	Description
	<p>corresponding option lists specified here. If you leave a given field empty, any value can be specified in the corresponding value field.</p> <p>The option lists and values specified here are also suggested in the corresponding fields on courses created in the window Course Information Card.</p>
<b>Value</b>	<p>In these fields, you can specify a number of values for further specification of the current course type and courses of the type in question. You can only use values available in the respective option lists specified in this island. If a given option list field in the position information card has been left blank, any text can be entered in the corresponding value field.</p> <p>The option lists and values specified here are also suggested in the corresponding fields on courses created in the window Course Information Card.</p>

### Company Island

Field	Description
<b>Company</b>	<p>In these fields, you can specify the name and number of the company to which the course type pertains. The contents of these fields determine which users have access to see information about the course type. In the window Company Information in the G/L module it is possible to assign each company to an access level. A user only has access to see information about a course type if he has granted access to the access level in the window Access Levels in the Set-Up module to which the company is assigned or a superordinate level. In addition, the user must have access to the access level specified in the island Access Level in order to have access to the current course type. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to course types may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.</p>
<b>Name</b>	<p>This field shows the name of the company shown in the field "Company No." above.</p>

### Participants Island

Field	Description
<b>Max. Number of Participants</b>	<p>In this field, you can specify the maximum number of participants to be suggested on courses of the current type. For further information on the effect of the maximum number of participants on courses, see the description of the field "Max. No. of Participants" in the window Course Information Card.</p>
<b>Max. Number on Waiting List</b>	<p>In this field, you can specify the maximum number of people allowed on the waiting list for courses of the current type. For further information on the effect of the maximum number of people on waiting lists for courses,</p>

Field	Description
	see the description of the field "Max. No. on Waiting List" in the window Course Information Card.

### Skill Island

Field	Description
<b>Skill</b>	In these fields, you can specify the name and number of the skill to be suggested in the corresponding field on courses of the current type. For further information on the effect of the skill number specified on courses, see the description of the field "Skill No." in the window Course Information Card.
<b>Skill Type</b>	This field shows the type of the skill specified in the field "Skill No." above.

### Job Cost Island

Field	Description
<b>Job</b>	In these fields, you can specify the name and number of the job to be suggested in the corresponding field on courses of the current type. For further information on the effect of the job number specified on courses, see the description of the field "Job No." in the window Course Information Card.
<b>Activity No.</b>	In this field, you can specify the number of the activity to be suggested in the corresponding field on courses of the current type. For more information on the effect of the activity number specified on courses, see the description of the "Activity No." field in the Course Information Card window.
<b>Task</b>	In this field, you can specify the name of the task to be suggested in the corresponding field on courses of the current type. For further information on the effect of the task specified on courses, see the description of the field "Task" in the window Course Information Card.

### User Island

Field	Description
<b>Created by</b>	This field shows the name of the user who initially created the information in the window.
<b>Date</b>	This first Date field shows the date on which the information was originally created.
<b>Updated by</b>	This field shows the name of the user that made the latest change.
<b>Date</b>	This second Date field shows the date on which the information was last changed.

Field	Description
<b>Version</b>	This field shows a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

## Course Information Card Single Dialog Workspace

Use this workspace to set up courses to run and set up a lesson plan with detailed information, such as time, duration, and trainer.

Use the Course Information Card tab to enter general information about the course, such as the time and place of the course, its purpose, the maximum number of participants, and the skills that participants acquire by participating in the course. You can also enter information about the job, activity, and task for which the course activities are entered. However, since no posting takes place in connection with courses, this job cost data is for information and reporting purposes only.

Use the Courses sub-tab to set up a detailed lesson plan, where each line represents a separate lesson with information about location, trainer, time, duration, contact information, and so on.

When you create a course, select a course type that contains template information for most of the fields in the Course Information Card tab. You can change this template information for the new course.

Maconomy automatically suggests the information from the Course Information Card tab in the corresponding fields of the lines that you create in the Courses sub-tab. Therefore, you can consider the information in the tab to be general course information that also functions as template information for the individual lessons.

Each lesson in the sub-tab is actually a sub-course that is assigned to the course that you entered in the Course Information Card tab. In Maconomy's database, information from both tabs and sub-tabs is stored in the same database table. However, Maconomy internally assigns a parent course number to each lesson (sub-course), enabling you to distinguish courses that represent parent courses from courses that represent lessons.

After you create a course, start inviting participants to the course and enter the people who enroll. If too many people want to enroll, you can maintain a waiting list. Enter participants in the Course Participants workspace.

### Course Information Card Tab

Use this section to specify various general information about the course, such as the time and place of the course, its purpose, the maximum number of participants and the skills that participants will acquire by participating in the course.

In the table part of the window, you can set up a detailed lesson plan, each line representing a separate lesson with information about location, trainer, time, duration, contact information, and so on.

### Course Island

Field	Description
<b>Course</b>	In these fields, you can specify the course name and number when creating a course. Both letters and numbers can be used in the course name and number. If you do not specify a value, the course is assigned the next available number from the number series "Course Series" in the window Number Series in the Set-Up module. Once the course has been created, the number can no longer be changed.
<b>Course Type No.</b>	In this field, you must specify a course type when creating a course. The course type contains certain template information which is transferred to the new course, but can subsequently be changed for the course.
<b>Responsible</b>	In this field, you can specify the number of the contact person responsible for the coordination of the current course.
<b>Trainer</b>	If the trainer on the current course is not a contact person in your system, specify in these fields the name and number of the trainer. If you specify a contact person number, Maconomy automatically completes the field "Trainer Name" with the name of the contact person in question.  If the trainer is not a contact person, leave the field "Trainer Number" blank and manually enter the name of the trainer in the field "Trainer Name."
<b>Blocked</b>	Mark this field if the current course should be blocked. When a given course is blocked, it is no longer possible to change information in the card or table part of the course in question. If you block a course for which sub-courses have been specified in the table part, the sub-courses are blocked as well.

### Company Island

Field	Description
<b>Company</b>	In these fields, you can specify the name and number of the company to which the course pertains. If you do not enter values manually, Maconomy will attempt to derive the values, using the order of priority set up in the window Dimension Derivations in the G/L module. If no values can be derived, the standard values are transferred from the window System Information in the set-up module.

### Course Description Island

Field	Description
<b>Description 1-5</b>	In these field, you can specify a number of texts describing the current course.
<b>www</b>	In this field, you can specify a web address pertaining to the current course. The field is for information only.

**Participants Island**

Field	Description
<b>Max. Number of Participants</b>	<p>In this field, you can specify the maximum number of participants allowed on the current course. If you specify a number, Maconomy automatically ensures that the number of participants enrolled for the current course does not exceed the specified number. If you do not wish to limit the number of participants allowed, specify 0.</p> <p>Participants are enrolled for courses by marking the field “Enrolled” in the table part of the window Course Participants.</p>
<b>Number Enrolled</b>	<p>This field shows how many participants have enrolled for the current course. Participants are registered as enrolled by marking the field “Enrolled” in the table part of the window Course Participants.</p>
<b>Max. Number on Waiting List</b>	<p>In this field, you can specify the maximum number of people allowed on the waiting list for the current course. If you specify a number, Maconomy automatically ensures that the number of participants on the waiting list does not exceed the specified number. If you do not wish to limit the size of the waiting list, specify 0.</p> <p>Participants are put on the waiting list by marking the field “On Waiting List” in the table part of the window Course Participants.</p>
<b>Number on Waiting List</b>	<p>This field shows how many participants are currently on the waiting list for the current course. Participants are registered on the waiting list by marking the field “On Waiting List” in the table part of the window Course Participants.</p>
<b>Closed for Enrollment</b>	<p>Select this field to close the course for enrollment. When a course is closed for enrollment it will not be possible to enroll more participants in the course.</p>

**Access Level Island**

Field	Description
<b>Name</b>	<p>Here you can enter the name of an access level created in the window Access Levels. Users only have access to information about the current course, and can only refer to it in other windows if they have been assigned to this or a higher access level in the window User Access Levels in the Set-Up module. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to courses may depend on other factors. For further information about the standard access control configuration and access control in a multi- company model, please see the section “Introduction to the Access Control System” in the Set-Up module. If you do not specify an access level, all users will have access to see information about the current course.</p> <p>Description This field shows the description of the access level specified in the field above.</p>

**Document Archive Island**

Field	Description
<b>Document Archive</b>	Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.

**Option List Fields Island**

Field	Description
<b>List</b>	<p>In these fields, you can specify the option lists containing the values that should be available for further specification in the fields “Value” in this island. This means that the fields “Value” in this island can only be completed with options available in the corresponding option lists specified here. If you leave a given field empty, any value can be specified in the corresponding value field.</p> <p>Maconomy suggests the option lists and values specified in the window Course Types for the course type of the current course.</p>
<b>Value</b>	<p>In these fields, you can specify a number of values for further specification of the current course. You can only use values available in the respective option lists specified in this island. If a given option list field has been left blank, any text can be entered in the corresponding value field.</p> <p>Maconomy suggests the values specified in the window Course Types for the course type of the current course.</p>

**Course Period Island**

Field	Description
<b>Period</b>	In these fields, you can specify the dates on which the current course is scheduled to start and end.
<b>Started</b>	In this field, you can specify the time at which the current course is scheduled to start, either on the starting date of the course or generally on each day throughout the course, depending on your use of the system.
<b>Finished</b>	In this field, you can specify the time at which the current course is scheduled to end, either on the ending date of the course or generally on each day throughout the course, depending on your use of the system.

**Skill Island**

Field	Description
<b>Skill</b>	In this field, you can specify the name and number of the skill to which the current course pertains, that is, the skill which the participants will acquire at a certain level by participating in the course. When the course has been completed, the trainer or trainers can use the window Course Participants to specify the acquired skill level for

Field	Description
	each participant and select the action "Transfer Skill" to transfer the skill levels to the window Employee Skills, thus automatically updating skill data for employees in your system. For further information, see the description of the action "Transfer Skill" in the window Course Participants.
<b>Skill Type</b>	This field shows the type of the skill specified in the field "Skill No." above.

### Job Cost Island

Field	Description
<b>Job</b>	In these fields, you can specify the name and number of a job if the current course is related to a given job or the course activities should be registered on a given job. However, as no automatic posting is made in connection with courses, the fields are for information only.
<b>Activity No.</b>	In this field, you can specify the number of the activity to be suggested in the corresponding field on courses of the current type. For more information on the effect of the activity number specified on courses, see the description of the "Activity No." field in the Course Information Card window.
<b>Task</b>	In this field, you can specify the name of a task if the current course is related to a given task or the course activities should be registered on a given task. However, as no automatic posting is made in connection with courses, the field is for information only.

### Course Location Island

In this island, you can specify the address at which the course is to take place as well as various contact information (for example, phone number and mail address) pertaining to the course location or course administration.

Field	Description
<b>Attn.</b>	In this field, you can specify an attention person.
<b>Country</b>	In this field, you can specify the name of the country in which the lesson is to take place. Maconomy suggests the value from the corresponding field in the card part of the window.
<b>Phone</b>	In this field, you can specify the phone number which participants should use in relation to the current lesson, for instance the phone number of the trainer or the location at which the lesson is to take place. Maconomy suggests the value from the corresponding field in the card part of the window.

Field	Description
<b>Fax</b>	In this field, you can specify the fax number which participants should use in relation to the current lesson, for instance the fax number of the trainer or the location at which the lesson is to take place.  Maconomy suggests the value from the corresponding field in the card part of the window.
<b>Telex</b>	In this field, you can specify the telex number which participants should use in relation to the current lesson, for instance the telex number of the trainer or the location at which the lesson is to take place.  Maconomy suggests the value from the corresponding field in the card part of the window.
<b>E-mail</b>	In this field, you can specify the e-mail address which participants should use in relation to the current lesson, for instance the e-mail address of the trainer or the location at which the lesson is to take place.  Maconomy suggests the value from the corresponding field in the card part of the window.
<b>Room</b>	In this field, you can specify the room in which the lesson is to take place.

### User Island

Field	Description
<b>Created by</b>	This field shows the name of the user who initially created the information in the window.
<b>Date</b>	This first Date field shows the date on which the information was originally created.
<b>Updated by</b>	This field shows the name of the user that made the latest change.
<b>Date</b>	This second Date field shows the date on which the information was last changed.
<b>Version</b>	This field shows a number corresponding to the version of the information shown. Maconomy automatically increases the version number by one every time the information is changed. It is not possible to retrieve previous versions.

### Courses Sub-Tab

Use this section to set up a detailed lesson plan, each line representing a separate lesson with information about location, trainer, time, duration, contact information, and so on.

Field	Description
<b>Name</b>	In this field, you can specify the name of the lesson to which the current line pertains.

Field	Description
<b>Trainer No.</b>	<p>If the trainer in the current lesson is a contact person in your company, specify in this field the number of the contact person in question. If you specify a contact person number, Maconomy automatically completes the field "Trainer Name" below with the name of the contact person in question.</p> <p>If the trainer is not a contact person, leave this field blank and manually enter the name of the trainer in the field "Trainer Name."</p> <p>Maconomy suggests the value from the corresponding field in the card part of the window.</p>
<b>Trainer</b>	<p>If the trainer in the current lesson is not a contact person in your system, specify in this field the name of the trainer.</p> <p>If the trainer is a contact person, leave this field blank and specify the number of the contact person in question in the field "Trainer No." above. This causes Maconomy to automatically complete this field with the name of the contact person in question.</p> <p>Maconomy suggests the value from the corresponding field in the card part of the window.</p>
<b>Starting Date</b>	<p>In this field, you can specify the date on which the current lesson is scheduled to start.</p> <p>Maconomy suggests the value from the corresponding field in the card part of the window.</p>
<b>Ending Date</b>	<p>In this field, you can specify the date on which the current lesson is scheduled to end.</p> <p>Maconomy suggests the value from the corresponding field in the card part of the window.</p>
<b>Started</b>	<p>In this field, you can specify the time at which the current lesson is scheduled to start on the starting date of the lesson.</p> <p>Maconomy suggests the value from the corresponding field in the card part of the window.</p>
<b>Finished</b>	<p>In this field, you can specify the time at which the current lesson is scheduled to end on the ending date of the lesson.</p> <p>Maconomy suggests the value from the corresponding field in the card part of the window.</p>
<b>Description 1-5</b>	<p>In these fields, you can specify a number of texts describing the current lesson.</p> <p>Maconomy suggests the values from the corresponding fields in the card part of the window.</p>
<b>www</b>	<p>In this field, you can specify a web address pertaining to the current lesson.</p> <p>Maconomy suggests the value from the corresponding field in the card part of the window.</p>

Field	Description
<b>Document Archive No.</b>	In this field, you can assign a document archive to the current lesson. By assigning a document archive to a lesson, you can keep track of the various documents related to the lesson. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.
<b>Description</b>	This field shows a description of the document archive specified in the field "Document Archive No." above.
<b>Document Count</b>	This field displays the number of documents in the Document Archive.
<b>Name 1-5</b>	In these fields, you can specify the name and address of the place at which the lesson is to take place. Maconomy suggests the value from the corresponding field in the card part of the window.
<b>Zip Code</b>	<p>In this field, you can specify the zip code of the address at which the lesson is to take place.</p> <p>Maconomy suggests the value from the corresponding field in the card part of the window.</p> <p>If you enter a new zip code and leave the postal district field blank, the postal district field is automatically completed, provided that the zip code in question has been entered for the relevant country in the window Postal Districts in the Set-Up module. For further information, see the description of the window Postal Districts.</p>
<b>Postal District</b>	<p>In this field, you can specify the name of the postal district to which the address at which the lesson is to take place belongs. Maconomy suggests the value from the corresponding field in the card part of the window.</p> <p>If you enter a new zip code on the line and leave this field blank, this field is automatically completed, provided that the zip code in question has been entered for the relevant country in the window Postal Districts in the Set-Up module. For further information, see the description of the window Postal Districts.</p>
<b>Attn.</b>	copy to come
<b>Country</b>	In this field, you can specify the name of the country in which the lesson is to take place. Maconomy suggests the value from the corresponding field in the card part of the window.
<b>Phone</b>	In this field, you can specify the phone number which participants should use in relation to the current lesson, for instance the phone number of the trainer or the location at which the lesson is to take place. Maconomy suggests the value from the corresponding field in the card part of the window.
<b>Fax</b>	In this field, you can specify the fax number which participants should use in relation to the current lesson, for instance the fax number of the trainer or the

Field	Description
	location at which the lesson is to take place. Maconomy suggests the value from the corresponding field in the card part of the window.
<b>Telex</b>	In this field, you can specify the telex number which participants should use in relation to the current lesson, for instance the telex number of the trainer or the location at which the lesson is to take place. Maconomy suggests the value from the corresponding field in the card part of the window.
<b>E-mail</b>	In this field, you can specify the e-mail address which participants should use in relation to the current lesson, for instance the e-mail address of the trainer or the location at which the lesson is to take place.  Maconomy suggests the value from the corresponding field in the card part of the window.
<b>Room</b>	In this field, you can specify the room in which the lesson is to take place.
<b>Option List 1-5</b>	In these fields, you can specify the option lists containing the values that should be available for further specification in the fields "Value 1-5" on the current line. This means that the fields "Value 1-5" on the line can only be completed with options available in the corresponding option lists specified here. If you leave a given field empty, any value can be specified in the corresponding value field.  In the first five fields, Maconomy suggests the option lists and values specified in the corresponding fields in the card part of the window.
<b>Selected Value 1-5</b>	In these fields, you can specify a number of values for further specification of the current lesson. You can only use values available in the respective option lists specified on the current line. If a given option list field has been left blank, any text can be entered in the corresponding value field.  In the first five fields, Maconomy suggests the values specified in the corresponding fields in the card part of the window.
<b>Course No.</b>	When creating a lesson, you can specify in this field a course number identifying the current lesson. Both letters and numbers can be used. If you do not specify a value, the lesson is assigned the next available number from the number series "Course Series" in the window Number Series in the Set-Up module. Once the line has been created, the number can no longer be changed.  Each lesson in the table part is actually a course assigned to the course specified in the card part, and thus, each lesson can be considered a sub-course. In Maconomy's database, both card and table parts are stored in the same database table. However, Maconomy internally assigns a parent course number to each lesson (sub-course), making it possible to distinguish courses that represent parent courses from courses that represent lessons. The fact that both card and table parts are technically both courses is the reason why a course number must be specified on each table line.

## Actions

This section shows the Actions available with this window.

### Top Tab

Field	Description
<b>Attach Document</b>	This action allows you to attach a document to the course in the card part.

### Bottom Tab

Field	Description
<b>Attach Document to SubCourse</b>	This action allows you to attach a document to the “sub” course in the table part.

## Subscription Overview

Use the Subscription module to enter subscribers and subscription orders as well as to enter subscription-related products such as publications and, in some cases, service agreements.

Common to all subscriptions is that deliveries and customer payments are made on a regular and consistent basis, as with, for example, monthly payment of a weekly magazine.

The Subscription module is an add-on module.

This module is closely integrated with the Sales Orders module and can only be used if that module has also been installed on your system.

### Registration Section

This section includes the fields and descriptions for the Registration workspaces.

#### Subscription Orders Single Dialog Workspace

Use this workspace to create and maintain subscription orders.

The Subscription Orders tab displays customer information. The Subscription Order Lines sub-tab displays the customer's subscriptions.

The Subscription Orders workspace is similar to the Sales Orders workspace in that a subscription order in Maconomy corresponds to an agreement on the delivery of items or services.

This workspace enables you to select an accrual type for a subscription order if you invoice the subscription order through the Job Cost module. This means that the revenue from the subscription order can be accrued evenly across the entire subscription period, rather than being reflected as a one-off sale when the relevant job entry is posted in Maconomy.

#### Subscription Orders Tab

This section includes the fields and descriptions for the Subscription Orders tab.

#### Subscription Order Island

Field	Description
<b>Subscrip. Order No.</b>	This field shows the number of the current subscription order. The number is automatically entered from the system numbers series "Sales Orders" in the window System Numbers in the Setup module.
<b>Order Mode</b>	This field shows the order mode of the subscription. This can, for example, be per phone or letter.
<b>Sales Rep. No.</b>	In this field, you enter the number of the sales representative responsible for the subscription.
<b>Sales Rep.</b>	This field shows the name of the sales representative.

Field	Description
<b>Received by</b>	In this field, you enter the name of the employee who received the order for the current subscription. By default, the user who created the order in Maconomy is shown, but you can alter the name in this field.

### Ship to Address Island

Field	Description
<b>Customer</b>	<p>In this field, you enter the number of the customer who ordered the subscription. Maconomy checks that the customer exists in the accounts receivable module and that order processing is not blocked.</p> <p>The other lines in this field show the customer's name and address. The information is automatically transferred from the customer information card in the accounts receivable module. However, you can alter the name and address in this field.</p>
<b>Attn.</b>	This field shows the name of the attention person of the customer to which any contact should be directed. The information is transferred from the customer information card, but you can alter the name here.
<b>Country</b>	This field shows the customer's country. The information is transferred from the customer information card, but you can alter the name here.
<b>Phone</b>	This field shows the customer's phone number. The information is transferred from the customer information card, but you can alter the name here.
<b>Fax</b>	This field shows the customer's fax number. The information is transferred from the customer information card, but you can alter the name here.
<b>Telex</b>	This field shows the customer's telex number. The information is transferred from the customer information card, but you can alter the name here.
<b>E-mail</b>	This field shows the customer's e-mail address. The information is transferred from the customer information card, but you can alter the name here.

### Company Island

Field	Description
<b>Company No.</b>	<p>This field shows the number of the company responsible for the subscription order. The number is either transferred from the customer's information card or the current user, depending on the order of priority set up in the window Dimension Derivation in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the set-up module.</p> <p>If the company in this field is different from the one shown in the island Settling Company, Maconomy will automatically create intercompany balances at the posting of the invoice created as a result of the order. In the intercompany balance, the company in this field will be the responsible company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company. See the section "Multiple Companies" in the chapter "Introduction to the G/L Module" and</p>

Field	Description
	<p>the window Intercompany Accounts in the G/L module for a further description of the concept of responsible companies and intercompany balances.</p> <p>This field also shows the name of the specified company.</p>

### Settling Company Island

Field	Description
<b>Settling Company</b>	<p>This field shows the number of the settling company that applies to the currently displayed subscription order.</p> <p>If the company in this field is different from the one shown in the island Company, Maconomy will automatically create intercompany balances at the posting of the invoice created as a result of the order. In the intercompany balance, the company in this field will be the intercompany company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>For further information about the influence of a settling company and how such a company is determined, please see the section "Multiple Companies" in the chapter "Introduction to the G/L module." Intercompany balances are described in the window Intercompany Accounts in the G/L module.</p> <p>This field also shows the name of the specified company.</p>

### Statistics to Tax Authorities Island

Field	Description
<b>EU Sale</b>	<p>Here you specify whether the current subscription order is to be considered an EU sale. If the field "Sales List System Rep." in the window System Information is marked, Maconomy will suggest EU Sale provided that the customer belong to another EU country and the field "Tax" is not marked. If you mark the field "Sales List System Rep.," it means that the invoice is included in the quarterly report to the List System in EU.</p>
<b>Intrastat Reg.</b>	<p>Here you specify whether the current subscription is to be included in the monthly report to Intrastat after invoicing. If the field "Intrastat Export Rep." in the window System Information is marked, Maconomy will suggest reporting to Intrastat provided that the customer belongs to another EU country and the field "Tax" is not marked.</p>
<b>EU Trade Type</b>	<p>In this field, you enter an EU trade type which can be either "Normal" or "Triangulation." The triangulation type is used if you work as an intermediary in connection with sales from a vendor in another EU country to a customer in a third EU country. In such cases, the invoice amount is not included in the report of EU sale on the tax return, but instead reported with a separate code to the List System.</p>

Field	Description
<b>Nature</b>	In this field, you select the nature of the transaction which is used for reports to Intrastat. Transaction natures are defined in the window Popup Fields in the Set-up module.

#### Extra Fields Island

Field	Description
<b>Popup 1-5</b>	In these fields, you can select a number of pop-up values for further specification of the customer and the current subscription order. When you create a new subscription order, the pop-up values are transferred from the customer's information card, but you can change the values here. The options are created in the window Popup fields in the Set-Up module.

#### Price Adjustment Island

Field	Description
<b>Price Adjustment Principle</b>	<p>In this field, you enter the price adjustment principle to be suggested on new lines created in the table part. Maconomy suggests the price adjustment principle entered on the customer information card in the A/R module, but you can alter the code in this field.</p> <p>For further information on the use of price adjustment principles, see the introduction to the window Price Adjustment Principles.</p>

#### Dimensions Island

Field	Description
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, the standard value is transferred from the window System Parameters in the set-up module.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.

Field	Description
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

### Print Control Island

Field	Description
<b>Layout</b>	In this field, you select the layout you wish to use. You can choose between the layouts "Standard," "Customer" and "Subscription Sorted." If you select the layout "Standard," one subscription order is printed out per page. If you use the layout "Customer" and "Subscription Sorted" respectively, the printout will be sorted in accordance with either customer or subscription numbers.

### Job Cost Island

Field	Description
<b>Invoice in Job Cost</b>	<p>If invoicing of the subscription order should be carried out in the Job Cost module, you can mark this field. You can only mark this field, if the subscription order is assigned to a job.</p> <p>If you mark this field, it is not possible to invoice the subscription order in the order module. The created sales order will be handled in the same way as sales orders assigned to the Job Cost module are handled.</p> <p>After having created order lines on the subscription order, the contents of this field cannot be changed (that is, lines are displayed in the window Subscription Order Lines).</p>
<b>Job No.</b>	<p>In this field, you can enter the number of a job registered in the Job Cost module, if you want to assign the current subscription order to a job. If you enter a job number when creating a subscription order and you leave the field "Customer No." blank in the island "Ship to Address," the order is automatically assigned to the same customer as the job.</p> <p>If the field "Invoice in Job Cost" has not been marked, the sales orders created will be invoiced separately in the order module, and the volume amounts will be transferred to the current job.</p> <p>Maconomy checks if the current job is on order and is neither blocked nor closed. If the subscription order is not provided with the same ship-to customer number as the job, Maconomy displays a warning. If a value is entered in this field, you must also enter the number of an amount activity in the field "Activity No.."</p> <p>Once you have created order lines on the subscription order, the contents of this field can no longer be changed (that is, lines are displayed in the window Subscription Order Lines).</p>

Field	Description
<b>Activity No.</b>	<p>In this field, you must enter the number of an activity in the Job Cost module if the current subscription order is assigned to a job. Sales will be registered on the specified activity.</p> <p>Once you have created lines on the subscription order, the contents of this field can no longer be changed.</p>
<b>Task</b>	<p>In this field, you can enter the name of a task, if the subscription order is assigned to a job.</p> <p>Once you have created lines on the subscription order, the contents of this field can no longer be changed.</p>
<b>Accrual Type</b>	<p>If you select a value in this field, the selected accrual type will be used when the subscription order is invoiced via the Job Cost module. This means the revenue generated from the subscription order will be accrued evenly across the invoicing period specified in the "Invoicing Start Date" and "Invoicing End Date" fields in the table part. Please note that this field can be changed manually after a subscription order has been created.</p> <p>If you do not specify an accrual type in this field, Maconomy will process the revenue from the subscription order as a one-off sale without accrual.</p>

#### Remarks Island

Field	Description
<b>End User No.</b>	This field shows a unique end customer number, which you can set up in the End Users workspace. The end customer is a customer who buys from one or more of your direct customers

#### Billing Address Island

Field	Description
<b>Bill to Customer</b>	<p>In this field, you enter the number of the billing customer. The value entered on the information card of the delivery customer is automatically transferred, but you can alter the billing customer's number in this field. Maconomy checks that the customer exists in the accounts receivable module.</p> <p>The two numbers Delivery Customer Number and Billing Customer Number are not necessarily alike, as you might want delivery to be made to one customer and the bill-to be sent to another customer, for example, the head office, and so on.</p> <p>The other lines in this field show the name and address of the billing customer, created in the accounts receivable module. Changes in the information in this field must be made on the customer information card.</p>
<b>Attn.</b>	This field shows the billing customer's address. The information is transferred from the customer information card.
<b>Country</b>	This field shows the country of the current billing customer. The information is transferred from the customer information card.

**Price Island**

Field	Description
<b>Currency</b>	In this field, you select the valid currency for the current subscription order. The value is transferred from the current customer's information card in the window Customer Information Card. You can modify the value here.
<b>Price List</b>	<p>In this field, you select a price list if you wish to use a price list to control the prices of an issue. The value entered on the information card of the delivery customer is automatically transferred, but you can select another price list in this field.</p> <p>If no price list is entered, the calculation of the price of an issue will be based on the valid cost at the warehouse in question as well as on markup percentages.</p>
<b>Price Step</b>	You only have to complete this field if the field "Price List" is also completed. The field is used for registering whether the prices on each issue line are to be transferred from a fixed price step on the entered price list. You can select a price step between 1 and 6. The value entered on the information card of the delivery customer is automatically transferred, but you can modify the price step in this field.
<b>Invoice Discount %</b>	In this field, you enter an invoice discount percentage. Maconomy suggests the percentage entered for either the delivery or the billing customer on the customer information card. Whether the percentage is transferred from the delivery or the billing customer will depend on whether the field "Inv. Disc from Bill to Cust." on the system information card is marked. If a specific discount has been granted the customer, you can alter the invoice discount. The invoice discount is automatically deducted from the total amount and will appear from the printout of several external order papers.
<b>Current price per year</b>	<p>This field shows the current invoice amount per year for the selected subscription order. The amount in this field shows the sum of the line values in the "Extended Price" field in the table part, adjusted to the value in the "Time Unit" field. Consequently, if more than one subscription order line has been entered in the table part, the total sum of the "Extended Price" values adjusted to the time unit values will be shown in the "Current price per year" field.</p> <p>The amount in this field also depends on the value entered in the "Invoicing Start Date" field. The date in this field on a subscription order line must be equal or prior to today's date for the corresponding value in the "Extended Price" field to be added to the amount in the "Current price per year" field. Also, please note that lines in which the value of the "Invoicing Method" field is set to "Per Delivery" will not be included in the calculated sum in the "Current price per year" field.</p>

**Customer Information Island**

Field	Description
<b>Department</b>	In this field, you select the department in the company to which the subscription order is relevant. Maconomy will suggest the department entered for either the delivery or the billing customer on the customer information card, depending on whether the field "Inv. Disc from Bill to Cust." on the system

Field	Description
	<p>information card is marked, but you can select a different department in this field.</p> <p>Departments are defined in the window Posting References in the G/L module.</p>
<b>Customer Group</b>	<p>This field shows the customer group to which the current customer was assigned when the subscription order was created. The value in this field is not automatically updated if the customer group is changed on the information card of the customer. However, you can change the value manually to match the new customer group of the customer.</p>
<b>Language</b>	<p>In this field, you enter the language code you wish to use on the current subscription order. Maconomy suggests the language entered on the customer information card in the A/R module, but you can alter the code in this field.</p> <p>Languages are defined in the window Popup Fields in the Set-Up module.</p>
<b>Tax</b>	<p>This field shows whether tax is to be calculated when invoicing takes place. The information is transferred from the customer information card, but you can alter the value in this field.</p>
<b>Tax No.</b>	<p>In this field, you enter the customer's tax number. The information is transferred from the customer information card, but you can alter the value in this field.</p>
<b>Pmt. Terms</b>	<p>In this field, you select the payment terms of the current subscription order. The value in the field is automatically transferred from the window Payment Information in the A/R module when a subscription order is created, but you can change the value in this field.</p>
<b>Global Location Number</b>	<p>In this field, you can specify a global location number. In the window Rules of Validation, you can set up validation rules for global location numbers to ensure that the numbers entered in this field are valid.</p>
<b>Cust. Payment Mode</b>	<p>In this field, you select the customer payment mode to apply to the current subscription order. The value in the field is automatically transferred from the window Payment Information in the A/R module when a subscription order is created, but you can change the value in this field.</p>
<b>Enterprise</b>	<p>In this field, you assign an enterprise to the subscription order. The value is transferred from the customer information card, but you can alter the value in this field.</p>
<b>Segment</b>	<p>In this field, you assign a segment to the subscription order. The value is transferred from the customer information card, but you can alter the value in this field.</p>
<b>Area</b>	<p>In this field, you assign an area to the subscription order. The value is transferred from the customer information card, but you can alter the value in this field.</p>

Field	Description
<b>Company Tax Code</b>	<p>In this field, you can specify a company tax code created in the window Popup Fields. The field is used by Maconomy for determining the tax code to be used in the calculation of tax for the current subscription order, as the reporting code is part of the criteria for the selection of a tax code in the window Tax Tables in the G/L module. At this selection, Maconomy uses the tax table specified for the responsible company of the subscription order. This tax table is selected in the window Company Information. However, the tax code is only selected from a tax table, if you have specified that tax tables which are specified in the window System Information are to be used, and only if the company responsible for the order is assigned to a tax table. If no tax table has been specified for the responsible company or if you use differentiated tax, and you do not use tax tables, Maconomy uses the tax code specified for the individual item in the window Item Information Card in the Inventory module. If you use neither differentiated tax nor tax tables, Maconomy uses the standard tax code specified in the window System Information in the Set-Up module.</p> <p>When posting subscription invoices, the reporting code is used for determining which tax report entries to create when crediting. Based on the tax report entries, you can create tax reports showing the tax and tax basis entries assigned to a given tax report field. However, this kind of reporting can only be made if extended tax reporting has been selected in the window System Information.</p> <p>The value in this field is transferred from the customer information card, but can be changed here.</p>

**Delivery Island**

Field	Description
<b>Blocked</b>	If you mark this field, you block the subscription order, and it is no longer possible to deliver items or carry out invoicing for this particular order.
<b>Vacation Start</b>	In this field, you enter the vacation start date of the delivery customer. Issues published within the period of vacation will be created as sales order lines, but the number will be set at zero.
<b>Vacation End</b>	In this field, you enter the end date of the delivery customer's vacation.
<b>Order Date</b>	In this field, you enter the order date of the current subscription order.
<b>Warehouse</b>	<p>In this field, you select the warehouse from which the current subscription order is to be delivered. Maconomy automatically suggests the warehouse which is normally used in connection with the customer, but you can alter the value in this field.</p> <p>If you specify more than one warehouse for the issues assigned to a subscription, the sales order related to the subscription order is split up, resulting in one sales order for each warehouse. The split-up takes place at</p>

Field	Description
	the approval of the subscription order. If the field “Get Inventory From Item” has been marked in the window System Information, Maconomy automatically transfers the primary warehouse of the item to each subscription order line. The primary warehouse of an item is specified in the window Item Information Card. If the field “Get Inventory From Item” has not been marked, Maconomy uses the warehouse specified in the card part of the window.
<b>Carrier</b>	In this field, you select the carrier who is to deliver the ordered issues. Maconomy automatically transfers the carrier registered on the customer information card, but you can alter the value in this field. Carriers are created in the window Popup Fields in the set-up module.
<b>Delivery Mode</b>	In this field, you select the delivery mode for the current subscription order. Maconomy automatically suggests the delivery mode which is used on the customer information card, but you can alter the value in this field.
<b>Delivery Terms</b>	In this field, you select the delivery terms for the current subscription order. Maconomy automatically suggests the delivery terms which are used on the customer information card, but you can alter the value in this field. Delivery terms are defined in the window Popup Fields in the set-up module.

### Invoicing Island

Field	Description
<b>Blanket Invoice</b>	You can mark this field if you want to invoice the subscription order in a blanket invoice. Maconomy suggests the value from the Customer Information Card, but you can change it.  Blanket invoicing means that all non-invoiced deliveries to customers with the same bill-to customer, the same currency, the same department, the same warehouse, and the same responsible company are invoiced in one invoice. This takes place in the window Invoicing.
<b>Preferred Inv. Date</b>	In this field, you can enter a preferred invoice date. The date is used in connection with the next invoicing. If you do not enter a date, the invoice date will correspond to the date on which invoicing is done.
<b>Batch Invoice</b>	In this field, you can specify whether the current subscription order should be included when running batch invoicing in the window Print Invoice in the Sales Orders module. If you unmark the field, the subscription order is not included in batch invoicing, even if the field “Create Subscription Invoices” is marked in that window. Therefore, if you unmark the field, you can only create invoices for the current subscription order in the window Sales Orders or by invoicing on account using the action “Print Invoice On Account” in this window.
<b>Batch Credit</b>	In this field, you can specify whether the current subscription order should be included when running batch crediting in the window Print Credit Memo in the Sales Orders module. If you unmark the field, the subscription order is not included in batch crediting, even if the field “Create Subs. Credit Memos” is

Field	Description
	marked in that window. Therefore, if you unmark the field, you can only credit the current subscription order using the action "Prepare Crediting" in this window.

### Invoicing on Account Island

Field	Description
<b>Amount</b>	In this field, you can enter an amount to be invoiced on account exclusive of tax. Note that the invoice on account is posted by accruing the amount invoiced on account exclusive of tax on the current customer's account. At the final invoicing of the subscription order, the amount invoiced exclusive of tax is balanced against the amount invoiced on account exclusive of tax.
<b>Tax</b>	In this field, you can enter the tax amount to be invoiced on account. Note that the tax amount of the invoice on account is posted on the account for the tax code registered on the subscription order. At the final invoicing of the subscription order, the tax amount invoiced is balanced against the tax amount invoiced on account.
<b>Calculate Tax</b>	In this field, you can mark whether Maconomy should calculate the tax amount on the basis of the amount entered in the field "Amount" in this island or if the tax amount stated should be maintained. If you mark this field, the tax amount is calculated each time the invoice amount is changed. If you enter a tax amount in the field "Tax amount" above, the mark in this field is automatically removed by Maconomy.
<b>Description</b>	In this field, you can enter a text for the invoice on account. The text in the field is automatically set to "Invoice On Account" by Maconomy, but it can be changed manually.
<b>Items on Account</b>	This field shows the total amount invoiced on account exclusive of tax on the current subscription order. The contents of the field are automatically updated upon use of the action "Print Invoice On Account" and cannot be changed manually.
<b>Tax on Account</b>	This field shows the total tax invoiced on account on the current subscription order. The contents of the field are updated automatically upon use of the action "Print Invoice On Account" and cannot be changed manually.

### Contact Management Island

Field	Description
<b>Campaign No.</b>	In this field, you can enter the number of a campaign if the current subscription order is assigned to a certain campaign in the Contact Management module. If you enter a campaign number, Maconomy transfers the number to the lines created in the table part. The campaign number can be used for, for example, statistical purposes.

**User Island**

See the chapter “Getting Started” for a description of the fields in the island User.

## Subscription Order Lines Sub-Tab

This section includes the fields and descriptions for the Subscription Order Lines sub-tab.

Field	Description
<b>Subscription No.</b>	Here you enter the number of the ordered subscription.
<b>Quantity</b>	Here you enter the quantity of the subscription. It is possible to alter the quantity after delivery has taken place. In such cases, the change will take effect when the subscription order is updated in the window Subscription Information Card. However, issues already transferred are not affected by the change.
<b>Unit</b>	In this field, you enter the unit in which the current is sold. Maconomy automatically suggests the unit which is used for the current item in the warehouse. The value is transferred from the Inventory module, but you can alter the unit in this field.
<b>Time Unit</b>	If you are dealing with subscriptions which are settled by their duration, this field will show the time unit used for the entered unit price.
<b>Subscription Text</b>	This field shows the description of the current subscription entered on the subscription information card. You can alter the description in this field.
<b>Unit Price</b>	This field shows the price per unit of the current subscription order. If a price adjustment principle is specified on the current line, the unit price in this field only applies until the first price adjustment takes place for the line, after which the adjusted unit price in the field “Adjusted Unit Price” will apply (and thus be invoiced). Price adjustment takes place when running subscription invoice preparations in the window Prepare Subscription Invoicing. For further information about the price adjustment process, see the introduction to the window Price Adjustment Principles. If % of Basis is different from 0, the unit price cannot be edited, but will be calculated as Basis of Calculation & % of Basis.
<b>Discount %</b>	If the conditions for discounts entered in the window Discount Table in the module Inventory are fulfilled and the subscription is periodical, this field shows the discount percentage. The creation of a customer or item discount agreement which entitles the customer to a discount will also cause a discount percentage to be shown. You can alter the suggested discount percentage in this field, but you cannot both enter a percentage and a discount amount in the field “Discount.” If you

Field	Description
	do so, the two fields will be adjusted to one another, as the discount percentage will follow the discount amount.
<b>Discount</b>	<p>If the conditions for discounts entered in the window Discount Table in the module Inventory are fulfilled and the subscription is periodical, this field shows the discount amount.</p> <p>You can alter the suggested discount, but you cannot both enter a discount amount and a percentage in the field "Discount %." If you do so, the two fields will be adjusted to one another, as the discount percentage will follow the discount amount.</p>
<b>Extended Price</b>	In this field, the price of the relevant subscription on the subscription line is shown. A price is only shown if you are dealing with a periodical subscription. The price is calculated by multiplying the ordered number of units by the unit price of the line and dividing this amount by the price unit entered on the line, and finally deducting the line discount, if any.
<b>Invoicing Method</b>	This field shows the invoicing method entered in the window Subscription Information Card. You can alter the value in this field, but you cannot change a periodical invoicing to invoicing per delivery and vice versa.
<b>Delivery Start Date</b>	In this field, you specify when delivery of the subscription is to start. The field is mandatory. By default, Maconomy suggest today's date when you create the subscription order.
<b>Delivery End Date</b>	In this field, you can enter a delivery end date of the subscription if the delivery is time limited.
<b>Discount Desc.</b>	This field shows the description of the discount. The description is only shown if the customer fulfills the conditions for a discount. The description is either transferred from a discount table line created in the window Discount Tables in the Inventory module, or from a discount agreement which entitles the customer to a discount on the current subscription order line. You can alter the description in this field.
<b>Pricing Unit</b>	This field shows the pricing unit of the current subscription which is connected to the unit price of the subscription. You cannot alter the value in this field.
<b>Price List</b>	<p>This field shows the price list on which the prices of the subscription order are based. If the customer is linked to a specific discount table on another price list, this price list will automatically be transferred to this field. If this is not the case, the price list is transferred from the corresponding field in the table part of this window. You cannot alter the choice of price list in this field.</p> <p>To set the price of a subscription, Maconomy uses the invoicing date in the field "Next Invoicing Date" to determine the price list issue that is valid on the date of the next invoicing.</p>
<b>Price Step</b>	This field shows the price step which is used for the current customer if a price list is used on the subscription order. If the customer has a discount agreement or is linked to a specific price step, using the field "Price step" in

Field	Description
	the table part of this window, the agreed discounts will be transferred to this field. If none of these cases occur, and a price list is selected, the price step stated on the price list will be transferred to this field. You cannot alter the value in this field.
<b>Price at Step 1</b>	This field shows the sales price of one price unit of a subscription. The price is only shown if the current subscription order is assigned to a price list on which the subscription has been created. If no price list is used or no price is created for the subscription on the price list, the value in this field is equal to the unit price. You cannot alter the value in this field.
<b>Quantity Disc.</b>	This field shows a quantity discount. The amount is calculated as the difference between the price at the first step of the price list, multiplied by the ordered number of units, and finally divided by the price unit. Normally, the amount in this field is equal to the total quantity discount on the current subscription order. You cannot alter the value in this field.
<b>Item No.</b>	This field shows the number of the item which is assigned to the subscription. The item number is transferred from the window Subscription Information Card when you create the subscription line. The item number is used for pricing periodical subscriptions based on price lists and discount agreements. Furthermore, it is used as reference to account references if posting is carried out per item sales and item expenditure in a specific item group.
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the field "Location" in the card part of the window.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

Field	Description
<b>Invoicing Start Date</b>	<p>By default, this field shows the date entered in the field “Start Date of Delivery.” Together with the “Invoicing End Date,” the invoicing start date determines the issues which are to be invoiced.</p> <p>You can alter the date until the subscription has been invoiced.</p>
<b>Invoicing End Date</b>	<p>In this field, you enter an end date of the invoicing period. For further description, see the field “Invoicing Start Date.”</p>
<b>Non-Invoiceable</b>	<p>If this field is marked, the subscription line is not invoiced and Next invoicing date will be cleared. It is not possible to mark the field if the line already has been invoiced. As default the field will not be ticked.</p>
<b>Invoiced Until</b>	<p>This field shows the last date of the period covered by the latest invoicing.</p>
<b>Credit From</b>	<p>In this field, you can specify the date from which the current subscription order line should be credited. You can only specify a date belonging to the range of dates in the fields “Invoicing Start Date” and “Invoiced Until” on the line. When you select the action “Prepare Crediting,” the field “Invoiced Until” is automatically updated with the date specified in this field. Maconomy then creates a credit order line for the period between the invoice starting date and the updated date in the field “Invoiced Until.” Once the credit order line has been created, this field is blanked. The credit order line can be displayed and edited in the window Subscription Order Lines.</p>
<b>Next Invoicing Date</b>	<p>In this field, you enter the date on which invoicing takes place, If no invoicing is actually taking place on the date of the next invoicing, the line will be invoiced on the first invoicing after the next invoicing date.</p> <p>You can alter the date manually, which enables you to both expedite and postpone invoicing. The field is only used for periodical subscriptions.</p>
<b>Invoicing Due Date</b>	<p>This field shows the invoicing due date which is entered on the information card of the subscription. You can alter the date here.</p>
<b>Order Date</b>	<p>By default, this field shows the date of creation of the subscription order in Maconomy but you can alter the transferred date.</p>
<b>Contact Person No.</b>	<p>As contact persons originate from the contact management module, you can only use this field, if the contact management module has been installed on your system.</p> <p>You use this field to enter the number of a contact person. If the field is completed, the contact person’s address is used as delivery address on the sales order which is created on the basis of the current subscription order line.</p> <p>Maconomy creates a separate sales order for each contact person specified on the same subscription order. Subscription order lines to the same contact person are placed on the same sales order when they are created. If you change the contact person on a line, this is automatically reflected on all other lines with the same contact person, provided that a sales order has</p>

Field	Description
	already been created. Note that the value blank is also considered a contact person. Therefore, changing the value from blank to another value will also cause the changes described above.
<b>Subscription Status</b>	In this field, you select a status of the subscription. There are no restrictions as to which status you can select. You create a subscription status in the window Popup Fields in the set-up module.
<b>External Subscription Text</b>	This is the subscription description printed on all external order documents. If a translation in the language specified in the card part of the subscription order exists for the subscription specified on the line, the translation in question is shown here. If no such translation exists, the text from the field "Subscription Description, Language 1" is suggested instead. You can change the text here. Translations are created in the window Language Texts in the Set-Up module.
<b>Internal Desc.</b>	This field shows the internal subscription text which is entered in the corresponding field on the subscription information card.
<b>Extra Text 1-10</b>	These fields show any extra text entered in the corresponding fields on the subscription information card.
<b>Popup 1-5</b>	In these fields, you can select a number of pop-up values for further specification of the current subscription. When you create a line, the pop-up values are transferred from the information card of the subscription, but you can change the values here. The options are created in the window Popup Fields in the Set-Up module.
<b>Campaign No.</b>	In this field, you can enter the number of a campaign if the current subscription order line is assigned to a certain campaign in the Contact Management module. If you enter a campaign number in the card part, Maconomy transfers the number to this field when lines are created. The campaign number can be used for, for example, statistical purposes.
<b>Price Adjustment Principle</b>	<p>In this field, you can specify the price adjustment principle to be used for adjusting the unit price on the current line. Maconomy suggests the adjustment principle specified in the card part, but you can specify another principle here.</p> <p>For a detailed description of the calculation of price adjustments and the situations in which price adjustments take place, see the introduction to the window Price Adjustment Principles.</p> <p>Automatic price adjustment only takes place for lines on which a price adjustment principle is specified. Therefore if you do not specify an adjustment principle on the line, it will not be subject to price adjustment.</p>
<b>Index Date, Base</b>	<p>This field is only relevant if a price adjustment principle has been specified on the current line.</p> <p>The pricing index valid when a new subscription is purchased is usually not 100, as your company may have been offering the subscription type in question for several years, and therefore kept the pricing index updated. In this field, you can therefore specify the date whose index value was valid</p>

Field	Description
	<p>when the line was created. This means that the first time price adjustment is run for the current line, the calculation is based on the assumption that the initial unit price corresponds to the index level valid on the date in this field. For a detailed description of how the field is used and how price adjustments are calculated, see the introduction to the window Price Adjustment Principles.</p>
<b>Date of Initial Adjustment</b>	<p>This field is only relevant if a price adjustment principle has been specified on the current line. The date in this field determines when the first price adjustment should be made. The first adjustment of the subscription line will only take place when running subscription preparation for a period covering the date in this field. The first adjustment date is typically set to one year after the creation date of the subscription line.</p> <p>For a detailed description of how the field is used and how price adjustments are calculated, see the introduction to the window Price Adjustment Principles.</p>
<b>Index Date, Initial Adjustment</b>	<p>This field is only relevant if a price adjustment principle has been specified on the current line. The date in this field is the date according to which the first price adjustment should be made for the line. This means that if the first price adjustment should be made according to the price index valid on 1 January 2006, Maconomy will look up the price index valid on that date when performing the first price adjustment, even if the price adjustment process is run on another date. The date on which the first adjustment should be made is specified in the field "Date of Initial Adjustment."</p> <p>For a detailed description of how the field is used and how price adjustments are calculated, see the introduction to the window Price Adjustment Principles.</p>
<b>Adjusted Unit Price</b>	<p>This field is only relevant if a price adjustment principle has been specified on the current line. The amount in this field is the one on which the next price adjustment will be based (except the initial adjustment which is based on the price specified in the field "Unit Price"). The amount shows the price at which the subscription was set at the previous adjustment, and the field is updated after the adjustment, so that all adjustments are based on a constantly updated unit price.</p> <p>For a detailed description of how the field is used and how price adjustments are calculated, see the introduction to the window Price Adjustment Principles.</p>
<b>Date of Latest Adjustment</b>	<p>This field is only relevant if a price adjustment principle has been specified on the current line. This field shows the last date on which the subscription price was adjusted. The value in this field is therefore also used in the next price adjustment to look up the index level to which the line was adjusted in the latest adjustment process.</p> <p>For a detailed description of how the field is used and how price adjustments are calculated, see the introduction to the window Price Adjustment Principles.</p>

Field	Description
<b>Date for Next Adjustment</b>	<p>This field is only relevant if a price adjustment principle has been specified on the current line. The field shows the earliest date on which the next adjustment can take place for the line. This means that a price adjustment will take place when running subscription preparation for a period starting on or after the date in this field. Upon price adjustment, the next adjustment date is automatically increased. For further information on this, see the introduction to the window Price Adjustment Principles.</p> <p>For a detailed description of how the field is used and how price adjustments are calculated, see the introduction to the window Price Adjustment Principles.</p>
<b>Basis Of Calculation</b>	In this field, you can enter an amount to use as the basis for the price calculation.
<b>% of Basis</b>	<p>In this field, you can enter a percentage used to calculate the unit price. If this field is set to 0 (zero) the functionality is not used.</p> <p>If the value is different from 0, the unit prices will be calculated as Basic of Calculation * % of Basis, and the unit price cannot be edited.</p>

## Actions

This section shows the Actions available in the Subscription Orders workspace.

### Top Tab

Field	Description
<b>Approve Order</b>	<p>When you use this action, you approve the current subscription order. A subscription order must be approved before you can carry out delivery and invoicing of issues.</p> <p>If more than one warehouse has been specified for the issues assigned to a subscription, the approval causes the sales order related to the subscription order to be split up, resulting in one sales order for each warehouse.</p>
<b>Calculate Quantity Discount</b>	<p>When you use this action, quantity discount is calculated on the subscription order lines created on the current subscription. Quantity discount is only calculated on periodical subscriptions.</p> <p>The discount is based on a price step which is set by the total number of ordered subscriptions within each assorted item group. If an item group is entered on the subscription information card for a number of issues, these issues all belong to the same item group even though the order might involve several subscription order lines. If you, for example, create 10 lines with the same subscription number and one piece is sold on each line, the assorted quantity discount is calculated as if one line with an order of 10 items had been created. The calculation of assorted quantity discount on an order line does not influence the prices entered on the issue lines.</p>

Field	Description
	<p>The calculation of graded quantity discount is carried out in the same way as described in the chapter "Sales Orders." By graded quantity discount is meant a discount, which does not affect all items on an order line but only the quantity of items within the quantity range of each quantity discount. If you for instance grant a discount of 10% on the purchase of 2 to 4 items and 20% on the purchase of 5 to 10 items, it means that an order for 8 items will be granted no discount on the first item, a 10% discount on the next 3 items, and 20% on the last 4 items.</p>
<b>Get Issues</b>	<p>When you use this action, all issues within the specified period of delivery are transferred to the current subscription order line. The transfer will also include issues or items which have no publishing date assigned to them. The transferred issues are created as delivery lines in the table part of the window Subscription Order Lines.</p> <p>Issues are only transferred to a subscription order once. This means that if you repeatedly use this action, you only transfer new issues.</p>
<b>Print Invoice On Account</b>	<p>When you select this action, an invoice on account is created and printed. The invoice is created on the basis of the amounts entered in the island Invoice On Account. The invoice on account is posted by accruing the amount invoiced on account exclusive of tax on the current customer's account. The tax amount invoiced on account is posted on the account of the tax code registered on the current subscription order. At the final invoicing of the subscription order, the invoiced amount exclusive of tax and the invoiced tax amount are balanced against the amount invoiced on account and the tax amount invoiced on account, respectively.</p>
<b>Prepare Crediting</b>	<p>When you select this action, you credit part or all of a subscription order line. The action can only be selected if you have entered a date in the field "Credit From" on one or several lines in the table part of the window. When you select the action, Maconomy runs the following procedure for each line on which a date has been specified in the field "Credit Until":</p> <p>The field "Invoiced Until" is automatically updated with the date specified in field "Credit Until." Maconomy then creates a credit order line for the period between the invoice starting date and the updated date in the field "Invoiced Until." Once the credit order line has been created, the field "Credit From" is blanked. The credit order line can be displayed and edited in the window Subscription Order Lines.</p> <p>Please note that if price adjustments have taken place for a given line, the credited price for this line will be based on the price in the field "Adjusted Unit Price." This means that the calculation of the credited amount does not take into account the fact that a different unit price may have applied in the period being credited.</p>

## Subscription Order Lines Single Dialog Workspace

Use this workspace to view and enter delivery lines that are assigned to a subscription order line.

The Subscription Order Lines tab displays the information that is included in the subscription order line in the Subscription Orders workspace.

If you want to change the information in the Subscription Order Lines tab, you use the Subscription Orders workspace. The information about each issue originates from the Subscription Information Card workspace and is transferred to each subscription order line when you update the subscription order using the **Update Orders** action in the Subscription Information Card workspace or the **Get Issues** action in this workspace. Maconomy transfers only those issues within the specified subscription period.

The Order Lines sub-tab displays the delivery lines that Maconomy transfers to the subscription order line. If Maconomy did not create any delivery lines automatically, you can create them manually. The Order Lines sub-tab also displays any credit order lines assigned to the subscription order line currently shown in the Subscription Order Lines tab. You can also create and edit credit order lines in this workspace.

If you want to limit the Order Lines sub-tab to display only issues that are to be delivered within a specific period, enter a range of delivery dates in the Selection Criteria island.

### Subscription Order Lines Tab

This section includes the fields and descriptions for the Subscription Order Lines tab.

#### Subscription Line Island

Field	Description
<b>Subscrip. Order No.</b>	This field shows the number of the subscription order to which the current subscription order line is assigned.
<b>Line No.</b>	This field shows the number of the current subscription order line.

#### Subscription Island

Field	Description
<b>Subscription No.</b>	This field shows the number of the subscription to which the current subscription line is assigned.
<b>Subscription Text</b>	This field shows the text which is entered as subscription description in the first language on the subscription information card.
<b>External Subscr. Text</b>	This field shows the text which describes the subscription on external papers as, for example, packing slips.
<b>Quantity</b>	This field shows the quantity of issues to be delivered to the customer. The quantity is reached by multiplying the quantity entered in the corresponding field on the subscription information card by the quantity entered in the corresponding field on the current subscription order.

Field	Description
<b>Time Unit</b>	If the subscription is periodical, this field shows the time unit entered along with the price. If the time unit is, for example, a year, the price of the subscription corresponds to the price of a yearly subscription.
<b>Order Date</b>	This field shows the date of receipt of the subscription order.
<b>Subscription Status</b>	This field shows the status of the subscription. You can define subscription statuses in the window Popup Field in the set-up module without any restrictions.

### Company Island

Field	Description
<b>Company</b>	This field shows the number of the company responsible for the subscription order. The number is transferred from the island Company in the window Subscription Orders. This field also shows the name of the specified company.

### Settling Company Island

Field	Description
<b>Company No.</b>	<p>This field shows the number of the settling company that applies to the current subscription order line.</p> <p>If the company in this field is different from the one shown in the island Company, Maconomy will automatically create intercompany balances at the posting of the invoice created as a result of the order. In the intercompany balance, the company in this field will be the intercompany company. However, if the system parameter "Create intercompany entries for companies with same parent company" is not marked, intercompany entries are only created if the two companies involved are not both assigned to the same parent company.</p> <p>For further information about the influence of a settling company and how such a company is determined, please see the section "Multiple Companies" in the chapter "Introduction to the G/L module." Intercompany balances are described in the window Intercompany Accounts in the G/L module.</p>
<b>Name</b>	This field shows the name of the company specified in the field "Company No." above.

### Item Island

Field	Description
<b>Item No.</b>	This field shows the item number of the current subscription.
<b>Description</b>	This field shows the description of the item which is assigned to the item number.

Field	Description
<b>External Desc.</b>	This field shows the item description printed on all external order documents. If a translation exists for the current issue in the language specified in the card part of the order to which the current subscription order line is assigned, the translation in question is shown here. If no such translation exists, the text from the field "Subscription Description, Language 1" on the item information card is shown instead. Translations are created in the window Language Texts in the Set-Up module.
<b>Internal Desc.</b>	This field shows the internal description of the item. The value is retrieved from the field "Internal Desc." in the item information card.

### Discount Island

Field	Description
<b>Quantity Disc.</b>	This field shows the calculated quantity discount on the subscription order line.
<b>Discount %</b>	This field shows any discount % on the subscription line.
<b>Discount</b>	This field shows any discount on the subscription line.
<b>Discount Desc.</b>	This field shows the description of the discount on the subscription line.

### Dimensions Island

Field	Description
<b>Location</b>	This field shows the value specified for the dimension Location on the current subscription order line in the window Subscription Orders.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

### Price List Island

Field	Description
<b>Price List</b>	The price list in this field shows the place of origin of the prices of any issue line on the subscription order.
<b>Price Step</b>	This field shows the current price step used for the calculation of the price.
<b>Price at Step 1</b>	If a price list is in use, this field shows the price of a single issue.

### Ship to Customer Island

Field	Description
<b>Ship to Customer</b>	This field shows the number of the customer to whom the subscription is delivered.
<b>Name</b>	This field shows the name of the delivery customer.
<b>Customer Group</b>	This field shows the customer group to which the current customer is assigned.

### Bill to Customer Island

Field	Description
<b>Bill to Customer</b>	This field shows the name and number of the billing customer.

### Period Island

Field	Description
<b>Delivery</b>	These fields show the starting and closing date of the delivery period. The period is transferred from the subscription order line.
<b>Invoicing</b>	These fields show the starting and closing date of the invoicing period. The period is transferred from the subscription order line.
<b>Invoiced Until</b>	This field shows the last date of the period covered by the latest invoicing.
<b>Credit From</b>	This field shows the date from which the current subscription order line is to be credited, if such a date has been specified in the window Subscription Orders.
<b>Next Invoicing Date</b>	This field shows the date on which the next invoicing of the current subscription will take place.

**Contact Person Island**

Field	Description
<b>Contact Person No.</b>	If a contact person is assigned to the subscription order in the table part of the window Subscription Orders, the contact person number is shown in this field. In the other lines in this field, the name and address of the contact person are transferred. Any changes are transferred to assigned sales orders and subscription orders with the same subscription and contact person numbers.
<b>Attn.</b>	This field shows the attention person. The person is transferred from the window Contact Persons in the Contact Management module, but you can alter the name in this field. For a more detailed description of updating procedures, see the field "Contact Person No." above.
<b>Country</b>	This field shows the contact person's country. The country is transferred from the window Contact Persons in the Contact Management module, but you can alter the country in this field. For a more detailed description of updating procedures, see the field "Contact Person No." above.
<b>Phone</b>	This field shows the contact person's phone number. The number is transferred from the window Contact Persons in the Contact Management module, but you can alter the number in this field. For a more detailed description of updating procedures, see the field "Contact Person No." above.
<b>Fax</b>	This field shows the contact person's fax number. The number is transferred from the window Contact Persons in the Contact Management module, but you can alter the number in this field. For a more detailed description of updating procedures, see the field "Contact Person No." above.
<b>Telex</b>	This field shows the contact person's telex number. The number is transferred from the window Contact Persons in the Contact Management module, but you can alter the number in this field. For a more detailed description of updating procedures, see the field "Contact Person No." above.
<b>E-mail</b>	This field shows the contact person's e-mail address. The address is transferred from the window Contact Persons in the Contact Management module, but you can alter it in this field. For a more detailed description of updating procedures, see the field "Contact Person No." above.

**Price Island**

Field	Description
<b>Invoicing Form</b>	This field shows the selected invoicing form.
<b>Unit Price</b>	This field shows the unit price which is used for the current issue.
<b>Pricing Unit</b>	This field shows the pricing unit.
<b>Extended Price</b>	This field shows the total price of the current subscription order line.

Field	Description
<b>Currency</b>	This field shows the currency in which the price is stated.

**Extra Fields Island**

Field	Description
<b>Popup 1-5</b>	These fields show the pop-up values selected on the corresponding fields on the subscription order line.

**Selection Criteria Island**

Field	Description
<b>Debit/Credit</b>	In this field, you can limit the table part to only show debit or credit lines. If no value is selected, the table part will show both debit and credit lines.
<b>Item No.</b>	In these fields, you enter a range of item numbers. The table part will only show issues with item numbers within the specified range.
<b>Deliv. Date</b>	In these fields, you enter a range of delivery dates. The range of dates determines the issue lines that will be shown in the table part. The table part will only show issues which are to be delivered within the specified period. By default, these fields show today's date and today's date plus a month, respectively.

**Order Lines Sub-Tab**

This section includes the fields and descriptions for the Order Lines sub-tab.

Field	Description
<b>Debit/Credit</b>	In this field, you can specify whether the current line is a sales order line or a credit order line. "Debit" indicates a sales order line whereas "Credit" indicates a credit order line. The field must be completed when creating a line manually and cannot be changed once you have pressed Return.
<b>Item No.</b>	This field shows the number of the item ordered by the customer.
<b>Quantity</b>	This field shows the quantity of ordered items.
<b>Credited</b>	In this field, specify the quantity to credit on the current line. The field can only be completed for credit lines.
<b>Unit</b>	In this field, you select the unit in which the current issue is delivered. This can, for example, be the unit "Piece."
<b>Description</b>	In this field, you enter a description of the item. Maconomy suggests the description which is entered in the field "Description, Lang. 1" on the information card of the item.

Field	Description
<b>Unit Price</b>	This field shows the unit price of the current issue line on the subscription order line. If the subscription is periodical, the price covers the full period.
<b>Discount %</b>	If the conditions for discounts entered in the window Discount Table in the Inventory module are fulfilled, and the subscription is periodical, this field shows the discount percentage. The creation of a customer or item discount agreement which entitles the customer to a discount will also cause the discount percentage to be shown.
<b>Discount</b>	If the conditions for discounts entered in the window Discount Table in the Inventory module are fulfilled, and the subscription is periodical, this field shows the discount. The creation of a customer or item discount agreement which entitles the customer to a discount will also cause the discount to be shown.
<b>Extended Price</b>	This field shows the price of the issue line. The price is reached by multiplying the ordered quantity of units by the unit price of the issue line. This amount is divided by the price unit on the current line and subtracted any discount granted on the current line.
<b>Deliv. Date</b>	This field shows the delivery date of the current issue.
<b>Deliv. Week</b>	This field shows the number of the delivery week in which the above mentioned delivery date is included. You cannot alter this value.
<b>Deliv. Remarks</b>	In this field, you enter a remark concerning the delivery of the current issue. You can, for example, use this field to register irregularities in connection with the delivery.
<b>Warehouse</b>	In this field, you can select the warehouse from which the item is to be delivered. If the field "Get Inventory From Item" in the window System Information has been marked, Maconomy transfers the warehouse from the window Item Information Card, when an item with serial number control is entered on a subscription order line. It is only possible to enter another warehouse for a subscription order line with items with serial number control if no serial numbers have been entered for the line in the window Serial Number Entry.
<b>Stock Location No.</b>	In this field, you can specify the location in the selected warehouse from which the items on the current line are to be shipped. When you create a line, Maconomy checks if a standard picking location has been specified in the table part of the item's information card on a line pertaining to the warehouse specified on the current line. If a standard picking location has been specified and if this location is also marked as a shipping location in the window Warehouse Information Card, the item's standard picking location is suggested in this field, but the value can be changed manually. If no standard picking location has been specified for the item or if the item has a standard picking location for the warehouse but it is not a shipping location, you must specify a value manually.

Field	Description
<b>Return</b>	In this field, you can specify the quantity of the item that you expect to be returned by the customer. The field can only be completed on credit lines. The quantity in this field is not necessarily the same as the quantity credited for the current line, as some units may have been lost or damaged during transport. The returned quantity will always be zero for lines pertaining to periodic subscription crediting.
<b>For Packing</b>	In this field, you can specify the number of units of the current issue to be packed if the ordered quantity of units is not available for delivery.
<b>Discount Desc.</b>	This field shows a description of the discount. The description is transferred from a discount table line in the window Discount Table in the Inventory module. The description is only transferred if the customer fulfills the conditions for discount via the current table line, or if a discount agreement for the subscription is established with the customer. You cannot alter the description in this field.
<b>Pricing Unit</b>	This field shows the number of units of the current issue included in the unit price of the issue. The pricing unit is transferred from the information card of the item in the Inventory module. You cannot alter the pricing unit in this field.
<b>External Desc.</b>	This is the item description printed on all external order documents. If a translation in the language specified in the card part of the subscription order exists for the item specified on the line, the translation in question is shown here. If no such translation exists, the text from the field "Subscription Description, Language 1" is suggested instead. You can change the text here. Translations are created in the window Language Texts in the Set-Up module.
<b>Internal Desc.</b>	This field shows the internal description which is entered in the window Item Information Card. The description is only printed out on internal order papers.
<b>Delivered</b>	This field show the delivered number of units already delivered for the current issue line. You cannot alter the value in this field.
<b>Invoiced</b>	This field shows the number of units already invoiced for the current issue. You cannot alter the value in this field.
<b>Back Orders</b>	This field shows the number of units of the current issue in back orders. You cannot alter the value in this field.
<b>Price List</b>	This field shows the price list which is used for the calculation of the price of the issue line. You cannot alter the value in this field.
<b>Price Step</b>	This field shows the price step of the current price list to which the issue line is assigned. If a fixed price step is used for the subscription order and a price is entered for this price step, the price step is automatically transferred to this field. You cannot alter the value in this field.
<b>Keep Price</b>	In this field, you can specify whether unit prices and discount percentages on order lines, invoice lines and credit memo lines pertaining to the current customer should be recalculated when changing the quantity. The value in

Field	Description
	this field is transferred to the card part of sales and credit orders as well as invoices and credit memos pertaining to the current customer, but can be changed for each order.
<b>Price at Step 1</b>	This field shows the price of one price unit on the subscription order line if this line is assigned to a price list with the current delivery. If no price list is used, or no price is entered for the delivery on the price list of the subscription order, the price in this field will correspond to the unit price. You cannot alter the value in this field.
<b>Quantity Disc.</b>	This field shows a discount amount which is defined as the difference between the price on the first price step of the price list and the granted unit price multiplied by the ordered number of units, and finally divided by the price unit. Normally, the amount in this field corresponds to the total quantity discount on the issue line. You cannot alter the value in this field.
<b>Period From</b>	In these fields, you can specify an accrual period for sales and credit order lines. However, this is only possible for order lines pertaining to subscriptions paid periodically. The subsequent invoicing or crediting of the current order line will be carried out for the period specified in these fields. This field shows the date from which the period starts.
<b>Period To</b>	This field shows the date from which the period ends.
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, Maconomy transfers the value from the field "Location" in the card part of the window. If the current line was created using the action "Update Orders" in the window Subscription Information Card," Maconomy suggests the value from the field "Location" in the card part of the window Subscription Orders.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.

Field	Description
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to the functionality of the field "Location" above.
<b>Last Deliv. Date</b>	This field shows the last delivery date of the current delivery. You cannot alter the date in this field.
<b>Sales Order No.</b>	This field shows the number of the sales order which is assigned to the current subscription order line.
<b>Latest Promised Deliv. Date</b>	In this field, you enter a date which is equivalent to the promised latest delivery date of the current delivery.
<b>Order Date</b>	In this field, the date of creation, and thus the order date of the delivery line, is entered.
<b>Extra Text 1-10</b>	The first three of these fields show the extra texts entered in the corresponding fields on the subscription information card. You can change the suggested texts and enter additional information in the remaining seven fields.
<b>Popup 1-5</b>	In these fields, you can select a number of pop-up values for further specification of the current subscription order line. When you create a subscription order, the pop-up values are transferred from the information card of the subscription, but you can change the values here. The options are created in the window Popup Fields in the Set-Up module.

## Actions

This section shows the Actions available in the Subscription Order Lines workspace.

### Top Tab

Field	Description
<b>Calculate Quantity Discount</b>	<p>When you select this action, Maconomy calculates both combined and graded quantity discounts on the delivery lines assigned to the current subscription line. However, subscription order lines for which invoicing has been made are not included in the calculation of quantity discounts.</p> <p>The calculation of quantity discount is only done if the field "Graded Quantity Discount" in the window Item Information Card is marked. By graded quantity discount is meant a discount, which does not affect all items on an order line but only the quantity of items within the quantity range of each quantity discount. If you for instance grant a discount of 10% on the purchase of 2 to 4 items and 20% on the purchase of 5 to 10 items, it means that an order for 8 items will be granted no discount on the first item, a 10% discount on the next 3 items, and 20% on the last 4 items.</p>

## Subscription Changes Single Dialog Workspace

Use this workspace to update prices on subscription orders.

If you enter a range of subscription orders, you can, for example, use this workspace to update the prices of those subscription order lines that are assigned to the subscription orders within the range.

Maconomy performs subscription changes only if the entered cut-off date is within the range of dates entered as the period of delivery for the subscription orders in question. If you calculate prices of subscriptions with a cut-off date within the delivery period, Maconomy recalculates the prices of the deliveries that are performed after the entered cut-off date.

Maconomy recalculates only the prices of periodical subscriptions; it does not recalculate combined quantity discount.

### Subscription Changes Tab

This section includes the fields and descriptions for the Subscription Changes tab.

#### Selection Criteria Island

Field	Description
<b>Subscrip. Order No.</b>	In these fields, you enter a range of subscription order numbers. If you do not enter a range, all subscription orders are affected by the changes.
<b>Subscription No.</b>	In these fields, you enter a range of subscription numbers. If you do not enter a range, all subscription orders are affected by the changes.
<b>Subscription Group</b>	In this field, you select a subscription group. If you do not enter a range, all subscription orders are affected by the changes regardless of subscription group.
<b>Customer No.</b>	In this field, you enter a range of customers. If you do not enter a range, all customers are affected by the changes regardless of customer number.
<b>Bill to Customer</b>	In this field, you enter a range of billing customers. If you do not enter a range, all billing customers are affected by the changes regardless of number.
<b>Company No.</b>	In this field, you can enter a range of company numbers. Changes will only be made to those subscription orders for which companies within the specified range are responsible.
<b>Customer Group</b>	In this field, you select a customer group. If you do not select a group, all customer groups are affected by the changes.
<b>Cut-off Date</b>	In this field, you enter a cut-off date which is used in connection with the recalculation of price changes for periodically invoiced subscriptions.

## Subscription Updating Single Dialog Workspace

Use this workspace to assign subscriptions to subscription orders and change the number of deliveries on existing subscription order lines.

You can specify that updating is only to be performed on a group within the selection criteria and thus update any number of delivery customers and their subscriptions at the same time.

The **Customer**, **Company**, **Customer Group**, **Statistics 1-4**, and **Subscription Order No.** fields limit the subscription orders to be updated. The **Subscription No.**, **Subscription Group**, and **Item No.** fields limit the individual subscriptions that are assigned to the subscription orders. The **Period** field limits the delivery period for delivery lines in the Subscription Order Lines workspace.

### Subscription Updating Tab

This section includes the fields and descriptions for the Subscription Updating tab.

#### Selection Criteria Island

Field	Description
<b>Customer No.</b>	In these fields, you enter a range of customer numbers. Only subscription orders assigned to a customer within the range of customer numbers are updated.
<b>Customer Group</b>	In this field, you select a customer group. Only subscription orders in the specified customer group are updated.
<b>Company</b>	In this field, you can enter a range of company numbers. Only subscription orders for which companies within the specified range are responsible are updated.
<b>Statistics 1-4</b>	In these fields, you can enter a code which refers to the island Print Control on the customer information card. Only subscription orders assigned to a customer within the specified range are updated.
<b>Subscript. Order No.</b>	In these fields, you enter a range of subscription order numbers. Only subscriptions with subscription orders within the specified range of numbers are updated.
<b>Subscription No.</b>	In these fields, you enter a range of subscription numbers. Only subscriptions within the entered range are updated.
<b>Subscription Group</b>	In this field, you select a subscription group. Only subscriptions in the selected subscription group are updated.
<b>Item No.</b>	In this field, you enter a range of item numbers for issues. Only subscription order lines within the specified range are updated.
<b>Period</b>	In these fields, you enter a period of delivery for delivery lines. Only delivery lines within the specified period are updated.

**Change Island**

Field	Description
<b>New Quantity</b>	In this field, you enter the new quantity of subscriptions or deliveries which is to be updated at subscription order lines or delivery lines, respectively. The change is only valid within the above specified selection criteria. The selection criteria and the fields “Update Delivery Lines” and “Update Subscription Order Lines,” respectively, define the type of lines on which the updating will have effect.
<b>Update Delivery Lines</b>	When you mark this field, all existing delivery lines within the specified selection criteria are updated. You can inspect the changes of the delivery lines in question in the window Subscription Order Lines.
<b>Update Subscription Order Lines</b>	When this field is marked, all subscription order lines within the selection criteria are updated. You can inspect the changes of the subscription order lines in question in the window Subscription Orders.
<b>New Subscription No.</b>	In this field, you add a new subscription number to an existing subscription order. A new subscription order line with the new subscription number will be added to all subscription orders within the selection criteria. You can inspect the subscription order lines in question in the window Subscription Orders.

**Actions**

This section shows the Actions available in the Subscription Updating workspace.

**Top Tab**

Field	Description
<b>OK</b>	Click OK to execute the specified updates.

**Update Subscription Orders Single Dialog Workspace**

Use this workspace to create subscription order lines and the corresponding sales orders that represent delivery of new issues in a range of subscriptions.

The functionality that this workspace provides corresponds to using the **Get Issues** action on the selected range of subscription orders in the Subscription Orders workspace. For each order that you are updating, you can also limit the update to only include issues within certain subscriptions. For a description of the effects of updating subscription orders through this workspace, see the description of the **Get Issues** action in the Subscription Orders workspace.

## Update Subscription Orders Tab

This section includes the fields and descriptions for the Update Subscription Orders tab.

### Selection Criteria Island

Field	Description
<b>Subscription Order No.</b>	In these fields, you enter a range of subscription order numbers. Only subscription orders with a number within the specified range will be included in the update.
<b>Customer No.</b>	In these fields, you enter a range of customer numbers. Only subscription orders assigned to a customer within the specified range will be included in the update.
<b>Bill to Customer</b>	In these fields, you enter a range of customer numbers. Only subscription orders on which the bill-to customer lies within the specified range will be included in the update.
<b>Company No.</b>	In this field, you can enter a range of company numbers. Only subscription orders for which companies within the specified range are responsible will be included in the update.
<b>Subscription No.</b>	In these fields, you enter a range of subscription numbers. For each subscription order included in the update, Maconomy only transfers new issues from subscriptions that appear on the order in question and lie within the range specified here.
<b>Subscription Group</b>	For each subscription order included in the update, Maconomy only transfers new issues from subscriptions that appear on the order in question and are part of the group specified here.
<b>Publishing Date</b>	In these fields, you enter a range of publishing dates if you wish to limit the printout to issues published within the specified period of time.
<b>Include Discontinued</b>	If you mark this field, the update will include discontinued issues.
<b>Item No.</b>	In this field, you enter a range of item numbers. For each subscription order and subscription included in the update, Maconomy only transfers new issues on which the item number lies within the range specified here.

## Actions

This section shows the Actions available in the Update Subscription Orders workspace.

### Top Tab

Field	Description
OK	Click OK to execute the specified updates.

## Invoicing Section

This section includes the fields and descriptions for the Invoicing workspaces.

### Prepare Subscription Invoicing Single Dialog Workspace

Use this workspace to prepare an invoice for periodical subscriptions.

This workspace has no relevance for any other types of subscriptions. You prepare subscriptions for subsequent invoicing in the Print Invoice workspace of the Sales Orders module.

In this workspace, you enter selection criteria for the group of subscriptions to be invoiced. When you finish preparing subscriptions, Maconomy creates sales order lines and uses them in connection with the subsequent invoicing. Those sales order lines are displayed in the Order Lines sub-tab of the Subscription Order Lines workspace; they correspond to the delivery lines that you can create manually in this workspace.

When you prepare subscriptions in this workspace, Maconomy automatically calculates any relevant price adjustments on subscription order lines that have a price adjustment principle. For more information about how Maconomy calculates price adjustments and determines whether price adjustment should occur on a given subscription line, see the introduction to the Price Adjustment Principles workspace.

Note that the information that you enter in the Selection Criteria island only applies to the preparation of new subscription orders to be invoiced, whereas the printout of this workspace contains all—old and new—of the prepared subscription order lines.

### Prepare Subscription Invoicing Tab

This section includes the fields and descriptions for the Prepare Subscription Invoicing tab.

#### Selection Criteria Island

Field	Description
Show Lines	When you mark this field, the lines matching the criteria specified in this island are shown in the table part of this window.
Invoice Date	In this field, you enter a range of invoice dates. Only subscriptions with next invoice date within the entered range are included in the preparation for invoicing.

Field	Description
<b>Bill to Customer</b>	In this field, you enter a range of billing customers. Only subscription invoices for subscriptions which are to be paid by customers within the specified range are included in the preparation for invoicing.
<b>Customer No.</b>	In this field, you enter a range of customer numbers. Only subscription invoices for subscriptions with a customer number within the specified range are included in the preparation for invoicing. The preparation does not include blocked customers.
<b>Customer Group</b>	In this field, you can limit the preparation of subscriptions to a specific customer group. Only subscriptions in the specified group are included in the preparation for invoicing.
<b>Subscrip. Order No.</b>	In these fields, you enter a range of subscription order numbers. Only subscriptions within the specified range are included in the preparation for invoicing.
<b>Subscription No.</b>	In these fields, you enter a range of subscription numbers. Only subscriptions with subscription numbers within the entered range are included in the preparation.
<b>Subscription Group</b>	In these fields, you select a subscription group. Only subscription orders within the specified subscription group are included in the preparation.
<b>Company No.</b>	In this field, you can enter a range of company numbers. Only subscription orders for which companies within the specified range are responsible are included in the preparation.
<b>Job No.</b>	In this field, you can enter a range of job numbers. Only subscription orders linked to jobs in the specified range are included in the preparation.
<b>Activity No.</b>	In this field, you can enter a range of activity numbers. Only subscription orders linked to activities in the specified range are included in the preparation.
<b>Department</b>	In this field, you select a department. Only subscription orders with the specified department are included in the preparation.
<b>Language</b>	In this field, you select a language. Only subscription orders with the specified language are included in the preparation.

### Subscriptions for Invoicing Sub-Tab

This section includes the fields and descriptions for the Subscriptions for Invoicing sub-tab.

Field	Description
<b>Selected for Invoicing</b>	If this field is ticked the subscription order will be prepared for invoicing when executing the action "Prepare for Invoicing."
<b>Subscrip. Order No.</b>	This field shows the number of the subscription order.

Field	Description
<b>Job No.</b>	This field shows the number of the job if the subscription order is assigned to a job.
<b>Activity No.</b>	This field shows the number of the activity that the subscription sales will be registered to if the subscription order is assigned to a job.
<b>Customer No.</b>	This field shows the customer number of the subscription order.
<b>Bill to Customer</b>	This field shows the customer number of the bill-to customer of the subscription order.
<b>Subscription No.</b>	This field shows the number of the subscription.
<b>Quantity</b>	This field shows the quantity of the subscription order line.
<b>Unit</b>	This field shows the unit of the subscription order line.
<b>Time Unit</b>	This field shows the time unit used for the entered unit price.
<b>Subscription Text</b>	This field shows the description of the subscription.
<b>Unit Price</b>	This field shows the price per unit of the current subscription order line.
<b>Discount %</b>	This field shows the discount % of the subscription order line.
<b>Discount</b>	This field shows the discount amount.
<b>Extended Price</b>	This field shows the price of the subscription order line.
<b>Invoicing Method</b>	This field shows the invoicing method.
<b>Delivery Start Date</b>	This field shows when delivery of the subscription is to start.
<b>Delivery End Date</b>	This field shows the delivery end date.
<b>Discount Desc.</b>	This field shows the description of the discount.
<b>Pricing Unit</b>	This field shows the pricing unit of the current subscription which is connected to the unit price of the subscription.

Field	Description
<b>Price List</b>	This field shows the price list on which the prices of the subscription order are based.
<b>Price Step</b>	This field shows the price step which is used for the current customer if a price list is used on the subscription order.
<b>Price at Step 1</b>	This field shows the sales price of one price unit of a subscription.
<b>Quantity Disc.</b>	This field shows a quantity discount.
<b>Item No.</b>	This field shows the number of the item which is assigned to the subscription.
<b>Location</b>	This field shows the value for the dimension Location on the subscription order line.
<b>Entity</b>	This field shows the value for the dimension Entity on the subscription order line.
<b>Project</b>	This field shows the value for the dimension Project on the subscription order line.
<b>Purpose</b>	This field shows the value for the dimension Purpose on the subscription order line.
<b>Spec. 1 – 3</b>	This field shows the value for the dimensions Spec. 1 – 3 on the subscription order line.
<b>Local Spec. 1 – 3</b>	This field shows the value for the dimensions Local Spec. 1 -3 on the subscription order line.
<b>Invoicing Start Date</b>	By default, this field shows the date entered in the field “Start Date of Delivery.” Together with the “Invoicing End Date,” the invoicing start date determines the issues which are to be invoiced.
<b>Invoicing End Date</b>	This field shows the end date of the invoicing period.
<b>Non-Invoiceable</b>	This field shows whether the subscription is invoiceable or non-invoiceable.
<b>Invoiced Until</b>	This field shows the last date of the period covered by the latest invoicing.
<b>Credit From</b>	This field shows the date from which the current subscription order line should be credited.
<b>Next Invoicing Date</b>	This field shows the date on which invoicing takes place, If no invoicing is actually taking place on the date of the next invoicing, the line will be invoiced on the first invoicing after the next invoicing date.
<b>Invoicing Due Date</b>	This field shows the invoicing due date which is entered on the information card of the subscription.

Field	Description
<b>Order Date</b>	this field shows the date of creation of the subscription order.
<b>Contact Person No.</b>	This field shows the number of a contact person assigned to the subscription order line.
<b>Subscription Status</b>	This field shows the status of the subscription order.
<b>External Subscription Text</b>	This is the subscription description printed on all external order documents.
<b>Internal Desc.</b>	This field shows the internal subscription text which is entered in the corresponding field on the subscription information card.
<b>Extra Text 1-10</b>	These fields show any extra text entered in the corresponding fields on the subscription information card.
<b>Popup 1-5</b>	These fields show the selected values of the pop-up fields.
<b>Campaign No.</b>	This field shows the campaign number if the subscription order line is assigned to a campaign.
<b>Price Adjustment Principle</b>	This field shows the price adjustment principle.
<b>Index Date, Base</b>	This field shows the index date, base.
<b>Date of Initial Adjustment</b>	This field shows the date of the first price adjustment.
<b>Index Date, Initial Adjustment</b>	This field shows the index data of the initial adjustment.
<b>Adjusted Unit Price</b>	The amount in this field is the one on which the next price adjustment will be based.
<b>Date of Last Adjustment</b>	This field shows the last date on which the subscription price was adjusted.
<b>Basis Of Calculation</b>	This field shows the amount used for the price calculation.
<b>% of Basis</b>	This field shows the percentage used to calculate the unit price.

## Actions

This section shows the Actions available in the Prepare Subscription Invoicing workspace.

### Top Tab

Field	Description
<b>Mark All for Invoicing</b>	Choose this action if you want to select all the lines in the table for invoicing.
<b>Unmark All</b>	Choose this action to unselect all marked lines in the table part.
<b>Prepare for Invoicing</b>	This action will prepare invoicing for all lines where Selected for Invoicing is selected.

## Set-Up Section

This section includes the fields and descriptions for the Set-Up workspaces.

### Subscription Information Card Single Dialog Workspace

Use this workspace to create and maintain information about subscriptions.

The Subscription Information Card tab contains general information about the subscription.

The list in the Subscription Information Card tab displays the issues that are included in the subscription. This list is equivalent to a publication list for the current subscription. The list is sorted by publishing date, with the oldest issue listed first.

The delivery period that you enter on the customer's subscription order in the Subscription Order Lines sub-tab in the Subscription Orders workspace determines the issues that a customer receives.

If you do not enter a publishing date for an issue, Maconomy sees the issue as a standard issue that is delivered to all subscribers. If you have a starter's package, for example, you can use this option for a folder for periodicals that are to be sent to all subscribers of a specific subscription.

### Subscription Information Card Tab

This section includes the fields and descriptions for the Subscription Information Card tab.

### Subscription Island

Field	Description
<b>Subscription No.</b>	In this field, you enter the number of the current subscription.
<b>Subscription Group</b>	In this field, you select the subscription group you wish to use for the current subscription. Subscription groups are defined in the window Popup Fields in the set-up module.

Field	Description
<b>Invoicing Method</b>	<p>In this field, you select the invoicing form you wish to use for the current subscription. Invoicing forms are defined in the window Popup Fields in the set-up module.</p> <p>Together with the invoicing due date, the invoicing form determines when invoicing of the subscription takes place and for how long a period invoicing spans. You can, however, change periodical invoicing in the window Subscription Orders if the invoicing form does not comply with the current customer's needs.</p>
<b>Invoicing Due Date</b>	<p>If you are dealing with a fixed date of payment, you enter the due date you wish to use in connection with the invoicing of the current subscription in this field.</p>
<b>Item No.</b>	<p>In this field, you enter the number of the type of the subscription if you deal with a periodical subscription. In order to do so, you must first create the subscription as an item on the item information card in the Inventory module.</p> <p>In connection with invoicing, the item number is used on the invoice. If a price list is assigned to the item number, the calculation of the price is based on this price list. The entered price is valid for one piece of the unit, which is entered in the field "Time Unit." If the time unit is quarterly, the entered price will thus correspond to a quarterly subscription.</p>
<b>Item Setup</b>	<p>Click the icon or link to access the Item Information Card workspace. In the Item Information Card workspace you can maintain information about your company's individual warehouse items. See "Item Information Card" in the "Set-Up" section of the Inventory Module for more information.</p>

### Units Island

Field	Description
<b>Time Unit</b>	<p>In this field, you register the time unit of the current subscription.</p> <p>If the time unit is, for example, one year, the price of the subscription corresponds to the price of a one-year subscription.</p> <p>You cannot specify an invoicing due date or time unit if the field "Per delivery" in the window Popup Fields has been marked for the selected invoicing form.</p>
<b>Unit, Sales</b>	<p>This field shows the unit used on subscription orders lines when these are created for a subscription order which contains the relevant subscription. In connection with subscriptions, the unit can, for example, be "Piece."</p>
<b>Minimum Sales Unit</b>	<p>This field shows the minimum sales unit a subscription order can contain. If a value is entered in this field, the number of ordered units of a subscription must be divisible by the subscription's minimum sales unit.</p>
<b>Pricing Unit, Sales</b>	<p>This field shows the number of units contained in the price of a periodical subscription.</p>

**Selection Criteria Island**

Field	Description
<b>Date</b>	<p>In these fields, you enter a range of publishing dates to limit the number of issues shown in the table part. A limitation can be useful if you plan to update subscription orders as well.</p> <p>By default, today's date and today's date plus a month, respectively, are shown in these fields.</p>
<b>Include Discontinued</b>	<p>If you mark this field, the table part will include discontinued issues. Discontinued issues are also included on subscription orders which are updated, using the action "Update Orders."</p>

**User Island**

See the chapter "Getting Started" for a description of the fields in the island User.

**Subscription Text Island**

Field	Description
<b>Subscription Text 1, Lang.</b>	<p>In this field, you enter a description of the subscription in the primary language of the system. The primary language is the one appearing on the first table line for the pop-up type "Languages" in the table part of the window Popup Fields. If you specify an item in the field "Item No.," the description is transferred from the information card of the item in question, but you can change it here.</p> <p>The description is used in the field "External Desc." on a subscription order line if the primary language is assigned to the order to which the subscription order line is assigned.</p> <p>The text you enter is furthermore created as an entry in the window Language Texts in the Set-Up module. It is then possible to assign translations of the description in the languages used in Maconomy. This makes it possible, for example, to send an invoice to a German company with the subscription descriptions in German. In those cases where no translation of the description has been made in the language used in a given context - for instance on the printout of an invoice, Maconomy uses the description in this field instead. For more information about item descriptions in other languages, please see the description of the window Language Texts in the Set-Up module.</p>
<b>Subscription Text 2, Lang.</b>	<p>In this field, you enter the subscription text in the secondary language of the system. The secondary language is the one appearing on the second table line for the pop-up type "Languages" in the table part of the window Popup Fields in the Set-Up module.</p> <p>The text is used in foreign language external documents, such as invoices. The text is transferred to the "External Desc." field on subscription order lines, if the subscription order in question is assigned to the secondary language.</p> <p>If you enter a text here, a line will automatically be created in the window Language Texts, where the specified text is used as a translation into the</p>

Field	Description
	<p>secondary language of the system. Similarly, if a language text translation line is created for the subscription into the secondary language, the translation will appear in this field. Subsequent changes in either of the windows will cause the update to be reflected in the other window.</p> <p>The text can be inserted in price lists using Maconomy's layout editing tools.</p>
<b>Subscription Text 3, Lang.</b>	<p>In this field, you enter the subscription text in the tertiary language of the system. The tertiary language is the one appearing on the third table line for the pop-up type "Languages" in the table part of the window Popup Fields in the Set-Up module.</p> <p>The text is used in foreign language external documents, such as invoices. The text is transferred to the "External Desc." field on subscription order lines, if the subscription order in question is assigned to the tertiary language.</p> <p>If you enter a text here, a line will automatically be created in the window Language Texts, where the specified text is used as a translation into the tertiary language of the system. Similarly, if a language text translation line is created for the subscription into the tertiary language, the translation will appear in this field. Subsequent changes in either of the windows will cause the update to be reflected in the other window.</p> <p>The text can be inserted in price lists using Maconomy's layout editing tools.</p>
<b>Internal Desc.</b>	<p>In this field, you enter an internal description of the subscription. The description is printed out on packing lists and is thus useful as an internal message for, for example, the warehouse clerks about specific requirements concerning packaging, and so on. The description is not used on any external papers printed out via the Sales Orders module.</p>
<b>Extra Text 1-10</b>	<p>In these fields, you enter extra texts if you wish to describe the current subscription further.</p>

### Extra Fields Island

Field	Description
<b>Popup 1-5</b>	<p>In these fields, you can select a number of pop-up values for further specification of the customer and the current subscription order. When you create a subscription order, the pop-up values are transferred from the customer's information card, but you can change the values here. The options are created in the window Popup fields in the Set-Up module.</p>

### Publications Sub-Tab

This section includes the fields and descriptions for the Publications sub-tab.

Field	Description
<b>Item No.</b>	<p>In this field, you enter the item number of the issue.</p>

Field	Description
<b>Quantity</b>	In this field, you enter the quantity of subscriptions.
<b>Unit</b>	This field shows the unit in which the subscription is delivered.
<b>Description</b>	This field shows the description of the item.
<b>Publishing Date</b>	In this field, you enter the publishing date of the current issue.
<b>Discontinued</b>	If this field is marked, the issue is discontinued.
<b>External Desc.</b>	<p>In this field, you can specify an item description to be suggested on order lines based on the current issue line, that is, lines in the table part of the window Subscription Order Lines.</p> <p>Maconomy suggests the item description in the primary language from the information card of the item, but you can change the description here.</p>
<b>Internal Desc.</b>	This field shows the internal description.
<b>Extra Text 1-10</b>	In these fields, you can enter a number of remarks for the current issue. When you create a subscription, Maconomy suggests the values from the corresponding fields in the item information card of the item entered in the field "Item No.." However, you can change the texts here.
<b>Popup 1-5</b>	In these fields, you can select a number of pop-up values for further specification of the current issue. When you create an issue, Maconomy suggests the values from the corresponding fields in the item information card of the item entered in the field "Item No.." However, you can change the pop-up values here. The options are created in the window Popup Fields in the Set-Up module.

## Actions

This section shows the Actions available in the Subscription Information Card workspace.

### Top Tab

Field	Description
<b>Update Orders</b>	When you use this action, you create delivery lines and sales orders for all subscription orders in which the current subscription is included. Updating subscription orders means that selected issues are transferred to the relevant subscription orders. Issues are only transferred to a subscription order once. This means that if you repeatedly use this action, you only transfer new issues. As mentioned in the window Subscription Orders, the transfer will also include issues or items which have no publishing date assigned to them.

Field	Description
	After carrying out the transfer, you can inspect the list of deliveries in the window Subscription Order Lines. A subscription order number is assigned to the sales order by which you can identify sales orders originally created in the subscription module.

## Price Adjustment Principles Single Dialog Workspace

Use this workspace to set up price adjustment principles that are used to adjust the prices of subscriptions.

A price adjustment principle is a set of rules that determine how prices should be updated on subscriptions to which the price adjustment principle in question is assigned. Each price adjustment principle can refer to a price index table in which you can maintain price increments, for instance, in accordance with consumer price indexes. In addition, you can define a minimum and maximum adjustment percentage, enabling you to set up adjustment principles that match your subscription contracts. If you do not assign a given principle to a price index table, Maconomy always performs price adjustments that use that principle according to the minimum adjustment percentage.

The adjustment of subscription prices occurs automatically when you prepare subscription invoicing. For each subscription included in the preparation, Maconomy takes into account the previous date on which the subscription price was updated and makes the necessary price adjustment. This can include multiple adjustment steps, for instance, if a subscription has run for a number of years before you perform the price adjustment.

You can assign adjustment principles to customers, subscription orders, and individual subscription order lines. A price adjustment principle that you specify on a customer information card is inherited by the main tab of any new subscription orders for the customer in question, and from the subscription order to the individual subscription order lines. By assigning an adjustment principle to a customer, you indicate a given price adjustment method that you agreed to with the customer. However, you can change the adjustment principle on the subscription orders and the individual order lines.

### Calculation Method in Price Adjustments

Price adjustments occur when you run subscription invoice preparations in the Prepare Subscription Invoicing workspace. You perform price adjustments for one subscription order line at a time, and only for subscription lines on which a price adjustment principle has been specified. Each adjustment occurs as follows:

1. Maconomy checks whether the line is eligible for price adjustment. If no price adjustment has occurred for the line before, the line is eligible if the value in the **Date of Initial Adjustment** field is earlier than the starting date of the period for which you are preparing invoicing. The line is eligible if the date in the **Date for Next Adjustment** field is equal to or earlier than the starting date of the period. If the line is eligible, Maconomy continues with step 2; if not, no price adjustment occurs for the subscription line.
2. Maconomy calculates the price adjustment from the basis price up to the current period. This means that instead of running an adjustment based on the latest adjusted price, Maconomy recalculates the price all the way back from the base price. This happens through a number of iterations where each iteration is based on the adjusted price and

adjustments/index dates that Maconomy calculated in the previous iteration. The procedure of each iteration is as follows:

Maconomy calculates an index increase percentage and determines whether this percentage is between the minimum and maximum adjustment percentages specified on the adjustment principle. If no price index table is assigned to the adjustment principle in question, the increase percentage is set to zero.

The formula used for calculating the index increase percentage is:

$$\left( \frac{\text{New Index Value}}{\text{Previous Index Value}} - 1 \right) \times 100$$

In this formula, the index values depend on whether this is the initial iteration of the calculation. If it is, the New Index Value is the index value that was valid on the date that you entered in the **Index Date, Initial Adjustment** field on the subscription line, and the Previous Index Value is the index value that was valid on the date that you entered in the **Index Date, Base** field. If it is not the first iteration, the New Index Value is the index value that was valid 1, 2, 3, and so on, years after the date in the **Index Date, Initial Adjustment** field, depending on the iteration. This means that in the second iteration, the New Index Value is the index value that was valid one year after the initial index date, and in each subsequent iteration, the Maconomy increases the date by one year. In addition, if it is not the first iteration, the Previous Index Value is the New Index Value that was used in the previous iteration.

The calculation results in a percentage that is compared to the minimum and maximum percentages that you entered for the price adjustment principle. If the calculated percentage is between the minimum and maximum percentages, Maconomy selects the calculated percentage. If it is higher than the maximum percentage, Maconomy selects the maximum percentage. If it is lower than the minimum percentage, Maconomy selects the minimum percentage.

3. Maconomy increases the adjusted unit price in the **Adjusted Unit Price** field on the line by the percentage that it selected in the previous step.
4. Maconomy updates the **Date of Last Adjustment** field to the value that was previously in the **Date for Next Adjustment** field and increases the date in the **Date for Next Adjustment** field by a year.
5. Maconomy checks whether the new value in the **Date for Next Adjustment** field is earlier than or equal to the start of the period for which you are preparing invoicing. If it is, Maconomy repeats this process, thus adjusting the (adjusted) unit price again, until it is in line with the index level of the period to be invoiced.

### Example

Assume that you have set up Adjustment Principle A for a minimum adjustment percentage of 3. In addition, a subscription contains a subscription line that uses Adjustment Principle A and has the following information:

Unit Price	Index Date, Base	Index Date, Initial Adj.	Date of Initial Adjustment	Adjusted Unit Price	Date of Latest Adjustment	Date of Next Adjustment

10,000	5 May 2015	1 Jan 2017	1 Apr 2017	10,000		1 April 2017
--------	------------	------------	------------	--------	--	--------------

Adjustment Principle A is assigned to a price index table that looks like the following:

Index Number	From Date	To Date
110	1 May 2015	31 May 2015
...		
120	1 Jan 2017	31 Jan 2017
...		
122	1 Jan 2018	

On 1 April 2018, you enter the Prepare Subscription Invoicing workspace to prepare invoicing for Q2. You enter an invoicing period of 1 April to 30 June. This period starts after the next adjustment date of the subscription line, causing Maconomy to calculate an adjustment. In the first iteration of the price adjustment calculation, Maconomy takes the unit price and adjusts it from the index value on the base index date (5 May 2015) to the index value on the index date for first adjustment (1 Jan 2017).

$$\left(\frac{120}{110} - 1\right) \times 100 = 9.09$$

Since this percentage is between the minimum and maximum percentages specified on the adjustment principle, Maconomy adjusts the unit price using the calculated percentage:

Adjusted Unit Price = 10,000 × 1.0909 = 10,909

After adjusting the unit price, Maconomy increases the date for next adjustment by a year (which was 1 April 2017-the date of initial adjustment). The result is 1 April 2018, which is also before the period for which you are preparing invoicing. Maconomy runs another adjustment of the already adjusted unit price of 10,909.

$$\left(\frac{122}{120} - 1\right) \times 100 = 1.67$$

Because this percentage is below the minimum percentage of 3, Maconomy increases the adjusted unit price by 3%.

Adjusted Unit Price = 10,909 × 1.03 = 11,236.36

Once again, Maconomy increases the date for next adjustment by a year (the previous value was 1 April 2018). The result is 1 April 2019. Because this date is after the starting date of the period for which you are preparing invoicing, Maconomy does not perform any additional adjustments. As a result, the information on the subscription order line is as follows:

Unit Price	Index Date, Base	Index Date, Initial Adj.	Date of Initial Adjustment	Adjusted Unit Price	Date of Latest Adjustment	Date of Next Adjustment
10,000	5 May 2015	1 Jan 2017	1 Apr 2017	11,236	1 Apr 2018	1 April 2019

## Price Adjustment Principles Tab

This section includes the fields and descriptions for the Field Adjustment Principles tab.

### Price Adjustment Principle Island

Field	Description
<b>Name</b>	In this field, you must specify the desired name when creating a price adjustment principle. Once the price adjustment principle has been created, the field is closed.
<b>Description</b>	In this field, you can enter a description of the current adjustment principle.
<b>Blocked</b>	<p>In this field, you can specify if the current adjustment principle is blocked. When a principle is blocked, it can no longer be specified on customer information cards, subscription orders and subscription order lines. Blocked principles already specified on customer information cards are not inherited to new subscription orders and subscription order lines.</p> <p>However, blocking a principle which is already specified on a subscription order line has no effect on the subscription order line in question. This means that even though the principle has been blocked, prices will still be adjusted for the line according to the adjustment principle.</p>
<b>Allow Deflation</b>	If this field is selected, prices are adjusted down in case of deflation (for example, the price index is lowered). If this is not selected, prices can only be adjusted up and not down, and in case of deflation the prices will therefore not be adjusted.
<b>Price Index Table</b>	In this field, you can specify the name of the price index table to be used for price adjustments on subscription lines with the current price adjustment principle. If you do not specify a price index table, price adjustments are always run according to the minimum and maximum percentages specified on the adjustment principle.
<b>Minimum Percentage</b>	In this field, you can specify the minimum percentage by which to adjust unit prices on subscription lines with the current price adjustment principle. If you specify 0.0, no minimum percentage will apply. For further information about the use of the field, see the introduction to this window.
<b>Maximum Percentage</b>	In this field, you can specify the maximum percentage by which to adjust unit prices on subscription lines with the current price adjustment principle. If you specify 0.0, no maximum percentage will apply. For further information about the use of the field, see the introduction to this window.

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

## Price Index Tables Single Dialog Workspace

Use this workspace to create and maintain price index tables that are used to adjust the prices of subscription orders.

You can enter a name and description for the current index table in the Price index Tables tab. You can also create lines that specify the price index that is valid in a given period in the Price Index sub-tab. The price index adjustment functionality is described in the introduction to the Price Adjustment Principles single dialog workspace.

### Price Index Tables Tab

This section includes the fields and descriptions for the Price Index Tables tab.

#### Price Index Island

Field	Description
<b>Name</b>	In this field, you can specify a name when creating a new price index table. Once the price index table has been created, the field can no longer be changed.
<b>Description</b>	In this field, you can specify a description of the current price index table.
<b>Blocked</b>	<p>If you mark this field, the current price index table is blocked.</p> <p>When a price index table is blocked, it is no longer possible to assign it to price adjustment principles. However, price adjustment principles to which the price index table is already assigned will still function, even though the price index table is blocked.</p> <p>If you unmark the field at a later time, it is once again possible to assign the price index table to price adjustment principles.</p>

#### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

### Price Index Sub-Tab

This section includes the fields and descriptions for the Price Index sub-tab.

Field	Description
<b>Start Date</b>	<p>In this field, you can specify the starting date of the period in which the price index on the line should apply. When you specify a starting date, the ending date on the line covering the period before the specified starting date is changed to the day before the specified date. Furthermore, if you enter a date which lies within the period covered by another line, the current line will be assigned the ending date of the line whose period the current line overlaps.</p> <p>The line with the latest starting date will always have an open ending date.</p>

Field	Description
	If you delete a line, the period of the line above the deleted line is prolonged, as it is assigned the ending date of the deleted line.
<b>Closing Date</b>	This field shows the ending date of the period in which the price index on the line should apply. Maconomy automatically assigns an ending date to each line, causing the period of each line to end on the day before the starting date of the next period defined on a line in the table part. However, the line with the latest starting date will always have a blank ending date. For a detailed description of the functionality of the field, see the field "From Date" above.
<b>Price Index</b>	In this field, specify the price index value to apply in the period specified on the line. For information about the use of the index, see the introduction to the window Price Adjustment Principles.

## Contact Management Overview

Use the Contact Management module to enter and maintain information about potential and existing customers and to enter information about contact with them. You can also enter isolated events and control complex work flows and campaigns aimed at selected target groups.

This chapter describes the Contact Management module. Because Contact Management is an add-on module to Maconomy, the workspaces in this module are only available if you have that add-on. However, the Contact Persons, Contact Group Types, and Contact Groups workspaces do not require that you have the Contact Management add-on.

### Registration Section

This section includes the fields and descriptions for the Registration workspaces.

### Event Flow Single Dialog Workspace

Use this workspace to create and work with event flows.

The Event flow tab displays an event flow number and description and summary information about the events assigned to the flow. The Events sub-tab displays a line for each event that is assigned to the flow. Use the Selection Criteria island to limit the number of lines that the sub-tab displays.

See the introduction to the Contact Management module for conceptual information about event flows.

When you create a flow, you must select an event flow type that contains template information for the new flow. You can change most of the information for the individual flow, but information such as the event flow status type is common to all flows of the selected type.

The events that you assign to an event flow are normal events that you create in the Events workspace, but you can also create them by adding lines to the Events sub-tab in this workspace.

You can automatically create event flows as part of a campaign. This happens when you use the **Create Initial Events** action in the Campaigns workspace. Using this action creates one or more events in each event flow, depending on the event plan that you select for the campaign. Event flows that you assign to campaigns function in the same ways that independent event flows do; however, you can use actions on all event flows that belong to a particular campaign in the Campaigns workspace.

You can assign a status to each event flow. Maconomy updates the status when an event that you selected as the next status-changing event closes. The Event flow tab shows information about the next status-changing event, when it is expected to take place, and who is responsible for it.

## Event Flow Tab

This section includes the fields and descriptions for the Event Flow tab.

### Event Flow Island

Field	Description
<b>Event Flow</b>	In this field, you can write a description and specify a number for the event flow when creating a flow. If you do not specify a number, Maconomy assigns a number from the number series "Event Flow" in the window Number Series in the Set-Up module.
<b>Event Flow Type</b>	<p>In this field, you must specify an event flow type created in the window Event Flow Types. The event flow type contains template information which is copied to new current event flows. Most of this information can be changed on the individual event flows. Event flows created automatically as part of a campaign are assigned the event flow type specified for the campaign.</p> <p>Please note that when creating an event flow and specifying a given event flow type with the application "History," Maconomy rejects the creation of the flow if the system already contains an event flow of the same type for the same contact person. This ensures that no more than one event flow with a given combination of contact person and history event flow type exists in the system.</p>
<b>Flow Status Type</b>	This field shows the name of the option list containing the options available for specifying event flow statuses in the current event flow. The value is transferred from the corresponding field in the event flow type of the event flow, and cannot be changed here. You can specify an event flow status on the individual events in the flow using the field "New Event Flow Status" in the table part. See this field and the field Current Event Flow Status in the card part of the window for more information on assigning event flow statuses to a flow. Event flow types are defined in the window Event Flow Types.
<b>Closed</b>	In this field, you can specify that the event flow is closed, for instance because the objective of the flow has been reached. An event flow can only be closed if there are no open events assigned to it. Once an event flow has been closed, you cannot change any of the fields on the event flow, and no further events can be assigned to it. However, an event flow can be reopened if the job (if any) to which the flow is assigned is still open. If the event flow is a subflow of an event, the event flow can only be reopened if the event in question is still open.
<b>Blocked</b>	If you mark this field, you block the current event flow for changes. This means that it is not possible to change any of the fields on the event flow, and that all events in the event flow are also blocked. However, you can unmark the field at any time to unblock the event flow and all related events. See the field "Blocked" in the window Events for information about the effects of blocking events.
<b>Current Flow Status</b>	This field shows the current status of the event flow. The status is updated when an event specified as a status changing event is closed, and the new event flow status will then be the one specified on the event that was closed. However, the status is only updated if the ending date (or, if the event flow type of the current event flow uses the application "History," the starting date) of the event being closed is later

Field	Description
	<p>than that of the last event which caused the event flow status to change. The number of this event is shown in the island Latest Status Change.</p> <p>If the event flow is assigned to a job whose job processing status type is the same option list as the event flow status type, the job processing status of the job in question is also updated with the new event flow status when the event is closed. The job processing status type of a given job is specified in the job parameters to which the job is assigned. The event flow status type is specified in the window Event Flow Types. In the island Expected Status Change, you can see information on the event expected to cause the next status change.</p>

### Job Cost Island

Field	Description
<b>Job</b>	In this field, you can specify the name and number of a job if the event flow pertains to a job. The company responsible for the job must be the same as the one responsible for the current event flow. All events in the event flow will also be assigned to this job.
<b>Activity No.</b>	If the event flow has been assigned to a job, you can specify the number of a time activity in this field. This activity will be suggested on new events subsequently created in the flow.
<b>Task</b>	If the event flow has been assigned to a job, you can specify the number of a task in this field. This task will be suggested on new events subsequently created in the flow.

### Campaign Island

Field	Description
<b>Campaign</b>	If the event flow is part of a campaign, that is, it was created by selecting the action "Create Initial Events" in the window Campaigns, this field shows the name and number of the campaign in question.

### Selection Criteria Island

Field	Description
<b>Planned Date</b>	In these fields, you can specify a range of dates. The table part will only display events whose range of dates in the fields "Planned Starting Date" and "Planned Ending Date" covers one or more dates within the range specified here. When you browse between event flows, the values specified in these fields are kept so that you do not need to re-enter them each time you browse to a new flow.
<b>Event Date</b>	In these fields, you can specify a range of dates. The table part will only display events whose range of dates in the fields "Event Starting Date" and "Event Closing Date" covers one or more dates within the range specified here. When you browse between event flows, the values specified in these fields are kept so that you do not need to re-enter them each time you browse to a new flow.

**Company Island**

Field	Description
<b>Company</b>	<p>In this field, you can enter the name and number of the company responsible for the event flow. If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>The contents of this field determine which users have access to see information about the event flow. In the window Company Information in the G/L module it is possible to assign each company to an access level. A user only has access to see information about a given event flow if he has been granted access to the access level in the window Access Levels in the Set-Up module that the company is assigned to or a superordinate level. In addition, the user must have access to the access level specified in the island Access Level to have access to the event flow. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to event flows may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>See the section "Multiple Companies" in the chapter "Introduction to the G/L Module" and the window Dimension Derivations in the G/L module for a further description of the concept of dimension derivation.</p>

**Access Level Island**

Field	Description
<b>Access Level</b>	<p>Here you can enter the name of an access level created in the window Access Levels. Users only have access to information about the current event flow if they have been assigned to this or a higher access level in the window User Access Levels in the Set-Up module. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to event flows may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section "Introduction to the Access Control System" in the Set-Up module.</p> <p>If you do not specify an access level, this field has no influence on whether the user has access to information about the current event flow.</p>

**Document Archive Island**

Field	Description
<b>Document Archive</b>	<p>In this field, you can assign a document archive to the event flow.</p> <p>By assigning a document archive to an event flow, you can keep track of the various documents related to the flow. Document archives are created in the</p>

Field	Description
	window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

### User Island

See the chapter “Getting Started” for a description of the fields in the island User.

### Expected Status Change Island

Field	Description
<b>Flow Status</b>	This field shows the status expected to be the next event flow status in the current flow, that is, the status specified in the field New Event Flow Status on the event whose number is shown in the field Event No. below.
<b>Event No.</b>	<p>This field shows the number of the next status changing event. Of the open, status changing events in the table part (events where the field “Closed” is unmarked and the field “Status Changing Event” is marked), the next status changing event is the one with the earliest date in the field “Event Closing Date” or, if the current flow is of a type using the application “History,” the one with the earliest date in the field “Event Starting Date.”</p> <p>If none of the currently open events are marked as the next status changing event, this field and the rest of the fields in this island are blank.</p> <p>If the next status changing event has a subflow assigned to it, and one of the open events in the subflow is marked as a status changing event, this field shows the number of the status changing event in the subflow. If that event also has a subflow with a status changing event, this field will show the number of that event, and so on. This functionality applies to any number of subflow levels.</p>
<b>Event Description</b>	This field shows the description of the event shown in the field “Event No.” in this island. The description can be edited on the relevant line in the table part of this window or in the window Events.
<b>Employee No.</b>	This field shows the number of the employee responsible for carrying out the event shown in the field “Event No.” in this island. The employee number can be edited on the relevant line in the table part of this window or in the window Events.
<b>Event Start</b>	This field shows the starting date and time of the event shown in the field “Event No.” in this island. The starting date and time can be edited on the relevant line in the table part of this window or in the window Events.
<b>Event Change</b>	These fields show the last date and time on which changes were made to the event shown in the field “Event No.” in this island.

**Option List Fields Island**

Field	Description
<b>List</b>	In these fields, you can select the option lists containing the values you wish to use for further specification of the event flow and its outcome. In the fields Value in this island, you can then select values from these lists. Maconomy will suggest the option list from the corresponding field in the event flow type of the event flow. However, you can change the suggested option lists here.
<b>Value</b>	In these fields, you can specify values available in the respective option lists specified in this island. The fields can, for example, be used for further specification of the event flow and its outcome.

**Employees Island**

Field	Description
<b>Name 1-5</b>	These fields show the names of the respective employees specified in the fields "Employee No. 1-5" in this island.
<b>Number 1-5</b>	In these fields, you can specify a number of employees related to the event flow.

**Flow Texts Island**

Field	Description
<b>Flow Text 1-20</b>	In these fields, you can specify a number of descriptive texts related to the event flow. The fields are for information only.

**Customer Island**

Field	Description
<b>Customer</b>	In this field, you can specify the customer whom the event flow concerns. This customer will also be suggested on all events created in the flow.

**Employee Information Island**

Field	Description
<b>Employee</b>	In this field, you can specify the employee who should be responsible for the current event flow. This employee will also be suggested on all events created in the flow.

**Event Plan Island**

Field	Description
<b>Event Plan</b>	In this field, you can write the description and specify the number of the event plan on which events automatically created in the current event flow should be based. When you select the action "Create Secondary Events," the information in this event plan will be used as basis for the created events. Maconomy

Field	Description
	suggests the event plan specified in the event flow type to which the event flow is assigned, but you can change it here as long as no events have been created in the flow. For further information on the creation of initial events and secondary events, please see the description of the actions in this window, the section “Introduction to the Contact Management Module,” and the window “Event Plans.”
<b>Create Secondary Events When Closing</b>	In this field, you can specify whether secondary events should automatically be created when an event in the current event flow is closed. If the field is marked, closing an event in the flow will cause Maconomy to create secondary events for that event, and that event only, as if you had selected the action “Create Secondary Events” in the window Events. Maconomy suggests the value from the corresponding field on the event flow type to which the current event flow is assigned, but you can change it here.
<b>Include Only Closed Events</b>	In this field, you can specify whether the action “Create Secondary Events” should only be carried out on closed events in the current event flow when the action is selected either for the whole flow in this window or for individual events in the window Events. If the field is not marked, the action will apply to both open and closed events in the flow. Maconomy suggests the value from the corresponding field on the event flow type to which the current event flow is assigned, but you can change it here. For further information, see the description of the action “Create Secondary Events” in this window and the window Events.

### Contact Island

Field	Description
<b>Contact Company</b>	<p>In this field, you can specify the name and number of the contact company to which the event flow pertains. If a customer was specified in the field “Customer” when the event flow was created, Maconomy suggests the contact company number of that customer in this field. However, the value can be changed as long as no events have been created in the flow. This contact company number will also be suggested on all events in the flow.</p> <p>If you leave the field unchanged and enter a contact person assigned to a contact company, the number of the contact company in question is automatically inserted in this field.</p>
<b>Contact Person</b>	<p>In this field, you can specify the name and number of the contact person to which the event flow pertains. This contact person will also apply to all events in the flow. If you specify both a contact company and a contact person at the same time before pressing Return, the contact person specified must be assigned to the contact company in question. If you specify a contact person without changing the contact company number, Maconomy automatically completes the field “Contact Company No.” with the number of the contact company (if any) to which the contact person in question is assigned.</p> <p>Please note that when creating an event flow and specifying a given event flow type with the application “History,” Maconomy rejects the creation of the flow if the</p>

Field	Description
	system already contains an event flow of the same type for the same contact person. This ensures that no more than one event flow with a given combination of contact person and history event flow type exists in the system.

### Dimensions Island

Field	Description
<b>Location</b>	In this field, you can enter a value for the dimension Location. When dimension values are derived to the events created in the flow, the value in this field will be used as a context value for the dimension Location, and thus in some cases be transferred to events in the flow. For a description of the term “context values” and the cases where context values are derived, see the section “Deriving Dimensions” in the G/L module.
<b>Entity</b>	The functionality of this field is similar to the functionality of the field Location above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field Location above.
<b>Purpose</b>	The functionality of this field is similar to that of the field Location above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field Location above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field Location above.

### Note Island

Field	Description
<b>Note</b>	<p>In this field, you can specify the name and number of a note relating to the current event flow.</p> <p>If the value “Update Note at Status Change” has been selected in the field “Note Management” in the event type of the current event flow, this field is automatically updated each time a status changing event is closed, causing any note assigned to the status changing event to be assigned to the event flow by means of this field. This allows you to, for example, run reports where information on the latest status changing event includes the note information from the event in question.</p> <p>Notes can be created manually in the window Notes in the Set-Up module where you can also edit the text and description.</p>

**Latest Status Change Island**

Field	Description
<b>Event No.</b>	This field shows the number of the last event in the table part which caused the event flow status to change. For information about the criteria for an event to update the event flow status, see the field Current Flow Status.
<b>Event Description</b>	This field shows the description of the event shown in the field "Event No." in this island.
<b>Event Result</b>	This field shows the result of the event shown in the field "Event No." in this island.
<b>Event Start</b>	This field shows the starting date and time of the event shown in the field "Event No." in this island.
<b>Event End</b>	These fields show the last date and time on which changes were made to the event shown in the field "Event No." in this island.

**Statistics Island**

Field	Description
<b>Number of Events</b>	This field shows how many events exist in the current event flow.
<b>Number of Open Events</b>	This field shows how many of the events in the current flow is open.
<b>Flow Start</b>	This field shows the starting date and time of the first event created in the flow.
<b>Changed</b>	This field shows the closing date and time of the closed event in the flow which has the latest closing date. When you close an event in the table part, Maconomy automatically transfers the event's closing date to this field if the event in question has a later closing date than the other closed events.
<b>Planned Change</b>	<p>These fields show the next planned change to the events contained in the event flow. All open events in the flow or in related sub flows are considered. The next planned change is the most proximate of the starting or ending dates of the events assigned to the flow. To find this, Maconomy considers the following:</p> <ul style="list-style-type: none"> <li>▪ The planned starting dates and times of events with blank event starting date</li> <li>▪ The planned ending dates and times of events that have been started (that is, have a value in the field "Event Starting Date") but not ended</li> <li>▪ Of the times and dates found, this field shows the earliest date and time. Consequently, if the time and date in these fields are before current time, this indicates an overdue event.</li> </ul>

Field	Description
<b>Actual Time</b>	This field shows the total amount of time that has been spent working on the events assigned to the current event flow. The field shows the sum of the values in the field "Time Elapsed" on all events assigned to the event flow. For a description of the field "Time Elapsed," please see the window Events.

#### Extra Date Fields Island

Field	Description
<b>Date and time 1-5</b>	In these fields, you can specify certain key times regarding the current event flow. The fields are for information only.

#### Events Sub-Tab

This section includes the fields and descriptions for the Events sub-tab.

Field	Description
<b>Event No.</b>	In this field, you can enter an event number if you are creating a line. The number can consist of both figures and letters. If you do not enter a number yourself, a number will be allocated automatically from the window Number Series.
<b>Event Type</b>	Enter an event type, such as a lead. When you create an event, its type is initialized to the event type that you specified on the event flow type, but you can change that value in this field.  If the event was created from an event template in an event plan, Maconomy copies the value from the corresponding field in the event template on which the event is based. You create event types in the Popup Fields window in the Set-Up module.
<b>Description</b>	In this field, you can enter a short description of the event.
<b>Closed</b>	When you mark this field, the event is closed. When an event is closed, it can no longer be changed in this window. Nor can the description of the event be changed in the table part of the window Events. Closing an event also means that any new job processing status or event flow status may be transferred to the current job and/or event flow. For more information on this process, see the description of the fields "New Job Processing Status" and "Event Flow Status" in the card part of the window.  Furthermore, if the field "Create Secondary Events when Closing" has been marked for the current event flow, the closing of the event can cause the automatic creation of new events in the flow. For more information on this process, see the description of the field "Create Secondary Events when Closing" in the card part of the window.  If the event is marked as a status changing event and the field "Aut. Status Update" is not marked for the event flow type of the current event flow, the event can only be closed if its closing date is later than that of the other

Field	Description
	closed, status changing events in the flow. If a subflow has been specified for the event, the event can only be closed if the subflow has been closed. A closed event cannot be reopened.
<b>Date Closed</b>	In this field, you can specify the date on which you expect to close the current event. If you do not enter an event closing date, Maconomy automatically enters today's date, and completes the field "Event Closing Time" with the relevant time when you close the event. If you enter an event closing date, this date remains unchanged when you close the event, and the system does not automatically complete the field "Event Closing Time."
<b>Closing Time</b>	If the event has been closed, this field shows the time at which the event was closed. However, if an event closing date had manually been specified in the field above before the event was closed, this field remains blank.
<b>Result Type</b>	This field shows the name of the option list containing the options that should be available in the field "Result." A result type is only available if the event was created from an event template in an event plan, and is derived from the event template on which the event was based. Option lists are created in the window Option Lists in the Set-Up module.
<b>Result</b>	In this field, you can specify the result of the current event. The result must be an option in the option list shown in the field "Result Type" for the event in question. If the event flow in the card part has been assigned to an event plan, the result of the event can determine whether the event will cause secondary events, as the event plan may contain templates where a given result is part of the condition for creating secondary events. For a further description of event plans, event templates and conditions for the creation of secondary events, please see the fields "Condition No." and "Condition Result" in the window Event Plans, as well as the action "Create Secondary Events."
<b>New Event Flow Status</b>	<p>In this field, you can specify the event flow status to be assigned to the event flow in the card part when the event is closed by marking the field "Closed." An event flow has only one event flow status at any time, and this status can only be changed by closing an event. For information about the criteria for an event to cause the event flow status to be updated, see the description of the fields "Event No." and "Current Flow Status."</p> <p>The event flow status can, for example, be used for indicating the progress of the event flow or the person or function responsible for the next step. The table part shows the event flow status assigned to the event flow upon closing each event belonging to the flow. This makes it possible to trace the process of the flow.</p> <p>You can choose from the options in the option list shown in the field "Flow Status Type" in the card part.</p> <p>The field "Aut. Status Update" in the event flow type of the event flow to which the current event is assigned determines whether you can specify a value in this field if the current event is not a status changing event. If the field is not marked, you can only select a new event flow status if the field</p>

Field	Description
	<p>“Status Changing Event” has been marked for the event. This ensures that only status changing events can have an event flow status. If the field “Aut. Status Update” is marked, you can select a new event flow status if the field “Status Changing Event” has not been marked for the event. This allows you to register a new event flow status for all events in a flow, to indicate their effects even if they do not affect the flow status.</p>
<b>Status Changing Event</b>	<p>In this field, you can specify whether the current event is a status changing event, that is, that when the event is closed, the value specified in the field “New Event Flow Status” above should be transferred as the current event flow status of the event flow to which the event is assigned. If you close an event where a new event flow status has been specified but this field is not marked, the event flow status is, however, not updated in the card part.</p> <p>When you close the event, the set-up of the event flow type of the event flow in the card part may cause Maconomy to automatically unmark this field. If the field “Aut. Status Update” is marked for the event flow type of the event flow to which the event is assigned, Maconomy automatically unmarks this field if the current event does not have a later closing date than that of the other closed, status changing events. This ensures that although you can specify new event flow statuses for multiple open events, the event flow status is not updated by previous events.</p>
<b>Subflow No.</b>	<p>In this field, you can specify the number of an existing event flow that should be a subflow of the current event, for instance because the event itself can be broken down into several minor tasks. When you assign a subflow to an event, information about the time spent on the events in the subflow will be summed for the current event. This way, the information in the islands Statistics and Expected Status Change in the event flow to which the current event is assigned will include the events in the subflow. Subflows can be assigned in any number of levels, causing the event flows on above levels to include summarized information from all levels below.</p>
<b>Description Subflow</b>	<p>This field shows the description of the event flow specified in the field “Subflow No.” above.</p>
<b>Employee No.</b>	<p>In this field, you can enter the number of the employee who should carry out the event. When using the action “Transfer to Time Sheet” in the window Events, the time consumed is transferred to a time sheet belonging to this employee. When you create a new event, Maconomy suggests the employee number of the current user if this user is also registered as an employee.</p>
<b>Employee Name</b>	<p>This field shows the name of the employee specified in the field “Employee No.” on the line.</p>
<b>Event Plan No.</b>	<p>If the event was created from an event plan, the number of the event plan in question is shown in this field.</p>
<b>Event Template No.</b>	<p>If the event was created from an event plan, this field shows the number of the event template in this plan from which the event was created. The event template number determines whether the current event should cause</p>

Field	Description
	secondary events when the action “Create Secondary Events” is selected, as the event plan specified above may contain templates where part of the conditions determining whether secondary events should be created for a given event is the template upon which the event was based. For a further description of event plans, event templates and conditions for the creation of secondary events, please see the fields “Condition No.” and “Condition Result” in the window Event Plans, as well as the action “Create Secondary Events” in this window.
<b>Planned Starting Date</b>	In this field, you can specify the date on which the event is to start according to plan. For events created from a template in an event plan, the planned starting date is either based on the planned starting date in the template in question or the number of days specified in the field “Delay” in the template. For a further description of the time and date fields of event templates, please see the window Event Plans.
<b>Planned Starting Time</b>	In this field, you can specify the time at which the event is to start according to plan. For events created from a template in an event plan, the planned starting time is either based on the planned starting time in the template in question or the number of days specified in the field “Delay” in the template. For a further description of the time and date fields of event templates, please see the window Event Plans.
<b>Planned Ending Date</b>	In this field, you can specify the date on which the event is to end according to plan. For events created from a template in an event plan, the planned ending date is either based on the planned ending date in the template in question or the number of days specified in the field “Delay” in the template. For a further description of the time and date fields of event templates, please see the window Event Plans.
<b>Planned Ending Time</b>	In this field, you can specify the time at which the event is to end according to plan. For events created from a template in an event plan, the planned ending time is either based on the planned ending time in the template in question or the number of days specified in the field “Delay” in the template. For a further description of the time and date fields of event templates, please see the window Event Plans.
<b>Event Starting Date</b>	In this field, you can specify the date on which the event was actually started. A future date can only be specified if the current event flow is assigned to an event flow type on which the value “History” has been specified in the field “Application.”
<b>Event Starting Time</b>	In this field, you can specify the time at which the event was actually started. If the event was created manually, Maconomy suggests the time of the event’s creation. If the event was created from an event plan, the field remains blank until the action “Start Timer” is selected in the window Events, and will then show the time at which the action was selected. However, in both cases, you can specify an earlier time.

Field	Description
<b>Event Ending Date</b>	In this field, you can specify the date on which you expect to close the current event. If you do not enter an event closing date, Maconomy automatically enters today's date, and completes the field "Event Closing Time" with the relevant time when you close the event. If you enter an event closing date, this date remains unchanged when you close the event, and the system does not automatically complete the field "Event Closing Time."
<b>Event Ending Time</b>	If the event has been closed, this field shows the time at which the event was closed. However, if an event closing date had manually been specified in the field above before the event was closed, this field remains blank.
<b>Accumulated Time</b>	<p>This field shows how long work on the event has been in progress. The field shows the total time in which the timer has been activated for the event, less any time already transferred to time sheets by means of the action "Transfer to Time Sheet" in the window Events. If the timer has been activated several times, the field shows the sum of the elapsed periods less the time already transferred to time sheets.</p> <p>When you select the action "Transfer to Time Sheet" in the window Events, the time transferred to the time sheet is the time registered in this field. The field is reset to zero when time is transferred.</p>
<b>Total Time Consumption</b>	This field shows the total time in which the timer has been activated for the event.
<b>Job No.</b>	<p>In this field, you can specify the number of a job. The field is automatically completed by Maconomy if the event was created in another window where events are used and a job number can be specified. In the window Job Events, you can see all of the events assigned to the same job, making it possible to trace the processing of the job.</p> <p>The job number can also be used for the automatic registration of time consumption in connection with the event. When the action "Transfer to Time Sheet" is selected, the registered time consumption is transferred to a time sheet line containing the job in this field and the activity number and task (if any) specified on the event. If the event has been closed, the time consumption is transferred to the time sheet belonging to the employee of the event that covers the ending date of the event. If the event has not been closed, the time consumption is transferred to the time sheet covering today's date.</p>
<b>Job Name</b>	This field shows the name of the job specified in the field "Job No." above.
<b>Activity No.</b>	If the event has been assigned to a job, you can specify the number of an activity which the event concerns in this field. When the action "Transfer to Time Sheet" is selected, the registered time consumption is transferred to a time sheet line containing the activity in this field and the job number and task (if any) specified on the event. If the event has been closed, the time consumption is transferred to the time sheet belonging to the employee of the event which covers the ending date of the event. If the event has not

Field	Description
	been closed, the time consumption is transferred to the time sheet covering today's date.
<b>Task</b>	If the event has been assigned to a job, you can specify the number of a task which the event concerns in this field. When the action "Transfer to Time Sheet" is selected, the registered time consumption is transferred to a time sheet line containing the job number and activity on the event, and any task specified in this field. If the event has been closed, the time consumption is transferred to the time sheet belonging to the employee of the event which covers the ending date of the event. If the event has not been closed, the time consumption is transferred to the time sheet covering today's date.
<b>Document Archive No.</b>	In this field, you can assign a document archive to the event. By assigning a document archive to an event, you can keep track of the various documents related to the event. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.

## Actions

This section shows the Actions available in the Event Flow workspace.

### Top Tab

Field	Description
<b>Create Events From Plan</b>	<p>When you select this action, Maconomy creates events for those events in the current flow that cause the creation of events according to the event plan selected in the flow. However, the first time the action is run on a manually created event flow, the action creates initial events instead.</p> <ul style="list-style-type: none"> <li>■ <b>Initial Events</b> — The first time you run the action on a manually created event flow, Maconomy creates an event per initial event template in the event plan of the flow and assigns it to the current flow. An initial event template is an event template on which no condition template has been specified. As an event plan can contain several initial event templates, this action can cause the creation of several events in the flow. Maconomy copies the contact mode, event type, employee number, starting date and various other information from the event template in question to each new initial event.</li> <li>■ <b>Secondary Events</b> — When you run the action on an event flow that is part of a campaign or you select the action for the second time (or more) on a manually created flow, Maconomy will create secondary events for certain events in the current flow. In the description of this process, the term "basis event" is used about any event assigned to the current flow. However, if the field "Include only Closed Events" is marked in the card</li> </ul>

Field	Description
	<p>part of the flow, only closed events in the flow are considered basis events.</p> <p>When the action is selected, Maconomy checks each basis event to see if the event plan assigned to the event flow contains one or several event templates where:</p> <ul style="list-style-type: none"> <li>▪ The condition number matches the event template number on which the basis event was based, and</li> <li>▪ The condition result matches the result specified in the field “Result” on the basis event in question.</li> <li>▪ No events have been created in the current flow based on the event template in question.</li> </ul> <p>For a further description of the concepts of condition results and condition numbers, please see the description of the fields “Condition Result” and “Condition No.” in the table part of the window Event Plans.</p> <p>In those cases where the above conditions are met, an event is created. Maconomy also creates an event for each event template in the event plan where no condition number and result has been specified, provided that no events have already been created in the current flow based on the event template in question. Maconomy copies the contact person and/or contact company from the event flow to each automatically created event, while contact mode, event type, employee number, starting date and various other information is copied from the event template which, in combination with the basis event, gave rise to the automatically created event.</p> <p>For an example illustrating how Maconomy finds out whether a given event should cause automatically created events, please see the description of the action “Create Secondary Events” in the window Campaigns.</p> <p>Please note that since several event templates may have a condition result and condition number that match the same event, the result of one event may cause the creation of several events.</p> <p>For a further description of the concept of secondary events, please see the section “Introduction to the Contact Management Module” and the description of the window Event Plans.</p>
<b>Close Events</b>	<p>When you select this action, Maconomy closes all open events assigned to the current event flow. If the flow is assigned to an event plan, this may cause the creation of events in the flow, as described in the field “Close” in the table part of the window. If one or several of the open events in the flow cannot be closed, for example, because they have open subflows assigned to them, the action is cancelled, and none of the events in the flow are closed.</p>
<b>Transfer to Time Sheet</b>	<p>When you select this action, Maconomy transfers the time consumed on each event in the table part to a time sheet belonging to the employee specified on the event in question. Time on a given event can only be transferred if the window Time Sheets contains a time sheet belonging to the employee and</p>

Field	Description
	<p>covering the closing date of the event if the event has been closed, or today's date if the event is still open.</p> <p>For each event in the event flow, Maconomy transfers the value in the field "Accumulated Time" to a new time sheet line with a job number, activity number, dimension values and task corresponding to the information specified in the event. The time consumption is registered on the closing date if the event has been closed and on today's date if the event is still open.</p> <p>If there are more than one event with the same combination of employee number, job number, activity number and task, a separate line is created for each event. However, if the field "Duplicate Lines on Time Sheet" has not been marked in the window System Information, multiple time sheet lines with the same combination of job number, activity number, task and dimension values are not allowed, and Maconomy will show an error message if more than one event with the same combination exists.</p> <p>Please note that since time is only transferred to one day on the time sheet, the maximum number of hours that can be transferred is 24. If the field "Accumulated Time" contains a greater number of hours, Maconomy will therefore show an error message when you use this action.</p>
<b>Attach Document to Event Flow</b>	This action allows you to attach a document to the event flow in the card part.
<b>Create Note</b>	Use this action to create a note. Maconomy derives the note type for the note from the event flow type of the event flow. This note's note number is referenced from the event flow number field.

**Bottom Tab**

Field	Description
<b>Attach Document to Event</b>	This action allows you to attach a document to the event in the table part.

## Campaigns Single Dialog Workspace

Use this workspace to create campaigns.

You use campaigns to automatically create events for a target group of contact companies and persons.

You specify a target group for a campaign by using one or several predefined selection criterion specifications that you create in the Selection Criterion Specification workspace in the Set-Up module. You enter these selection criterion specifications in the Campaigns tab in this workspace. When you initiate a campaign by using the **Create Initial Events** action, Maconomy creates an event flow for each combination of contact company and contact person that matches one or more of the selection criterion specifications in the campaign 's tab, linking the event flows to the campaign.

Maconomy uses the event flow type that you enter for the campaign as the basis for the event flow and identifies the event plan to be used for all of the flows in the campaign. Maconomy then creates one or more events in each of these event flows, based on the templates for initial events in this event plan. Maconomy assigns these events to the company and people who have that event flow. Maconomy transfers the information about each event from the templates for initial events, the event flows, and the contact companies and people for whom it creates the events.

Before you create events, check the size of the campaign by using the **Calculate Target Group Size** action, which calculates the number of contact companies and people that match the selection criterion specifications in the Campaigns tab. You can then change the target group if the campaign includes too many or too few contact companies and people.

You process the events that Maconomy creates separately in the Events workspace, where you can enter the result of the event and a thorough description of the course of the event. However, in the Campaigns workspace you can perform actions on all events that you assign to a campaign. You can also work with all of the events in an event flow and perform actions on them in the Event Flow workspace.

You can use the **Create Secondary Events** action if you want Maconomy to create secondary events for all of the events that belong to a campaign. You can close all of the events in a campaign by using the **Close Events** action.

You can add contact companies and people to a campaign, even after you create the initial events. To do this, change the selection criterion specifications in the Campaigns tab and use the **Create Initial Events** action again. Maconomy then identifies the contact companies and people that match the new target group in the Campaigns tab and creates initial event flows and events for those contact companies and people for which you have not yet created events in the current campaign.

## Campaigns Tab

This section includes the fields and descriptions for the Campaigns tab.

### Campaign Island

Field	Description
<b>Campaign</b>	In this field, you enter the name and number of the campaign.
<b>Description</b>	In this field, you can enter a short description of the campaign.

### Targeting Code Island

Field	Description
<b>Targeting Code</b>	Enter a targeting code. You can only use this field if you have not entered any selection criteria in the table part.  If you specify a targeting code in this field, the Create Initial Events action acts on all contact persons and companies that are assigned to this targeting code.

### Event Flow Island

Event Flow Type If contact management setup defined a default event flow type for campaigns, this field initializes that event flow type.

In this field, you must specify an event flow type created in the Event Flow Types window. The event flow type contains template information which is copied to new current event flows. Most of this information can be changed on the individual event flows. Event flows created automatically as part of a campaign are assigned the event flow type specified for the campaign.

### Company Island

Field	Description
<b>Company</b>	<p>In this field, you can enter the name and number of the company responsible for the campaign. This company number is assigned to the event flows and events created in connection with the current campaign.</p> <p>If you do not enter a value manually, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>See the section “Multiple Companies” in the chapter “Introduction to the G/L Module” and the window Dimension Derivations in the G/L module for a further description of the concept of dimension derivation.</p>

### Remarks Island

In these fields you can enter additional remarks about the campaign.

### Status Island

Field	Description
<b>Event Flows Initiated</b>	<p>This field shows the total number of contact companies and persons for which events have been created in the current campaign.</p> <p>If a contact person matches the criteria in one or several of the selection criterion specifications in the table part, the contact person in question is only included in the campaign once, meaning that Maconomy does not create events for each of the selection criterion specifications matched by the same contact person.</p> <p>A contact company can be included several times, so that several events with the same contact company number are created. Maconomy uses the following rules to determine the number of times the same contact company should be included:</p> <p>A contact company is included once if it matches one or several of the selection criterion specifications of the type “Contact Company” specified in the table part. This means that Maconomy does not create additional events for each of the contact company selection criterion specifications matched by the same contact company.</p> <p>However, if the table part contains selection criterion specifications of the type “Contact Person,” a contact company is furthermore included once for each</p>

Field	Description
	included contact person assigned to the contact company in question. As mentioned, each contact person is only included once, even if he matches several of the contact person selection criterion specifications.
<b>Date Of Last Initial Event Creation</b>	This field shows the last date on which initial events were created for the campaign, using the action "Create Initial Events."
<b>Date of Last Secondary Event Creation</b>	This field shows the last date on which secondary events were created for the campaign, using the action "Create Secondary Events" in this window. Selecting the corresponding action for individual event flows in the campaign in the window Event Flows will not cause an update in this field.
<b>Blocked</b>	<p>If you mark this field, the current campaign is blocked. When a campaign is blocked, you can no longer select any of the actions in the Action menu, and you can no longer assign new events to the current campaign. Maconomy also marks the field "Blocked" on all event flows assigned to the campaign.</p> <p>You can thus mark this field if you wish to stop the development of a campaign.</p> <p>You can unmark the field at any time, thus unblocking the campaign and its event flows.</p>

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

### Campaign Selection Criterion Sub-Tab

This section includes the fields and descriptions for the Campaign Selection Criterion sub-tab.

Field	Description
<b>Selection Criterion Specification No.</b>	<p>In this field, you can specify the number of a selection criterion specification created in the window Selection Criterion Specification. Depending on whether the selection criterion specification type is "Contact Company" or "Contact Person," the campaign will thus include the contact companies or persons matching the criteria in the selection criterion specification in question. If several selection criterion specifications are added to the table part, a contact company or person need only match the criteria in one of these selection criterion specifications to be included in the campaign.</p> <p>If a contact person matches the criteria in one or several of the selection criterion specifications in the table part, the contact person in question is only included in the campaign once, meaning that Maconomy does not create event flows and events for each of the selection criterion specifications matched by the same contact person.</p> <p>A contact company can be included several times, so that several event flows and events with the same contact company number are created.</p>

Field	Description
	<p>Maconomy uses the following rules to determine the number of times the same contact company should be included:</p> <p>A contact company is included once if it matches one or several of the selection criterion specifications of the type "Contact Company" specified in the table part. This means that Maconomy does not create event flows and events for each of the contact company selection criterion specifications matched by the same contact company.</p> <p>However, if the table part contains selection criterion specifications of the type "Contact Person," a contact company is furthermore included once for each included contact person assigned to the contact company in question.</p>
<b>Selection Criterion Specification Type</b>	<p>In this field, you must specify if the current selection criterion specification pertains to contact companies or contact persons. In the window Selection Criterion Specification, you specify for each selection criterion specification to which one of these types of information the selection criterion specification pertains.</p> <p>As it is possible to have two different selection criterion specifications that have the same number but pertain to different types of information, you must specify in this field which of the two selection criterion specifications is in question.</p> <p>The selection criterion specification type must be specified regardless of whether there are several specifications with the number entered in the field "Selection Criterion Specification No.," but Maconomy checks that a selection criterion specification with the specified combination of number and type exists.</p>
<b>Description</b>	This field shows a description of the current selection criterion specification.

## Events Single Dialog Workspace

Use this workspace to enter and maintain information about events.

An event can be contact with a customer—such as a phone call, a meeting, and so on—but it can also be part of the processing of a job. Among other things, you can enter how the event is performed, who performs it, the name of the contact person, and whether the event is part of a campaign.

You can create events manually in this workspace, or you can create them automatically as part of an event flow. You can do this for individual event flows in the Event Flow workspace, or for all of the event flows that you assign to the same campaign in the Campaigns workspace. When you create events automatically as part of an event flow, the creation is based on an event plan that contains template information that Maconomy copies to each event. See the Event Plans workspace for more information about this functionality. You can also create events manually as lines in the Job Events and Event Flow workspace's sub-tabs.

You can assign an event to a job and an activity, as well as to a task. You can use the integration with jobs in the Job Cost module to manage the job process and keep track of who is responsible for the next step in the process. To do this, create a job that is assigned to an event each time

that you close part of the job process, or when you pass the job on to another employee for further processing. By creating several events for the same job, you can document the job process thoroughly. For instance, you can use the notes in the Note Lines sub-tab to describe in detail what happens in each part of the job processing, and you can use the job processing status to indicate the progress of the job or the person or function responsible for the next step. In the Job Events workspace, you can trace the processing of a job, because that workspace shows the description, job processing status, and so on, for each event that you assigned to the same job. The Event Flows workspace provides similar functionality for documenting event flows. For more information about this, see the description of the **Event Flow Status** field.

You can have Maconomy enter the time that each event consumes by using a timing function that you activate and deactivate using the **Start Timer** and **Stop Timer** actions.

Use the **Transfer to Time Sheet** action to transfer the time consumption of an event to a time sheet. You identify the relevant time sheet by the employee number, dimension values, job, and activity number that you enter for the event. However, you can only transfer time to a time sheet if a time sheet that covers the relevant period already exists for the employee in question.

The Note Lines sub-tab displays the contents of a note that you assign to the current event, enabling you to describe the event in detail. However, to be able to enter or change text in the Note Lines sub-tab, you must assign the event to a note. Maconomy does this automatically at event creation if you set up the event flow type by selecting the **Create Aut. Note** field. You set up the event type in the Popup Fields workspace in the Set-Up module. If you have not set up the event type for automatic note creation, you can assign a note to the current event by specifying a note manually in the **Note No.** field or using the **Create Note** action.

## Events Tab

This section includes the fields and descriptions for the Events tab.

### Event Island

Field	Description
<b>Event No.</b>	In this field, you can enter the number of the event. The number can consist of both figures and letters. If you do not enter a number yourself, a number will be allocated automatically from the window Number Series.
<b>Event Type</b>	Select an event type from the drop-down list. When you create an event, the type is initialized to the event type that you specified in the contact management setup. However, you can change that value in this field.  If the event was created in the Campaigns window, Maconomy copies the value from the corresponding field in the event template on which the event is based. The event type also determines the options that are available for headings in the table part.
<b>Description</b>	Enter a description for the event type, or press CTRL+G to search for a possible description for this event type. The CTRL+G search option is available if a description option list is specified for the event type.
<b>Closed</b>	Here you specify whether the event has been closed. When an event is closed, the fields in the card and table parts can no longer be changed. Closing an event also means that if the event is assigned to an event flow, any new event flow

Field	Description
	<p>status may be transferred to the event flow to which the event is assigned. Similarly, if the event is not assigned to an event flow, any new job processing status in the field “New Job Processing Status” is transferred to the job to which the event is assigned. Furthermore, if the event is assigned to an event flow where the field “Create Secondary Events when Closing” has been marked, the closing of the event can cause the automatic creation of events in the flow in question. For more information on this process, see the description of the field “Create Secondary Events when Closing” in the card part of the window Event Flows.</p> <p>If the event is assigned to an event flow and is marked as a status changing event, and if the field “Aut. Status Update” is not marked for the event flow type of the event flow in question, the event can only be closed if its closing date is later than that of the other closed, status changing events in the flow.</p> <p>If a subflow has been specified for the event, the event can only be closed if the subflow has been closed. A closed event cannot be reopened. When an event is closed, Maconomy automatically stops the timer if it is currently activated.</p> <p>If a note is assigned to an event being closed, the note in question is also closed.</p>
<b>Date Closed</b>	In this field, you can specify the date on which you expect to close the current event. If you do not enter an event closing date, Maconomy automatically enters today's date, and completes the field “Event Closing Time” with the relevant time when you close the event. If you enter an event closing date, this date remains unchanged when you close the event, and the system does not automatically complete the field “Event Closing Time.”
<b>Closing Time</b>	If the event has been closed, this field shows the time at which the event was closed. However, if an event closing date had manually been specified in the field above before the event was closed, this field remains blank.
<b>Result Type</b>	In this field, you can specify the option list containing the options that should be available in the field “Result.” Option lists are created in the window Option Lists in the Set-Up module.
<b>Result</b>	In this field, you can specify the result of the current event. The value must be an option in the option list specified in the field “Result Type” above. If the event has been assigned to an event plan, the result determines whether the current event should cause secondary events when the action “Create Secondary Events” is selected, as the event plan may contain templates where a given result is part of the condition for creating secondary events. For a further description of event plans, event templates and conditions for the creation of secondary events, please see the fields “Condition No.” and “Condition Result” in the window Event Plans, as well as the action “Create Secondary Events” in this window.

**Employee Information Island**

Field	Description
<b>Employee</b>	In this field, you can enter the name and number of the employee who should carry out the event. When using the action "Transfer to Time Sheet," the time consumed is transferred to a time sheet belonging to this employee. When you create an event, Maconomy suggests the employee number of the current user if this user is also registered as an employee.

**Job Cost Island**

Field	Description
<b>Job No.</b>	<p>In this field, you can specify the name and number of a job. The field is automatically completed by Maconomy if the event was created in the window Job Events. In the window Job Events, you can also see all of the events assigned to the same job, making it possible to trace the processing of the job.</p> <p>The job number can also be used for the automatic registration of time consumption in connection with the event. When the action "Transfer to Time Sheet" is selected, the registered time consumption is transferred to a time sheet line containing the job in this field and the activity number and task (if any) specified on the event. If the event has been closed, the time consumption is transferred to the time sheet belonging to the employee of the event that covers the ending date of the event. If the event has not been closed, the time consumption is transferred to the time sheet covering today's date.</p>
<b>Activity No</b>	If the event has been assigned to a job, you can specify the number of an activity which the event concerns in this field. When the action "Transfer to Time Sheet" is selected, the registered time consumption is transferred to a time sheet line containing the activity in this field and the job number and task (if any) specified on the event. If the event has been closed, the time consumption is transferred to the time sheet belonging to the employee of the event which covers the ending date of the event. If the event has not been closed, the time consumption is transferred to the time sheet covering today's date.
<b>Task</b>	If the event has been assigned to a job, you can specify the number of a task which the event concerns in this field. When the action "Transfer to Time Sheet" is selected, the registered time consumption is transferred to a time sheet line containing the job number and activity on the event, and any task specified in this field. If the event has been closed, the time consumption is transferred to the time sheet belonging to the employee of the event which covers the ending date of the event. If the event has not been closed, the time consumption is transferred to the time sheet covering today's date.
<b>New Job Proc. Status</b>	If the event has been assigned to a job, you can specify in this field the job processing status to be assigned to the job in question when the event is closed by marking the field "Closed." However, the status is only updated on the job if the event is not assigned to an event flow. If the event is assigned to an event flow whose event flow status type is the same option list as the job processing status type of the job, the job's job processing status will be updated with the value in the field "New Event Flow Status" instead, when the event is closed.

Field	Description
	<p>You can choose from the options in the option list specified in the job parameter assigned to the job in question. A job thus has only one job processing status at any time, and this status can only be changed by closing an event.</p> <p>The job processing status can, for example, be used for indicating the progress of the job or the person or function responsible for the next step. In the window Job Events, Maconomy shows the job status assigned to the current job upon closing each event belonging to the job. This makes it possible to trace the process of the job.</p>

### Time Island

Field	Description
<b>Planned Starting Time</b>	In these fields, you can specify the date and time on which the event is to start according to plan. For events created from a template in an event plan, the planned starting and ending time are either based on the planned starting and ending time in the template in question or the number of days specified in the field "Delay" in the template. For a further description of the time and date fields of event templates, please see the window Event Plans.
<b>Planned Ending Time</b>	In these fields, you can specify the date and time on which the event is to end according to plan. For events created from a template in an event plan, the planned starting and ending time are either based on the planned starting and ending time in the template in question or the number of days specified in the field "Delay" in the template. For a further description of the time and date fields of event templates, please see the window Event Plans.
<b>Event Start</b>	In these fields, you can specify the date and time on which the event was actually started. If the event was created manually, Maconomy suggests the time of the event's creation, unless the event is assigned to an event flow using the "History" functionality, in which case no date and time is suggested. If the event was created from an event plan, the fields remain blank until the action "Start Timer" is selected, and will then show the date on which the action was selected. However, in both cases, you can specify an earlier date and time.
<b>Event Closed</b>	In this field, you can specify the date on which you expect to close the current event. If you do not enter an event closing date, Maconomy automatically enters today's date, and the relevant time when you close the event. If you enter an event closing date, this date remains unchanged when you close the event, but the system does not automatically register the closing time.
<b>Total Time Consumption</b>	This field shows the total time in which the timer has been activated for the event.
<b>Accumulated Time</b>	This field shows the total time in which the timer has been activated for the current event since time was last transferred to time sheets by means of the action "Transfer to Time Sheet." If the timer has been activated several

Field	Description
	times, the field shows the sum of the elapsed periods less the time already transferred to time sheets. However, you can change the value manually. When you select the action "Transfer to Time Sheet," the time transferred to the time sheet is the time registered in this field. The field is reset to zero when time is transferred.
<b>Timer Start</b>	If the timer has been activated using the action "Start Timer," these fields show the date and time on which the timer was activated.
<b>Time Elapsed</b>	If the timer has been activated using the action "Start Timer," this field shows how much time has elapsed since the timer was activated. The timer can be activated and deactivated any number of times in the course of the event, but this field only shows the time elapsed in the latest timer activation. The total time in which the timer has been activated for the event is shown in the field "Accumulated Time."

### Company Island

Field	Description
<b>Company</b>	<p>This field shows the name and number of the company responsible for the event. If the event was created as part of a campaign in the window Campaigns, the company number of the campaign is copied to this field. If the event is assigned to a job, the company must be the same as the one responsible for the job in question.</p> <p>If the event is created manually, and you do not enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived, the standard value is transferred from the window System Information in the Set-Up module.</p> <p>See the section "Multiple Companies" in the chapter "Introduction to the G/L Module" and the window Dimension Derivations in the G/L module for a further description of the concept of dimension derivation.</p>

### Document Archive Island

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the event. By assigning a document archive to an event, you can keep track of the various documents related to the event. Document archives are created in the window Document Archives in the Set-Up module. See the description of that window for further information on the use of document archives.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

### Note Island

Field	Description
<b>Note</b>	<p>In this field, you can write a description and specify the number of a note relating to the current event. The contents of this note are shown in the table part of the window, and you can change the text freely. It is only possible to enter information in the table part if a note has been specified in this field.</p> <p>When you create an event, Maconomy automatically assigns a note to the event if the event flow type of the event is set up with a mark in the field "Create Aut. Note." If the event type has not been set up for automatic note creation, you can specify the number of an existing note manually, but using the action "Create Note," you can have Maconomy automatically create a note and assign it to the current event in this field. Notes can also be created manually in the window Notes in the Set-Up module where you can also edit the text and description. You can only assign a note of the type specified in the definition of the event type of the current event. Event types are defined in the window Popup Fields.</p>

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

### Opportunity Island

Field	Description
<b>Opportunity</b>	In this field, you can write a description and specify the number of an opportunity to which the event should be assigned. Once an event has been assigned to an opportunity, the opportunity number can no longer be changed.

### Event flow Island

Field	Description
<b>Event Flow</b>	In this field, you can write a description and specify the number of an event flow to which the event should be assigned. The field is automatically completed if the event was assigned to an opportunity, created automatically or by adding a new line in the table part of the window Event Flows. Once an event has been assigned to an event flow, the event flow number can no longer be changed.
<b>Flow Status Type</b>	If the event is assigned to an event flow, this field shows the event flow status type of that event flow, that is, the option list whose options are available in the field "New Event Flow Status."
<b>New Event Flow Status</b>	If the event has been assigned to an event flow, you can specify in this field the event flow status to be assigned to the event flow in question when the event is closed by marking the field "Closed." An event flow has only one event flow status at any time, and this status can only be changed by closing an event. The event flow status can, for example, be used for indicating the progress of the event flow or the person or function responsible for the next step.

Field	Description
	<p>You can choose from the options in the option list shown in the field “Flow Status Type” above. The field “Aut. Status Update” in the event flow type of the event flow to which the current event is assigned determines whether you can specify a value in this field if the current event is not a status changing event. If the field is not marked, you can only select a new event flow status if the field “Status Changing Event” has been marked for the event. This ensures that only status changing events can have an event flow status. If the field “Aut. Status Update” is marked, you can select a new event flow status if the field “Status Changing Event” has not been marked for the event. This allows you to register a new event flow status for all events in a flow, to indicate their effects even if they do not affect the flow status.</p>
<b>Status Changing Event</b>	<p>If the event is assigned to an event flow, you can specify in this field whether the current event is a status changing event, that is, that when the event is closed, the value specified in the field “New Event Flow Status” above should be transferred as the current event flow type of the event flow to which the event is assigned. If you close an event where a new event flow status has been specified but this field is not marked, the event flow status is, however, not updated in the card part of the window Event Flows.</p> <p>When you close the event, the set-up of the event flow type of the event flow to which the event is assigned may cause Maconomy to automatically unmark this field. If the field “Aut. Status Update” is marked for the event flow type of the event flow to which the event is assigned, Maconomy automatically unmarks this field if the current event does not have a later closing date than the other closed, status changing events in the flow. This ensures that although you can specify new event flow statuses for multiple open events, the event flow status is not updated by previous events. If the field “Aut. Status Update” is not marked for the event flow type, you can only close a status changing event if its closing date is later than that of the other closed, status changing events in the flow.</p>
<b>Subflow</b>	<p>In this field, you can write a description and specify the number of an existing event flow that should be a subflow of the current event, for instance because the event itself can be broken down into several minor tasks. You can only assign a subflow to an event if the event itself is part of an event flow. When you assign a subflow to an event, information about the time spent on the events in the subflow will be summed for the current event. This way, the information in the islands Statistics and Expected Status Change in the event flow to which the current event is assigned will include the events in the subflow. Subflows can be assigned in any number of levels, causing the event flows on above levels to include summarized information from all levels below.</p>

### Customer Island

Field	Description
<b>Customer No.</b>	<p>In this field, you can specify the number of the customer which the event concerns. If a job or a contact company assigned to a customer has been specified for the event, Maconomy suggests the customer assigned to the contact company or job in question.</p>

Field	Description
<b>Name</b>	This field shows the name of the employee specified in the field "Employee No." above.

**Event Plan Island**

Field	Description
<b>Event Plan No.</b>	If the event was created from an event plan, the number of the event plan in question is shown in this field.
<b>Event Template No.</b>	If the event was created from an event plan, this field shows the number of the event template in this plan from which the event was created. The event template number determines whether the current event should cause secondary events when the action "Create Secondary Events" is selected, as the event plan specified above may contain templates where part of the conditions determining whether secondary events should be created for a given event is the template upon which the event was based. For a further description of event plans, event templates and conditions for the creation of secondary events, please see the fields "Condition No." and "Condition Result" in the window Event Plans, as well as the action "Create Secondary Events" in this window.

**Contact Island**

Field	Description
<b>Contact Company</b>	<p>In this field, you can specify the name and number of the contact company which the event concerns.</p> <p>If a customer number has been specified when creating the event, Maconomy will suggest the contact company number related to the customer in question.</p> <p>If you leave the field unchanged and enter a contact person assigned to a contact company, the number of the contact company in question is automatically inserted in this field.</p>
<b>Contact Person</b>	<p>In this field, you can enter the name and number of the contact person to whom the event should be directed. If you specify both a contact company and a contact person at the same time before pressing Return, the contact person specified must be assigned to the contact company in question. If you specify a contact person without changing the contact company number, Maconomy automatically completes the field "Contact Company No." with the number of the contact company (if any) to which the contact person in question is assigned.</p>
<b>Contact Mode</b>	<p>In this field, you can specify the way in which the event should be carried out, for example, contact by phone, letter, meeting, and so on. Contact modes are created in the window PopUp Fields in the Set-Up module.</p>

## Campaign Island

Field	Description
<b>Campaign</b>	<p>This field shows the name of the campaign to which the event is assigned, if applicable. The field is automatically completed by Maconomy on events assigned to an event flow that is part of a campaign.</p> <p>Please note that you cannot specify an event plan for a manually created event. This means that even if the event has been manually assigned to a campaign, no secondary events can be created for the event.</p>

## Item Island

Field	Description
<b>Item No.</b>	In this field, you can enter an item number if the event is related to a specific item. The field is for information only.
<b>Description</b>	This field shows the description of the item specified in the field "Item No." above. The description is retrieved from the item's first description line in the card part of the window Item Information Card.

## Dimensions Island

Field	Description
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, the standard value is transferred from the window System Parameters in the Set-Up module.</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

**Extra Fields Island**

Field	Description
<b>Text 1-5</b>	In these fields, you can enter various additional information about the event. The fields are for information only, and can, for example, be used for statistical purposes.

## Note Lines Sub-Tab

This section includes the fields and descriptions for the Note Lines sub-tab.

Field	Description
<b>Heading</b>	<p>In this field, you can enter a heading for the text on the current line. A heading can only be specified if a note type has been specified for the event type of the current event, and the heading must be one of the options in the note type in question. You can see the available options by using the associated Find window.</p> <p>A heading can only appear once in the table part. Assigned to the heading is a section of text fields in the column "Value" from the row containing the heading to the row containing the next heading. The format of the heading determines what type of information may be entered in the field "Value" on the lines within this section. The format of each heading is specified in the window Note Types in the Set-Up module, and can, for example, indicate that the "Value" fields under the heading in question can only contain figures or amounts. For further information on the use of heading formats, see the description of the window Notes.</p>
<b>Value</b>	<p>In this field, you can enter a description of the event if a note has been assigned to the event. A note is assigned to an event in the field "Note No." in the card part of the window. When you press Return, Maconomy automatically wraps the text, so that text exceeding the standard width of the field is automatically moved down to the necessary number of lines.</p> <p>The text can be divided into paragraphs by inserting one or several blank lines between the paragraphs. Please note that the Enter key cannot be used for dividing the text into paragraphs, as this key is used for executing the changes made on a line, just like in any other Maconomy window.</p> <p>If a heading is specified on the current line or a line above it, the value in this field must comply with the format specified for the heading on the current line or, if no heading is specified on the current line, the nearest above line where a heading has been specified. Similarly, if an option list has been specified for the heading in question in the note type, you can only select an option within the option list in question. For further information on the use of heading formats, see the fields "Format" and "Option List" in the window Note Types in the Set-Up module.</p>
<b>Format</b>	This field shows the format specified for the current heading on the note type. For notes without a note type the format will always be 'Text value'. For further information on the use of heading formats, see the fields "Format" and "Option List" in the window Note Types in the Set-Up module.

## Actions

This section shows the Actions available in the Events workspace.

### Top Tab

Field	Description
<b>Create Note</b>	When you select this action, Maconomy creates a note in the window Notes, and assigns it to the current event. The note created is assigned the same note type as the event type of the current event. You cannot enter information in the table part until a note has been assigned to the event.
<b>Wrap Lines</b>	When you select this action, Maconomy wraps the text entered in the table part as described in the field "Value." When you enter information in the window Events, Maconomy automatically wraps the text entered, but lines created using the import program Import Events are not wrapped unless you use this action. This also applies to event lines created in version 4.2 or earlier, as lines were not wrapped automatically in those versions. It is therefore possible to wrap these types of text lines by means of this action.
<b>Start Timer</b>	<p>When you select this action, Maconomy starts timing the time consumption in connection with the current event. The field "Timer Start" shows the time on which the timer was activated, and the timer stays activated until the action "Stop Timer" is selected. The timer can be activated and deactivated any number of times for each event.</p> <p>As long as the timer is activated, the field "Elapsed Time" shows the time elapsed since the timing was started. When the timer is stopped, the elapsed time is added to the value in the field "Accumulated Time" which shows the total amount of time in which the timer has been activated for the current event.</p>
<b>Stop Timer</b>	When this action is selected, Maconomy stops timing the time consumption in connection with the current event. Maconomy blanks the field "Timer Start" and adds the elapsed time in the field "Elapsed Time" to the value in the field "Accumulated Time" which shows the total amount of time in which the timer has been activated for the current event.
<b>Transfer to Time Sheet</b>	<p>When you select this action, Maconomy transfers the time consumed on the event to a time sheet belonging to the employee specified on the event. Time can only be transferred if the window Time Sheets contains a time sheet belonging to the employee and covering the closing date of the event if the event has been closed, or today's date if the event is still open.</p> <p>Maconomy transfers the value in the field "Accumulated Time" to a new time sheet line with a job number, activity number, dimension values and task corresponding to the information specified in the event. The time consumption is registered on the closing date if the event has been closed and on today's date if the event is still open.</p> <p>Please note that since time is only transferred to one day on the time sheet, the maximum number of hours that can be transferred is 24. If the field "Accumulated Time" contains a greater number of hours, Maconomy will therefore show an error message when you use this action.</p>

Field	Description
<b>Create Secondary Events</b>	<p>When you select this action, Maconomy creates secondary events for the current event if it gives rise to the creation of secondary events according to the event plan of the event flow to which the event is assigned. However, if the event is assigned to an event flow where the field "Include Only Closed Events" is marked, and the current event is still open, selecting this action will not result in any secondary events.</p> <p>In the description of this action, the term "basis event" is used about the event currently shown in the window.</p> <p>When the action is selected, Maconomy checks the current basis event to see if the event plan of the event flow to which the basis event is assigned contains one or several event templates where:</p> <ul style="list-style-type: none"> <li>▪ The condition number matches the event template number on which the basis event was based, and</li> <li>▪ The condition result matches the result specified in the field "Result" on the basis event in question.</li> <li>▪ No events have been created in the event flow in question based on the event template in question.</li> </ul> <p>For a further description of the concepts of condition results and condition numbers, please see the description of the fields "Condition Result" and "Condition No." in the table part of the window Event Plans.</p> <p>In those cases where the above conditions are met, a secondary event is created. Maconomy copies the contact person and/or contact company from the basis event to each secondary event, while contact mode, event type, employee number, starting date and other information is copied from the event template which, in combination with the basis event, gave rise to the secondary event.</p> <p>For an example illustrating how Maconomy finds out whether the event should cause secondary events, please see the description of the action "Create Secondary Events" in the window Campaigns.</p> <p>Please note that since several event templates may have a condition result and condition number that match the same event, the result of one event may cause the creation of several secondary events.</p> <p>For a further description of the concept of secondary events, please see the section "Introduction to the Contact Management Module" and the description of the window Event Plans.</p>
<b>Attach Document</b>	<p>This action allows you to attach a document to the event.</p>

**Bottom Tab**

Field	Description
<b>Import Text</b>	When you select this action, you can import a text file to the table part of the window. Maconomy will show a dialog prompting you for the location of the file. The text in the file will be wrapped automatically, meaning that text exceeding the width of the text field in the table part will be wrapped and placed on separate lines. A line shift in the file will result in a blank line in the table.
<b>Export Text</b>	When you select this action, Maconomy exports the text in the table part to a text file in which the wrapped text is reformatted so that consecutive table lines are concatenated into one text string, and blank table lines are converted to line shifts. Maconomy will show a dialog prompting you for a target the location for the file.

## Event Contact Persons Single Dialog Workspace

Use this workspace to associate contact persons with an event.

You can associate all contact persons with an event, regardless of whether or not they are associated with the same contact company as the event. When you enter a contact person for an event, Maconomy creates an entry in the list of associated contact persons and marks it as primary. You can only change the primary contact from the event, and not directly in the list.

If a contact person in the list is an internal contact (that is, the contact person is linked to an employee) Maconomy marks the entry as internal.

If a contact person exists for the employee for the event, Maconomy creates an entry in the list of contact persons and marks it as owner and internal. You can edit the owner only from within the event, and not from the list of associated contact persons. Likewise, you cannot delete the owner or primary contact for the event directly from the list. If you remove owners or primary contacts from an event, Maconomy automatically removes them from the list.

### Event Tab

This section includes the fields and descriptions for the Event tab.

**Event Island**

Field	Description
<b>Event</b>	This field contains the event description and number.
<b>Event Start</b>	This field contains the start date and time for the event.
<b>Event Closed</b>	This field contains the end date and time for the event.
<b>Closed</b>	This field indicates that the event is closed.

**Employee Information Island**

Field	Description
<b>Employee No.</b>	This field contains the employee number of the owner of the event.
<b>Name</b>	This field contains the name of the employee.

**Contact Island**

Field	Description
<b>Contact Comp. No.</b>	This field contains the number of the contact company involved with the event.
<b>Name</b>	This field contains the name of the contact company involved with the event.
<b>Contact Person No.</b>	This field contains the number of the primary contact person.
<b>Name</b>	This field contains the name of primary contact person.
<b>Contact Mode</b>	In this field, you can select a contact mode.

## Contact Persons Sub-Tab

This section includes the fields and descriptions for the Contact Persons sub-tab.

Field	Description
<b>Contact Person Type</b>	<p>This field shows whether it is an employee or a contact. Values are Employee and Contact.</p> <p>A contact person is considered an employee if he/she is linked to an employee and the termination date on the employee is blank or after the starting date of the event. The type field is not updated if the contact person is changed.</p>
<b>Contact Person No.</b>	In this field, you can enter the number of the contact person. A given contact person can only be associated once with an event.
<b>Name</b>	This field shows the name of the contact person.
<b>Position</b>	This field shows the title of the contact person's job at the company.
<b>Phone</b>	This field shows the contact person's phone number.

Field	Description
<b>Mobile</b>	This field shows the contact person's mobile number.
<b>Email</b>	This field shows the contact person's email address.
<b>Primary</b>	This field shows whether the contact is the primary contact.
<b>Owner</b>	This field shows whether an employee is the owner of the event.

## Opportunities Single Dialog Workspace

Use this workspace to enter information about sales opportunities.

A sales opportunity is a potential sale to a customer or a prospective customer with whom you are in contact.

An opportunity can represent a specific sales case or a potential account size—for example, if you expect that signing a given customer will generate a certain revenue over a certain period.

For each opportunity, enter information about the starting date of the sales activity and the expected closing date of the sale. Also enter the expected value of the opportunity and a probability percentage that represents the estimated chance of closing the sale successfully. Based on these figures, Maconomy calculates a weighted value for the opportunity. As a result, entering opportunities provides you with a tool for calculating estimated pipeline sizes and for running reports that show success rates and estimated sales within a given period.

You can also enter information about the events that occur in connection with sales activities. For instance, you might want to track each contact that you make with the prospective customer so that you accumulate historical information about their requests and inquiries. Or you might want to enter information about the internal activities that occur in connection with the sales opportunity.

You manage historical information about the sales process through the event flow functionality. Each time that you create an opportunity, Maconomy automatically creates an event flow in the Event Flows workspace. Use the event functionality to enter historical information about the opportunity. The opportunity's current event flow status is displayed in the **Phase** field, allowing you to see the progress of the opportunity.

You can assign each opportunity to a given job in the Job Cost module, so that employees can enter and track the time that they spend working on the opportunity. Use the fields in the Job Cost island in the Opportunities tab of this workspace to enter a job, activity, and task for each event in the opportunity's event flow. This enables you to automatically transfer time spent on the opportunity to employee time sheets.

You must assign each opportunity to a contact company that you create in the Contact Companies workspace. You can assign opportunities to existing customers or prospective customers.

When you finally settle an opportunity, you close it. Depending on the outcome of the opportunity, use the **Close as Won** or **Close as Lost** action. When you use one of those actions:

- The **Status** field indicates the outcome that you selected.

- The probability percentage is set to 100 (for a win) or 0 (for a loss).
- The event flow that you assigned to the opportunity is closed. You can no longer change the information for the opportunity. However, you can use the **Reopen** action to reopen the opportunity, which sets its status field to **Open**.

## Opportunities Tab

This section includes the fields and descriptions for the Opportunities tab.

### Opportunity Island

Field	Description
<b>Opportunity</b>	In this field, you can write a description and specify an identification number when creating an opportunity. Both letters and numbers can be used in the identification number. If you do not specify a value, the agreement is assigned the next available number from the number series "Opportunity Series" in the window Number Series in the Set-Up module. Once the opportunity has been created, the number can no longer be changed.
<b>Opportunity Type</b>	In this field, you can specify an opportunity type created in the window Opportunity Types when creating an opportunity. The opportunity type contains various template data which is suggested on the new opportunity, including an event flow type for the event automatically created for the opportunity. For further information on this, see the description of the field "Event Flow Type."
<b>Status</b>	This field shows the status of the current opportunity. The status can either be "Open," "Won" or "Lost." As long as the status is "Open," the opportunity can be changed, and you can adjust the probability percentage and other information in accordance with the latest development in the opportunity case. When the opportunity is finally settled, for instance if the sales case was a success or the opportunity did not result in a sale, you can close the opportunity by selecting the action "Close as Won" or "Close as Lost," depending on the outcome of the opportunity. When you do so, this field is set to the relevant value, the probability percentage is set to 100 or 0, and the event flow assigned to the opportunity is closed. The opportunity is then considered closed, meaning that it is no longer possible to change the information on the opportunity. However, using the action "Reopen," you can reopen the opportunity, causing the value of this field to be set to "Open."
<b>Phase</b>	<p>This field shows the current phase of the opportunity. The phase indicates how far the sales process has progressed, for instance that you are now in the initial phase, proofing phase or contract negotiations. The value is retrieved from the field "Current Flow Status" in the card part of the event flow assigned to the current opportunity.</p> <p>The phase is changed by specifying the new phase in the field "New Event Flow Status" on a status changing event in the event flow assigned to the current opportunity, and closing this event. This causes the event flow status and thereby this field to be updated accordingly. For further information on</p>

Field	Description
	status changing events and updating the event flow status, see the description of the fields “Current Flow Status” and “New Event Flow Status,” and the introduction to the window Event Flow.
<b>Probability %</b>	<p>In this field, you can specify the probability percentage indicating the chance that the opportunity will result in a sale. Maconomy uses this value for calculating the weighted value of the opportunity in various currencies by multiplying the probability percentage by the estimated opportunity value specified in the fields “Sales Estimate, Currency,” “Sales Estimate, Base” and “Sales Estimate, Enterprise.”</p> <p>You can change the value as desired until the opportunity is closed by selecting one of the actions “Close as Won” and “Close as Lost,” at which point the value is set to either 100 or 0, depending on the action selected. For further information, see the description of the field “Status” below.</p>
<b>Currency</b>	In this field, you can specify the currency in which the estimated opportunity value in the field “Sales Estimate, Currency” is expressed.
<b>Sales Estimate, Currency</b>	<p>In this field, you can specify the estimated value of the current opportunity, expressed in the currency specified in the field “Currency” above. Maconomy uses this value for calculating the weighted value of the opportunity by multiplying the probability percentage specified in the field “Probability %” by the sales estimate.</p> <p>If a budget has been created, you cannot enter a value here manually. Instead, Maconomy automatically keeps the field updated with a value corresponding to the total billing price budgeted for the opportunity.</p>
<b>Weighted Sales Estimate, Currency</b>	<p>This field shows the weighted value of the current opportunity in the currency specified in the field “Currency” above. The figure is calculated by multiplying the probability percentage specified in the field “Probability %” by the estimated opportunity value specified in the field “Sales Estimate, Currency.”</p> <p>Maconomy rounds off the calculated value according to the rounding principles set up for the currency in question in the window Currency Rounding. Please note that this may influence pipeline figures in your reports.</p>
<b>Sales Estimate, Base</b>	The functionality of this field is similar to that of the field “Sales Estimate, Currency” above.
<b>Weighted Sales Estimate, Base</b>	<p>This field shows the value of the field “Weighted Sales Estimate, Currency,” converted into the base currency of the company to which the current opportunity is assigned.</p> <p>Maconomy rounds off the calculated value according to the rounding principles set up for the currency in question in the window Currency Rounding. Please note that this may influence pipeline figures in your reports.</p>
<b>Sales Estimate, Enterprise</b>	The functionality of this field is similar to that of the field “Sales Estimate, Currency” above.

Field	Description
<b>Weighted Sales Estimate, Enterprise</b>	This field shows the value of the field "Weighted Sales Estimate, Currency," converted into the enterprise currency of the Maconomy system. Maconomy rounds off the calculated value according to the rounding principles set up for the currency in question in the window Currency Rounding. Please note that this may influence pipeline figures in your reports.
<b>Start Date</b>	In this field, you can specify the starting date of the current opportunity, for example, the date when the first contact with the prospective customer was made. Maconomy suggests today's date.
<b>Expected Closing Date</b>	In this field, you can specify the date on which you expect to close the current opportunity, for instance the date on which a contract is expected to be signed or the date by which the prospective customer is expected to choose a supplier.
<b>Closing Date</b>	In this field, you can specify the actual closing date of the current opportunity.
<b>Include in Forecast</b>	In this field, you can select whether figures on opportunity budgets on the opportunity are to be included in the report Periodic Sum Job Budget. The default is that the field is marked

### Persons Island

Field	Description
<b>Sales Person</b>	In this field, you can specify the name and number of the employee acting as sales representative in connection with the current opportunity. Maconomy suggests the sales representative responsible for the contact company in question.
<b>Contact Person 1-3</b>	In each of these fields, you can specify the name and number of a contact person relating to the current opportunity. The fields are for information only.

### Job Cost Island

Field	Description
<b>Job</b>	In this field, you can specify the job on which the time spent on the current opportunity should be posted. The job number is transferred to the event flow assigned to the opportunity, and changing the job number on the opportunity causes the event flow to be updated accordingly. However, changing the job number on the event flow does not cause the opportunity to be updated.  You can use this field if you want time spent on the opportunity to automatically be transferred to time sheets using the action "Transfer to Time Sheet" in the window Event Flow. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question. In the time sheet, the time is registered on a line with the combination of job number, activity and task specified on the event in question. As

Field	Description
	<p>the job number in this field is transferred to the event flow assigned to the opportunity and the job number on the event flow is suggested on events in the flow in question, the value in this field functions as a template value for events in the event flow. For further information, see the description of the action "Transfer to Time Sheet."</p> <p>It is only possible to specify a job belonging to the same company as the current opportunity.</p>
<b>Activity No.</b>	<p>In this field, you can specify the activity on which the time spent on the current opportunity should be posted. The activity number is transferred to the event flow assigned to the opportunity, and changing the activity number on the opportunity causes the event flow to be updated accordingly. However, changing the activity number on the event flow does not cause the opportunity to be updated.</p> <p>You can use this field if you want time spent on the opportunity to automatically be transferred to time sheets using the action "Transfer to Time Sheet" in the window Event Flow. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question. In the time sheet, the time is registered on a line with the combination of job number, activity and task specified on the event in question. As the activity number in this field is transferred to the event flow assigned to the opportunity and the activity number on the event flow is suggested on events in the flow in question, the value in this field functions as a template value for events in the event flow. For further information, see the description of the action "Transfer to Time Sheet."</p>
<b>Task</b>	<p>In this field, you can specify the task on which the time spent on the current opportunity should be posted. The task is transferred to the event flow assigned to the opportunity, and changing the task on the opportunity causes the event flow to be updated accordingly. However, changing the task on the event flow does not cause the opportunity to be updated.</p> <p>You can use this field if you want time spent on the opportunity to automatically be transferred to time sheets using the action "Transfer to Time Sheet" in the window Event Flow. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question. In the time sheet, the time is registered on a line with the combination of job number, activity and task specified on the event in question. As the task in this field is transferred to the event flow assigned to the opportunity and the activity number on the event flow is suggested on events in the flow in question, the value in this field functions as a template value for events in the event flow. For further information, see the description of the action "Transfer to Time Sheet."</p>

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

**Dimensions Island**

Field	Description
<b>Location</b>	<p>In this field, you can specify the location to which the current opportunity pertains.</p> <p>The location is transferred to the event flow assigned to the opportunity, and changing the location on the opportunity causes the event flow to be updated accordingly. However, changing the location on the event flow does not cause the opportunity to be updated.</p> <p>You can use this field if you want time spent on the opportunity to automatically be transferred to time sheets using the action "Transfer to Time Sheet" in the window Event Flow. When this action is selected, the accumulated time on each event in the selected event flow is transferred to a time sheet for the employee specified on the event in question. In the time sheet, the time is registered on a line with the allocation combination, of job number, activity and task specified on the event in question. As the location in this field is transferred to the event flow assigned to the opportunity and the location on the event flow is suggested on events in the flow in question, the value in this field functions as a template value for events in the event flow. For further information, see the description of the action "Transfer to Time Sheet".</p>
<b>Entity</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to the functionality of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.

**Remarks Island**

In these fields, you can enter additional remarks about the current opportunity.

**Extra Fields Island**

Field	Description
<b>Text 1-10</b>	In these ten text fields, you can enter various information about the opportunity.
<b>Date 1-5</b>	In these five fields, you can enter dates connected to the opportunity.
<b>Real 1-5</b>	In these five fields, you can enter numbers connected to the opportunity.

Field	Description
<b>Amount 1-5</b>	In these five fields, you can enter amounts connected to the opportunity
<b>Boolean 1-5</b>	In these five Boolean fields, you can assign attributes to the opportunity.
<b>Popup 1-10</b>	In these ten fields, you can select various information about the opportunity. These are pop-up fields, which means you can choose from the options created for each field. They are created as Opportunity Popup 1 - Opportunity Popup 10 in the window Popup Fields.

### Contact Company Island

Field	Description
<b>Contact Comp. No.</b>	<p>In this field, you must specify the number of the contact company which the current opportunity concerns. Once the opportunity has been created, the number can no longer be changed.</p> <p>When creating an opportunity, Maconomy automatically creates an event flow and assigns it to the contact company specified in this field, allowing you to register information about the events taking place in connection with the current opportunity. For further information on this, see the introduction to the window.</p> <p>When you press Return upon creating an opportunity, Maconomy retrieves various information from the window Contact Companies, and suggests the values in the corresponding fields in this island. However, you can change the suggested values.</p>
<b>Attn.</b>	In this field, you can enter the name of an attention person pertaining to the current contact company. Maconomy suggests the attention person specified for the current contact company in the window Contact Companies, but you can specify another attention person.
<b>Country</b>	In this field, you can specify the country in which the current contact company resides. Maconomy suggests the country specified for the current contact company in the window Contact Companies, but you can specify another country.
<b>Phone</b>	In this field, you enter the telephone number of the current contact company. Maconomy suggests the phone number specified for the current contact company in the window Contact Companies, but you can specify another phone number.
<b>Fax</b>	In this field, you enter the customer's fax number. Maconomy suggests the fax number specified for the current contact company in the window Contact Companies, but you can specify another fax number.
<b>Telex</b>	In this field, you enter the telex number of the current contact company. Maconomy suggests the telex number specified for the current contact company in the window Contact Companies, but you can specify another telex number.
<b>E-mail</b>	Here you can enter the customer's electronic mail address.

Field	Description
	Maconomy suggests the e-mail address specified for the current contact company in the window Contact Companies, but you can specify another e-mail address.

### Status Update Island

Field	Description
<b>Won, Phase</b>	<p>If the current opportunity can be considered won when entering a given phase (see the field "Phase"), you can specify the phase in question in this field. When the opportunity enters the specified phase as a result of the event flow status of the event flow assigned to the opportunity being changed to the value in this field, Maconomy will automatically close the opportunity as won by running the action "Close as Won." This, in turn, causes the event flow assigned to the opportunity to be closed.</p> <p>Using this functionality, you can cause the opportunity to be closed automatically when the event flow reaches a point indicating a closed sale.</p> <p>Please note that manually closing the opportunity as won will not cause the event flow status to be changed to the value in this field.</p>
<b>Lost, Phase</b>	<p>If the current opportunity can be considered lost when entering a given phase (see the field "Phase"), you can specify the phase in question in this field. When the opportunity enters the specified phase as a result of the event flow status of the event flow assigned to the opportunity being changed to the value in this field, Maconomy will automatically close the opportunity as lost by running the action "Close as Lost." This, in turn, causes the event flow assigned to the opportunity to be closed.</p> <p>Using this functionality, you can cause the opportunity to be closed automatically when the event flow reaches a point indicating a lost sale.</p>

### Campaign Island

Field	Description
<b>Campaign</b>	<p>In this field, you can specify the name and number of a campaign when creating an opportunity, thus assigning the opportunity to the campaign in question.</p> <p>When creating an opportunity, Maconomy suggests the values from the corresponding field on the opportunity type selected in the field "Opportunity Type." Campaigns are created in the window Campaigns.</p>

### Company Island

Field	Description
<b>Company</b>	<p>When creating an opportunity, you can specify in this field the name and number of the company responsible for the new opportunity. If you do not enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivations in the G/L module. If no value can be derived,</p>

Field	Description
	<p>the standard value is transferred from the window System Information in the Set-Up module.</p> <p>See the section “Multiple Companies” in the chapter “Introduction to the G/L Module” and the window Dimension Derivations in the G/L module for a further description of the concept of dimension derivation.</p>
<b>Base Currency</b>	This field shows the base currency of the company specified in the field “Company No.” on the line.

### Event Flow Island

Field	Description
<b>Event Flow Type</b>	<p>When creating an opportunity, you can specify in this field the event flow type to be used on the event flow automatically created for the opportunity. The event flow type points out the event flow status type which contains the options available for specifying the individual phases in the opportunity. For further information, see the description of the field “Phase.”</p> <p>The event flow type also points out any event plan to be used for managing a fixed sales procedure. For further information on the use of event plans, see the description of the field “Event Plan No.” in the window Event Flow Types.</p> <p>If you do not specify an event flow type, the opportunity is automatically assigned to the event flow type specified on the opportunity type selected in the field “Opportunity Type.”</p>
<b>Event Flow No.</b>	This field shows the number of the event flow assigned to the current opportunity.

### Access Level Island

Field	Description
<b>Access Level</b>	<p>In this field, you can enter the name of an access level created in the window Access Levels. Users only have access to information about the current opportunity if they have been assigned to this or a higher access level in the window User Access Levels in the Set-Up module. Please note that this access control model only applies if the standard access control configuration has not been changed in your Maconomy system. If it has, the access to opportunities may depend on other factors. For further information about the standard access control configuration and access control in a multi-company model, please see the section “Introduction to the Access Control System” in the Set-Up module.</p> <p>If you do not specify an access level, this field has no influence on whether the user has access to information about the current opportunity.</p>

**Option List Fields Island**

Field	Description
<b>List</b>	<p>In these fields, you can specify the option lists containing the values you wish to use for further specification of the opportunity. In the fields “Value 1-5” in this island, you can then select values from these lists. If you leave a given option list field in this island blank, any text can be entered in the corresponding value field.</p> <p>When creating an opportunity, Maconomy suggests the values from the corresponding fields on the opportunity type selected in the field “Opportunity Type.”</p>
<b>Value</b>	<p>In these fields, you can specify a number of values for further specification of the current opportunity. You can only specify values available in the respective option lists specified in this island. If a given option list field has been left blank, any text can be entered in the corresponding value field.</p> <p>When creating an opportunity, Maconomy suggests the values from the corresponding fields on the opportunity type selected in the field “Opportunity Type.”</p>

**Contact Persons Sub-Tab**

This section includes the fields and descriptions for the Contact Persons sub-tab.

Field	Description
<b>Contact Person No.</b>	Enter the contact person’s number in this field.
<b>Name</b>	This field shows the contact person’s name.
<b>Position</b>	This field shows the contact person’s position.
<b>Phone</b>	This field shows the contact person’s phone number.
<b>Mobile</b>	This field shows the contact person’s mobile number.
<b>Email</b>	This field shows the contact person’s email address.
<b>Role</b>	Enter the contact person’s role for the opportunity.
<b>Primary</b>	This field shows whether the contact person has been entered on the opportunity card.

## Actions

This section shows the Actions available in the Opportunities workspace.

### Top Tab

Field	Description
<b>Close as Won</b>	Select this action if the opportunity was won, resulting in a sale. When you select this action, the probability percentage is set to 100, the field "Status" is set to "Won," the closing date is set to today's date and the event flow assigned to the opportunity is closed. Furthermore, the opportunity is closed, meaning that you can no longer change any information on the opportunity. Therefore, to ensure that the value of the opportunity is reflected correctly, you should enter the final value of the opportunity in the field "Sales Estimate, Currency" before selecting this action. You can reopen the opportunity by selecting the action "Reopen."
<b>Close as Lost</b>	Select this action if the opportunity was lost. When you select this action, the probability percentage is set to 0, the field "Status" is set to "Lost," the closing date is set to today's date, and the event flow assigned to the opportunity is closed. Furthermore, the opportunity is closed, meaning that you can no longer change any information on the opportunity. You can reopen the opportunity by selecting the action "Reopen."
<b>Reopen</b>	This action is only available if the opportunity has been closed by selecting one of the actions "Close as Won" and "Close as Lost." Furthermore, the action is only available if no budget has been created for the opportunity in the window Opportunity Budgets, and if the opportunity has not been converted into a job. When you select this action, the opportunity is reopened, causing the field "Status" to be set to "Open" and the assigned event flow to be reopened so that it once again becomes possible to change the information on the opportunity.
<b>Send Opportunity to People Planner</b>	If this field is marked, the employee category will be included in the scheduled import to People Planner. Setting this field will only have an effect if the field is included in the relevant queries in the .I files on the web server.

## Opportunity Employees Single Dialog Workspace

Use this workspace to associate employees with an opportunity.

The employee who is entered as the sales representative on the opportunity card is automatically included in the list. You can only change or delete the sales representative via the Opportunity workspace, and not via the list.

## Opportunity Tab

This section includes the fields and descriptions for the Opportunity tab.

### Opportunity Island

Field	Description
<b>Opportunity</b>	This field shows the opportunity description and number.
<b>Contact Company</b>	This field shows the contact company name and number for the opportunity.

## Employees Sub-Tab

This section includes the fields and descriptions for the Employees sub-tab.

Field	Description
<b>Employee No.</b>	This field shows the number of the employee associated with the opportunity.
<b>Name</b>	This field shows the name of the employee associated with the opportunity.
<b>Position</b>	This field shows the employee's position.
<b>Phone</b>	This field shows the employee's phone number.
<b>Mobile</b>	This field shows the employee's mobile number.
<b>Email</b>	This field shows the employee's email address.
<b>Role</b>	Use this field to enter the employee's role with regard to the opportunity.
<b>Sales Rep.</b>	This field shows whether the employee is the sales rep for the opportunity. When the sales rep. on an opportunity is updated in the Opportunities window, the corresponding opportunity employee gets updated in this field as well. You can delete the sales rep using the card part of the Opportunities window.
<b>Company No.</b>	This field shows the employee's company number.
<b>Company Name</b>	This field shows the name of the employee's company.
<b>Account</b>	This field shows the employee's account number.

Field	Description
<b>Location</b>	This field shows the location of the employee.
<b>Entity</b>	This field shows the name of the entity associated with employee.
<b>Project</b>	This field shows the employee's project.
<b>Purpose</b>	This field shows the purpose associated with the employee.
<b>Spec. 1–3</b>	This field shows the specifications associated with the employee.
<b>Local Spec. 1–3</b>	This field shows the local specifications associated with the employee.

## Opportunity Partners Single Dialog Workspace

Use this workspace to assign contact companies to an opportunity as partners.

### Opportunity Tab

This section includes the fields and descriptions for the Opportunity tab.

#### Opportunity Island

Field	Description
<b>Opportunity</b>	This field shows the opportunity description and number.
<b>Contact Company</b>	This field shows the contact company name and number.

### Partners Sub-Tab

This section includes the fields and descriptions for the Partners sub-tab.

Field	Description
<b>Contact Company No.</b>	Enter the contact company number for the contact company that you want to associate as partner.
<b>Name</b>	This field shows the partner contact company's name.
<b>Address 1-2</b>	These fields show the first and second lines of the partner's address.

Field	Description
<b>Postal Code</b>	This field shows the postal code of the partner's address.
<b>City</b>	This field shows the city of the partner's address.
<b>Address 3-4</b>	These fields show the third and fourth lines of the partner's address.
<b>Attn.</b>	This field shows the partner's attention person.
<b>Country</b>	This field shows the country of the partner's address.
<b>Phone</b>	This field shows the partner's telephone number.
<b>E-mail</b>	This field shows the partner's e-mail address.
<b>Department</b>	This field shows the department to which the partner pertains.
<b>Sales Rep. No.</b>	This field shows the sales representative number for the partner sales representative.
<b>Sales Rep.</b>	This field shows the name of the partner sales representative.
<b>Role</b>	Enter the partner's role for the opportunity. You can edit this field.

## Opportunity Budgets Single Dialog Workspace

Use this workspace to create detailed budgets for opportunities.

Using opportunity budgets, you can create detailed budgets, similar to job budgets, that cover all of the activities and tasks that are involved in the prospective job.

To ensure realistic pricing of your opportunities, you can leverage experience from previous jobs. Copy a template budget or the budget of a similar job so that you have a complete list of tasks to consider. Because Maconomy also copies hours, quantities, and prices, you have a very sound and detailed basis for calculating an accurate estimate.

If the opportunity results in a win, and you create a job, you can transfer the opportunity budget to the new job, as the basis for baseline budgets. You avoid double data entry and ensure that Maconomy uses the deliverables and prices that you set in the quoting phase throughout the project life cycle.

## Opportunity Budgets Tab

This section includes the fields and descriptions for the Opportunity Budgets tab.

### Opportunity Island

Field	Description
<b>Opportunity</b>	This field shows the description and number of the current opportunity.
<b>Status</b>	This field shows the status of the current opportunity. The value is taken from the corresponding field in the window Opportunities.
<b>Phase</b>	This field shows the current phase of the current opportunity. The value is taken from the corresponding field in the window Opportunities.
<b>Probability %</b>	In this field, you can specify the success probability percentage of the current opportunity. For further information about the probability percentage, see the description of the corresponding field in the window Opportunities.
<b>Currency</b>	In this field, you can select the currency in which the figures in the opportunity budget are to be displayed and entered. If you change the currency after entering budget figures, the figures will be converted automatically. Please note that amounts are rounded when converted into a new currency. This means that changing the currency and subsequently returning to the original currency may cause the amounts to differ slightly from the original ones.
<b>Budget Created</b>	This field shows whether a budget has been created for the current opportunity. It is only possible to enter information in the table part if a budget has been created. Budgets are created using the action "Create Budget."
<b>Sent to People Planner</b>	If the People Planner integration add-on is enabled and the "Integration Status Note Type" system parameter is set, this field will show when the opportunity was last sent to People Planner.

### Template Job Island

Field	Description
<b>Job</b>	In this field, you can select a template job. When you select a template job, you can preview the budget of the job in question to determine whether the budget of the template job matches the opportunity in question. Once you have selected a template job and pressed Return, you can view the different budgets of the template job using the field "Show Budget" in the island Budget Type. Maconomy suggests the budget type marked as the standard opportunity budget type (see "Job Budget Types" in the Set-up module). If no budget type is marked as standard opportunity budget type, the baseline budget of the template job is suggested.

Field	Description
	When you select the action “Create Budget,” the budgets of all budget types for the template job are copied to the new opportunity budget. However, until the action is selected, the window shows budgets as a preview only.

### Contact Company Island

Field	Description
<b>Contact Comp. No.</b>	This field shows the number of the contact company to which the current opportunity pertains.
<b>Name</b>	This field shows the name of the contact company to which the current opportunity pertains. You can change the name here, causing it to be updated accordingly in the window Opportunities.
<b>Customer No.</b>	This field shows the number of the customer assigned to the contact company of the current opportunity.

### Budgeting Island

Field	Description
<b>Hours Per Man Day</b>	In this field, you can specify how many hours are in a man day. In the table part, quantities for time activities can be specified either as a number of hours or a number of days. There are separate fields for specifying hours and days. When you specify a number of days, the corresponding number of hours is automatically calculated by multiplying the number of days by the value in this field. Similarly, when you specify a number of hours, the corresponding number of days is calculated by dividing the number of hours by the value in this field. The field is also used for calculating prices per day from hour based prices.

### Limit Island

The functionality of the fields in this island corresponds to that of the fields in the island Limit in the window Job Budgets.

### Budget, Base Island

The functionality of the fields in this island corresponds to that of the fields in the island Budget, Base in the window Job Budgets.

Field	Description
<b>Hours</b>	This field shows the amount of employee hours you estimate will be spent on the job. The “Time” field shows the total of the budgeted hours, which have been entered for time activities in the “Quantity” field in the table part. Since the budget figure for amount activities cannot be estimated in hours, there is no figure in the “Amount” and “Total” fields. The “Total per” field shows the unit given in the Unit Analysis island.

Field	Description
	<p>The field "Limit" displays the total number of employee hours you expect to use on the job. You can have a value displayed in this field by entering the value in the field "Hours" in the island Limit. See the description of this island for further information.</p> <p>Only users for whom the field "Can Change Job Budget" in the window Actions in the Set-Up module is marked may change this field.</p>
<b>Cost</b>	<p>In these fields the budgeted cost of the job in the base currency of the job's responsible company.</p> <p>The "Time," "Amount" and "Total" fields show three totals of costs from the budget lines entered in the table part of the window. They are the cost totals of time activities, amount activities and a total for all budget lines.</p> <p>If the user does not have access to see cost for time, as specified in the window Actions in the Set-Up module, the cost shown next to "Time" and "Total" will be zero.</p> <p>The "Total per" field shows the quantity in the "Total" field immediately above it, divided by the quantity given in the Unit Analysis island.</p> <p>The field "Limit" displays the estimated or agreed billing price of the job. You can have a value displayed in this field by entering the value in the field "Hours" in the island Limit. See the description of this island for further information.</p>
<b>Billing Price</b>	<p>These fields show the budgeted cost of the job in the base currency of the job's responsible company.</p> <p>The "Time," "Amount" and "Total" fields show three totals of billing prices from the budget lines entered in the table part of the window. They are the billing price totals of time activities, amount activities and a total for all budget lines.</p> <p>The "Total as of" field shows the quantity in the "Total" field immediately above it, divided by the quantity given in the Unit Analysis island.</p> <p>The field "Limit" displays the estimated or agreed billing price of the job. You can have a value displayed in this field by entering the value in the field "Billing Price, Currency" in the island Limit. See the description of this island for further information.</p> <p>The budget Limit can either be compared to the total of budgeted costs in the "Total" field, or you can use it in a subsequent budget control calculation, in which you compare budget with actual figures.</p> <p>If you create a quote from a job budget, by choosing "Transfer to Quote" in the Action menu, or if you change quotes in the window Quote Editing, the billing price in this field will automatically be changed to the total of the quote lines. It is then not possible to change it here.</p> <p>When you create invoice selections in the window Invoice Selection, you can transfer the quote price from this field to the total amount of the invoice.</p>
<b>GM</b>	<p>These three fields show the job's budgeted gross margin (GM) in the base currency. Gross margin is calculated by subtracting the cost in the "Cost" field from the billing price in the "Billing Price" field. Gross margin is calculated for the job's time activities, amount activities and total.</p>

Field	Description
	<p>The “Time” field shows the budgeted gross margin total for all time activities.</p> <p>The “Amount” field shows the budgeted gross margin total for all amount activities.</p> <p>The “Total” field shows the budgeted gross margin for the whole job.</p> <p>If the user does not have access to see cost for time, as specified in the window Actions in the Set-Up module, the cost shown next to “Time” and “Total” will be zero.</p> <p>The “Total as of” field shows the quantity in the Total field immediately above it, divided by the quantity given in the Unit Analysis island.</p>
<b>GM %</b>	<p>These three fields show the job’s budgeted gross margin percent (GM %). Gross margin percent is calculated as the gross margin percentage of the billing price in the “Billing Price” field. Gross margin is shown in the “GM” field. Gross margin percent is calculated for the job’s time activities, amount activities and total.</p> <p>The “Time” field shows the average budgeted gross margin percentage for all time activities.</p> <p>The “Amount” field shows the average budgeted gross margin percentage for all amount activities.</p> <p>The “Total” field shows the average gross margin percent for the whole job budget.</p> <p>If the user does not have access to see cost for time, as specified in the window Actions in the Set-Up module, the cost shown next to “Time” and “Total” will be zero.</p>
<b>Time</b>	<p>This is the total of the budgeted hours, costs, billing prices and gross margin, which have been entered in the table part for time activities. It also shows the average gross margin percent for the budget’s time activities.</p>
<b>Amount</b>	<p>This is the total of the budgeted costs and billing prices entered for amount activities in the table part. It also shows the average gross margin for all amount activities.</p> <p>Since the budgeted amount for amount activities does not correspond to a number of hours, the “Time” field is empty.</p>
<b>Total</b>	<p>This is the total of all the budgeted costs and billing prices entered in the table part of the window.</p> <p>Since it is not possible to enter hour estimates for amount activities, the “Hours” field is empty. The total of budgeted hours is shown in the “Time” field.</p>
<b>Hereof Outlays</b>	<p>These fields show the budgeted costs for all amount activities, for which the cost type has been set to “Outlays.” This means that the field only shows the cost part of the relevant outlays, whereas the below field “Excluding Outlays” also includes the gross margin from the outlay. For more information about outlay activities, please see the description of the window Activities.</p>
<b>Excluding Outlays</b>	<p>These fields show the sum of the budgeted prices for all activities in the table part of this window, less the cost price for any amount activities for which the cost type</p>

Field	Description
	has been set to "Outlays." Furthermore, the resulting gross margin and GM % are shown excluding outlays.
<b>Total Per</b>	This shows the unit given in the Unit Analysis window, as well as the values in the "Total" row, divided by the quantity given in the Unit Analysis island. If, for example, the job is for two advertisements, three houses, or ten meters of cable, you can use this row to check cost and billing prices per unit.
<b>Limit</b>	<p>In this field, you can enter a budget limit for the job. You can, for example, register how much money you expect to use on the job. You can also enter how many hours you expect to use, as well as estimated cost and billing price.</p> <p>Maconomy alerts you if you exceed one or more of the three budget limits, when you enter the detailed budget in the table part.</p> <p>You can use the budget limit to make a comparison with the total of the individual budget lines in the table part, and you can use it to make a manual budget control after you have the actual amount of hours used and the actual cost and billing prices of the job.</p> <p>In the Print Job Report window, you can print a job report, specifying the contents yourself. You can use the report to make a budget control, which compares the number of hours and the budgeted sales and costs at the activity level with actual figures. The budget limit is not printed in the report.</p>

### Budget, Currency Island

The fields in this island correspond to the fields in the island Budget, Base. The only difference is the fact that in this island, the amounts are shown in the currency selected for the opportunity.

### Line Creation Island

The functionality of the field in this island corresponds to that of the field in the island Line Creation in the window Job Budgets.

Field	Description
<b>Default Line Type</b>	<p>In this pop-up field, you can select a default value for the field "Line Type" in the table part of the window. Every time you create a line, the value selected here will be selected on the new line, and you may then change it to something else.</p> <p>Please see the description of the field "Line Type" in the table part for a description of the options in this field.</p>

### Unit Analysis Island

Field	Description
<b>Quantity</b>	If the job is for several similar units, for example, two advertisements, three houses, or ten meters of cable, the quantity of these units can be given here. You can then use the Budget island in this window and the Summary island in the Job Card window to see the "Total" values per unit.

Field	Description
<b>Unit</b>	If there is a value in the "Quantity" field, you can enter the unit here.

### Company Island

Field	Description
<b>Company</b>	This field shows the name and number of the company to which the opportunity is assigned.
<b>Base Currency</b>	This field shows the currency used as base currency in the company shown in the field "Company No." above.

### User Island

See the chapter "Getting Started" for a description of the fields in the island User.

### Budget Type Island

Field	Description
<b>Show Budget</b>	In this field, you choose the budget you wish to preview, if no budget has been created for the opportunity, or the budget you wish to work with if a budget has been created. Once you have selected a template job in the field "Template Job No." and pressed Return, you can view the different budgets of the template job using this field. Maconomy suggests the budget type marked as standard opportunity budget type in the window Popup Fields. If no budget type is marked as standard opportunity budget type, the baseline budget of the template job is suggested.

### Employee Category Prices Island

The functionality of the fields in this island corresponds to that of the fields in the island Employee Category Prices in the window Job Budgets.

Field	Description
<b>Employee Category No.</b>	In this field, you can select an employee category.
<b>Employee Category Name</b>	This field shows the name of the current employee category.
<b>Billing Price, Hour</b>	In this field, Maconomy shows the default billing price of the employee category when you select it manually in the field "Employee Category No." above or by specifying it in a job budget line. However, you can enter a new billing price per hour for employees of the current employee category. When you enter a new price, any job budget lines and job specific price list lines on which the current employee category is selected will be updated to

Field	Description
	reflect the new price, unless the field “Line Specific Billing Price” is marked in the table part.
<b>Billing Price, Day</b>	The functionality of this field is similar to that of the field “Billing Price” above, but concerns the billing price per day. The relation between this amount and the amount per hour is defined in the field “Hours per Man Day.”
<b>Cost Price, Hour</b>	This field shows cost price for the selected employee category.
<b>Cost Price, Day</b>	This field shows cost price for the selected employee category per day. The relation between this amount and the amount per hour is defined in the field “Hours per Man Day.”
<b>Price Control Budget Type</b>	Only the baseline budget is used for controlling budget prices. This field shows the type of the baseline budget, as selected in the job parameter attribute “Baseline, Budget Type” of the type “Planning.”
<b>Price Control from Budgets</b>	Maconomy marks this field if the current job is set up to control prices from the budget, that is the job parameter attribute “Price Control from Budgets” of the type “Budgeting” is true for the current job.

### Billing Price Deviations Island

The functionality of the fields in this island corresponds to that of the fields in the island Billing Price Deviations in the window Job Budgets.

Field	Description
<b>Standard Billing Price, Base</b>	This field shows the total budgeted standard billing prices in the company’s base currency.
<b>Billing Price, Base</b>	This field shows the total budgeted billing prices in the company’s base currency.
<b>Budgeted Up/Down</b>	This field shows the difference between the budgeted billing price and the standard billing price. The amount in this field is the write-up or write-down of the budgeted billing price compared to the standard billing price. For more information about standard billing price, please see “Appendix A: Price Calculation in the Job Cost Module.”

### Copy Budget Island

The functionality of the fields in this island corresponds to that of the fields in the island Copy Budget in the window Job Budgets.

Field	Description
<b>Copy from Job No.</b>	In this field, you enter a job number if you wish to copy a job budget from another job than the job currently shown. See the description of the action “Copy Budget” for more information about budget copying.

Field	Description
<b>Copy from Budget</b>	In this field, you select the budget from which you wish to copy. If you have entered a job number in the field above, the budget will be copied from that job. If not, Maconomy copies the job budget shown in the window when you use the action “Copy Budget.”
<b>Copy From Revision No.</b>	In this field, you can select which revision of the job budget entered above you wish to copy. If the revision number is “0” or the field is blank, the latest revision of the budget will be copied.
<b>Copy from Actuals (Job No.)</b>	In this field, you can enter a job number. When you use the action “Copy Budget,” the latest approved revision of the working budget of the specified job will be copied. If there are no approved revisions of the working budget of the job, the latest non-approved revision of the working budget is copied instead.
<b>Copy from Opportunity No.</b>	In this field, you enter an Opportunity number if you wish to copy a job budget from another opportunity than the opportunity currently shown. It is not possible to enter an opportunity number if you have entered a job number.
<b>Overwrite Duplicate Lines</b>	If this field is selected, lines from the copied budget will replace existing lines with the same task and activity combination.

## Opportunity Budget Lines Sub-Tab

This section includes the fields and descriptions for the Opportunity Budget Lines sub-tab.

Field	Description
<b>Description</b>	In this field, you enter a text, which is attached to the activity on quotes and order confirmations. If you enter an activity, Maconomy suggests either the activity text from the “Description” field in the window Activities or the description of the entered task (if any) in the window Job Tasks, but you can change it on the budget line. In the window Activities, you can set up which text to derive as budget line description for each activity. The original activity text is displayed in the field “Activity Name.”
<b>Line Type</b>	<p>In this pop-up field, you select the type of the current job budget line. Selecting a value is mandatory. In the card part, the field “Default Line Type” in the island Line Creation defines the default value of this field, that is the value which is automatically suggested when you create the line. You may then select something else. You can choose between the following values:</p> <ul style="list-style-type: none"> <li>Sum/Text — If you select this value, the current line can be used as a text line, simply adding a line of text to the budget, or as a sum line. A sum line is used as a grouping level when you use work breakdown structure as described in “Getting Started with the Java™ Client.” In</li> </ul>

Field	Description
	<p>both cases, no reference to activity or task may be specified on the line, and the line cannot be marked as a milestone.</p> <ul style="list-style-type: none"> <li>Time — If you select this value, the current line is used for specifying a time activity. The activity number will change to the activity specified in the job parameter attribute “Default Time Activity” of the type “Budgeting.”</li> <li>Outlay — If you select this value, the current line is used for specifying an outlay activity. The activity number will change to the activity specified in the job parameter attribute “Default Outlay Activity” of the type “Budgeting.”</li> <li>Amount — If you select this value, the current line is used for specifying an amount activity. The activity number will change to the activity specified in the job parameter attribute “Default Amount Activity” of the type “Budgeting.”</li> <li>Milestone — If you select this value, the current line is used for specifying a milestone. Any existing activity number will be removed, and the field “Milestone” will be marked (this field is not shown in the standard layout of the Job Budgets window).</li> </ul> <p>Note that by changing the line type, you change the activity number. See the description of the field “Act. No.” for considerations with regard to changing the activity number. If you specify an activity in the field “Act. No.,” this field will change to reflect the type of activity you entered, that is either “Time,” “Amount,” or “Outlay.”</p>
<b>Task</b>	<p>In this field, you can specify the task to which the job budget line is to be assigned. Specifying a task list is mandatory, if a task list has been specified for the job, typically via the template based on which the job was created, or if the action “Require Tasks” has been selected in the window Job Tasks.</p> <p>If neither of the system parameters “Create Tasks from Job Budgets” nor “Extended Task Creation from Budgets” (see below) has been marked, you must enter a task which exists in the task list in question.</p> <p>If both this field and the field “Act. No.” are left blank, the line can be used as a text line for a more detailed budget description or as a grouping level in a work breakdown structure.</p> <p>If either of the system parameters “Create Tasks from Job Budgets” or “Extended Task Creation from Budgets” has been marked, you can enter a task which does not already exist in the job’s task list. When you do, Maconomy will create the task in the job’s private task list, using the activity entered on the line as derived activity. If a job specific task list does not already exist, the shared task list assigned to the job will be copied and made job specific. For more information, see the description of the window Job Tasks.</p> <p>If the system parameter “Mark ‘Overwrite Activity’ On Tasks” is marked, the field “Overwrite Activity” is marked in the new task. The description entered in the field “Description” is transferred to the new task and used as task</p>

Field	Description
	<p>description according to the rules outlined in the description of the two system parameters which concern task creation. Be aware that the specified activity can be set up to derive either the activity text or the task description in the field "Description." The way the new task is named is defined by and described in the system parameters "Number of Trailing Characters for Task Names" and "Extended Task Creation from Budgets."</p> <p>Tasks may need to be approved (see the window Approve Tasks). If this is the case, you cannot use the actions "Submit Budget" or "Transfer to Sales Order" until all tasks in the budget have been approved.</p> <p>If dimension values have been specified for the task, these dimensions are automatically suggested on new budget lines unless other values have been entered manually. If the window Job Tasks or Task Lists specifies that derived dimension values should overwrite existing dimensions values, any manually entered dimensions will be overwritten.</p>
<b>Act. No.</b>	<p>In this field, you enter the number of the activity for which you wish to make a budget estimate. If both this field and the field "Task" are blank, the line is a text line. If this field shows "*", the line is a summary line which creates a subtotal when the budget is printed using the "Standard" layout. You cannot budget on summary activities. Note that you cannot enter a "*" if you use work breakdown structure. Instead use the field "Line Type" to specify that the current line is a line of the type "Sum/Text" and indent the relevant lines below it. You can enter more than one line for the same activity, but note that every job entry is registered to an activity and not to a budget line.</p> <p>If a job budget text from the window Activities has been assigned to one of the activities used in this window, the standard text will be transferred to the window Job Budget Texts. You can subsequently edit the text so that it fits each job budget line in the window Job Budget Texts.</p> <p>You can change the activity on a line if the line does not have sales orders, requisitions, or purchase orders assigned to it, and the budget is not closed. You can change the activity directly or by changing the line type in the field "Line Type." If tasks are required for the current job, the activity may be derived from the task. If you change the activity, you will be asked to confirm the change, and the task will be updated in the job specific task list to derive the new activity – provided that tasks can be created from budgets (see the description of the field "Task" above). Furthermore, the task may need to be approved again, if task approval is required.</p> <p>Note that if price control from budget is enabled, changing the activity to an activity of another type (for example from a time activity to an amount activity) will cause the price on the current line to be recalculated, even if the system parameter "Update prices upon dimension change" is not set.</p>
<b>Empl. Cat. No.</b>	<p>In this field, you can assign a certain employee category to the job budget. If no specific employee has been specified for this line, Maconomy will instead use the cost, intercompany or billing price for the specified employee category for price calculations, if the field "Hourly Rate" in the window System</p>

Field	Description
	<p>Information in the Set-Up module has been set to “By Employee” or “Employee Priority.”</p> <p>If the current job is set up for price control from budgets, the employee category is added to the island Employee category Prices in the card part when you add or change the employee category, if it is not already present in that island.</p> <p>If you specify or change an employee category on an existing line, prices are only recalculated if the system parameter “Update prices upon dimension change” has been marked.</p> <p>If the system parameter “Empl. cat. on job budgets required” is marked, it will not be possible to leave out an employee category number in this field, unless the field “Empl.” is also blank.</p>
<b>Quantity</b>	<p>In this field, you enter the budgeted quantity for the line. If the activity is a time activity, the quantity is interpreted as number of hours. It is therefore totaled in the “Hours” field by the “Time” field in the card part of the window. Maconomy alerts you if the sum of hours exceeds the hours limit. If you enter a number of hours, it is automatically converted into a number of days which is inserted in the field “Quantity, Days.” The number of days is calculated by dividing the number of hours by the value in the field “Hours per Man Day” in the card part of the window Jobs.</p>
<b>Quantity, Days</b>	<p>The functionality of this field is similar to that of the field “Quantity.” However, this field only applies to time activities, and you enter the budgeted quantity as a number of days instead of a number of hours. If you enter a number of days, it is automatically converted into a number of hours which is inserted in the field “Quantity.” The number of hours is calculated by multiplying the number of days by the value in the field “Hours per Man Day” in the card part of the window Jobs.</p> <p>If you wish to assign items to the job budget line in the window Job Budget Item Lines, the value here must be 1. You can then enter the relevant item quantity on the individual job budget item line.</p> <p>The quantity is used to calculate the budget lines’ total in the fields “Total Cost, Base” and “Billing Price Total, Base.” It is multiplied by the amounts in the fields “Cost, Base” and “Billing Price, Base” on the budget line. This applies to both time and amount activities.</p> <p>Note that if you change the quantity specified in this field on a planning budget, and work has been registered on the current planning budget line since the quantity was specified, the reestimated quantity cannot be lower than the work registered if a new estimated time to completion is currently being specified for the job.</p>
<b>Cost, Base</b>	<p>In this field, you enter the budgeted cost in the base currency for one unit of the activity on the budget line. For a further description of how Maconomy calculates these prices, please refer to “Appendix A: Price Calculation in the Job Cost module.”</p>

Field	Description
	<p>Maconomy calculates the cost based on information from job price lists, item price lists, and employee or activity information cards. If the executing company behind the activity is different from the company responsible for the job, Maconomy suggests the intercompany price of that company. For a further description of how Maconomy calculates these prices, please see "Appendix A: Price Calculation in the Job Cost module."</p> <p>If the current job is set up for price control from budgets (see "Price control from budgets" on), changing the cost in this field in such a way that the billing price is also changed, the corresponding job specific price list line is updated with the new billing price in currency. The corresponding job specific price list line is the price list line with the same task and activity number as on the job budget line.</p> <p>If you have entered a tax code which includes an investment tax rate, the investment tax rate will be included in the cost. Investment tax rates are described in further detail in the field "Tax Code."</p> <p>It is possible to change the suggested cost for amount activities and sometimes for time activities (see below). If you change it, Maconomy will recalculate the budget line billing price based on the new cost and the markup percentage in the field "Markup %." However, if you have selected a tax code, you can only change the net cost.</p> <p>If the system parameter "Keep Billing Price when Changing Cost Price" is set, the billing price on the line will not be changed if the cost is changed manually. However, the value in the field "Markup %" will change to reflect the new ratio between cost and billing price. If the billing price or cost is subsequently changed manually, Maconomy will calculate the prices as outlined in "Appendix A: Price Calculation in the Job Cost Module."</p> <p>If the system parameter "Update prices upon dimension change" has been marked, the price in this field is updated when certain key information on the line is changed, for instance the activity, employee or dimension values. For further information on this and for a complete list of the fields causing the price to be updated, see the description of the system parameter "Update prices upon dimension change." If the system parameter is not marked and you wish to ensure that all prices reflect the current set-up of the budget lines, use the action "Recalculate Job Budget."</p> <p>You can change the costs in this field for time activities if the field "Change Costs for Time" is marked in the window Actions in the Set-Up module. Furthermore, you can only see the cost for time activities if the field "See Time Cost" is marked in the window Actions. If neither field is marked, the value here will be zero and cannot be changed.</p> <p>Maconomy multiplies the cost from this field with the number in the "Quantity" field. The total cost of the line is calculated in the "Total Cost, Base" field.</p> <p>If purchase order lines have been created from the current line, and you decrease the amount in this field, Maconomy checks if the new amount causes budget violations according to the rules set up in the job parameter attributes "Limit Purchase Amount to Budget," "Limit Purchase on Sum or Line Level," "Limit Purchase, Currency Margin" and "Limit Purchase, Percentage Margin"</p>

Field	Description
	for the job. If the change causes a budget violation, an error message is displayed.
<b>Cost Per Day, Base</b>	This field only applies to time activities. The field shows the value in the field "Cost, Base" converted into a cost per day. The value is calculated by multiplying the value in the field "Cost, Base" by the value specified in the field "Hours per Man Day" for the current job in the window Jobs.
<b>Total Cost, Base</b>	<p>This field shows the total estimated cost in base currency for the budget line. The total cost is found by multiplying the number in the "Quantity" field by the cost per piece in the "Cost" field. Cost prices are totaled in the card part of the window, and Maconomy alerts you if the grand total exceeds the budget limit, which is entered in the "Limit" field in the Budget island. You can also choose to enter a total in this field. Maconomy will then calculate the unit price in the field "Cost, Base" as the total cost price divided by the figure in the field "Quantity."</p> <p>If the user does not have access to see cost for time, as specified in the window Actions in the Set-Up module, the value here will be zero and cannot be changed.</p>
<b>Billing Price, Curr.</b>	<p>In this field, you enter the budgeted billing price in the job's currency of one unit of the activity on the budget line. If the activity is non-invoiceable, you cannot enter a price here, and the value must be "0.00." In the window Activities you can mark the activity as invoiceable in the "Invoice" field.</p> <p>If you want to enter the billing price in another currency than the job's currency, use the field "Billing Price, Purchase Currency."</p> <p>Maconomy calculates the billing price based on information from job price lists, item price lists, adjustment percentage, the employee or activity information card, and information in the window System Information in the Set-Up module. For a further description of how Maconomy calculates these prices, please refer to "Appendix A: Price Calculation in the Job Cost module."</p> <p>If the current job is set up for price control from budgets (see "Price control from budgets"), changing the billing price causes the corresponding job specific price list line to be updated with the new billing price in currency. The corresponding job specific price list line is the price list line with the same task and activity number as on the job budget line. Furthermore, the field "Line Specific" is marked on the current line.</p> <p>If you change the billing price in this field, the markup percentage is changed proportionally in the field "Markup %," and the billing price is hereafter interpreted as "Entered" when calculating the price.</p> <p>Maconomy multiplies the billing price in this field with the number in the "Quantity" field. The line's total billing price is shown in the "Billing Price Total, Currency" field.</p> <p>The billing price in this field and the billing price total are converted to the base currency in the "Billing Price, Base" and "Billing Price Total, Base" fields according to the principles described in "Appendix A: Price Calculation in the Job Cost module."</p>

Field	Description
	<p>If the system parameter "Update prices upon dimension change" has been marked, the price in this field is updated when certain key information on the line is changed, for instance the activity, employee or dimension values. For further information on this and for a complete list of the fields causing the price to be updated, see the description of the system parameter "Update prices upon dimension change." If the system parameter is not marked and you wish to ensure that all prices reflect the current set-up of the budget lines, use the action "Recalculate Job Budget."</p> <p>If purchase order lines have been created from the current line, and you decrease the amount in this field, Maconomy checks if the new amount causes budget violations according to the rules set up in the job parameter attributes "Limit Purchase Amount to Budget," "Limit Purchase on Sum or Line Level," "Limit Purchase, Currency Margin" and "Limit Purchase, Percentage Margin" for the job. If the change causes a budget violation, an error message is displayed.</p>
<b>Billing Price Per Day, Curr.</b>	<p>This field only applies to time activities. The field shows the value in the field "Billing Price, Currency" converted into a billing price per day. The value is calculated by multiplying the value in the field "Billing Price, Currency" by the value specified in the field "Hours per Man Day" for the current job in the window Jobs.</p>
<b>Total Billing Price, Currency</b>	<p>This shows the budget lines total budgeted billing price in the job currency. The total billing price is calculated by multiplying the number in the "Quantity" field by the billing price per piece in the "Billing Price, Currency" field. Billing prices are totaled in the card part of the window, and Maconomy alerts you if the grand total exceeds the billing price budget limit, which is entered in the "Limit" field in the Budget island.</p>
<b>Markup %</b>	<p>In this field, you enter the budgeted gross margin % for the activity on the budget line. Gross margin is calculated from cost. If the activity is non-invoiceable, you cannot enter a markup percentage here. The value will then always be "-100." In the window Activities, you can mark the activity as invoiceable in the field "Invoice." If you want a billing price of zero, you can set the value in this field to "-100."</p> <p>If you change this value, the billing price is changed proportionally, and the billing price is hereafter interpreted as "Entered" when calculating the price (see "Appendix A: Price Calculation in the Job Cost module"). If you change the values in the fields "Billing Price, Currency" and "Markup %" at the same time, the entered billing price is used, and the markup percentage is adjusted proportionally.</p> <p>If the current job is set up for price control from budgets, the billing price of amount activities is adjusted by changing the markup percentage. The underlying job specific price list line only records the markup percentage for the current combination of task and activity. If the current line concerns a time activity, changing the markup percentage causes the corresponding job specific price list line to be updated with a new billing price in currency. The corresponding job specific price list line is the price list line with the same task</p>

Field	Description
	<p>and activity number as on the job budget line. Furthermore, the field "Line Specific" is marked on the current line.</p> <p>If the system parameter "Update prices upon dimension change" has been marked, the markup percentage in this field is updated when certain key information on the line is changed, for instance the activity, employee or dimension values.</p> <p>If the system parameter is not marked and you wish to ensure that all markup percentages reflect the current set-up of the budget lines, use the action "Recalculate Job Budget."</p> <p>If the user does not have access to see cost for time, as specified in the window Actions in the Set-Up module, the value here will be zero and cannot be changed.</p>
<b>Line Specific Billing Price</b>	<p>If the current job is set up for price control from budgets, this field indicates if the billing price differs from the price originally derived from the employee category on the current line. If the line is not marked, the price is the original price. If you change the billing price (for time activities) or markup percentage (for amount activities) on the line, the field will be marked by Maconomy, and the underlying job specific price list line will be updated.</p> <p>You can mark the field manually to specify that the current price is just the price you want, and that changes in the island Employee Category Prices should not be reflected on this line. If you mark the field on the only line in the budget referring to a certain employee category, Maconomy will remove the employee category in question from the island Employee Category Prices.</p> <p>If you remove the mark, Maconomy will replace the current billing price with the original price from the employee category, and the employee category will appear in the island Employee Category Prices (if it was not there already).</p> <p>If prices are not controlled from the budget, or if the current budget type is not the price controlling budget type, this field will always be unmarked.</p>
<b>Cost Type</b>	<p>This field shows the cost type selected for the current activity in the window Activities: "Turnover" or "Outlays." The sum of activities of the type "Outlays" is deducted from the calculation of the gross margin percentage of a job. For more information about outlay activities, please see the description of the window Activities.</p>
<b>Incl. in Fixed Price</b>	<p>This field shows whether or not the entry applying to the line is included in the fixed price of a job. The set-up of the job in question determines whether or not this field is marked when a line is created.</p> <p>If a fixed-price job or a time-and-material job is assigned the job parameter attribute "Fixed Price Basis" with the value "Budget," the marking of this field determines which budget lines are included in the fixed quote price of a job and which entries are not included in the fixed quote price of a job. The fixed price of such a job is the sum of the billing prices displayed in the table part of this window for those lines on which the field "Incl. in Fixed Price" has not been marked. The fixed price of a job is also displayed in the island Price in the window Jobs. See also the introduction of the window Invoice Selection for</p>

Field	Description
	information on how Maconomy determines whether or not entries are to be included in the fixed price of a job.
<b>Planned Starting Date</b>	<p>In this field, you can enter the date you plan to begin the activity. Maconomy uses the prices valid per this date when deciding which version of the price list assigned to the job, if any, should be used for price calculation on job budget lines. If you do not specify a date in this field, Maconomy uses today's date for the calculation of prices.</p> <p>If you later change the value in this field, Maconomy will recalculate prices on job budget lines only if the budget has not been approved, and if the system is set up to update prices upon dimension change in the window System Parameters. You can also choose to have Maconomy recalculate prices by means of the function "Recalculate Job Budget." When you select this action, Maconomy will also use the price lists valid per the date specified in this field, if any, for the recalculation.</p> <p>By selecting the action "Transfer Job Dates," you can prefill this field with the value of the field "Start Date" in the window Jobs for the current job. At the same time, the field "Planned Ending Date" is completed with the value of the field "Estimated Ending Date" in the window Jobs.</p> <p>When creating requisitions or purchase orders from the current line, the date in this field is transferred to the field "Pref. Deliv. Date" in the card part of the requisition or purchase order and the field "Delivery Date" in the table part. Furthermore, the specified date can be used in reports.</p> <p>If you copy a budget with a planned starting date to a new budget with the same job number, this field will also be copied to the new budget. However, you should note that a date in this field does not influence the possibility of assigning periods to the budget line in the window Periodic Job Budgets.</p>
<b>Planned Duration</b>	<p>In this field, you can enter a planned duration of the activity. This duration will always be the number of days from the planned starting date to the planned ending date. If a week calendar has been selected in the job parameter attribute "Standard Week Calendar" of the type "Planning," the date calculation adjusts for weekends and holidays as specified in the week calendar. Otherwise, calendar days are used. If the value of the field is changed, the field "Planned Ending Date" will automatically be adjusted correspondingly. If the value of the fields "Planned Starting Date" or "Planned Ending Date" is empty, the value of this field will be 0.</p>
<b>Planned Ending Date</b>	<p>In this field, you can enter the date you plan to end the activity. The date specified will be of importance in the window Detailed Planning in the Resource Planning module as the date specified in this field will be copied to planning lines created on the basis of the budget in question.</p> <p>By selecting the action "Transfer Job Dates," you can prefill this field with the value of the field "Estimated Ending Date" in the window Jobs for the current job. At the same time, the field Deliv. Remarks "Planned Starting Date" is completed with the value of the field "Start Date" in the window Jobs.</p>

Field	Description
<b>Milestone</b>	If you mark this field, the task on the current line is considered to be a milestone. This means that the task has no duration (the planned starting date and the planned ending date are identical). Furthermore, no activity or task can be assigned to a milestone line the line must be a text line. Milestones are used for traffic reporting purposes, and should not be confused with the milestones in the window Invoicing Plans.
<b>Standard Billing Price, Currency</b>	This field shows the standard billing price per unit in the currency of the job. If the system parameter "Update prices upon dimension change" has been marked, the price in this field is updated when certain key information on the line is changed, for instance the activity, employee or dimension values. For further information on this and for a complete list of the fields causing the price to be updated, see the description of the system parameter "Update prices upon dimension change." If the system parameter is not marked and you wish to ensure that all prices reflect the current set-up of the budget lines, use the action "Recalculate Job Budget."
<b>Standard Billing Price Per Day, Currency</b>	This field only applies to time activities. The field shows the value in the field "Standard Billing Price, Currency" converted into a standard billing price per day. The value is calculated by multiplying the value in the field "Billing Price, Currency" by the value specified in the field "Hours per Man Day" for the current job in the window Jobs.
<b>Total Standard Billing Price, Currency</b>	This field shows the total standard billing price of the current budget entry in the currency of the job. If the system parameter "Update prices upon dimension change" has been marked, the price in this field is updated when certain key information on the line is changed, for instance the activity, employee or dimension values. For further information on this and for a complete list of the fields causing the price to be updated, see the description of the system parameter "Update prices upon dimension change." If the system parameter is not marked and you wish to ensure that all prices reflect the current set-up of the budget lines, use the action "Recalculate Job Budget."
<b>Purchase Currency</b>	In this field, you can select a currency. Depending on whether you have entered the cost in base currency or in another currency, the value is calculated in the field "Cost, Base" or in the field "Cost, Purchase Currency" by means of this currency. If another currency is subsequently selected, the value in the field "Cost, Purchase Currency" is then recalculated. For a further description of how Maconomy calculates these prices, please refer to "Appendix A: Price Calculation in the Job Cost module."  If the job budget is structured hierarchically, selecting a purchase currency on a group header line makes it possible to see the total purchase amount for the subordinate lines in a specific currency.
<b>Cost, Purchase Currency</b>	In this field, you can enter or see the cost in the currency selected in the field "Purchase Currency." If you enter a value here, the value in the field "Cost, Base" will be calculated. If a value is entered in the field "Cost, Base," the calculated cost is displayed in currency in this field. The two fields cannot be

Field	Description
	<p>filled in at the same time. For a further description of how Maconomy calculates these prices, please refer to "Appendix A: Price Calculation in the Job Cost module."</p> <p>If the system parameter "Update prices upon dimension change" has been marked, the price in this field is updated when certain key information on the line is changed, for instance the activity, employee or dimension values. For further information on this and for a complete list of the fields causing the price to be updated, see the description of the system parameter "Update prices upon dimension change." If the system parameter is not marked and you wish to ensure that all prices reflect the current set-up of the budget lines, use the action "Recalculate Job Budget."</p> <p>If the user does not have access to see cost for time, as specified in the window Actions in the Set-Up module, the value here will be zero and cannot be changed.</p> <p>Maconomy multiplies the cost in this field with the figure in the field "Quantity," so that the total cost is calculated in the field "Total Cost, Purchase Currency."</p> <p>If purchase order lines have been created from the current line, and you decrease the amount in this field, Maconomy checks if the new amount causes budget violations according to the rules set up in the job parameter attributes "Limit Purchase Amount to Budget," "Limit Purchase on Sum or Line Level," "Limit Purchase, Currency Margin" and "Limit Purchase, Percentage Margin" for the job. If the change causes a budget violation, an error message is displayed.</p>
<b>Cost Per Day, Purchase Currency</b>	<p>This field only applies to time activities. The field shows the value in the field "Cost, Purchase Currency" converted into a cost per day. The value is calculated by multiplying the value in the field "Cost, Purchase Currency" by the value specified in the field "Hours per Man Day" for the current job in the window Jobs.</p>
<b>Total Cost, Purchase Currency</b>	<p>In this field, you can see the total budgeted cost in the current job's currency. The total cost price is calculated by multiplying the figure in the field "Quantity" by the cost per unit in the field "Cost, Purchase Currency." The cost is summed up in the card part, and Maconomy alerts you if this total exceeds the cost limit. You can also choose to enter a total in this field. Maconomy will then calculate the unit price in the field "Cost, Purchase Currency" as the total cost price divided by the figure in the field "Quantity."</p> <p>If the user does not have access to see cost for time, as specified in the window Actions in the Set-Up module, the value here will be zero and cannot be changed.</p>
<b>Billing Price, Purchase Currency</b>	<p>If you want to enter the billing price in another currency than the job's currency, you can use this field. Maconomy uses the currency specified in the field "Purchase Currency" for converting the amount to the job currency, using the current exchange rate table for purchase at the time of entry. If you change the currency later, Maconomy will recalculate the contents of this field. See also the description of the field "Billing Price, Currency." For a further description of</p>

Field	Description
	how Maconomy calculates these prices, please refer to "Appendix A: Price Calculation in the Job Cost module."
<b>Billing Price Per Day, Purchase Currency</b>	This field only applies to time activities. The field shows the value in the field "Billing Price, Purchase Currency" converted into a billing price per day. The value is calculated by multiplying the value in the field "Billing Price, Purchase Currency" by the value specified in the field "Hours per Man Day" for the current job in the window Jobs.
<b>Billing Price Total, Purchase Currency</b>	This field displays the total sales price in purchase currency, that is, the field "Billing Price, Purchase Currency" multiplied by the number in the field "Quantity."
<b>Deliv. Remarks</b>	In this field, you can enter delivery remarks to be used in connection with the delivery of the items.
<b>Billing Price, Base</b>	This field shows the amount from the field "Billing Price, Currency" on the current budget line converted into the base currency. For a further description of how Maconomy calculates these prices, please refer to "Appendix A: Price Calculation in the Job Cost Module."
<b>Billing Price Per Day, Base</b>	This field only applies to time activities. The field shows the value in the field "Billing Price, Base" converted into a billing price per day. The value is calculated by multiplying the value in the field "Billing Price, Base" by the value specified in the field "Hours per Man Day" for the current job in the window Jobs.
<b>Billing Price Total, Base</b>	This field shows the amount from the field "Billing Price Total, Currency" on the current budget line converted into the base currency. For a further description of how Maconomy calculates these prices, please refer to "Appendix A: Price Calculation in the Job Cost Module."
<b>Standard Billing Price, Base</b>	This field shows the standard billing price per unit in the base currency of the company. If you change the value in the field "Billing Price, Purchase Currency" or "Billing Price, Currency," this number can only change if the standard billing price is calculated as a standard markup percentage.
<b>Total Standard Billing Price, Base</b>	This field shows the total standard billing price of the current budget entry in the base currency of the company.
<b>Exec. Company No.</b>	This field shows the name of the company carrying out the specified activity. The field cannot be changed.
<b>Name</b>	This field shows the name of the executing company.

Field	Description
<b>Location</b>	<p>In this field, you can enter a value for the dimension Location. If you do not manually enter a value, Maconomy will attempt to derive a value, using the order of priority set up in the window Dimension Derivation in the G/L module. However, any manually entered value will be overwritten if Maconomy can derive a value for which overwriting has been selected. If no value can be derived, the standard value is transferred from the window System Parameters in the Set-Up module.</p> <p>If the system parameter "Update prices upon dimension change" has been marked, changing the location on a line will cause the prices on the line to be recalculated. If the current job is set up for price control from budgets (see "Price control from budgets"), and the field "Line Specific Billing Price" is marked for the current line, the billing price is not changed upon recalculation.</p> <p>If the budget controls prices, the function of the system parameter "Update prices upon dimension change" is different. Even if the parameter is set, changing dimensions does not affect the prices. Only changing the employee category on lines related to a time activity will cause a recalculation of the price, and the line will be considered line specific. To recalculate the price after changing dimensions, use the action "Recalculate Job Budget."</p> <p>See the section on dimension derivation in the chapter "Introduction to the G/L module" as well as the description of the window Dimension Derivation for further information about dimension derivation.</p>
<b>Entity</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Project</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Purpose</b>	The functionality of this field is similar to that of the field "Location" above.
<b>Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Local Spec. 1-3</b>	The functionality of these fields is similar to that of the field "Location" above.
<b>Net Cost, Base</b>	This field is only used in Norwegian systems. This field shows a net cost for amount activities.
<b>Net Cost Per Day, Base</b>	This field only applies to time activities. The field shows the net cost per day budgeted for the current job budget lines. The value is based on the value in the field "Net Cost Base" above and the number of hours per man day specified for the job in the field "Hours per Man Day" in the "Jobs" window.
<b>Tax Code</b>	This field is only used in Norwegian systems. This field shows a G/L tax receivable code if the activity on the line is an amount activity.
<b>Activity Name</b>	This field displays the text defined for the current activity. This text is suggested by Maconomy as entry text when a line is created in this window.

Field	Description
	The entry text can be changed, and this is then displayed in the field "Description" in the table part of this window.
<b>Task Description</b>	This field shows the text defined for the current task, if a description has been entered in the field "Task."
<b>Empl. Cat. Name</b>	This field shows the name of the employee category selected in the field 'Empl. Cat. No.'.
<b>Job Budget Text</b>	In the window Job Budget Texts, it is possible to assign text lines to a job budget line. This field, which cannot be changed, displays whether such text lines are assigned to the current line.
<b>Remarks 1-10</b>	In these fields, you can assign remarks to the current job budget line. The remarks are for information only and can, for example, be used in reports.

## Actions

This section shows the actions that are available in the Opportunity Budgets workspace.

### Top Tab

Field	Description
<b>Copy Budget</b>	The functionality of this action is similar to that of the <b>Copy Budget</b> action in the Jobs workspace.
<b>Print Price Overview</b>	The functionality of this action is similar to that of the <b>Print Price Overview</b> action in the Job Budgets workspace.
<b>Recalculate Budget</b>	The functionality of this action is similar to that of the <b>Recalculate Job Budget</b> action in the Job Budgets workspace.
<b>Require Tasks</b>	The functionality of this action is similar to that of the <b>Require Tasks</b> action in the Job Tasks workspace.
<b>Disallow Tasks</b>	The functionality of this action is similar to that of the <b>Disallow Tasks</b> action in the Job Tasks window.
<b>Create Budget</b>	<p>When you use this action, Maconomy creates a job for the current opportunity, and copies budget information from the selected template job to the new job. The budget is created with the same time unit as the template job from which the budget is created.</p> <p>The job is created based on the job specified in the <b>Template Job No.</b> field, meaning that both basic information and budget information is copied from this job. The new job is assigned a job number that corresponds to the number of the opportunity, prefixed by an underscore. If the opportunity number is 10050, the number of the new job will thus be _10050. If another</p>

Field	Description
	<p>job with the generated job number already exists, Maconomy adds an extra underscore to the job number, for example, resulting in the number _ _10050. This procedure is repeated until a unique job number is found.</p> <p>Maconomy copies all information from all budget types. This means that even if you selected a given budget type in the <b>Show Budget</b> field, any budget figures that exist for the template job for other budget types are also copied.</p> <p>When a budget has been created, the sales estimate in the <b>Sales Estimate, Currency</b> field in the Opportunities workspace can no longer be updated manually. Instead, it corresponds to the total billing price budgeted for the budget type selected as the standard opportunity budget type (see “Job Budget Types” in the Set-up module). If no budget type is selected as standard opportunity budget type, the total billing price of the baseline budget of the template job is used instead.</p>
<b>Delete Budget</b>	<p>When you use this action, the job created for the opportunity is deleted, along with all lines in the sub-tab. This means that to enter budget information for the opportunity, you must specify a template job and use the <b>Create Budget</b> action again.</p>
<b>Send Opportunity to People Planner</b>	<p>When you use this action, it sends the opportunity, including the budget, to People Planner. The budget that is sent is the type that is selected as Standard Opportunity Budget type for the <b>Job Budget Types</b> pop-up field.</p> <p>This action is only available if the add-ons for People Planner and Custom Actions are installed, and the Enable Custom People Planner Actions system parameter is set to “True.”</p>

## Contact Person Relations Single Dialog Workspace

Use this workspace to enter relations between a given contact person and other contact persons and contact companies.

For each contact person, you can specify the other contact persons and companies with which that person is in contact. You can also enter the type of relationship that they have, such as whether it is professional or personal.

You can enter information for any contact persons (employees and customers) and contact companies. This information can prove very useful when you need to learn about a prospect or customer. You can browse the workspace to look for someone who knows the customer or has a relationship with the prospect organization.

The Contact Person Relations tab displays information about the currently selected contact person; you can change contact person information and create contact persons in the same way as you do in the Contact Persons workspace. The fields in this tab correspond to the fields in the Contact Persons workspace tab; changing the information here updates the Contact Persons workspace appropriately.

In the Contact Relations sub-tab, you can view and enter information about the contact persons and companies with which the contact person in question has a relationship. Contact relationship information is bidirectional; if you select contact person A in the tab and create a line that

specifies contact person B in the sub-tab, that corresponds exactly to selecting contact person B in the tab and entering contact person A in the sub-tab. This functionality also applies to relationships between contact persons and contact companies. Consequently, each relationship appears in the sub-tab of both parties.

For more information about creating contact persons, the functionality of specific fields in the tab, and the actions that you can use in this workspace, see the description of the Contact Persons workspace.

## Contact Person Relations Tab

This section includes the fields and descriptions for the Contact Person Relations tab.

### Contact Person Island

Field	Description
<b>Contact Person</b>	In this field, you can enter the name and number of a contact person when creating a contact person. For information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Attn.</b>	In this field you can enter an attention person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Country</b>	Here you select the country in which the contact person is located. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Phone</b>	Here you can enter the phone number to the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Phone 2</b>	Here you can enter a second phone number to the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Mobile</b>	Here you can enter the mobile phone number to the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Mobile 2</b>	Here you can enter a second mobile phone number to the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.

Field	Description
<b>Fax</b>	Here you can enter the fax number of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Telex</b>	Here you can enter the telex number of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>E-mail</b>	Here you can enter the e-mail address of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Department</b>	In this field, you can select the department to which the contact person pertains. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Education</b>	Here you can enter the education of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Position</b>	Here you can enter the current position of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Initials</b>	Here you can enter the initials of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Soc. Security No.</b>	Here you can enter the social security number of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Date of Birth</b>	Here you can enter the contact person's date of birth. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Age</b>	Here you can enter the education of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Gender</b>	Here you can enter the gender of the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Blocked</b>	Here you can specify whether the contact person is blocked. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.

**Employee Information Island**

Field	Description
<b>New Employee No.</b>	When you select the action "Create Employee," an employee is created on the basis of the current contact person, and in this field you can specify information about the employee number to be assigned to the new employee. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Employee No.</b>	When creating a contact person, you can base the contact person on an existing employee by specifying a number in this field. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Termination Date</b>	If the employee in the field "Employee No." above has been terminated, this field shows the date when the termination took place.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In this field, you can write a description and assign a document archive to the contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

**Extra Fields Island**

Field	Description
<b>Date 1-5</b>	In these fields, you can enter dates relevant to the contact person. The fields are for information only.
<b>Amount 1-5</b>	In these fields, you can enter amounts relevant to the contact person. The fields are for information only.

**User Island**

See the chapter "Getting Started" for a description of the fields in the island User.

**Remarks Island**

In these fields, you can enter additional remarks about the current contact person.

**Company Island**

Field	Description
<b>Company</b>	In this field, you can enter the name and number of a company to which the contact person is assigned. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.

**Contact Company Island**

Field	Description
<b>Contact Company</b>	If the contact person is related to a contact company, you can specify the name and number of the contact company in question in this field.  For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons
<b>Linking Rule</b>	In this field, you can specify the linking rule that you want to use for the creation of the current contact person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.

**Information Island**

Field	Description
<b>Popup 1-20</b>	In these fields, you can select information concerning the current contact company. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Persons.

**Personnel Requisition Island**

Field	Description
<b>Requisition No.</b>	If the current contact person is associated with a personnel requisition, for instance because he or she was created as a contact person as a result for applying for a position on a personnel requisition, you can specify the requisition number in this field. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Persons.

**Selection Criteria Island**

Field	Description
<b>Contact Type</b>	In this field, you can select a contact type (contact person or contact company). Only relations of the selected type will be displayed in the table part.

Field	Description
<b>Relation Type</b>	In this field, you can select a relation type. Only relations for which the selected relation type has been selected will be displayed in the table part.
<b>Show Non-active</b>	In this field, you can specify whether relations that are no longer active, that is, the field "Active" is unmarked should be shown in the table part. If you do not mark this field, only active relations are shown.

### Employee Information Island

Field	Description
<b>Responsible Employee</b>	In this field, you can specify the number of the employee responsible for the current contact person.
<b>Name</b>	This field shows the name of the employee specified in the above field "Responsible Employee No."

### Access Level Island

Field	Description
<b>Access Level</b>	In this field, you can enter the name and description of an access level. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Persons.

### Option List Fields Island

Field	Description
<b>List</b>	In these fields, you can specify the option lists containing the values you wish to use for further specification of the contact person. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Persons.
<b>Value</b>	In these fields, you can specify values available in the respective option lists specified in this island. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Persons.

### Contact Relations Sub-Tab

This section includes the fields and descriptions for the Contact Relations sub-tab.

Field	Description
<b>Contact Type</b>	<p>In this field, you can specify whether the contact on the current line is a contact person or contact company. The value determines whether a contact person number or a contact company number must be specified in the field "Contact No." on the line.</p> <p>Once the line has been created, the field is closed and can no longer be changed.</p>

Field	Description
<b>Contact No.</b>	<p>In this field, specify the number of the contact company or contact person which is a contact of the contact person in the card part. Specify a contact person if you have selected "Contact Person" in the field "Contact Type," or a contact company if you have selected "Contact Company."</p> <p>Once the line has been created, the field is closed and can no longer be changed.</p>
<b>Contact Name</b>	This field shows the name of the contact person or company specified in the field "Contact No." above.
<b>Relation Type</b>	Enter a relation type for the relation, or press CTRL+G to search for a possible relation type. The CTRL+G search option is available if a relation type option list is specified in the Contact Management Setup window.
<b>Active</b>	In this field, you can specify whether the contact is still active, that is, whether the two parties still have contact with each other.
<b>Status, Date of Change</b>	This field shows the latest date on which the field "Active" was changed. When a line is created, the date is set to today's date.
<b>Current Customer/Employee</b>	<p>This field shows whether the contact specified on the line is a non-terminated customer or employee. This means that if the contact on the line is assigned to a customer or an employee, and no termination date or a termination date later than today's date has been specified on the customer or employee in question, the contact is considered a current customer or employee and this field will therefore be marked. You cannot change the field manually.</p> <p>Please note that if the contact is assigned to a customer or employee, either this field or the field "Former Customer/Employee" will be marked. If none of these fields are marked, the contact is assigned to neither a customer nor an employee.</p>
<b>Former Customer/Employee</b>	<p>This field shows whether the contact specified on the line is a former customer or employee. This means that if the contact on the line is assigned to a customer or an employee, and a termination date earlier than or equal to today's date has been specified on the customer or employee in question, the contact is considered a former customer or employee and this field will therefore be marked. You cannot change the field manually.</p> <p>Please note that if the contact is assigned to a customer or employee, this field or the field "Current Customer/Employee" above will always be marked. If none of these fields are marked, the contact is assigned to neither a customer nor an employee.</p>
<b>Created by</b>	This field shows the name of the user who created the current line.
<b>Created on</b>	This field shows the date on which the current line was created.
<b>Changed by</b>	This field shows the name of the last user who made changes to the current line.

Field	Description
<b>Changed on</b>	This field shows the date on which the latest change was made to the current line.
<b>Version</b>	This field shows a number corresponding to the version of the information on the line. Maconomy automatically increases the version number by one every time the information on the line is changed. It is not possible to retrieve previous versions.

## Actions

This section shows the Actions available in the Contact Person Relations workspace.

### Top Tab

Field	Description
<b>Create Employee</b>	The functionality of this action is similar to that of the action “Create Employee” in the window Contact Persons.

## Contact Company Relations Single Dialog Workspace

Use this workspace to enter relationships between a given contact company and other contact companies and contact persons.

For each contact company, you can enter the other contact companies and persons with which that company is in contact. You can also specify the type of relationship, for instance, whether it is professional or personal.

You can enter information for any contact persons (employees and customers) and contact companies.

This information can prove very useful when you need to learn about a prospect or customer. You can browse the workspace to look for someone who knows the customer or has a relationship with the prospect organization.

The Contact Company Relations tab displays information about the selected contact company; you can change contact company information and create contact companies in the same way as you do in the Contact Companies workspace. The fields in this tab correspond to the fields in the Contact Companies tab in the Contact Companies workspace; changing the information here updates the Contact Companies workspace appropriately

In the Contact Relations sub-tab, you can view and enter information about the contact persons and companies with which the contact company in question has a relationship. Contact relationship information is bidirectional. This means that if you select contact company A in the tab and create a line that specifies contact company B in the sub-tab, it corresponds exactly to selecting contact company B in the tab and entering contact company A in the sub-tab. This functionality also applies to relationships between contact companies and contact persons. Consequently, each relationship appears in the sub-tab of both parties.

For more information about creating contact companies and the functionality of the individual tab fields and actions that are available in this workspace, see the description of the Contact Companies workspace.

## Contact Company Relations Tab

This section includes the fields and descriptions for the Contact Company Relations tab.

### Contact Company Island

Field	Description
<b>Contact Company</b>	<p>In this field, you can enter a contact company number when creating a contact company. In the fields below the contact company number, you can enter the name and address of the contact company.</p> <p>For information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.</p>
<b>Attn.</b>	<p>In this field you can enter an attention person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.</p>
<b>Country</b>	<p>Here you select the country in which the contact company is located. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.</p>
<b>Phone</b>	<p>Here you can enter the phone number of the contact company.</p> <p>For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.</p>
<b>Fax</b>	<p>Here you can enter the fax number of the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.</p>
<b>Telex</b>	<p>Here you can enter the telex number of the contact company.</p> <p>For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.</p>
<b>E-mail</b>	<p>Here you can enter the e-mail address of the contact company.</p> <p>For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.</p>
<b>Department</b>	<p>In this field, you can select the department to which the contact company pertains. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.</p>
<b>Sales Rep. No.</b>	<p>Here you can enter the employee number of the sales representative in charge of the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.</p>

Field	Description
<b>Name</b>	This field shows the name of the sales representative.

**Customer Island**

Field	Description
<b>New Cust. No.</b>	If you want to register the current contact company as a customer, you can enter a new customer number here. For further information about the functionality of the field and the creation of customers from contact companies, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Customer No.</b>	If you want to register an existing customer as a contact company, you can enter the customer number in this field when you create a contact company. For further information about the functionality of the field and assigning customers to contact companies, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Termination Date</b>	If cooperation with the customer shown in the field "Customer No." above has been terminated, this field shows the date when the termination took place.

**Company Island**

Field	Description
<b>Company No.</b>	In this field, you can enter the number of a company to which the contact company is assigned. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

**Access Level Island**

Field	Description
<b>Access Level</b>	In this field, you can enter the name and description of an access level. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the contact company. For further information about the functionality of the field, please see the

Field	Description
	description of the corresponding field in the card part of the window Contact Companies.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

**Selection Criteria Island**

Field	Description
<b>Contact Type</b>	In this field, you can select a contact type (contact person or contact company). Only relations of the selected type will be displayed in the table part.
<b>Relation Type</b>	In this field, you can select a relation type. Only relations for which the selected relation type has been selected will be displayed in the table part.
<b>Show Non-active</b>	In this field, you can specify whether relations that are no longer active, that is, the field "Active" is unmarked should be shown in the table part. If you do not mark this field, only active relations are shown.

**Print Control Island**

Field	Description
<b>Statistic 1-4 Value</b>	In these fields, you can enter various statistic codes. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Statistics 1-4 List</b>	In these fields, you can specify the option lists containing the values you wish to be available in the fields "Statistics 1-4 Value." For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.

**Extra Fields Island**

Field	Description
<b>Date 1-5</b>	In these fields, you can enter a number of dates relevant to the contact company. The fields are for information only.

**User Island**

See the chapter "Getting Started" for a description of the fields in the island User.

**Remarks Island**

In these fields, you can enter additional remarks about the current contact company.

**Information Island**

Field	Description
<b>Enterprise</b>	In this field, you can attach the company to an enterprise. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Segment</b>	In this field, you can select a segment. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Area</b>	In this field, you can select an area. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Industry Code</b>	Here you can enter an industry code for the current contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Popup 1-20</b>	In these fields, you can select information concerning the current contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Information 1-5</b>	In these fields, you can enter general information concerning the current contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Origin</b>	In this field, you can register the place from which the current contact company originates. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.

**Option List Fields Island**

Field	Description
<b>Option List</b>	In these fields, you can specify the option lists containing the values you wish to use for further specification of the contact company. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Option Value</b>	In these fields, you can specify values available in the respective option lists specified in this island. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Companies.

## Contact Relations Sub-Tab

This section includes the fields and descriptions for the Contact Relations sub-tab.

Field	Description
<b>Contact Type</b>	<p>In this field, you can specify whether the contact on the current line is a contact person or contact company. The value determines whether a contact person number or a contact company number must be specified in the field "Contact No." on the line.</p> <p>Once the line has been created, the field is closed and can no longer be changed.</p>
<b>Contact No.</b>	<p>In this field, specify the number of the contact company or contact person which is a contact of the contact company in the card part. Specify a contact person if you have selected "Contact Person" in the field "Contact Type," or a contact company if you have selected "Contact Company."</p> <p>Once the line has been created, the field is closed and can no longer be changed.</p>
<b>Contact Name</b>	<p>This field shows the name of the contact person or company specified in the field "Contact No." above.</p>
<b>Relation Type</b>	<p>Enter a relation type for the relation, or press CTRL+G to search for a possible relation type. The CTRL+G search option is available if a relation type option list is specified in the Contact Management Setup window.</p>
<b>Active</b>	<p>In this field, you can specify whether the contact is still active, that is, whether the two parties still have contact with each other.</p>
<b>Status, Date of Change</b>	<p>This field shows the latest date on which the field "Active" was changed. When a line is created, the date is set to today's date.</p>
<b>Current Customer/Employee</b>	<p>This field shows whether the contact specified on the line is a non-terminated customer or employee. This means that if the contact on the line is assigned to a customer or an employee, and no termination date or a termination date later than today's date has been specified on the customer or employee in question, the contact is considered a current customer or employee and this field will therefore be marked. You cannot change the field manually.</p> <p>Please note that if the contact is assigned to a customer or employee, either this field or the field "Former Customer/Employee" will be marked. If none of these fields are marked, the contact is assigned to neither a customer nor an employee.</p>
<b>Former Customer/Employee</b>	<p>This field shows whether the contact specified on the line is a former customer or employee. This means that if the contact on the line is assigned to a customer or an employee, and a termination date earlier than or equal to today's date has been specified on the customer or employee in question, the contact is considered a former customer or employee and this field will therefore be marked. You cannot change the field manually.</p>

Field	Description
	Please note that if the contact is assigned to a customer or employee, this field or the field "Current Customer/Employee" above will always be marked. If none of these fields are marked, the contact is assigned to neither a customer nor an employee.
<b>Created by</b>	This field shows the name of the user who created the current line.
<b>Created on</b>	This field shows the date on which the current line was created.
<b>Changed by</b>	This field shows the name of the last user who made changes to the current line.
<b>Changed on</b>	This field shows the date on which the latest change was made to the current line.
<b>Version</b>	This field shows a number corresponding to the version of the information on the line. Maconomy automatically increases the version number by one every time the information on the line is changed. It is not possible to retrieve previous versions.

## Actions

This section shows the Actions available in the Contact Company Relations workspace.

### Top Tab

Field	Description
<b>Create Customer</b>	This action is used for creating a customer from the current contact company. For further information about the functionality of the action, please see the description of the action "Create Customer" in the window Contact Companies.

## Lookup Section

This section includes the fields and descriptions for the Lookup workspaces.

### Event Flow per Contact Company Single Dialog Workspace

Use this workspace to review the event flows that you assigned to the individual contact companies.

You can view information about contact companies and create others in the same way as when you create contact companies in the Contact Companies workspace.

In the Event Flow per Contact Company tab, each line displays an event flow that is assigned to the current contact company. You create event flows for the current contact company by adding lines in this tab.

The fields in this tab correspond to the fields in the Contact Companies workspace tab; changing the information here updates the Contact Companies workspace appropriately. Similarly, the information in the Event flows sub-tab derives from the Event flow tab of the Event Flow workspace; changing the information here also updates the Event Flow workspace appropriately. For more information about creating contact companies and event flows and the functionality of the individual fields and actions that are available in this workspace, see the descriptions of the Contact Companies and Event Flow workspaces.

### Event Flow per Contact Company Tab

This section includes the fields and descriptions for the Event Flow per Contact Company tab.

#### Contact Company Island

Field	Description
<b>Contact Company</b>	In this field, you can enter the name and number of a contact company when creating a contact company. For information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Attn.</b>	In this field you can enter an attention person. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Country</b>	Here you select the country in which the contact company is located. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Phone</b>	Here you can enter the phone number of the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Fax</b>	Here you can enter the fax number of the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Telex</b>	Here you can enter the telex number of the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>E-mail</b>	Here you can enter the e-mail address of the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Department</b>	In this field, you can select the department to which the contact company pertains. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.

Field	Description
<b>Sales Rep. No.</b>	Here you can enter the employee number of the sales representative in charge of the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Name</b>	This field shows the name of the sales representative.

**Customer Island**

Field	Description
<b>New Cust. No.</b>	If you want to register the current contact company as a customer, you can enter a new customer number here. For further information about the functionality of the field and the creation of customers from contact companies, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Customer No.</b>	If you want to register an existing customer as a contact company, you can enter the customer number in this field when you create a contact company. For further information about the functionality of the field and assigning customers to contact companies, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Termination Date</b>	If cooperation with the customer shown in the field "Customer No." above has been terminated, this field shows the date when the termination took place.

**Company Island**

Field	Description
<b>Company No.</b>	In this field, you can enter the number of a company to which the contact company is assigned. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Name</b>	This field shows the name of the company shown in the field "Company No." above.

**Access Level Island**

Field	Description
<b>Access Level</b>	In this field, you can enter the name and description of an access level. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.

**Document Archive Island**

Field	Description
<b>Document Archive</b>	In this field, you can assign a document archive to the contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Document Count</b>	This field shows the total number of documents in the Document Archive.

**Selection Criteria Island**

Field	Description
<b>Show Closed</b>	Mark this field if you want the table part to show closed event flows as well as open ones. If you do not mark the field, only open event flows are included in the table part.
<b>Starting Date, Flow</b>	In these fields, you can specify a range of dates. The table part will only include event flows with starting dates within the specified range.  Latest date of change In these fields, you can specify a range of dates. The table part will only include event flows whose latest date of change is within the specified range.

**Print Control Island**

Field	Description
<b>Statistic 1-4 Value</b>	In these fields, you can enter various statistic codes. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Statistics 1-4 List</b>	In these fields, you can specify the option lists containing the values you wish to be available in the fields "Statistics 1-4 Value." For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.

**Extra Fields Island**

Field	Description
<b>Date 1-5</b>	In these fields, you can enter a number of dates relevant to the contact company. The fields are for information only.

**User Island**

See the chapter "Getting Started" for a description of the fields in the island User.

**Remarks Island**

In these fields, you can enter additional remarks about the current contact company.

**Information Island**

Field	Description
<b>Enterprise</b>	In this field, you can attach the company to an enterprise. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Segment</b>	In this field, you can select a segment. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Area</b>	In this field, you can select an area. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Industry Code</b>	Here you can enter an industry code for the current contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Popup 1-20</b>	In these fields, you can select information concerning the current contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Information 1-5</b>	In these fields, you can enter general information concerning the current contact company. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Origin</b>	In this field, you can register the place from which the current contact company originates. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Contact Companies.

**Option List Fields island**

Field	Description
<b>Option List</b>	In these fields, you can specify the option lists containing the values you wish to use for further specification of the contact company. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Companies.
<b>Option Value</b>	In these fields, you can specify values available in the respective option lists specified in this island. For further information about the functionality of the fields, please see the description of the corresponding field in the card part of the window Contact Companies.

## Event flows Sub-Tab

This section includes the fields and descriptions for the Event flows sub-tab.

Field	Description
<b>Event Flow No.</b>	In this field, you can specify a number for the event flow when creating a flow. For further information about the functionality of the field, please see the description of the corresponding field in the card part of the window Event Flow.
<b>Description</b>	In this field, you can enter a description of the current event flow.
<b>Event Flow Type</b>	When creating an event flow, you must specify in this field an event flow type created in the window Event Flow Types.
